Approval Profile	Indicates the approval profile which must be used to define approval hierarchy for the off-process request type.
	Note: The Approval Profile field appears when the Approval Required check box is selected. It has a link. On clicking the link, the Approval Profile screen appears where you can view the details of the respective approval profile.
Approval To Do Type	Indicates that the To Do entry of the specified To Do type must be created when an off-process request is submit for approval.
	Note: It has a link. On clicking the link, the To Do Type screen appears where you can view the details of the respective To Do type. This field appears when the Approval Required option is selected.
Approval To Do Role	Indicates that users with the specified To Do role can only approve an off-process request which is submitted for approval.

Column Name	Column Description
	<p>Note:</p> <p>It has a link. On clicking the link, the To Do Role screen appears where you can view the details of the respective To Do role.</p> <p>This field appears when the Approval Required option is selected.</p>

- **Accumulation Amendment Details** - Lists the types of accumulation defined for the off-process type. It contains the following columns:

Column Name	Column Description
Accumulation Category	Indicates the category for which the adjustment or billable charge is created.
Amendment Field	Indicates the field for which the adjustment or billable charge is created.
Contract Type	Indicates the contract type which is associated while defining the off-process request type.
Adjustment Type/Billable Charge Line Type	Indicates the adjustment or billable charge line type using which the adjustment or billable charge should be created through the off-process request.

- **Characteristics** - The **Characteristics** section lists the characteristics of the off-process request type. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - The **Record Actions** section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the off-process request type.
Delete	Used to delete the off-process request type.
	<p>Note: You can delete a off-process request type when you have not created a off-process request using the off-process request type.</p>
Duplicate	Used to create a new off-process request type using an existing off-process request type.

- **Record Information** - The **Record Information** section contains the following fields:

Field Name	Field Description
Business Object	Indicates the business object using which the off-process request type is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.
	<p>Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.</p>

By default, the **Off-Process Request Type** zone does not appear in the **Off-Process Request Type** screen. It appears when you click the **Broadcast** (📡) icon corresponding to the off-process request type in the **Off-Process Request Type List** zone.

Defining an Off-Process Request Type

Prerequisites

To define an off-process request type, you should have:

- Off-process request type business objects defined in the application
- Off-process request business objects defined in the application
- Required approval profiles defined in the application
- Required To Do role assigned to the **C1-OFPAP** To Do type in the application
- Accumulation category defined in the application
- Amendment field and amendment mode defined in the application
- Contract type defined in the application
- Adjustment type and billable charge line type defined in the application
- Off-process request type status defined in the application

Procedure

To define an off-process request type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **O** and then click **Off-Process Request Type**.
A sub-menu appears.
3. Click the **Add** option from the **Off-Process Request Type** sub-menu.

The **Off-Process Request Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the off-process request type.
- **Accumulation Amendment Details** - Used to specify the accumulation amendment details for the off-process request type.
- **Characteristics** - Used to define the characteristics for the off-process request type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Type	Used to specify the off-process request type.	Yes
Business Object	Indicates the business object using which you are defining the off-process request type.	Not applicable
Description	Used to specify the description for the off-process request type.	Yes
Detailed Description	Used to specify additional information about the off-process request type.	No

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Business Object	Used to indicate the business object using which you want to create the off-process request.	Yes
Status	Used to indicate the status of the off-process request type. The valid values are: <ul style="list-style-type: none"> Active Inactive 	Not applicable
	Note: You cannot change the status of an off-process request type to Inactive when the corresponding off-process request is in a status other than Processed or Rejected . By default, the Active option is selected.	
Amendment Mode	Used to indicate the amendment mode selected for the off-process request type. The valid values are: <ul style="list-style-type: none"> Adjustment Billable Charge 	Yes
Approval Required	Used to indicate whether the approval is required before generating adjustments or billable charges through an off-process request.	No
Approval To Do Type	Used to indicate that To Do entry of the specified To Do type must be created when an off-process request is submitted for approval.	Yes (Conditional)
	Note: The Search  icon appears corresponding to the Approval To Do Type field. On clicking the Search icon, the To Do Type Search window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field. This field appears when the Approval Required option is selected.	Note: This field is required when the Approval Required option is selected.
Approval To Do Role	Used to indicate that users with the specified To Do role can only approve an off-process request submitted for approval.	Yes (Conditional)
	Note: The list includes only those To Do roles which are associated to the specified approval To Do type. This field appears only when the Approval Required option is selected.	Note: This field is required when the Approval Required option is selected.

4. Enter the required details in the **Main** section.

5. Define the accumulation amendment details for the off-process request type, if required.

- 6. Define characteristics for the off-process request type, if required.
- 7. Click **Save**.
The off-process request type is defined.

Adding the Accumulation Amendment Details in an Off-Process Request Type

Prerequisites

To add accumulation amendment details in an off-process request type, you should have:

- Accumulation categories defined in the application
- Amendment fields defined in the application
- Contract types defined in the application
- Adjustment type and billable charge line type defined in the application

Procedure

To add accumulation amendment details in an off-process request types:

1. Ensure that the **Accumulation Amendment Details** section is expanded when you are adding the accumulation amendment details in an off-process request type.

The **Accumulation Amendment Details** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Accumulation Category	Used to indicate the category that you want to use for accumulation. The valid values are: <ul style="list-style-type: none">• Aggregate Stop Loss• Discount Arrangement• Level Funded• Specific Stop-Loss	Yes
Amendment Field	Used to indicate the field that you want to use for accumulation purposes. The valid values are: <ul style="list-style-type: none">• ASL Limit• Aggregated Amount• Cumulative ASL Credit• Cumulative SSL Credit• Maximum Limit• Minimum Limit• Run Out Fund• Settlement Fund	Yes

Field Name	Field Description	Mandatory (Yes or No)
Contract Type	Used to indicate the contract that you want to use for accumulation and amendment purposes.	Yes (Conditional)
	Note: The Search  icon appears corresponding to the Contract Type field. On clicking the Search icon, the Contract Type Search window appears.	Note: This field is required when you are defining accumulation amendment details in an off-process request type.
Adjustment Type/Billable Charge Line Type	Used to indicate the type of charge using which you want to create adjustments or billable charges.	Yes (Conditional)
	The Search  icon appears corresponding to the Adjustment Type/Billable Charge Line Type field. On clicking the Search icon, the Adjustment Type/Billable Charge Line Type Search window appears.	Note: This field is required when you are defining accumulation amendment details in an off-process request type.

- Enter the required details in the **Accumulation Amendment Details** section.
- If you want to define more than one accumulation amendment details for the off-process request type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove an accumulation amendment detail(s) from the off-process request type, click the **Delete**  icon corresponding to the accumulation amendment details.

Defining a Characteristic for an Off-Process Request Type

Prerequisites

To define a characteristic for an off-process request type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Off-Process Request**)

Procedure

To define a characteristic for an off-process request type:

- Ensure that the **Characteristics** section is expanded when you are defining, editing, or copying an off-process request type.

The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	Note: The list includes only those characteristic types where the characteristic entity is set to Off-Process Request .	Note: This field is required when you are defining a characteristic for the off-process request type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the Search (Q) icon appears corresponding to the Characteristic Value field. On clicking the Search icon, the Predefined Characteristic Search window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the Characteristic Value field.	Note: This field is required when you are defining a characteristic for the off-process request type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the off-process request type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a characteristic from the off-process request type, click the **Delete** (■) icon corresponding to the characteristic.

Editing an Off-Process Request Type

Prerequisites

To edit an off-process request type, you should have:

- Off-process request business objects defined in the application
- Adjustment type and billable charge line type defined in the application
- Required approval profiles defined in the application
- A To Do role assigned to the **C1-OFPAP** To Do type in the application
- Accumulation category defined in the application
- Amendment field and amendment mode defined in the application
- Contract type defined in the application
- Off-process request type status defined in the application

Procedure

To edit an off-process request type:

1. Click the **Admin** link in the **Application** toolbar.

A list appears.

2. From the **Admin** menu, select **O** and then click **Off-Process Request Type**.

A sub-menu appears.

3. Click the **Search** option from the **Off-Process Request Type** sub-menu.

The **Off-Process Request Type** screen appears.

4. In the **Off-Process Request Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the off-process request type whose details you want to edit.

The **Off-Process Request Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the off-process request type.
- **Characteristics** - Used to define the characteristics for the off-process request type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Type	Displays the off-process request type.	Not applicable
Business Object	Indicates the business object using which you are defining the off-process request type.	Not applicable
Description	Used to specify the description for the off-process request type.	Yes
Off-Process Request Business Object	Used to indicate the business object using which you want to create the off-process request.	Yes
Detailed Description	Used to specify additional information about the off-process request type.	No
Status	Used to indicate the status of the off-process request type. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	Yes
	Note: You cannot change the status of an off-process request type to Inactive when the corresponding off-process request is in a status other than Processed or Rejected . If you do not specify the status, by default, it is set to Active .	
Amendment Mode	Used to indicate the amendment mode selected for the off-process request type. The valid values are: <ul style="list-style-type: none"> • Adjustment • Billable Charge 	Yes
Approval Required	Used to indicate whether the approval is required before generating adjustments or billable charges through an off-process request.	No
Approval To Do Type	Used to indicate that To Do entry of the specified To Do type must be created when an off-process request is submitted for approval.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	Note: The Search  icon appears corresponding to the Approval To Do Type field. On clicking the Search icon, the To Do Type Search window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field. This field appears when the Approval Required option is selected.	Note: This field is required when the Approval Required option is selected.
Approval To Do Role	Used to indicate that users with the specified To Do role can only approve an off-process request submitted for approval.	Yes (Conditional)
	Note: The list includes only those To Do roles which are associated to the specified approval To Do type. This field appears only when the Approval Required option is selected.	Note: This field is required when the Approval Required option is selected.

Tip: Alternatively, you can edit the details of a off-process request type by clicking the **Edit** button in the **Off-Process Request Type** zone.

- 5. Modify the details in the **Main** section, if required.
- 6. Define, edit, or remove accumulation amendment details from the off-process request type, if required.
- 7. Define, edit, or remove characteristics of the off-process request type, if required.
- 8. Click **Save**.
The changes made to the off-process request type are saved.

Deleting an Off-Process Request Type

Procedure

To delete an off-process request type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **O** and then click **Off-Process Request Type**.
A sub-menu appears.
3. Click the **Search** option from the **Off-Process Request Type** sub-menu.
The **Off-Process Request Type** screen appears.
4. In the **Off-Process Request Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the off-process request type that you want to delete.

A message appears confirming whether you want to delete the off-process request type.

Note: You can delete an off-process request type when you have not created an off-process request using the off-process request type.

Tip: Alternatively, you can delete an off-process request type by clicking the **Delete** button in the **Off-Process Request Type** zone.

5. Click **OK**.
The off-process request type is deleted.

Copying an Off-Process Request Type

Instead of creating an off-process request type from scratch, you can create a new off-process request type using an existing off-process request type. This is possible through copying an off-process request type. On copying an off-process request type, the details including the characteristics are copied to the new off-process request type. You can then edit the details, if required.

Prerequisites

To copy an off-process request type, you should have:

- Off-process request type (whose copy you want to create) defined in the application
- Off-process request business objects defined in the application
- Required approval profiles defined in the application
- A To Do role assigned to the **C1-OFPAP** To Do type in the application
- Accumulation category defined in the application
- Amendment field and amendment mode defined in the application
- Contract type defined in the application
- Adjustment type and billable charge line type defined in the application
- Off-process request type status defined in the application

Procedure

To copy an off-process request type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **O** and then click **Off-Process Request Type**.

A sub-menu appears.

3. Click the **Search** option from the **Off-Process Request Type** sub-menu.
The **Off-Process Request Type** screen appears.
4. In the **Off-Process Request Type List** zone, click the **Duplicate** (🔗) icon in the **Duplicate** column corresponding to the off-process request type whose copy you want to create.

The **Off-Process Request Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the off-process request type.
- **Characteristics** - Used to define the characteristics for the off-process request type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Type	Used to specify the off-process request type.	Yes
Business Object	Indicates the business object using which you are defining the off-process request type.	Not applicable
Description	Used to specify the description for the off-process request type.	Yes
Off-Process Request Business Object	Used to indicate the business object using which you want to create the off-process request.	Yes
Detailed Description	Used to specify additional information about the off-process request type.	No
Off-Process Request Business Object	Used to indicate the business object using which you want to create the respective off-process request type.	Yes
Status	Used to indicate the status of the off-process request type. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	Yes
	Note: You cannot change the status of an off-process request type to Inactive when the corresponding off-process request is in a status other than Processed or Rejected . If you do not specify the status, by default, it is set to Active .	
Amendment Mode	Used to indicate the amendment mode selected for the off-process request type. The valid values are: <ul style="list-style-type: none"> • Adjustment • Billable Charge 	Yes
Approval Required	Used to indicate whether the approval is required before generating adjustments or billable charges through an off-process request.	No
Approval To Do Type	Used to indicate that To Do entry of the specified To Do type must be created when an off-process request is submitted for approval.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The Search  icon appears corresponding to the Approval To Do Type field. On clicking the Search icon, the To Do Type Search window appears.</p> <p>On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field.</p> <p>This field appears when the Approval Required option is selected.</p>	<p>Note: This field is required when the Approval Required option is selected.</p>
Approval To Do Role	<p>Used to indicate that users with the specified To Do role can only approve an off-process request submitted for approval.</p> <p>Note:</p> <p>The list includes only those To Do roles which are associated to the specified approval To Do type.</p> <p>This field appears only when the Approval Required option is selected.</p>	<p>Yes (Conditional)</p> <p>Note: This field is required when the Approval Required option is selected.</p>

Tip: Alternatively, you can copy an off-process request type by clicking the **Duplicate** button in the **Off-Process Request Type** zone.

- Enter the required details in the **Main** section.
- Define, edit, or remove the accumulation amendment details from the off-process request type, if required.
- Define, edit, or remove characteristics of the off-process request type, if required.
- Click **Save**.
The new off-process request type is defined.

Searching for an Off-Process Request

Prerequisites

To search for an off-process request, you should have:

- Off-process request types defined in the application

Procedure

To search for an off-process request:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Transaction and Audit Event Management** and then click **Off-Process Request**.
A sub-menu appears.
3. Click the **Search** option from the **Off-Process Request** sub-menu.
The **Off-Process Request** screen appears.
4. Enter the search criteria in the **Search-Off Process Request** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of off-process requests that meet the search criteria appears in the **Search Results** section.

Defining an Off-Process Request

Prerequisites

To create an off-process request, you should have:

- Off-Process request types defined in the application
- Accumulation category and accumulation group defined in the application
- Amendment field defined in the application
- Persons defined in the application
- Account ID defined in the application
- Characteristic types defined in the application
- Adjustment types or billable charge line types defined in the application

Procedure

To create an off-process request:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Transaction and Audit Event Management** and then click **Off-Process Request**.
A sub-menu appears.
3. Click the **Add** option from the **Off-Process Request** sub-menu.

The **Add Off-Process Request** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Type	Used to indicate the off-process request type using which you want to create the off-process request.	Yes

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Off-Process Request** screen.

4. Select the required off-process request type from the **Off-Process Request Type** field.
5. Click **OK**.
The **Off-Process Request** screen appears. It contains the following sections:
 - **Main** - Used to specify basic details about the off-process request.
 - **Off-Process Request Information** - Used to specify the off-process request information.

- **Characteristics** - Used to define the characteristics for the off-process request.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Type	Indicates the off-process request type using which you want to create the off-process request.	Not applicable
Creation Mode	Indicates the mode in which the offset request is created. The valid values are: <ul style="list-style-type: none">• Automatic• Manual	Not applicable
Parent Person Id	Used to indicate the parent customer (.e. person whose person type is set to Parent Customer) for which you want to create an off-process request.	Yes
	Note: The Search (🔍) icon appears corresponding to the Parent Person ID field. On clicking the Search icon, the Parent Customer Search window appears. On specifying the parent person, the description of the parent person appears corresponding to the Parent Person ID field.	
Comments	Used to specify the comments for an off-process request.	No

6. Enter the required details in the **Main** section.
7. Add the accumulation amendment details in the off-process request, if required.
8. Define characteristics for the off-process request, if required.
9. Click **Save**.
The off-process request is created in the **Draft** status.

Off-Process Request

The **Off-Process Request** zone displays the details of the off-process request. It contains the following sections:

- **Main** - Displays basic information about the off-process request. It contains the following fields:

Field Name	Field Description
Off-Process Request Information	Displays information about the off-process request.
Off-Process Request Type	Indicates the off-process request type using which the off-process request is created.
	Note: It has a link. On clicking the link, the Off-Process Request Type screen appears where you can view the details of the respective off-process request type.
Parent Person	Indicates the parent person for whom the off-process request is created.
Status	Indicates the status of the off-process request. The valid values are: <ul style="list-style-type: none"> Approval In Progress Draft Processed Rejected
Creation Mode	Indicates whether the off-process request is created automatically or manually. The valid values are: <ul style="list-style-type: none"> Automatic Manual

- **Record Actions** - This section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the off-process request.
	Note: The Edit button appears when the off-process request is in the Draft status.
Delete	Used to delete the off-process request.
	Note: The Delete button appears when the off-process request is in the Draft status.
Submit	Used to submit the off-process request.
	Note: The Submit button appears when the off-process request is in the Draft status.
Approve	Used to approve the off-process request.
	Note: The Approve button appears when: <ul style="list-style-type: none"> The off-process request is in the Approval In Progress status. A user with the approval To Do role is reviewing the off-process request.
Reject	Used to reject the off-process request.
	Note: The Reject button appears when: <ul style="list-style-type: none"> The off-process request is in the Approval In Progress status. A user with the approval To Do role is reviewing the off-process request.

- **Record Information** - This section contains the following fields:

Field Name	Field Description
Business Object	Indicates the business object using which the off-process request is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.
Status Date/Time	Displays the date and time when the off-process request status is updated
Create Date/Time	Displays the date and time when the off-process request is created.

- **Characteristics** - Lists the characteristics defined for the off-process request. It contains the following columns:

Column Name	Column Description
Effective Date	Displays the date from when the characteristic is effective for the off-process request.
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

Adding the Off-Process Request Details in an Off-Process Request

Prerequisites

To add the off-process request details in an off-process request, you should have:

- Off-process request types defined in the application
- Categories defined in the application (where the characteristic entity is set to **Off-Process Request**)
- Applicable adjustments and billable charge line types defined in the application.

Procedure

To add the off-process request details in an off-process request:

1. Ensure that the **Off-Process Request Details** section is expanded when you are editing an off-process request.

The **Off-Process Request Details** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Accumulation Category	Used to indicate the accumulation category whose field value you want to amend through the off-process request. The valid values are: <ul style="list-style-type: none">• Aggregate Stop Loss• Discount Arrangement• Level Funded• Specific Stop-Loss	Yes
Accumulation Group ID	<div>Used to indicate the accumulation group for which the (accumulation and amendment) changes should be reflected in the system.</div> <div>Note: The Search (🔍) icon appears corresponding to the Accumulation Group ID field. On clicking the Search icon, the Accumulation Group Search window appears. On specifying the accumulation group Id, the description of the accumulation group Id appears corresponding to the Accumulation Group ID field. If the accumulation category is set to Specific Stop-Loss, you can only select the accumulation group defined at the bill group level. However, if the accumulation category is set to Aggregate Stop-Loss, Discount Arrangement, or Level Funded, you can only select the accumulation group defined at the parent customer level.</div>	No
Amendment Field	<div>Used to indicate the accumulation field whose value you want to amend through the off-process request. The valid values are:<ul style="list-style-type: none">• ASL Limit• Aggregated Amount• Cumulative ASL Credit• Cumulative SSL Credit• Maximum Limit• Minimum Limit• Run Out Fund• Settlement Fund</div>	<div>Yes (Conditional)</div> <div>Note: This field is required when you select the Accumulation Category for the off-process request.</div>

Field Name	Field Description	Mandatory (Yes or No)
	Note: You can select only those accumulation categories and fields for which the contract type and adjustment type or billable charge line type information is available in the respective off-process request type.	
Account ID	Used to indicate the account for which the adjustment or billable charge should be created in the system.	Yes (Conditional)
	Note: The account ID and the account information appear automatically when you select the appropriate option from the Amendment Field field.	Note: This field is required when you select the Accumulation Group ID for the off-process request.
	The Search (🔍) icon appears corresponding to the Account ID field. On clicking the Search icon, the Account Search window appears. On specifying the account ID, the description of the account appears corresponding to the Account ID field.	
Off-Process Amount	Used to specify the amount which you want amend through the off-process request.	Yes (Conditional)
		Note: This field is required when you select the Accumulation Category for the off-process request.
Adjustment Type/ Billable Charge Line Type	Used to indicate the adjustment type or billable charge line type using which the adjustment or billable charge should be created when the amendment mode is set to Adjustment or Billable Charge in the respective off-process request type.	Yes (Conditional)
	Note: The Search (🔍) icon appears corresponding to the Adjustment Type/Billable Charge Line Type field. On clicking the Search icon, the Adjustment Type/Billable Charge Line Type Search window appears. On specifying the value for a predefined adjustment type or billable charge line type, the description of the adjustment type or billable charge line type appears corresponding to the Adjustment Type/Billable Charge Line Type Search field. Once the Amendment Field is selected, its respective adjustment type or billable charge line type appears in the Adjustment Type/Billable Charge Line Type field.	Note: This field is required when you select the Accumulation Category for the off-process request.
Member/Subscriber ID	Used to specify member or the main subscriber for whom the field value should be amended in the system.	No

Field Name	Field Description	Mandatory (Yes or No)
Effective Date	Used to indicate the date from when the field value should be amended in the system.	Yes (Conditional)
		Note: This field is required when you select the Accumulation Category for the off-process request.
Coverage Start Date	Used to indicate the date from when the amendment is applicable for the off-process request.	No
Coverage End Date	Used to indicate the date till when the amendment is applicable for the off-process request.	No

- Enter the required details in the **Off-Process Request Details** section.
- If you want to define more than one off-process request detail for the off-process request, click the **Add (+)** icon and then repeat step 2.

Note: However, if you want to remove an off-process request detail from the off-process request, click the **Delete** (🗑) icon corresponding to the off-process request detail.

Defining a Characteristic for an Off-Process Request

Prerequisites

To define a characteristic for an off-process request, you should have:

- Off-process request types defined in the application
- Characteristic types defined in the application (where the characteristic entity is set to **Off-Process Request**)

Procedure

To define a characteristic for an off-process request:

- Ensure that the **Characteristics** section is expanded when you are defining, editing, or copying an off-process request.

The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Effective Date	Used to specify the date from when the characteristic is effective for the off-process request.	Yes (Conditional)
		Note: This field is required when you are defining a characteristic for the off-process request.
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	Note: The list includes only those characteristic types where the characteristic entity is set to Off-Process Request .	Note: This field is required when you are defining a characteristic for the off-process request.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional) Note: This field is required when you are defining a characteristic for the off-process request.

- 2. Enter the required details in the **Characteristic** section.
- 3. If you want to define more than one characteristic for the off-process request, click the **Add (+)** icon and then repeat step 2.

Note: However, if you want to remove a characteristic from the off-process request, click the **Delete (■)** icon corresponding to the off-process request information.

Chapter 41

Individual Health Insurance Pricing

Topics:

- [Business Rules](#)
- [Young Adult Coverage in an Individual Membership](#)

Oracle Revenue Management and Billing enables you to define pricing for different services offered in a health plan. Each service offered in a health plan should be defined as a price item in the system. For example, services may include medical insurance, home care, hospital visits, etc.

You can define the age based, tier based, or additional fee pricing for a price item using the respective pricing rule. You can create an age based, tier based, and additional fee pricing rule using the respective pricing rule type. The following pricing rule type and pricing rule business objects are enhanced to support the fully-insured individual business:

- C1-PrcRuleTypeAgeBased
- C1-PricingRuleAgeBased
- C1-PrcRuleTypeTierBased
- C1-PricingRuleTierBased
- C1-PrcRuleTypeCapitationFee
- C1-PricingRuleCapitationFee
- C1-PrcRuleTypeBenefit

You can create a pricing rule for a health plan using a pricing rule type only when the pricing rule type is associated with the health plan. The system enables you to define pricing rules for various services offered in the health plan. You must add the required price items in a pricing rule type. The system then enables you to create a pricing rule for a price item using the respective pricing rule type. While defining an age based pricing rule for a price item, you can offer different rates to different member persons based on the age, member relationship, geographic rating area, member person attributes, etc. You can also charge additional fee or given discount to a member person based on modifier attributes. For example, you may charge more premium to an alcoholic person compared to a non-alcoholic person for the same service (i.e. price item). While defining a tier based pricing rule for a price item, you can offer different rates to different memberships based on the subscription tier, geographic rating area, member person attributes, etc.

You can associate one or more pricing rule types with a health plan through a health product and plan inbound message. You can define one or more pricing rules for a health plan through a health product and plan inbound message. The system creates the pricing rule for a price item using the business object which is specified in the pricing rule type. While creating a pricing rule for a health plan, you can define pricing eligibility rules for a pricing rule. The system considers the pricing rule for an individual membership when the pricing eligibility rule (i.e. eligibility criteria) is satisfied.

The system enables you to define a pricing rule for a price item without the pricing rule eligibility. Such pricing rule is considered as a default pricing rule for the price item. If an individual membership is not eligible for any pricing

rule, the system uses the default pricing rule of the price item for the individual membership.

Note: On inactivating a health plan, the system will not automatically inactivate the pricing rules defined for the health plan.

Business Rules

Oracle Revenue Management and Billing facilitates you to calculate the premium for each individual membership differently based on various health product, health plan, membership, or member person attributes. You can define different set of business rules for the following categories:

- **Binder Payment** - If an individual membership meets the criteria of a binder payment business rule, the system derives the following information from the business rule:
 - Binder Payment Applicability
 - Threshold Percentage
 - Grace Days
 - Hold Billing
- **Fully-Insured Pricing** - If an individual membership meets the criteria of a fully-insured pricing business rule, the system derives the following information from the business rule:
 - Maximum Age Limit of Dependents
 - Dependent Order Priority
 - Age Calculation Date
 - Age Recalculation Date
 - Young Adult Applicability
 - Young Adult Max Age Limit
 - Member Relationship Derivation Date
- **New Born** - If an individual membership meets the criteria of a new born business rule, the system derives the following information from the business rule:
 - Gift Days Applicability
 - New Born Gift Days
- **Rate Guarantee** - If an individual membership meets the criteria of a rate guarantee business rule, the system derives the following information from the business rule:
 - Rate Guarantee Applicability
 - Rate Guarantee Period
- **Refund/Write Off** - If an individual membership meets the criteria of a refund/write-off business rule, the system derives the following information from the business rule:
 - Refund Threshold Amount
 - Defer Refund (in Days)
 - Write Off Threshold Amount
 - Defer Write Off (in Days)
- **Delinquency Grace Period** - If an individual membership meets the criteria of a delinquency grace period business rule, the system derives the following information from the business rule:
 - Criteria Description
 - Effective Date
 - Status
 - Grace Period (Days)
- **Delinquency Event Attributes** - If an individual membership meets the criteria of a delinquency event attributes business rule, the system derives the following information from the business rule:
 - Criteria Description
 - Effective Date
 - Status
 - Wait Days
 - Wait Month

- Wait Day of Month
- Send Membership Level Notification
- **Delinquency Termination Date** - If an individual membership meets the criteria of a delinquency termination date business rule, the system derives the following information from the business rule:
 - Criteria Description
 - Effective Date
 - Status
 - Termination Date Rule
- **Delinquency Miscellaneous Options** - If an individual membership meets the criteria of a delinquency miscellaneous options business rule, the system derives the following information from the business rule:
 - Criteria Description
 - Effective Date
 - Status
 - Trigger Date Recalculation On Hold Release
 - Trigger Date Recalculation On Resume
 - Trigger Termination Process
 - Immediate
 - Month End
 - After X Days
 - Termination Wait Days
 - Add Days to Coverage End Date
 - Add Days to Paid Through Date
 - Add Months to Paid Through Date
 - Add Days to Grace End Date
 - Add Days to Date of Processing of Termination Request

A business rule contains a criteria. If the criteria of the business rule is met, the information is derived from the business rule. This information is used while deriving the member relationship for a member person, subscription tier for an individual membership, and while deriving eligible member persons for premium calculation.

You can define criteria for a business rule using a set of parameters which are associated with a business rule type. The system enables you to associate only those parameters in a business rule type where the parameter usage is set to **Business Rule Eligibility Criteria**.

To implement the business rule feature, the following new screens are introduced in this release:

- **Business Rule Type** - Used to specify a list of parameters where the parameter usage is set to **Business Rule Eligibility Criteria**. You can then use the parameter while defining a criteria in the business rule.
- **Business Rule** - Used to search business rules of a particular category (i.e. Fully-Insured Pricing or New Born).

Binder Payment Business Rules

Oracle Revenue Management and Billing enables you to define business rules for binder payment. A new category named **Binder Payment Business Rule** is introduced in this release. The binder payment business rules are used for used for monitoring and processing the binder payments of an individual membership.

The system derives the binder payment business rules for an individual membership while creating or editing an individual membership, or while adding, editing, or inactivating a member person in an individual membership. While deriving a business rule of the **Binder Payment Business Rule** category, the ORMB application considers the respective business rules which are effective on the membership start date. Once the effective business rules are identified, the ORMB application executes these business rules in the order of their priority.

Once the criteria of the business rule is met, the business rule is stamped against the individual membership. If two or more business rules have the same priority, the ORMB application sorts the business rules for execution, based

on the business rule criteria sequence. The ORMB application derives the binder payment details for an individual membership through a binder payment business rule only when the binder payment details are not available for an individual membership in the respective table.

While defining the binder payment business rule criteria, you can use the parameters which are defined on the following entities:

- Health Plan
- Health Product
- Individual Membership
- Member Person of an Individual Membership

You can define, edit, and delete a binder payment business rule through the **Business Rule** screen. While defining a binder payment business rule, you need to set its category to **Binder Payment Business Rule**. The binder payment business rule enables you to define the following parameters:

- **Binder Payment Applicability** - Used to indicate that you want the system to monitor whether the binder payment is received or not before activating the individual membership.
- **Threshold Percentage** - Used to specify the threshold percentage using which the threshold amount should be calculated.
- **Grace Days** - Used to calculate the grace date for the individual membership.
- **Hold Billing** - Used to indicate whether you want to hold the bill generation process for the individual membership until the binder payment is received.

You can view the binder payment business rules through the **Business Rule** screen.

Fully-Insured Pricing Business Rules

Oracle Revenue Management and Billing enables you to define business rules for fully-insured pricing. A new category named **Fully-Insured Pricing Business Rule** is introduced in this release. The premium calculation process for an individual membership is described as follows:

- If you want to calculate the premium for an individual membership using an **Age Based Pricing** rule, the system derives the rate for each eligible member person. Once the rate is derived, the system identifies members that are eligible for premium calculation using the fully-insured pricing business rules. On creating or editing an individual membership through a health care inbound message or membership repricing inbound web service, the system determines the fully-insured pricing business rules which are applicable for the individual membership. If an individual membership meets the criteria of the fully-insured pricing business rule, the system then stamps the fully-insured pricing business rule corresponding to the individual membership.
- If you want to calculate the premium for an individual membership using a **Tier Based Pricing** rule, the system derives the subscription tier using the fully-insured pricing business rules. Once the premium is calculated for an individual membership, the system creates a billable charge for the premium. If the account is defined for the individual membership using the characteristic types specified in the **Account Identifier Type Char Type** and **Account Identifier Value Char Type** option types of the **C1-ASOBLLNG** feature configuration, the system uses the account to bill the charge for the premium. However, if these characteristics are not defined for the individual membership, the system considers the account of the financially responsible member person to the charge for the premium.

Note: While deriving a business rule of the **Fully-Insured Pricing Business Rule** category, the system considers the respective business rules which are effective on the audit event's effective date.

You can define, edit, and delete a fully-insured pricing business rule through the **Business Rule** screen. While defining a fully-insured pricing business rule, you need to set its category to **Fully-Insured Pricing Business Rule**. The fully-insured pricing business rule enables you to define the following parameters:

- **Maximum Dependents** - Used to specify the maximum number of children which are eligible for premium calculation.
- **Dependent Max Age Limit** - Used to specify the maximum age limit for children eligible for premium calculation.

- **Dependent Order Priority** - Used to indicate the order priority of the dependent during premium calculation.
- **Age Calculation Date** - Used to indicate whether the member person's age should be calculated using the member person's enrollment date or policy's start or renewal date.
- **Age Recalculation Date** - Used to indicate whether the member person's age should be recalculated using the member person's enrollment date or policy's start or renewal date.
- **Young Adult Applicability** - Used to indicate that the child or dependent enrolling in the membership becomes the young adult in the enrollment period.
- **Young Adult Max Age Limit** - Used to specify the maximum age limit for young adults which are eligible for premium calculation.
- **Member Relationship Derivation Date** - Used to indicate the member relationship for a member person.

You can view the fully-insured pricing business rules through the **Business Rule** screen.

New Born Business Rules

Oracle Revenue Management and Billing enables you to define business rules for newborn pricing. A new category named **New Born Business Rule** is introduced in this release. The premium calculation process for an individual membership is described as follows:

- If you want to calculate the premium for an individual membership using an age based pricing rule, the system derives the rate for each eligible member person. Once the rate is derived, the system identifies members that are eligible for premium calculation using the newborn business rules. On creating or editing an individual membership through a health care inbound message or membership repricing inbound web service, the system determines the newborn business rules which are applicable for the individual membership. If an individual membership meets the criteria of the newborn business rule, the system then stamps the newborn business rule corresponding to the individual membership.
- If you want to calculate the premium for an individual membership using a tier based pricing rule, the system derives the subscription tier using the newborn business rules. Once the premium is calculated for an individual membership, the system creates a billable charge for the premium. If the account is defined for the individual membership using the characteristic types specified in the **Account Identifier Type Char Type** and **Account Identifier Value Char Type** option types of the **C1-ASOBLLNG** feature configuration, the system uses the account to bill the charge for the premium. However, if these characteristics are not defined for the individual membership, the system considers the account of the financially responsible member person to the charge for the premium.

Note: While deriving a business rule of the **New Born Business Rule** category, the system considers the respective business rules which are effective on the audit event's effective date.

You can define, edit, and delete a newborn business rule through the **Business Rule** screen. While defining a newborn business rule, you need to set its category to **Fully-Insured Pricing Business Rule**. The newborn business rule enables you to define the following parameters:

- **Gift Days Applicability** - Used to indicate whether you want to offer gift days in case of a newborn child.
- **New Born Gift Days** - Used to specify the number of days you want to offer as gift days from the newborn child's birth date.

You can view the newborn business rules through the **Business Rule** screen.

Rate Guarantee Business Rules

Oracle Revenue Management and Billing enables you to define a rate guarantee business rule for an individual membership. A new category named **Rate Guarantee Business Rule** is introduced in this release.

While deriving a business rule of the **Rate Guarantee Business Rule** category, the system considers the respective business rules which are effective on the membership start date. Once the effective business rules are identified, the system executes these business rules in the order of their priority. Once the criteria of the business rule is met, the

business rule is stamped against the individual membership. If two or more business rules have the same priority, the system sorts the business rules for execution based the business rule criteria sequence.

While defining the rate guarantee business rule criteria, you can use the parameters which are defined on the following entities:

- Health Plan
- Health Product
- Individual Membership
- Member Person of an Individual Membership

You can define, edit, and delete a rate guarantee business rule through the **Business Rule** screen. While defining a rate guarantee business rule, you need to set its category to **Rate Guarantee Business Rule**. The rate guarantee business rule enables you to define the following parameters:

- **Rate Guarantee Applicability** - Used to indicate whether the rate guarantee is available for the individual membership.
- **Rate Guarantee Period** - Used to derive the rate guarantee start and end dates.

Note: The system sets the rate guarantee start date to the membership start date and the rate guarantee end date to the rate guarantee start date + rate guarantee period.

You can view the rate guarantee business rules through the **Business Rule** screen.

Refund/Write Off Business Rules

Oracle Revenue Management and Billing enables you to define business rules for automatic refund and write off creation. A new category named **Refund/Write Off Business Rule** is introduced in this release. The refund/write off business rules are used for creating automatic refund and write off requests for accounts when the fully-insured group policy or individual membership is terminated.

While terminating a fully-insured group policy or individual membership, the system derives the refund/write off business rule for the fully-insured group policy or individual membership. While deriving the refund/write off business rule for a fully-insured group policy or individual membership, the system considers the business rules which are effective on the termination date. Once the effective business rules are identified, the system executes these business rules in the order of their priority. Once the criteria of the business rule are met, the business rule is stamped against the fully-insured group policy or individual membership. If two or more business rules have the same priority, the system sorts the business rules for execution based the business rule criteria sequence.

While defining the refund/write off business rule criteria, you can use the parameters which are defined on the following entities:

- Individual Membership
- Member Person of Individual Membership
- Health Plan
- Health Product
- Policy
- Account

You can define, edit, and delete a refund/write off business rule through the **Business Rule** screen. While defining a refund/write off business rule, you need to set its category to **Refund/Write Off Business Rule**. The refund/write off business rule enables you to define the following parameters:

- **Refund Threshold Amount** - Used to specify the threshold amount for refund. If the account balance is greater than or equal to the refund threshold amount, the system creates automatic refund for an account.
- **Defer Refund (in Days)** - Used to specify the number of days till when you want to defer the automatic refund for an account. It is used while calculating the automatic refund request creation date.
- **Write Off Threshold Amount** - Used to specify the threshold amount for write off. If the account balance is less than or equal to the write off threshold amount, the system creates automatic write off for an account.

- **Defer Write Off (in Days)** - Used to specify the number of days till when you want to defer the automatic write off for an account. It is used while calculating the automatic write off request creation date.

You can view the refund/write off business rules through the **Business Rule** screen.

Delinquency Grace Period Business Rule

Oracle Revenue Management and Billing enables you to define business rules for determining the grace period during the delinquency management. The insurance company may offer different grace period to different individuals based on certain parameters, such as division, customer class, region, and jurisdiction in which the individual customer has availed for the health plan coverage. The system will then accordingly use the grace period to calculate the following:

- Trigger dates for the delinquency events
- Termination request date when you want to send the outbound message to the external system requesting to terminate the individual membership

The system considers the delinquency grace period business rules to determine the grace period only when the grace period source is set to **Algorithm** in the respective delinquency process type. If the grace period source is set to **Algorithm**, the system executes the **C1-DERGRBR** algorithm attached to the **Grace Period Derivation** system event of the delinquency process type when you execute the **C1-DPEVL** batch. For more information on how the grace period is derived, refer to the respective algorithm description in the [Delinquency Process Type Algorithms](#) on page 3945 section.

While defining the delinquency grace period business rule criteria, you can use the parameters which are defined on the following entities for individual membership:

- Delinquency Event Type
- Health Plan
- Health Product
- Membership
- Membership Person

While defining the delinquency grace period business rule criteria, you can use the parameters which are defined on the following entities for group membership:

- Account
- Customer Class
- Delinquency Event Type
- Division
- Policy
- Policy Plan

You can define, edit, and delete a delinquency grace period business rule through the **Business Rule** screen. While defining a delinquency grace period business rule, you need to set its category to **Delinquency Grace Period Business Rule** and specify the following details:

- **Criteria Description** - Used to indicate the business criteria that an individual membership must satisfy in order to derive the grace period from the business rule.
- **Effective Date** - Used to specify the date from when the business rule is effective.
- **Status** - Used to indicate the status of the business rule. The valid values are **Active** and **Inactive**.
- **Grace Period (Days)** - Used to specify the grace period in days.

You can view the delinquency grace period business rules through the **Business Rule** screen.

Delinquency Events Attribute Business Rule

Oracle Revenue Management and Billing enables you to define business rules for determining the waiting time (in days or months) before triggering a delinquency event in the delinquency process. The insurance company may offer different waiting time for different delinquency event types (such as sending letters, sending To Do notification, or initiating the termination request) based on certain parameters, such as division, customer class, region, and jurisdiction in which the individual customer has availed for the health plan coverage. The system will then accordingly use the wait days or the wait months and the day of month (depending on the wait period that is configured) to calculate the trigger dates for the delinquency events.

The system considers the delinquency event attributes business rules to determine the wait period only when the wait period source is set to **Algorithm** in the respective delinquency process type. If the wait period source is set to **Algorithm**, the system executes the **C1-DERWDBR** algorithm attached to the **Wait Days Derivation** system event of the delinquency process type when you execute the **C1-DPEVL** batch. For more information on how the wait period is derived, refer to the respective algorithm description in the [Delinquency Process Type Algorithms](#) on page 3945 section.

While defining the delinquency event attributes business rule criteria, you can use the parameters which are defined on the following entities for individual membership:

- Delinquency Event Type
- Health Plan
- Health Product
- Membership
- Membership Person

While defining the delinquency event attributes business rule criteria, you can use the parameters which are defined on the following entities for group membership:

- Account
- Customer Class
- Delinquency Event Type
- Division
- Policy
- Policy Plan

You can define, edit, and delete a delinquency event attributes business rule through the **Business Rule** screen. While defining a delinquency event attributes business rule, you need to set its category to **Delinquency Event Attributes Business Rule** and specify the following details:

- **Criteria Description** - Used to indicate the business criteria that an individual membership must satisfy in order to derive the wait period from the business rule.
- **Effective Date** - Used to specify the date from when the business rule is effective.
- **Status** - Used to indicate the status of the business rule. The valid values are **Active** and **Inactive**.
- **Wait Days** - Used to indicate the number of days for which you want to delay a delinquency event in a delinquency process.
- **Wait Month** - Used to indicate the number of months for which you want to delay a delinquency event in a delinquency process.
- **Wait Day of Month** - Used to indicate the day of the month when you want to trigger a delinquency event of a delinquency process.
- **Send Membership Level Notification** - This parameter is not applicable for the fully insured individual business.

You can view the delinquency event attributes business rules through the **Business Rule** screen.

Delinquency Termination Date Rule Business Rule

Oracle Revenue Management and Billing enables you to define business rules for determining the termination date rule during the delinquency management. The termination date rule is used to derive the termination date for a policy or individual membership. The insurance company may derive different termination date rule for different policies or individual memberships based on certain parameters, such as division, customer class, region, and jurisdiction, in which the group or individual customer has availed for the policy plan or health plan coverage. The system will then accordingly use the termination date rule to calculate the termination date for the delinquency event type that requests to terminate the following:

- Policies billed to the delinquent person or account
- Individual memberships billed to the delinquent account

The system always derives the termination date rule through a delinquency termination date rule business rule. The system executes the **C1-DERTBR** algorithm attached to the **Termination Date Rule Derivation** system event of the respective delinquency process type to derive the termination date rule for the delinquency event. For more information on how the termination date rule is derived, refer to the **C1-DERTBR** algorithm description in the [Delinquency Process Type Algorithms](#) on page 3945 section.

While defining the delinquency termination date rule business rule criteria, you can use the parameters which are defined on the following entities:

The following table lists the entities on which the parameters are used while defining the delinquency termination date rule business rule criteria

Line of Business	Source Entity	Supported Source Type
Fully Insured Group Health Insurance	Account	Field and Characteristic
	Customer Class	Field
	Delinquency Event Type	Field
	Division	Field
	Policy	Field and Characteristic
	Policy Plan	Field and Characteristic
Fully Insured Individual Health Insurance	Health Plan	Field and Characteristic
	Health Product	Field and Characteristic
	Delinquency Event Type	Field
	Membership	Field and Characteristic
	Membership Person	Field and Characteristic

Note:

If the delinquency process is created at the person level and if an attribute of a division or customer class is used in the business rule criteria, the system will check whether the division or customer class is present on the person (i.e. on the parent customer or bill group, respectively) while evaluating the business rule criteria. If so, the system will use the details of the person to evaluate the business rule criteria. However, if the division or customer class is not present on the person, the system will use the details of any account where the person is added as the main customer to evaluate the business rule criteria.

If the delinquency process is created at the account level and if an attribute of a division or customer class is used in the business rule criteria, the system will use the details of the respective account to evaluate the business rule criteria.

You can define, edit, and delete a delinquency termination date rule business rule through the **Business Rule** screen. While defining a delinquency termination date rule business rule, you need to set its category to **Delinquency Termination Date Rule Business Rule** and specify the following details:

- **Criteria Description** - Used to indicate the business criteria that a policy or individual membership must satisfy in order to derive the termination date rule from the business rule.
- **Effective Date** - Used to specify the date from when the business rule is effective.
- **Status** - Used to indicate the status of the business rule. The valid values are:
 - Active
 - Inactive
- **Termination Date Rule** - Used to indicate the termination date rule using which you want to calculate the termination date. The valid values are:
 - Latest Billed Coverage End Date
 - Latest Due Coverage End Date
 - X days After Paid Through Date
 - X Months After Paid Through Date
 - Month End of Grace Period Start
 - Month End of Termination Letter Creation
 - Month End of Termination Request Event
 - X days After Grace End Date
 - X days After Termination Request Event

Once the business rule is created, the business rule ID is generated. While creating a business rule, the status is, by default, non-editable and set to **Active**. While editing a business rule, you can change its status from **Active** to **Inactive** and vice-versa. Note that you cannot edit or delete a business rule if it is referred in the system. You can view the delinquency termination date rule business rules through the **Business Rule** screen.

For more information on how the termination date rule is used to calculate the termination date, refer to the **C1-DETERMDT** algorithm description in the **Delinquency Event Activation** section.

Delinquency Miscellaneous Options Business Rule

Oracle Revenue Management and Billing enables you to define business rules for determining the following during the delinquency management:

- Whether the trigger dates of delinquency events should be recalculated when the hold on the delinquency process is released
- Whether the trigger dates of delinquency events should be recalculated when the delinquency process is resumed after cancellation
- Whether you want to send an outbound message to the enrollment system for terminating the individual memberships billed to the delinquent account immediately, at the end of the month when the termination event is triggered, or after X number of days (i.e. termination wait days) from the termination event trigger date
- The number of days that you want to add to the base date while calculating the termination effective date

The insurance company may offer different delinquency arrangements to different individuals based on certain parameters, such as division, customer class, region, and jurisdiction in which the individual customer has availed for the health plan coverage. The system will then accordingly use the business rule to calculate the following:

- Trigger dates for the delinquency events
- Termination request date when you want to send the outbound message to the external system requesting to terminate the individual membership
- Termination effective date for the delinquency event type that requests to terminate the individual memberships billed to the delinquent account

The system considers the delinquency miscellaneous options business rules to determine the following:

- The value for the **Trigger Date Recalculation On Hold Release** flag when the trigger date recalculation on hold release source is set to **Algorithm** in the respective delinquency process type. If the trigger date recalculation on hold release source is set to **Algorithm**, the system executes the **C1-DERRTDBR** algorithm attached to the **Trigger Date Recalculation Option Derivation** system event of the delinquency process type when you execute the **C1-DPMON** batch. For more information on how the value is derived for the **Trigger Date Recalculation On Hold Release** flag, refer to the respective algorithm description in the [Delinquency Process Type Algorithms](#) on page 3945 section.
- The value for the **Trigger Date Recalculation On Resume** flag when the trigger date recalculation on resume source is set to **Algorithm** in the respective delinquency process type. If the trigger date recalculation on resume source is set to **Algorithm**, the system executes the **C1-DERRTDBR** algorithm attached to the **Trigger Date Recalculation Option Derivation** system event of the delinquency process type when you execute the **C1-DPMON** batch. For more information on how the value is derived for the **Trigger Date Recalculation On Resume** flag, refer to the respective algorithm description in the [Delinquency Process Type Algorithms](#) on page 3945 section.
- The value for the **Trigger Termination Process** flag and the termination wait days when the termination reinstatement configuration source is set to **Algorithm** in the respective delinquency process type. If the termination reinstatement configuration source is set to **Algorithm**, the system executes the **C1-DERTROBR** algorithm attached to the **Termination and Reinstatement Configuration Derivation** system event of the delinquency process type when you execute the **C1-DPMON** batch. For more information on how the value is derived for the **Trigger Termination Process** flag, refer to the respective algorithm description in the [Delinquency Process Type Algorithms](#) on page 3945 section.
- The number of days that you want to add to the base date while deriving the termination effective date. The system executes the **C1-DETERMDT** algorithm attached to the **Event Activation** system event of the respective delinquency event type whenever the delinquency event is triggered manually or automatically on the trigger date.
 - Add Days to Coverage End Date
 - Add Days to Paid Through Date
 - Add Months to Paid Through Date
 - Add Days to Grace End Date
 - Add Days to Date of Processing of Termination Request

While defining the delinquency miscellaneous options business rule criteria, you can use the parameters which are defined on the following entities for individual membership:

- Delinquency Event Type
- Health Plan
- Health Product
- Membership
- Membership Person

While defining the delinquency miscellaneous options business rule criteria, you can use the parameters which are defined on the following entities for group membership:

- Account
- Customer Class
- Delinquency Event Type
- Division
- Policy
- Policy Plan

You can define, edit, and delete a delinquency miscellaneous options business rule through the **Business Rule** screen. While defining a delinquency miscellaneous options business rule, you need to set its category to **Delinquency Miscellaneous Options Business Rule** and specify the following details:

- **Criteria Description** - Used to indicate the business criteria that an individual membership must satisfy in order to derive the required parameters from the business rule.
- **Effective Date** - Used to specify the date from when the business rule is effective.
- **Status** - Used to indicate the status of the business rule. The valid values are **Active** and **Inactive**.

- **Trigger Date Recalculation On Hold Release** - Used to indicate whether the trigger dates of delinquency events should be recalculated when the hold on the delinquency process is released. The valid values are - **Yes** and **No**.
- **Trigger Date Recalculation On Resume** - Used to indicate whether the trigger dates of delinquency events should be recalculated when the delinquency process is resumed after cancellation. The valid values are - **Yes** and **No**.
- **Trigger Termination Process** - Used to indicate when you want the system to send an outbound message to the enrollment system for terminating the individual memberships billed to the delinquent account. The valid values are:
 - **Immediate** - Used when you want the system to send an outbound message for termination on the same day when the termination event is triggered.
 - **Month End** - Used when you want the system to send an outbound message for termination at the end of the month when the termination event is triggered.
 - **After X Days** - Used when you want the system to send an outbound message for termination after X number of days from the date when the termination event is triggered.
- **Termination Wait Days** - Used to specify the number of days after which an outbound message for termination should be sent to the enrollment system. This parameter is required only when the **Trigger Termination Process** parameter in the business rule is set to **After X Days**.
- **Add Days to Coverage End Date** - Used to specify the number of days that you want to add to coverage end date in order to derive termination effective date.
- **Add Days to Paid Through Date** - Used to specify the number of days that you want to add to the paid through date (of the account) in order to derive termination effective date.
- **Add Months to Paid Through Date** - Used to specify the number of months that you want to add to the paid through month (derived from the paid through date of the account) in order to derive termination effective date.
- **Add Days to Grace End Date** - Used to specify the number of days that you want to add to grace end date in order to derive termination effective date.
- **Add Days to Date of Processing of Termination Request** - Used to specify the number of days that you want to add to termination request date in order to derive termination effective date.

Note: The **Allow Automatic Reinstatement**, **Maximum Automatic Reinstatement Count**, **Trigger Reinstatement Process**, **Reinstatement Wait Days**, **Reinstatement Threshold (%)**, **Days Since Termination**, and **Member Notification Days** parameters in the delinquency miscellaneous options business rule are not applicable for the fully insured individual business.

You can view the delinquency miscellaneous options business rules through the **Business Rule** screen.

Business Rule Type

The **Business Rule Type** screen allows you to search for a business rule type using various search criteria. It also allows you to define, edit and delete a business rule type. It contains the following zone:

- [Search Business Rule Type](#) on page 3511
- [Business Rule Type](#) on page 3515
- [Business Rule Criteria](#) on page 3516

Search Business Rule Type

The **Search Business Rule Type** zone allows you to search for a business rule type using various search criteria. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Business Rule Type	Used to search a particular business rule type.	No
Priority	Used to search a business rule type based on the priority.	No

Field Name	Field Description	Mandatory (Yes or No)
	Note: If you set the priority to a lowest number, the system crawls from the lowest number to the highest, whenever you perform a search for a business rule type. For example, a business rule type with the priority 10 will be searched before a business rule type with the priority 20.	
Description	Used to search a business rule type having a particular description.	No
Criteria Sequence	Used to search a business rule type where the business rule criteria has a specific order of execution. Note: This field appears when you click the Advanced Search link.	No
Criteria Description	Used to search a business rule type where the business rule criteria has a specific description. Note: This field appears when you click the Advanced Search link.	No

Searching for a Business Rule Type

Prerequisites

To search for a business rule type, you should have:

- Parameters defined in the application where the parameter usage is set to **Business Rule Eligibility Criteria**

Procedure

To search for a business rule type:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, click **B** and then click **Business Rule Type**.
A sub-menu appears.
- Click the **Search** option from the **Business Rule Type** sub-menu.
The **Business Rule Type** screen appears.
- Enter the search criteria in the **Search Business Rule Type** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- Click **Search**.
A list of business rule types that meet the search criteria appears in the **Search Results** section.

Note: Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Defining a Business Rule Type

Prerequisites

To define a business rule type you should have:

- Parameters defined in the application (where the **Business Rule Eligibility Criteria** option is selected in the **Parameter Usage** section)
- Characteristic types defined in the application (where the characteristic entity is set to **Business Rule Type**).

Procedure

To define a business rule type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **B** and then click **Business Rule Type**.
A sub-menu appears.
3. Click the **Add** option from the **Business Rule Type** sub-menu.

The **Business Rule Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the business rule type.
- **Parameters** - Used to associate the parameters with the business rule type.
- **Characteristics** - Used to define the characteristics for the business rule type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Business Rule Type	Used to specify the business rule type.	Yes
Priority	Used to specify the priority for the business rule type. Note: If you set the priority to a lowest number, the system crawls from the lowest number to the highest, whenever you perform a search for a business rule type. For example, a business rule type with the priority 10 will be searched before a business rule type with the priority 20. The priority cannot be less than or equal to zero.	Yes
Description	Used to specify the description for the business rule type.	Yes

Tip: Alternatively, you can access the **Business Rule Type** screen by clicking the **Add** button in the **Page Title** area of the **Business Rule Type** screen.

4. Enter the required details in the **Main** section.
5. Associate the parameters with the business rule type, if required.
6. Define the characteristics for the business rule type, if required.
7. Click **Save**.
The business rule type is defined.

Associating a Parameter with a Business Rule Type

Prerequisites

To associate a parameter with a business rule type, you should have:

- Parameters defined in the application (where the **Business Rule Eligibility Criteria** option is selected in the **Parameter Usage** section)

Procedure

To associate a parameter with a business rule type:

1. Ensure that the **Parameters** section is expanded when you are defining, editing, or copying a business rule type.

The **Parameters** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Sequence	Used to specify the sequence number for the parameter.	Yes (Conditional)
	Note: The sequence cannot be less than or equal to zero.	Note: This data is required while associating the parameters with the business rule type.
Parameter	Used to indicate the parameter which you want to associate with the business rule type.	Yes (Conditional)
	Note: The Search (🔍) icon appears corresponding to the Parameter field. On clicking the Search icon, the Parameter Search window appears. On specifying the value for a parameter, the description of the parameter appears corresponding to the Parameter field.	Note: This data is required while associating the parameters with the business rule type.

2. Enter the required details in the **Parameters** section.
3. If you want to associate more than one parameter with the business rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to disassociate a parameter from the business rule type, click the **Delete** (🗑️) icon corresponding to the parameter.

4. Click **Save**.
The parameter is associated with the business rule type.

Defining a Characteristic for a Business Rule Type

Prerequisites

To define a characteristic for a business rule type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Business Rule Definition**)

Procedure

To define a characteristic for a business rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining, editing, or copying a business rule type.

The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	No
	Note: The list includes only those characteristic types where the characteristic entity is set to Business Rule Definition .	
Characteristic Value	Used to specify the value for the characteristic type.	No
	Note: On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the Characteristic Value field.	

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the business rule type, click the **Add (+)** icon and then repeat step 2.

Note: However, if you want to remove a characteristic from the business rule type, click the **Delete (■)** icon corresponding to the characteristic.

4. Click **Save**.
The characteristic is defined for the business rule type.

Searching for a Business Rule**Prerequisites**

To search for a business rule, you should have:

- Business rule criteria defined in the respective business rule type.
- Parameters associated with the respective business rule type.

Procedure

To search for a business rule:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, click **B** and then click **Business Rule**.
A sub-menu appears.
3. Click the **Search** option from the **Business Rule** sub-menu.
The **Business Rule** screen appears.
4. Enter the search criteria in the **Search Business Rule** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.

A list of business rules that meet the search criteria appears in the **Search Results** section.

Note: Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Defining a Delinquency Grace Period Business Rule

To define a delinquency grace period business rule, you should have:

- Business rule type defined in the application.
- Business rule criteria defined in the respective business rule type.

Procedure

To define a delinquency grace period business rule:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.

2. From the **Admin** menu, select **B** and then click **Business Rule**.
A sub-menu appears.
3. Click the **Add** option from the **Business Rule** sub-menu.

The **Select Business Rule Category** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Business Rule Category	Used to indicate the category for which you want to create a business rule. The valid values are: <ul style="list-style-type: none"> • Binder Payment Business Rule • Delinquency Event Attributes Business Rule • Delinquency Grace Period Business Rule • Delinquency Miscellaneous Options Business Rule • Delinquency Termination Date Rule Business Rule • Fully-Insured Pricing Business Rule • New Born Business Rule • Rate Guarantee Business Rule • Refund/Write Off Business Rule 	Yes

Note: Alternatively, you can access the **Delinquency Grace Period Business Rule** screen by clicking the **Add** button in the **Page Title** area of the **Business Rule** screen.

4. Select the **Delinquency Grace Period Business Rule** option from the **Business Rule Category** list.
5. Click **OK**.

The **Delinquency Grace Period Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Used to indicate the business criteria that group membership and individual membership must satisfy in order to derive the grace period from the business rule.	Yes
	Note: The Search (🔍) icon appears corresponding to the Criteria Description field. On clicking the Search icon, the Business Rule Criteria Search window appears.	
Effective Date	Used to specify the date from when the business rule is effective.	Yes
	Note: You can either manually specify the date or select it using the Date Picker icon corresponding to the field.	
Status	Used to indicate the status of the grace period business rule.	Not applicable
	Note: This field is non-editable. By default, the Active option is selected.	
Grace Period	Used to specify the number of days which are used to define the grace period end date for the delinquency process.	No

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>For example, if a delinquency process contains bills with the latest bill due date as 01-Jan-2023, the system considers the latest bill due date as the grace period start date which happens to be 01-Jan-2023. If you have configured the grace period as 30 days, the system calculates the grace period end date as 31-Jan-2023 by using the following formula:</p> $\text{Grace Period End Date} = \text{Grace Period Start Date} + \text{Grace Period}$ <p>If you do not specify the value, by default, it is set to zero(0).</p>	

Note: You can define the business rule when it is not yet used in the system.

- Enter the required details in the **Delinquency Grace Period Business Rule** screen.
- If you want to define more than one delinquency grace period business rule, click the **Add (+)** icon and then repeat step 6.

Note: However, if you want to remove a delinquency grace period business rule, click the **Delete (🗑)** icon corresponding to the **Criteria Description** field.

- Click **Save**.
The delinquency grace period business rule is defined.

Field Name	Field Description	Mandatory (Yes or No)
Status	Used to indicate the status of the business rule. The valid values are: <ul style="list-style-type: none"> Active Inactive 	No
Grace Period (Days)	Displays the number of days which are used to define the grace period end date for the delinquency process.	No
	Note: For example, if a delinquency process contains bills with the latest bill due date as 01-Jan-2023, the system considers the latest bill due date as the grace period start date which is 01-Jan-2023. If you have configured the grace period as 30 days, the system calculates the grace period end date as 31-Jan-2023 by using the following formula: <pre>Grace Period End Date = Grace Period ' Start Date + Grace Period</pre> If you do not specify the value, by default, it is set to zero(0).	

3. Modify the required details in the **Delinquency Grace Period Business Rule** screen.

4. Click **Save**.

The changes made to the delinquency grace period business rule are saved.

Editing a Delinquency Event Attribute Business Rule

To edit a delinquency event attribute business rule, you should have:

- Status defined for the delinquency event attribute business rule in the application

Procedure

To edit a delinquency event attribute business rule:

- Search for the delinquency event attribute business rule in the **Business Rule** screen.
- In the **Search Results** section, select the option corresponding to the **Criteria Description** column and click the **Edit** button.

Note:

You can also edit more than one delinquency event attribute business rule by selecting multiple options and clicking the **Edit** button.

You can edit the delinquency event attribute business rule when it is not yet used in the system.

The **Delinquency Event Attribute Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Used to indicate the business criteria that group membership and individual membership must satisfy in order to derive the wait period from the business rule.	Not applicable
Effective Date	Used to specify the date from when the business rule is effective.	Yes
	Note: You can either manually specify the date or select it using the Date Picker icon corresponding to the field.	
Status	Used to indicate the status of the business rule. The valid values are: <ul style="list-style-type: none"> Active Inactive 	Yes
Wait Days	Used to specify the number of days for which you want to delay a delinquency event in a delinquency process.	No
Wait Month	Used to specify the number of months for which you want to delay a delinquency event in a delinquency process.	No
Wait Day of Month	Used to specify the day of the month when you want to trigger a delinquency event of a delinquency process.	No
Send Membership Level Notification	Used to indicate whether you want to send membership level notification when the customer contacts are created as part of the events in the delinquency process that are created using the delinquency process type. The valid values are: <ul style="list-style-type: none"> Send Member Level Notification Not Required Send Member Level Notification Required 	No
	Note: The list includes only those values which are defined in the SEND_MBR_NOTIF_FLG lookup field.	

3. Modify the required details in the **Delinquency Event Attribute Business Rule** screen.

4. Click **Save**.

The changes made to the delinquency event attribute business rule are saved.

Editing a Delinquency Termination Date Rule Business Rule

To edit a delinquency termination date rule business rule, you should have:

- Status defined for the delinquency termination date rule business rule in the application

Procedure

To edit a delinquency termination date rule business rule:

- 1. Search for the delinquency termination date rule business rule in the **Business Rule** screen.
- 2. In the **Search Results** section, select the option corresponding to the **Criteria Description** column and click the **Edit** button.

Note:
You can also edit more than one delinquency termination date rule business rule by selecting multiple options and clicking the **Edit** button.
You can edit the delinquency termination date rule business rule only when it is not yet used in the system.

The **Delinquency Termination Date Rule Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Used to indicate the business criteria that group membership and individual membership must satisfy in order to derive the termination date rule from the business rule.	Not applicable
Effective Date	Used to specify the date from when the business rule is effective.	Yes
	Note: You can either manually specify the date or select it using the Date Picker icon corresponding to the field.	
Status	Used to indicate the status of the business rule. The valid values are: <ul style="list-style-type: none">• Active• Inactive	Yes
Termination Date Rule	Used to indicate the termination date rule using which you want to calculate the termination date. The valid values are: <ul style="list-style-type: none">• Latest Billed Coverage End Date• Latest Due Coverage End Date• Month End of Grace Period Start• Month End of Termination Letter Creation• Month End of Termination Request Event• X Months After Paid Through Date• X days After Grace End Date• X days After Paid Through Date• X days After Termination Request Event	No
	Note: The list includes only those values which are defined in the TERM_DATE_RULE_FLG lookup field.	

- 3. Modify the required details in the **Delinquency Termination Date Rule Business Rule** screen.
- 4. Click **Save**.
The changes made to the delinquency termination date rule are saved.

Editing a Delinquency Miscellaneous Options Business Rule

To edit a delinquency miscellaneous options business rule, you should have:

- Status defined for the delinquency miscellaneous options business rule in the application

Procedure

To edit a delinquency miscellaneous options business rule:

1. Search for the delinquency miscellaneous options business rule in the **Business Rule** screen.
2. In the **Search Results** section, select the option corresponding to the **Criteria Description** column and click the **Edit** button.

Note:
You can also edit more than one delinquency miscellaneous options business rule by selecting multiple options and clicking the **Edit** button.

You can edit the delinquency miscellaneous options business rule when it is not yet used in the system.

The **Delinquency Miscellaneous Options Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Used to indicate the business criteria that group membership and individual membership must satisfy in order to derive the required parameters from the business rule.	Not applicable
Effective Date	Used to specify the date from when the business rule is effective.	Yes
	Note: You can either manually specify the date or select it using the Date Picker icon corresponding to the field.	
Status	Used to indicate the status of the business rule. The valid values are: <ul style="list-style-type: none">• Active• Inactive	Yes
Trigger Date Recalculation On Hold Release	Used to indicate whether the trigger dates of delinquency events should be recalculated when the hold on the delinquency process is released. The valid values are: <ul style="list-style-type: none">• No• Yes	No
Trigger Date Recalculation On Resume	Used to indicate whether the trigger dates of delinquency events should be recalculated when the delinquency process is resumed after cancellation. The valid values are: <ul style="list-style-type: none">• No• Yes	No

Field Name	Field Description	Mandatory (Yes or No)
Trigger Termination Process	<p>Used to indicate when you want the system to send an outbound message to the enrollment system for terminating the individual memberships billed to the delinquent account. The valid values are:</p> <ul style="list-style-type: none"> • After X Days - Used when you want the system to send an outbound message for termination after X number of days from the date when the termination event is triggered. • Immediate - Used when you want the system to send an outbound message for termination on the same day when the termination event is triggered. • Month End - Used when you want the system to send an outbound message for termination at the end of the month when the termination event is triggered. <p>Note: The list includes only those values which are defined in the TERM_TRIGGER_OPTION_FLG lookup field</p>	No
Termination Wait Days	<p>Used to specify the number of days after which an outbound message for termination should be sent to the enrollment system.</p> <p>Note:</p> <p>The system sets the termination wait days to zero, if you do not specify a value while defining or editing a delinquency process type.</p> <p>This field is required only when the Trigger Termination Process field in the business rule is set to After X Days.</p>	No
Allow Automatic Reinstatement	<p>Used to indicate whether you want to allow automatic reinstatement of the individual membership. The valid values are:</p> <ul style="list-style-type: none"> • No • Yes <p>Note: The list includes only those values which are defined in the ALLOW_AUTO_REIN_FLG lookup field</p>	No
Maximum Automatic Reinstatement Count	<p>Used to specify the maximum number of time the system allows automatic reinstatement.</p> <p>Note: This field is not applicable for Individual Delinquency.</p>	No
Trigger Reinstatement Process	<p>Used to indicate an option based on which the reinstatement process must be triggered. The valid values are:</p> <ul style="list-style-type: none"> • After X Days • Immediate • Month End 	No

Field Name	Field Description	Mandatory (Yes or No)
	Note: The list includes only those values which are defined in the REIN_TRIGGER_OPTION_FLG lookup field	
Reinstatement Wait Days	Used to specify the wait period (in days) after which the reinstatement process is triggered.	No
	Note: This field is not applicable for Individual Delinquency .	
Reinstatement Threshold	Used to specify the percentage value based on which the automatic reinstatement takes place.	No
	Note: This field is not applicable for Individual Delinquency .	
Days Since Termination	Used to specify the number of days since the termination effective date for automatic reinstatement to take place.	No
	Note: This field is not applicable for Individual Delinquency .	
Member Notification Days	Used to specify the number of days after which the member receives notification.	No
	Note: This field is not applicable for Individual Delinquency .	
Add Days to Date of Processing of Termination Request	Used to specify the number of days that you want to add to termination request date in order to derive termination effective date.	No
	Note: This field is not applicable for Individual Delinquency .	
Add Days to Grace End Date	Used to specify the number of days that you want to add to grace end date in order to derive termination effective date.	No
Add Days to Coverage End Date	Used to specify the number of days that you want to add to coverage end date in order to derive termination effective date.	No
Add Days to Paid Through Date	Used to specify the number of days that you want to add to the paid through date (of the account) in order to derive termination effective date.	No
Add Months to Paid Through Date	Used to specify the number of months that you want to add to the paid through month (derived from the paid through date of the account) in order to derive termination effective date.	No
Minimum Days Before Customer Contact	Used to specify the number of days to add to the delinquency date to calculate the date for initiating customer contact.	No

3. Modify the required details in the **Delinquency Miscellaneous Options Business Rule** screen.

4. Click **Save**.

The changes made to the delinquency miscellaneous options business rule are saved.

Young Adult Coverage in an Individual Membership

Oracle Revenue Management and Billing enables you to calculate premium for the young adults who are covered in an individual membership. While creating or editing an individual membership, or while adding, editing, or inactivating a member person in an individual membership through a health care inbound message or through membership repricing inbound web service, the system derives the fully-insured pricing business rule for the individual membership. The system enables you to define the following young adult related output parameters in the fully-insured pricing business rules:

- **Young Adult Applicability** - Used to indicate whether you want to consider the young adults during the premium calculation. The valid values are - **Yes** and **No**.
- **Young Adult Max Age Limit** - Used to indicate the maximum age limit for young adults who are eligible for premium calculation. This output parameter is mandatory when the **Young Adult Applicability** parameter is set to **Yes**.

While deriving member relationship for each member person of the individual membership from a member relationship structure, the system considers the following information from the fully-insured pricing business rule of the individual membership:

- Young Adult Applicability
- Young Adult Max Age Limit

Similarly, while deriving subscription tier for the individual membership from a subscription tier structure, the system considers the following information from the fully-insured pricing business rule of the individual membership:

- Young Adult Applicability
- Young Adult Max Age Limit

Thus, while calculating the premium for an individual membership using an age based or tier based pricing rule, the system considers the young adult for the premium calculation based on the above two parameters set in the fully-insured pricing business rule.

Chapter

42

Individual Health Insurance Billing

While calculating the premium for an individual membership using an age based pricing rule, the system derives the rate for each eligible member person. The system identifies members which are eligible for premium calculation using the fully-insured pricing and newborn business rules.

On creating or editing an individual membership through a health care inbound message or membership repricing inbound web service, the system determines the fully-insured pricing and newborn business rules which are applicable for the individual membership. The system enables you to define business rules of the following categories:

- Fully-Insured Pricing
- New Born

While determining the business rules which are applicable for an individual membership, the system executes the business rules of each category which are effective on the inbound processing date based on the priority of the business rule. If an individual membership meets the criteria of the business rule, the system stamps the respective business rule corresponding to the individual membership. In this way, the system derives two business rules - one fully-insured pricing business rule and another newborn business rule.

While calculating the premium for an individual membership using a tier based pricing rule, the system derives the subscription tier using the fully-insured pricing and newborn business rules.

Once the premium is calculated for an individual membership, the system creates a billable charge for the premium. If the account is defined for the individual membership using the characteristic types specified in the **Account Identifier Type Char Type** and **Account Identifier Value Char Type** option types of the **C1-ASOBLLNG** feature configuration, the system uses the account to bill the charge for the premium. However, if these characteristics are not defined for the individual membership, the system considers the account of the financially responsible member person to the charge for the premium.

Entity Audit

Topics:

- [Audit Event Status Transition](#)
- [Prerequisites](#)
- [Entity Audit Process](#)
- [Algorithms Used in the Entity Audit Process](#)
- [Audit Event Type](#)
- [Audit Event \(Used for Searching\)](#)
- [Audit Event \(Used for Viewing\)](#)

Oracle Revenue Management and Billing provides a mechanism wherein auditors can track various actions, such as add, update, and delete for an entity. If the entity audit feature is enabled for a business object, the system creates audit events whenever you define, edit, or delete an entity (which is created using the respective business object). For example, if the entity audit feature is enabled for the **C1-Membership** business object, the system creates an audit event whenever you define, edit, or delete a membership in a policy plan or whenever you add or remove persons from a membership. For more information on how to enable the entity audit feature for a business object, see [Prerequisites](#) on page 3574.

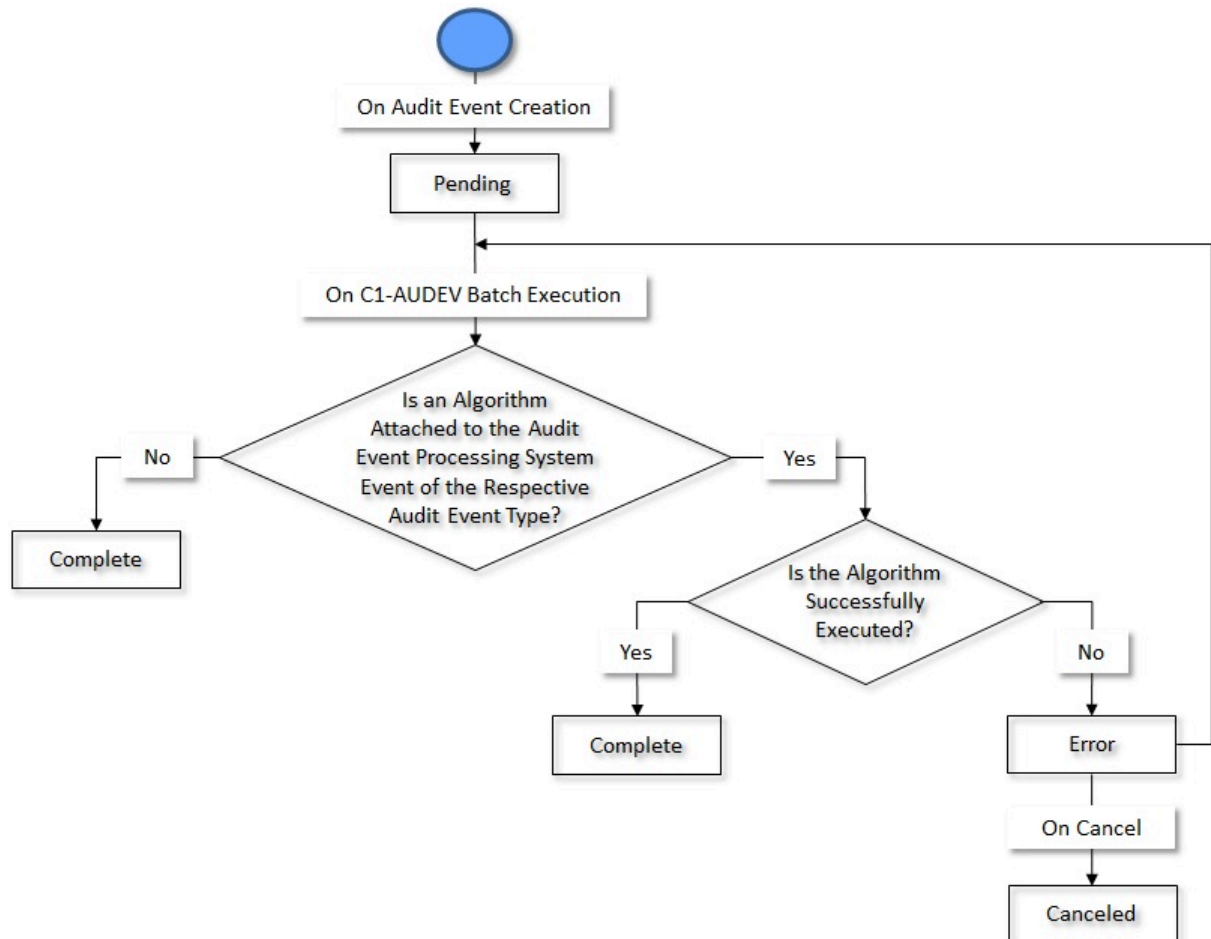

The entity audit process is a two-step process, wherein the system creates the audit events and then processes them whenever the **Audit Event Processing (C1-AUDEV)** batch is executed. For more information about these processes, see the following sections:

- [Audit Event Creation](#) on page 3575
- [Audit Event Processing](#) on page 3576

During the entity audit process, each audit event goes through various statuses in its lifecycle. For more information about the audit event statuses, see [Audit Event Status Transition](#) on page 3574.

Audit Event Status Transition

The following figure graphically indicates how an audit event moves from one status to another in its lifecycle:

Prerequisites

To setup the entity audit feature for a business object, you need to do the following:

- Set the **Eligible for Audit Event** option type of the entity business object to **Y**.

Note: The **Eligible for Audit Event** option type is available for the entity business object when the **Valid BO Option Type** option type of the respective maintenance object is set to **C1AT**.

- Attach an algorithm created using the **C1-READEVNT** algorithm type to the **Audit** system event of the entity business object.

Note:

At present, this algorithm is designed to work with the following business objects:

- C1-POLICY
- C1-ASOPolicy
- C1-Membership
- C1-PolicyPlan
- C1_PERSON_BO
- C1-PricingRuleTierBased
- C1-PricingRuleAgeBased

If you want to use the audit algorithm for the business objects which are not listed above, you need to create a custom audit algorithm.

- Define an active audit event type for the entity business object in the system.
- Define the required algorithm types where the algorithm entity is set to **Audit Event Processing**.
- Create the required algorithms and attach them to the **Audit Event Processing** system event of the audit event type.

Note: The C1-AUDEVMPR algorithm type is shipped with the product. You must attach an algorithm created using the C1-AUDEVMPR algorithm type to the audit event types which are defined for the C1-PricingRuleTierBased and C1-PricingRuleAgeBased business objects.

- Define the values for the AUDIT_USAGE_FLG lookup field
- Define the required characteristic types where the characteristic entity is set to **Audit Event Type**.

Entity Audit Process

The entity audit process consists of the following two sub-processes:

- [Audit Event Creation](#) on page 3575
- [Audit Event Processing](#) on page 3576

Audit Event Creation

If you add, edit, or delete an entity which is created using a business object for which the entity audit feature is enabled, the system checks whether an active audit event type exists for the entity business object. If so, it considers the active audit event type and creates the audit event using the respective audit event type. The system creates the audit event while:

- Defining an entity when the **Add Action** option is selected in the audit event type
- Editing an entity when the **Update All** option is selected in the audit event type or when the updated element is listed in the **Audit Elements for Entity Update** section
- Deleting an entity when the **Delete Action** option is selected in the audit event type

For more information about the audit event type, see [Audit Event Type](#) on page 3577.

The audit event is created in the **Pending** status. Note that the system creates one audit event for the entity irrespective of the number of changes made during the entity update. The entity type and entity ID for which an audit event is created are added corresponding to the audit event in the C1_AUDIT_EVENT table. For example, if the audit event is created while adding or updating a pricing rule, then the entity type is set to **Pricing Rule** and entity ID is set to the pricing rule ID. In addition, an effective date is stamped corresponding to the audit event in the C1_AUDIT_EVENT table. Note that if the entity has a start date, then the effective date is set to the entity's start date. But, if the entity does not have a start date, then the effective date is set to the system date.

At a time, you can have only two audit events for the entity in the **Pending** status - one audit event which is created during the **Add** action and another audit event which is created during the **Update** action.

Note: Before creating an audit event, the system checks whether an audit event for the entity ID with the same effective date already exists in the **Pending** or **Error** status for the respective action. If so, the system does not create a new audit event for the entity. Instead, the system adds a new log entry in the existing audit event.

Audit Event Processing

On executing the **Audit Event Processing (C1-AUDEV)** batch, the system checks whether there are any audit events in the **Pending** status. If there is an audit event in the **Pending** status, the system checks whether an algorithm is attached to the **Audit Event Processing** system event of the respective audit event type. If an algorithm is not attached to the **Audit Event Processing** system event of the respective audit event type, the status of the audit event is set to **Complete**.

However, if an algorithm is attached to the **Audit Event Processing** system event of the respective audit event type, the system executes the algorithm and accordingly changes the status of the audit event to **Complete**. For example, while processing the audit events of the **C1-PricingRuleTierBased** and **C1-PricingRuleAgeBased** business objects, the system checks whether an algorithm is attached to the **Audit Event Processing** system event of the respective audit event type. If the **C1-AUDEVMPR** algorithm is attached to the audit event type, the system identifies the policy plan where the pricing rule is defined. Once the policy plan is identified, it extracts a list of membership defined on the policy plan and the pricing rule type using which the pricing rule is created. Then, the system creates an entry for each membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of these entries is set to **P**. Finally, the status of the audit event is set to **Complete**.

If any error occurs, the status of the audit event is set to **Error**. The system enables you to either reprocess or cancel the audit events which are in the **Error** status. On canceling an audit event, the status of the audit event is changed to **Canceled**.

For more information about the **Audit Event Processing (C1-AUDEV)** batch and its parameters, see *Oracle Revenue Management and Billing Batch Guide*.

Algorithms Used in the Entity Audit Process

The following table lists the algorithms which are designed to implement the entity audit process:

Algorithm	Algorithm Type	Attached To	System Event	Algorithm Description
C1-REAUDEVNT	C1-REAUDEVNT	Entity Business Object	Audit	Refer to C1-REAUDEVNT on page 3576.
C1-AUDEVMPR	C1-AUDEVMPR	Audit Event Type of the C1-PricingRuleAgeBased and C1-PricingRuleTierBased business objects	Audit Event Processing	Refer to C1-AUDEVMPR on page 3577.

C1-REAUDEVNT

If this algorithm is attached to the **Audit** system event of a business object, it is invoked whenever you define, edit, or delete the respective entity. It checks whether an active audit event type exists for the entity business object. If so, it considers the active audit event type and creates the audit event using the respective audit event type. The system creates the audit event while:

- Defining an entity when the **Add Action** option is selected in the audit event type

- Editing an entity when the **Update All** option is selected in the audit event type or when the updated element is listed in the **Audit Elements for Entity Update** section
- Deleting an entity when the **Delete Action** option is selected in the audit event type

The entity type and entity ID for which an audit event is created are added corresponding to the audit event in the **C1_AUDIT_EVENT** table. In addition, the effective date is stamped corresponding to the audit event in the **C1_AUDIT_EVENT** table. Note that if the entity has a start date, then the effective date is set to the entity's start date. But, if the entity does not have a start date, then the effective date is set to the system date.

Note: Before creating an audit event, the system checks whether an audit event for the entity ID with the same effective date already exists in the **Pending** or **Error** status for the respective action. If so, the system does not create a new audit event for the entity. Instead, the system adds a new log entry in the existing audit event.

At present, this algorithm is designed to work with the following business objects:

- C1-POLICY
- C1-ASOPolicy
- C1-Membership
- C1-PolicyPlan
- C1_PERSON_BO
- C1-PricingRuleTierBased
- C1-PricingRuleAgeBased

If you want to use the audit algorithm for the business objects which are not listed above, you need to create a custom audit algorithm.

It contains the following parameters:

- **Audit Event Business Object** - Used to specify the business object using which you want to create the audit event.
- **Audit Event Pending Status** - Used to specify the status in which you want to create the audit event. This parameter is also used for determining whether an audit event for the entity ID already exists in the system.
- **Audit Event Error Status** - Used to specify the status in which an audit event is transitioned when an error occurs while processing the audit event. This parameter is used for determining whether an audit event for the entity ID already exists in the system.

All the above parameters are mandatory.

C1-AUDEVMPR

You must attach this algorithm to the **Audit Event Processing** system event while creating an audit event type for the **C1-PricingRuleAgeBased** and **C1-PricingRuleTierBased** business objects.

This algorithm is invoked when the **Audit Event Processing (C1-AUDEV)** batch is executed. If this algorithm is attached to the **Audit Event Processing** system event of the respective audit event type, the system identifies the policy plan where the pricing rule is defined. Once the policy plan is identified, it extracts a list of membership defined on the policy plan and the pricing rule type using which the pricing rule is created. Then, the system creates an entry for each membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of these entries is set to **P** in the **CI_REPRC_ENTITY_DTL** table.

Audit Event Type

Oracle Revenue Management and Billing enables you to define an audit event type for an entity business object. However, at a time, only one audit event type of the entity business object can be in the **Active** status. The system creates an audit event using the active audit event type whenever you define, edit, or delete the respective entity. The audit event type helps the system to determine:

- **Entity Business Object** - The business object for which you want to define the audit event type.
- **Audit Usage** - The usage indicates the purpose of auditing an entity which is created using the entity business object. For example, membership premium charges might change due to change in pricing and therefore you may want to audit the pricing rules for premium calculation.
- **Audit Actions** - The various options, such as **Add Action**, **Delete Action**, and **Update All** are available while defining an audit event type. The system creates an audit event while defining, editing or deleting an entity depending on whether the respective option is selected in the audit event type. For example, if you create the active audit event types for the following entity business objects where the below listed options are selected:

Audit Event Type	Entity Business Object	Add Action	Update All	Delete Action
AETY1	C1-POLICY	Y	N	N
AETY2	C1-ASOPolicy	Y	Y	Y

Then, the system will create an audit event using the **AETY1** audit event type when you define a fully-insured group policy. But, the system will not create an audit event when you edit or delete a fully-insured group policy. However, the system will create an audit event using the **AETY2** audit event type when you define, edit, or delete a self-funded policy.

- **Audit Elements During Update** - Alternatively, you can list the elements of the entity business object which should be monitored for the auditing purpose while editing an entity in the audit event type. You can list the elements of the entity business object when the **Update All** option is not selected. The system enables you to monitor a set of the business object statuses, characteristic types, and fields and accordingly creates an audit event while editing an entity. For example, if you create the audit event types for the following entity business objects:

Audit Event Type	Entity Business Object	Update All	Audit Elements During Update
AETY3	C1_PERSON_BO	Y	Not applicable
AETY4	C1-PricingRuleTierBased	N	Pricing Start Date, Rate Option, Base Fee for a Price Component
AETY5	C1-PricingRuleAgeBased	N	Rate Option, Base Fee for a Price Component

Then, the system will create an audit event using the **AETY3** audit event type when you edit any details of a person. But, the system will create an audit event using the **AETY4** audit event type when the following fields in a tier based pricing rule are edited:

- Pricing Start Date
- Rate Option
- Base Fee for a Price Component

Similarly, the system will create an audit event using the **AETY5** audit event type when the following fields in an age based pricing rule are edited:

- Rate Option
- Base Fee for a Price Component

The **Audit Event Type** screen allows you to define, edit, copy, and delete an audit event type. It contains the following zones:

- [Audit Event Type List](#) on page 3579
- [Audit Event Type](#) on page 3580

Audit Event Type List

The **Audit Event Type List** zone lists the audit event types that are already defined in the system. It contains the following columns:

Column Name	Column Description
Audit Event Type	Displays the audit event type.
Description	Displays the description of the audit event type.
Entity Business Object	Indicates the business object for which the audit event type is created. In addition, this column has a context menu which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.
Status	Indicates the status of the audit event type. The valid values are: <ul style="list-style-type: none">ActiveInactive
Audit Usage	Indicates the purpose of auditing an entity which is created using the entity business object. The valid values are: <ul style="list-style-type: none">Disaggregation/Reseeding - Used when you want to audit an entity for which the system should automatically create disaggregation or reseeding request.Premium Calculation - Used when you want to audit an entity which has an impact on membership premium calculation.
Edit	On clicking the Edit (✎) icon, the Audit Event Type screen appears where you can edit the details of the audit event type.
	Note: You can edit an audit event type when an audit event is not yet created using the audit event type. However, if an audit event is created using the audit event type, you can only do the following: <ul style="list-style-type: none">Change the status from Active to Inactive and vice-versaAttach algorithms (if required) to the audit event typeDefine, edit, or remove characteristics of the audit event type
Duplicate	On clicking the Duplicate (📄) icon, the Audit Event Type screen appears where you can define a new audit event type using an existing audit event type.
Delete	On clicking the Delete (🗑) icon, you can delete the audit event type.
	Note: You can delete an audit event type when an audit event is not yet created using the audit event type.

Note: Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

You can filter the list using various search criteria (such as, **Status** and **Entity Business Object**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (🔍) icon in the upper right corner of this zone.

On clicking the **Broadcast** (📡) icon corresponding to an audit event type, the **Audit Event Type** zone appears with the details of the respective audit event type.

Audit Event Type

The **Audit Event Type** zone displays the details of the audit event type. It contains the following sections:

- **Main** - Displays basic information about the audit event type. It contains the following fields:

Field Name	Field Description
Audit Event Type	Displays the audit event type.
Description	Displays the description of the audit event type.
Detailed Description	Displays additional information about the audit event type.
Status	Indicates the status of the audit event type. The valid values are: <ul style="list-style-type: none">• Active• Inactive
Entity Business Object	Indicates the business object for which the audit event type is defined. In addition, this field has a context menu which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.
Audit Usage	Indicates the purpose of auditing an entity which is created using the entity business object. The valid values are: <ul style="list-style-type: none">• Premium Calculation - Used when you want to audit an entity which has an impact on membership premium calculation.• Disaggregation/Reseeding - Used when you want to audit an entity for which the system should automatically create disaggregation or reseeding request.
Update All	Indicates whether an audit event must be created whenever any field, characteristic, or status of the entity is updated.
Add Action	Indicates whether an audit event must be created whenever an entity is added.
Delete Action	Indicate whether an audit event must be created whenever an entity is deleted.

- **Algorithms** - Lists the algorithms associated with the audit event type. It contains the following columns:

Column Name	Column Description
System Event	Indicates the system event when the algorithm must be triggered. The valid value is: <ul style="list-style-type: none"> Audit Event Processing
Sequence	Indicates the order in which the algorithms with the same system event must be triggered.
Algorithm	Indicates the algorithm attached to the system event.
	Note: It has a link. On clicking the link, the Algorithm screen appears where you can view the details of the respective algorithm.

- **Audit Elements for Entity Update** - Lists the elements which must be monitored for auditing while updating the entity. It contains the following columns:

Column Name	Column Description						
Element Type	Indicates the type of element. The valid values are: <ul style="list-style-type: none">Business Object StatusCharacteristicField						
Element Name	Displays the element which must be monitored for auditing.						
	Note: If the element is a part of a group or list, the system displays the element name along with the element group and/or list. For example, if you select the policyPerRole element of the C1-ASOPolicy business object, the system displays the <code>policyPersons/policyPerRole</code> in the Element Name field. Here, the policyPersons is the element list.						
Element Value	The following table lists the element value depending on the element type:						
	<table><tr><th>Element Type</th><th>Element Value</th></tr><tr><td>Business Object Status</td><td>Indicates the status of the entity business object which must be monitored for auditing.</td></tr><tr><td>Characteristic</td><td>Indicates the characteristic type which must be monitored for auditing.</td></tr></table>	Element Type	Element Value	Business Object Status	Indicates the status of the entity business object which must be monitored for auditing.	Characteristic	Indicates the characteristic type which must be monitored for auditing.
	Element Type	Element Value					
	Business Object Status	Indicates the status of the entity business object which must be monitored for auditing.					
	Characteristic	Indicates the characteristic type which must be monitored for auditing.					
Note: The data does not appear in this column when the element type is set to Field .							

- **Characteristics** - Lists the characteristics which are defined for the audit event type. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - This section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the audit event type.

Button Name	Button Description
	Note: You can edit an audit event type when an audit event is not yet created using the audit event type. However, if an audit event is created using the audit event type, you can only do the following: <ul style="list-style-type: none">• Change the status from Active to Inactive and vice-versa• Attach algorithms (if required) to the audit event type• Define, edit, or remove characteristics of the audit event type
Delete	Used to delete the audit event type. Note: You can delete an audit event type when an audit event is not yet created using the audit event type.
Duplicate	Used to create a new audit event type using an existing audit event type.

- **Record Information** - This section contains the following field:

Field Name	Field Description
Business Object	Indicates the business object using which the audit event type is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application. Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.

By default, the **Audit Event Type** zone does not appear in the **Audit Event Type** screen. It appears when you click the **Broadcast** (📡) icon corresponding to an audit event type in the **Audit Event Type List** zone.

Defining an Audit Event Type

Prerequisites

To define an audit event type, you should have:

- Entity business objects defined in the application
- The **Eligible for Audit Event** option type of the entity business object (for which you want to define an audit event type) set to **Y**

Note: The **Eligible for Audit Event** option type is available for the entity business object when the **Valid BO Option Type** option type of the respective maintenance object is set to **CIAT**.

- Values defined for the **AUDIT_USAGE_FLG** lookup field

Procedure

To define an audit event type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **A** and then click **Audit Event Type**.
A sub-menu appears.
3. Click the **Add** option from the **Audit Event Type** sub-menu.

The **Audit Event Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic information about the audit event type.
- **Algorithms** - Used to associate algorithms with the audit event type.
- **Audit Elements for Entity Update** - Used to list the elements from the entity business object which you want to monitor for auditing while updating the entity.

Note: The **Audit Elements for Entity Update** section is enabled only when the **Update All** option is not selected in the **Main** section.

- **Characteristics** - Used to define the characteristics for the audit event type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Audit Event Type	Used to specify the audit event type.	Yes
	Note: You cannot specify any special characters except hyphen and underscore in the audit event type.	
Business Object	Indicates the business object using which you are defining the audit event type.	Not applicable
Description	Used to specify the description for the audit event type.	Yes
Detailed Description	Used to specify additional information about the audit event type.	No
Status	Used to indicate the status of the audit event type. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	Yes
	Note: You can create only one audit event type in the Active status for an entity business object.	
Entity Business Object	Used to indicate the business object for which you want to define the audit event type.	Yes
	Note: The list includes only those business objects where the Eligible for Audit Event option type is set to Y .	
Audit Usage	Used to indicate the purpose of auditing an entity which is created using the entity business object. The valid values are: <ul style="list-style-type: none"> • Disaggregation/Reseeding - Used when you want to audit an entity for which the system should 	Yes

Field Name	Field Description	Mandatory (Yes or No)
	automatically create disaggregation or reseeding request. • Premium Calculation - Used when you want to audit an entity which has an impact on membership premium calculation.	
Update All	Used to indicate whether you want to create an audit event whenever any field, characteristic, or status of the entity is updated.	No
Add Action	Used to indicate whether you want to create an audit event whenever the entity is added.	Yes (Conditional) Note: This field is required when you want to create an audit event while adding the entity.
Delete Action	Used to indicate whether you want to create an audit event whenever the entity is deleted.	Yes (Conditional) Note: This field is required when you want to create an audit event while deleting the entity.

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Audit Event Type** screen.

- Enter the required details in the **Main** section.
- Associate the required algorithms with the audit event type.
- Add elements (such as, field, characteristic, or status) which you want to monitor for auditing while updating the entity.

Note: You can list the elements for auditing when the **Update All** option is not selected in the **Main** section.

- Define characteristics for the audit event type, if required.
- Click **Save**.
The audit event type is defined.

Associating an Algorithm with an Audit Event Type

Prerequisites

To associate an algorithm with an audit event type, you should have:

- Algorithms defined in the application (which are created using an algorithm type where the algorithm entity is set to **Audit Event Processing**)

Note: The **C1-AUDEVMPR** algorithm type is shipped with the product. You must attach an algorithm created using the **C1-AUDEVMPR** algorithm type to the audit event types which are defined for the **C1-PricingRuleTierBased** and **C1-PricingRuleAgeBased** business objects.

Procedure

To associate an algorithm with an audit event type:

- Ensure that the **Algorithms** section is expanded when you are defining, editing, or copying an audit event type.

The **Algorithms** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to trigger the algorithm. The valid value is: <ul style="list-style-type: none">Audit Event Processing - Used when you want to trigger the attached algorithm while executing the Audit Event Process Monitor (C1-AUDEV) batch.	Yes (Conditional)
		Note: This field is required when you are associating an algorithm with the audit event type.
Sequence	Used to indicate the order in which the algorithms with the same system event should be triggered.	Yes (Conditional)
		Note: This field is required when you are associating an algorithm with the audit event type.
Algorithm	Used to indicate the algorithm that you want to attach to the system event.	Yes (Conditional)
	Note: Once you select the system event, the Search (🔍) icon appears corresponding to the Algorithm field. On clicking the Search icon, the Algorithm Search window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the Algorithm field.	Note: This field is required when you are associating an algorithm with the audit event type.

- Enter the required details in the **Algorithms** section.
- If you want to associate more than one algorithm with the audit event type, click the **Add (+)** icon, and then repeat step 2.

Note: However, if you want to remove an algorithm from the audit event type, click the **Delete** (🗑️) icon corresponding to the algorithm.

Adding an Element for Auditing in an Audit Event Type

Prerequisites

To add an element for auditing in an audit event type, you should have:

- Required elements defined in the entity business object schema
- Required statuses defined in the lifecycle of the entity business object
- Required characteristic types defined in the application (where the characteristic entity is set to the respective entity)

Procedure

To add an element for auditing in an audit event type:

1. Ensure that the **Audit Elements for Entity Update** section is expanded when you are defining, editing, or copying an audit event type.

The **Audit Elements for Entity Update** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Element Type	Used to indicate the type of element. The valid values are: <ul style="list-style-type: none">• Business Object Status• Characteristic• Field	Yes (Conditional)
		Note: This field is required when you want to create an audit event whenever the specified element is updated.
Element Name	Used to specify the element which you want to monitor while updating the entity. The following table lists the elements which you must select for the respective element type:	Yes (Conditional)
		Note: This field is required when you want to create an audit event whenever the specified element is updated.

Field Name	Field Description		Mandatory (Yes or No)
	Element Type	Element Name	
		Note: Here, you must not specify a element whose type is set to group or list . If the element is a part of a group or list, the system displays the element name along with the element group and/or list. For example, if you select the policyPerRole element of the C1-ASOPolicy business object, the system displays the policyPersons/policyPerRole in the Element Name field. Here, the policyPersons is the element list.	
	Note: The Search (🔍) icon appears corresponding to the Element Name field. On clicking the Search icon, the Schema window appears. The Schema window does not appear when the entity business object is not specified in the Main section.		
Element Value	Used to specify the element value depending on the element type. The following table lists the element value that you must specify depending on the element type:		Yes (Conditional)
	Element Type	Element Value	Note: This field is required when you want to create an audit event whenever the specified element is updated.
	Business Object Status	Used to indicate the status of the entity business object which you want to monitor for auditing. The system then creates an audit event whenever the entity is transitioned to the specified status.	
	Characteristic	Used to indicate the characteristic type which you want to monitor for auditing. Here, you must specify a characteristic type where the characteristic entity is set to the respective entity. The system then creates an audit event whenever the specified characteristic is defined, edited, or removed from the entity.	

Field Name	Field Description		Mandatory (Yes or No)
	Element Type	Element Value	
		Note: The Search (🔍) icon appears corresponding to the Element Value field. On clicking the Search icon, the Characteristic Type Search window appears.	
	Note: This field does not appear when the Field option is selected from the Element Type list.		

Note: The **Audit Elements for Entity Update** section is enabled when the **Update All** option is not selected in the **Main** section.

- 2. Enter the required details in the **Audit Elements for Entity Update** section.
- 3. If you want to add more than one element for auditing in the audit event type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove an element from the audit event type, click the **Delete** (🗑️) icon corresponding to the element.

Defining a Characteristic for an Audit Event Type

Prerequisites

To define a characteristic for an audit event type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Audit Event Type**)

Procedure

To define a characteristic for an audit event type:

- 1. Ensure that the **Characteristics** section is expanded when you are defining, editing, or copying an audit event type.

The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to Audit Event Type .	Note: This field is required when you are defining a characteristic for the audit event type.

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the Search (🔍) icon appears corresponding to the Characteristic Value field. On clicking the Search icon, the Predefined Characteristic Search window appears where you can search for a predefined characteristic value. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the Characteristic Value field.	Note: This field is required when you are defining a characteristic for the audit event type.

- 2. Enter the required details in the **Characteristics** section.
- 3. If you want to define more than one characteristic for the audit event type, click the **Add** (+) icon, and then repeat step 2.

Note: However, if you want to remove a characteristic from the audit event type, click the **Delete** (🗑) icon corresponding to the characteristic.

How to define an audit event type	Defining an Audit Event Type on page 3582
How to edit an audit event type	Editing an Audit Event Type on page 3589
How to copy an audit event type	Copying an Audit Event Type on page 3592

Editing an Audit Event Type

You can edit an audit event type when an audit event is not yet created using the audit event type. However, if an audit event is created using the audit event type, you can only do the following:

- Change the status from **Active** to **Inactive** and vice-versa
- Attach algorithms (if required) to the audit event type
- Define, edit, or remove characteristics of the audit event type

Prerequisites

To edit an audit event type, you should have:

- Values defined for the **AUDIT_USAGE_FLG** lookup field

Procedure

To edit an audit event type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **A** and then click **Audit Event Type**.
A sub-menu appears.
3. Click the **Search** option from the **Audit Event Type** sub-menu.
The **Audit Event Type** screen appears.

4. In the **Audit Event Type List** zone, click the **Edit** (🔗) icon in the **Edit** column corresponding to the audit event type whose details you want to edit.

The **Audit Event Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic information about the audit event type.
- **Algorithms** - Used to associate algorithms with the audit event type.
- **Audit Elements for Entity Update** - Used to list the elements from the entity business object which you want to monitor for auditing while updating the entity.

Note: The **Audit Elements for Entity Update** section is enabled only when the **Update All** option is not selected in the **Main** section.

- **Characteristics** - Used to define the characteristics for the audit event type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Audit Event Type	Displays the audit event type.	Not applicable
Business Object	Indicates the business object which is used while defining the audit event type.	Not applicable
Description	Used to specify the description for the audit event type.	Yes
Detailed Description	Used to specify additional information about the audit event type.	No
Status	Used to indicate the status of the audit event type. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	Yes
	Note: You can create only one audit event type in the Active status for an entity business object.	
Entity Business Object	Indicates the business object for which the audit event type is defined.	Not applicable
Audit Usage	Used to indicate the purpose of auditing an entity which is created using the entity business object. The valid values are: <ul style="list-style-type: none"> • Premium Calculation - Used when you want to audit an entity which has an impact on membership premium calculation. • Disaggregation/Reseeding - Used when you want to audit an entity for which the system should automatically create disaggregation or reseeding request. 	Yes
Update All	Used to indicate whether you want to create an audit event whenever any field, characteristic, or status of the entity is updated.	No
Add Action	Used to indicate whether you want to create an audit event whenever the entity is added.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
		Note: This field is required when you want to create an audit event while adding the entity.
Delete Action	Used to indicate whether you want to create an audit event whenever the entity is deleted.	Yes (Conditional) Note: This field is required when you want to create an audit event while deleting the entity.

Tip: Alternatively, you can access this screen by clicking the **Edit** button in the **Audit Event Type** zone.

- 5. Modify the required details in the **Main** section.
- 6. Associate or disassociate the required algorithms from the audit event type.

Note: If an audit event is created using the audit event type, you cannot edit or remove algorithms from the audit event type. In such case, you can only associate additional algorithms with the audit event type.

- 7. Add, edit, or remove elements from the audit event type, if required.

Note:

The **Audit Elements for Entity Update** section is enabled when the **Update All** option is not selected in the **Main** section.

You cannot add, edit, or remove elements from the **Audit Elements for Entity Update** section when an audit event is already created using the audit event type.

- 8. Define, edit, or remove characteristics of the audit event type, if required.

Note: You cannot define, edit, or remove characteristics of the **Characteristics** section when an audit event is already created using the audit event type.

- 9. Click **Save**.
The changes made to the audit event type are saved.

Copying an Audit Event Type

Instead of creating an audit event type from scratch, you can create a new audit event type using an existing audit event type. This is possible through copying an audit event type. On copying an audit event type, the details including the algorithms, audit elements, and characteristics are copied to the new audit event type. You can then edit the details, if required.

Prerequisites

To copy an audit event type, you should have:

- Audit event type (whose copy you want to create) defined in the application
- Entity business objects defined in the application
- The **Eligible for Audit Event** option type of the entity business object (for which you want to define an audit event type) set to **Y**

Note: The **Eligible for Audit Event** option type is available for the entity business object when the **Valid BO Option Type** option type of the respective maintenance object is set to **C1AT**.

- Values defined for the **AUDIT_USAGE_FLG** lookup field

Procedure

To copy an audit event type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **A** and then click **Audit Event Type**.
A sub-menu appears.
3. Click the **Search** option from the **Audit Event Type** sub-menu.
The **Audit Event Type** screen appears.
4. In the **Audit Event Type List** zone, click the **Duplicate** (🔗) icon in the **Duplicate** column corresponding to the audit event type whose copy you want to create.

The **Audit Event Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic information about the audit event type.
- **Algorithms** - Used to associate algorithms with the audit event type.
- **Audit Elements for Entity Update** - Used to list the elements from the entity business object which you want to monitor for auditing while updating the entity.

Note: The **Audit Elements for Entity Update** section is enabled only when the **Update All** option is not selected in the **Main** section.

- **Characteristics** - Used to define the characteristics for the audit event type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Audit Event Type	Used to specify the audit event type.	Yes
	Note: You cannot specify any special characters except hyphen and underscore in the audit event type.	
Business Object	Indicates the business object which is used while defining the audit event type.	Not applicable

Field Name	Field Description	Mandatory (Yes or No)
Description	Used to specify the description for the audit event type.	Yes
Detailed Description	Used to specify additional information about the audit event type.	No
Status	Used to indicate the status of the audit event type. The valid values are: <ul style="list-style-type: none"> Active Inactive 	Yes
	Note: You can create only one audit event type in the Active status for an entity business object.	
Entity Business Object	Used to indicate the business object for which you want to define the audit event type.	Yes
	Note: The list includes only those business objects where the Eligible for Audit Event option type is set to Y .	
Audit Usage	Used to indicate the purpose of auditing an entity which is created using the entity business object. The valid values are: <ul style="list-style-type: none"> Premium Calculation - Used when you want to audit an entity which has an impact on membership premium calculation. Disaggregation/Reseeding - Used when you want to audit an entity for which the system should automatically create disaggregation or reseeding request. 	Yes
Update All	Used to indicate whether you want to create an audit event whenever any field, characteristic, or status of the entity is updated.	No
Add Action	Used to indicate whether you want to create an audit event whenever the entity is added.	Yes (Conditional)
		Note: This field is required when you want to create an audit event while adding the entity.
Delete Action	Used to indicate whether you want to create an audit event whenever the entity is deleted.	Yes (Conditional)
		Note: This field is required when you want to create an audit event while deleting the entity.

Tip: Alternatively, you can copy an audit event type by clicking the **Duplicate** button in the **Audit Event Type** zone.

5. Enter the required details in the **Main** section.
6. Associate or disassociate the required algorithms from the audit event type.
7. Add, edit, or remove elements from the audit event type, if required.

Note: The **Audit Elements for Entity Update** section is enabled when the **Update All** option is not selected in the **Main** section.

- 8. Define, edit, or remove characteristics of the audit event type, if required.
- 9. Click **Save**.
The new audit event type is defined.

Deleting an Audit Event Type

Procedure

To delete an audit event type:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **A** and then click **Audit Event Type**.
A sub-menu appears.
- 3. Click the **Search** option from the **Audit Event Type** sub-menu.
The **Audit Event Type** screen appears.
- 4. In the **Audit Event Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the audit event type that you want to delete.

A message appears confirming whether you want to delete the audit event type.

Note: You can delete an audit event type when an audit event is not yet created using the audit event type.

Tip: Alternatively, you can delete an audit event type by clicking the **Delete** button in the **Audit Event Type** zone.

- 5. Click **OK**.
The audit event type is deleted.

Search Audit Event

The **Search Audit Event** zone allows you to search for an audit event using various search criteria. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Search By	Used to indicate whether you want to search for an audit event using the entity or audit event details. The valid values are: <ul style="list-style-type: none"> Entity Details Audit Event Details 	Yes
	Note: By default, the Entity Details option is selected.	
Entity	Used to search audit events which are created for a particular entity business object.	No
	Note: This field appears when the Entity Details option is selected from the Search By list. The list includes only those entity business objects where the Eligible for Audit Event option type is set to Y .	
Created From	Used to search audit events which are created from a particular date onwards.	No
Created To	Used to search audit events which are created till a particular date.	No
Entity ID	Used to search audit events which are created for a particular entity.	No
	Note: This field appears when the following conditions are met: <ul style="list-style-type: none"> The Entity Details option is selected from the Search By list. The entity business object is selected from the Entity list. You can search for an audit event by clicking the Search (🔍) icon corresponding to the field.	
Status	Used to search audit events with a particular status. The valid values are: <ul style="list-style-type: none"> Canceled Complete Error Pending 	No

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field appears in the search criteria by default, when the Audit Event Details option is selected from the Search By list. In case you choose the Entity Details option, this field appears only when the entity business object is selected from the Entity list.	
From Effective Date	Used to search audit events whose effective date is equal to or later than the specified date. Note: This field appears only when you choose the Entity Details option from the Search By list and entity business object from the Entity list.	No
To Effective Date	Used to search audit events whose effective date is equal to or earlier than the specified date. Note: This field appears only when you choose the Entity Details option from the Search By list and entity business object from the Entity list.	No
Audit Event ID	Used to search a particular audit event. Note: This field appears when the Audit Event Details option is selected from the Search By list.	No
Audit Event Type	Used to search audit events which are created using a particular audit event type. Note: This field appears when the Audit Event Details option is selected from the Search By list.	No
Audit Action	Used to search audit events which are created while adding, updating, or deleting an entity. The valid values are: <ul style="list-style-type: none"> • Add Row • Change Row • Delete Row Note: This field appears when the Audit Event Details option is selected from the Search By list.	No

Note: You must specify at least one search criterion while searching for an audit event.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Creation Date Time	Displays the date and time when the audit event is created.

Column Name	Column Description
Audit Event Information	Displays information about the audit event.
	Note: It has a link. On clicking the link, the Audit Event screen appears where you can view the details of the respective audit event.
Entity ID	Indicates the entity for which the audit event is created.
Entity	Indicates the entity business object for which the audit event is created.
Effective Date	Displays the effective date which is stamped corresponding to the audit event.
	Note: The effective date is used later to derive the timeline for premium calculation.
Status	Indicates the status of the audit event. The valid values are: <ul style="list-style-type: none">• Canceled• Complete• Error• Pending
Audit Action	Indicates the action due to which the audit event is created for the entity. The valid values are: <ul style="list-style-type: none">• Add Row• Change Row• Delete Row
Pricing Requested	Indicates whether the repricing entity detail records are created for the audit event. The valid values are: <ul style="list-style-type: none">• Yes• No
	Note: It has a link. On clicking the link, if the repricing entity record exist, the Repricing Request screen appears where you can view the details of the repricing entity. In case the record does not exist, the system displays a warning message.

Note: Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Searching for an Audit Event

Prerequisites

To search for an audit event, you should have:

- Entity business objects defined in the application

- The **Eligible for Audit Event** option type of the entity business object set to **Y**

Note: The **Eligible for Audit Event** option type is available for the entity business object when the **Valid BO Option Type** option type of the respective maintenance object is set to **C1AT**.

Procedure

To search for an audit event:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Transaction and Audit Event Management** and then click **Audit Event**.
The **Audit Event** screen appears.
3. Enter the search criteria in the **Search Audit Event** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

4. Click **Search**.
A list of audit events that meet the search criteria appears in the **Search Results** section.

Viewing the Audit Event Details

Procedure

To view the details of an audit event:

1. Search for the audit event in the **Audit Event** screen.
2. In the **Search Results** section, click the link in the **Audit Event Information** column corresponding to the *audit* event whose details you want to view.
The **Audit Event** screen appears.
3. Ensure that the **Main** tab is selected.
4. View the details of the audit event in the **Audit Event** zone.

Audit Event - Main

The **Main** tab displays information about the audit event. It contains the following zone:

- [Audit Event](#) on page 3600

Audit Event

The **Audit Event** zone displays the details of the audit event. It contains the following sections:

- **Main** - Displays basic information about the audit event. It contains the following fields:

Field Name	Field Description
Audit Event Information	Displays information about the audit event.
Audit Event Type	Indicates the audit event type using which the audit event is created.
	Note: It has a link. On clicking the link, the Audit Event Type screen appears where you can view the details of the respective audit event type.
Status	Indicates the status of the audit event. The valid values are: <ul style="list-style-type: none">• Canceled• Complete• Error• Pending
Entity ID	Indicates the entity for which the audit event is created.
Effective Date	Displays the effective date which is stamped corresponding to the audit event in the C1_AUDIT_EVENT table.
	Note: If the entity has a start date, then the effective date is set to the entity's start date. But, if the entity does not have a start date, then the effective date is set to the system date.
Audit Action Flag	Indicates the action due to which the audit event is created for the entity. The valid values are:

Field Name	Field Description
	<ul style="list-style-type: none"> Add Row Change Row Delete Row
Maintenance Object	<p>Indicates the maintenance object of the entity business object for which the audit event is created.</p> <p>Note: It has a link. On clicking the link, the Maintenance Object screen appears where you can view the details of the respective maintenance object.</p>

- **Characteristics** - Lists the characteristics defined for the audit event. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - This section contains the following button:

Button Name	Button Description
Cancel	Used to cancel the audit event.
	Note: The Cancel button appears when the audit event is in the Error status.

- **Record Information** - This section contains the following fields:

Field Name	Field Description
Business Object	<p>Indicates the business object using which the audit event is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.</p> <p>Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.</p>
Status Date/Time	Displays the date and time when the audit event status is updated.
Create Date/Time	Displays the date and time when the audit event is created.

Canceling an Audit Event

There might be situations when an erroneous audit event is created in the system. In such case, the system provides you with an ability to cancel such audit events. However, note that you can cancel an audit event when the audit event is in the **Error** status.

Prerequisites

To cancel an audit event, you should have:

- Cancel reasons defined in the application

Note: While cancelling an audit event, you need to specify the reason why you want to cancel the audit event. You can select the appropriate cancel reason when you have defined the reasons for the **Canceled** status of the **C1-AuditEvent** business object in the **Status Reason** screen.

Procedure

To cancel an audit event:

1. Search for the audit event in the **Audit Event** screen.
2. In the **Search Results** section, click the link in the **Audit Event Information** column corresponding to the audit event which you want to cancel.
The **Audit Event** screen appears.
3. Ensure that the **Main** tab is selected.
4. Click the **Cancel** button in the **Audit Event** zone.

The **Status Reason** window appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Status Reason	Used to indicate the reason why you want to cancel the audit event.	Yes

Note: The **Cancel** button appears when the audit event is in the **Error** status.

- 5. Select the cancel reason from the **Status Reason** list.
- 6. Click **Save**.
The status of the audit event is changed to **Canceled**.

- [Invoice Request \(Used for Viewing\)](#)

Oracle Revenue Management and Billing enables you to create invoice request for the following lines of health insurance business:

- **Fully-Insured Group Business** - For more information about the invoice request for the fully-insured group business, see [Invoice Request for Group Health Insurance Billing](#) on page 3606 and [Types of Invoice Request for Fully-Insured Group Business](#) on page 3608
- **Fully-Insured Individual Business** - For more information about the invoice request for the fully-insured individual business, see and [Invoice Request for Individual Health Insurance Billing](#) on page 3610 and [Types of Invoice Request for Fully-Insured Individual Business](#) on page 3612

Invoice Request for Group Health Insurance Billing

Oracle Revenue Management and Billing enables you to generate an adhoc regular or trial bill for an account through an invoice request. The system enables you to create an invoice request manually or automatically. It enables you to create an invoice request for a person or an account. You can create an invoice request for an account where the **Eligible For Invoice Request Creation (INVRACTE)** characteristic is set to **Y**.

If you create an invoice request for a person, the system will consider all those accounts of the person where the **Eligible For Invoice Request Creation (INVRACTE)** characteristic is set to **Y**. You can then exclude an account from the invoice request, if required. The system also enables you to consider all accounts of the person and its child persons where the **Eligible For Invoice Request Creation (INVRACTE)** characteristic is set to **Y**.

Note: The system searches for the characteristic type which is specified in the **Invoice Request Account Eligibility Char Type** option type of the **C1-INVREQ** feature configuration. By default, this option type is set to **INVRACTE**. You can change the characteristic type, if required.

In other words, the system enables you to create the following types of invoice request:

- **Manual Regular Bill Generation Invoice Request** - It is used to generate an adhoc regular bill for an account. You can create a manual regular bill generation invoice request for a person or an account from the user interface.
- **Manual Trial Bill Generation Invoice Request** - It is used to generate an adhoc trial bill for an account. You can create a manual trial bill generation invoice request for a person or an account from the user interface.
- **Automatic Regular Bill Generation Invoice Request** - It is used to generate an adhoc regular bill for an account. You can configure the system such that an automatic regular bill generation invoice request is created for an account automatically when a fully-insured group policy is activated, terminated, reinstated, or renewed from the user interface or through a health care inbound message.

Note:
The automatic invoice request creation feature is only designed to work for the fully-insured group health insurance business and not for the financial services or self-funded health insurance business.
You cannot create an automatic regular bill generation invoice request for a person.
At present, the system is not designed to create an automatic trial bill generation invoice request.

While creating an invoice request, you need to specify an invoice request type using which you want to create the invoice request. The system enables you to create the invoice request types with the following combinations:

Invoice Mode	Bill Generation Type	Approval Process
Manual	Regular	On
Manual	Regular	Off
Manual	Trial	Off
Automatic	Regular	Off

It is the invoice request type which helps the system to determine:

- The business object using which the invoice request should be created in the system

Note: Two invoice request business objects named **Invoice Request - Regular Bill Generation (C1-InvoiceRequest)** and **Invoice Request - Trial Bill Generation (C1-InvoiceRequestTrial)** are introduced in this release. If the **Bill Generation Type** field is set to **Regular**, you must select the **Invoice Request - Regular Bill Generation** business object from the **Invoice Request Business Object** list. However, if the **Bill Generation Type** field is set to **Trial**, you must select the **Invoice Request - Trial Bill Generation** business object from the **Invoice Request Business Object** list.

- Whether a manual or automatic invoice request should be created in the system
- Whether a regular or trial bill generation invoice request should be created in the system
- Whether a manual regular bill generation invoice request for an account should be processed in the online or deferred mode

Note:

The system will process a manual regular bill generation invoice request for an account in the deferred mode when the number of billable charges of the account exceeds the defer processing billable charge count.

The defer processing billable charge count is not considered when a manual regular bill generation invoice request is created for a person.

You can specify the defer processing billable charge count when the invoice mode is set to **Manual** and bill generation type is set to **Regular**.

- Whether the approval is required for the invoice request

Note: You can only set the **Approval Required** flag when the invoice mode is set to **Manual** and bill generation type is set to **Regular**.

- The wait days which is used to calculate the processing date for an invoice request

Note:

If the invoice request is processed in the online mode, the system will process the invoice request when the processing date is earlier than or equal to the system date. However, if the invoice request is processed in the deferred mode, the system will process the invoice request when the processing date is earlier than or equal to the batch business date.

If required, you can configure the system such that the processing date does not fall on a holiday. To implement this requirement you need to specify the work calendar which helps to determine the working day.

- The date calculation algorithm which is used to calculate the processing date for an automatic regular bill generation invoice request

Note: In addition, you can configure threshold days for automatic invoice request creation. It is used to determine whether the number of days between the bill cycle date and processing date is greater than the threshold days. This parameter is used in Invoice Request Date Calculation algorithm to check whether the processing date of the invoice request is within threshold period. If so, the automatic invoice request is not created for the account. This parameter is only applicable while activating or renewing a fully-insured group policy.

While creating a manual invoice request, you need to specify the following - invoice request type, entity (i.e. person or account for which the invoice request should be created), cutoff date, accounting date, and bill date.

Note: The cutoff date, accounting date, and bill date are derived while creating an automatic invoice request for an account.

For more information about the types of invoice request, see [Types of Invoice Request for Fully-Insured Group Business](#) on page 3608.

For more information on how to setup the invoice request feature, see [Prerequisites](#) on page 3616.

Types of Invoice Request for Fully-Insured Group Business

The system allows you to create the following types of invoice requests for the fully-insured group business:

- [Manual Regular Bill Generation Invoice Request](#) on page 3608
- [Manual Trial Bill Generation Invoice Request](#) on page 3609
- [Automatic Regular Bill Generation Invoice Request](#) on page 3609

Manual Regular Bill Generation Invoice Request

Once a manual regular bill generation invoice request is created in the **Draft** status, the system checks whether it is created for a person or an account. If a manual regular bill generation invoice request is created for an account, you can submit the invoice request. On submitting the invoice request, the system checks whether the number of the billable charges of the account exceed the defer processing billable charge count. If the number of the billable charges of the account exceed the defer processing billable charge count, the status of the invoice request is changed to **Defer Processing Batch**. However, if the number of the billable charges of the account does not exceed the defer processing billable charge count, the system checks whether the processing date of the invoice request is earlier than or equal to the system date. If the processing date is later than the system date, the status of the invoice request is changed to **Defer Processing**. On the C1-INVRQ batch execution, the system checks whether there are any invoice requests in the **Defer Processing** status. If there is an invoice request in the **Defer Processing** status, the system checks whether the processing date of the invoice request is earlier than or equal to the system date. If the processing date is later than the system date, the status of the invoice request remains as **Defer Processing**.

Note: The system enables you to cancel an invoice request which is in the **Defer Processing Batch** or **Defer Processing** status.

However, if the processing date is earlier than or equal to the system date, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar is open for the accounting date. If the accounting calendar is open for the accounting date, the system creates the adhoc regular bill for the account in the online mode. Finally, the status of the invoice request is changed to **Processed**.

However, if the pending bill exists for the account, or if the cutoff date is earlier than or equal to the bill after date, or if the accounting calendar is not open for the accounting date, or if an error occurs while creating adhoc regular bill or its bill segments, the status of the invoice request is changed to **Error**. The system enables you to move such erroneous invoice request back to the **Draft** status.

However, if a manual regular bill generation invoice request is created for a person, the system checks whether the number of accounts of the person (if the **Include Person Hierarchy** option is not selected) or the number of accounts of the person and its child persons (if the **Include Person Hierarchy** option is selected) exceeds the limit defined in the **Account Limit** option type of the C1-INVREQ feature configuration. If the number of accounts does not exceed the account limit, the system derives the account of the person or the person and its child persons. Once the accounts are successfully derived, the status of the invoice request is changed to **Defer Processing Batch**.

However, if the number of accounts exceeds the account limit, the status of the invoice request is changed to **Account Derivation Pending**. On the C1-INVRQ batch execution, the system checks whether there are any invoice requests in the **Account Derivation Pending** status. If there is an invoice request in the **Account Derivation Pending** status, the system derives the accounts of the person or the person and its child persons. Once the accounts are successfully derived, the status of the invoice request is changed to **Defer Processing Batch**.

When you execute the BILLOPEN batch with the **Off Cycle Switch** parameter set to **Y**, the system checks whether the account that meets the search criteria is included in any invoice request which is in the **Defer Processing Batch** status. If the account is included in the invoice request, the system checks whether the processing date of the invoice request is earlier than or equal to the batch business date. If processing date is earlier than or equal to the batch business date, the system checks whether there is any record in the **Processing** status for the account in the invoice request. If so, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar is open for the accounting date. If the accounting calendar is

open for the accounting date, the system creates the adhoc regular bill for the account in the **Pending** status. When you execute the **BSGENREQ** batch with the **Off Cycle Switch** parameter set to **Y**, the system creates the bill segments for the adhoc regular bill. When you execute the **POSTPROC** batch with the **Off Cycle Switch** parameter set to **Y**, the system creates the post-processing bill segments (if any) and completes the adhoc regular bill of the account. Finally, the status of the invoice request is changed to **Processed**.

However, if the pending bill exists for the account, or if the cutoff date is earlier than or equal to the bill after date, or if the accounting calendar is not open for the accounting date, or if an error occurs while creating adhoc regular bill or its bill segments, or if a To Do is generated for the bill review, the status of the record in the invoice request is changed to **Error**. If all records in the invoice request are in the **Error** status, the status of the invoice request is changed to **Error**. The system enables you to move such erroneous invoice request back to the **Draft** status.

You can optionally configure the approval process for the manual regular bill generation invoice request. If the **Approval Required** flag is set to **Yes** in the invoice request type, the status of the manual regular bill generation invoice request is changed to **Approval In Progress** when you submit the invoice request. The approver can then approve or reject the manual regular bill generation invoice request based on the observations.

Manual Trial Bill Generation Invoice Request

The manual regular bill generation invoice request and manual trial bill generation invoice request are created and processed identically with the following exceptions:

- On submitting the manual trial bill generation invoice request for an account, the system does not check whether the number of the billable charges of the account exceed the defer processing billable charge count. Therefore, the manual trial bill generation invoice request is always processed in the deferred mode.
- You need to specify the following parameters while executing the **BILLOPEN**, **BSGENREQ**, and **POSTPROC** batches:
 - Bill Generation Type (set to **Trial**)
 - Description for Trial Billing Batch Run
 - Off Cycle Switch (set to **Y**)
- The **BSGENREQ** batch will not freeze and complete a trail bill for the account.
- At present, a To Do is not generated for a trial bill review, and therefore the system does not check whether a To Do is generated for a trial bill review.

Automatic Regular Bill Generation Invoice Request

The following table lists the algorithms that you need to attach to the corresponding business objects in the respective scenarios:

If you want to create an automatic invoice request for an account while...	Then attach the algorithm....			
	Business Object	Status	System Event	Algo
Activating a Fully-Insured Group Policy	C1-POLICY	In Force/Active	Enter	C1-IN
Note: This happens only on the customer onboarding. If an invoice request is already processed for any account in the person's hierarchy, the system will not create an invoice request for the account.				
Terminating a Fully-Insured Group Policy		Terminated	Enter	C1-IN
Reinstating a Fully-Insured Group Policy		Reinstated	Enter	C1-IN
Renewing a Fully-Insured Group Policy		-	Audit	C1-IR
Creating an Account for a Parent Customer or Bill Group who is the Main Customer of the Fully-Insured Group Policy	C1-AccountBO	-	Post-Processing	C1-IN

If you want to create an automatic invoice request for an account while...	Then attach the algorithm....			
	Business Object	Status	System Event	Algor
Note: This happens only on the customer onboarding. If an invoice request is already processed for any account in the person's hierarchy, the system will not create an invoice request for the account.				

The above algorithms contain a parameter wherein you can specify the invoice request type using which the automatic invoice request should be created in the system.

If the automatic invoice request creation feature is configured for the fully-insured group health insurance business, the system creates an automatic regular bill generation invoice request in the **Defer Processing Batch** status for an account when:

- A fully-insured group policy is activated, terminated, reinstated, or renewed
- An account is created for a parent customer or bill group who is the main customer of the fully-insured group policy

The deferred mode processing for manual regular bill generation invoice request and automatic regular bill generation invoice request is identical.

Invoice Request for Individual Health Insurance Billing

Until now, the system enabled you to generate an adhoc regular or trial bill for an account through an invoice request for the fully insured group business. Now, this feature is extended to support the adhoc billing requirements of the fully insured individual business.

The system enables you to manually or automatically create an invoice request for the fully insured individual business. It enables you to create an invoice request for an account to which an individual membership is billed. Before creating an invoice request for an account of an individual membership, the system validates whether the individual membership is eligible for the invoice request creation. You can create an invoice request only for an account of those individual memberships where the **Eligible For Invoice Request Creation (INVRACTE)** characteristic is set to **Y**. Whenever an invoice request is created for the account of an individual membership, the system adds the appropriate log entries for the individual membership in the **Log** tab of the **Membership** screen.

Note: The system validates whether the individual membership is eligible for invoice request creation using the characteristic type which is specified in the **Invoice Request Eligibility Char Type** option type of the **C1-INVREQ** feature configuration. By default, this option type is set to **INVRACTE**. You can change the characteristic type, if required.

The system enables you to create the following types of invoice request for the fully insured individual business:

- **Manual Regular Bill Generation Invoice Request** - It is used to generate an adhoc regular bill for an account. You can create a manual regular bill generation invoice request for an account from the user interface.
- **Manual Trial Bill Generation Invoice Request** - It is used to generate an adhoc trial bill for an account. You can create a manual trial bill generation invoice request for an account from the user interface.
- **Automatic Regular Bill Generation Invoice Request** - It is used to generate an adhoc regular bill for an account. You can configure the system such that an automatic regular bill generation invoice request is automatically created for an account when an individual membership is enrolled, terminated, reinstated, or canceled through a health care inbound message.

Note:

The automatic invoice request creation feature is only designed to work for the fully insured group and individual businesses and not for the financial services or self-funded health insurance business.

At present, the system is not designed to create an automatic trial bill generation invoice request.

While creating an invoice request, you need to specify an invoice request type using which you want to create the invoice request. The system enables you to create the invoice request types with the following combinations:

Invoice Mode	Bill Generation Type	Approval Process
Manual	Regular	On
Manual	Regular	Off
Manual	Trial	Off
Automatic	Regular	Off

It is the invoice request type which helps the system to determine:

- The business object using which the invoice request should be created in the system

Note: If the **Bill Generation Type** field is set to **Regular**, you must select the **Invoice Request - Regular Bill Generation** business object from the **Invoice Request Business Object** list. However, if the **Bill Generation Type** field is set to **Trial**, you must select the **Invoice Request - Trial Bill Generation** business object from the **Invoice Request Business Object** list.

- Whether a manual or automatic invoice request should be created in the system
- Whether a regular or trial bill generation invoice request should be created in the system
- Whether a manual regular bill generation invoice request for an account should be processed in the online or deferred mode

Note:

The system will process a manual regular bill generation invoice request for an account in the deferred mode when the number of billable charges of the account exceeds the defer processing billable charge count.

You can specify the defer processing billable charge count only when the invoice mode is set to **Manual** and bill generation type is set to **Regular**.

- Whether the approval is required for the invoice request

Note: You can set the **Approval Required** flag only when the invoice mode is set to **Manual** and bill generation type is set to **Regular**.

- The wait days using which the processing date is calculated for an invoice request

Note: If the invoice request is processed in the online mode, the system will process the invoice request when the processing date is earlier than or equal to the system date. However, if the invoice request is processed in the deferred mode, the system will process the invoice request when the processing date is earlier than or equal to the batch business date.

- The date calculation algorithm which is used to calculate the cutoff date, bill date, processing date, and accounting date for an automatic regular bill generation invoice request

Note:

The **C1-INVRDTCIM** algorithm is shipped in this release for the fully insured individual business. It is used to calculate the cutoff date, bill date, processing date, and accounting date for an automatic regular bill generation invoice request. If required, you can configure the algorithm such that the processing date does not fall on a holiday. In that case, you need to specify the work calendar which helps to determine the working day. You can specify the work calendar in the **C1-INVRDTCIM** algorithm. Alternatively, if the work calendar is not specified in the **C1-INVRDTCIM** algorithm, the system will use the work calendar of the account's division to ensure that the processing date falls on a working day.

In addition, you can configure threshold days for the automatic invoice request creation. The system then determines whether the number of days between the bill cycle date and processing date is greater than the threshold days. If so, the automatic invoice request is created for the account. However, if the number of days between the bill cycle date and processing date is less than or equal to the threshold days, the automatic invoice request is created for the account such that cutoff date is calculated using the next window of the bill cycle.

While creating a manual invoice request, you need to specify the following - invoice request type, account, cutoff date, accounting date, and bill date. Note that before manually or automatically creating an invoice request for an account, you need to ensure that the following algorithms are attached to the respective system event of the corresponding customer class:

System Event	Algorithm
Invoice Request Account Selection	C1-INVACTEL
Invoice Request Status Update	C1-INVRSTUP

For more information about the types of invoice request, see [Types of Invoice Request for Fully-Insured Individual Business](#) on page 3612.

For more information on how to setup the invoice request feature, see [Prerequisites](#) on page 3616.

Types of Invoice Request for Fully-Insured Individual Business

The system allows you to create the following types of invoice requests for the fully-insured individual business:

- [Manual Regular Bill Generation Invoice Request](#) on page 3612
- [Manual Trial Bill Generation Invoice Request](#) on page 3613
- [Automatic Regular Bill Generation Invoice Request](#) on page 3613

Manual Regular Bill Generation Invoice Request

Once you manually create a regular bill generation invoice request for an account, the status of the invoice request is set to **Draft**. You can then submit the invoice request. You can optionally configure the approval process for the manual regular bill generation invoice request. If the **Approval Required** flag is set to **Yes** in the invoice request type, the status of the manual regular bill generation invoice request is changed to **Approval In Progress** when you submit the invoice request. The approver can then approve or reject the manual regular bill generation invoice request based on the observations.

On submitting or approving the invoice request, the system checks whether the number of the billable charges of the account exceeds the defer processing billable charge count. If the number of the billable charges of the account exceeds the defer processing billable charge count, the status of the invoice request is changed to **Defer Processing**. However, if the number of the billable charges of the account does not exceed the defer processing billable charge count, the system checks whether the processing date of the invoice request is earlier than or equal to the system date.

If the processing date is earlier than or equal to the system date, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar

is open for the accounting date. If the accounting calendar is open for the accounting date, the system creates the adhoc regular bill for the account in the online mode. Finally, the status of the invoice request is changed to **Processed**. But, if the pending bill exists for the account, or if the cutoff date is earlier than or equal to the bill after date, or if the accounting calendar is not open for the accounting date, or if an error occurs while creating adhoc regular bill or its bill segments, the status of the invoice request is changed to **Error**. The system enables you to move such erroneous invoice request back to the **Draft** status.

However, if the processing date is later than the system date, the status of the invoice request is changed to **Defer Processing**. On the **C1-INVRQ** batch execution, the system checks whether there are any invoice requests in the **Defer Processing** status. If there is an invoice request in the **Defer Processing** status, the system checks whether the processing date of the invoice request is earlier than or equal to the system date. If the processing date is earlier than or equal to the system date, the status of the invoice request is changed to **Processing** and the algorithm attached to the **Processing** status is invoked. However, if the processing date is later than the system date, the status of the invoice request remains as **Defer Processing**.

Note: The system enables you to cancel an invoice request which is in the **Defer Processing** status.

Manual Trial Bill Generation Invoice Request

The manual regular bill generation invoice request and manual trial bill generation invoice request are created and processed identically with the following exceptions:

- On submitting the manual trial bill generation invoice request for an account, the system does not check whether the number of the billable charges of the account exceed the defer processing billable charge count. The manual trial bill generation invoice request is always processed in the deferred mode.
- You need to specify the following parameters while executing the **BILLOPEN**, **BSGENREG**, and **POSTPROC** batches:
 - Bill Generation Type** (set to **Trial**)
 - Description for Trial Billing Batch Run**
 - Off Cycle Switch** (set to **Y**)
- The **BSGENREG** batch will not freeze and complete a trail bill for the account.
- At present, a To Do is not generated for a trial bill review, and therefore the system does not check whether a To Do is generated for a trial bill review.

Automatic Regular Bill Generation Invoice Request

To enable the automatic invoice request creation feature for the fully insured individual business, you need to attach the following algorithms:

The following table illustrates the algorithms that you need to attach if you want to create an automatic invoice request for the account while Activating, Terminating, Reinstating, and Canceling an active individual membership:

If you want to create an automatic invoice request for the account while...	Then attach the algorithm....			
	Business Object	Status	System Event	Algorithm
Activating an individual membership	C1-IndMembership	Active	Enter	C1-INVRQIMEN
Terminating an individual membership		Terminated	Enter	C1-INVRQIMTM
Reinstating a terminated individual membership		Active	Enter	C1-INVRQIMEN
Canceling an active individual membership		Canceled	Enter	C1-INVRQIMCN

You can create a single or different invoice request type for each individual membership event (such as, activation, termination, reinstatement, or cancelation) depending on the wait days you want to configure for the respective event. While attaching the above algorithms, you need to specify the following parameters:

The following table illustrates the algorithms and their respective parameters:

Algorithm	Parameter	Parameter Description
C1-INVRQIMEN	Invoice Request Type for Individual Membership New Enrollment	Used to indicate the invoice request type using which you want the system to automatically create an invoice request when an individual membership is activated.
		Note: This parameter is mandatory.
	Invoice Request Type for Individual Membership Reinstatement	Used to indicate the invoice request type using which you want the system to automatically create an invoice request when an individual membership is reinstated.
		Note: This parameter is optional.
	Termination Reason	Used to specify the termination reason. The system will automatically create an invoice request while reinstating an individual membership which was terminated due to the specified reason.
		Note: This parameter is valid only when you specify the Invoice Request Type for Individual Membership Reinstatement parameter. This parameter is optional. If you do not specify a termination reason, the system will create the invoice request on the individual membership reinstatement screen without specifying the termination reason. However, if you specify a termination reason, the system will create the invoice request on the individual membership reinstatement only if the individual membership was terminated due to the specified reason. You can specify maximum five comma-separated values for this parameter. You must specify a reason which is already specified in the Terminated status of the C1-IndMemberships object in the Status Reason screen.
C1-INVRQIMTM	Invoice Request Type	Used to indicate the invoice request type using which you want the system to automatically create an invoice request when an individual membership is terminated.
		Note: This parameter is mandatory.
	Termination Reason	Used to specify the termination reason. The system will automatically create an invoice request when the individual membership is terminated due to the specified reason.

Algorithm	Parameter	Parameter Description
		<p>Note:</p> <p>This parameter is optional. If you do not specify a termination reason, the system will create the invoice request on the individual membership termination irrespective of the termination reason. However, if you specify the termination reason, the system will create the invoice request for individual membership termination only when the individual membership is terminated due to the specified reason.</p> <p>You can specify maximum five comma-separated values for this parameter.</p> <p>You must specify a reason which is already defined in the Terminated status of the C1-IndMembership object in the Status Reason screen.</p>
C1-INVRQIMCN	Invoice Request Type	<p>Used to indicate the invoice request type using the parameter value. If you want the system to automatically create an invoice request when an individual membership is canceled.</p> <p>Note: This parameter is mandatory.</p>
	Cancellation Reason	<p>Used to specify the cancellation reason. The system will automatically create an invoice request when the individual membership is canceled due to the specified reason.</p> <p>Note:</p> <p>This parameter is optional. If you do not specify a cancellation reason, the system will create the invoice request on the individual membership cancellation irrespective of the cancellation reason. However, if you specify the cancellation reason, the system will create the invoice request for individual membership cancellation only when the individual membership is canceled due to the specified reason.</p> <p>You can specify maximum five comma-separated values for this parameter.</p> <p>You must specify a reason which is already defined in the Canceled status of the C1-IndMembership business object in the Status Reason screen.</p>

The system determines the account to which the individual membership should be billed using the Account Identifier Type and Account Identifier Value characteristics which are defined on the individual membership. While fetching the characteristics, the system considers the characteristic types which are specified in the **Account Identifier Type Char Type** and **Account Identifier Value Char Type** option types of the **C1-ASOBLLNG** feature configuration. Before automatically creating an invoice request for the account of an individual membership, the system validates whether the individual membership is eligible for the invoice request creation. If the individual membership is eligible for the invoice request creation, the system checks whether any invoice request already exists for the account in the non-final status. If an invoice request exists for the account in the non-final status, a new invoice request is not created for the account. However, if an invoice request does not exist for the account in the non-final status, a new invoice request is created for the account in the **Draft** status. The system then transitions the status of the invoice request from **Draft** to **Defer Processing Batch**.

Note:

The system validates whether the individual membership is eligible for the invoice request creation only while activating an individual membership and not while terminating, reinstating, or canceling an individual membership.

The system enables you to cancel an invoice request which is in the **Defer Processing Batch** status.

When you execute the **BILLOPEN** batch with the **Off Cycle Switch** parameter set to **Y**, the system checks whether the account that meets the search criteria is included in any invoice request which is in the **Defer Processing Batch** status. If the account is included in the invoice request, the system checks whether the processing date of the invoice request is earlier than or equal to the batch business date. If the processing date is earlier than or equal to the batch business date, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar is open for the accounting date. If the accounting calendar is open for the accounting date, the system creates the adhoc regular bill for the account in the **Pending** status. When you execute the **BSGENREG** batch with the **Off Cycle Switch** parameter set to **Y**, the system creates the bill segments for the adhoc regular bill. When you execute the **POSTPROC** batch with the **Off Cycle Switch** parameter set to **Y**, the system creates the post-processing bill segments (if any) and completes the adhoc regular bill of the account. Finally, the status of the invoice request is changed to **Processed**.

However, if the pending bill exists for the account, or if the cutoff date is earlier than or equal to the bill after date, or if the accounting calendar is not open for the accounting date, or if an error occurs while creating adhoc regular bill or its bill segments, or if a To Do is generated for the bill review, the status of the invoice request is changed to **Error**. The system enables you to move such erroneous invoice request back to the **Draft** status.

Prerequisites

To setup the invoice request process, you need to do the following:

- Define the required invoice request types in the system.
- Define the required characteristic types where the characteristic entity is set to **Invoice Request Type**
- Define the required characteristic types where the characteristic entity is set to **Invoice Request**
- Assign the **C1-INVRA** To Do type to a To Do role whose users must receive To Do generated while submitting an invoice request for approval
- Assign the **C1-INVRS** To Do type to a To Do role whose users must receive To Do generated while resubmitting an invoice request
- Set the batch control type of the **Invoice Request Periodic Monitor (C1-INVRO)** batch to **Timed** and define the following attributes:
 - Time Interval
 - Timer Active
 - User ID
 - Batch Language
 - Email Address

For more information about the **Invoice Request Periodic Monitor (C1-INVRO)** batch, see *Oracle Revenue Management and Billing Batch Guide*.

- Set the batch control type of the **Pending Bill Generation (BILLOPEN)**, **Bill Segment Generation (BSGENREG)**, and **Bill Completion (POSTPROC)** batches to **Timed** and define the following attributes:
 - Time Interval
 - Timer Active
 - User ID
 - Batch Language
 - Email Address

For more information about these batches, see *Oracle Revenue Management and Billing Batch Guide*.

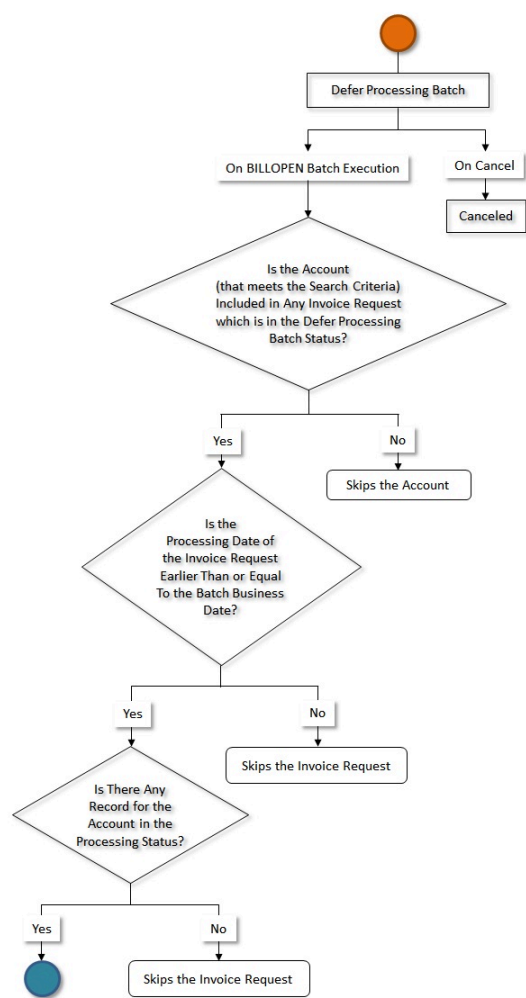

Set the following feature configuration in the system:

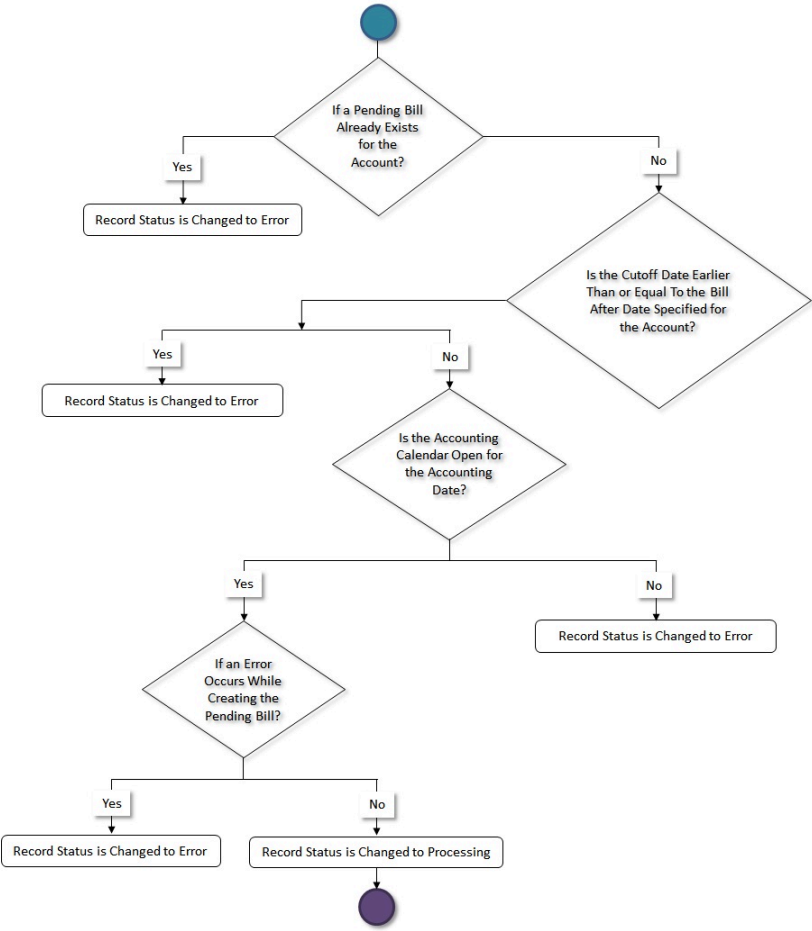

- **Invoice Request Configuration (C1-INVREQ)**

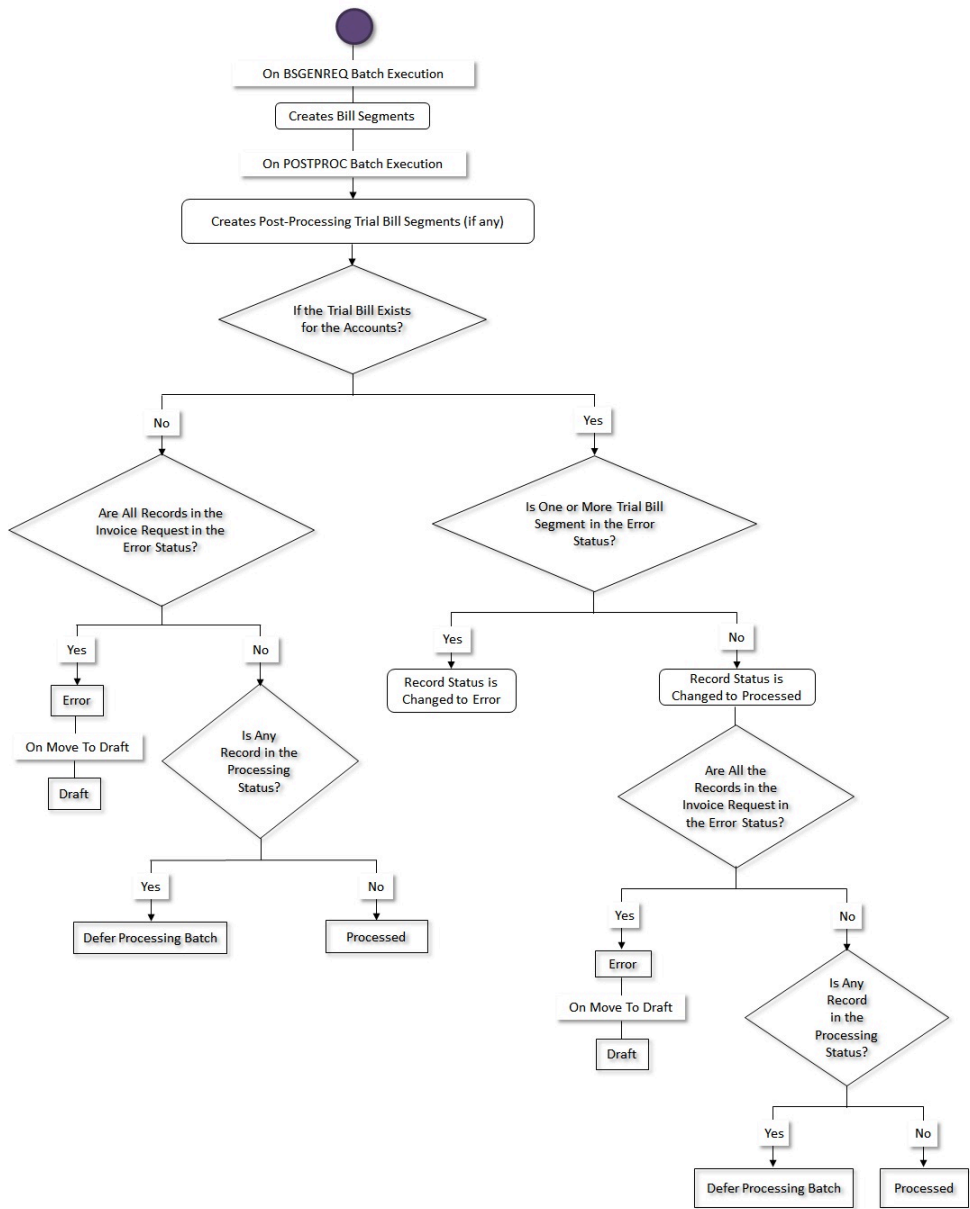

Invoice Request Manual Trial Bill Generation (Without Approval) Status Transition

The following figure graphically indicates how an invoice request in the manual trial bill generation process moves from one status to another when the approval process is not configured in the invoice request type:

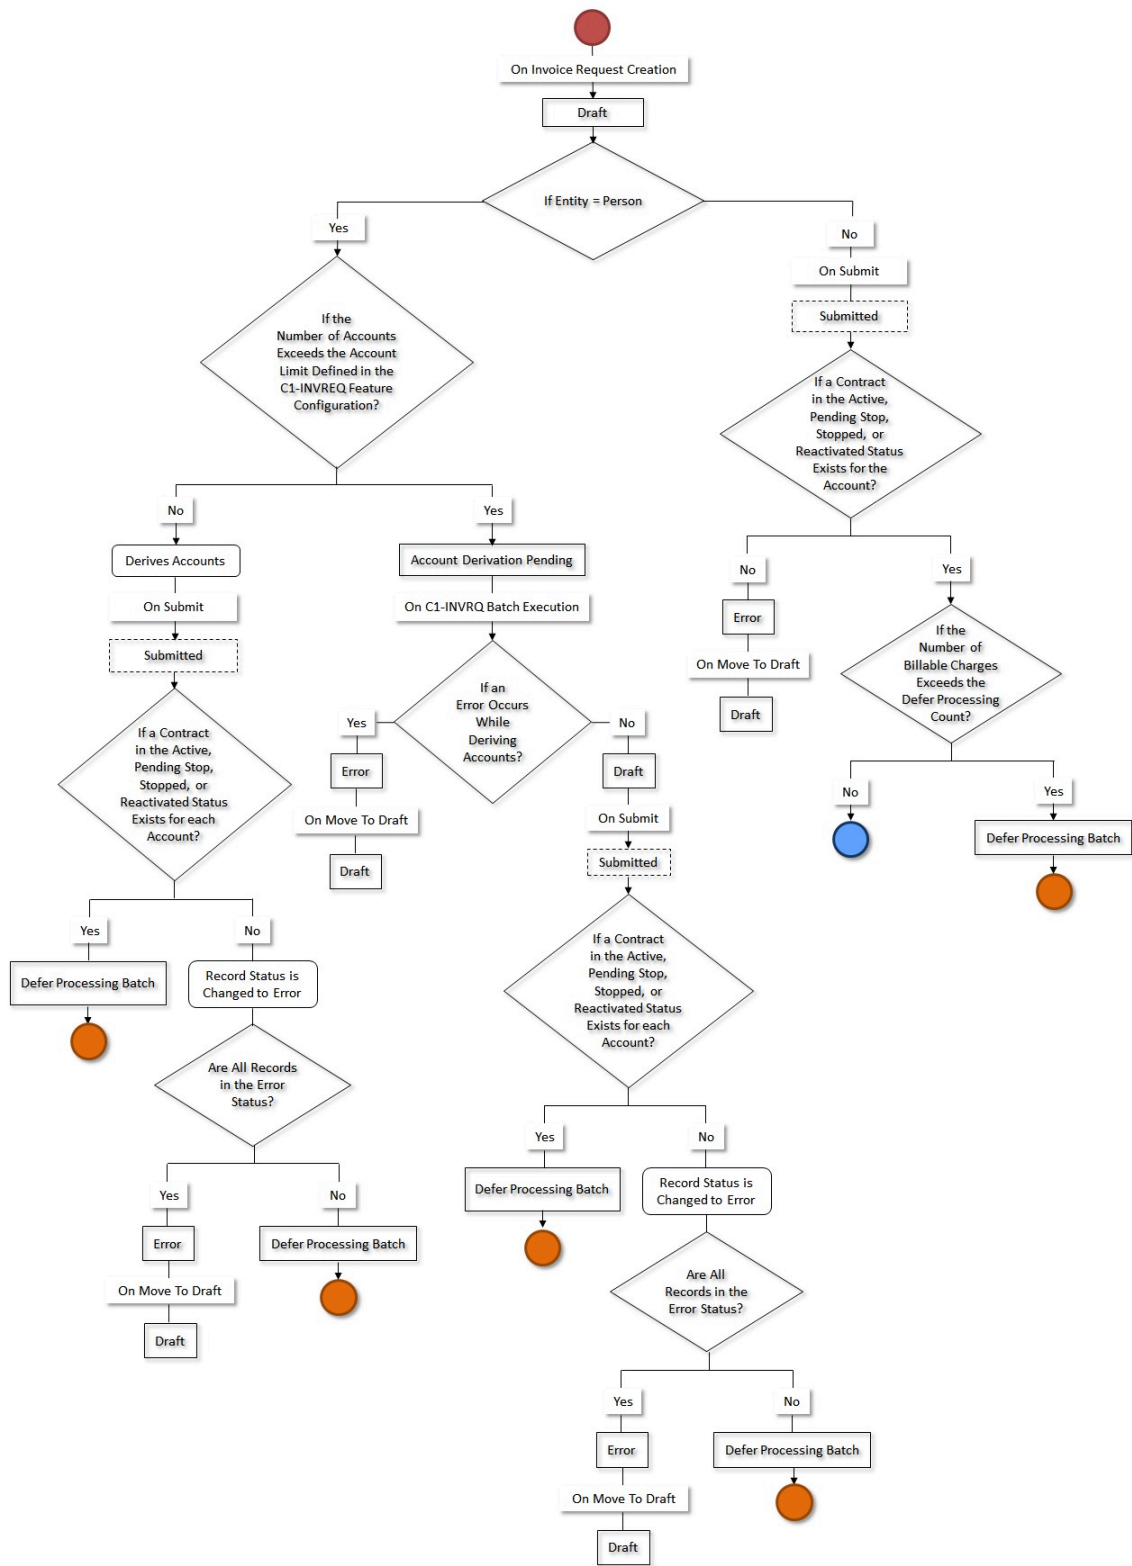

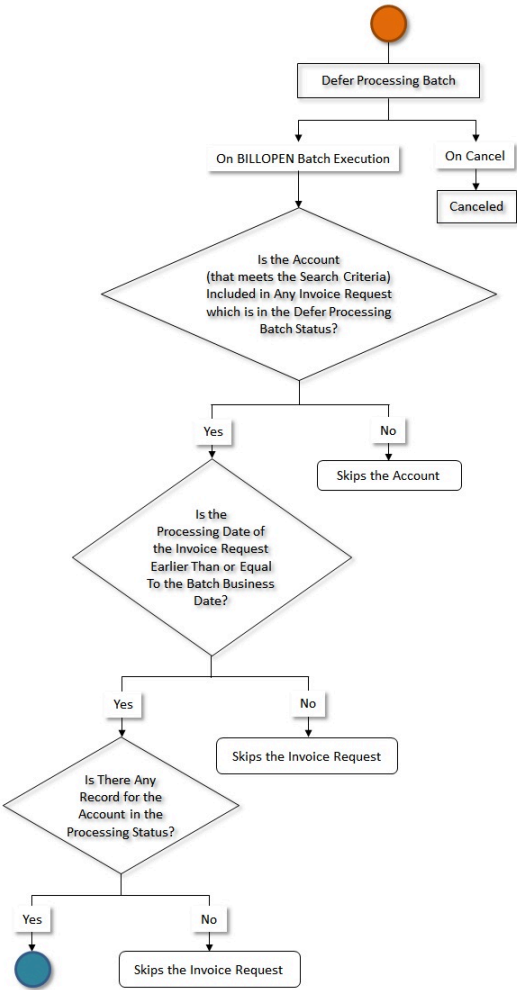

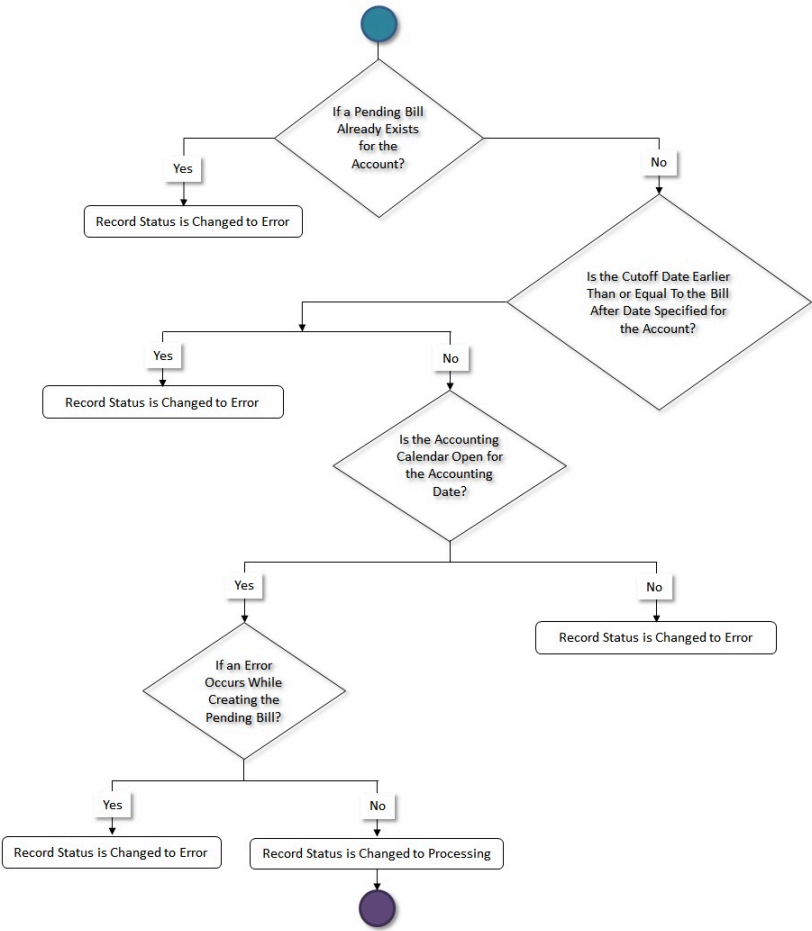

Invoice Request Manual Regular Bill Generation (Without Approval) Status Transition

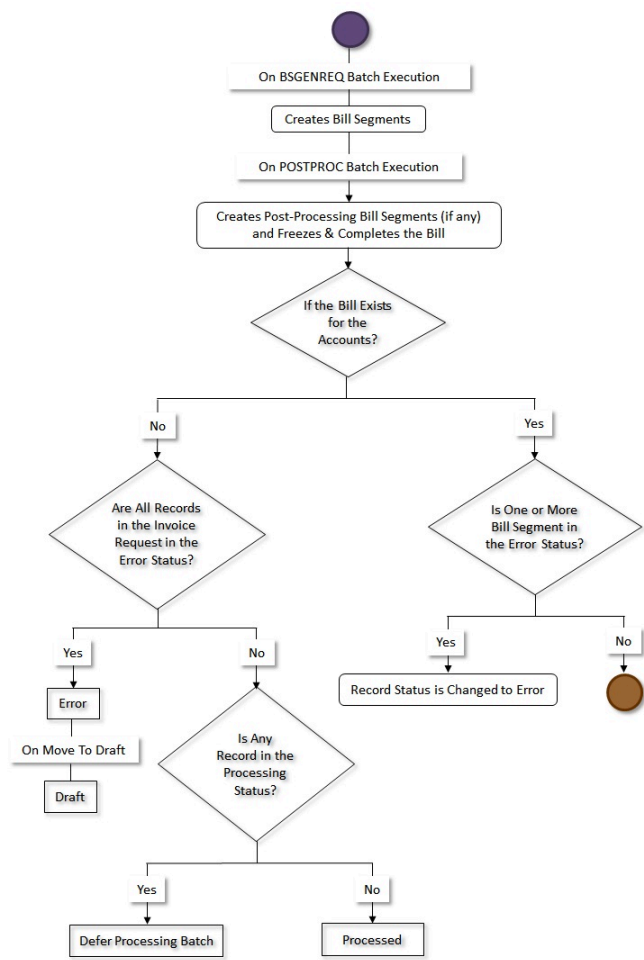

The following figure graphically indicates how an invoice request in the manual regular bill generation process moves from one status to another when the approval process is not configured in the invoice request type:

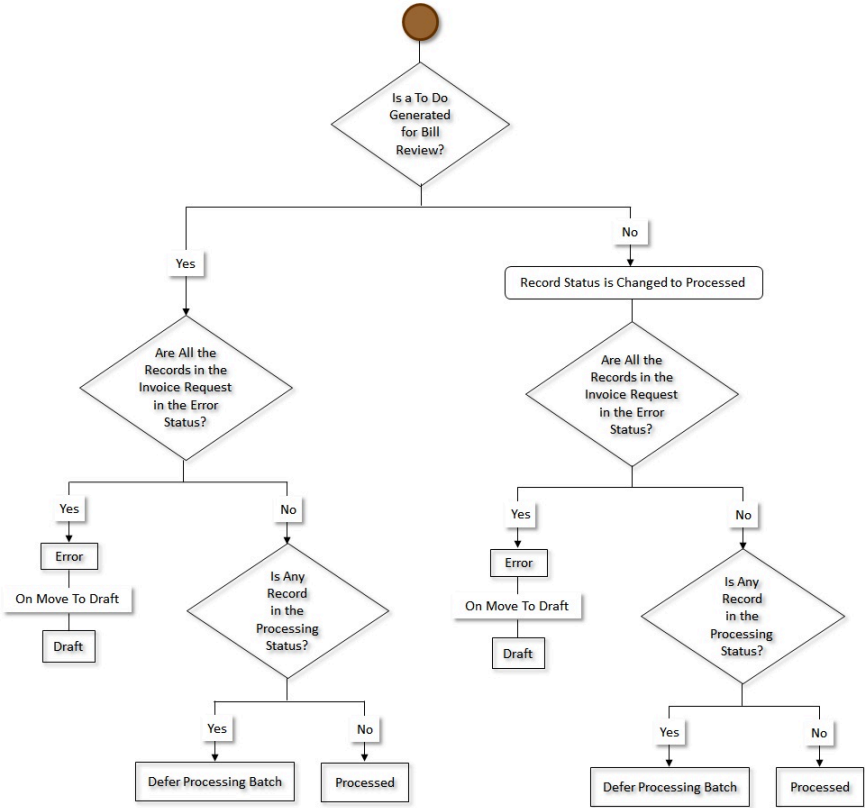

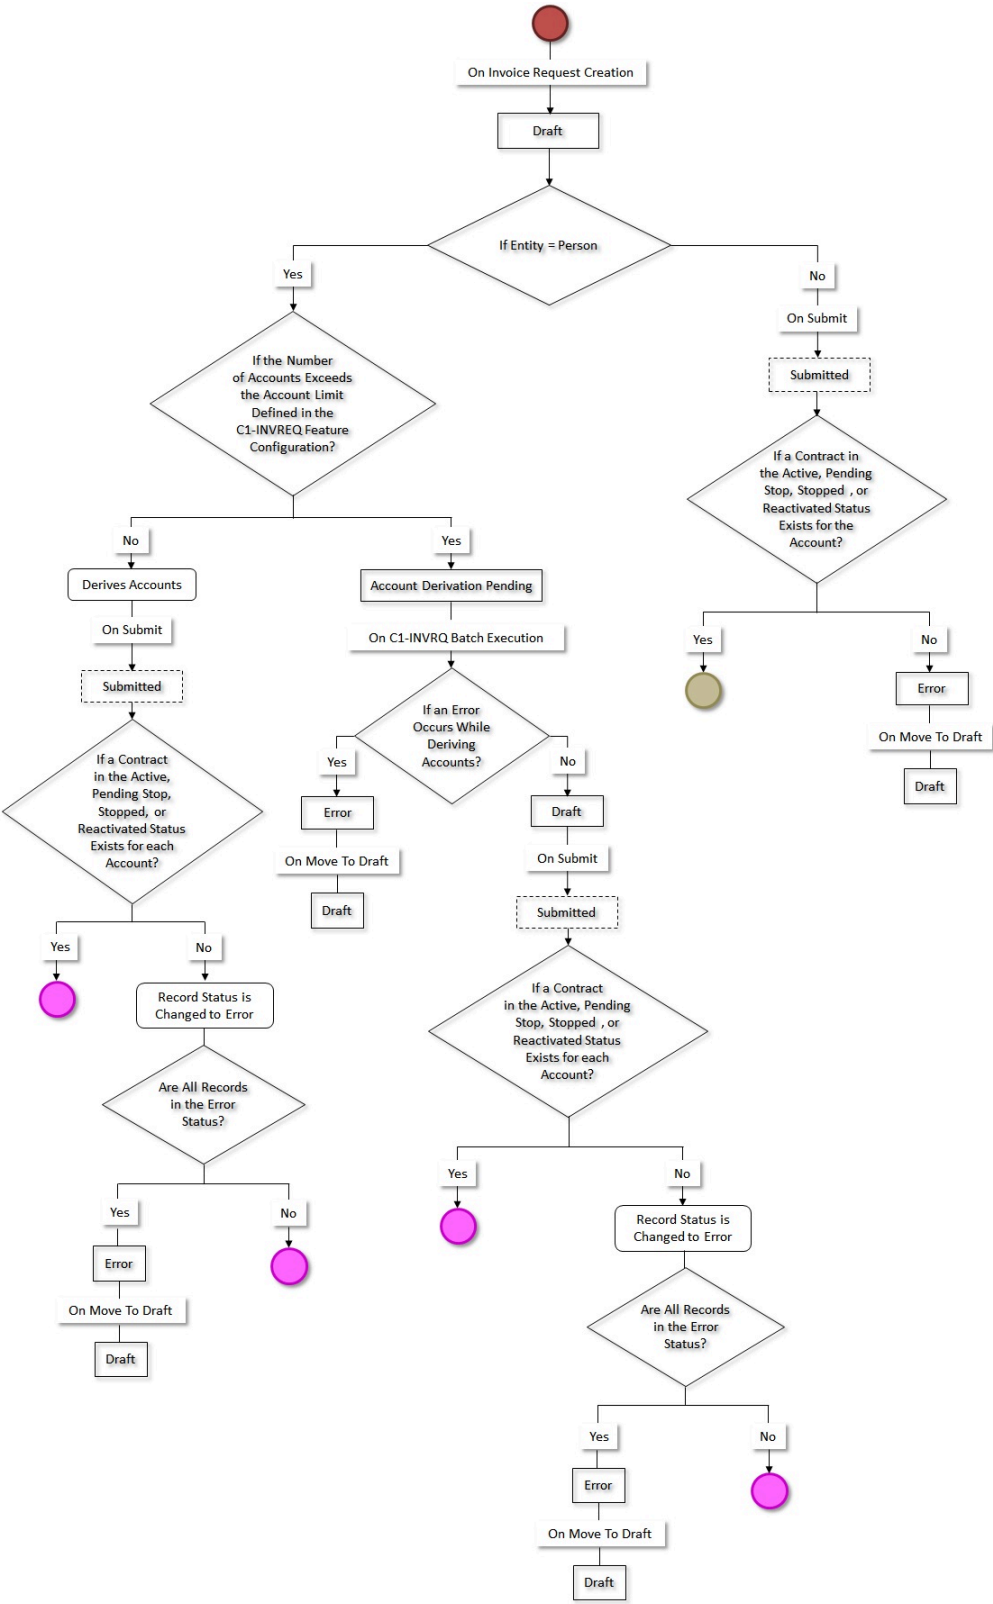

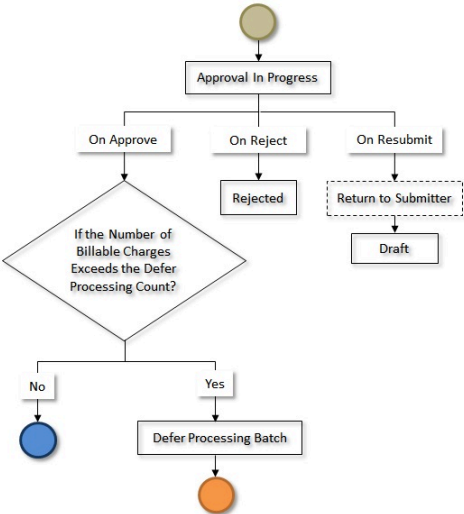

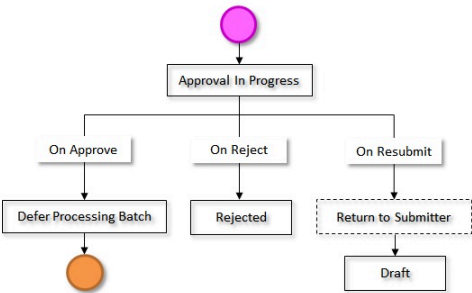

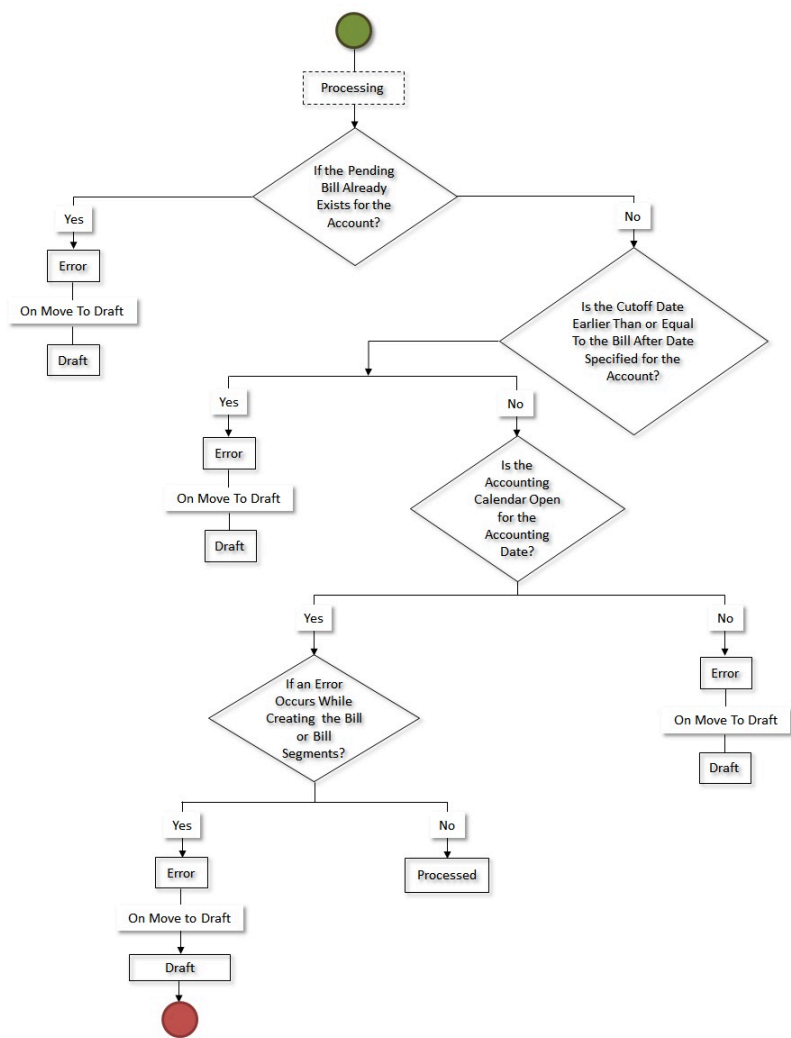

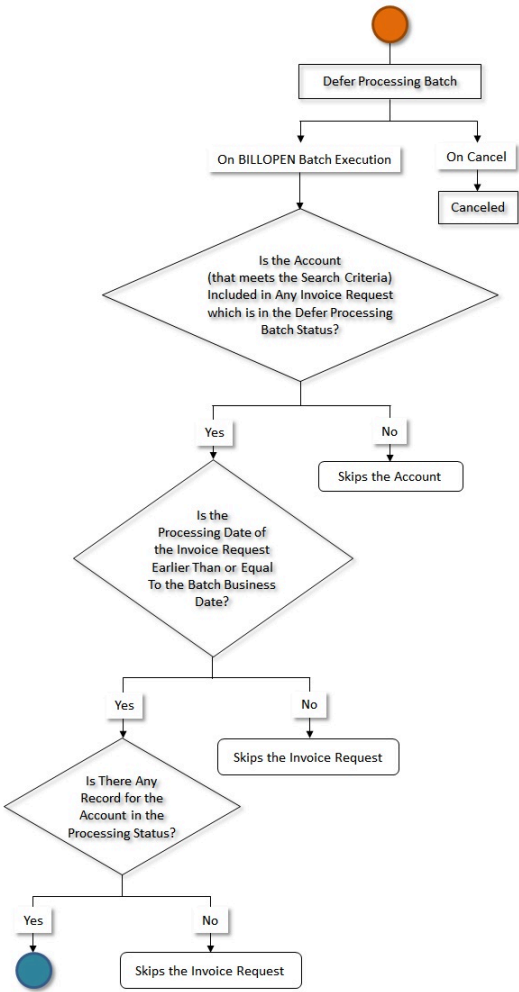

Invoice Request Manual Regular Bill Generation (With Approval) Status Transition

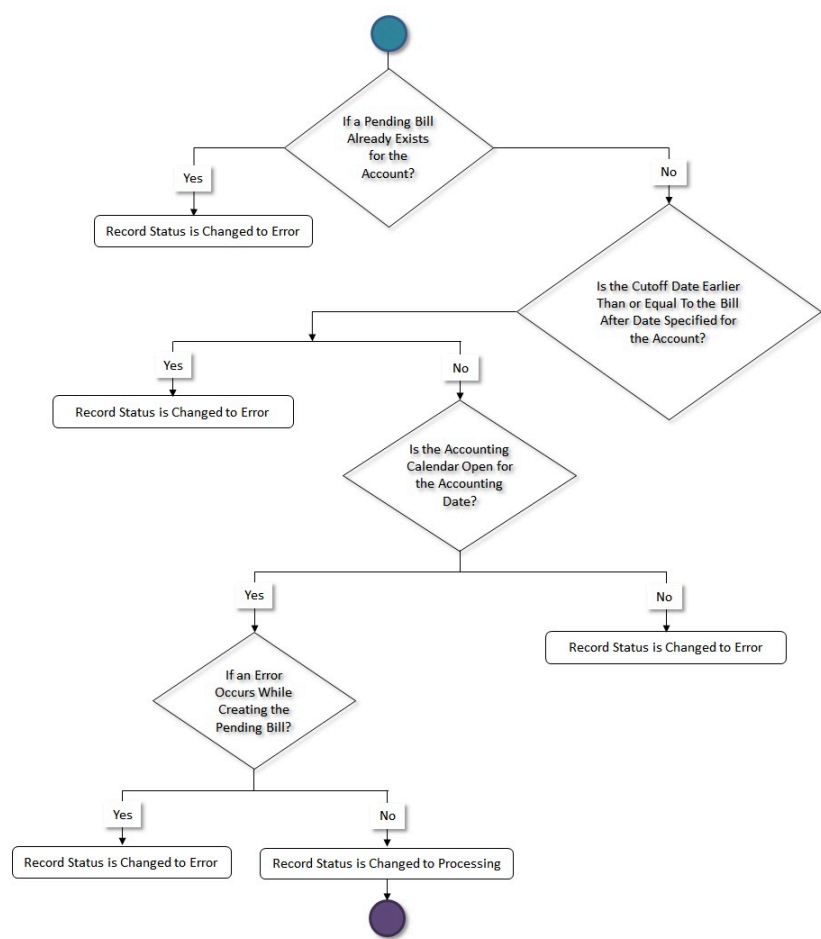

The following figure graphically indicates how an invoice request created through the manual regular bill generation process moves from one status to another when the approval process is configured in the invoice request type:

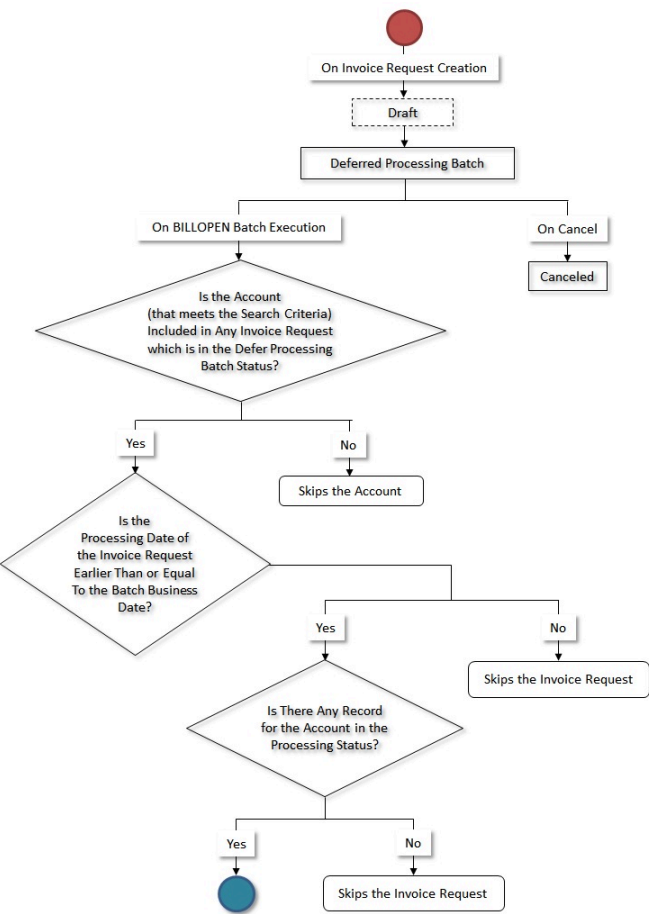

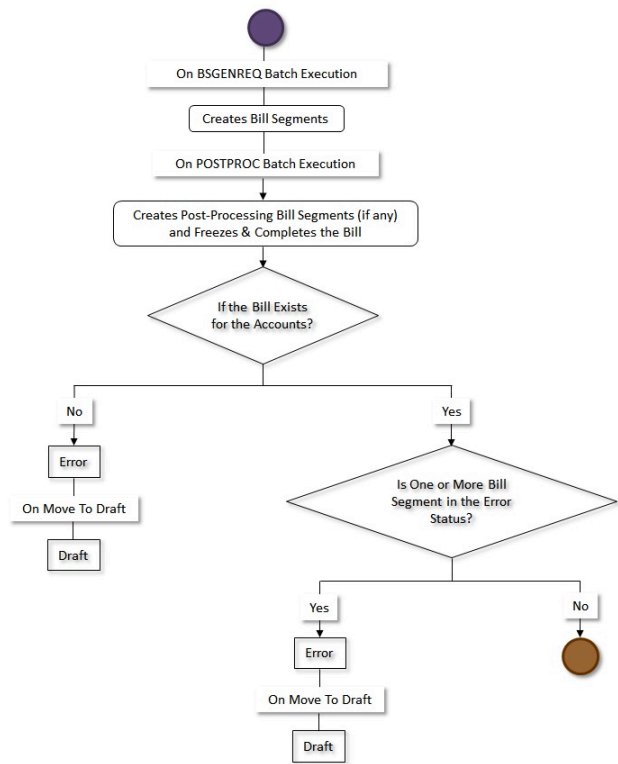

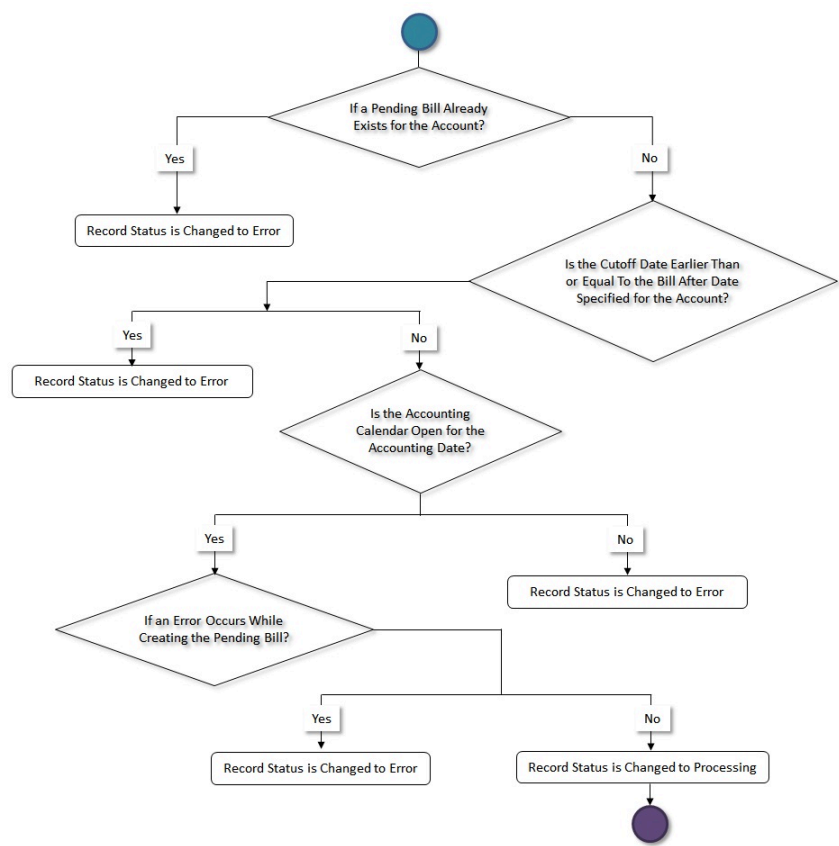

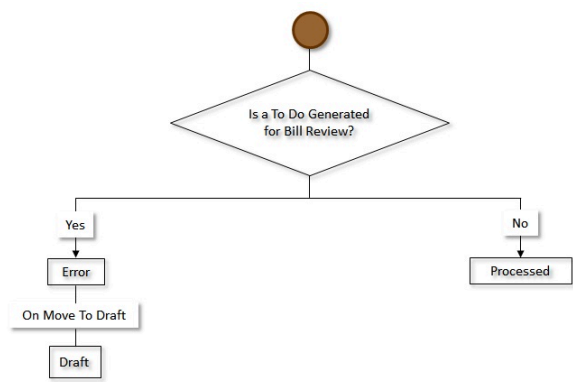

Invoice Request Automatic Regular Bill Generation (Without Approval) Status Transition

The following figure graphically indicates how an invoice request created through the automatic regular bill generation process moves from one status to another when the approval process is not configured in the invoice request type:

Invoice Request Type

Oracle Revenue Management and Billing enables you to configure an invoice request type using which you can create an invoice request. The invoice request type helps the system to determine:

- The invoice request business object for which the invoice request should be created in the system
- The mode in which the invoice should be created in the system
- The bill generation type using which the invoice should be created in the system
- Whether a manual regular bill generation invoice request for an account should be processed in the online or deferred mode
- The date calculation algorithm which is used to calculate the processing date for an automatic regular bill generation invoice request
- Whether the approval is required for the invoice request
- The submitter To Do role for resubmitting the invoice request for approval
- The wait days which is used to calculate the invoice request processing date

Note: The automatic invoice request is designed to work only for the fully-insured group and individual health insurance businesses and not for the financial services or self-funded health insurance businesses.

The **Invoice Request Type** screen allows you to define, edit, copy, delete, and view the details of an invoice request type. It contains the following zones:

- [Invoice Request Type List](#) on page 3635
- [Invoice Request Type](#) on page 3636

Invoice Request Type List

The **Invoice Request Type List** zone lists the invoice request types that are already defined in the system. It contains the following columns:

Column Name	Column Description
Invoice Request Type	Displays the invoice request type.
Description	Displays the description of the invoice request type.
Edit	On clicking the Edit (✎) icon, the Invoice Request Type screen appears where you can edit the details of the invoice request type.
Duplicate	On clicking the Duplicate (📄) icon, the Invoice Request Type screen appears where you can define a new invoice request type using an existing invoice request type.

Column Name	Column Description
Delete	On clicking the Delete (🗑) icon, you can delete the invoice request type.
	Note: You can delete an invoice request type only when an invoice request is not yet created using the invoice request type.

On clicking the **Broadcast** (📡) icon corresponding to an invoice request type, the **Invoice Request Type** zone appears with the details of the respective invoice request type.

Invoice Request Type

The **Invoice Request Type** zone displays the details of the invoice request type. It contains the following sections:

- **Main** - The **Main** section displays basic information about the invoice request type. It contains the following fields:

Field Name	Field Description
Invoice Request Type	Displays the invoice request type.
Description	Displays the description of the invoice request type.
Invoice Request Business Object	Indicates the business object using which the invoice request should be created in the system. In addition, the context menu (☺) icon appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.
Detailed Description	Displays additional information about the invoice request type.
Status	Indicates the current status of the invoice request type. The valid values are: <ul style="list-style-type: none"> • Active • Inactive
Invoice Mode	Indicates the mode in which the invoice request is created in the system using the invoice request type. The valid values are: <ul style="list-style-type: none"> • Automatic • Manual

Field Name	Field Description
Bill Generation Type	<p>Indicates the type of bill that is generated for the invoice request in the system. The valid values are:</p> <ul style="list-style-type: none"> Regular Trial
Defer Processing Billable Charge Count	<p>Displays the count which helps to determine whether the invoice request must be processed in the deferred mode (i.e. in the background) or in real time (i.e. immediately). If the number of billable charges created for the bills which are selected in the invoice request exceeds the defer processing billable charge count, the system processes the invoice request in the deferred mode. However, if the number of billable charges created for the bills which are selected in the invoice request does not exceed the defer processing billable charge count, the system processes the invoice request in real time (i.e. immediately).</p> <p>Note:</p> <p>This field appears only when the Invoice Mode is set to Manual and the Bill Generation Type is set to Regular.</p> <p>If you set the defer processing billable charge count to zero (0), the system resets the default value to 500.</p>
Date Calculation Algorithm	<p>Indicates the algorithm using which the date is calculated for processing the billable charges created for the bills in the invoice request.</p> <p>Note:</p> <p>It has a link. On clicking the link, the Algorithm screen appears where you can view the details of the respective algorithm.</p> <p>This field appears only when the Invoice Mode is set to Automatic.</p>
Approval Required	<p>Indicates whether approval is required for approving the bills generated through the invoice request.</p> <p>Note: This field appears only when the Invoice Mode is set to Manual and the Bill Generation Type is set to Regular.</p>
Approval To Do Type	<p>Indicates that the To Do task of the specified To Do type must be created when the invoice request is submitted for approval.</p> <p>Note:</p> <p>It has a link. On clicking the link, the To Do Type screen appears where you can view the details of the respective To Do type.</p> <p>This field appears only when the Approval Required option is selected.</p>
Approval To Do Role	Indicates the user and/or group of users who can approve the invoice request.

Field Name	Field Description
	<p>Note:</p> <p>It has a link. On clicking the link, the To Do Role screen appears where you can view the details of the respective To Do role.</p> <p>This field appears only when the Approval Required option is selected.</p>
Submitter To Do Type	<p>Indicates that the To Do task of the specified To Do type is created for re-submitting the invoice request for approval.</p> <p>Note: It has a link. On clicking the link, the To Do Type screen appears where you can view the details of the respective To Do type.</p>
Submitter To Do Role	<p>Indicates the user and/or group of users who can re-submit the invoice request for approval.</p> <p>Note: It has a link. On clicking the link, the To Do Role screen appears where you can view the details of the respective To Do role.</p>
Wait Days	<p>Displays the maximum wait period (in days) after which the bills of the invoice request are processed.</p> <p>Note: You cannot specify a negative value in the Wait Days field.</p>

- **Characteristics** - The **Characteristics** section lists the characteristics defined for the invoice request type. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - The **Record Actions** section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the invoice request type.
Delete	<p>Used to delete the invoice request type.</p> <p>Note: You can delete an invoice request type only when an invoice request is not yet created using the invoice request type.</p>
Duplicate	Used to create a new invoice request type using an existing invoice request type.

- **Record Information** - The **Record Information** section contains the following field:

Field Name	Field Description
Business Object	<p>Indicates the business object using which the invoice request type is created in the system. In addition, the context menu (☺) icon appears corresponding to this field which helps in navigating to other screens in the application.</p> <p>Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.</p>

By default, the **Invoice Request Type** zone does not appear in the **Invoice Request Type** screen. It appears when you click the **Broadcast** (📡) icon corresponding to an invoice request type in the **Invoice Request Type List** zone.

Defining an Invoice Request Type

Prerequisites

To define an invoice request type, you should have:

- Invoice request type business object defined in the application.
- Invoice request business objects defined in the application.
- Date calculation algorithm defined using the **C1-INVREDTCA** algorithm type.
- Required To Do role assigned to the **C1-INVRA** and **C1-INVRS** To Do types in the application

Procedure

To define an invoice request type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **I** and then click **Invoice Request Type**.
A sub-menu appears.
3. Click the **Add** option from the **Invoice Request Type** sub-menu.

The **Invoice Request Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the invoice request type.
- **Characteristics** - Used to define a list of characteristics for the invoice request type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Invoice Request Type	Used to specify the invoice request type.	Yes
Business Object	Indicates the business object using which you want to define the invoice request type.	Not applicable
Description	Used to specify the description for the invoice request type.	Yes
Invoice Request Business Object	Used to indicate the invoice request business object for which you want to define the invoice request type. The valid values are: <ul style="list-style-type: none"> • Invoice Request - Regular Bill Generation • Invoice Request - Trial Bill Generation 	Yes
Detailed Description	Used to specify additional information about the invoice request type.	No

Field Name	Field Description	Mandatory (Yes or No)
Status	Used to indicate the current status of the invoice request type. The valid values are: <ul style="list-style-type: none"> Active Inactive 	Yes
Invoice Mode	Used to indicate the mode in which the invoice request should be created in the system using the invoice request type. The valid values are: <ul style="list-style-type: none"> Automatic <div> Note: The automatic mode is not supported while creating an invoice request type for the financial services domain. </div> <ul style="list-style-type: none"> Manual 	Yes
Bill Generation Type	Used to indicate the type of bill that should be generated for the invoice request in the system using the invoice request type. The valid values are: <ul style="list-style-type: none"> Regular Trial <div> Note: By default, this field is set to Regular when the Invoice Mode is set to Automatic. </div>	Yes
Defer Processing Billable Charge Count	Used to specify the count which helps to determine whether the invoice request must be processed in the deferred mode (i.e. in the background) or in real time (i.e. immediately). If the number of billable charges created for the bills which are selected in the invoice request exceeds the defer processing billable charge count, the system processes the invoice request in the deferred mode. However, if the number of billable charges created for the bills which are selected in the invoice request does not exceed the defer processing billable charge count, the system processes the invoice request in real time (i.e. immediately). <div> Note: You cannot specify a negative value in this field. Deferred mode means, in the background, when the Generic Request Periodic Monitor (C1-GENRQ) batch is invoked. You can configure the Generic Request Periodic Monitor (C1-GENRQ) batch such that it is executed at regular intervals. For more information about the Generic Request Periodic Monitor (C1-GENRQ) batch, refer to <i>Oracle Revenue Management and Billing Batch Guide</i>. </div>	No

Field Name	Field Description	Mandatory (Yes or No)
Date Calculation Algorithm	Used to indicate the algorithm using which the date is calculated for processing the billable charges created for the bills in the invoice request.	Yes (Conditional)
	Note: The Search (🔍) icon appears corresponding to the Date Calculation Algorithm field. On clicking the Search icon, the Algorithm Search window appears. On specifying the date calculation algorithm, the description of the date calculation algorithm appears corresponding to the Date Calculation Algorithm field. You can specify the date calculation algorithm only when the Invoice Mode is set to Automatic .	Note: This field is required for creating an invoice request in the automatic mode.
Approval Required	Used to indicate whether approval is required for approving the bills generated through the invoice request.	No
	Note: This field appears only when the Invoice Mode is set to Manual and the Bill Generation Type is set to Regular .	
Approval To Do Type	Used to indicate that the To Do task of the specified To Do type must be created when the invoice request is submitted for approval.	Yes (Conditional)
	Note: The Search (🔍) icon appears corresponding to the Approval To Do Type field. On clicking the Search icon, the To Do Type Search window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field. This field appears only when the Approval Required option is selected. The C1-INVRA To Do type is shipped with the product. You can use the C1-INVRA To Do type or a custom To Do type, if required.	Note: This field is required for approving the invoice request which is created using the invoice request type.
Approval To Do Role	Used to indicate the user and/or group of users who can approve the invoice request.	Yes (Conditional)
	Note: The list includes only those To Do roles which are associated with the approval To Do type. This field appears only when the Approval Required option is selected.	Note: This field is required for approving the invoice request which is created using the invoice request type.

Field Name	Field Description	Mandatory (Yes or No)
Submitter To Do Type	Used to indicate that the To Do task of the specified To Do type is created for re-submitting the invoice request for approval.	Yes (Conditional)
	Note: The Search (🔍) icon appears corresponding to the Submitter To Do Type field. On clicking the Search icon, the To Do Type Search window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Submitter To Do Type field. The C1-INVRS To Do type is shipped with the product. You can use the C1-INVRS To Do type or a custom To Do type, if required.	Note: This field is required for resubmitting the invoice request for approval.
Submitter To Do Role	Used to indicate the user and/or group of users who can re-submit the invoice request for approval.	Yes (Conditional)
	Note: The list includes only those To Do roles which are associated with the submitter To Do type.	Note: This field is required for resubmitting the invoice request for approval. Once the it is defined and saved, it cannot be changed as it is linked to request(s) which are under processing.
Wait Days	Used to specify the maximum wait period (in days) after which the bills in the invoice request are processed.	No
	Note: You cannot specify a negative value in the Wait Days field.	

4. Enter the required details in the **Main** section.
5. Define a list of characteristics for the invoice request type, if required.
6. Click **Save**.
The invoice request type is defined.

Invoice Request Type screen	Invoice Request Type on page 3635
How to define a characteristic for an invoice request type	Defining a Characteristic for an Invoice Request on page 3671

Defining a Characteristic for an Invoice Request Type

Prerequisites

To define a characteristic for an invoice request type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Invoice Request Type**)

Procedure

To define a characteristic for an invoice request type:

1. Ensure that the **Characteristics** section is expanded when you *are* defining, editing, or copying an invoice request type.

The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to Invoice Request Type .	Note: This field is required while defining a characteristic for an invoice request type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the Search (🔍) icon appears corresponding to the Characteristic Value field. On clicking the Search icon, the Predefined Characteristic Search window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the Characteristic Value field.	Note: This field is required while defining a characteristic for an invoice request type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the invoice request type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a characteristic from the invoice request type, click the **Delete** (🗑️) icon corresponding to the characteristic.

Editing an Invoice Request Type

Prerequisites

To edit an invoice request type, you should have:

- Invoice request type business object defined in the application.
- Invoice request business objects defined in the application.
- Date calculation algorithm defined using the **C1-INVREDTCA** algorithm type.
- Required To Do role assigned to the **C1-INVRA** and **C1-INVRS** To Do types in the application

Procedure

To edit an invoice request type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **I** and then click **Invoice Request Type**.
A sub-menu appears.
3. Click the **Search** option from the **Invoice Request Type** sub-menu.
The **Invoice Request Type** screen appears.
4. In the **Invoice Request Type List** zone, click the **Edit**() icon in the **Edit** column corresponding to the invoice request type whose details you want to edit.

The **Invoice Request Type** screen appears. It contains the following section:

- **Main** - Used to specify basic details about the invoice request type.
- **Characteristics** - Used to define a list of characteristics for the invoice request type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Invoice Request Type	Displays the invoice request type.	Not applicable
Business Object	Indicates the business object using which you want to define the invoice request type.	Not applicable
Description	Used to specify the description for the invoice request type.	Yes
Invoice Request Business Object	Used to indicate the invoice request business object for which you want to define the invoice request type. The valid values are: <ul style="list-style-type: none"> • Invoice Request - Regular Bill Generation • Invoice Request - Trial Bill Generation 	Yes
Detailed Description	Used to specify additional information about the invoice request type.	No
Status	Used to indicate the current status of the invoice request type. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	Yes
Invoice Mode	Used to indicate the mode in which the invoice request should be created in the system using the invoice request type. The valid values are:	Yes

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> Automatic <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> Note: The automatic mode is not supported while creating an invoice request type for the financial services domain. </div> <ul style="list-style-type: none"> Manual 	
Bill Generation Type	<p>Used to indicate the type of bill that should be generated for the invoice request in the system using the invoice request type. The valid values are:</p> <ul style="list-style-type: none"> Regular Trial <p>Note: By default, this field is set to Regular when the Invoice Mode is set to Automatic.</p>	Yes
Defer Processing Billable Charge Count	<p>Used to specify the count which helps to determine whether the invoice request must be processed in the deferred mode (i.e. in the background) or in real time (i.e. immediately). If the number of billable charges created for the bills which are selected in the invoice request exceeds the defer processing billable charge count, the system processes the invoice request in the deferred mode. However, if the number of billable charges created for the bills which are selected in the invoice request does not exceed the defer processing billable charge count, the system processes the invoice request in real time (i.e. immediately).</p> <p>Note:</p> <p>You cannot specify a negative value in this field.</p> <p>Deferred mode means, in the background, when the Generic Request Periodic Monitor (C1-GENRQ) batch is invoked. You can configure the Generic Request Periodic Monitor (C1-GENRQ) batch such that it is executed at regular intervals. For more information about the Generic Request Periodic Monitor (C1-GENRQ) batch, refer to <i>Oracle Revenue Management and Billing Batch Guide</i>.</p>	No
Date Calculation Algorithm	Used to indicate the algorithm using which the date is calculated for processing the billable charges created for the bills in the invoice request.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The Search (Q) icon appears corresponding to the Date Calculation Algorithm field. On clicking the Search icon, the Algorithm Search window appears.</p> <p>On specifying the date calculation algorithm, the description of the date calculation algorithm appears corresponding to the Date Calculation Algorithm field.</p> <p>You can specify the date calculation algorithm only when the Invoice Mode is set to Automatic.</p>	<p>Note: This field is required for creating an invoice request in the automatic mode.</p>
Approval Required	<p>Used to indicate whether approval is required for approving the bills generated through the invoice request.</p> <p>Note: This field appears only when the Invoice Mode is set to Manual and the Bill Generation Type is set to Regular.</p>	No
Approval To Do Type	<p>Used to indicate that the To Do task of the specified To Do type must be created when the invoice request is submitted for approval.</p> <p>Note:</p> <p>The Search (Q) icon appears corresponding to the Approval To Do Type field. On clicking the Search icon, the To Do Type Search window appears.</p> <p>On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field.</p> <p>This field appears only when the Approval Required option is selected.</p> <p>The C1-INVRA To Do type is shipped with the product. You can use the C1-INVRA To Do type or a custom To Do type, if required.</p>	<p>Yes (Conditional)</p> <p>Note: This field is required for approving the invoice request which is created using the invoice request type.</p>
Approval To Do Role	<p>Used to indicate the user and/or group of users who can approve the invoice request.</p> <p>Note:</p> <p>The list includes only those To Do roles which are associated with the approval To Do type.</p> <p>This field appears only when the Approval Required option is selected.</p>	<p>Yes (Conditional)</p> <p>Note: This field is required for approving the invoice request which is created using the invoice request type.</p>
Submitter To Do Type	Used to indicate that the To Do task of the specified To Do type is created for re-submitting the invoice request for approval.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The Search (Q) icon appears corresponding to the Submitter To Do Type field. On clicking the Search icon, the To Do Type Search window appears.</p> <p>On specifying the To Do type, the description of the To Do type appears corresponding to the Submitter To Do Type field.</p> <p>The C1-INVRS To Do type is shipped with the product. You can use the C1-INVRS To Do type or a custom To Do type, if required.</p>	<p>Note: This field is required for resubmitting the invoice request for approval.</p>
Submitter To Do Role	<p>Used to indicate the user and/or group of users who can re-submit the invoice request for approval.</p> <p>Note: The list includes only those To Do roles which are associated with the submitter To Do type.</p>	<p>Yes (Conditional)</p> <p>Note: This field is required for resubmitting the invoice request for approval.</p> <p>Once the it is defined and saved, it cannot be changed as it is linked to request(s) which are under processing.</p>
Wait Days	<p>Used to specify the maximum wait period (in days) after which the bills in the invoice request are processed.</p> <p>Note: You cannot specify a negative value in the Wait Days field.</p>	No

Tip: Alternatively, you can access this screen by clicking the **Edit** button in the **Invoice Request Type** zone.

5. Modify the required details in the **Main** section.
6. Define, edit, or remove characteristics from the invoice request type, if required.
7. Click **Save**.
The changes made to the invoice request type are saved.

Deleting an Invoice Request Type

Procedure

To delete an invoice request type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **I** and then click **Invoice Request Type**.
A sub-menu appears.
3. Click the **Search** option from the **Invoice Request Type** sub-menu.
The **Invoice Request Type** screen appears.
4. In the **Invoice Request Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the invoice request type that you want to delete.

A message appears confirming whether you want to delete the invoice request type.

Note: You can delete an invoice request type only when an invoice request is not yet created using the invoice request type.

5. Click **OK**.
The invoice request type is deleted.

Tip: Alternatively, you can delete an invoice request type by clicking the **Delete** button in the **Invoice Request Type** zone.

Copying an Invoice Request Type

Instead of creating an invoice request type from scratch, you can create a new invoice request type using an existing invoice request type. This is possible through copying an invoice request type. On copying an invoice request type, the details including the characteristics are copied to the new invoice request type. You can then edit the details, if required.

Prerequisites

To copy an invoice request type, you should have:

- Invoice request type (whose copy you want to create) defined in the application.
- Invoice request type business object defined in the application.
- Invoice request business objects defined in the application.
- Date calculation algorithm defined using the **C1-INVREDTCA** algorithm type.
- Required To Do role assigned to the **C1-INVRA** and **C1-INVRS** To Do types in the application

Procedure

To copy an invoice request type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **I** and then click **Invoice Request Type**.
A sub-menu appears.
3. Click the **Search** option from the **Invoice Request Type** sub-menu.
The **Invoice Request Type** screen appears.
4. In the **Invoice Request Type List** zone, click the **Duplicate** (🔗) icon in the **Duplicate** column corresponding to the invoice request type whose copy you want to create.

The **Invoice Request Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the invoice request type.
- **Characteristics** - Used to define a list of characteristics for the invoice request type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Invoice Request Type	Used to specify the invoice request type.	Yes
Business Object	Indicates the business object using which you want to define the invoice request type.	Not applicable
Description	Used to specify the description for the invoice request type.	Yes
Invoice Request Business Object	Used to indicate the invoice request business object for which you want to define the invoice request type. The valid values are: <ul style="list-style-type: none"> • Invoice Request - Regular Bill Generation • Invoice Request - Trial Bill Generation 	Yes
Detailed Description	Used to specify additional information about the invoice request type.	No
Status	Used to indicate the current status of the invoice request type. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	Yes
Invoice Mode	Used to indicate the mode in which the invoice request should be created in the system using the invoice request type. The valid values are: <ul style="list-style-type: none"> • Automatic <div style="border: 1px solid black; padding: 5px; margin: 5px 0;"> Note: The automatic mode is not supported while creating an invoice request type for the financial services domain. </div> <ul style="list-style-type: none"> • Manual 	Yes
Bill Generation Type	Used to indicate the type of bill that should be generated for the invoice request in the system using the invoice request type. The valid values are: <ul style="list-style-type: none"> • Regular 	Yes

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> Trial 	
	Note: By default, this field is set to Regular when the Invoice Mode is set to Automatic .	
Defer Processing Billable Charge Count	<p>Used to specify the count which helps to determine whether the invoice request must be processed in the deferred mode (i.e. in the background) or in real time (i.e. immediately). If the number of billable charges created for the bills which are selected in the invoice request exceeds the defer processing billable charge count, the system processes the invoice request in the deferred mode. However, if the number of billable charges created for the bills which are selected in the invoice request does not exceed the defer processing billable charge count, the system processes the invoice request in real time (i.e. immediately).</p> <p>Note: You cannot specify a negative value in this field.</p> <p>Deferred mode means, in the background, when the Generic Request Periodic Monitor (C1-GENRQ) batch is invoked. You can configure the Generic Request Periodic Monitor (C1-GENRQ) batch such that it is executed at regular intervals. For more information about the Generic Request Periodic Monitor (C1-GENRQ) batch, refer to <i>Oracle Revenue Management and Billing Batch Guide</i>.</p>	No
Date Calculation Algorithm	Used to indicate the algorithm using which the date is calculated for processing the billable charges created for the bills in the invoice request.	Yes (Conditional)
	<p>Note: The Search (🔍) icon appears corresponding to the Date Calculation Algorithm field. On clicking the Search icon, the Algorithm Search window appears.</p> <p>On specifying the date calculation algorithm, the description of the date calculation algorithm appears corresponding to the Date Calculation Algorithm field.</p> <p>You can specify the date calculation algorithm only when the Invoice Mode is set to Automatic.</p>	<p>Note: This field is required for creating an invoice request in the automatic mode.</p>
Approval Required	Used to indicate whether approval is required for approving the bills generated through the invoice request.	No
	Note: This field appears only when the Invoice Mode is set to Manual and the Bill Generation Type is set to Regular .	

Field Name	Field Description	Mandatory (Yes or No)
Approval To Do Type	Used to indicate that the To Do task of the specified To Do type must be created when the invoice request is submitted for approval.	Yes (Conditional)
	Note: The Search (🔍) icon appears corresponding to the Approval To Do Type field. On clicking the Search icon, the To Do Type Search window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field. This field appears only when the Approval Required option is selected. The C1-INVRA To Do type is shipped with the product. You can use the C1-INVRA To Do type or a custom To Do type, if required.	Note: This field is required for approving the invoice request which is created using the invoice request type.
Approval To Do Role	Used to indicate the user and/or group of users who can approve the invoice request.	Yes (Conditional)
	Note: The list includes only those To Do roles which are associated with the approval To Do type. This field appears only when the Approval Required option is selected.	Note: This field is required for approving the invoice request which is created using the invoice request type.
Submitter To Do Type	Used to indicate that the To Do task of the specified To Do type is created for re-submitting the invoice request for approval.	Yes (Conditional)
	Note: The Search (🔍) icon appears corresponding to the Submitter To Do Type field. On clicking the Search icon, the To Do Type Search window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Submitter To Do Type field. The C1-INVRS To Do type is shipped with the product. You can use the C1-INVRS To Do type or a custom To Do type, if required.	Note: This field is required for resubmitting the invoice request for approval.
Submitter To Do Role	Used to indicate the user and/or group of users who can re-submit the invoice request for approval.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	Note: The list includes only those To Do roles which are associated with the submitter To Do type.	Note: This field is required for resubmitting the invoice request for approval. Once the it is defined and saved, it cannot be changed as it is linked to request(s) which are under processing.
Wait Days	Used to specify the maximum wait period (in days) after which the bills in the invoice request are processed.	No
	Note: You cannot specify a negative value in the Wait Days field.	

Tip: Alternatively, you can copy an invoice request type by clicking the **Duplicate** button in the **Invoice Request Type** zone.

- Enter the required details in the **Main** section.
- Define, edit, or remove characteristics from the invoice request type, if required.
- Click **Save**.
The new invoice request type is defined.

Invoice Request (Used for Searching)

The **Invoice Request** screen allows you to search for an invoice request using various search criteria. It also allows you to manually create an invoice request. It contains the following zone:

- [Search Invoice Request](#) on page 3653

Through this screen, you can navigate to the following screen:

- [Invoice Request \(Used for Viewing\)](#) on page 3661

Search Invoice Request

The **Search Invoice Request** zone allows you to search for an invoice request using various search criteria. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Search By	Used to indicate whether you want to search for an invoice request created for an account or a person. The valid values are: <ul style="list-style-type: none">• Invoice Requests for Accounts• Invoice Requests for Persons	Yes
	Note: By default, the Invoice Requests for Accounts option is selected.	
Invoice Request ID	Used to search a particular invoice request.	No
Creation From Date	Used to search invoice requests which are created from a particular date onwards.	No

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.</p> <p>The Creation From Date cannot be later than the Created To date.</p>	
Created To	<p>Used to search invoice requests which are created till a particular date.</p> <p>Note:</p> <p>You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.</p> <p>The Created To date cannot be earlier than the Creation From Date.</p>	No
Cutoff From	<p>Used to indicate the date from when the billable charges are considered for processing the invoice request.</p> <p>Note:</p> <p>You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.</p> <p>The cutoff from date cannot be later than the cutoff to date.</p>	No
Cutoff To	<p>Used to indicate the date till when the billable charges are considered for processing the invoice request.</p> <p>Note:</p> <p>You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.</p> <p>The cutoff to date cannot be earlier than the cutoff from date.</p>	No
Invoice Request Type	Used to search invoice requests which are created using a particular invoice request type.	No
Status	<p>Used to search invoice requests which are in a particular status. The valid values are:</p> <ul style="list-style-type: none"> Account Derivation Pending Approved Approval In Progress Canceled 	No

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> Deferred Processing Deferred Processing Batch Draft Error Processed Rejected 	
Person ID	Used to search invoice requests which include bills of a particular person.	No
	Note: The Search (🔍) icon appears corresponding to the Person ID field. On clicking the Search icon, the Person Search window appears where you can search for a particular person.	
Account ID	Used to search invoice requests which include bills of a particular account.	No
	Note: The Search (🔍) icon appears corresponding to the Account ID field. On clicking the Search icon, the Account Search window appears where you can search for a particular account. This field appears only when the Invoice Requests for Accounts option is selected from the Search By list.	
Bill Generation Type	Used to indicate the bill generation type using which the bills of the invoice request are created in the system. The valid values are: <ul style="list-style-type: none"> Regular Trial 	No
External Reference Type	Used to indicate the external reference type using which the invoice request is created in the system. The valid values are: <ul style="list-style-type: none"> Membership Policy 	No
	Note: This field appears only when the Invoice Requests for Accounts option is selected from the Search By list. This field is not applicable for the banking business.	
External Reference ID	Used to specify the external reference ID of the account for which the invoice request is created in the system.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The Search (🔍) icon appears corresponding to the External Reference ID field. On clicking the Search icon, the Search Membership or the Search Policy window appears depending upon the option selected from the External Reference Type list.</p> <p>This field appears only when the Invoice Requests for Accounts option is selected from the Search By list.</p> <p>This field is not applicable for the banking business.</p>	This field is required when you specify the external reference type.

Note: You must specify at least one search criterion while searching for an invoice request.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Creation Date Time	Displays the date and time when the invoice request is created in the system.
Invoice Request Information	<p>Displays information about the invoice request.</p> <p>Note: It has a link. On clicking the link, the Invoice Request screen appears where you can view the details of the respective invoice request.</p>
Created By	Indicates the user who has created the invoice request.
Cutoff Date	Displays the date till when all the billable charges are considered for processing the invoice request.
Account Information	<p>Displays information about the account for which the invoice request is processed in the system. In addition, this column has a context menu (☰) which helps in navigating to other screens in the application.</p> <p>Note:</p> <p>It has a link. How to search for an invoice request	Searching for an Invoice Request on page 3658

Searching for an Invoice Request

Prerequisites

To search for an invoice request, you should have:

- Invoice requests defined in the application

Procedure

To search for an invoice request:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Billing Management** and then click **Invoice Request**.
A sub-menu appears.
3. Click the **Search** option from the **Invoice Request** sub-menu.
The **Invoice Request** screen appears.
4. Enter the search criteria in the **Search Invoice Request** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of invoice requests that meet the search criteria appears in the **Search Results** section.

Manually Creating an Invoice Request

Prerequisites

To manually create an invoice request, you should have:

- Invoice request types defined in the application
- Entity (i.e., person or account for which you want to create the invoice request) defined in the application
- Bills generated for the entity (i.e., person or account) in the application

Procedure

To manually create an invoice request:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Billing Management** and then click **Invoice Request**.
A sub-menu appears.
3. Click the **Add** option from the **Invoice Request** sub-menu.

The **Add Invoice Request** window appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Invoice Request Type	Used to indicate the invoice request type using which you want to create the invoice request in the system.	Yes

4. Select the required invoice request type from the **Invoice Request Type** list.
5. Click **OK**.

The **Invoice Request** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the invoice request.
- **Characteristics** - Used to define a list of characteristics for the invoice request.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Invoice Request Type	Indicates the invoice request type using which you want to create the invoice request.	Not applicable
Entity	Used to indicate the entity for which you want to create the invoice request. The valid values are: <ul style="list-style-type: none"> • Account • Person 	Yes
	Note: By default, the Account option is selected.	
Account ID	Used to indicate the invoice request which includes the bills of a particular account.	Yes (Conditional) This field is required while specifying the account for which you want to create the invoice request.
	Note: The Search (🔍) icon appears corresponding to the Account ID field. On clicking the Search icon, the Account Search window appears where you can search for the respective account. This field appears only when you select the Account option from the Entity list.	
Person ID	Used to indicate the invoice request which includes the bills of a particular person.	Yes (Conditional) This field is required while specifying the

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The Search (🔍) icon appears corresponding to Person ID field. On clicking the Search icon, the Person Search window appears where you can search for the respective person.</p> <p>This field appears only when you select the Person option from the Entity list.</p>	person for whose accounts you want to create the invoice request.
Include Person Hierarchy	<p>Used to specify whether you want to include the accounts of all the child persons of the main person for creating the invoice request.</p> <p>Note: This field appears when you select the Person option from the Entity list.</p>	No
Cutoff Date	<p>Used to specify the date till when all the billable charges are considered for processing the invoice request.</p> <p>Note:</p> <p>By default, the current date appears in this field.</p> <p>You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.</p>	No
Accounting Date	<p>Used to specify the accounting date for which the financial transaction of the bill is created.</p> <p>Note:</p> <p>By default, the current date appears in this field.</p> <p>You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.</p>	No
Bill Date	<p>Used to specify the date on which the bill is generated for the entity.</p> <p>Note:</p> <p>The bill date cannot be on or earlier than the last bill date of the account.</p> <p>By default, the current date appears in this field.</p> <p>You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.</p>	No
Comments	Used to specify additional information about the invoice request.	No

6. Enter the required details in the **Main** section.
7. Define a list of characteristics for the invoice request in the **Characteristics** section, if required.
8. Click **Save**

The invoice request is created in the **Draft** status and the status of all the records (in the invoice request) is set to **Pending**.

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Invoice Request** screen.

	Note: The bill date must not be equal to or earlier than the last bill date of the account for which the invoice request is generated.
Processing Date	Indicates the date when the invoice request is processed.
	Note: Processing Date = Invoice Request Creation Date + ' Wait Day + Work Days
Status	Indicates the current status of the invoice request. The valid values are: <ul style="list-style-type: none"> • Account Derivation Pending • Approved • Approval In Progress • Cancelled • Deferred Processing • Deferred Processing - Batch • Draft • Error • Processed • Rejected • Submitted • Processing • Return to Submitter
Status Reason	Indicates the reason why the status of the invoice request is changed.
	Note: It has a link. On clicking the link, the Status Reason screen appears where you can view the details of the respective status. This field appears only when you select canceled option from the status list.
Comments	Displays additional information about the invoice request.
	Note: This field appears only when the invoice request is in the Processed status.

- **Characteristics** - The **Characteristics** section lists the characteristics defined for the invoice request. It contains the following columns:

Column Name	Column Description
Effective Date	Displays the date from when the characteristic is effective for the invoice request.
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - The **Record Actions** section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the invoice request.
	Note: The Edit button appears only when the invoice request is in the Draft status.
Delete	Used to delete the invoice request.
	Note: The Delete button appears only when the invoice request is in the Draft status.
Submit	Used to submit the invoice request for approval.
	Note: The Submit button appears only when the invoice request is in the Draft status.
Cancel	Used to cancel the invoice request.
	Note: The Cancel button appears when the invoice request is in the Deferred Processing Batch status.
Approve	Used to approve the invoice request.
	Note: The Approve button appears when: <ul style="list-style-type: none"> • The invoice request is in the Approval In Progress status. • A user with the approval To Do role is reviewing the invoice request.
Reject	Used to reject the invoice request.
	Note: The Reject button appears when: <ul style="list-style-type: none"> • The invoice request is in the Approval In Progress status. • A user with the approval To Do role is reviewing the invoice request.
Re Submit	Used to request the user for resubmitting the invoice request for approval.
	Note: The Re Submit button appears when: <ul style="list-style-type: none"> • The invoice request is in the Approval In Progress status. • A user with the approval To Do role is reviewing the invoice request.

- **Record Information** - The **Record Information** section contains the following fields:

Field Name	Field Description
Business Object	Indicates the business object using which the invoice request is created in the system. In addition, this column has a context menu (☺) icon appears

Field Name	Field Description
	corresponding to this column which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.
Status Date/Time	Displays the date and time when the invoice request status is updated.
Create Date/Time	Displays the date and time when the invoice request is created.

- **External Reference** - The **External Reference** section lists the external references using which the invoice request is created in the system. It contains the following columns:

Column Name	Column Description
External Reference Type	Indicates the external reference type using which the invoice request is created for the external references. The valid values are:
	<ul style="list-style-type: none"> • Membership • Policy
	Note: The value in this field appears only when you are viewing the invoice request details of an account which belongs to the health insurance business and is created using an external reference.
External Reference Information	Displays information about the external reference for the invoice request.
	Note: It has a link. On clicking the link, the Policy screen appears with the details of the respective policy. The value in this field appears only when you are viewing the invoice request details of an account which belongs to the health insurance business and is created using an external reference.

- **Statistics** - The **Statistics** section displays information about the records generated while processing the invoice request. It contains the following fields:

Field Name	Field Description
Total Records	Displays the total number of records that were considered for processing the invoice request.
Processed Records	Displays the number of records that were processed while processing the invoice request.
Total Bills Created	Displays the total number of bills generated for the accounts considered for processing the invoice request.
Excluded Records	Displays the number of records that were excluded from the invoice request generation process.
Error Records	Displays the number of records which are in the error status.
Processing Records	Displays the number of records in the invoice request which are still under the generation process.
Pending Records	Displays the number of records that are pending to be processed for the invoice request generation process.

Invoice Request Details

The **Invoice Request Details** zone lists the persons whose accounts are added to the invoice request. It contains the following columns:

Column Name	Column Description
Person Information	Indicates the person for which the invoice request is created. In addition, this column has a context menu (☺) icon appears corresponding to this column which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Person screen appears where you can view the details of the respective person.
Record Status	Indicates the status of the bills in the invoice request. The valid values are: <ul style="list-style-type: none"> • Pending • Error • Processing
Bill Information	Indicates the bill which is added to the invoice request. In addition, this column has a context menu (☺) icon appears corresponding to this column which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Bill screen appears where you can view the details of the respective bill.
Error Message	Displays the error message indicating the error that occurred while processing the bills in the invoice request.
Recent Billed Date	Displays the date of the bill that has been recently processed from the invoice request.

Note:

Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

The **Filter** icon appears when the zone is **Account List**.

You can filter the list using various search criteria (such as, **Record Status**, **Account ID**, and **Person ID**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (⌵) icon in the upper right corner of this zone.

Account List

The **Account List** zone lists the accounts of the entity whose bills are considered for creating the invoice request. It contains the following columns:

Column Name	Column Description
Account Information	Indicates the account for which the invoice request is created in the system. In addition, this column has a context menu (☺) which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Account screen appears where you can view the details of the respective account.
Person Information	Indicates the person for which the invoice request is created in the system. In addition, this column has a context menu (☺) which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Person screen appears where you can view the details of the respective person.
Record Status	Indicates the status of the bills in the invoice request. The valid values are: <ul style="list-style-type: none">• Pending• Error• Processing
Bill Information	Indicates the bill which is added to the invoice request. In addition, this column has a context menu (☺) which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Bill screen appears where you can view the details of the respective bill.
Error Message	Displays the error message indicating the error that occurred while processing the bills in the invoice request for the account.
Recent Billed Date	Displays the date of the bill that has been recently processed from the invoice request for the account.

A check-box appears corresponding to each account when the invoice request is in the **Draft** status. On selecting the check-box, and clicking the **Exclude** button, you can exclude the account from the invoice request process. You can also select multiple accounts at the same time. In addition, you can select the check box corresponding to the column header to exclude all the accounts from the invoice request process.

Note:

Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

You can filter the list using various search criteria (such as, **Record Status**, **Account ID**, and **Person ID**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (⌵) icon in the upper right corner of this zone.

Excluded Accounts

The **Excluded Accounts** zone lists the accounts of the main person whose bills are not considered for processing the invoice request. It contains the following columns:

Column Name	Column Description
Account Information	Indicates the account whose bills are excluded from the invoice request process. In addition, this column has a context menu (☺) which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Account screen appears where you can view the details of the respective account.
Person Information	Indicates the person to which the account belongs. In addition, this column has a context menu (☺) which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Person screen appears where you can view the details of the respective person.

A check-box appears corresponding to each account when the invoice request is in the **Draft** status. On selecting the check-box, and clicking the **Include** button, you can include the account to the invoice request process. You can also select multiple accounts at the same time. In addition, you can select the check box corresponding to the column header to include all the accounts of the person to the invoice request process.

Note:

Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

You can filter the list using various search criteria (such as, **Record Status**, **Account ID**, and **Person ID**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (⌵) icon in the upper right corner of this zone.

The **Excluded Accounts** zone appears when **Invoice Requests for Persons** option is selected from the **Search By list** in the **Search Invoice Request** zone.

Invoice Request - Log

The **Log** tab contains the following zone:

- [Invoice Request Log](#) on page 3668

Invoice Request Log

The **Invoice Request Log** zone lists the complete trail of actions performed on the invoice request. It contains the following columns:

Column Name	Column Description
Creation Date/Time	Displays the date and time when the action was performed on the invoice request.
Details	Displays the details of the action performed on the invoice request.
User	Indicates the user who has performed the action on the invoice request.
Log Type	Indicates the type of log.
Related Object	Indicates the object or entity which is created when the action is performed on the invoice request.
	Note: At present, no data appears in this column. The implementation team can build the custom logic to meet the business requirements.
Status Reason	Indicates the reason why the status of the invoice request was changed.

Note: You can manually add a log entry for the invoice request by clicking the **Add Log Entry** link in the upper right corner of the **Invoice Request Log** zone.

Editing an Invoice Request

Prerequisites

To edit an invoice request, you should have:

- Invoice request types defined in the application
- Bills created in the application
- Account and Person entities defined in the application

Procedure

To edit an invoice request:

1. Search for the invoice request in the **Invoice Request** screen.
2. In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to the invoice request whose details you want to edit.
The **Invoice Request** screen appears.
3. Click the **Edit** button in the **Invoice Request** zone.

The **Invoice Request** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the invoice request.
- **Characteristics** - Used to define a list of characteristics for the invoice request.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Invoice Request Information	Displays information about the invoice request.	Not applicable
Invoice Request Type	Indicates the invoice request type using which the invoice request is created in the system.	Not applicable
Entity	Indicates the entity for which the invoice request is created in the system. The valid values are: <ul style="list-style-type: none"> Account Person 	Not applicable
Account ID	Used to edit the invoice request which includes the bills of a particular account.	Yes
	Note: The Search (🔍) icon appears corresponding to the Account ID field. On clicking the Search icon, the Account Search window appears where you can search for the respective account. This field appears only when the Account option is selected from the Entity list.	
Person ID	Used to edit the invoice request which includes the bills of a particular person.	Yes
	Note: The Search (🔍) icon appears corresponding to Person ID field. On clicking the Search icon, the Person Search window appears where you can search for the respective person. This field appears only when the Person option is selected from the Entity list.	
Include Person Hierarchy	Used to specify whether you want to include the accounts of all the child persons of the main person for creating the invoice request.	No
	Note: This field appears only when the Person option is selected from the Entity list.	
Cutoff Date	Used to specify the date till when all the billable charges are considered for processing the invoice request.	No
	Note: You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.	
Accounting Date	Used to specify the accounting date for which the financial transaction of the bill is created.	No

Field Name	Field Description	Mandatory (Yes or No)
	Note: You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.	
Bill Date	Used to specify the date on which the bill is generated for the entity. Note: The bill date cannot be on or earlier than the last bill date of the account. You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.	No
Processing Date	Displays the date when the invoice request is processed in the system.	No
Comments	Used to specify additional information about the invoice request.	No

Note: The **Edit** button appears when the invoice request is in the **Draft** status.

4. Modify the details of the invoice request, if required.
5. Define, edit, or remove characteristics from the invoice request, if required.
6. Click **Save**.
The changes made to the invoice request are saved.

Defining a Characteristic for an Invoice Request

Prerequisites

To define a characteristic for an invoice request, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Invoice Request**)

Procedure

To define a characteristic for an invoice request:

1. Ensure that the **Characteristics** section is expanded when you *are* manually creating or editing an invoice request.
The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Effective Date	Used to specify the date from when the characteristic is effective for the invoice request.	Yes (Conditional)
	Note: You can either manually specify the date or select it using the Date Picker (📅) icon corresponding to the field.	Note: This field is required when you are defining a characteristic for the invoice request.
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to Invoice Request .	Note: This field is required when you are defining a characteristic for the invoice request.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the Search (🔍) icon appears corresponding to the Characteristic Value field. On clicking the Search icon, you can search for a predefined characteristic value. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the Characteristic Value field.	Note: This field is required when you are defining a characteristic for the invoice request.

- Enter the required details in the **Characteristics** section.
- If you want to define more than one characteristic for the invoice request, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a characteristic from the invoice request, click the **Delete** (🗑) icon corresponding to the characteristic.

- Click **Save**.
The characteristic is defined for the invoice request.

Canceling an Invoice Request

Prerequisites

To cancel an invoice request, you should have:

- Reasons defined for the **Canceled** status of the **C1-InvoiceRequest** business object in the **Status Reason** screen

Procedure

To cancel an invoice request:

- 1. Search for the invoice request in the **Invoice Request** screen.
- 2. In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to the invoice request that you want to cancel.
The **Invoice Request** screen appears.
- 3. Click the **Cancel** button in the **Invoice Request** zone.

The **Invoice Request** window appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Status Reason	Used to indicate the reason why you want to cancel the invoice request.	Yes
	Note: The list includes only those reasons which are defined for the Canceled status of the C1-InvoiceRequest business object in the Status Reason screen.	

Note: The **Cancel** button appears when the invoice request is in the **Deferred Processing** or **Deferred Processing - Batch** status.

- 4. Select the reason for canceling the invoice request from the **Status Reason** list.
- 5. Click **Save**.
The status of the invoice request (along with the bills within the invoice request) is changed to **Canceled**.

Submitting an Invoice Request

Prerequisites

To submit an invoice request, you should have:

- The status of the invoice request in the **Draft** status.
- The invoice request type as **Manual**.

Procedure

To submit an invoice request:

1. Search for the invoice request in the **Invoice Request** screen.
2. In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to the invoice request that you want to submit.
The **Invoice Request** screen appears.
3. Click the **Submit** button in the **Invoice Request** zone.

The system behaves in the following manner:

If...	Then...
The Approval Required option is selected in the respective invoice request type	The status of the invoice request is changed to Approval In Progress . In this status, you can perform various actions on the invoice request, such as, Approve or Reject or Return To Submitter . If the approver clicks the Approve button, the status of the invoice request is changed to Approved . If the approver clicks the Reject button, the status of the invoice request is changed to Rejected . If the approver clicks the Return To Submitter button, a To Do is generated and the invoice request status is changed to Draft . The submitter updates the invoice request and redirects it back to the approver for approval purposes.
The Approval Required option is not selected in the respective invoice request type and the entity type is Person	The status of the invoice request is changed to Processed , or Deferred Processing or Deferred Processing Batch .
The Approval Required option is not selected in the respective invoice request type, and the entity type is Account , and the billable charge count exceeds the defer processing billable charge count	The status of the invoice request is changed to Deferred Processing Batch .
The Approval Required option is not selected in the respective invoice request type, and the entity type is Account , and the billable charge count does not exceed the defer processing billable charge count, and	The status of the invoice request is changed to Processed else it is changed to Deferred Processing .

If...	Then...
the invoice processing date does not exceed the system date	

Note:
The **Submit** button appears when the invoice request is in the **Draft** status and invoice request type is **Manual**.

Approving an Invoice Request

You can view the number of invoice requests which are pending for approval in the **Invoice Request** screen. The approver can review, and accordingly approve, reject, or ask the submitter to resubmit the invoice request based on the observations.

Note: The system will not allow you to approve, reject, or resubmit an invoice request submitted by you.

Prerequisites

To approve an invoice request, you should have:

- Approval To Do role assigned in the system

Procedure

To approve an invoice request:

1. Do either of the following:

If you want to...	Then...
Approve an invoice request through the Invoice Request screen	<p>a. Search for the invoice request in the Invoice Request screen.</p> <p>b. In the Search Results section, click the link in the Invoice Request Information column corresponding to the invoice request which you want to review.</p>
Approve an Invoice request from the To Do List screen	<p>a. Click the Menu link in the Application toolbar.</p> <p>A list appears.</p> <p>b. From the Main menu, select To Do and then click To Do List.</p> <p>The To Do Type for User Search window appears.</p> <p>c. Enter C1-INVRATODO in the To Do Type field.</p> <p>d. Click the Search button corresponding to the To Do Type field.</p> <p>The To Do List screen appears.</p> <p>e. Select the Open option from the Filter by list to view all unassigned To Dos.</p> <p>f. Click the link in the Message column corresponding to the To Do of the invoice request that you want to review.</p>

The **Invoice Request** screen appears.

- 2. Review the details in the **Invoice Request** screen.
- 3. If the information in the invoice request is accurate, then click the **Approve** button in the **Invoice Request** zone.

The system behaves in the following manner:

If...	Then...
The status of the invoice request is changed to Approved	A To Do entry is created using the To Do type F1-TODOCOMPL specified in the approval profile and is assigned back to the submitter to complete the invoice request.

Note: The **Approve** button appears when:

- The invoice request is in the **Approval In Progress** status.
- A user with the approval To Do role is reviewing the invoice request.

Rejecting an Invoice Request

Prerequisites

To reject an invoice request, you should have:

- Reasons defined for the **Rejected** status of the **C1-InvoiceRequest** business object in the **Status Reason** screen.

Note: The system will not allow you to approve, reject, or resubmit an invoice request submitted by you.

Procedure

To reject an invoice request:

- 1. Do either of the following:

If you want to...	Then...
Reject an invoice request through the Invoice Request screen	<ul style="list-style-type: none">a. Search for the invoice request in the Invoice Request screen.b. In the Search Results section, click the link in the Invoice Request Information column corresponding to the invoice request which you want to review.
Reject an invoice request from the To Do List screen	<ul style="list-style-type: none">a. Click the Menu link in the Application toolbar. A list appears.b. From the Main menu, select To Do and then click To Do List. The To Do Type for User Search window appears.c. Enter C1-INVRATODO in the To Do Type field.

If you want to...	Then...
	<p>d. Click the Search button corresponding to the To Do Type field.</p> <p>The To Do List screen appears.</p> <p>e. Select the Open option from the Filter by list to view all unassigned To Dos.</p> <p>f. Click the link in the Message column corresponding to the To Do of the invoice request that you want to review.</p>

The **Invoice Request** screen appears.

- Review the details in the **Invoice Request** screen.
- If the information in the invoice request is incorrect, then click the **Reject** button in the **Invoice Request** zone. The **Reject Invoice Request** window appears. It contains following fields:

Field Name	Field Description	Mandatory (Yes or No)
Status Reason	Used to indicate the reason why you want to reject the invoice request.	Yes
	Note: The list includes only those reasons which are defined for the Rejected status of the C1-InvoiceRequest business object in the Status Reason screen.	
Comments	Used to specify additional information for rejecting the invoice request.	No

Note: The **Reject** button appears when:

- The invoice request is in the **Approval In Progress** status.
- A user with the approval To Do role is reviewing the invoice request.

- Select the reason for rejecting the invoice request from the **Status Reason** list.
- Click **Save**.
The status of the invoice request is changed to **Rejected**.

Requesting the Submitter to Resubmit the Invoice Request for Approval

Procedure

To request the submitter to resubmit the invoice request for approval:

- Do either of the following:

If you want to...	Then...
Request for resubmitting an invoice request through the Invoice Request screen	<p>a. Search for the invoice request in the Invoice Request screen.</p> <p>b. In the Search Results section, click the link in the Invoice Request Information column corresponding to the invoice request which you want to review.</p>
Request for resubmitting an invoice request from the To Do List screen	<p>a. Click the Menu link in the Application toolbar.</p> <p>A list appears.</p> <p>b. From the Main menu, select To Do and then click To Do List.</p> <p>The To Do Type for User Search window appears.</p> <p>c. Enter C1-INVRATODO in the To Do Type field.</p> <p>d. Click the Search button corresponding to the To Do Type field.</p> <p>The To Do List screen appears.</p> <p>e. Select the Open option from the Filter by list to view all unassigned To Dos.</p> <p>f. Click the link in the Message column corresponding to the To Do of the invoice request that you want to review.</p>

The **Invoice Request** screen appears.

- Review the details in the **Invoice Request** screen.
- If the information in the invoice request is incomplete and you want the submitter to make the required changes and resubmit the invoice request for approval, then click the **Resubmit** button in the **Invoice Request** zone. The **Resubmit Invoice Request** window appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Comments	Used to specify the changes which the submitter should make in the invoice request before resubmitting it for approval.	Yes

Note: The **Resubmit** button appears when:

- The invoice request is in the **Approval In Progress** status.
- A user with the approval To Do role is reviewing the invoice request.

- Specify the changes in the **Comments** field and then click **Save**.
A To Do is created using the submitter To Do type and assigned to all users with a submitter To Do role specified in the invoice request type. In addition, the status of the invoice request is changed to **Draft**.

Viewing the Log of an Invoice Request

Procedure

To view the log of an invoice request:

1. Search for the invoice request in the **Invoice Request** screen.
2. In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to the invoice request whose log you want to view.
The **Invoice Request** screen appears.
3. Click the **Log** tab.
The **Log** tab appears.
4. View the complete trail of actions performed on the invoice request in the **Invoice Request Log** zone.

Adding a Log Entry for an Invoice Request

Procedure

To add a log entry for an invoice request:

1. Search for the invoice request in the **Invoice Request** screen.
2. In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to the invoice request for which you want to add a log entry.
The **Invoice Request** screen appears.
3. Click the **Log** tab.
The **Log** tab appears.
4. Click the **Add Log Entry** link in the upper right corner of the **Invoice Request Log** zone.

The **Add Request Log** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Request Information	Displays information about the invoice request.	Not applicable
Log Details	Used to specify the reason for adding a log entry for the invoice request.	Yes

5. Enter the required details in the **Log Details** field.
6. Click **Save**.
The log entry is added for the **Invoice Request Log** zone.

Hold Request Creation, Modification, Release, and View Through Inbound Web Service

Topics:

- [C1-CreateHoldRequest Business Service](#)
- [C1-UpdateHoldRequest Business Service](#)
- [C1-GetHoldRequestHistory Business Service](#)
- [C1-ReleaseHoldRequest Business Service](#)

Oracle Revenue Management and Billing enables you to create, edit, and release a hold request through an inbound web service. It also enables you to view the details of a hold request through an inbound web service. You can send the hold creation, update, view, or release request from an external system through an inbound web service.

The following business services are shipped with the product to support different hold request operations:

- **C1-CreateHoldRequest** – Used to create a hold request for a single entity (i.e., for a particular person, account, or bill). For more information, see [C1-CreateHoldRequest Business Service](#) on page 3682.
- **C1-UpdateHoldRequest** – Used to edit an active hold request. For more information, see [C1-UpdateHoldRequest Business Service](#) on page 3704.
- **C1-GetHoldRequestHistory** – Used to fetch the details of the active hold requests for a single entity (i.e. person, account, or bill). For more information, see [C1-GetHoldRequestHistory Business Service](#) on page 3720.
- **C1-ReleaseHoldRequest** – Used to release an active hold request with a single entity (i.e. person, account, or bill). For more information, see [C1-ReleaseHoldRequest Business Service](#) on page 3735.

You can create one inbound web service which supports all four operations - hold creation request, hold update request, hold release request, and hold view request. Alternatively, you can create four different inbound web services - one for hold creation request, another for hold update request, third for hold release request, and fourth for hold view request.

You can create a SOAP or REST based inbound web service. If you want to send the request in the XML and/or JSON format, you need to ensure that you create a REST based inbound web service. However, if you want to send the request in the XML format, you can create a SOAP or REST based inbound web service.

C1-CreateHoldRequest Business Service

The **Create Hold Request (C1-CreateHoldRequest)** business service enables you to create a hold request for a single entity (i.e., for a particular person, account, or bill). In other words, you cannot include multiple entities in the same hold request. You can call this business service from an external system through an inbound web service. If you want to send the hold creation request in the XML and/or JSON format, you need to ensure that you create a REST based inbound web service in Oracle Revenue Management and Billing. However, if you want to send the hold creation request in the XML format, you can create a SOAP or REST based inbound web service in Oracle Revenue Management and Billing.

While sending the hold creation request, you need to specify the following details:

- Hold request type, hold request start date, and hold request end date or hold days (which is used to calculate hold request end date if not specified).
- Entity (i.e., Person, Account, or Bill) for which you want to create the hold request.
- Hold reason and comments, if any.
- Entity identifiers or entity ID when the entity is an account or a person, and the entity ID when the entity is a bill.
- Hold entity and hold process end dates.
- Business processes (i.e., Auto Pay, Bill Generation, Delinquency, Funding, Overdue, Refund) which you want to hold for the entity for the given duration.
- Characteristics for the hold request, if required.

Note:

You must specify an active hold request type where the approval process is not configured for activation and release. If you do not specify the hold request type, the system, by default, considers the hold request type specified in the **Default Hold Request Type for IWS** option type of the **C1-HOLDSRCH** feature configuration.

This business service allows you to create a future dated hold request but not a past dated hold request.

Even if you explicitly specify a value for the defer processing count in the hold request type, it is not considered by this business service while creating a hold request. The system will always create the hold request in the **Active** status.

On creating a hold request, the status of the hold request is set to **Active**. The start date of the hold entity and hold process is set to the hold request start date. If you do not specify the hold entity and/or hold process end dates, the system, by default, sets it to the hold request end date. While creating a hold request through an inbound web service, the system sets the creation mode of the hold request to **Automatic**.

Once the hold request is created through an inbound web service, the hold request ID is sent in the response along with its status. If an error occurs while creating the hold request, the system sends the error message in the response. The system enables you to track the hold creation response sent to the external system using the **Inbound Web Service History** feature.

For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.

Sample Hold Creation Request and Response in the JSON Format	Sample Hold Creation Request and Response in the JSON Format on page 3702

Prerequisites

To create a hold request through an inbound web service, you need to do the following:

- Define a REST or SOAP based inbound web service to call the **C1-CreateHoldRequest** business service where **HTTP Method** is set to **Post** and **URI Component** is set to **/createHold**.
- Authorize the ORMB user to access the required application service.
- Define the required active hold request type where the **Activation Approval** option is not selected.
- Define the required source systems in the **C1-SourceSystemLookup** extendable lookup.
- Define the required person or account identifier types in the system.
- Ensure that the entities (i.e., person, account, or bill) that you want to keep on hold through a hold request should exist in the system.
- Define the required values for the **HOLD_REASON_FLG**, **HOLD_ENTITY_LVL_FLG**, and **HOLD_PROCESS_FLG** lookup fields.
- Define the required characteristic types where the characteristic entity is set to **Hold Request**.
- Set the **Default Hold Request Type for IWS** option type of the **C1-HOLDSRCH** feature configuration.

How to setup the C1-HOLDSRCH feature configuration	Setting the C1-HOLDSRCH Feature Configuration on page 1838

Hold Creation Request in the XML Format

The following code snippet illustrates how the tags should be nested while receiving the hold creation request in the XML format:

```
<C1-CreateHoldRequest>
  <holdRequest>
    <sourceSystem></sourceSystem>
    <externalTransactionId></externalTransactionId>
    <externalSourceId></externalSourceId>
    <holdStartDate></holdStartDate>
    <holdEndDate></holdEndDate>
    <holdDays></holdDays>
    <holdRequestType></holdRequestType>
```

```
<holdEntity></holdEntity>
<holdReason></holdReason>
<holdComments></holdComments>
<entityIdentifierType></entityIdentifierType>
<entityIdentifierValue></entityIdentifierValue>
<entityId></entityId>
<holdEntityEndDate></holdEntityEndDate>
<hierarchySwitch></hierarchySwitch>
<holdProcessData>
  <holdProcess></holdProcess>
  <holdProcessEndDate></holdProcessEndDate>
</holdProcessData>
<characteristics>
  <characteristicType></characteristicType>
  <characteristicValue></characteristicValue>
  <effectiveDate></effectiveDate>
</characteristics>
</holdRequest>
</C1-CreateHoldRequest>
```

Note: Here, the **C1-CreateHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-CreateHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **CreateHoldRequest**, then you need to specify the **CreateHoldRequest** tag instead of the **C1-CreateHoldRequest** tag in the above request.

Hold Creation Response in the XML Format

The following code snippet illustrates how the tags are nested while sending the hold creation response in the XML format:

```
<C1-CreateHoldRequest>
  <holdRequest>
    <statusCd></statusCd>
    <holdRequestId></holdRequestId>
    <holdStatus></holdStatus>
    <messageText></messageText>
    <sourceSystem></sourceSystem>
    <externalTransactionId></externalTransactionId>
    <externalSourceId></externalSourceId>
    <holdStartDate></holdStartDate>
    <holdEndDate></holdEndDate>
    <holdDays></holdDays>
    <holdRequestType></holdRequestType>
    <holdEntity></holdEntity>
    <holdReason></holdReason>
    <holdComments></holdComments>
    <entityIdentifierType></entityIdentifierType>
```

```
<entityIdentifierValue></entityIdentifierValue>
<entityId></entityId>
<holdEntityEndDate></holdEntityEndDate>
<hierarchySwitch></hierarchySwitch>
<holdProcessData>
  <holdProcess></holdProcess>
  <holdProcessEndDate></holdProcessEndDate>
</holdProcessData>
<characteristics>
  <characteristicType></characteristicType>
  <characteristicValue></characteristicValue>
  <effectiveDate></effectiveDate>
</characteristics>
</holdRequest>
</C1-CreateHoldRequest>
```

Note: Here, the **C1-CreateHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-CreateHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **CreateHoldRequest**, then the **CreateHoldRequest** tag appears instead of the **C1-CreateHoldRequest** tag in the above response.

Hold Creation Request and Response - Tags in XML Format

Note: We recommend you to refer the [Hold Creation Request in the XML Format](#) on page 3683 and [Hold Creation Response in the XML Format](#) on page 3684 topics in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the XML format.

Before calling the **C1-CreateHoldRequest** business service through an inbound web service, you need to ensure that the hold creation request contains the following tags:

Tag Name	Tag Description	Mandatory (Yes or No)
C1-CreateHoldRequest	Used to indicate that you want to invoke the C1-CreateHoldRequest business service.	Yes

Tag Name	Tag Description	Mandatory (Yes or No)
	<p>Note: Here, the C1-CreateHoldRequest tag represents the operation in the inbound web service which is used to call the C1-CreateHoldRequest business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to CreateHoldRequest, then you need to specify the CreateHoldRequest tag instead of the C1-CreateHoldRequest tag in the hold creation request.</p>	
holdRequest	Used to specify the details of the hold request.	Yes
sourceSystem	<p>Used to indicate the external system from where the hold creation request is received.</p> <p>Note:</p> <p>You must specify an external system which is already defined in the system.</p> <p>If the Inbound Web Service History feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the C1-IWSHIST algorithm. If so, the system stamps the specified external system corresponding to the record in the C1_IWS_HIST table.</p> <p>If the external system is not specified in the hold creation request, the system, by default, stamps the external system associated with the outbound message type (specified in the C1-IWSHIST algorithm) corresponding to the record in the C1_IWS_HIST table.</p> <p>For more information, see the Inbound Web Service History section in the <i>Oracle Revenue Management and Billing Administrative Guide</i>.</p>	No
externalTransactionId	<p>Used to indicate the transaction in the external system through which the hold creation request is received.</p> <p>Note: If the Inbound Web Service History feature is enabled, the system stores the external transaction ID corresponding to the record in the C1_IWS_HIST table.</p>	No
externalSourceId	Used to specify the external source system ID.	No

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: If the Inbound Web Service History feature is enabled, the system stores the external source system ID corresponding to the record in the C1_IWS_HIST table.	
holdStartDate	Used to specify the date from when the hold request is effective. Note: The hold request start date cannot be later than the hold request end date. You must specify the date in the YYYY-MM-DD format. Here, you can specify the current or any future date but not a past date.	Yes
holdEndDate	Used to specify the date till when the hold request is effective. Note: The hold request end date cannot be earlier than the hold request start date. You must specify the date in the YYYY-MM-DD format.	Yes (Conditional) Note: This data is required when the value is not specified in the holdDays tag.
holdDays	Used to indicate the number of days for which an entity should be kept on hold through the hold request. The system then calculates the hold request end date using the hold days (i.e., hold request end date = hold request start date + hold days). For example, if the hold request start date is 01-Jan-2025 and hold days is 20, then the system sets the hold request end date to 20-Jan-2025. Note: You must specify a positive integer value in this tag.	Yes (Conditional) Note: This data is required when the value is not specified in the holdEndDate tag.
holdRequestType	Used to indicate a hold request type using which you want to create the hold request.	No

Tag Name	Tag Description	Mandatory (Yes or No)
	<p>Note:</p> <p>You must specify a hold request type which is already defined in the system. It should be in the Active status. Also, ensure that the Activation Approval option is not selected in the specified hold request type.</p> <p>If you do not specify a hold request type, the system, by default, considers the hold request type specified in the Default Hold Request Type for IWS option type of the C1-HOLDSRCH feature configuration.</p>	
holdEntity	<p>Used to indicate the type of entity for which you want to create the hold request. The valid values are:</p> <ul style="list-style-type: none"> • ACCT - Used when you want to create a hold request for an account. • BILL - Used when you want to create a hold request for a bill. • PERS - Used when you want to create a hold request for a person. <p>Note:</p> <p>You must specify a value which is already defined in the HOLD_ENTITY_LVL_FLG lookup field. It must be in the Active status.</p>	Yes
holdReason	<p>Used to indicate the reason why you want to hold the entity.</p> <p>Note: You must specify a value which is already defined in the HOLD_REASON_FLG lookup field. It must be in the Active status.</p>	Yes
holdComments	Used to specify additional information about the hold request.	No
entityIdentifierType	Used to specify the person or account identifier type.	Yes (Conditional)
	<p>Note: You must specify a person or account identifier type which is already defined in the system. It should be a primary identifier type for the respective entity.</p>	<p>Note: This data is required when:</p> <ul style="list-style-type: none"> • ACCT or PERS is specified in the holdEntity tag. • The value is not specified in the entityId tag.

Tag Name	Tag Description	Mandatory (Yes or No)
entityIdentifierValue	Used to specify the entity identifier (i.e., person or account identifier). It should be the primary identifier of the respective entity.	Yes (Conditional)
	Note: The system then derives the person or account ID using the given primary entity identifier details, and accordingly creates a hold request for the respective entity.	Note: This data is required when: <ul style="list-style-type: none"> • ACCT or PERS is specified in the holdEntity tag. • The value is not specified in the entityId tag.
entityId	Used to specify the entity ID (i.e., person, account, or bill ID).	Yes (Conditional)
	Note: If you have specified the bill ID, the system checks whether a bill exists in the system with the given ID. If so, the system creates a hold request for the respective bill. However, if the system could not derive the bill using the bill ID, the system considers the given value as the alternate bill ID and then checks whether any bill exists in the system with the alternate bill ID. If so, the system creates a hold request for the respective bill. However, if the system could not derive the bill using the alternate bill ID, the system does not allow you to create a hold request.	Note: This data is required when: <ul style="list-style-type: none"> • ACCT or PERS is specified in the holdEntity tag and the values are not specified in the entityIdentifierType and entityIdentifierValue tags. • BILL is specified in the holdEntity tag.
holdEntityEndDate	Used to specify the date till when you want to hold the entity.	No
	Note: You must specify the date in the YYYY-MM-DD format. The hold entity end date must be between hold request start and end dates and between at least one process's start and end dates. The hold entity end date cannot be earlier than the hold entity start date. Note that, by default, the system sets the hold entity start date to the hold request start date. If you do not specify the hold entity end date, the system, by default, sets it to the hold request end date.	
hierarchySwitch	Used to indicate whether all the accounts in the person's hierarchy or only the persons' immediate accounts should be kept on hold. Note that the system considers only the child persons and not the grand child persons from the person's hierarchy and then derives the accounts where the child person is the main customer. The valid values are: <ul style="list-style-type: none"> • Y • N 	No

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: This tag is applicable only when PERS is specified in the holdEntity tag.	
holdProcessData	Used to specify information about the process that you want to hold for the entity.	Yes
holdProcess	<p>Used to specify the process that you want to keep on hold for the entity. The valid values are:</p> <ul style="list-style-type: none"> • ATPY - Used when you want to hold the auto pay process of the entity. It is valid only when ACCT is specified in the holdEntity tag. • BILL - Used when you want to hold the bill generation process of the entity. It is valid only when ACCT or PERS is specified in the holdEntity tag. • DELQ - Used when you want to hold the delinquency process of the entity. It is valid only when ACCT or PERS is specified in the holdEntity tag. • FNDG - Used when you want to hold the funding process of the entity. It is valid when ACCT, PERS, or BILL is specified in the holdEntity tag. • OVDU - Used when you want to hold the overdue process of the entity. It is valid only when ACCT is specified in the holdEntity tag. • REFD - Used when you want to hold the refund process of the entity. It is valid only when ACCT is specified in the holdEntity tag. <p>Note:</p> <p>You must specify a value which is already defined in the HOLD_PROCESS_FLG lookup field. It must be in the Active status.</p> <p>You cannot specify both the OVDU and DELQ processes at a time in the hold creation request.</p> <p>The Overdue process is valid for the financial services and health insurance domains but the Delinquency process is valid only for the health insurance domain.</p>	Yes
holdProcessEndDate	Used to specify the date till when you want to hold the process of the entity.	No

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: You must specify the date in the YYYY-MM-DD format. The hold process end date must be between the hold request start and end dates. The hold process end date cannot be earlier than the hold process start date. Note that, by default, the system sets the hold process start date to the hold request start date. If you do not specify the hold process end date, the system, by default, sets it to the hold request end date.	
characteristics	Used to specify a characteristic for the hold request.	No
characteristicType	Used to indicate the characteristic type.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Hold Request .	Note: This data is required while defining a characteristic for the hold request.
characteristicValue	Used to specify the value for the characteristic type.	Yes (Conditional)
		Note: This data is required while defining a characteristic for the hold request.
effectiveDate	Used to specify the date from when the characteristic is effective for the hold request.	Yes (Conditional)
		Note: This data is required while defining a characteristic for the hold request.

The following table lists and describes additional tags that are included in the hold creation response:

Tag Name	Tag Description
statusCd	Indicates whether the hold creation request is successfully processed or not. The valid values are: <ul style="list-style-type: none"> Success Failure
holdRequestId	Displays the hold request ID. Note: This tag appears when the value in the statusCd tag is set to Success .
holdStatus	Indicates the status of the hold request. The valid value is: <ul style="list-style-type: none"> Active

Tag Name	Tag Description
	Note: This tag appears when the value in the statusCd tag is set to Success .
messageText	Indicates the error that occurred while creating the hold request.
	Note: This tag appears when the value in the statusCd tag is set to Failure .

    <holdRequestType>HOLD_WITHOUT_APPROVAL</holdRequestType>
    <holdEntity>ACCT</holdEntity>
    <holdReason>DSRE</holdReason>
    <holdComments>Disaster Recovery</holdComments>
    <entityIdentifierType>IBAN</entityIdentifierType>
    <entityIdentifierValue>XX00XXX111111</entityIdentifierValue>
    <entityId></entityId>
    <holdEntityEndDate>2024-12-30</holdEntityEndDate>
    <hierarchySwitch></hierarchySwitch>
    <holdProcessData>
      <holdProcess>BILL</holdProcess>
      <holdProcessEndDate>2024-12-20</holdProcessEndDate>
    </holdProcessData>
    <holdProcessData>
      <holdProcess>ATPY</holdProcess>
      <holdProcessEndDate>2024-12-31</holdProcessEndDate>
    </holdProcessData>
    <characteristics>
      <characteristicType>HOLD_TYPE</characteristicType>
      <characteristicValue>P</characteristicValue>
      <effectiveDate>2024-12-01</effectiveDate>
    </characteristics>
    <characteristics>
      <characteristicType>ESC_PATH</characteristicType>
      <characteristicValue>01</characteristicValue>
      <effectiveDate>2024-12-01</effectiveDate>
    </characteristics>
  </holdRequest>
</C1-CreateAdjustment>
```

Note: We have given the above request sample to illustrate how the tags should be nested while receiving a hold creation request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Hold Creation Request in the JSON Format

The following code snippet illustrates how the attribute/value pairs should be structured while receiving the hold creation request in the JSON format:

```
{
  -"C1-CreateHoldRequest": {
    -"holdRequest": {
      -"sourceSystem": -"",
      -"externalTransactionId": -"",
      -"externalSourceId": -"",
      -"holdStartDate": -"",
      -"holdEndDate": -"",
      -"holdDays": -"",
      -"holdRequestType": -"",
      -"holdEntity": -"",
      -"holdReason": -"",
      -"holdComments": -"",
      -"entityIdentifierType": -"",
      -"entityIdentifierValue": -"",
      -"entityId": -"",
      -"holdEntityEndDate": -"",
      -"hierarchySwitch": -"",
      -"holdProcessData": {
        -"holdProcess": -"",
        -"holdProcessEndDate": -""
      },
      -"characteristics": {
        -"characteristicType": -"",
        -"characteristicValue": -"",
        -"effectiveDate": -""
      }
    }
  }
}
```

Note: Here, the **C1-CreateHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-CreateHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **CreateHoldRequest**, then you need to specify the **CreateHoldRequest** attribute instead of the **C1-CreateHoldRequest** attribute in the above request.

Hold Creation Response in the JSON Format

The following code snippet illustrates how the attribute/value pairs are structured while sending the hold creation response in the JSON format:

```
{
  -"C1-CreateHoldRequest": {
    -"holdRequest": {
      -"statusCd": -"",
      -"holdRequestId": -"",
      -"holdStatus": -"",
      -"messageText": -"",
      -"sourceSystem": -"",
      -"externalTransactionId": -"",
      -"externalSourceId": -"",
      -"holdStartDate": -"",
      -"holdEndDate": -"",
      -"holdDays": -"",
      -"holdRequestType": -"",
      -"holdEntity": -"",
      -"holdReason": -"",
      -"holdComments": -"",
      -"entityIdentifierType": -"",
      -"entityIdentifierValue": -"",
      -"entityId": -"",
      -"holdEntityEndDate": -"",
      -"hierarchySwitch": -"",
      -"holdProcessData": {
        -"holdProcess": -"",
        -"holdProcessEndDate": -""
      },
      -"characteristics": {
        -"characteristicType": -"",
        -"characteristicValue": -"",
        -"effectiveDate": -""
      }
    }
  }
}
```

Note: Here, the **C1-CreateHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-CreateHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **CreateHoldRequest**, then the **CreateHoldRequest** attribute appears instead of the **C1-CreateHoldRequest** attribute in the above response.

Hold Creation Request and Response - Attribute/Value Pairs in JSON Format

Note: We recommend you to refer the [Hold Creation Request in the JSON Format](#) on page 3694 and [Hold Creation Response in the JSON Format](#) on page 3695 topics in parallel while understanding the below mentioned attributes. This will help you to understand how the attribute/value pairs are structured in the JSON format.

Before calling the **C1-CreateHoldRequest** business service through an inbound web service, you need to ensure that the hold creation request contains the following attributes:

Attribute Name	Attribute Description	Mandatory (Yes or No)
C1-CreateHoldRequest	Used to indicate that you want to invoke the C1-CreateHoldRequest business service.	Yes
	Note: Here, the C1-CreateHoldRequest attribute represents the operation in the inbound web service which is used to call the C1-CreateHoldRequest business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to CreateHoldRequest , then you need to specify the CreateHoldRequest attribute instead of the C1-CreateHoldRequest attribute in the hold creation request.	
holdRequest	Used to specify the details of the hold request.	Yes
sourceSystem	Used to indicate the external system from where the hold creation request is received.	No
	<p>Note:</p> <p>You must specify an external system which is already defined in the system.</p> <p>If the Inbound Web Service History feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the C1-IWSHIST algorithm. If so, the system stamps the specified external system corresponding to the record in the C1_IWS_HIST table.</p> <p>If the external system is not specified in the hold creation request, the system, by default, stamps the external system associated with the outbound message type (specified in the C1-IWSHIST algorithm) corresponding to the record in the C1_IWS_HIST table.</p> <p>For more information, see the Inbound Web Service History section in the <i>Oracle Revenue Management and Billing Administrative Guide</i>.</p>	

Attribute Name	Attribute Description	Mandatory (Yes or No)
externalTransactionId	Used to indicate the transaction in the external system through which the hold creation request is received.	No
	Note: If the Inbound Web Service History feature is enabled, the system stores the external transaction ID corresponding to the record in the C1_IWS_HIST table.	
externalSourceId	Used to specify the external source system ID.	No
	Note: If the Inbound Web Service History feature is enabled, the system stores the external source system ID corresponding to the record in the C1_IWS_HIST table.	
holdStartDate	Used to specify the date from when the hold request is effective.	Yes
	Note: The hold request start date cannot be later than the hold request end date. You must specify the date in the YYYY-MM-DD format. Here, you can specify the current or any future date but not a past date.	
holdEndDate	Used to specify the date till when the hold request is effective.	Yes (Conditional)
	Note: The hold request end date cannot be earlier than the hold request start date. You must specify the date in the YYYY-MM-DD format.	Note: This data is required when the value is not specified for the holdDays attribute.
holdDays	Used to indicate the number of days for which an entity should be kept on hold through the hold request. The system then calculates the hold request end date using the hold days (i.e., hold request end date = hold request start date + hold days). For example, if the hold request start date is 01-Jan-2025 and hold days is 20, then the system sets the hold request end date to 20-Jan-2025.	Yes (Conditional)
	Note: You must specify a positive integer value in this attribute.	Note: This data is required when the value is not specified for the holdEndDate attribute.
holdRequestType	Used to indicate a hold request type using which you want to create the hold request.	No

Attribute Name	Attribute Description	Mandatory (Yes or No)
	<p>Note:</p> <p>You must specify a hold request type which is already defined in the system. It should be in the Active status. Also, ensure that the Activation Approval option is not selected in the specified hold request type.</p> <p>If you do not specify a hold request type, the system, by default, considers the hold request type specified in the Default Hold Request Type for IWS option type of the C1-HOLDSRCH feature configuration.</p>	
holdEntity	<p>Used to indicate the type of entity for which you want to create the hold request. The valid values are:</p> <ul style="list-style-type: none"> • ACCT - Used when you want to create a hold request for an account. • BILL - Used when you want to create a hold request for a bill. • PERS - Used when you want to create a hold request for a person. <p>Note:</p> <p>You must specify a value which is already defined in the HOLD_ENTITY_LVL_FLG lookup field. It must be in the Active status.</p>	Yes
holdReason	<p>Used to indicate the reason why you want to hold the entity.</p> <p>Note: You must specify a value which is already defined in the HOLD_REASON_FLG lookup field. It must be in the Active status.</p>	Yes
holdComments	Used to specify additional information about the hold request.	No
entityIdentifierType	Used to specify the person or account identifier type.	Yes (Conditional)
	<p>Note: You must specify a person or account identifier type which is already defined in the system. It should be a primary identifier type for the respective entity.</p>	<p>Note: This data is required when:</p> <ul style="list-style-type: none"> • ACCT or PERS is specified for the holdEntity attribute. • The value is not specified for the entityId attribute.

Attribute Name	Attribute Description	Mandatory (Yes or No)
entityIdentifierValue	Used to specify the entity identifier (i.e., person or account identifier). It should be the primary identifier of the respective entity.	Yes (Conditional)
	Note: The system then derives the person or account ID using the given primary entity identifier details, and accordingly creates a hold request for the respective entity.	Note: This data is required when: <ul style="list-style-type: none"> • ACCT or PERS is specified for the holdEntity attribute. • The value is not specified for the entityId attribute.
entityId	Used to specify the entity ID (i.e., person, account, or bill ID).	Yes (Conditional)
	Note: If you have specified the bill ID, the system checks whether a bill exists in the system with the given ID. If so, the system creates a hold request for the respective bill. However, if the system could not derive the bill using the bill ID, the system considers the given value as the alternate bill ID and then checks whether any bill exists in the system with the alternate bill ID. If so, the system creates a hold request for the respective bill. However, if the system could not derive the bill using the alternate bill ID, the system does not allow you to create a hold request.	Note: This data is required when: <ul style="list-style-type: none"> • ACCT or PERS is specified for the holdEntity attribute and the values are not specified for the entityIdentifierType and entityIdentifierValue attributes. • BILL is specified for the holdEntity attribute.
holdEntityEndDate	Used to specify the date till when you want to hold the entity.	No
	Note: You must specify the date in the YYYY-MM-DD format. The hold entity end date must be between hold request start and end dates and between at least one process's start and end dates. The hold entity end date cannot be earlier than the hold entity start date. Note that, by default, the system sets the hold entity start date to the hold request start date. If you do not specify the hold entity end date, the system, by default, sets it to the hold request end date.	
hierarchySwitch	Used to indicate whether all the accounts in the person's hierarchy or only the persons' immediate accounts should be kept on hold. Note that the system considers only the child persons and not the grand child persons from the person's hierarchy and then derives the accounts where the child person is the main customer. The valid values are: <ul style="list-style-type: none"> • Y • N 	No

Attribute Name	Attribute Description	Mandatory (Yes or No)
	Note: This attribute is applicable only when PERS is specified for the holdEntity attribute.	
holdProcessData	Used to specify information about the process that you want to hold for the entity.	Yes
holdProcess	<p>Used to specify the process that you want to keep on hold for the entity. The valid values are:</p> <ul style="list-style-type: none"> • ATPY - Used when you want to hold the auto pay process of the entity. It is valid only when ACCT is specified for the holdEntity attribute. • BILL - Used when you want to hold the bill generation process of the entity. It is valid only when ACCT or PERS is specified for the holdEntity attribute. • DELQ - Used when you want to hold the delinquency process of the entity. It is valid only when ACCT or PERS is specified for the holdEntity attribute. • FNDG - Used when you want to hold the funding process of the entity. It is valid when ACCT, PERS, or BILL is specified for the holdEntity attribute. • OVDU - Used when you want to hold the overdue process of the entity. It is valid only when ACCT is specified for the holdEntity attribute. • REFD - Used when you want to hold the refund process of the entity. It is valid only when ACCT is specified for the holdEntity attribute. <p>Note:</p> <p>You must specify a value which is already defined in the HOLD_PROCESS_FLG lookup field. It must be in the Active status.</p> <p>You cannot specify both the OVDU and DELQ processes at a time in the hold creation request.</p> <p>The Overdue process is valid for the financial services and health insurance domains but the Delinquency process is valid only for the health insurance domain.</p>	Yes
holdProcessEndDate	Used to specify the date till when you want to hold the process of the entity.	No

Attribute Name	Attribute Description	Mandatory (Yes or No)
	<p>Note:</p> <p>You must specify the date in the YYYY-MM-DD format.</p> <p>The hold process end date must be between the hold request start and end dates.</p> <p>The hold process end date cannot be earlier than the hold process start date. Note that, by default, the system sets the hold process start date to the hold request start date.</p> <p>If you do not specify the hold process end date, the system, by default, sets it to the hold request end date.</p>	
characteristics	Used to specify a characteristic for the hold request.	No
characteristicType	Used to indicate the characteristic type.	Yes (Conditional)
	<p>Note: You must specify a characteristic type where the characteristic entity is set to Hold Request.</p>	<p>Note: This data is required while defining a characteristic for the hold request.</p>
characteristicValue	Used to specify the value for the characteristic type.	Yes (Conditional)
		<p>Note: This data is required while defining a characteristic for the hold request.</p>
effectiveDate	Used to specify the date from when the characteristic is effective for the hold request.	Yes (Conditional)
		<p>Note: This data is required while defining a characteristic for the hold request.</p>

The following table lists and describes additional attributes that are included in the hold creation response:

Attribute Name	Attribute Description
statusCd	<p>Indicates whether the hold creation request is successfully processed or not. The valid values are:</p> <ul style="list-style-type: none"> Success Failure
holdRequestId	<p>Displays the hold request ID.</p> <p>Note: This attribute appears when the value of the statusCd attribute is set to Success.</p>
holdStatus	<p>Indicates the status of the hold request. The valid value is:</p> <ul style="list-style-type: none"> Active

Attribute Name	Attribute Description
	Note: This attribute appears when the value of the statusCd attribute is set to Success .
messageText	Indicates the error that occurred while creating the hold request.
	Note: This attribute appears when the value of the statusCd attribute is set to Failure .

Sample Hold Creation Request and Response in the JSON Format

Using the below example, you can create a hold request for a bill where the funding process is kept on hold.

Sample Hold Creation Request in the JSON Format

```
{
  -"CreateHoldRequest": {
    -"holdRequest": {
      -"sourceSystem": -"SMALL_PRIME",
      -"externalTransactionId": -"567888876665",
      -"externalSourceId": -"656565",
      -"holdStartDate": -"2024-12-01",
      -"holdEndDate": -"",
      -"holdDays": "31",
      -"holdRequestType": -"HOLD_WITHOUT_APPROVAL",
      -"holdEntity": -"BILL",
      -"holdReason": -"DSRE",
      -"holdComments": -"Disaster Recovery",
      -"entityIdentifierType": -"",
      -"entityIdentifierValue": -"",
      -"entityId": -"233960569988",
      -"holdEntityEndDate": -"2024-12-30",
      -"hierarchySwitch": -"",
      -"holdProcessData": {
        -"holdProcess": -"FNDG",
        -"holdProcessEndDate": -"2024-12-30"
      },
    },
    -"characteristics": [
      {
        -"characteristicType": -"HOLD_TYPE",
        -"characteristicValue": -"P",
        -"effectiveDate": -"2024-12-01"
      },
      {
        -"characteristicType": -"ESC_PATH",
        -"characteristicValue": -"01",
        -"effectiveDate": -"2024-12-01"
      }
    ]
  }
}
```

```
-}
```

Sample Hold Creation Response in the JSON Format

```
{
  -"CreateHoldRequest": {
    -"holdRequest": {
      -"statusCd": -"Success",
      -"holdRequestId": -"790420762388",
      -"holdStatus": -"Active",
    -"sourceSystem": -"SMALL_PRIME",
      -"externalTransactionId": -"567888876665",
      -"externalSourceId": -"656565",
      -"holdStartDate": -"2024-12-01",
      -"holdEndDate": -"",
      -"holdDays": "31",
      -"holdRequestType": -"HOLD_WITHOUT_APPROVAL",
      -"holdEntity": -"BILL",
      -"holdReason": -"DSRE",
      -"holdComments": -"Disaster Recovery",
      -"entityIdentifierType": -"",
      -"entityIdentifierValue": -"",
      -"entityId": -"233960569988",
      -"holdEntityEndDate": -"2024-12-30",
      -"hierarchySwitch": -"",
      -"holdProcessData": {
        -"holdProcess": -"FNDG",
        -"holdProcessEndDate": -"2024-12-30"
      },
    -"characteristics": [
      {
        -"characteristicType": -"HOLD_TYPE",
        -"characteristicValue": -"P",
        -"effectiveDate": -"2024-12-01"
      },
      {
        -"characteristicType": -"ESC_PATH",
        -"characteristicValue": -"01",
        -"effectiveDate": -"2024-12-01"
      }
    ]
  }
}
```

Note: We have given the above request sample to illustrate how the attribute/value pairs should be structured while receiving a hold creation request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

C1-UpdateHoldRequest Business Service

The **Update Hold Request (C1-UpdateHoldRequest)** business service enables you to edit an existing hold request which is in the **Active** status. You can call this business service from an external system through an inbound web service. If you want to send the hold update request in the XML and/or JSON format, you need to ensure that you create a REST based inbound web service in Oracle Revenue Management and Billing. However, if you want to send the hold update request in the XML format, you can create a SOAP or REST based inbound web service in Oracle Revenue Management and Billing.

While sending the hold update request, you need to specify the following details:

- Hold Request ID
- Hold Entity ID (i.e. person ID, account ID, or bill ID)

Through this service, you can edit the following details of an active hold request:

- End date, comments, and characteristics of the hold request
- End date of a single hold entity in the hold request
- End date of multiple hold processes in the hold request

Note: At present, you can only update the end date of a single entity through a hold update request. If two or more entities are kept on hold through a hold request, you need to initiate a separate hold update request for each entity in order to update their respective end dates.

In addition, this service enables you to:

- **Add a New Hold Process to an Existing Hold Request** - While adding a new process to an existing hold request, the system does the following:
 - Sets the hold process start date to the hold request start date.
 - If you do not specify the hold process end date, the system, by default, sets it to the hold request end date.
- **Define, Edit, or Remove a Characteristic from an Existing Hold Request** - The system enables you to perform the following actions for a hold request characteristic:
 - **UPDATE** - Used when you want to add a new characteristic to the hold request or update the details of an existing characteristic of the hold request. The system first checks whether a characteristic with the given characteristic type and effective date combination exists for the hold request. If so, the system updates the existing characteristic of the hold request. However, if a characteristic does not exist with the given characteristic type and effective date combination for the hold request, the system creates a new characteristic for the hold request.
 - **DELETE** - Used when you want to delete an existing characteristic from the hold request.

Once the hold request is edited through an inbound web service, the hold request ID is sent in the response. If an error occurs while updating the hold request, the system sends the error message in the response. The system enables you to track the hold update response sent to the external system using the **Inbound Web Service History** feature.

For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.

Note: After updating the end date of a hold entity, you need to execute the **Hold Request Monitor (C1-HLMON)** batch. On executing the batch, the system will accordingly update the bill after date, postpone credit review until date, defer auto pay date, and hold refund until date, if required, for the respective entity.

Sample Hold Update Release Request and Response in the XML Format	Sample Hold Update Request and Response in the XML Format on page 3711
Sample Hold Update Release Request and Response in the JSON Format	Sample Hold Update Request and Response in the JSON Format on page 3719

Prerequisites

To update a hold request through an inbound web service, you need to do the following:

- Define a REST or SOAP based inbound web service to call the **C1-UpdateHoldRequest** business service where **HTTP Method** is set to **Post** and **URI Component** is set to **/updateHold**.
- Authorize the ORMB user to access the required application service.
- Define the required source systems in the **C1-SourceSystemLookup** extendable lookup.
- Ensure that the entities (i.e., person, account, or bill) are already included in the hold request.
- Define the required values for the **HOLD_PROCESS_FLG** lookup field.
- Define the required characteristic types where the characteristic entity is set to **Hold Request**.

Hold Update Request in the XML Format

The following code snippet illustrates how the tags should be nested while receiving the hold update request in the XML format:

```
<C1-UpdateHoldRequest>
  <sourceSystem></sourceSystem>
  <externalTransactionId></externalTransactionId>
  <externalSourceId></externalSourceId>
  <holdRequestId></holdRequestId>
  <holdComments></holdComments>
  <holdEndDate></holdEndDate>
  <entityId></entityId>
  <entityEndDate></entityEndDate>
  <holdProcessData>
    <holdProcess></holdProcess>
    <holdProcessEndDate></holdProcessEndDate>
  </holdProcessData>
  <characteristics>
    <action></action>
    <characteristicType></characteristicType>
    <characteristicValue></characteristicValue>
    <effectiveDate></effectiveDate>
```

```
</characteristics>
</C1-UpdateHoldRequest>
```

Note: Here, the **C1-UpdateHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-UpdateHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **UpdateHoldRequest**, then you need to specify the **UpdateHoldRequest** tag instead of the **C1-UpdateHoldRequest** tag in the above request.

Hold Update Response in the XML Format

The following code snippet illustrates how the tags are nested while sending the hold update response in the XML format:

```
<C1-UpdateHoldRequest>
  <requestProcessStatus></requestProcessStatus>
  <sourceSystem></sourceSystem>
  <externalTransactionId></externalTransactionId>
  <externalSourceId></externalSourceId>
  <holdRequestId></holdRequestId>
  <holdComments></holdComments>
  <holdEndDate></holdEndDate>
  <entityId></entityId>
  <entityEndDate></entityEndDate>
  <holdProcessData>
    <holdProcess></holdProcess>
    <holdProcessEndDate></holdProcessEndDate>
  </holdProcessData>
  <characteristics>
    <action></action>
    <characteristicType></characteristicType>
    <characteristicValue></characteristicValue>
    <effectiveDate></effectiveDate>
  </characteristics>
  </errormsg><errormsg>
</C1-UpdateHoldRequest>
```

Note: Here, the **C1-UpdateHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-UpdateHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **UpdateHoldRequest**, then the **UpdateHoldRequest** tag appears instead of the **C1-UpdateHoldRequest** tag in the above response.

Hold Update Request and Response - Tags in XML Format

Note: We recommend you to refer the [Hold Update Request in the XML Format](#) on page 3705 and [Hold Update Response in the XML Format](#) on page 3706 topics in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the XML format.

Before calling the **C1-UpdateHoldRequest** business service through an inbound web service, you need to ensure that the hold update request contains the following tags:

Tag Name	Tag Description	Mandatory (Yes or No)
C1-UpdateHoldRequest	Used to indicate that you want to invoke the C1-UpdateHoldRequest business service.	Yes
	Note: Here, the C1-UpdateHoldRequest tag represents the operation in the inbound web service which is used to call the C1-UpdateHoldRequest business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to UpdateHoldRequest , then you need to specify the UpdateHoldRequest tag instead of the C1-UpdateHoldRequest tag in the hold update request.	
sourceSystem	Used to indicate the external system from where the hold update request is received.	No

Tag Name	Tag Description	Mandatory (Yes or No)
	<p>Note:</p> <p>You must specify an external system which is already defined in the system.</p> <p>If the Inbound Web Service History feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the C1-IWSHIST algorithm. If so, the system stamps the specified external system corresponding to the record in the C1_IWS_HIST table.</p> <p>If the external system is not specified in the hold update request, the system, by default, stamps the external system associated with the outbound message type (specified in the C1-IWSHIST algorithm) corresponding to the record in the C1_IWS_HIST table.</p> <p>For more information, see the Inbound Web Service History section in the <i>Oracle Revenue Management and Billing Administrative Guide</i>.</p>	
externalTransactionId	<p>Used to indicate the transaction in the external system through which the hold update request is received.</p> <p>Note: If the Inbound Web Service History feature is enabled, the system stores the external transaction ID corresponding to the record in the C1_IWS_HIST table.</p>	No
externalSourceId	<p>Used to specify the external source system ID.</p> <p>Note: If the Inbound Web Service History feature is enabled, the system stores the external source system ID corresponding to the record in the C1_IWS_HIST table.</p>	No
holdRequestId	<p>Used to indicate the hold request whose details you want to update.</p> <p>Note: You can only update a hold request which is in the Active status through an inbound web service.</p>	Yes
holdComments	Used to specify additional information about the hold request.	No
holdEndDate	Used to specify the date till when the hold request is effective.	No

Tag Name	Tag Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The hold request end date cannot be earlier than the hold request start date.</p> <p>You must specify the date in the YYYY-MM-DD format.</p>	
entityId	Used to specify the entity ID (i.e., person, account, or bill ID).	Yes
entityEndDate	<p>Used to specify the date till when you want to hold the entity.</p> <p>Note:</p> <p>You must specify the date in the YYYY-MM-DD format.</p> <p>The hold entity end date must be between hold request start and end dates and between at least one process's start and end dates.</p> <p>The hold entity end date cannot be earlier than the hold entity start date.</p> <p>At present, you can only update the end date of a single entity through a hold update request. If two or more entities are kept on hold through a hold request, you need to initiate a separate hold update request for each entity in order to update their respective end date.</p>	Yes
holdProcessData	Used to add a new hold process or update the details of an existing hold process in the hold request.	No
holdProcess	<p>Used to specify the process that you want to add or update in the hold request. The valid values are:</p> <ul style="list-style-type: none"> ATPY - Used when you want to hold the auto pay process of the entity. It is valid only when the entity level of the hold request is set to ACCT. BILL - Used when you want to hold the bill generation process of the entity. It is valid only when the entity level of the hold request is set to ACCT or PERS. DELQ - Used when you want to hold the delinquency process of the entity. It is valid only when the entity level of the hold request is set to ACCT or PERS. FNDG - Used when you want to hold the funding process of the entity. It is valid only when the entity level of the hold request is set to ACCT, PERS, or BILL. OVDU - Used when you want to hold the overdue process of the entity. It is valid only when the entity level of the hold request is set to ACCT. 	<p>Yes (Conditional)</p> <p>Note: This data is required when:</p> <ul style="list-style-type: none"> You want to update the end date of a hold process. You want to add a new hold process to the hold request.

Tag Name	Tag Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> REFD - Used when you want to hold the refund process of the entity. It is valid only when the entity level of the hold request is set to ACCT. <p>Note:</p> <p>You must specify a value which is already defined in the HOLD_PROCESS_FLG lookup field. It must be in the Active status.</p> <p>You cannot specify both the OVDU and DELQ processes at a time in the hold update request.</p> <p>The Overdue process is valid for the financial services and health insurance domains but the Delinquency process is valid only for the health insurance domain.</p>	
holdProcessEndDate	<p>Used to specify the date till when you want to hold the process of the entity.</p> <p>Note:</p> <p>You must specify the date in the YYYY-MM-DD format.</p> <p>The hold process end date must be between the hold request start and end dates.</p> <p>The hold process end date cannot be earlier than the hold process start date.</p> <p>While adding a new process to the hold request, the system does the following:</p> <ul style="list-style-type: none"> Sets the hold process start date to the hold request start date. If you do not specify the hold process end date, the system, by default, sets it to the hold request end date. 	<p>Yes (Conditional)</p> <p>Note: This data is required when:</p> <ul style="list-style-type: none"> You want to update the end date of a hold process.
characteristics	Used to add, update, or delete a characteristic from the hold request.	No
action	<p>Used to indicate whether you want to add, update, or delete a characteristic from the hold request. The valid values are:</p> <ul style="list-style-type: none"> UPDATE - Used when you want to add a new characteristic to the hold request or update the details of an existing characteristic of the hold request. The system first checks whether a characteristic with the given characteristic type and effective date combination exists for the hold request. If so, the system updates the existing characteristic of the hold request. However, if a characteristic does not exist with the given characteristic type and effective date combination for the hold request, the system creates a new characteristic for the hold request. 	<p>Yes (Conditional)</p> <p>Note: This data is required when you want to add, update, or delete a characteristic from the hold request.</p>

Tag Name	Tag Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> DELETE - Used when you want to delete an existing characteristic from the hold request. 	
characteristicType	Used to indicate the characteristic type.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Hold Request .	Note: This data is required when you want to add, update, or delete a characteristic from the hold request.
characteristicValue	Used to specify the value for the characteristic type.	Yes (Conditional)
		Note: This data is required when you want to add, update, or delete a characteristic from the hold request.
effectiveDate	Used to specify the date from when the characteristic is effective for the hold request.	Yes (Conditional)
		Note: This data is required when you want to add, update, or delete a characteristic from the hold request.

The following table lists and describes additional tags that are included in the hold update response:

Tag Name	Tag Description
requestProcessStatus	Indicates whether the hold update request is successfully processed or not. The valid values are: <ul style="list-style-type: none"> Success Failure
errmsg	Indicates the error that occurred while updating the hold request.
	Note: This tag appears when the value in the requestProcessStatus tag is set to Failure .

Sample Hold Update Request and Response in the XML Format

Using the below example, you can update the hold end date of the bill generation and funding processes and add two characteristics for the given hold request.

Sample Hold Update Request in the XML Format

```
<C1-UpdateHoldRequest>
  <sourceSystem>SMALL_PRIME</sourceSystem>
```

```

<externalTransactionId>567888876677</externalTransactionId>
<externalSourceId>656565</externalSourceId>
<holdRequestId>100002522626</holdRequestId>
<holdComments></holdComments>
<holdEndDate></holdEndDate>
<entityId>2339689532</entityId>
<entityEndDate>2025-12-24</entityEndDate>
<holdProcessData>
  <holdProcess>BILL</holdProcess>
  <holdProcessEndDate>2025-10-24</holdProcessEndDate>
</holdProcessData>
<holdProcessData>
  <holdProcess>FNDG</holdProcess>
  <holdProcessEndDate>2025-12-24</holdProcessEndDate>
</holdProcessData>
<characteristics>
  <action>UPDATE</action>
  <characteristicType>HOLD_TYPE</characteristicType>
  <characteristicValue>T</characteristicValue>
  <effectiveDate>2025-12-24</effectiveDate>
</characteristics>
<characteristics>
  <action>UPDATE</action>
  <characteristicType>ESC_PATH</characteristicType>
  <characteristicValue>01</characteristicValue>
  <effectiveDate>2025-12-24</effectiveDate>
</characteristics>
</C1-UpdateHoldRequest>

```

Sample Hold Update Response in the XML Format

```

<C1-UpdateHoldRequest>
  <requestProcessStatus>Success</requestProcessStatus>
  <sourceSystem>SMALL_PRIME</sourceSystem>
  <externalTransactionId>567888876677</externalTransactionId>
  <externalSourceId>656565</externalSourceId>
  <holdRequestId>100002522626</holdRequestId>
  <holdComments></holdComments>
  <holdEndDate></holdEndDate>
  <entityId>2339689532</entityId>
  <entityEndDate>2025-12-24</entityEndDate>
  <holdProcessData>
    <holdProcess>BILL</holdProcess>
    <holdProcessEndDate>2025-10-24</holdProcessEndDate>
  </holdProcessData>
  <holdProcessData>
    <holdProcess>FNDG</holdProcess>
    <holdProcessEndDate>2025-12-24</holdProcessEndDate>
  </holdProcessData>
  <characteristics>
    <action>UPDATE</action>
    <characteristicType>HOLD_TYPE</characteristicType>
    <characteristicValue>T</characteristicValue>
    <effectiveDate>2025-12-24</effectiveDate>
  </characteristics>
  <characteristics>
    <action>UPDATE</action>
    <characteristicType>ESC_PATH</characteristicType>
    <characteristicValue>01</characteristicValue>
    <effectiveDate>2025-12-24</effectiveDate>
  </characteristics>
</C1-UpdateHoldRequest>

```

Note: We have given the above request sample to illustrate how the tags should be nested while receiving a hold update request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Hold Update Request in the JSON Format

The following code snippet illustrates how the attribute/value pairs should be structured while receiving the hold update request in the JSON format:

```
{
  -"C1-UpdateHoldRequest": {
    -"sourceSystem": -"",
    -"externalTransactionId": -"",
    -"externalSourceId": -"",
    -"holdRequestId": -"",
    -"holdComments": -"",
    -"holdEndDate": -"",
    -"entityId": -"",
    -"entityEndDate": -"",
    -"holdProcessData": {
      -"holdProcess": -"",
      -"holdProcessEndDate": -""
    },
    -"characteristics": {
      -"action": -"",
      -"characteristicType": -"",
      -"characteristicValue": -"",
      -"effectiveDate": -""
    }
  }
}
```

Note: Here, the **C1-UpdateHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-UpdateHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **UpdateHoldRequest**, then you need to specify the **UpdateHoldRequest** attribute instead of the **C1-UpdateHoldRequest** attribute in the above request.

Hold Update Response in the JSON Format

The following code snippet illustrates how the attribute/value pairs are structured while sending the hold update response in the JSON format:

```
{
  -"C1-UpdateHoldRequest": {
    -"requestProcessStatus": -"",
    -"sourceSystem": -"",
    -"externalTransactionId": -"",
    -"externalSourceId": -"",
    -"holdRequestId": -"",
    -"holdComments": -"",
    -"holdEndDate": -"",
    -"entityId": -"",
    -"entityEndDate": -"",
    -"holdProcessData": {
      -"holdProcess": -"",
      -"holdProcessEndDate": -""
    },
    -"characteristics": {
      -"action": -"",
      -"characteristicType": -"",
      -"characteristicValue": -"",
      -"effectiveDate": -""
    },
    -"errormsg": -""
  },
  -"error": -""
}
```

Note: Here, the **C1-UpdateHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-UpdateHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **UpdateHoldRequest**, then the **UpdateHoldRequest** attribute appears instead of the **C1-UpdateHoldRequest** attribute in the above response.

Hold Update Request and Response - Attribute/Value Pairs in JSON Format

Note: We recommend you to refer the [Hold Update Request in the JSON Format](#) on page 3713 and [Hold Update Response in the JSON Format](#) on page 3714 topics in parallel while understanding the below mentioned attributes. This will help you to understand how the attribute/value pairs are structured in the JSON format.

Before calling the **C1-UpdateHoldRequest** business service through an inbound web service, you need to ensure that the hold update request contains the following attributes:

Attribute Name	Attribute Description	Mandatory (Yes or No)
C1-UpdateHoldRequest	Used to indicate that you want to invoke the C1-UpdateHoldRequest business service.	Yes
	Note: Here, the C1-UpdateHoldRequest attribute represents the operation in the inbound web service which is used to call the C1-UpdateHoldRequest business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to UpdateHoldRequest , then you need to specify the UpdateHoldRequest attribute instead of the C1-UpdateHoldRequest attribute in the hold update request.	
sourceSystem	Used to indicate the external system from where the hold update request is received.	No
	Note: You must specify an external system which is already defined in the system. If the Inbound Web Service History feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the C1-IWSHIST algorithm. If so, the system stamps the specified external system corresponding to the record in the C1_IWS_HIST table. If the external system is not specified in the hold update request, the system, by default, stamps the external system associated with the outbound message type (specified in the C1-IWSHIST algorithm) corresponding to the record in the C1_IWS_HIST table. For more information, see the Inbound Web Service History section in the <i>Oracle Revenue Management and Billing Administrative Guide</i> .	
externalTransactionId	Used to indicate the transaction in the external system through which the hold update request is received.	No
	Note: If the Inbound Web Service History feature is enabled, the system stores the external transaction ID corresponding to the record in the C1_IWS_HIST table.	
externalSourceId	Used to specify the external source system ID.	No
	Note: If the Inbound Web Service History feature is enabled, the system stores the external source system ID corresponding to the record in the C1_IWS_HIST table.	

Attribute Name	Attribute Description	Mandatory (Yes or No)
holdRequestId	Used to indicate hold request whose details you want to update.	Yes
	Note: You can only update a hold request which is in the Active status through an inbound web service.	
holdComments	Used to specify additional information about the hold request.	No
holdEndDate	Used to specify the date till when the hold request is effective.	No
	Note: The hold request end date cannot be earlier than the hold request start date. You must specify the date in the YYYY-MM-DD format.	
entityId	Used to specify the entity ID (i.e., person, account, or bill ID).	Yes
entityEndDate	Used to specify the date till when you want to hold the entity.	Yes
	Note: You must specify the date in the YYYY-MM-DD format. The hold entity end date must be between hold request start and end dates and between at least one process's start and end dates. The hold entity end date cannot be earlier than the hold entity start date. At present, you can only update the end date of a single entity through a hold update request. If two or more entities are kept on hold through a hold request, you need to initiate a separate hold update request for each entity in order to update their respective end date.	
holdProcessData	Used to add a new hold process or update the details of an existing hold process in the hold request.	No
holdProcess	Used to specify the process that you want to add or update in the hold request. The valid values are: <ul style="list-style-type: none">ATPY - Used when you want to hold the auto pay process of the entity. It is valid only when the entity level of the hold request is set to ACCT.BILL - Used when you want to hold the bill generation process of the entity. It is valid only when the entity level of the hold request is set to ACCT or PERS.DELQ - Used when you want to hold the delinquency process of the entity. It is valid only when the entity level of the hold request is set to ACCT or PERS.	Yes (Conditional)
		Note: This data is required when: <ul style="list-style-type: none">You want to update the end date of a hold process.You want to add a new hold process to the hold request.

Attribute Name	Attribute Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> FNDG - Used when you want to hold the funding process of the entity. It is valid only when the entity level of the hold request is set to ACCT, PERS, or BILL. OVDU - Used when you want to hold the overdue process of the entity. It is valid only when the entity level of the hold request is set to ACCT. REFD - Used when you want to hold the refund process of the entity. It is valid only when the entity level of the hold request is set to ACCT. <p>Note:</p> <p>You must specify a value which is already defined in the HOLD_PROCESS_FLG lookup field. It must be in the Active status.</p> <p>You cannot specify both the OVDU and DELQ processes at a time in the hold update request.</p> <p>The Overdue process is valid for the financial services and health insurance domains but the Delinquency process is valid only for the health insurance domain.</p>	
holdProcessEndDate	Used to specify the date till when you want to hold the process of the entity.	Yes (Conditional)
	<p>Note:</p> <p>You must specify the date in the YYYY-MM-DD format.</p> <p>The hold process end date must be between the hold request start and end dates.</p> <p>The hold process end date cannot be earlier than the hold process start date.</p> <p>While adding a new process to the hold request, the system does the following:</p> <ul style="list-style-type: none"> Sets the hold process start date to the hold request start date. If you do not specify the hold process end date, the system, by default, sets it to the hold request end date. 	<p>Note: This data is required when:</p> <ul style="list-style-type: none"> You want to update the end date of a hold process.
characteristics	Used to add, update, or delete a characteristic from the hold request.	No
action	Used to indicate whether you want to add, update, or delete a characteristic from the hold request. The valid values are:	Yes (Conditional)
	<ul style="list-style-type: none"> UPDATE - Used when you want to add a new characteristic to the hold request or update the details of an existing characteristic of the hold request. The system first checks whether a characteristic with the given characteristic type and effective date combination exists for the hold request. If so, the system updates the existing characteristic of the hold 	<p>Note: This data is required when you want to add, update, or delete a characteristic from the hold request.</p>

Attribute Name	Attribute Description	Mandatory (Yes or No)
	request. However, if a characteristic does not exist with the given characteristic type and effective date combination for the hold request, the system creates a new characteristic for the hold request. <ul style="list-style-type: none"> DELETE - Used when you want to delete an existing characteristic from the hold request. 	
characteristicType	Used to indicate the characteristic type.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Hold Request .	Note: This data is required when you want to add, update, or delete a characteristic from the hold request.
characteristicValue	Used to specify the value for the characteristic type.	Yes (Conditional)
		Note: This data is required when you want to add, update, or delete a characteristic from the hold request.
effectiveDate	Used to specify the date from when the characteristic is effective for the hold request.	Yes (Conditional)
		Note: This data is required when you want to add, update, or delete a characteristic from the hold request.

The following table lists and describes additional attributes that are included in the hold update response:

Attribute Name	Attribute Description
requestProcessStatus	Indicates whether the hold update request is successfully processed or not. The valid values are: <ul style="list-style-type: none"> Success Failure
errorMsg	Indicates the error that occurred while updating the hold request.
	Note: This attribute appears when the value in the requestProcessStatus attribute is set to Failure .

C1-GetHoldRequestHistory Business Service

The **Inquire Hold Request Details (C1-GetHoldRequestHistory)** business service enables you to view the details of an existing hold request which is in the **Active** status. At a time, you can view the hold request details of a single entity (i.e., for a particular person, account, or bill). You can call this business service from an external system through an inbound web service. If you want to send the hold view request in the XML and/or JSON format, you need to ensure that you create a REST based inbound web service in Oracle Revenue Management and Billing. However, if you want to send the hold view request in the XML format, you can create a SOAP or REST based inbound web service in Oracle Revenue Management and Billing.

While sending the hold view request, you need to specify the following details:

- Entity (i.e., Person, Account, or Bill) whose hold requests you want to view.
- Entity identifiers or entity ID when the entity is an account or a person, and the entity ID when the entity is a bill.

In addition, you can specify the following filter criteria – Hold Request Start Date, Hold Request End Date, Hold Reason, and Hold Process. On specifying the hold process, the system fetches one or more active hold requests of the entity with the given hold process. This hold request may have one or more hold processes including the given hold process.

Once the hold view request is processed through an inbound web service, the system displays the details of one or more active hold requests that meet the search criteria. If an error occurs while retrieving the hold requests for the entity, the

system sends the error message in the response. The system enables you to track the hold view response sent to the external system using the **Inbound Web Service History** feature.

For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.

Sample Hold View Request and Response in the JSON Format	Sample Hold View Request and Response in the JSON Format on page 3734

Prerequisites

To view the hold requests of an entity through an inbound web service, you need to do the following:

- Define a REST or SOAP based inbound web service to call the **C1-GetHoldRequestHistory** business service where **HTTP Method** is set to **Post** and **URI Component** is set to **/inquire**.
- Authorize the ORMB user to access the required application service.
- Define the required source systems in the **C1-SourceSystemLookup** extendable lookup.
- Define the required person or account identifier types in the system.
- Define the required values for the **HOLD_REASON_FLG**, **HOLD_ENTITY_LVL_FLG**, and **HOLD_PROCESS_FLG** lookup fields.

Hold View Request in the XML Format

The following code snippet illustrates how the tags should be nested while receiving the hold view request in the XML format:

```
<C1-GetHoldRequestHistory>
  <getHoldReqHistRequest>
    <sourceSystem></sourceSystem>
    <externalSourceId></externalSourceId>
    <c1ExternalTransactionId></c1ExternalTransactionId>
    <getHoldReqStartDt></getHoldReqStartDt>
```

```
<getHoldReqEndDt></getHoldReqEndDt>
<getHoldReqEntity></getHoldReqEntity>
<getHoldReqReason></getHoldReqReason>
<getHoldReqEntIdentType></getHoldReqEntIdentType>
<getHoldReqEntIdentValue></getHoldReqEntIdentValue>
<getHoldReqEntityId></getHoldReqEntityId>
<getHoldReqProcess></getHoldReqProcess>
</getHoldReqHistRequest>
</C1-GetHoldRequestHistory>
```

Note: Here, the **C1-GetHoldRequestHistory** tag represents the operation in the inbound web service which is used to call the **C1-GetHoldRequestHistory** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **GetHoldRequestHistory**, then you need to specify the **GetHoldRequestHistory** tag instead of the **C1-GetHoldRequestHistory** tag in the above request.

Hold View Response in the XML Format

The following code snippet illustrates how the tags are nested while sending the hold view response in the XML format:

```
<C1-GetHoldRequestHistory>
  <getHoldReqHistRequest>
    <sourceSystem></sourceSystem>
    <externalSourceId></externalSourceId>
    <c1ExternalTransactionId></c1ExternalTransactionId>
    <getHoldReqStartDt></getHoldReqStartDt>
    <getHoldReqEndDt></getHoldReqEndDt>
    <getHoldReqEntity></getHoldReqEntity>
    <getHoldReqReason></getHoldReqReason>
    <getHoldReqEntIdentType></getHoldReqEntIdentType>
    <getHoldReqEntIdentValue></getHoldReqEntIdentValue>
    <getHoldReqEntityId></getHoldReqEntityId>
    <getHoldReqProcess></getHoldReqProcess>
  </getHoldReqHistRequest>
  <holdReqHistResponse>
    <statusCd></statusCd>
    <messageText></messageText>
    <holdReqHistList>
      <holdReqId></holdReqId>
      <holdReqStartDt></holdReqStartDt>
      <holdReqEndDt></holdReqEndDt>
      <holdReqStatus></holdReqStatus>
      <holdReqType></holdReqType>
      <holdReqReason></holdReqReason>
      <holdReqEntity></holdReqEntity>
      <holdReqProcesses></holdReqProcesses>
    </holdReqHistList>
  </holdReqHistResponse>
</C1-GetHoldRequestHistory>
```

```
</holdReqHistResponse>
</C1-GetHoldRequestHistory>
```

Note: Here, the **C1-GetHoldRequestHistory** tag represents the operation in the inbound web service which is used to call the **C1-GetHoldRequestHistory** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **GetHoldRequestHistory**, then the **GetHoldRequestHistory** tag appears instead of the **C1-GetHoldRequestHistory** tag in the above response.

Hold View Request and Response - Tags in XML Format

Note: We recommend you to refer the [Hold View Request in the XML Format](#) on page 3721 and [Hold View Response in the XML Format](#) on page 3722 topics in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the XML format.

Before calling the **C1-GetHoldRequestHistory** business service through an inbound web service, you need to ensure that the hold view request contains the following tags:

Tag Name	Tag Description	Mandatory (Yes or No)
C1-GetHoldRequestHistory	Used to indicate that you want to invoke the C1-GetHoldRequestHistory business service.	Yes
	Note: Here, the C1-GetHoldRequestHistory tag represents the operation in the inbound web service which is used to call the C1-GetHoldRequestHistory business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to GetHoldRequestHistory , then you need to specify the GetHoldRequestHistory tag instead of the C1-GetHoldRequestHistory tag in the hold view request.	
getHoldReqHistRequest	Used to specify additional criteria along with the details of the entity whose hold requests you want to view.	Yes
sourceSystem	Used to indicate the external system from where the hold view request is received.	No

Tag Name	Tag Description	Mandatory (Yes or No)
	<p>Note:</p> <p>You must specify an external system which is already defined in the system.</p> <p>If the Inbound Web Service History feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the C1-IWSHIST algorithm. If so, the system stamps the specified external system corresponding to the record in the C1_IWS_HIST table.</p> <p>If the external system is not specified in the hold view request, the system, by default, stamps the external system associated with the outbound message type (specified in the C1-IWSHIST algorithm) corresponding to the record in the C1_IWS_HIST table.</p> <p>For more information, see the Inbound Web Service History section in the <i>Oracle Revenue Management and Billing Administrative Guide</i>.</p>	
c1ExternalTransactionId	<p>Used to indicate the transaction in the external system through which the hold view request is received.</p> <p>Note: If the Inbound Web Service History feature is enabled, the system stores the external transaction ID corresponding to the record in the C1_IWS_HIST table.</p>	No
externalSourceId	<p>Used to specify the external source system ID.</p> <p>Note: If the Inbound Web Service History feature is enabled, the system stores the external source system ID corresponding to the record in the C1_IWS_HIST table.</p>	No
getHoldReqStartDt	<p>Used when you want to view hold requests which are effective from a particular date onwards.</p> <p>Note:</p> <p>You must specify the date in the YYYY-MM-DD format.</p> <p>The date should be earlier than the date specified in the getHoldReqEndDt tag.</p>	No
getHoldReqEndDt	Used when you want to view hold requests which are effective till a particular date.	No

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: You must specify the date in the YYYY-MM-DD format. The date should be later than the date specified in the getHoldReqStartDt tag.	
getHoldReqEntity	Used to indicate the type of entity whose hold requests you want to view. The valid values are: <ul style="list-style-type: none"> • ACCT - Used when you want to view hold requests through which an account is kept on hold. • BILL - Used when you want to view hold requests through which a bill is kept on hold. • PERS - Used when you want to view hold requests through which a person is kept on hold. Note: You must specify a value which is already defined in the HOLD_ENTITY_LVL_FLG lookup field. It must be in the Active status.	Yes
getHoldReqReason	Used when you want to view hold requests which are created for a particular reason. Note: You must specify a value which is already defined in the HOLD_REASON_FLG lookup field. It must be in the Active status.	No
getHoldReqEntIdentType	Used to specify the person or account identifier type. Note: You must specify a person or account identifier type which is already defined in the system. It should be a primary identifier type for the respective entity.	Yes (Conditional) Note: This data is required when: <ul style="list-style-type: none"> • ACCT or PERS is specified in the getHoldReqEntity tag. • The value is not specified in the getHoldReqEntityId tag.
getHoldReqEntIdentValue	Used to specify the entity identifier (i.e., person or account identifier). It should be the primary identifier of the respective entity. Note: The system then derives the person or account ID using the given primary entity identifier details, and accordingly fetches the hold requests of the respective entity.	Yes (Conditional) Note: This data is required when: <ul style="list-style-type: none"> • ACCT or PERS is specified in the getHoldReqEntity tag. • The value is not specified in the getHoldReqEntityId tag.
getHoldReqEntityId	Used to specify the entity ID (i.e., person, account, or bill ID).	Yes (Conditional)

Tag Name	Tag Description	Mandatory (Yes or No)
		Note: This data is required when: <ul style="list-style-type: none"> • ACCT or PERS is specified in the getHoldReqEntity tag and the values are not specified in the getHoldReqEntIdentType and getHoldReqEntIdentValue tags. • BILL is specified in the getHoldReqEntity tag.
getHoldReqProcess	Used when you want to view hold requests where the given processes are kept on hold. The valid values are: <ul style="list-style-type: none"> • ATPY • BILL • DELQ • FNDG • OVDU • REFD Note: You must specify a value which is already defined in the HOLD_PROCESS_FLG lookup field. It must be in the Active status.	No

The following table lists and describes additional tags that are included in the hold view response:

Tag Name	Tag Description
holdReqHistResponse	Displays the response received for the hold view request.
statusCd	Indicates whether the hold view request is successfully processed or not. The valid values are: <ul style="list-style-type: none"> • Success • Failure
messageText	Indicates the error that occurred while retrieving the hold requests for the entity. Note: This tag appears when the value in the statusCd tag is set to Failure .
holdReqHistList	Displays the details of a hold request. Note: This tag appears when the value in the statusCd tag is set to Success .
holdRequestId	Displays the hold request ID.
holdReqStartDt	Displays the date from when the hold request is effective.
holdReqEndDt	Displays the date till when the hold request is effective.
holdStatus	Indicates the status of the hold request. The valid value is: <ul style="list-style-type: none"> • Active

Tag Name	Tag Description
holdReqType	Indicates the hold request type using which the hold request is created.
holdReqReason	Indicates the reason why the entity is kept on hold.
holdReqEntity	Indicates the entity for which the hold request is created.
holdReqProcesses	Indicates the process which is kept on hold. The valid values are: <ul style="list-style-type: none">• Auto Pay• Bill Generation• Delinquency• Funding• Overdue• Refund <div>Note: If multiple processes are kept on hold for an entity through the hold request, a comma-separated list of hold processes appears in the tag.</div>

Sample Hold View Request and Response in the XML Format

Using the below example, you can view hold requests which are created for an account with the specified hold reason.

Sample Hold View Request in the XML Format

```
<C1-GetHoldRequestHistory>
  <getHoldReqHistRequest>
    <sourceSystem>SMALL_PRIME</sourceSystem>
    <externalSourceId>656565</externalSourceId>
    <c1ExternalTransactionId>567888876611</c1ExternalTransactionId>
    <getHoldReqStartDt></getHoldReqStartDt>
    <getHoldReqEndDt></getHoldReqEndDt>
    <getHoldReqEntity>ACCT</getHoldReqEntity>
    <getHoldReqReason>DSRE</getHoldReqReason>
    <getHoldReqEntIdentType>IBAN</getHoldReqEntIdentType>
    <getHoldReqEntIdentValue>XX00XXX111111</getHoldReqEntIdentValue>
    <getHoldReqEntityId></getHoldReqEntityId>
    <getHoldReqProcess></getHoldReqProcess>
  </getHoldReqHistRequest>
</C1-GetHoldRequestHistory>
```

Sample Hold View Response in the XML Format

```
<C1-GetHoldRequestHistory>
  <getHoldReqHistRequest>
    <sourceSystem>SMALL_PRIME</sourceSystem>
    <externalSourceId>656565</externalSourceId>
    <c1ExternalTransactionId>567888876611</c1ExternalTransactionId>
    <getHoldReqStartDt></getHoldReqStartDt>
    <getHoldReqEndDt></getHoldReqEndDt>
    <getHoldReqEntity>ACCT</getHoldReqEntity>
```

```
<getHoldReqReason>DSRE</getHoldReqReason>
<getHoldReqEntIdentType>IBAN</getHoldReqEntIdentType>
<getHoldReqEntIdentValue>XX00XXX111111</getHoldReqEntIdentValue>
<getHoldReqEntityId></getHoldReqEntityId>
<getHoldReqProcess></getHoldReqProcess>
</getHoldReqHistRequest>
<holdReqHistResponse>
  <statusCd>Success</statusCd>
  <holdReqHistList>
    <holdReqId>110060465751</holdReqId>
    <holdReqStartDt>2025-01-01</holdReqStartDt>
    <holdReqEndDt>2025-01-31</holdReqEndDt>
    <holdReqStatus>Active</holdReqStatus>
    <holdReqType>HOLD_WITHOUT_APPROVAL</holdReqType>
    <holdReqReason>Disaster Recovery</holdReqReason>
    <holdReqEntity>9571248085</holdReqEntity>
    <holdReqProcesses>Auto Pay</holdReqProcesses>
  </holdReqHistList>
</holdReqHistResponse>
</C1-GetHoldRequestHistory>
```

Note: We have given the above request sample to illustrate how the tags should be nested while receiving a hold view request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Hold View Request and Response - Tags in XML Format	Hold View Request and Response - Tags in XML Format on page 3723

Hold View Request in the JSON Format

The following code snippet illustrates how the attribute/value pairs should be structured while receiving the hold view request in the JSON format:

```
{
  -"C1-GetHoldRequestHistory": {
    -"getHoldReqHistRequest": {
      -"sourceSystem": -"",
      -"externalSourceId": -"",
      -"clExternalTransactionId": -"",
      -"getHoldReqStartDt": -"",
      -"getHoldReqEndDt": -"",
      -"getHoldReqEntity": -"",
      -"getHoldReqReason": -"",
      -"getHoldReqEntIdentType": -"",
      -"getHoldReqEntIdentValue": -"",
      -"getHoldReqEntityId": -"",
      -"getHoldReqProcess": -""
    }
  }
}
```

Note: Here, the **C1-GetHoldRequestHistory** attribute represents the operation in the inbound web service which is used to call the **C1-GetHoldRequestHistory** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **GetHoldRequestHistory**, then you need to specify the **GetHoldRequestHistory** attribute instead of the **C1-GetHoldRequestHistory** attribute in the above request.

Hold View Request and Response - Attribute/Value Pairs in JSON Format

Note: We recommend you to refer the [Hold View Request in the JSON Format](#) on page 3728 and [Hold View Response in the JSON Format](#) on page 3729 topics in parallel while understanding the below mentioned attributes. This will help you to understand how the attribute/value pairs are structured in the JSON format.

Before calling the **C1-GetHoldRequestHistory** business service through an inbound web service, you need to ensure that the hold view request contains the following attributes:

Attribute Name	Attribute Description	Mandatory (Yes or No)
C1-GetHoldRequestHistory	Used to indicate that you want to invoke the C1-GetHoldRequestHistory business service.	Yes
	Note: Here, the C1-GetHoldRequestHistory attribute represents the operation in the inbound web service which is used to call the C1-GetHoldRequestHistory business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to GetHoldRequestHistory , then you need to specify the GetHoldRequestHistory attribute instead of the C1-GetHoldRequestHistory attribute in the hold view request.	
getHoldReqHistRequest	Used to specify additional criteria along with the details of the entity whose hold requests you want to view.	Yes
sourceSystem	Used to indicate the external system from where the hold view request is received.	No

Attribute Name	Attribute Description	Mandatory (Yes or No)
	<p>Note:</p> <p>You must specify an external system which is already defined in the system.</p> <p>If the Inbound Web Service History feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the C1-IWSHIST algorithm. If so, the system stamps the specified external system corresponding to the record in the C1_IWS_HIST table.</p> <p>If the external system is not specified in the hold view request, the system, by default, stamps the external system associated with the outbound message type (specified in the C1-IWSHIST algorithm) corresponding to the record in the C1_IWS_HIST table.</p> <p>For more information, see the Inbound Web Service History section in the <i>Oracle Revenue Management and Billing Administrative Guide</i>.</p>	
c1ExternalTransactionId	<p>Used to indicate the transaction in the external system through which the hold view request is received.</p> <p>Note: If the Inbound Web Service History feature is enabled, the system stores the external transaction ID corresponding to the record in the C1_IWS_HIST table.</p>	No
externalSourceId	<p>Used to specify the external source system ID.</p> <p>Note: If the Inbound Web Service History feature is enabled, the system stores the external source system ID corresponding to the record in the C1_IWS_HIST table.</p>	No
getHoldReqStartDt	<p>Used when you want to view hold requests which are effective from a particular date onwards.</p> <p>Note:</p> <p>You must specify the date in the YYYY-MM-DD format.</p> <p>The date should be earlier than the date specified in the getHoldReqEndDt attribute.</p>	No
getHoldReqEndDt	Used when you want to view hold requests which are effective till a particular date.	No

Attribute Name	Attribute Description	Mandatory (Yes or No)
	Note: You must specify the date in the YYYY-MM-DD format. The date should be later than the date specified in the getHoldReqStartDt attribute.	
getHoldReqEntity	Used to indicate the type of entity whose hold requests you want to view. The valid values are: <ul style="list-style-type: none"> • ACCT - Used when you want to view hold requests through which an account is kept on hold. • BILL - Used when you want to view hold requests through which a bill is kept on hold. • PERS - Used when you want to view hold requests through which a person is kept on hold. Note: You must specify a value which is already defined in the HOLD_ENTITY_LVL_FLG lookup field. It must be in the Active status.	Yes
getHoldReqReason	Used when you want to view hold requests which are created for a particular reason. Note: You must specify a value which is already defined in the HOLD_REASON_FLG lookup field. It must be in the Active status.	No
getHoldReqEntIdentType	Used to specify the person or account identifier type. Note: You must specify a person or account identifier type which is already defined in the system. It should be a primary identifier type for the respective entity.	Yes (Conditional) Note: This data is required when: <ul style="list-style-type: none"> • ACCT or PERS is specified in the getHoldReqEntity attribute. • The value is not specified in the getHoldReqEntityId attribute.
getHoldReqEntIdentValue	Used to specify the entity identifier (i.e., person or account identifier). It should be the primary identifier of the respective entity. Note: The system then derives the person or account ID using the given primary entity identifier details, and accordingly fetches the hold requests of the respective entity.	Yes (Conditional) Note: This data is required when: <ul style="list-style-type: none"> • ACCT or PERS is specified in the getHoldReqEntity attribute. • The value is not specified in the getHoldReqEntityId attribute.
getHoldReqEntityId	Used to specify the entity ID (i.e., person, account, or bill ID).	Yes (Conditional)

Attribute Name	Attribute Description	Mandatory (Yes or No)
		Note: This data is required when: <ul style="list-style-type: none"> • ACCT or PERS is specified in the getHoldReqEntity attribute and the values are not specified in the getHoldReqEntIdentType and getHoldReqEntIdentValue attributes. • BILL is specified in the getHoldReqEntity attribute.
getHoldReqProcess	<p>Used when you want to view hold requests where the given processes are kept on hold. The valid values are:</p> <ul style="list-style-type: none"> • ATPY • BILL • DELQ • FNDG • OVDU • REFD <p>Note: You must specify a value which is already defined in the HOLD_PROCESS_FLG lookup field. It must be in the Active status.</p>	No

The following table lists and describes additional attributes that are included in the hold view response:

Attribute Name	Attribute Description
holdReqHistResponse	Displays the response received for the hold view request.
statusCd	<p>Indicates whether the hold view request is successfully processed or not. The valid values are:</p> <ul style="list-style-type: none"> • Success • Failure
messageText	<p>Indicates the error that occurred while retrieving the hold requests for the entity.</p> <p>Note: This attribute appears when the value in the statusCd attribute is set to Failure.</p>
holdReqHistList	<p>Displays the details of a hold request.</p> <p>Note: This attribute appears when the value in the statusCd attribute is set to Success.</p>
holdRequestId	Displays the hold request ID.
holdReqStartDt	Displays the date from when the hold request is effective.
holdReqEndDt	Displays the date till when the hold request is effective.
holdStatus	<p>Indicates the status of the hold request. The valid value is:</p> <ul style="list-style-type: none"> • Active

Attribute Name	Attribute Description
holdReqType	Indicates the hold request type using which the hold request is created.
holdReqReason	Indicates the reason why the entity is kept on hold.
holdReqEntity	Indicates the entity for which the hold request is created.
holdReqProcesses	Indicates the process which is kept on hold. The valid values are: <ul style="list-style-type: none">• Auto Pay• Bill Generation• Delinquency• Funding• Overdue• Refund <div>Note: If multiple processes are kept on hold for an entity through the hold request, a comma-separated list of hold processes appears in the attribute.</div>

Sample Hold View Request and Response in the JSON Format

Using the below example, you can view hold requests which are created for a bill and are effective from a particular date.

Sample Hold View Request in the JSON Format

```
{
  -"C1-GetHoldRequestHistory": {
    -"getHoldReqHistRequest": {
      -"sourceSystem": -"SMALL PRIME",
      -"externalSourceId": -"656565",
      -"clExternalTransactionId": -"567888876600",
      -"getHoldReqStartDt": -"2025-01-01",
      -"getHoldReqEndDt": -"",
      -"getHoldReqEntity": -"BILL",
      -"getHoldReqReason": -"",
      -"getHoldReqEntIdentType": -"",
      -"getHoldReqEntIdentValue": -"",
      -"getHoldReqEntityId": -"2339633684",
      -"getHoldReqProcess": -""
    }
  }
}
```

Sample Hold View Response in the JSON Format

```
{
  -"C1-GetHoldRequestHistory": {
    -"getHoldReqHistRequest": {
      -"sourceSystem": -"SMALL PRIME",
      -"externalSourceId": -"656565",
      -"clExternalTransactionId": -"567888876600",
```

```
-"getHoldReqStartDt": -"2025-01-01",
-"getHoldReqEndDt": -"",
-"getHoldReqEntity": -"BILL",
-"getHoldReqReason": -"",
-"getHoldReqEntIdentType": -"",
-"getHoldReqEntIdentValue": -"",
-"getHoldReqEntityId": -"2339633684",
-"getHoldReqProcess": -""
-}
-"holdReqHistResponse": {
  -"statusCd": -"Success",
  -"holdReqHistList": [
    {
      -"holdReqId": -"588586064410",
      -"holdReqStartDt": -"2025-01-01",
      -"holdReqEndDt": -"2025-01-31",
      -"holdReqStatus": -"Active",
      -"holdReqType": -"HOLD WITHOUT APPROVAL",

      -"holdReqEntity": -"2339633684",
      -"holdReqProcesses": -"Funding"
    },
    {
      -"holdReqId": -"588586064411",
      -"holdReqStartDt": -"2025-03-01",
      -"holdReqEndDt": -"2025-03-31",
      -"holdReqStatus": -"Active",
      -"holdReqType": -"HOLD WITHOUT APPROVAL",
      -"holdReqReason": -"Disaster Recovery",
      -"holdReqEntity": -"2339633684",
      -"holdReqProcesses": -"Funding"
    }
  ]
-}
-}
-}
```

Note: We have given the above request sample to illustrate how the attribute/value pairs should be structured while receiving a hold view request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

C1-ReleaseHoldRequest Business Service

The **Release Hold Request (C1-ReleaseHoldRequest)** business service enables you to release an existing hold request which is in the **Active** status. You can call this business service from an external system through an inbound web service. At present, you can release a hold request through an inbound web service only when it has a single entity (i.e., a particular person, account, or bill) in the hold request. If you want to send the hold release request in the XML and/or JSON format, you need to ensure that you create a REST based inbound web service in Oracle Revenue Management and Billing. However, if you want to send the hold release request in the XML format, you can create a SOAP or REST based inbound web service in Oracle Revenue Management and Billing.

While sending the hold release request, you need to specify the following details:

- Hold Request ID
- Hold release reason and comments, if any

Note:

You must specify a reason which is already defined for the **Released** status of the **C1-HoldRequest** business object through the **Status Reason** screen.

You can release a hold request through an inbound web service only when the release approval process is not configured on the respective hold request type.

You cannot release a hold request through an inbound web service when the hold request start date is later than the system date or when the system date is later than the hold request end date.

If you want to release a hold request with multiple entities, you can opt to update the end date of each entity in the hold request through **C1-UpdateHoldRequest** business service by calling it separately for each entity of the hold request. Once the end date of all the entities in the hold request is updated through an inbound web service, you can then execute the **C1-HLMON** batch for necessary updates. For more information about the batch, see *Oracle Revenue Management and Billing Batch Guide*. Alternatively, you can release a hold request with multiple entities from the user interface.

Once the hold request is released through an inbound web service, the status of the hold request is set to **Released**. In addition, the hold request end date is set to the system date. If an error occurs while releasing the hold request, the system sends the error message in the response. The system enables you to track the hold release response sent to the external system using the **Inbound Web Service History** feature.

For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.

Sample Hold Release Request and Response in the JSON Format	Sample Hold Release Request and Response in the JSON Format on page 3744

Prerequisites

To release a hold request through an inbound web service, you need to do the following:

- Define a REST or SOAP based inbound web service to call the **C1-ReleaseHoldRequest** business service where the **HTTP Method** is set to **Post** and the **URI Component** is set to **/releaseHold**.
- Authorize the ORMB user to access the required application service
- Define the required hold request type where the **Release Approval** option is not selected and the status is set to **Active**.
- Define the required values for the **HOLD_REASON_FLG** lookup field.
- Define the required values for the **HOLD_ENTITY_LVL_FLG** lookup field.
- Define the required values for the **HOLD_PROCESS_FLG** lookup field.
- Define the required characteristic types where the characteristic entity is set to **Hold Request**
- Reasons defined for the **Released** status of the **C1-HoldRequest** business object in the **Status Reason** screen

Hold Release Request in the XML Format

The following code snippet illustrates how the tags should be nested while receiving the hold release request in the XML format:

```
<C1-ReleaseHoldRequest>
  <sourceSystem></sourceSystem>
  <externalTransactionId></externalTransactionId>
  <externalSourceId></externalSourceId>
  <holdRequestId></holdRequestId>
  <holdReleaseReason></holdReleaseReason>
  <holdComments></holdComments>
</C1-ReleaseHoldRequest>
```

Note: Here, the **C1-ReleaseHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-ReleaseHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **ReleaseHoldRequest**, then you need to specify the **ReleaseHoldRequest** tag instead of the **C1-ReleaseHoldRequest** tag in the above request.

Hold Release Request and Response - Tags in XML Format

Note: We recommend you to refer the [Hold Release Request in the XML Format](#) on page 3737 and [Hold Release Response in the XML Format](#) on page 3738 topics in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the XML format.

Before calling the **C1-ReleaseHoldRequest** business service through an inbound web service, you need to ensure that the hold release request contains the following tags:

Tag Name	Tag Description	Mandatory (Yes or No)
C1-ReleaseHoldRequest	Used to indicate that you want to invoke the C1-ReleaseHoldRequest business service.	Yes
	Note: Here, the C1-ReleaseHoldRequest tag represents the operation in the inbound web service which is used to call the C1-ReleaseHoldRequest business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to ReleaseHoldRequest , then you need to specify the ReleaseHoldRequest tag instead of the C1-ReleaseHoldRequest tag in the hold release request.	
sourceSystem	Used to indicate the external system from where the hold release request is received.	No
	<p>Note:</p> <p>You must specify an external system which is already defined in the system.</p> <p>If the Inbound Web Service History feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the C1-IWSHIST algorithm. If so, the system stamps the specified external system corresponding to the record in the C1_IWS_HIST table.</p> <p>If the external system is not specified in the hold creation request, the system, by default, stamps the external system associated with the outbound message type (specified in the C1-IWSHIST algorithm) corresponding to the record in the C1_IWS_HIST table.</p> <p>For more information, see the Inbound Web Service History section in the <i>Oracle Revenue Management and Billing Administrative Guide</i>.</p>	
externalTransactionId	Used to indicate the transaction in the external system through which the hold release request is received.	No
	Note: If the Inbound Web Service History feature is enabled, the system stores the external transaction ID corresponding to the record in the C1_IWS_HIST table.	
externalSourceId	Used to specify the external source system ID.	No
	Note: If the Inbound Web Service History feature is enabled, the system stores the external source system ID corresponding to the record in the C1_IWS_HIST table.	
holdRequestId	Used to indicate the hold request that you want to release.	Yes
holdReleaseReason	Used to specify the reason why you want to release the hold request.	Yes

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: You must specify a reason which is defined for the Released status of the C1-HoldRequest business object through the Status Reason screen.	
holdComments	Used to specify additional information while releasing the hold request.	No

The following table lists and describes additional tags that are included in the hold release response:

Tag Name	Tag Description
requestProcessStatus	Indicates whether the hold release request is successfully processed or not. The valid values are: <ul style="list-style-type: none">SuccessFailure
errormsg	Indicates the error that occurred while releasing the hold request. Note: This tag appears when the value in the requestProcessStatus tag is set to Failure .
holdEndDate	Displays the date till when the hold request is effective. Note: The system sets the hold end date to the system date (i.e., when the hold request is released through the inbound web service). This tag appears when the value in the requestProcessStatus tag is set to Success .
holdRequestStatus	Indicates the status of the hold request. The valid value is: <ul style="list-style-type: none">Release Note: This tag appears when the value in the requestProcessStatus tag is set to Success .

Sample Hold Release Request and Response in the XML Format

Using the below example, you can release a hold request.

Sample Hold Release Request in the XML Format

```
<C1-ReleaseHoldRequest>
  <sourceSystem>SMALL_PRIME</sourceSystem>
  <externalTransactionId>567800876666</externalTransactionId>
  <externalSourceId>656565</externalSourceId>
  <holdRequestId>220419105258</holdRequestId>
  <holdReleaseReason>SUFF</holdReleaseReason>
```

```
<holdComments>Sufficient Funds Available</holdComments>
</C1-ReleaseHoldRequest>
```

Sample Hold Release Response in the XML Format

```
<C1-ReleaseHoldRequest>
  <requestProcessStatus>Success</requestProcessStatus>
  <sourceSystem>SMALL_PRIME</sourceSystem>
  <externalTransactionId>567800876666</externalTransactionId>
  <externalSourceId>656565</externalSourceId>
  <holdRequestId>220419105258</holdRequestId>
  <holdReleaseReason>SUFF</holdReleaseReason>
  <holdComments>Sufficient Funds Available</holdComments>
  <holdEndDate>2025-01-31</holdEndDate>
  <holdRequestStatus>Release</holdRequestStatus>
</C1-ReleaseHoldRequest>
```

Note: We have given the above request sample to illustrate how the tags should be nested while receiving a hold release request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Hold Release Request and Response - Attribute/Value Pairs in JSON Format

Note: We recommend you to refer the [Hold Release Request in the JSON Format](#) on page 3741 and [Hold Release Response in the JSON Format](#) on page 3742 topics in parallel while understanding the below mentioned attributes. This will help you to understand how the attribute/value pairs are structured in the JSON format.

Before calling the **C1-ReleaseHoldRequest** business service through an inbound web service, you need to ensure that the hold release request contains the following attributes:

Attribute Name	Attribute Description	Mandatory (Yes or No)
C1-ReleaseHoldRequest	Used to indicate that you want to invoke the C1-ReleaseHoldRequest business service.	Yes
	Note: Here, the C1-ReleaseHoldRequest attribute represents the operation in the inbound web service which is used to call the C1-ReleaseHoldRequest business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to ReleaseHoldRequest , then you need to specify the ReleaseHoldRequest attribute instead of the C1-ReleaseHoldRequest attribute in the hold release request.	
sourceSystem	Used to indicate the external system from where the hold release request is received.	No
	Note: You must specify an external system which is already defined in the system. If the Inbound Web Service History feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the C1-IWSHIST algorithm. If so, the system stamps the specified external system corresponding to the record in the C1_IWS_HIST table. If the external system is not specified in the hold creation request, the system, by default, stamps the external system associated with the outbound message type (specified in the C1-IWSHIST algorithm) corresponding to the record in the C1_IWS_HIST table. For more information, see the Inbound Web Service History section in the <i>Oracle Revenue Management and Billing Administrative Guide</i> .	
externalTransactionId	Used to indicate the transaction in the external system through which the hold release request is received.	No
	Note: If the Inbound Web Service History feature is enabled, the system stores the external transaction ID corresponding to the record in the C1_IWS_HIST table.	
externalSourceId	Used to specify the external source system ID.	No
	Note: If the Inbound Web Service History feature is enabled, the system stores the external source system ID corresponding to the record in the C1_IWS_HIST table.	
holdRequestId	Used to indicate the hold request that you want to release.	Yes
holdReleaseReason	Used to specify the reason why you want to release the hold request.	Yes

Attribute Name	Attribute Description	Mandatory (Yes or No)
	Note: You must specify a reason which is defined for the Released status of the C1-HoldRequest business object through the Status Reason screen.	
holdComments	Used to specify additional information while releasing the hold request.	No

The following table lists and describes additional attributes that are included in the hold release response:

Attribute Name	Attribute Description
requestProcessStatus	Indicates whether the hold release request is successfully processed or not. The valid values are: <ul style="list-style-type: none"> Success Failure
errormsg	Indicates the error that occurred while releasing the hold request. <p>Note: This attribute appears when the value in the requestProcessStatus attribute is set to Failure.</p>
holdEndDate	Displays the date till when the hold request is effective. <p>Note:</p> <p>The system sets the hold end date to the system date (i.e., when the hold request is released through the inbound web service).</p> <p>This attribute appears when the value in the requestProcessStatus attribute is set to Success.</p>
holdRequestStatus	Indicates the status of the hold request. The valid value is: <ul style="list-style-type: none"> Release <p>Note: This attribute appears when the value in the requestProcessStatus attribute is set to Success.</p>

Hold Direct Debit Instruction

Topics:

- [Prerequisites](#)
- [Algorithms Used in C1-AutoPayRequest](#)
- [Auto Pay Request Status Transition without Approval](#)
- [Auto Pay Request Status Transition with Approval](#)
- [Auto Pay Request Type](#)
- [Auto Pay Request \(Used for Searching\)](#)
- [Auto Pay Request \(Used for Viewing\)](#)

In the financial services and health insurance domains, there might be scenarios wherein the customers would like to review their invoices before the charges are directly debited from their accounts. In such scenarios, there is a need to hold a direct debit (i.e. automatic payment) for a bill until the confirmation is received from the customer.

Oracle Revenue Management and Billing provides the ability to hold a direct debit (i.e. automatic payment) for a bill until the confirmation is received from the customer. A new field named **Auto Pay Review Required** is added in the **Auto Pay** tab of the **Account** screen. On completing a bill for an account, the system creates the automatic payment records in the **CI_BILL_ACH** table as per the auto pay instructions defined for the account. If the **Auto Pay Review Required** option is selected, the system sets the **EXTRACT_ELIG_SW** column corresponding to the automatic payment records in the **CI_BILL_ACH** table to N. However, if the **Auto Pay Review Required** option is not selected, the system sets the **EXTRACT_ELIG_SW** column corresponding to the automatic payment records in the **CI_BILL_ACH** table to Y. The **EXTRACT_ELIG_SW** column indicates whether the automatic payment record is eligible for the extraction. If the **EXTRACT_ELIG_SW** column is set to N, the **APAYCRET** batch does not consider the automatic payment record in the **CI_BILL_ACH** table for automatic payment creation.

Once the confirmation is received for one or more bills, the system enables you to create an automatic payment request for the bills. While creating an automatic payment request, you need to specify an automatic payment request type using which you want to create the automatic payment request. It is the automatic payment request type which helps the system to determine:

- The business object using which the automatic payment request should be created in the system
- Whether the approval is required for the automatic payment request

Once you specify the automatic payment request type, the system creates the automatic payment request in the **Draft** status. You can then include the bills for which invoice confirmation is received from the customers in the automatic payment request. At least one bill should be included in the automatic payment request. Before submitting an automatic payment request, you need to do the following:

- Edit the Schedule Extract Date (if required) of each bill
- Set the **Eligible for Extraction** field of each bill to Y

You can also delete a bill from an automatic payment request when it is in the **Draft** status. Once you edit the required details of the bills in an automatic payment request, you can submit the automatic payment request. If the approval process is not configured in the respective automatic payment request type, the system does the following:

- Updates the **ELIG_EXTRACT_SW** and **APAY_CRE_DT** columns corresponding to the automatic payment records in the **CI_BILL_ACH** table
- Changes the status of the automatic payment request to **Processed**

If the approval process is configured in the respective automatic payment request type, the system changes the status of the automatic payment request to **Approval In Progress**. A To Do notification is created for the approver using the approval To Do type (specified in the respective automatic payment request type) and assigned to the users with the approval To Do role (specified in the respective automatic payment request type). Once the approver reviews an automatic payment request, the approver can approve, reject, or resubmit the automatic payment request based on the observations. If the approver approves the automatic payment request, the system does the following:

- Updates the **ELIG_EXTRACT_SW** and **APAY_CRE_DT** columns corresponding to the automatic payment records in the **CI_BILL_ACH** table
- Changes the status of the automatic payment request to **Processed**

If the approver rejects an automatic payment request, the status of the automatic payment request is changed to **Rejected**. However, if the approver requests the submitter to resubmit an automatic payment request, the status of the automatic payment request is changed to **Draft**. A To Do notification is created for the submitter using the submitter To Do type (specified in the respective automatic payment request type) and assigned to the users with the submitter To Do role (specified in the respective automatic payment request type). While rejecting or resubmitting an automatic payment request, the approver needs to specify the reason for rejection or resubmission.

To implement the hold direct debit feature, the following new screens are introduced in this release:

- **Auto Pay Request Type** - Enables you to create, edit, delete, and copy an automatic payment request type.
- **Auto Pay Request (Used for Searching)** - Enables you to search for an automatic payment request. It also enables you to create an automatic payment request.
- **Auto Pay Request (Used for Viewing)** - Enables you to edit, delete, submit, approve, reject, and resubmit the automatic payment request. It also enables you to add, edit, and delete bills from the automatic payment request.

In addition, the following changes are made to the system:

- **Auto Pay Review Required** - This field is added in the **Auto Pay** tab of the **Account** screen. It indicates whether you want to hold direct debit (i.e. automatic payment) for the bills of the account until the confirmation is received from the customer.
- **Eligible for Extraction** - This column is added in the **Auto Pay** tab of the **Bill** screen. It indicates whether the automatic payment record for the bill is eligible for extraction.

Prerequisites

To setup the auto pay request feature, you need to do the following:

- Auto pay request type business object defined in the application
- Auto pay request types defined in the system.
- Approval To Do types and To Do roles defined in the application
- Submitter To Do types and To Do roles defined in the application
- Characteristic types defined in the application

Algorithms Used in C1-AutoPayRequest

The following table lists the algorithm which is attached to the **C1-AutoPayRequest** business object:

System Event	Algorithm	Algorithm Type	Description
Information	C1-APAYRQINF	C1-APAYRQINF	Refer to C1-APAYRQINF on page 3749

The following table lists the algorithms which are used in the lifecycle of the **C1-AutoPayRequest** business object:

Status	System Event	Algorithm	Algorithm Type	Description
Draft	Exit	F1-TODOCOMPL	F1-TODOCOMPL	Refer to F1-TODOCOMPL on page 1428
Submitted	Enter	C1-APAYSUB	C1-APAYSUB	Refer to C1-APAYSUB on page 3750

Processed	-	-	-	-
Rejected	-	-	-	-

C1-APAYRQINF

The **C1-APAYRQINF** algorithm generates the auto pay request information string and is plugged in at **System Event: Information** of business object: **C1-AutoPayRequest**.

It concatenates the following fields:

- Auto Pay Request Type Description

- Auto Pay Request Status Description
- Auto Pay Request ID

F1-TODOCOMPL

This algorithm completes the To Do entries that are linked to an object when the object exits the given status. It finds and completes all open To Do entries where the business object's primary key is defined as a drill key. However, if the **Exclude To Do Entries From Auto Completion (F1-EXLTD)** characteristic is set to **Y** for a To Do type, the system does not automatically complete the respective To Do entry.

This algorithm contains the following parameter:

- **'Do Not Complete To Do Type' Char Type** – Used to specify the characteristic type that indicates whether the To Do entries should be automatically completed or not.

Note: The **F1-EXLTD** characteristic type is shipped with the product. You can either use the **F1-EXLTD** characteristic type or a custom characteristic type, if required. Note that you must specify a predefined characteristic type where the characteristic entity is set to **To Do Type** and the predefined values are set to **Y** or **N**.

C1-APAYSUB

The **C1-APAYSUB** algorithm will be plugged at the **"Enter" System event** of the business object (**C1-AutoPayRequest**) life cycle status: **SUBMITTED**.

This algorithm checks the following:

1. Whether the approval is required for the auto pay request based on the configuration in auto pay request type (**IS_APPR_REQ = Y**).
 - a. If the approval is required for the auto pay request, the status of the auto pay request is changed to **Approval In Progress**.
 - b. If the approval is not required for the auto pay request, the status of the auto pay request is changed to **UPDATEAPAY**.
2. At least one auto pay record is selected in the auto pay request.
3. Updated scheduled extraction date cannot be less than system date.
4. **Auto Pay Request** cannot be created for any auto pay record if the same auto pay record is selected in another request which is in the **Approval In Progress** status.

C1-APAYAPP

The **C1-APAYAPP** algorithm creates the following:

1. A To Do using the To Do type specified in the approval profile which is attached to the **Auto Pay Request Type**. The To Do is sent to the appropriate users in the approval hierarchy depending on whether hierarchical approval is required or not.
2. A log entry is added when a To Do is created using the To Do type. It will create To Do Entry when **Auto Pay Request** enters in the **Approval in Progress** status from **Submit** status.

C1-UPDAPAY

The **C1-UPDAPAY** algorithm will be plugged in at **"Enter" System event** of the business object (**C1-AutoPayRequest**) life cycle status: **UPDATEAPAY**.

1. The **Extract Eligible Switch** and **Auto Pay Creation Date** are updated in the **CI_BILL_ACH** table with the latest values present in **Auto Pay Request Details** table. The auto pay request status is then changed to **PROCESSED**.

2. If the bill which is present in the **Auto Pay Request** is cancelled then the latest details of **Extract Eligible Switch** and **Auto Pay Creation Date** are not updated in the **CI_BILL_ACH** table and the auto pay request status is changed to **PROCESSED**.

C1-APAYAPRVD

The **C1-APAYAPRVD** algorithm is the **Enter** status algorithm. This algorithm is invoked when you approve an **Auto Pay Request**. It confirms whether the approval flag is true and the status of the **Auto Pay request** is **APPROVED** to transit it to the next level.

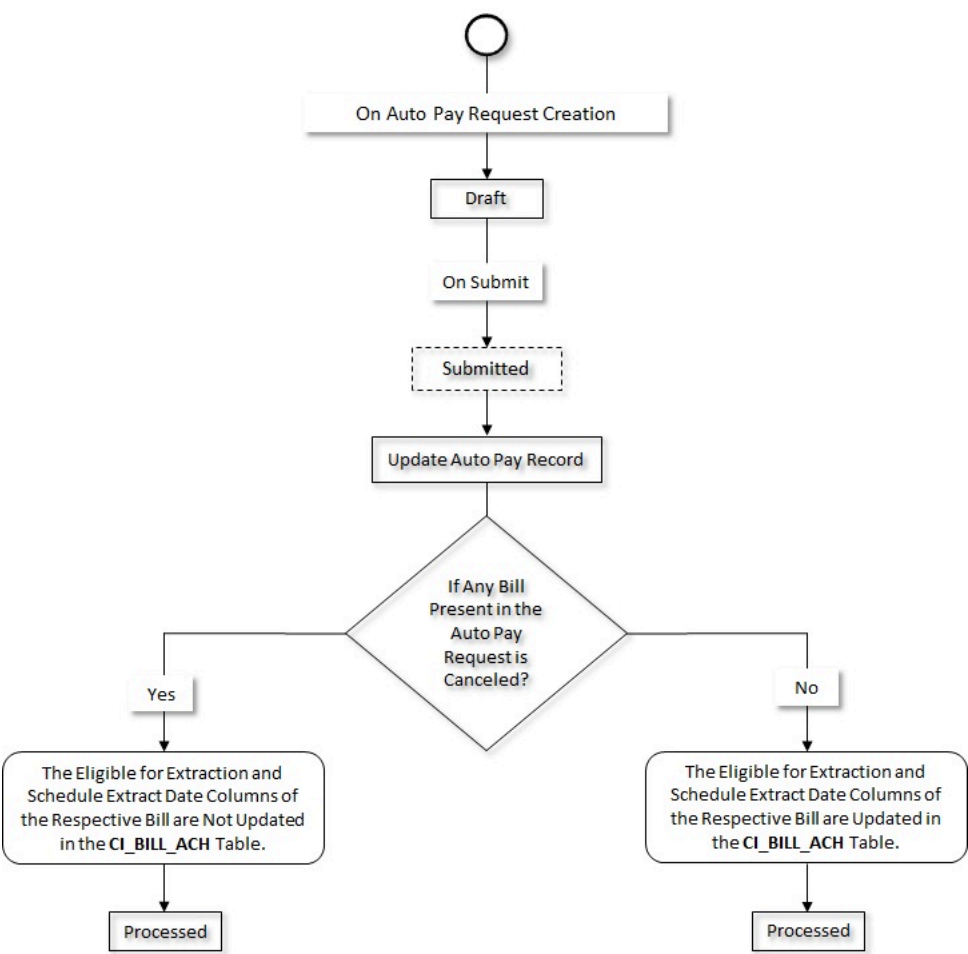

C1-APAYRESUB

The **C1-APAYRESUB** algorithm is invoked on the **Re-Submit** button. It moves the status of the **Auto Pay Request** to **Draft**.

A To Do is generated for the user as submitter whose To Do type and To Do role are fetched from the **Auto Pay Request Type**. This algorithm creates the To Do entry when the **Auto Pay Request** enters into the **Return to Submitter** status from the **Approval In Progress** status.

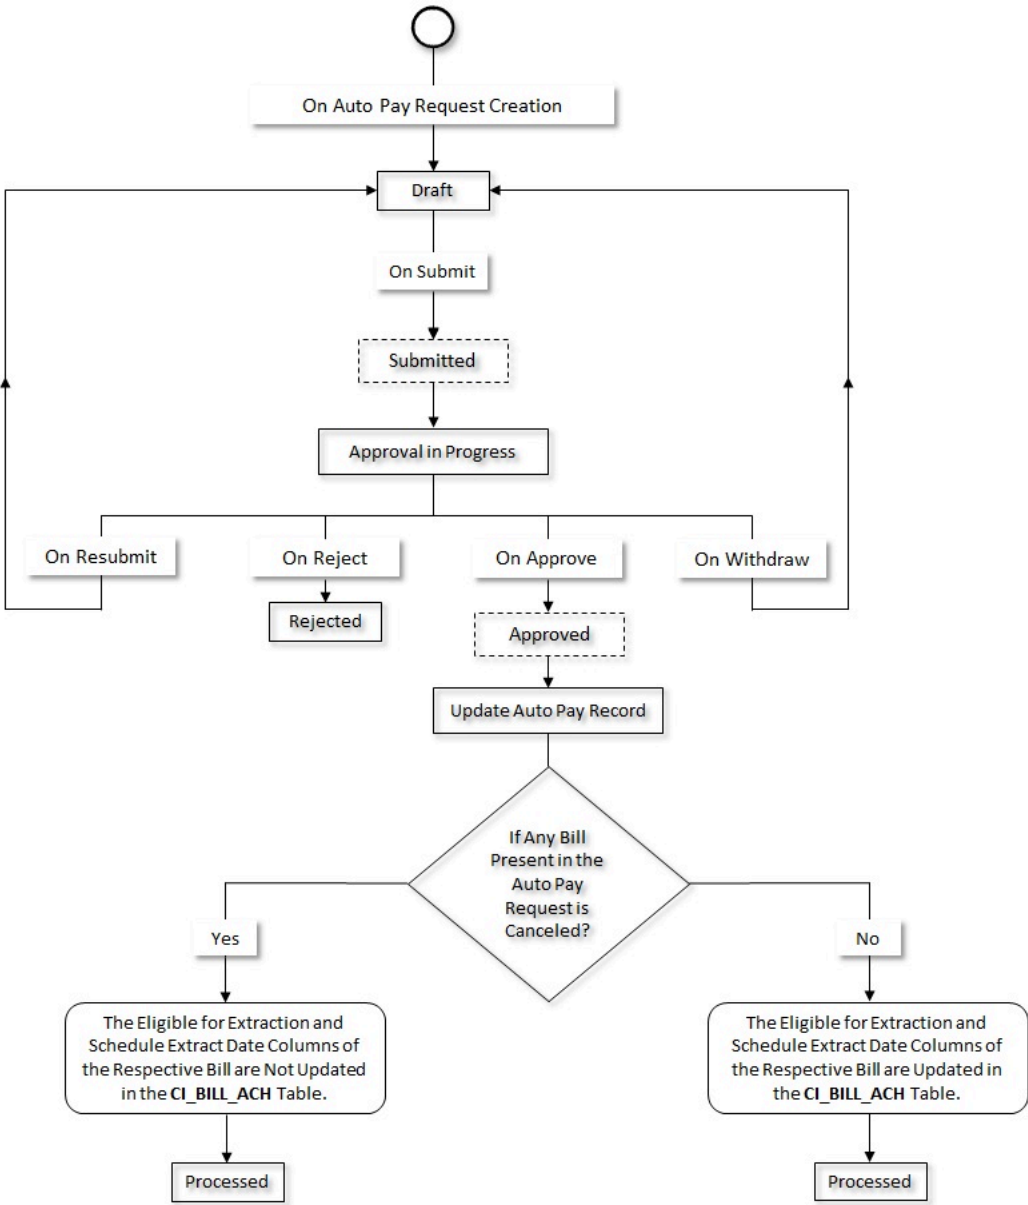

Auto Pay Request Status Transition without Approval

The following figure graphically indicates how an auto pay request moves from one status to another when the approval process is not configured in the auto pay request type:

Auto Pay Request Status Transition with Approval

The following figure graphically indicates how an auto pay request moves from one status to another when the approval process is configured in the auto pay request type:

Auto Pay Request Type

The **Auto Pay Request Type** screen allows you to define, edit, copy, and delete an auto pay request type. It also allows you to view the details of an auto pay request type. It contains the following zones:

- [Auto Pay Request Type List](#) on page 3753
- [Auto Pay Request Type](#) on page 3754

Auto Pay Request Type List

The **Auto Pay Request Type List** zone lists the auto pay request types that are already defined in the system. It contains the following columns:

Column Name	Column Description
Auto Pay Request Type	Displays the auto pay request type.
Description	Displays the description of the auto pay request type.
Edit	On clicking the Edit (✎) icon, the Auto Pay Request Type screen appears where you can edit the details of the auto pay request type.
Duplicate	On clicking the Duplicate (📄) icon, the Auto Pay Request Type screen appears where you can define an auto pay request type using an existing auto pay request type.
Delete	On clicking the Delete (🗑) icon, you can delete the auto pay request type.
	Note: You can delete an auto pay request type only when an auto pay request is not yet created using the auto pay request type.

On clicking the **Broadcast** (📡) icon corresponding to an auto pay request type, the **Auto Pay Request Type** zone appears with the details of the respective auto pay request type.

Auto Pay Request Type

The **Auto Pay Request Type** zone displays the details of the auto pay request type. It contains the following sections:

- **Main** - Displays basic information about the auto pay request type. It contains the following fields:

Field Name	Field Description
Auto Pay Request Type	Displays the auto pay request type.
Description	Displays the description of the auto pay request type.
Related Transaction BO	Indicates the business object using which the auto pay transaction is performed. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.
Detailed Description	Displays additional information about the auto pay request type.
Auto Pay Request Action	Indicates the action which is performed on the auto pay request using the auto pay request type.

Field Name	Field Description
Status	Indicates the current status of the auto pay request type. The valid values are: <ul style="list-style-type: none"> Active Inactive
Approval Required	Indicates whether approval is required for the auto pay request which is created using the auto pay request type.
Approval To Do Type	Indicates that the To Do entry of the specified To Do Type is created when you submit the auto pay request for an approval.
	Note: It has a link. On clicking the link, the To Do Type screen appears where you can view the details of the respective To Do type. This field appears only when the Approval Required option is selected.
Approval To Do Role	Indicates that the users which belong to the specified To Do role can only approve the auto pay request when it is submitted for an approval.
	Note: It has a link. On clicking the link, the To Do Role screen appears where you can view the details of the respective To Do role. This field appears only when the Approval Required option is selected.
Submitter To Do Type	Indicates that the To Do entry of the specified To Do task is created when an auto pay request is resubmitted by an approver.
	Note: It has a link. On clicking the link, the To Do Type screen appears where you can view the details of the respective To Do type.
Submitter To Do Role	Indicates that the approvers which belong to the specified To Do role can only resubmit the auto pay request.
	Note: It has a link. On clicking the link, the To Do Role screen appears where you can view the details of the respective To Do role.

- **Characteristic** - Lists the characteristics defined for the auto pay request type. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - The **Record Actions** section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the auto pay request type.
Delete	Used to delete the auto pay request type.
	Note: You can delete an auto pay request type only when an auto pay request is not yet created using the auto pay request type.

Button Name	Button Description
Duplicate	Used to create a new auto pay request type using an existing auto pay request type.

- **Record Information** - The **Record Information** section contains the following fields:

Field Name	Field Description
Business Object	Indicates the business object using which the auto pay request type is created in the system. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.

By default, the **Auto Pay Request Type** zone does not appear in the **Auto Pay Request Type** screen. It appears only when you click the **Broadcast** (📡) icon corresponding to an auto pay request type in the **Auto Pay Request Type List** zone.

Defining an Auto Pay Request Type

Prerequisites

To define an auto pay request type, you should have:

- Auto pay request type business objects defined in the application
- Approval To Do Types and To Do roles defined in the application
- Submitter To Do Types and To Do roles defined in the application

Procedure

To define an auto pay request type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **A** and then click **Auto Pay Request Type**.
A sub-menu appears.
3. Click the **Add** option from the **Auto Pay Request Type** sub-menu.

Tip: Alternatively, you can access the **Auto Pay Request Type** screen by clicking the **Add** button in the **Page Title** area of the **Auto Pay Request Type** screen.

Note: The **Select Business Object** screen appears when there are multiple auto pay request type business objects defined in the application. If there is only one auto pay request type business object defined in the application, the **Auto Pay Request Type** screen appears.

4. Select the required auto pay request type business object from the respective field.
5. Click **OK**.

The **Auto Pay Request Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the auto pay request type.
- **Characteristics** - Used to define the characteristics for the auto pay request type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Auto Pay Request Type	Used to specify the auto pay request type.	Yes
Business Object	Indicates the business object using which the auto pay request type is defined in the system.	Not applicable
Description	Used to specify the description for the auto pay request type.	Yes
Related Transaction BO	Used to indicate the business object using which the auto pay transaction is performed. The valid value is: <ul style="list-style-type: none"> • Auto Pay Request 	Yes
Detailed Description	Used to specify additional information about the auto pay request type.	No
Auto Pay Request Action	Indicates the action which is performed on the auto pay request using the auto pay request type. The valid value is: <ul style="list-style-type: none"> • Update 	Not applicable
	Note: By default, the Update option is selected and cannot be edited.	
Status	Used to indicate the current status of the auto pay request type. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	Yes
	Note: You cannot change the status of an auto pay request type to Inactive when an auto pay request created using the auto pay request type is in the Draft or Rejected status.	
Approval Required	Used to indicate whether approval is required for the auto pay request which is created using the auto pay request type.	No
Approval To Do Type	Used to specify the To Do entry of the specified To Do Type that is created when you submit the auto pay request for an approval.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The Search (🔍) icon appears corresponding to the Approval To Do Type field. On clicking the Search icon, the To Do Type Search window appears.</p> <p>On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field.</p> <p>This field appears only when the Approval Required check box is selected.</p>	<p>Note: This field is required while approving an auto pay request which is created using the auto pay request type.</p>
Approval To Do Role	Used to indicate the users which belong to the specified To Do role who can approve the auto pay request when it is submitted for an approval.	Yes (Conditional)
	<p>Note:</p> <p>The list includes only those To Do roles which are associated with the specified Approval To Do Type.</p> <p>This field appears only when the Approval Required check box is selected.</p>	<p>Note: This field is required while approving an auto pay request which is created using the auto pay request type.</p>
Submitter To Do Type	Used to indicate the To Do entry of the specified To Do Type that is created when an auto pay request is resubmitted by an approver.	Yes (Conditional)
	<p>Note:</p> <p>The Search (🔍) icon appears corresponding to the Submitter To Do Type field. On clicking the Search icon, the To Do Type Search window appears.</p> <p>On specifying the To Do type, the description of the To Do type appears corresponding to the Submitter To Do Type field.</p> <p>This field appears only when the Approval Required check box is selected.</p>	<p>Note: This field is required while resubmitting an auto pay request which is created using the auto pay request type.</p>
Submitter To Do Role	Used to indicate the users which belong to the specified To Do role who can resubmit the auto pay request when it is submitted for an approval.	Yes (Conditional)
	<p>Note:</p> <p>The list includes only those To Do roles which are associated with the specified Submitter To Do Type.</p> <p>This field appears only when the Approval Required check box is selected.</p>	<p>Note: This field is required while resubmitting an auto pay request which is created using the auto pay request type.</p>

6. Enter the required details in the **Main** section.

- 7. Define a list of characteristics for the auto pay request type, if required.
- 8. Click **Save**.
The auto pay request type is defined.

Defining a Characteristic for an Auto Pay Request Type

Prerequisites

To define a characteristic for an auto pay request type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Auto Pay Request Type**)

Procedure

To define a characteristic for an auto pay request type:

1. Ensure that the **Characteristics** section is expanded when you are defining, editing, or copying an auto pay request type.

The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to Auto Pay Request Type .	Note: This field is required while defining a characteristic for the auto pay request type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the Search (🔍) icon appears corresponding to the Characteristic Value field. On clicking the Search icon, you can search for the respective characteristic value. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the Characteristic Value field.	Note: This field is required while defining a characteristic for the auto pay request type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the auto pay request type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a characteristic from the auto pay request type, click the **Delete** (🗑️) icon corresponding to the characteristic.

Editing an Auto Pay Request Type

Prerequisites

To edit an auto pay request type, you should have:

- Auto pay request type that you want to edit defined in the application

Procedure

To edit an auto pay request type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **A** and then click **Auto Pay Request Type**.
A sub-menu appears.
3. Click the **Search** option from the **Auto Pay Request Type** sub-menu.
The **Auto Pay Request Type** screen appears.
4. In the **Auto Pay Request Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the auto pay request type whose details you want to edit.

The **Auto Pay Request Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the auto pay request type.
- **Characteristics** - Used to define the characteristics for the auto pay request type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Auto Pay Request Type	Displays the auto pay request type.	Not applicable
Business Object	Indicates the business object using which the auto pay request type is defined in the system.	Not applicable
Description	Used to specify the description for the auto pay request type.	Yes
Related Transaction BO	Used to indicate the business object using which the auto pay transaction is performed.	Yes
Detailed Description	Used to specify additional information about the auto pay request type.	No
Auto Pay Request Action	Displays the action which is performed on the auto pay request using the auto pay request type.	Not applicable

Field Name	Field Description	Mandatory (Yes or No)
Status	Used to indicate the status of the auto pay request type. The valid values are: <ul style="list-style-type: none"> Active Inactive 	Yes
Approval Required	Used to indicate whether approval is required for the auto pay request which is created using the auto pay request type.	No
Approval To Do Type	<p>Used to indicate the To Do task which is performed by the approver while approving the auto pay request.</p> <p>Note:</p> <p>The Search (🔍) icon appears corresponding to the Approval To Do Type field. On clicking the Search (🔍) icon, the To Do Type Search window appears.</p> <p>On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field.</p> <p>This field appears when the Approval Required option is selected.</p>	Yes

Copying an Auto Pay Request Type

Instead of creating an auto pay request type from scratch, you can create a new auto pay request type using an existing auto pay request type. This is possible through copying an auto pay request type. On copying an auto pay request type, the details including the characteristics are copied to the new auto pay request type. You can then edit the details, if required.

Prerequisites

To copy an auto pay request type, you should have:

- Auto pay request type (whose copy you want to create) defined in the application
- Auto pay request business objects defined in the application

Procedure

To copy an auto pay request type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **A** and then click **Auto Pay Request Type**.
A sub-menu appears.
3. Click the **Search** option from the **Auto Pay Request Type** sub-menu.
The **Auto Pay Request Type** screen appears.
4. In the **Auto Pay Request Type List** zone, click the **Duplicate** (📄) icon in the **Duplicate** column corresponding to the auto pay request type whose copy you want to create.

The **Auto Pay Request Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the auto pay request type.
- **Characteristics** - Used to define the characteristics for the auto pay request type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Auto Pay Request Type	Used to specify the auto pay request type.	Yes
Business Object	Indicates the business object using which the auto pay request type is defined in the system.	Not applicable
Description	Used to specify the description for the auto pay request type.	Yes
Related Transaction BO	Used to indicate the business object using which the auto pay transaction is performed.	Yes
Detailed Description	Used to specify additional information about the auto pay request type.	No
Status	Used to indicate the status of the auto pay request type. The valid values are: <ul style="list-style-type: none"> Active Inactive 	Yes
Approval Required	Used to indicate whether approval is required for the auto pay request which is created using the auto pay request type.	No
Approval To Do Type	Used to indicate the To Do task which is performed by the approver while approving the auto pay request.	Yes
	Note: The Search (🔍) icon appears corresponding to the Approval To Do Type field. On clicking the Search icon, the To Do Type Search window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field. This field appears when the Approval Required option is selected.	
Approval To Do Role	Used to indicate the users with the specified To Do role who can approve the auto pay request.	Yes
	Note: The list includes only those To Do roles which are associated with the approval To Do type. This field appears when the Approval Required option is selected.	
Submitter To Do Type	Used to indicate the To Do task created when an auto pay request is submitted by an approver.	Yes

Field Name	Field Description	Mandatory (Yes or No)
	Note: The Search (🔍) icon appears corresponding to the Submitter To Do Type field. On clicking the Search icon, the To Do Type Search window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Submitter To Do Type field.	
Submitter To Do Role	Used to indicate the users with the specified To Do role who can submit the auto pay request for approval. Note: The list includes only those To Do roles which are associated with the submitter To Do type.	Yes

Tip: Alternatively, you can copy an auto pay request type by clicking the **Duplicate** button in the **Auto Pay Request Type** zone.

- 5. Enter the required details in the **Main** section.
- 6. Define, edit, or remove characteristics of the auto pay request type, if required.
- 7. Click **Save**.
The new auto pay request type is defined.

Deleting an Auto Pay Request Type

Procedure

To delete an auto pay request type:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **A** and then click **Auto Pay Request Type**.
A sub-menu appears.
- 3. Click the **Search** option from the **Auto Pay Request Type** sub-menu.
The **Auto Pay Request Type** screen appears.
- 4. In the **Auto Pay Request Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the *auto* pay request type that you want to delete.

A message appears confirming whether you want to delete the auto pay request type.

Tip: Alternatively, you can delete an auto pay request type by clicking the **Delete** button in the **Auto Pay Request Type** zone.

5. Click **OK**.
The auto pay request type is deleted.

Auto Pay Request (Used for Searching)

The **Auto Pay Request** screen allows you to search for an auto pay request using various search criteria. It contains the following zone:

- [Search Auto Pay Request](#) on page 3766

Through this screen, you can navigate to the following screen:

- [Auto Pay Request \(Used for Viewing\)](#) on page 3771

Search Auto Pay Request

The **Search Auto Pay Request** zone allows you to search for an auto pay request using various search criteria. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Search By	Used to indicate whether you want to search for an auto pay request using the auto pay request or person, account or bill details. The valid values are: <ul style="list-style-type: none"> • Request Details • Person, Account or Bill Details 	Yes
	Note: By default, the Request Details option is selected.	
Auto Pay Request Type	Used to search auto pay requests which are created using a particular auto pay request type.	No
	Note: This field appears when the Request Details option is selected from the Search By list.	
Status	Used to search auto pay requests with a particular status. The valid values are: <ul style="list-style-type: none"> • Approved • Approval in Progress • Draft • Processed • Rejected • Update Auto Pay Record 	Yes
	Note: This field appears when the Request Details option is selected from the Search By list.	
Created From	Used to search auto pay requests which are created from a particular date onwards.	No
	Note: This field appears when the Request Details option is selected from the Search By list.	
User ID	Used to search auto pay requests which are created by a particular user.	No
	Note: This field appears when the Request Details option is selected from the Search By list.	

Field Name	Field Description	Mandatory (Yes or No)
Created Until	Used to search auto pay requests which are created till a particular date.	No
	Note: This field appears when the Request Details option is selected from the Search By list.	
Auto Pay Request ID	Used to search a particular auto pay request.	No
	Note: This field appears when the Request Details option is selected from the Search By list.	
Person ID	Used to search auto pay requests which include bills of a particular person.	No
	Note: The Search (🔍) icon appears corresponding to the Person ID field. On clicking the Search icon, the Person Search window appears. This field appears when the Person, Account or Bill Details option is selected from the Search By list.	
Account ID	Used to search auto pay requests which include bills of a particular account.	No
	Note: The Search (🔍) icon appears corresponding to the Account ID field. On clicking the Search icon, the Account Search window appears. This field appears when the Person, Account or Bill Details option is selected from the Search By list.	
Bill ID	Used to search auto pay requests which include a particular bill.	No
	Note: The Search (🔍) icon appears corresponding to the Bill ID field. On clicking the Search icon, the Bill Search window appears. This field appears when the Person, Account or Bill Details option is selected from the Search By list.	
From Bill Date	Used to search auto pay requests which include bills created from a particular date onwards.	No

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field appears when the Person, Account or Bill Details option is selected from the Search By list.	
Auto Pay ID	Used to search auto pay requests which include bills of a particular auto pay ID. Note: This field appears when the Person, Account or Bill Details option is selected from the Search By list.	No
To Bill Date	Used to search auto pay requests which include bills created till a particular date. Note: This field appears when the Person, Account or Bill Details option is selected from the Search By list.	No

Note: You must specify at least one search criterion while searching for an auto pay request.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Creation Date Time	Displays the date and time when the auto pay request is created.
Auto Pay Request Information	Displays the concatenated string of information about the auto pay request. Note: It has a link. On clicking the link, the Auto Pay Request screen appears where you can view the details of the respective auto pay request.
Status	Indicates the status of the auto pay request. The valid values are: <ul style="list-style-type: none"> • Approved • Approval in Progress • Draft • Processed • Rejected • Update Auto Pay Record
Auto Pay Request Type	Indicates the type of the auto pay request.
Created By	Indicates the concatenated string of the user information who has created the auto pay request.

Note: Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Searching for an Auto Pay Request

Prerequisites

To search for an auto pay request, you should have:

- Auto pay request types defined in the application

Procedure

To search for an auto pay request:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Accounting and Receivable** and then click **Auto Pay Request**.
A sub-menu appears.
3. Click the **Search** option from the **Auto Pay Request** sub-menu.
The **Auto Pay Request** screen appears.
4. Enter the search criteria in the **Search Auto Pay Request** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of auto pay requests that meet the search criteria appears in the **Search Results** section.

Creating an Auto Pay Request

Prerequisites

To create an auto pay request, you should have:

- Auto pay request types defined in the application

Procedure

To create an auto pay request:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Accounting and Receivable** and then click **Auto Pay Request**.
A sub-menu appears.

3. Click the **Add** option from the **Auto Pay Request** sub-menu.

The **Add Auto Pay Request** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Auto Pay Request Type	Used to indicate the auto pay request type using which you want to create the auto pay request for the bills.	Yes

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Auto Pay Request** screen.

4. Select the required auto pay request type from the **Add Auto Pay Request** screen.
5. Click **OK**.

The **Auto Pay Request** screen appears with the auto pay request details in the **Draft** status.

6. Add the auto pay line items of the bills by searching for the bills in the **Search Bills** zone of the **Auto Pay Request - Bills** tab.
7. Define characteristics for the auto pay request by editing the auto pay request, if required.
8. Add logs for the auto pay request in the **Auto Pay Request Log** zone of the **Auto Pay Request - Log** tab, if required.

 - 2. In the **Search Results** section, click the link in the **Auto Pay Request Information** column corresponding to the auto pay request whose details you want to view.
The **Auto Pay Request** screen appears.
 - 3. Click the **Log** tab.
The **Log** tab appears.
 - 4. View the complete trail of actions performed on the auto pay request in the **Auto Pay Request Log** zone.

Adding a Log Entry for an Auto Pay Request

Procedure

To add a log entry for an auto pay request:

1. Search for the auto pay request in the **Search Auto Pay Request** zone of the **Auto Pay Request** screen.
2. In the **Search Results** section, click the link in the **Auto Pay Request Information** column corresponding to the auto pay request for which you want to add a log entry.
The **Auto Pay Request** screen appears.
3. Click the **Log** tab.
The **Log** tab appears.
4. Click the **Add Log Entry** link in the upper right corner of the **Auto Pay Request Log** zone.

The **Add Request Log** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Auto Pay Request ID	Displays the auto pay request ID.	Not applicable
Log Details	Used to specify additional comments for the auto pay request.	Yes

5. Enter the comments in the **Log Details** field.
6. Click **Save**.
The log entry is added in the **Auto Pay Request Log** zone.

Chapter

47

Garbling Customer Information

Oracle Revenue Management and Billing enables you to garble the personal information of a customer, such as the customer name, address, email ID, social security number or any other identifier, birth date, gender, and so on. On receiving the data erasure request from a customer, the data controller will garble the personal information of the customer by masking the data with random characters and then cease the access to the customer records.

To garble the information of one or more persons, you need to do the following:

1. Define the **Garble Data (C1-GRBL)** characteristic for each person whose data needs to be garbled and set its value to **Y**.
2. Execute the **Garble Person Information (C1-GRBPI)** batch. For more information about this batch, see *Oracle Revenue Management and Billing Batch Guide*.

On executing the **Garble Person Information (C1-GRBPI)** batch, the system identifies the persons where the **Garble Data (C1-GRBL)** characteristic is set to **Y** and the **Garbling Completed (C1-GBCM)** characteristic is either not defined or set to **N**. Note that the system considers the **Garble Data (C1-GRBL)** characteristic value which is effective on the batch business date.

Once the persons are identified, the data in the following fields is masked with random characters across all records in the system:

- ACCOUNT_NBR
- ACCT_NBR
- ADDRESS1
- ADDRESS1_UPR
- ADDRESS2
- ADDRESS3
- ADDRESS4
- BIRTH_DT
- BROKER_NAME
- CITY
- COUNTRY
- COUNTY
- CUSTOMER_NAME
- EMAILID
- ENTITY_NAME
- ENTITY_NAME1
- ENTITY_NAME2
- ENTITY_NAME3
- GEO_CODE
- HOUSE_TYPE

- IN_CITY_LIMIT
- NAME1
- OVRD_MAIL_NAME1
- OVRD_MAIL_NAME2
- OVRD_MAIL_NAME3
- PER_ID_NBR
- PHONE
- POSTAL
- POSTAL_UPR
- STATE

In other words, the personal and account related information of a customer is garbled across the system. In addition, this batch allows you to garble the required characteristics and identifiers of a person and account.

Note: An account may have one or more persons linked to it. The information of an account is garbled when the data erasure request is received for the main customer of the account.

Once the personal and account related information of a customer is garbled, the access group of the person is changed to **C1GB** (which does not have any data access role). This ensures that the data of the person and his or her accounts cannot be accessed from any screens in the system. If an approval transaction contains personal and account related information of a customer, you cannot even view the approval transaction in the system.

Note: The access is forbidden for performing any transaction for the person and account only from the user interface and web services and not through the background process.

You can also garble the data of a person using the **C1-GRBPI** inbound web service. However, you can garble the data of only one person at a time using this inbound web service.

Chapter

48

Deleting Inactive Customer or Closed Account Information

Oracle Revenue Management and Billing enables you to delete all records of a person or account from the system. A new batch named **C1-GDPR** is introduced in this release. It enables you to delete all records of a person or account from the system. You can either delete the records of a particular person or account using its ID or delete the records of a set of persons or accounts at once using its characteristic. A new characteristic type named **C1-GDPRE** is shipped with the product. While executing the batch, the system first checks whether the person or account ID is specified in the batch. If so, the batch deletes the records of the respective person or account from the system. You cannot specify both the person and account ID at the same time while executing the batch.

If the person or account ID is not specified while executing the batch, the system checks whether the **Delete Characteristic Type** parameter is defined in the **C1-GDPR** batch. You can define the **C1-GDPRE** characteristic for the persons or accounts whose records you want to delete from the system. If you set the **Delete Characteristic Type** parameter in the **C1-GDPR** batch to **C1-GDPRE**, the batch considers those person or accounts for deletion where the **C1-GDPRE** characteristic is set to **Y**.

The system deletes all records of a particular account only when the following conditions are met:

- account's closing date is earlier than or equal to system date
- All contracts of the account should either be in the **Closed** or **Canceled** status

The system deletes all records of a particular person only when the following conditions are met:

- The closing date of all its accounts is earlier than or equal to system date
- All contracts of all its accounts should either be in the **Closed** or **Canceled** status

The **C1-GDPR** batch contains the following parameters:

- **Account ID** - Used to indicate the account whose records you want to delete from the system.
- **Person ID** - Used to indicate the person whose records you want to delete from the system.
- **Delete Characteristic Type** - Used to specify the characteristic type. Here, you must specify the **C1-GDPRE** characteristic type. The system then considers those person or accounts for deletion where the **C1-GDPRE** characteristic is set to **Y**.
- **Clear CLOB Data** - Used to indicate whether you want to delete the references of the persons or accounts considered for deletion from the CLOB data. The valid values are **Y** and **N**. Note that if you set the value for this

parameter to **Y**, the performance of the batch would be impacted when there is voluminous data.

- **Thread Pool Name** - Used to specify the thread pool on which you want to execute the batch.

The **C1-GDPR** batch is a multi-threaded batch. The multi-threading is based on the person or account ID and chunks for multi-threading are created based on numerical distribution of person or account ID.

Chapter

49

Automatic Refund

Until now, the system considered the records with the debit amount in the **CI_BILL_ACH** table during the **Create Automatic Payments and Refunds (APAYCRET)** batch execution. Now, the system considers the records with the debit and credit amount in the **CI_BILL_ACH** table during the **Create Automatic Payments and Refunds (APAYCRET)** batch execution. If the automatic payment amount stamped against a bill is in debit, the batch creates automatic payment and payment event for such bill. It also creates a clearing record for each automatic payment in the **CI_APAY_CLR_STG** table. The payment freeze date in the clearing records is set to NULL. The automatic payment is created when an algorithm using the **APAY-CREATE** algorithm type is created and attached to the **Automatic Payment Creation** system event in the installation options.

However, if the automatic payment amount stamped against a bill is in credit, the batch creates a refund request against the bill. The refund request is created when an algorithm using the **CI-AREF-CRET** algorithm type is created and attached to the **Automatic Adjustment Creation** system event in the installation options. This algorithm indicates the refund request type using which the refund request must be created. If the approval workflow is configured for the refund request type, the status of the refund request is set to **Pending for Approval**. However, if the approval workflow is not configured for the refund request type, the status of the refund request is set to **Processed** and the refund adjustment is created in the **Frozen** status. In addition, it creates a clearing record for each automatic refund in the **CI_ADJ_CLR_STG** table.

The refund request and refund adjustments are created when the automatic payment amount is in credit irrespective of whether the **Autopay Creation Option** field in the installation options is set to **Create At Bill Completion**, **Create On Extract Date**, or **Freeze Payment on Notification**.

Note: In the **Freeze Payment on Notification** feature, the automatic payments and refunds are created. However, at present, you cannot activate and extract the automatic refund clearing records using the **Activate Automatic Payments (ACTVTAPY)** and **Extract Automatic Payments (APAYACH)** batches, respectively. The implementation team will have to develop the custom logic to activate and extract automatic refund clearing records in a flat file.

If required, you can void the refund request and cancel the refund adjustments from the user interface. If the **Autopay Creation Option** field in the installation options is set to **Freeze Payment on Notification**, you can void the refund request and cancel the refund adjustments using the **Cancel Automatic Refunds (AREFRA)** batch once the review comments are stored in the staging tables.

Chapter

50

Payment Distribution

Topics:

- [Account Level Payment Distribution](#)
- [Statement Level Payment Distribution](#)

Until now, you were able to distribute payments against a particular bill and/or contract. Now, the system enables you to distribute payments against the unpaid bills of the account or statement. For more information, refer to the following topics:

- [Account Level Payment Distribution](#) on page 3794
- [Statement Level Payment Distribution](#) on page 3795

Account Level Payment Distribution

Until now, you were able to match a payment against a particular bill of an account. Oracle Revenue Management and Billing now provides the ability to apply a payment on an account which will get matched against the unpaid bills of the account. This feature is only applicable for accounts which practice open item accounting. The system supports the account level payment distribution through the following modes:

- Inbound web service
- EDI 820 file
- Payment request
- Payment upload

While creating a match type for the account level payment distribution, you must set the entity type of the match type to **Account**. Earlier, the manual distribution algorithm of a match type was invoked only when the payment distribution was done through the payment request feature. Now, the manual distribution algorithm of a match type is invoked when the payment distribution is done using any of the above modes. The existing manual distribution algorithm spot of a match type is enhanced to support the account level payment distribution. In case of the account level payment distribution, the manual distribution algorithm spot receives the account ID as the input parameter. When this algorithm spot is invoked through the payment request feature, the account ID is passed as the match value. However, when this algorithm spot is invoked through the inbound web service, EDI 820, and payment upload feature, the account ID is not passed as the match value. Instead, the payment is distributed using the payee account ID. The manual distribution algorithm spot then returns a list of unpaid bills of the account.

A new manual distribution algorithm named **C1-MD-ACCT** is introduced in this release. It distributes the payment amount against the unpaid bills of the account in the ascending order of due date (i.e. bill with the oldest due date will have high priority). If there are multiple unpaid bills with the same due date, the system distributes the payment amount against the unpaid bills in the ascending order of the unpaid amount (i.e. bill with the lowest amount will have high priority). And, if there are two or more unpaid bills with the same due date and unpaid amount, the system will randomly distribute the payment amount against any of the unpaid bills of the account.

Once the system distributes the payment amount against the unpaid bills of the account, the system creates a payment for each unpaid bill. Here, all these payments would be created under the same payment event.

Any excess amount that is left after distributing the payments on the unpaid bills of the account should be applied on the on-account contract of the account. The system derives the on-account contract using the contract type specified in the **On-Account Contract Type** option type of the **C1-ADJ-PAY** feature configuration. If the on-account contract of the specified contract type is not available for the account, the system creates on-account contract using the contract type specified in the **On-Account Contract Type** option type of the **C1-ADJ-PAY** feature configuration. The system then parks the excess credit payment on the on-account contract of the account.

While creating the excess credit payment, the system uses the match type which is specified in the **On-Account Match Type** option type of the **C1-ADJ-PAY** feature configuration.

Once all payments including the excess credit payment is created, the system will store the payee account ID on all payments when the payment is applied at the account level. The payee account ID is stored as a characteristic using the characteristic type which is specified in the **Account Level Payment Characteristic Type** option type of the **C1-ADJ-PAY** feature configuration. The **C1-ACPAY** characteristic type is shipped with the product.

Note that you can apply payments on the account level using the single-step approach of the **PUPL** batch and not using the three-step approach of the **PUPL** batch. Also, note that multi tender distribution is not supported for the account level payment distribution.

Statement Level Payment Distribution

Until now, you were able to match a payment against a particular bill of an account. Oracle Revenue Management and Billing now provides the ability to apply a payment on a statement which will get matched against the unpaid bills on the statement. The bills on a statement may belong to the same or different accounts of the person for whom the statement is created using the statement construct. Note that the system supports the statement level payment distribution for those statements:

- Which are created using the statement constructs comprising of one or more accounts and no contracts (under construct details)
- Which are in the **Printed** status

This feature is only applicable for accounts which practice open item accounting. The system supports the statement level payment distribution through the following modes:

- Inbound web service
- EDI 820 file
- Payment request
- Payment upload

While creating a match type for the statement level payment distribution, you must set the entity type of the match type to **Statement**. Earlier, the manual distribution algorithm of a match type was invoked only when payment distribution was done through the payment request feature. Now, the manual distribution algorithm of a match type is invoked when the payment distribution is done using any of the above modes. The existing manual distribution algorithm spot of a match type is enhanced to support the statement level payment distribution. In case of the statement level payment distribution, the manual distribution algorithm spot receives the statement ID as the input parameter. When this algorithm spot is invoked through the payment request feature, the statement ID is passed as the match value. However, when this algorithm spot is invoked through the inbound web service, EDI 820, or payment upload feature, the statement ID is not passed as the match value. Instead, the statement ID is directly fetched from the dataset. The manual distribution algorithm spot then returns a list of unpaid bills on the statement.

A new manual distribution algorithm named **C1-MD-STMT** is introduced in this release. It distributes the payment amount against the unpaid bills of the statement in the ascending order of due date (i.e. bill with the oldest due date will have high priority). If there are multiple unpaid bills with the same due date, the system distributes the payment amount against the unpaid bills in either of the following two ways:

- In the ascending order of the unpaid amount (i.e. bill with the lowest amount will have high priority)
- Using the weighted distribution based on the unpaid amount of each bill

If you want to distribute the payment amount using the former method, you must set the **Weighted distribution of payments among bills of same age. (Valid Values :Y,N)** parameter of the **C1-MD-STMT** algorithm to **N**. However, if you want to distribute the payment amount using the latter method, you must set the **Weighted distribution of payments among bills of same age. (Valid Values :Y,N)** parameter of the **C1-MD-STMT** algorithm to **Y**.

Once the system distributes the payment amount against the unpaid bills of the statement, the system creates a payment for each unpaid bill. Here, all these payments would be created under the same payment event.

Any excess amount that is left after distributing the payments on the unpaid bills of the statement should be applied on the on-account contract of the account. The person linked to the statement construct using which the statement is created should have an account which will be used to park the excess amount paid on a statement. If the account is not available and the payment against a statement is in excess of the total unpaid balance of the statement, then the entire payment on the statement ID will be errored out and won't be applied on any of the bills.

The system derives the on-account contract of the account using the contract type specified in the **On-Account Contract Type** option type of the **C1-ADJ-PAY** feature configuration. If the on-account contract of the specified contract type is not available for the account, the system creates on-account contract using the contract type specified in the **On-Account Contract Type** option type of the **C1-ADJ-PAY** feature configuration. The system then parks the excess credit

payment on the on-account contract of the account. While creating the excess credit payment, the system uses the match type which is specified in the **On-Account Match Type** option type of the **C1-ADJ-PAY** feature configuration.

Once all payments including the excess credit payment is created, the system will store the statement ID on all payments when the payment is applied at the statement level. The statement ID is stored as a characteristic using the characteristic type which is specified in the **Statement Level Payment Characteristic Type** option type of the **C1-ADJ-PAY** feature configuration. The **C1-STPAY** characteristic type is shipped with the product.

Note that you can apply payments on the statement level using the single-step approach of the **PUPL** batch and not using the three-step approach of the **PUPL** batch. Also, note that multi tender distribution is not supported for the statement level payment distribution.

Note: At the moment, you can delete a statement which is used for the payment distribution from the user interface. The system neither performs any validation during the statement deletion nor cancels any payments when a statement is deleted. Therefore, you need to ensure that you do not delete any statements which are used for payment distribution in the system.

Chapter

51

Mass Payment Transfer

Topics:

- [Full Payment Transfer](#)
- [Partial Payment Transfer](#)
- [Mass Payment Transfer Process](#)
- [CSV File Format for Mass Payment Transfer](#)
- [Sample CSV File for Mass Payment Transfer](#)

Oracle Revenue Management and Billing facilitates mass payment transfer using the **File Upload Interface** feature. In the mass payment transfer, you can transfer multiple payments at once. You can transfer payments at the payment or payment event level (i.e. transfer an individual payment or all payments of a payment event at once). However, note that you can transfer only those payments which are in the **Frozen** status.

You can upload the data for either full or partial payment transfer in the CSV format through the **File Transformation and Upload (C1-FTRAN)** batch. While executing the **File Transformation and Upload (C1-FTRAN)** batch, you need to specify a file request type which indicates the XPath of the fields where the data from the CSV record should be stored while transforming the data in the XML format using the **C1-TransferPaymentService** business service. Once each CSV file record is transformed in the XML format, you can transfer payments through the **File Request Processing (C1-FREQP)** batch.

Full Payment Transfer

You can upload the data for full payment transfer from the CSV file using the **File Upload Interface** utility. Ideally, you should not specify the transfer amount during the full payment transfer. If you do not specify the transfer amount or if the transfer amount is equal to the payment amount or to the sum of all frozen payments in the payment event, the system does the full payment transfer. However, if the transfer amount is less than the payment amount or the sum of all frozen payments in the payment event, the system does the partial payment transfer. Note that the payment transfer amount should not be more than the payment amount or the sum of all frozen payments in the payment event. Also, note that you should only transfer positive payments which are in the **Frozen** status and where the payment amount is greater than zero using the **File Upload Interface** utility.

While doing full payment transfer at the payment level, the system cancels the old payment and creates one new payment using the specified match type in the **Frozen** status. For example, the P1 payment is created against the contract of the A1 account, as shown in the following table:

Account	Payment Event	Payment Details	Match Type	Match Value	Amount	Status
A1	PE1	P1	Suspense Contract	C1	\$200	Frozen

Now, when you fully transfer the payment using the match type as Bill from the A1 to A2 account, the system will cancel the old payment and create a new payment as shown in the following table:

Account	Payment Event	Payment Details	Match Type	Match Value	Amount	Status
A1	PE1	P1	Suspense Contract	C1	\$200	Canceled
A2	PE2	P2	Bill	Bill1	\$200	Frozen

While doing full payment transfer at the payment event level, the system fetches the list of frozen payments linked to the payment event and then adds them in the **C1_PAY_DETAILS** table. In addition, the system sets the **PY_CANCEL_SW** column corresponding to the payments in the **C1_PAY_DETAILS** table to **Y**. Let us assume that the following payments are made to the A1 account through the PE1 payment event:

Account	Payment Event	Payment Details	Match Type	Match Value	Amount	Status
A1	PE1	P1	Suspense Contract	C1	\$100	Frozen
		P2	On Account Contract	C2	\$50	Frozen
		P3	Suspense Contract	C3	\$100	Frozen
		P4	Overpayment on Bill	C4	\$100	Frozen
		P5	On Account Contract	C5	\$100	Frozen
		P6	Suspense Contract	C1	\$100	Frozen

Account	Payment Event	Payment Details	Match Type	Match Value	Amount	Status
		P7	On Account Contract	C5	\$100	Frozen
		P8	Overpayment on Bill	C4	\$75	Canceled
		P10	Bill	Bill1	\$200	Frozen
		P11	Bill	Bill2	\$100	Frozen
		P12	Bill	Bill3	\$350	Frozen
		P13	Bill	Bill2	\$25	Canceled

Now, if you want to fully transfer the payments from the A1 account to the A2 account using the match type as Bill, the system considers the following payments for transfer from the payment list:

Account	Payment Event	Payment Details	Match Type	Match Value	Amount	Status
A1	PE1	P1	Suspense Contract	C1	\$100	Frozen
		P2	On Account Contract	C2	\$50	Frozen
		P3	Suspense Contract	C3	\$100	Frozen
		P4	Overpayment on Bill	C4	\$100	Frozen
		P5	On Account Contract	C5	\$100	Frozen
		P6	Suspense Contract	C1	\$100	Frozen
		P7	On Account Contract	C5	\$100	Frozen
		P10	Bill	Bill1	\$200	Frozen
		P11	Bill	Bill2	\$100	Frozen
		P12	Bill	Bill3	\$350	Frozen

Then, the system will cancel the old payments and create a new payment, as shown in the following table:

Account	Payment Event	Payment Details	Match Type	Match Value	Amount	Status
A1	PE1	P1	Suspense Contract	C1	\$100	Canceled
		P2	On Account Contract	C2	\$50	Canceled
		P3	Suspense Contract	C3	\$100	Canceled

Account	Payment Event	Payment Details	Match Type	Match Value	Amount	Status
		P4	Overpayment on Bill	C4	\$100	Canceled
		P5	On Account Contract	C5	\$100	Canceled
		P6	Suspense Contract	C1	\$100	Canceled
		P7	On Account Contract	C5	\$100	Canceled
		P10	Bill	Bill1	\$200	Canceled
		P11	Bill	Bill2	\$100	Canceled
		P12	Bill	Bill3	\$350	Canceled
A2	PE2	P1	Bill	Bill4	\$1300	Frozen

Partial Payment Transfer

You can upload the data for partial payment transfer from the CSV file using the **File Upload Interface** utility. The transfer amount is required for partial payment transfer. Therefore, the **Transfer Amount** column should be added in the CSV file while uploading the data for partial payment transfer. You should update the existing file request type to include the **Transfer Amount** field in the **Field Transformation** section.

You can specify the transfer amount either less than or equal to the payment amount or to sum of all frozen payments in the payment event depending on whether payment transfer is done at the payment or payment event level. If you do not specify the transfer amount or if the transfer amount is equal to the payment amount or to the sum of all frozen payments in the payment event, the system does the full payment transfer. However, if the transfer amount is less than the payment amount or the sum of all frozen payments in the payment event, the system does the partial payment transfer. Note that the payment transfer amount should not be more than the payment amount or the sum of all frozen payments in the payment event. Also, note that you should only transfer positive payments which are in the **Frozen** status and where the payment amount is greater than zero using the **File Upload Interface** utility.

While doing partial payment transfer at the payment level, the system cancels the old payment and creates two new payments in the **Frozen** status - one with the transfer amount using the specified match type and another with the remaining amount (if any) using the match type of the old payment. For example, the P1 payment is created against the contract of the A1 account, as shown in the following table:

Account	Payment Event	Payment Details	Match Type	Match Value	Amount	Status
A1	PE1	P1	Suspense Contract	C1	\$200	Frozen

Now, when you partially transfer \$150 of payment using the match type as Bill from the A1 to A2 account, the system will cancel the old payment and create the new payments as shown in the following table:

Account	Payment Event	Payment Details	Match Type	Match Value	Amount	Status
A1	PE1	P1	Suspense Contract	C1	\$200	Canceled

Account	Payment Event	Payment Details	Match Type	Match Value	Amount	Status
A2	PE2	P2	Bill	Bill1	\$150	Frozen
A1	PE1	P3	Suspense Contract	C1	\$50	Frozen

While doing partial payment transfer at the payment event level, the system fetches the list of frozen payments linked to the payment event and then identifies the payments which are eligible for transfer from the payment list in the following manner:

1. If the payments are created against the contracts, the system considers the following option types of the **C1_CMO** feature configuration to determine the payments which are eligible for transfer from the payment list:
 - Suspense Contract Type
 - On Account Contract Type
 - Excess Credit Contract Type

For more information about the **C1_CMO** feature configuration, see [Setting the C1_CMO Feature Configuration](#) on page 4215.

2. However, if the payments are created against the bills, the system considers the bill date and bill amount to determine the payments which are eligible for transfer from the payment list.

The payments which are eligible for transfer from the payment list are added in the **C1_PAY_DETAILS** table. The system stamps the transfer priority corresponding to eligible payments in the **TRANSFER_PRIORITY** column of the **C1_PAY_DETAILS** table. The system assigns transfer priority to each eligible payment in the following sequence:

1. Considers payments against the contracts which are created using the contract type specified in the **Suspense Contract Type** option type of the **C1_CMO** feature configuration. If there are multiple payments which are created on the suspense contracts, the system assigns the same transfer priority to these payments. For example, if you partially transfer P1 and P2 from the A1 account to the A2 account through a payment transfer request where P1 is created against C1, P2 is created against C2, and C1 and C2 are both suspense contracts, then the system sets the transfer priority of P1 and P2 to 1 in the payment transfer request.
2. Considers payments against the contracts which are created using the contract type specified in the **On Account Contract Type** option type of the **C1_CMO** feature configuration. For example, if you partially transfer P1 and P2 from the A1 account to the A2 account through a payment transfer request where P1 is created against C1, P2 is created against C2, C1 is a suspense contract, and C2 is an on account contract, then the system sets the transfer priority of P1 to 1 and P2 to 2 in the payment transfer request. However, if you partially transfer P3 from the A1 account to the A2 account through a payment transfer request where P3 is created against C3 and C3 is an on account contract, then the system sets the transfer priority of P3 to 1 in the payment transfer request. If there are multiple payments on the on account contracts, the system assigns the same transfer priority to these payments. For example, if you partially transfer P1, P2, and P3 from the A1 account to the A2 account through a payment transfer request where P1 is created against C1, P2 is created against C2, P3 is created against C3, C1 is a suspense contract, and C2 and C3 are both on account contracts, then the system sets the transfer priority of P1 to 1 and P2 and P3 to 2 in the payment transfer request.
3. Considers payments against the contracts which are created using the contract type specified in the **Excess Credit Contract Type** option type of the **C1_CMO** feature configuration. For example, if you partially transfer P1 and P2 from the A1 account to the A2 account through a payment transfer request where P1 is created against C1, P2 is created against C2, C1 is an on account contract, and C2 is an excess credit contract, then the system sets the transfer priority of P1 to 1 and P2 to 2 in the payment transfer request. However, if you partially transfer P3 from the A1 account to the A2 account through a payment transfer request where P3 is created against C3 and C3 is an excess credit contract, then the system sets the transfer priority of P3 to 1 in the payment transfer request. If there are multiple payments on the excess credit contracts, the system assigns the same transfer priority to these payments. For example, if you partially transfer P1, P2, and P3 from the A1 account to the A2 account through a payment transfer request where P1 is created against C1, P2 is created against C2, P3 is created against C3, C1 is a suspense contract, and C2 and C3 are both excess credit contracts, then the system sets the transfer priority of P1 to 1 and P2 and P3 to 2 in the payment transfer request.

4. Considers payments created against the bills in the descending order of the bill date (i.e. bill with the latest date). If there are multiple payments which are created against the bills having the same bill date, the system considers the payments which are created against the bills in the descending order of the bill amount (i.e. bill with the highest amount). However, if there are multiple payments which are created against the bills having the same bill date and bill amount, the system assigns the same transfer priority to these payments. For example, if you partially transfer P1, P2, P3, and P4 from the A1 account to the A2 account through a payment transfer request where P1 is created against B1 (with the bill date 01-Jan-2020 and bill amount \$100), P2 is created against B2 (with the bill date 01-Feb-2022 and bill amount \$20), P3 is created against B3 (with the bill date 01-Mar-2022 and bill amount \$30), and P4 is created against B4 (with the bill date as 01-Mar-2022 and bill amount \$40), the system sets the transfer priority of P4 to 1, P3 to 2, P2 to 3, and P1 to 4, respectively, in the payment transfer request.
5. Considers payments which are created against entities other than contracts or bills and assigns the same transfer priority to these payments.

In addition, the system sets the **PY_CANCEL_SW** column corresponding the payments in the **C1_PAY_DETAILS** table to **Y** or **N** depending on whether these eligible payments are considered for transfer or not. Let us assume that the following payments are made to the A1 account through the PE1 payment event:

Payment Details	Match Type	Match Value	Contract Type	Bill Date	Amount	Status
P1	Suspense Contract	C1	CT1		\$100	Frozen
P2	On Account Contract	C2	CT2		\$50	Frozen
P3	Suspense Contract	C3	CT3		\$100	Frozen
P4	Overpayment on Bill	C4	CT4		\$100	Frozen
P5	On Account Contract	C5	CT5		\$100	Frozen
P6	Suspense Contract	C1	CT1		\$100	Frozen
P7	On Account Contract	C5	CT5		\$100	Frozen
P8	Overpayment on Bill	C4	CT4		\$75	Canceled
P10	Bill	Bill1		21-Mar-2021	\$200	Frozen
P11	Bill	Bill2		21-Feb-2021	\$100	Frozen
P12	Bill	Bill3		21-Jan-2021	\$350	Frozen
P13	Bill	Bill2		22-Feb-2021	\$25	Frozen

And, let us assume that the **Suspense Contract Type**, **On Account Contract Type**, and **Excess Credit Contract Type** option types of the **C1_CMO** feature configuration are set to CT1, CT5, and CT4, respectively.

Now, if you want to partially transfer \$900 of payment from the A1 account to the A2 account using the match type as Bill, the system considers the following payments for transfer from the payment list using the given transfer priority:

Payment Details	Match Type	Match Value	Contract Type	Bill Date	Amount	Eligible for Transfer	Transfer Priority	Cancel Switch
P1	Suspense Contract	C1	CT1		\$100	Y	1	Y
P2	On Account Contract	C2	CT2		\$50	N		N
P3	Suspense Contract	C3	CT3		\$100	N		N
P4	Overpayment on Bill	C4	CT4		\$100	Y	3	Y
P5	On Account Contract	C5	CT5		\$100	Y	2	Y
P6	Suspense Contract	C1	CT1		\$100	Y	1	Y
P7	On Account Contract	C5	CT5		\$100	Y	2	Y
P8	Overpayment on Bill	C4	CT4		\$75	N		N
P10	Bill	Bill1		21-Mar-2021	\$200	Y	4	Y
P11	Bill	Bill2		21-Feb-2021	\$100	Y	6	Y
P12	Bill	Bill3		21-Jan-2021	\$350	Y	7	Y
P13	Bill	Bill2		22-Feb-2021	\$25	Y	5	Y

If the remaining transfer amount is greater than zero after considering frozen payments against the above mentioned contracts and bills of the account, the system will randomly consider other payments from the payment list which are created against entities other than the above mentioned contracts and bills of the account and assign the same transfer priority to all such payments.

While partially transferring at the payment event level, the system will cancel all payments which are transferred and then create new payments using the specified match type. Here, the status of the old payments is changed to **Canceled** and the status of the new payments is set to **Frozen**. In addition, if there is a remaining balance on any payment which is considered for transfer, the system will create a new payment for the remaining amount using the match type which is specified in the old payment. The payment for the remaining amount is created in the **Frozen** status. In the above example, the system will cancel the old payments and create the new payments, as shown in the following table:

Payment Details	Match Type	Match Value	Contract Type	Bill Date	Amount	Status
P1	Suspense Contract	C1	CT1		\$100	Canceled
P4	Overpayment on Bill	C4	CT4		\$100	Canceled
P5	On Account Contract	C5	CT5		\$100	Canceled
P6	Suspense Contract	C1	CT1		\$100	Canceled
P7	On Account Contract	C5	CT5		\$100	Canceled
P10	Bill	Bill1		21-Mar-2021	\$200	Canceled

Payment Details	Match Type	Match Value	Contract Type	Bill Date	Amount	Status
P11	Bill	Bill2		21-Feb-2021	\$100	Canceled
P12	Bill	Bill3		21-Jan-2021	\$350	Canceled
P13	Bill	Bill2		22-Feb-2021	\$25	Canceled
P14	Bill	Bill4		21-Jan-2021	\$900	Frozen
P15	Bill	Bill3		21-Jan-2021	\$275	Frozen

Mass Payment Transfer Process

The following are the different steps involved in the Mass Payment Transfer process:

1. [Defining a File Request Type for Payment Transfer](#) on page 3804
2. [Uploading a Payment Transfer File](#) on page 3805
3. [Transferring Payments](#) on page 3806

Defining a File Request Type for Payment Transfer

Procedure

To define a file request type for payment transfer:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **File Request Type**.
A sub-menu appears.
3. Click the **Add** option from the **File Request Type** sub-menu.
The **File Request Type** screen appears.
4. Do the following in the **Main** section:
 - a) Enter the file request type and description in the respective fields.
 - b) Select the **Data Transformation Required** option.
The **File Format** and **File Extension** fields are enabled. In addition, the **Root XML Tag** field appears in the **Main** section.
 - c) Select the **Comma Separated Values** option from the **File Format** list.
 - d) Enter `csv` in the **File Extension** field.
 - e) Ensure that the **C1-FRTA** algorithm is attached to the **Data Transformation Algorithm** field.
5. Do the following in the **Services** section:
 - a) Enter the sequence number in the respective field.
 - b) Select the **Business Service** option from the **Service Type** list.
 - c) Enter the **C1-TransferPaymentService** business service in the **Service Name** field.
 - d) Select the **Update** option from the **Operation** list.
6. If you have included a header in the CSV file, add the appropriate details in the **Header Transformation** section.
7. Similarly, if you have included a footer in the CSV file, add the appropriate details in the **Footer Transformation** section.
8. In the **Field Transformation** section, you need to specify the following details:

Field Name	Field Description	Mandatory (Yes or No)
Sequence	Used to indicate the data field in the CSV record which you want to upload in the system.	Yes
Field Name	Used to indicate the field for which you want to upload the data in the system.	Yes
Map Field XPath	Used to specify the XPath of the field where you want to store the data field from the CSV record.	Yes

While creating a file request type for mass payment transfer, you need to specify the following field mappings in the **Field Transformation** section:

Sequence	Field Name	Map Field XPath
1	PAY_EVENT_ID	C1-TransferPaymentService/ paymentEventId
2	PAY_ID	C1-TransferPaymentService/ paymentId
3	TRANSFER_TYPE	C1-TransferPaymentService/ transferType
4	TRANSFER_REASON	C1-TransferPaymentService/ transferReason
5	MATCH_TYPE	C1-TransferPaymentService/ matchType
6	MATCH_TYPE_VALUE	C1-TransferPaymentService/ matchTypeValue
7	SRC_SYSTEM	C1-TransferPaymentService/ sourceSystem
8	EXT_TXN_ID	C1-TransferPaymentService/ externalTransactionId
9	EXT_SRC_ID	C1-TransferPaymentService/ externalSourceId
10	TRANSFER_AMT	C1-TransferPaymentService/ transferAmount

9. Click **Save**.

The file request type is defined for mass payment transfer.

Uploading a Payment Transfer File

You can upload the mass payment transfer file in the CSV format through the **File Transformation and Upload (C1-FTRAN)** batch. While executing this batch, you need to specify a file request type using which you want to upload the payment transfer data from the CSV file in the respective fields. For more information about the batch, refer to *Oracle Revenue Management and Billing File Upload Interface Batch Execution Guide*.

Once the CSV file is uploaded in the system, you can download the file or move the file to a different directory on the SFTP server using the **File Management System** screen. You can also view whether the CSV file records are successfully uploaded or not, whether an error occurred while uploading the file, and the header and footer details of

the file using the **File Upload Dashboard** screen. In addition, if the CSV file records are successfully added in the system, you can view the status of the file records and their original and transformed payloads through the **File Record Details** screen. For more information about these screens, refer to *Oracle Revenue Management and Billing File Upload Interface User Guide*.

Transferring Payments

You can transfer multiple payments at once through the **File Request Processing (C1-FREQP)** batch. While executing this batch, you need to specify a file request type using which the payment transfer data is transformed in the XML format. For more information about the batch, refer to *Oracle Revenue Management and Billing File Upload Interface Batch Execution Guide*.

Once the CSV file record is successfully processed, the payment is transferred from one account to another. To view the details of the payment, you can navigate to the **Payment** screen through the **File Record Details** screen. For more information about the **File Record Details** screen, refer to *Oracle Revenue Management and Billing File Upload Interface User Guide*.

CSV File Format for Mass Payment Transfer

Before uploading a payment transfer file through the **File Upload Interface** utility, you need to ensure that the CSV file contains the following data:

Payment Event ID	Used to indicate the payment event whose frozen payments you want to transfer.	Yes (Conditional)
		Note: This data is required when you want to transfer all frozen payments of a particular payment event.
Payment ID	Used to indicate the payment that you want to transfer.	Yes (Conditional)
	Note: The system allows you to transfer a payment which is in the Frozen status.	Note: This data is required when you want to transfer a particular payment.
Transfer Type	Used to indicate whether you want to transfer payments at the payment or payment event level. The valid values are: <ul style="list-style-type: none">• E - Used when you want to transfer all frozen payments of a particular payment event.• P - Used when you want to transfer a particular payment.	Yes
Transfer Reason	Used to indicate the reason why you want to transfer the payment.	Yes
	Note: Here, you must specify the payment cancel reason where the Payment Transfer option is selected.	
Match Type	Used to indicate the match type using which you want to transfer the payment.	Yes
	Note: You must specify the match type which is already defined in the system.	

Match Value	Used to indicate the entity against which you want to transfer the payment.	Yes
	Note: Here, the entity can be account, bill, or contract. You must specify an entity which already exists in the system.	
Source System	Used to indicate the external system from where the payment transfer data is received.	No
	Note: You must specify an external system which is already defined in the system.	
External Transaction ID	Used to indicate the transaction in the external system through which the payment transfer data is received.	No
External Source System ID	Used to specify the external source system ID.	No
Transfer Amount	Used to specify the transfer amount.	Yes (Conditional)
	Note: Here, you must specify a positive value. The transfer amount should not be more than the payment amount or the sum of all frozen payments in the payment event.	Note: This data is required when you want to make a partial payment transfer.

Related Topics

For more information on...	See...
Sample CSV File for Mass Payment Transfer	Sample CSV File for Mass Payment Transfer on page 3807

Sample CSV File for Mass Payment Transfer

```
, 436878000000, P, ROBL, HCMATCH, 770018000000, , , , 120
, 436229000000, P, ENTR, HCMATCH, 770018000000, , , , 100
436560000000, , E, NSF, HCMATCH, 770018000000, , , , 180
, 436912000000, P, ACCT, HCMATCH, 770018000000, , , , 200
```

Let us assume that the payment transfer file is uploaded and transformed using a file request type with the following field transformation details:

1	Payment Event ID	C1-TransferPaymentService/paymentEventId
2	Payment ID	C1-TransferPaymentService/paymentId
3	Transfer Type	C1-TransferPaymentService/transferType
4	Transfer Reason	C1-TransferPaymentService/transferReason
5	Match Type	C1-TransferPaymentService/matchType
6	Match Type Value	C1-TransferPaymentService/matchTypeValue

7	Source System	C1-TransferPaymentService/sourceSystem
8	External Transaction Id	C1-TransferPaymentService/externalTransactionId
9	External Source system Id	C1-TransferPaymentService/externalSourceId
10	Transfer Amount	C1-TransferPaymentService/transferAmount

On successfully uploading and transforming the data, the system creates a transformed payload for each CSV file record. The transformed payload stores the payment transfer data in the following tags:

Service Payload		CSV File Record 1	CSV File Record 2	CSV File Record 3	CSV File Record 4
C1-Transfer Payment Service	paymentEventId	-	-	436560000000	-
	paymentId	436878000000	436229000000	-	436912000000
	transferType	P	P	E	P
	transferReason	ROBL	ENTR	NSF	ACCT
	matchType	HCMATCH	HCMATCH	HCMATCH	HCMATCH
	matchTypeValue	770018000000	770018000000	770018000000	770018000000
	sourceSystem	-	-	-	-
	externalTransactionId	-	-	-	-
	externalSourceId	-	-	-	-
	transferAmount	120	100	180	200

Reporting

Topics:

- [Report Creation Using Apache FOP Framework](#)
- [FOP Reports](#)

Oracle Revenue Management and Billing provides best-in-class enterprise reporting feature which enables its customers to uncover new sights for taking faster and more informed business decisions. The reporting feature is a unique platform which easily integrates with the existing infrastructure and provides reusable design, data elements, and easy access to the application programming interface.

Oracle Revenue Management and Billing Reporting feature provides its customers the following benefits:

- Allows to generate and deliver customized reports to users in various departments and customers on time.
- Allows the implementers to efficiently create and update document templates.
- Supports output in the CSV, JSON, PDF, XML, and XLS formats using custom Formatting Objects Processor (FOP) templates.

Report Creation Using Apache FOP Framework

Oracle Revenue management and Billing allows you to create reports in the CSV, JSON, PDF, XML, and XLS formats using the Apache FOP (Formatting Objects Processor) framework. Apache FOP is an output arrangement which is driven by the XSL formatting object. It is a Java application that reads the XSL formatting object tree conforming to the XSL 1.1 Recommendation (05 December 2006) and then converts it into a document in the required output format. It allows you to preview the output directly on the screen.

To understand more about the framework, refer to the official Apache FOP site at <https://xmlgraphics.apache.org/fop/> or you can also refer GitHub at <https://github.com/apache/fop>.

Prerequisites

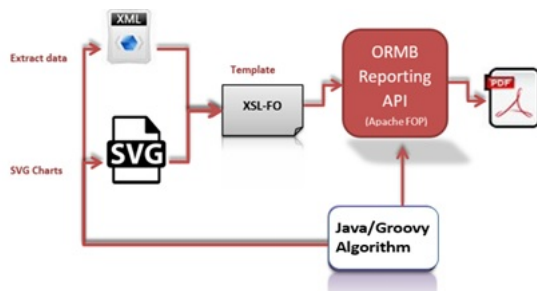

To use the Apache FOP reporting feature in ORMB, you should have:

- **C1-REPORTVW** feature configuration set in the application

PDF Generation Using Apache FOP

For generating a PDF from an XML file you need an XSLT stylesheet which converts the XML file to an XSL-FO file. The created XSL-FO file is also an XML file which contains all the formatted objects. The ORMB FOP reporting framework reads the XSL-FO file and formats it to a PDF document.

The process overview of PDF generation from an XML file is shown in the below image:

Excel (XLS) Generation Using XSL Transformation

For generating an Excel (XLS) from an XML file you need an XSLT stylesheet which converts the XML file to an XSL file. The created XSL file is also an XML file which contains all the formatted objects. The ORMB reporting framework reads the XSL file and formats it to an Excel (XLS) document.

The process overview of Excel (XLS) generation from an XML file is shown in the below image:

Sample XML Format for FOP Reporting

Using the below example, you can create an XML which contains name and a list of friends with contact numbers:

Sample XML Format for FOP Reporting

```
<?xml version="1.0" encoding="utf-8"?>
<root>
<name>Ryan</name>
<friend>
  <name>David</name>
  <phNo>+1.603.555.0100</phNo>
</friend>
<friend>
  <name>John</name>
  <phNo>+1.603.555.0101</phNo>
</friend>
</root>
```

Note: This is how an XML should be generated with encoded UTF-8 format.

Sample XSL Format for FOP Reporting

Using the below example, you can create an XSL format which renders the table that contains details of friends given in the above sample XML format:

Sample XSL Format for FOP Reporting

```
<?xml version="1.0" encoding="utf-8"?>
<xsl:stylesheet version="1.1"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:fo="http://www.w3.org/1999/XSL/Format"
  exclude-result-prefixes="fo">
<xsl:template match="root">
<fo:root xmlns:fo="http://www.w3.org/1999/XSL/Format">
  <fo:layout-master-set>
    <fo:simple-page-master master-name="my-page">
      <fo:region-body margin="1in"/>
    </fo:simple-page-master>
  </fo:layout-master-set>
  <fo:page-sequence master-reference="my-page">
    <fo:flow flow-name="xsl-region-body">
      <fo:block>Hello, <xsl:value-of select="name" -/>!/</fo:block>
      <fo:block>
        <fo:table>
          <fo:table-body>
            <fo:table-row>
              <fo:table-cell border="solid 1px black" text-align="center" font-weight="bold">
                <fo:block>No.</fo:block>
              </fo:table-cell>
              <fo:table-cell border="solid 1px black" text-align="center" font-weight="bold">
                <fo:block>Name</fo:block>
              </fo:table-cell>
              <fo:table-cell border="solid 1px black" text-align="center" font-weight="bold">
                <fo:block>Phone Number</fo:block>
              </fo:table-cell>
            </fo:table-row>
```

```
<xsl:for-each select="./friend">
<fo:table-row>
  <fo:table-cell border="solid 1px black" text-align="center">
    <fo:block>
      <xsl:value-of select="position()" -/>
    </fo:block>
  </fo:table-cell>
  <fo:table-cell border="solid 1px black" text-align="center">
    <fo:block>
      <xsl:value-of select="name" -/>
    </fo:block>
  </fo:table-cell>
  <fo:table-cell border="solid 1px black" text-align="center">
    <fo:block>
      <xsl:value-of select="phNo" -/>
    </fo:block>
  </fo:table-cell>
</fo:table-row>
</xsl:for-each>
</fo:table-body>
</fo:table>
</fo:block>
</fo:flow>
</fo:page-sequence>
</fo:root>
</xsl:template>
</xsl:stylesheet>
```

Note: For more information on XSL Format, refer below links:

- <https://www.netjstech.com/2015/07/how-to-create-pdf-from-xml-using-apache-fop.html>.
- <https://xmlgraphics.apache.org/fop/>

Create XSL Template for an FOP Report

The XSL template is required to create an FOP report in the PDF of Excel (XLS) format. The XSL template converts the XML file into XSL-FO file. This XSL-FO is further read by the ORMB FOP reporting framework and formats the XSL-FO file into a PDF/Excel (XLS) file.

Note: For more information on XSL Format, refer below links:

- <https://www.netjstech.com/2015/07/how-to-create-pdf-from-xml-using-apache-fop.html>.
- <https://xmlgraphics.apache.org/fop/>

Create an Algorithm for an FOP Report

Before creating any new custom FOP report an algorithm is created which contains the following content:

- Query for the report
- XML formation code
- Input parameter validation
- Call to report generation algorithm

The algorithm is then associated with the FOP report while defining the FOP report in the application. When the FOP report is generated, the algorithm which is attached to the FOP report does the following:

- Extract data from the system in an XML file
- Present the extracted data in CSV, JSON, PDF, XML, or XLS format using the XSL file associated with the FOP report

The following algorithms for the corresponding FOP reports are shipped with ORMB:

FOP Report	Report Generation Algorithm
FOPADJBXLS	C1_FOPADJUST

Creating a Message for an FOP Report

Prerequisite

To create a message for an FOP report you should have:

- Error message added in the MessageRepository.java file. For example:

```
public static ServerMessage searchByIsNull()
{
    MessageRepository repo = MessageRepository.getInstance();
    MessageParameters messageParms = new MessageParameters();
    return repo.getMessage(SEARCH_BY_IS_NULL, messageParms);
}
```

- Error code added in the ReportingMessage.java file. For example:

```
public static final int SEARCH_BY_IS_NULL = 2039;
```

Procedure

To create a message for an FOP report:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **M** and then click **Message**.
A sub-menu appears
- Click the **Add** option from the **Message** sub-menu.
The Select Business Object screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Message Business Object	Used to indicate that you want to create a message for a business object.	Yes

4. Select **Message** from the **Message Business Object** list.

5. Click **OK**.

The **Message** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Message Category	Used to indicate the category for which you want to create a message. The valid value is: <ul style="list-style-type: none">• Reports	Yes
Message Number	Used to specify the error code which you have added in the ReportingMessage.java file.	Yes
Message Text	Used to specify the error message.	Yes
Detailed Description	Used to specify additional information about the message.	No

6. Click **Save**.

The message is created.

Calling the ORMB FOP Reporting API

Procedure

To call the ORMB FOP reporting API:

1. You should use the ORMB provided business component to call the below reporting API which generates the FOP reports:

com.splwg.ccb.domain.reportsubmission.FOPReportGenerationComponent_Impl

2. Call the reporting API method in the below format:

public String generateReport(String xslTemplateName, String xmlContent, String outputFileName)

The parameters for the reporting API method is defined as below:

Parameter Name	Parameter Description
xslTemplateName	Used to pass the XSL-FO/XSL file name. It is given in the below format: <div><name of report>.xsl</div>
xmlContent	Used to pass the XML content generated by the algorithm.
outputFileName	Used to pass the PDF/Excel (XLS) file name that you want to generated. It is given in the below format: <div><name_of_report>.pdf/xls</div>

Setting Master Configuration for Email Notification

Procedure

Email notification is configured for FOP reports which are generated in the batch mode. To set master configuration for email notification:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **M** and then click **Master Configuration**.
The **Master Configuration** screen appears.
- 3. Search for **Reporting Email Sender Configuration** in the **Master Configuration List** zone.
- 4. Click the **Add** (⊕) icon in the **Action** column corresponding to **Reporting Email Sender Configuration**.

The **Master Configuration** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Master Configuration	Displays the master configuration	Not Applicable
SMTP Host Name	Used to specify the SMTP application to send and receive emails.	Yes
SMTP Port	Used to specify the communication endpoint to transfer email data over SMTP through a network, from one server to another. The valid value is: <ul style="list-style-type: none">• 25	Yes
Username	Used to specify the username of the user.	Yes
Password	Used to specify the password for the user.	Yes
Secure Sockets Layer	Used to indicate whether you want to transfer the email data securely across a network.	No
Test	Used to configure the sender's and receiver's email ID.	Yes
From Email Address	Used to specify the user's email ID.	Yes
	Note: This field appears only when you select the check box corresponding to the Test field.	
To Recipient Email ID	Used to specify the receiver's email ID.	Yes
	Note: This field appears only when you select the check box corresponding to the Test field.	

- 5. Enter the required details in the **Master Configuration** screen.
- 6. Click **Save**.
The master configuration for email notification is set.

Creating a Custom Algorithm for FOP Reports

Prerequisite

To create a custom algorithm for FOP reports you should have:

- The **ReportDataExtractAlgorithmSpot** algorithm spot defined in the application

Procedure

To create a custom algorithm for FOP reports:

1. Log into **Eclipse**.
2. In the navigation pane, right click on the **C1** folder.
A list appears.
3. From the list, select **New** and then click **Others**.

The **Select a Wizard** window appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Wizard	Used to filter the Algorithm Implementation wizard.	No

Note: You can also navigate to the **Algorithm Implementation** wizard in the **Oracle Utilities** section through the navigation window provided below the **Wizard** field.

4. Select **Algorithm Implementation** from the navigation window.
5. Click **Next**.

The **New Algorithm Implementation** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Source Folder	Displays the source from where the algorithm spot is called. The valid value is: <div>C1/Java</div>	Not Applicable
Package	Used to specify the directory in the source folder where you want the algorithm to appear. The valid value is: <div>com.splwg.ccb.domain. reportsubmission.custom</div>	Yes
Name	Used to specify the algorithm that you want to create.	Yes
Soft Parameters	Used to specify parameters for the algorithm.	No
Algorithm Spot Interface	Used to specify the algorithm spot used to create custom data extract in the PDF or XLS format. The valid value is: <div>com.splwg.ccb.domain. reportsubmission.ReportDataExtractAlgorithmSpot</div>	Yes
	Note: You can also extract data in the XML, CSV, or JSON formats by calling the CommonUtil_Impl API while generating the respective report.	

6. Click **Finish**.
The custom algorithm for FOP report is created.

Configuring the Custom Algorithm from the User Interface

Prerequisites

To configure the custom algorithm from the user interface you should:

- Define custom algorithm JAVA code
- Generate artifacts, do Web Build and start the WebLogic server to bring the ORMB application up and running

Procedure

To configure the custom algorithm from the user interface you should:

- Create an algorithm type and associate it with the custom algorithm java code
 - Create an algorithm and associate it with the algorithm type
1. To create an algorithm type, click the **Admin** link in the **Application** toolbar.
A list appears.
 2. From the **Admin** menu, select **A** and then click **Algorithm Type**.
A sub-menu appears
 3. Click the **Add** option from the **Algorithm Type** sub-menu.
The **Algorithm Type** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Algorithm Type	Used to specify the algorithm type that you want to create in the system.	Yes
Description	Used to specify the description for the algorithm type.	Yes
Detailed Description	Used to specify additional information about the algorithm type	No
Algorithm Entity	Used to indicate the algorithm entity for which you want to create the algorithm type. The valid value is: <ul style="list-style-type: none">• Report-Data Extract Algorithm	Yes
Program Type	Used to indicate the program code using which the custom algorithm is created. The valid value is: <ul style="list-style-type: none">• JAVA	Yes
Program Name	Used to specify the custom algorithm java code. The valid value is: <div>com.splwg.ccb.domain. reportsubmission.ReportDataExtractAlgorithmSpot</div>	Yes

In addition, the **Algorithm Type** screen contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Sequence	Used to specify the sequence in which the parameter is considered for the algorithm type.	No
Parameter	Used to specify the parameter using which you want to create the algorithm type.	No
Required	Used to indicate whether the parameter is required or not.	No
Owner	Indicates the user who associated the parameter with the algorithm type.	No

4. Enter the required details in the **Algorithm Type** screen.
5. Click **Save**.
The algorithm type is saved.
6. To create an algorithm, click the **Admin** link in the **Application** toolbar.
A list appears.
7. From the **Admin** menu, select **A** and then click **Algorithm**.
A sub-menu appears
8. Click the **Add** option from the **Algorithm** sub-menu.
The **Algorithm** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Algorithm Code	Used to specify the algorithm that you want to create in the system	Yes
Description	Used to specify the description for the algorithm.	Yes
Algorithm Type	Used to specify the algorithm type to which you want to associate the algorithm.	Yes
Algorithm Type Description	Displays the description of the algorithm type.	Not Applicable
Parameter	Displays the parameter of the algorithm.	Not Applicable
Effective Date	Displays the date from when the algorithm type is effective for the algorithm.	Not Applicable

9. Enter the required details in the **Algorithm** screen.
10. Click **Save**.
The custom algorithm is configured in the user interface.

Reporting Template Upload

Information will be available shortly!

Report Creation

The **Report Creation** screen allows you to define reports for extracting data of a person and/or its accounts using the Apache FOP framework. It also enables you to view, edit, or delete an existing report. It contains the following zone:

[Report Search](#) on page 3823

Report Search

The **Report Search** zone allows you to search for an existing FOP report using various search criteria. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Report	Used to search for a particular FOP report.	No
Description	Used to search FOP reports with a particular description.	No

Note: You must specify at least one search criterion while searching for an FOP report.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Report	Displays the FOP report.
Description	Displays the description of the FOP report.
Output Format	Indicates the format in which the FOP report is extracted from the system. Note: At present, you can extract an FOP report in PDF, CSV, and XML formats.
Report Type	Indicates the type of information which is extracted using the FOP report. The valid values are: <ul style="list-style-type: none">• Bill• Custom• Letter
View	On clicking the View button you can view the details of the FOP report.
Edit	On clicking the Edit (✎) icon, the Report Creation screen appears where you can edit the details of the FOP report.
Delete	On clicking the Delete (🗑) icon, you can delete the FOP report.

Note: Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Searching for an FOP Report

Procedure

To search for an FOP report:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **R** and then click **Report Creation**.
The **Report Creation** screen appears.
3. Enter the search criteria in the **Report Search** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

4. Click **Search**.
A list of FOP reports that meet the search criteria appears in the **Search Results** section.

Defining an FOP Report

Prerequisites

To define an FOP report you should have:

- FOP reporting framework configured in the system
- **C1_FOPONBL** algorithm defined in the system to create FOP reports for bill templates
- Parameters defined for the **C1_FOPONBL** algorithm
- **C1_FOPONBL** algorithm attached to the **Online Bill Display** system event
- **C1_FOPLTRALG** algorithm defined in the system to create FOP reports for letter templates
- Parameters defined for the **C1_FOPLTRALG** algorithm
- **C1_FOPLTRALG** algorithm attached to the **Online Letter Image** system event
- Algorithms defined in the application for creating custom FOP reports

Procedure

To define an FOP report:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **R** and then click **Report Creation**.
The **Report Creation** screen appears.
3. Click the **Add** button available at the upper right corner of the **Report Creation** screen.

The **Report Creation** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Report	Used to specify the FOP report	No

Field Name	Field Description	Mandatory (Yes or No)
Description	Used to specify the description for the FOP report	No
Output Format	<p>Used to indicate the format in which you want to generate the FOP report. The valid values are:</p> <ul style="list-style-type: none"> • CSV • DOCX • JSON • PDF • Web • XLS • XML <p>Note:</p> <p>At present, the system supports extraction of an FOP report in the CSV, JSON, PDF, XML, and XLS formats.</p> <p>You can customize the algorithm to support the extraction of an FOP report in the DOCX and Web formats.</p>	Yes
Script	<p>Used to indicate the script using which the FOP report is extracted in the Web format.</p> <p>Note: This field is enabled only when you select the Web option from the Output Format list.</p>	No
Report Type	<p>Used to indicate the type of information that you want to extract using the FOP report. The valid values are:</p> <ul style="list-style-type: none"> • Bill • Custom • Letter <p>Note: This field is disabled when you select the Web option from the Output Format list.</p>	Yes
Report Template	<p>Used to indicate the template using which the FOP report is uploaded in the system.</p> <p>Note: This field appears only when you select the Bill or Letter option from the Report Type list.</p>	Yes
XSL Template	Used to indicate the XSL template file using which you want to create the FOP report.	Yes

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The Upload button appears corresponding to the XSL Template field. On clicking the Upload button, the Upload XSL Template window appears where you can choose the required XSL template.</p> <p>This field is disabled when you select the Web option from the Output Format list.</p>	
Report Generation Algorithm	Used to indicate the algorithm defined for creating a custom FOP report.	Yes (Conditional)
	<p>Note:</p> <p>The Search (Q) icon appears corresponding to the Report Generation Algorithm field. On clicking the Search icon, the Algorithm Code/Description window appears where you can search for the required algorithm.</p> <p>This field is enabled only when you select the Custom option from the Report Type list.</p>	<p>Note: This field is required while creating a custom FOP report.</p>
Reporting Mode	<p>Used to indicate whether you want to generate the FOP report in the batch mode or online mode. The valid values are:</p> <ul style="list-style-type: none"> Batch Online 	Yes
Email ID	Used to specify the email ID where you want to send the notification of the FOP report generation.	Yes (Conditional)
	Note: This field is enabled only when you select the Batch option from the Reporting Mode list.	Note: The field is required for generating FOP report in the batch mode.
Subject	Used to specify the text which you want to appear in the subject line of the email.	Yes (Conditional)
	Note: This field is enabled only when you select the Batch option from the Reporting Mode list.	Note: The field is required for generating FOP report in the batch mode.
Email Body Content	Used to specify the content which you want to appear in the email body,	Yes (Conditional)
		Note: The field is required for generating FOP report in the batch mode.

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field is enabled only when you select the Batch option from the Reporting Mode list.	

In addition, the **Report Creation** screen contains the following columns:

Column Name	Column Description	Mandatory (Yes or No)
Display Sequence	Used to indicate the sequence of the parameter.	No
Report Parameter	Used to indicate the parameter which you want to define while generating the FOP report. Note: The Search (🔍) icon appears corresponding to the Report Parameter field. On clicking the Search icon, the Field Details window appears where you can search for the required parameter. On specifying the parameter, the description of the parameter appears corresponding to the Report Parameter field.	No

Note: The above columns do not appear when you select the **Web** option from the **Output Format** list.

4. Enter the required details in the **Report Creation** screen.

5. Click **Save**.

The FOP report is defined.

Editing an FOP Report

Prerequisites

To edit an FOP report you should have:

- FOP report (whose details you want to edit) defined in the application
- Algorithms defined in the application for creating custom FOP reports

Procedure

To edit an FOP report:

1. Search for the FOP report in the **Report Search** zone of the **Report Creation** screen.
2. In the **Search Results** section, click the **Edit** (✎) icon in the **Edit** column corresponding to the FOP report whose details you want to edit.

The **Report Creation** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Report	Used to specify the FOP report	Not Applicable
Description	Used to specify the description for the FOP report	No
Output Format	Used to indicate the format in which you want to generate the FOP report. The valid values are: <ul style="list-style-type: none"> • CSV • DOCX • JSON • PDF • Web • XLS • XML 	Yes
	Note: At present, the system supports extraction of an FOP report in the CSV, JSON, PDF, XML, and XLS formats. You can customize the algorithm to support the extraction of an FOP report in the DOCX and Web formats.	
Script	Used to indicate the script using which the FOP report is extracted in the Web format.	No
	Note: This field is enabled only when you select the Web option from the Output Format list.	
Report Type	Used to indicate the type of information that you want to extract using the FOP report. The valid values are: <ul style="list-style-type: none"> • Bill • Custom • Letter 	Yes
	Note: This field is disabled when you select the Web option from the Output Format list.	
Report Template	Used to indicate the template using which the FOP report is uploaded in the system.	Yes
	Note: This field appears only when you select the Bill or Letter option from the Report Type list.	

Field Name	Field Description	Mandatory (Yes or No)
XSL Template	Used to indicate the XSL template file using which you want to create the FOP report.	Yes
	Note: The Upload button appears corresponding to the XSL Template field. On clicking the Upload button, the Upload XSL Template window appears where you can choose the required XSL template. This field is disabled when you select the Web option from the Output Format list.	
Report Generation Algorithm	Used to indicate the algorithm defined for creating a custom FOP report.	Yes (Conditional)
	Note: The Search (🔍) icon appears corresponding to the Report Generation Algorithm field. On clicking the Search icon, the Algorithm Code/Description window appears where you can search for the required algorithm. This field is enabled only when you select the Custom option from the Report Type list.	Note: This field is required while creating a custom FOP report.
Reporting Mode	Used to indicate whether you want to generate the FOP report in the batch mode or online mode. The valid values are: <ul style="list-style-type: none"> • Batch • Online 	Yes
Email ID	Used to specify the email ID where you want to send the notification of the FOP report generation.	Yes (Conditional)
	Note: This field is enabled only when you select the Batch option from the Reporting Mode list.	Note: The field is required for generating FOP report in the batch mode.
Subject	Used to specify the text which you want to appear in the subject line of the email.	Yes (Conditional)
	Note: This field is enabled only when you select the Batch option from the Reporting Mode list.	Note: The field is required for generating FOP report in the batch mode.
Email Body Content	Used to specify the content which you want to appear in the email body,	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field is enabled only when you select the Batch option from the Reporting Mode list.	Note: The field is required for generating FOP report in the batch mode.

In addition, the **Report Creation** screen contains the following columns:

Column Name	Column Description	Mandatory (Yes or No)
Display Sequence	Used to indicate the sequence of the parameter.	No
Report Parameter	Used to indicate the parameter which you want to define while generating the FOP report. Note: The Search (🔍) icon appears corresponding to the Report Parameter field. On clicking the Search icon, the Field Details window appears where you can search for the required parameter. On specifying the parameter, the description of the parameter appears corresponding to the Report Parameter field.	No

Note: The above columns do not appear when you select the **Web** option from the **Output Format** list.

3. Modify the required details in the **Report Creation** screen.

4. Click **Save**.

The changes made to the FOP report are saved.

Deleting an FOP Report

Procedure

To delete an FOP report:

- Search for the FOP report in the **Report Search** zone of the **Report Creation** screen.
- In the **Search Results** section, click the **Delete** (🗑) icon in the **Delete** column corresponding to the FOP report that you want to delete.
A message appears confirming whether you want to delete the FOP report from the system.
- Click **OK**.

4. The FOP report is deleted.

Viewing the FOP Report Details

Prerequisites

To view the FOP report details you should have:

- FOP report (whose details you want to view) defined in the system

Procedure

To view the FOP report details:

1. Search for the FOP report in the **Report Search** zone of the **Report Creation** screen.
2. In the **Search Results** section, click the **View** button in the **View** column corresponding to the FOP report whose details you want to view.
The **Report Details** screen appears.
3. View the details of the FOP report in the **Report Details** screen.

Report Audit

The **Report Audit** screen allows you to track the records of the generated FOP reports in the system. It also allows you to do the following:

- Download the FOP reports which are generated successfully in the system
- View the error message of the FOP report which did not generate successfully

The **Report Audit** screen contains the following zone:

[Report Generation List](#) on page 3831

Related Topics

How to downloading an FOP Report	Downloading an FOP Report on page 3832

Report Generation List

The **Report Generation List** zone allows you to view a list of FOP reports which are generated in the system. It contains the following columns:

Column Name	Column Description
Sequence	Displays the sequence of the generated FOP report.
Report ID	Displays the unique identification number which is created automatically by the system for a particular FOP report during report generation process.
Report	Displays the FOP report which is generated in the system.
Created By	Displays the user who has generated the FOP report in the system.
Creation Date Time	Displays the date and time when the FOP report is generated in the system.
Generation Successful	Indicates whether the FOP report generation is successful or not. The valid values are: <ul style="list-style-type: none"> No Yes
Message Text	Displays information about the FOP report generation.
	<p>Note:</p> <p>If the FOP report generation is successful, then, this column displays the following message:</p> <p>Report Generation Success</p> <p>However, if the FOP report generation is not successful, then, this column displays the reason why the FOP reports is not generated successfully in the system.</p>
Download Report	On clicking the Download link, you can download the FOP report.
	<p>Note: The Download link does not appear for FOP reports which are not generated successfully in the system.</p>

Downloading an FOP Report

Prerequisites

To download an FOP report you should have:

- FOP reports generated successfully in the system

Procedure

To download an FOP report:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **R** and then click **Report Audit**.
The **Report Audit** screen appears.
- Ensure that the **Report Generation List** zone is expanded in the **Report Audit** screen.
- Click the **Filters** (🔍) icon available at the upper right corner of the **Report Generation List** zone.
The **Report** field appears below the report list.
- Specify the FOP report which you want to download in the **Report** field.

- 6. Click **Search**.
The specified FOP report is filtered in the **Report Generation List** zone.
- 7. Click the **Download** link in the **Download** column corresponding to the FOP report that you want to download.
The FOP report is downloaded.

Report Generation

The **Report Generation** screen allows you to extract the details of an FOP report.

Generating an FOP Report

Prerequisites

To generate an FOP report you should have:

- FOP reports created in the system

Procedure

To generate an FOP report:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Reports** and then click **Report Generation**.

The **Report Generation** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Report	Used to indicate the FOP report that you want to generate.	Yes
Description	Displays the description of the FOP report	Not Applicable

In addition, the **Report Generation** screen contains the following columns:

Column Name	Column Description
Display Sequence	Displays the sequence in which the parameter is defined for the FOP report.
Report Parameter	Displays the parameter which is defined for the FOP report.
Report Parameter Value	Used to specify the value of the parameter for generating the FOP report.

3. Select the required FOP report from the **Report** list.
4. Specify the values of the parameters defined for the FOP report in the **Report Parameter** Value column.
5. Click **Generate**.
The FOP report is generated.

FOP Reports

Oracle Revenue Management and Billing enables you to extract data using the following FOP reports:

- [Adjustment Detail Report](#) on page 3834
- [Aggregate Stop-Loss Report](#) on page 3834
- [Entity Hold Detail Report](#) on page 3835
- [Invoice Aging Report](#) on page 3835
- [Payment Detail Report for Fully-Insured Individual Business](#) on page 3836
- [Payment Detail Report for Self-funded and Fully-Insured Group Business](#) on page 3836
- [Payment Summary Report for Fully-Insured Individual Business](#) on page 3837
- [Payment Summary Report for Self-funded and Fully-Insured Group Business](#) on page 3837
- [Specific Stop-Loss Report](#) on page 3837
- [To Do Report](#) on page 3838
- [User Access Report](#) on page 3838
- [Automatic Payment Response Report](#) on page 3838
- [Binder Payment Report](#) on page 3839
- [Quick Response Code Generation](#) on page 3839

For more information about these FOP reports, refer to *Oracle Revenue Management and Billing FOP Reports Guide*

Adjustment Detail Report

The **Adjustment Detail** report enables you to view the adjustments which are created for persons or accounts, or which are created against bills. While generating the adjustment detail report, you can specify the following parameters - Start Date, End Date, Division, Entity Type, and Entity ID. The start date is mandatory. If you do not specify the end date, the system by default sets it to the system date. For example, if you specify the start date as 01-01-2022 and entity type as Account, the system will extract all adjustments which are created for the accounts from 01-01-2022 till the current date.

You can generate the adjustment detail report from the user interface or through a batch process in the Excel format. We have shipped the following adjustment detail reports in this release:

- **FOPADJBXLS** - Used when you want to generate the adjustment detail report through the **C1-RPTGN** batch in the Excel format.
- **FOPADJOXLS** - Used when you want to generate the adjustment detail report from the user interface in the Excel format.

Aggregate Stop-Loss Report

The **Aggregate Stop-Loss** report enables you to view the aggregate stop-loss which is billed to a parent customer. At a time, it enables you to view the aggregate stop-loss information of a particular parent customer which belongs to a particular division. While generating the aggregate stop-loss report, you can specify the following parameters - Division, Parent Customer, Claim Billed Through, Policy Start Date, and Policy End Date. The division and parent customer are mandatory. If you specify the claim billed until date, you need to specify the policy start and end dates. For example, if you specify 04-01-2021 in the **Claim Billed Through** parameter, 01-01-2021 in the **Policy Start Date** parameter, and 12-31-2021 in the **Policy End Date** parameter, the system fetches the aggregate stop-loss charges which are billed to the parent customer between 01-01-2022 to 04-01-2022.

This report can be used for the self-funded business. You can generate the aggregate stop-loss report from the user interface or through a batch process in either PDF or Excel format. We have shipped the following aggregate stop-loss reports in this release:

- **FOPASLHCBPDF** - Used when you want to generate the aggregate stop-loss report through the **C1-RPTGN** batch in the PDF format.
- **FOPASLHCBXLS** - Used when you want to generate the aggregate stop-loss report through the **C1-RPTGN** batch in the Excel format.
- **FOPASLHCOPDF** - Used when you want to generate the aggregate stop-loss report from the user interface in the PDF format.
- **FOPASLHCOXLS** - Used when you want to generate the aggregate stop-loss report from the user interface in the Excel format.

Entity Hold Detail Report

The **Entity Hold Detail** report enables you to view the entities, such as persons, accounts, or bills for which the business processes, such as bill generation, automatic payment, funding, overdue, or refund, are on hold for a given period. While generating the entity hold detail report, you can specify the following parameters - Start Date, End Date, Division, Hold Entity, Entity ID, Hold Process, and Hold Status. The start date is mandatory. If you do not specify the end date, the system by default sets it to the system date. For example, if you specify the start date as 01-01-2021 and hold entity as Bill, the system will extract all hold requests which are created for the bills from 01-01-2021 till the current date.

You can generate the entity hold detail report from the user interface or through a batch process in the Excel format. We have shipped the following entity hold detail reports in this release:

- **FOPHLDBXLS** - Used when you want to generate the entity hold detail report through the **C1-RPTGN** batch in the Excel format.
- **FOPHLDOXLS** - Used when you want to generate the entity hold detail report from the user interface in the Excel format.

Invoice Aging Report

The **Invoice Aging** report enables you to view the invoices which are due for payment in different age buckets. At a time, it enables you to view the invoice aging data of all customers which belong to a particular division. While generating the invoice aging report, you can specify the following parameters - Start Date, End Date, Division, and Customer Class. The start date and division are mandatory. If you do not specify the end date, the system by default sets it to the system date. While generating the invoice aging report, the system does the currency conversion when the accounts' invoice currency is different from the customer's division currency.

This report can be used for the self-funded, fully-insured group, and fully-insured individual business. In case of the self-funded and fully-insured group business, the aging data is grouped at the bill group and parent customer levels. However, in case of the fully-insured individual business, the aging data is grouped at the individual customer level.

You can generate the invoice aging report from the user interface or through a batch process in either PDF or Excel format. We have shipped the following invoice aging reports in this release:

- **FOPAGEHCBPDF** - Used when you want to generate the invoice aging report through the **C1-RPTGN** batch in the PDF format.
- **FOPAGEHCBXLS** - Used when you want to generate the invoice aging report through the **C1-RPTGN** batch in the Excel format.
- **FOPAGEHCOPDF** - Used when you want to generate the invoice aging report from the user interface in the PDF format.
- **FOPAGEHCOXLS** - Used when you want to generate the invoice aging report from the user interface in the Excel format.

Payment Detail Report for Fully-Insured Individual Business

The **Payment Detail** report for fully-insured individual business enables you to view the payment details of each account. At a time, it enables you to view the payments of all accounts which belong to a particular division. While generating the payment detail report for the fully-insured individual business, you can specify the following parameters - Division, Start Date, End Date, Person Identifier Type, Person Identifier, Account Identifier Type, Account Identifier, Payment Status, Payment Amount Range, Health Plan ID, and Customer Class. The division and start date are mandatory. If you do not specify the end date, the system by default sets it to the system date. While filtering the data using the payment amount range, you need to specify the lower and upper range value separated by the hyphen (-) symbol. For example, if you set the start date to 01-01-2021, division to D10, and payment amount range to 150-200, the system will extract all payments which are created from 01-01-2021 till the current date, whose payment amount is between 150 and 200, and which are created for the accounts belonging to the D10 division. The payments are shown in the payment currency.

You can generate the payment detail report from the user interface or through a batch process in either PDF or Excel format. We have shipped the following payment detail reports for the fully-insured individual business in this release:

- **FOPPADTHBPDF** - Used when you want to generate the payment detail report through the **C1-RPTGN** batch in the PDF format.
- **FOPPADTHBXLS** - Used when you want to generate the payment detail report through the **C1-RPTGN** batch in the Excel format.
- **FOPPADTHOPDF** - Used when you want to generate the payment detail report from the user interface in the PDF format.
- **FOPPADTHOXLS** - Used when you want to generate the payment detail report from the user interface in the Excel format.

Payment Detail Report for Self-funded and Fully-Insured Group Business

The **Payment Detail** report for self-funded and fully-insured group business enables you to view the payment details of each account. At a time, it enables you to view the payments of all accounts which belong to a particular division. While generating the payment detail report for the self-funded or fully-insured group business, you can specify the following parameters - Division, Start Date, End Date, Person Identifier Type, Person Identifier, Account Identifier Type, Account Identifier, Payment Status, Payment Amount Range, and Customer Class. The division and start date are mandatory. If you do not specify the end date, the system by default sets it to the system date. While filtering the data using the payment amount range, you need to specify the lower and upper range value separated by the hyphen (-) symbol.

For example, if you set the start date to 01-01-2020, division to D1, and payment amount range to 50-100, the system will extract all payments which are created from 01-01-2020 till the current date, whose payment amount is between 50 and 100, and which are created for the accounts belonging to the D1 division. The payments are shown in the payment currency.

You can generate the payment detail report from the user interface or through a batch process in either PDF or Excel format. We have shipped the following payment detail reports for the self-funded and fully-insured group business in this release:

- **FOPPADGHBPDF** - Used when you want to generate the payment detail report through the **C1-RPTGN** batch in the PDF format.
- **FOPPADGHBXLS** - Used when you want to generate the payment detail report through the **C1-RPTGN** batch in the Excel format.
- **FOPPADGHOPDF** - Used when you want to generate the payment detail report from the user interface in the PDF format.
- **FOPPADGHOXLS** - Used when you want to generate the payment detail report from the user interface in the Excel format.

Payment Summary Report for Fully-Insured Individual Business

The **Payment Summary** report for fully-insured individual business enables you to view the total payment made for each account. At a time, it enables you to view the total payment of each account which belongs to a particular division. While generating the payment summary report for the fully-insured individual business, you can specify the following parameters - Division, Start Date, End Date, Person Identifier Type, Person Identifier, Account Identifier Type, Account Identifier, Health Plan ID, and Customer Class. The division and start date are mandatory. If you do not specify the end date, the system by default sets it to the system date. The payment total is shown in the customer's division currency. While generating the payment summary report, the system does the currency conversion when the payment currency is different from the customer's division currency.

You can generate the payment summary report from the user interface or through a batch process in either PDF or Excel format. We have shipped the following payment summary reports for the fully-insured individual business in this release:

- **FOPPASMHBPDF** - Used when you want to generate the payment summary report through the **C1-RPTGN** batch in the PDF format.
- **FOPPASMHBXLS** - Used when you want to generate the payment summary report through the **C1-RPTGN** batch in the Excel format.
- **FOPPASMHOPDF** - Used when you want to generate the payment summary report from the user interface in the PDF format.
- **FOPPASMHOXLS** - Used when you want to generate the payment summary report from the user interface in the Excel format.

Payment Summary Report for Self-funded and Fully-Insured Group Business

The **Payment Summary** report for self-funded and fully-insured group business enables you to view the total payment made for each account. At a time, it enables you to view the total payment of each account which belongs to a particular division. While generating the payment summary report for the self-funded or fully-insured group business, you can specify the following parameters - Division, Start Date, End Date, Person Identifier Type, Person Identifier, Account Identifier Type, Account Identifier, and Customer Class. The division and start date are mandatory. If you do not specify the end date, the system by default sets it to the system date. The payment total is shown in the customer's division currency. While generating the payment summary report, the system does the currency conversion when the payment currency is different from the customer's division currency.

You can generate the payment summary report from the user interface or through a batch process in either PDF or Excel format. We have shipped the following payment summary reports for the self-funded and fully-insured group business in this release:

- **FOPPASGHBPDP** - Used when you want to generate the payment summary report through the **C1-RPTGN** batch in the PDF format.
- **FOPPASGHBXLS** - Used when you want to generate the payment summary report through the **C1-RPTGN** batch in the Excel format.
- **FOPPASGHOPDP** - Used when you want to generate the payment summary report from the user interface in the PDF format.
- **FOPPASGHOXLS** - Used when you want to generate the payment summary report from the user interface in the Excel format.

Specific Stop-Loss Report

The **Specific Stop-Loss** report enables you to view the specific stop-loss which is billed for each member to a bill group. At a time, it enables you to view the specific stop-loss information of a particular parent customer which belongs to a particular division. While generating the specific stop-loss report, you can specify the following parameters - Division, Parent Customer, Claim Billed Through, Policy Start Date, and Policy End Date. The division and parent customer are

mandatory. If you specify the claim billed until date, you need to specify the policy start and end dates. For example, if you specify 03-01-2022 in the **Claim Billed Through** parameter, 01-01-2022 in the **Policy Start Date** parameter, and 12-31-2022 in the **Policy End Date** parameter, the system fetches the specific stop-loss charges which are billed to different bill groups of the parent customer between 01-01-2022 to 03-01-2022.

This report can be used for the self-funded business. You can generate the specific stop-loss report from the user interface or through a batch process in either PDF or Excel format. We have shipped the following specific stop-loss reports in this release:

- **FOPSSLHCBPDF** - Used when you want to generate the specific stop-loss report through the **C1-RPTGN** batch in the PDF format.
- **FOPSSLHCBXLS** - Used when you want to generate the specific stop-loss report through the **C1-RPTGN** batch in the Excel format.
- **FOPSSLHCOPDF** - Used when you want to generate the specific stop-loss report from the user interface in the PDF format.
- **FOPSSLHCOXLS** - Used when you want to generate the specific stop-loss report from the user interface in the Excel format.

To Do Report

The **To Do** report enables you to view the notifications (i.e. To Dos) assigned to a user and its current status. While generating the To Do report, you can specify the following parameters - Start Date, End Date, To Do Type, To Do Type Description, Assigned User, Created By, Status, Operator, and To Do Age. The start date is mandatory. If you do not specify the end date, the system by default sets it to the system date. For example, if you specify the start date as 06-01-2022 and To Do type as C1-ACCL, the system will extract all To Dos which are created using the C1-ACCL To Do type from 06-01-2022 till the current date. While filtering the data using the To Do age, you need to specify the operator along with the To Do age. The system supports the following operators: Greater Than (>), Less Than (<), Less Than Equal To (<=), Greater Than Equal To (>=), and Equal To (=). For example, if you specify the start date as 06-01-2022, To Do age as 50, and operator as >, the system will extract all To Dos which are open in the system since more than 50 days.

You can generate the To Do report from the user interface or through a batch process in the PDF format. We have shipped the following To Do reports in this release:

- **FOPTODOBPDF** - Used when you want to generate the To Do report through the **C1-RPTGN** batch in the PDF format.
- **FOPTODOOPDF** - Used when you want to generate the To Do report from the user interface in the PDF format.

User Access Report

The **User Access** report enables you to view the permissions granted to different users for accessing the data. While generating the user access report, you can specify the following parameters - User Group, User Group Description, To Do Role, and To Do Role Description.

You can generate the user access report from the user interface in the PDF format. We have shipped the following user access report in this release:

- **FOPUSROPDF** - Used when you want to generate the user access report from the user interface in the PDF format.

Automatic Payment Response Report

Oracle Revenue Management and Billing enables you to extract the response received for automatic payment clearing records from the auto clearing house along with the current payment status through an FOP report. While generating the automatic payment response report, you can specify the following parameters - Search By, Start Date, End Date, Division, Customer Class, Person Name, Person Identifier Type, Person Identifier, Account Identifier Type, Account

Identifier, and Automatic Payment Response. The **Search By** filter enables you to extract the automatic payment clearing records either using the following values:

- **AUTOPAY_EXTRACTION_DATE** - If you set the **Search By** parameter to **AUTOPAY_EXTRACTION_DATE**, the system considers the automatic payment clearing records whose extract date falls within the start and end dates.
- **UPLOAD_DATE** - If you set the **Search By** parameter to **UPLOAD_DATE**, the system considers the automatic payment clearing records whose response from the auto clearing house is uploaded within the start and end dates.

The **Search By**, **Start Date**, and **Division** are mandatory. If you do not specify the end date, the system by default sets it to the system date. You can generate the automatic payment response report from the user interface or through a batch process in either PDF or Excel format. We have shipped the following automatic payment response reports in this release:

- **FOPAPAYHBPDP** - Used when you want to generate the automatic payment response report through the **C1-RPTGN** batch in the PDF format.
- **FOPAPAYHBXLS** - Used when you want to generate the automatic payment response report through the **C1-RPTGN** batch in the Excel format.
- **FOPAPAYHOPDP** - Used when you want to generate the automatic payment response report from the user interface in the PDF format.
- **FOPAPAYHOXLS** - Used when you want to generate the automatic payment response report from the user interface in the Excel format.

Binder Payment Report

Oracle Revenue Management and Billing enables you to extract the binder payments through an FOP report. While generating the binder payment report, you can specify the following parameters - Start Date, End Date, Division, Customer Class, Person Name, Exchange Subscriber Identifier Type, Exchange Subscriber Identifier, Membership Status, and Binder Payment Status.

The **Start Date**, **End Date**, and **Division** are mandatory. You can generate the binder payment report from the user interface or through a batch process in either PDF or Excel format. We have shipped the following binder payment reports in this release:

- **FOPBIPAHOPDP** - Used when you want to generate the binder payment report through the **C1-RPTGN** batch in the PDF format.
- **FOPBIPAHOXLS** - Used when you want to generate the binder payment report through the **C1-RPTGN** batch in the Excel format.
- **FOPBIPAHBPDP** - Used when you want to generate the binder payment report from the user interface in the PDF format.
- **FOPBIPAHBXLS** - Used when you want to generate the binder payment report from the user interface in the Excel format.

Quick Response Code Generation

A Quick Response (QR) code is a type of matrix barcode (or two-dimensional barcode). A barcode is a machine-readable optical label that can contain information about the item to which it is attached. Oracle Revenue Management and Billing provides a QR code generator using which you can generate a QR code. At the moment, the QR code is only supported for the FOP reports which are generated in the PDF format. You can define dataset for the QR string using which you want to generate the QR code. You can insert a QR code on any page in the Portable Document Format (PDF) file.

To insert a QR code in an FOP report, you need to add QR related code snippets in the respective XSL file. Only then, the system will insert the QR code when you generate the FOP report in the PDF format.

Chapter

53

Automatic Refund/Write Off

Topics:

- [Refund/Write Off Business Rules](#)
- [Automatic Refund/Write Off on Terminating a Group Policy or Individual Membership](#)
- [Rollback Automatic Refund/Write Off on Reinstating a Group Policy or Individual Membership](#)
- [Automatic Refund/Write Off Preference](#)
- [Refund/Write Off Instruction](#)

Oracle Revenue Management and Billing enables you to create an automatic refund/write off instruction for an account when a fully-insured group policy or individual membership is terminated. It also enables you to rollback an automatic refund/write off for an account when the fully-insured group policy or individual membership is reinstated. For more information, refer to the respective sections in this chapter.

Refund/Write Off Business Rules

Oracle Revenue Management and Billing enables you to define business rules for automatic refund and write off creation. A new category named **Refund/Write Off Business Rule** is introduced in this release. The refund/write off business rules are used for creating automatic refund and write off requests for accounts when the fully-insured group policy or individual membership is terminated.

While terminating a fully-insured group policy or individual membership, the system derives the refund/write off business rule for the fully-insured group policy or individual membership. While deriving the refund/write off business rule for a fully-insured group policy or individual membership, the system considers the business rules which are effective on the termination date. Once the effective business rules are identified, the system executes these business rules in the order of their priority. Once the criteria of the business rule are met, the business rule is stamped against the fully-insured group policy or individual membership. If two or more business rules have the same priority, the system sorts the business rules for execution based the business rule criteria sequence.

While defining the refund/write off business rule criteria, you can use the parameters which are defined on the following entities:

- Individual Membership
- Member Person of Individual Membership
- Health Plan
- Health Product
- Policy
- Account

You can define, edit, and delete a refund/write off business rule through the **Business Rule** screen. While defining a refund/write off business rule, you need to set its category to **Refund/Write Off Business Rule**. The refund/write off business rule enables you to define the following parameters:

- **Refund Threshold Amount** - Used to specify the threshold amount for refund. If the account balance is greater than or equal to the refund threshold amount, the system creates automatic refund for an account.
- **Defer Refund (in Days)** - Used to specify the number of days till when you want to defer the automatic refund for an account. It is used while calculating the automatic refund request creation date.
- **Write Off Threshold Amount** - Used to specify the threshold amount for write off. If the account balance is less than or equal to the write off threshold amount, the system creates automatic write off for an account.
- **Defer Write Off (in Days)** - Used to specify the number of days till when you want to defer the automatic write off for an account. It is used while calculating the automatic write off request creation date.

You can view the refund/write off business rules through the **Business Rule** screen.

Automatic Refund/Write Off on Terminating a Group Policy or Individual Membership

On terminating a fully-insured group policy or individual membership, the system derives the refund/write off business rule for the fully-insured group policy or individual membership and stamps it against the policy or membership ID in the **C1_ENT_BUS_RULE** table.

If the fully-insured group policy is defined for a parent customer, the system derives all accounts of the parent customer and its bill groups and then creates an automatic refund/write off instruction for each account of the parent customer and its bill groups. However, if the fully-insured group policy is defined for a bill group, the system derives all accounts of the bill group and then creates an automatic refund/write off instruction for each account of the bill group. While deriving the parent customer and bill group of the fully-insured group policy, the system considers the **Parent Person Type** and **Bill Group Person Type** option types of the **C1-PERSTYPE** feature configuration. However, in case of individual membership, the system derives all accounts of the financially responsible person and then creates an automatic refund/write off instruction for each account of the financially responsible person.

Note:

The system does not create a new automatic refund/write off instruction for an account when an automatic refund/write off instruction already exists for the account in the **Pending**, **Valid**, **Error**, or **Pending Completion** status.

If you want to create automatic refund/write off instruction for an account on terminating a fully-insured group policy, you need to ensure that the **C1-POTR-INS** algorithm is attached to the **Terminated** status of the **C1-POLICY** business object.

If you want to create automatic refund/write off instruction for an account on terminating an individual membership, you need to ensure that the **C1-IMTR-INS** algorithm is attached to the **Terminated** status of the **C1-IndMembership** business object.

The system calculates the wait date using the wait days specified in the **C1-POTR-INS** or **C1-IMTR-INS** algorithm, respectively. In case of a fully-insured group policy, the wait days is added to the policy end date to derive the wait date. However, in case of an individual membership, the wait days is added to the membership end date to derive the wait date. The wait date is later used to calculate the automatic refund/write off request creation date. A new screen named **Refund/Write off Instruction** is introduced in this release. It enables you to view the automatic refund/write off instructions of an account which are created on terminating a fully-insured group policy or individual membership. On creating an automatic refund/write off instruction, the status of the automatic refund/write off instruction is set to **Pending**. The following two batches are introduced in this release:

- [Identify Refund/Write Off Eligibility \(C1-RFWO1\)](#) on page 3843
- [Automatic Creation of Refund/Write Off \(C1-RFWO2\)](#) on page 3844

On voiding a refund request created through an automatic refund instruction, the system cancels the transfer adjustments and refund adjustment on the netting contract of the account. And, on canceling a write off request created through an automatic write off instruction, the system cancels the transfer adjustments and write off adjustment on the netting contract of the account.

Identify Refund/Write Off Eligibility (C1-RFWO1)

The **Identify Refund/Write Off Eligibility (C1-RFWO1)** batch is used to check whether there are any automatic refund/write off instructions in the **Pending** status. If there is an automatic refund/write off instruction in the **Pending** status, the system derives the business rule stamped against the fully-insured group policy or individual membership for which the automatic refund/write off instruction is created. If the business rule is not found for the fully-insured group policy or individual membership in the **C1_ENT_BUS_RULE** table, the system changes the status of the automatic refund/write off instruction to **Invalid**. In addition, the automatic refund/write off instruction reason is set to **INBR** (Business Rule Could not be Derived). However, if the business rule is found for the fully-insured group policy or individual membership in the **C1_ENT_BUS_RULE** table, the system derives the account balance. If the account balance is zero, the system changes the status of the automatic refund/write off instruction to **Invalid**. In addition, the automatic refund/write off instruction reason is set to **INZR** (Account Balance Is Zero).

If the account balance is greater than zero but less than the refund threshold amount, the system changes the status of the automatic refund instruction to **Invalid**. In addition, the automatic refund instruction reason is set to **INTH** (Account Balance Doesn't Meet Threshold Limit). However, if the account balance is greater than zero and greater than or equal to the refund threshold amount, the system does the following:

- Changes the status of the automatic refund instruction to **Valid**.
- Derives the refund request type from the automatic refund/write off field mapping which is specified in the **C1_REFWO** feature configuration.
- Calculates the automatic refund request creation date using the wait date (calculated earlier using the wait days) and defer refund days specified in the business rule.

If the account balance is less than zero but greater than the write off threshold amount, the system changes the status of the automatic write off instruction to **Invalid**. In addition, the automatic write off instruction reason is set to **INTH** (Account Balance Doesn't Meet Threshold Limit). However, if the account balance is less than zero and less than or equal to the write off threshold amount, the system does the following:

- Changes the status of the automatic write off instruction to **Valid**.
- Derives the write off request type from the automatic refund/write off field mapping which is specified in the **C1_REFWO** feature configuration.
- Calculates the automatic write off request creation date using the wait date (calculated earlier using the wait days) and defer write off days specified in the business rule.

Note: If the system is used for both the fully-insured group and fully-insured individual line of business, you need to define two separate field mappings of the **Automatic Refund/Write-Off** preference category - one for each line of business (i.e. fully-insured group business and fully-insured individual business). Once you define the field mapping for each line of business, you need to set them against the **Field Mapping Preference for Individual Membership** and **Field Mapping Preference for Policy (Small Group)** option types, respectively, in the **C1_REFWO** feature configuration.

If the netting contract type is not specified in the refund/write off request type, the system changes the status of the automatic refund/write off instruction to **Invalid**. In addition, the automatic refund/write off instruction reason is set to **NCTM** (Netting Contract Type Missing).

Automatic Creation of Refund/Write Off (C1-RFWO2)

The **Automatic Creation of Refund/Write Off (C1-RFWO2)** batch is used to check whether there are any automatic refund/write off instructions in the **Valid**, **Pending Completion**, or **Error** status. If there is an automatic refund/write off instruction in the **Valid** or **Error** status and if the refund/write off request creation date in the automatic refund/write off instruction is earlier than or equal to the batch business date, the system verifies the account balance. Note that the automatic refund/write off instruction in the **Error** status are considered only when the **Select records in Error (Y/ N)** parameter in the batch is set to **Y**. If the current account balance does not match the account balance retrieved in the **C1-RFWO1** batch, the system cancels the automatic refund/write off instruction. The status of the automatic refund/write off instruction is changed to **Canceled** and the automatic refund/write off instruction reason is set to the reason code which is specified in the **Instruction Cancel Reason on Account Balance Change** attribute of the automatic refund/write off field mapping.

If the current account balance matches the account balance retrieved in the **C1-RFWO1** batch, the system creates the refund/write off request using the refund/write off request type (which is specified in the automatic refund/write off field mapping). While creating the refund/write off request, the adjustment level is set to **Account**. If the approval process is not configured on the refund/write off request type, the refund/write off request is created and processed immediately. On processing a refund/write off request, the system does the following:

- Creates transfer adjustments against the unmatched financial transactions of the account on the netting contract
- Creates one refund/write off adjustment against the netting contract
- Changes the status of the refund/write off request to **Processed**
- Changes the status of the automatic refund/write off instruction to **Completed**

If the approval process is configured on the refund/write off request type, the refund/write off request is created in the **Approval in Progress** status. The status of the automatic refund/write off instruction is then changed to **Pending Completion**.

Note: An approver can approve or reject the refund/write off request from the user interface. If the approver approves the refund/write off request, the system creates transfer adjustments against the unmatched financial transactions of the account on the netting contract and creates one refund/write off adjustment against the netting contract. Finally, the status of the refund/write off request is changed to **Processed**. However, if the approver rejects the refund/write off request, the system sets the automatic refund/write off instruction reason to the reason code which is specified in the **Instruction Cancel Reason on Rejecting Request** attribute of the automatic refund/write off field mapping.

In addition, if the refund process is on hold for the account, the refund request is created in the **Hold** status. The status of the automatic refund instruction is then changed to **Pending Completion**.

If an error occurs while creating a refund/write off request, the system does the following:

- Changes the status of the automatic refund/write off instruction to **Error**

- Sets the automatic refund/write off instruction reason to the reason code which is specified in the **Error Code on Processing Refund/Write Off Request** attribute of the automatic refund/write off field mapping.
- Creates a To Do using the **C1-ATRFWO** To Do type for the automatic refund/write off instruction

If there is an automatic refund/write off instruction in the **Pending Completion** status and if the refund/write off request creation date in the automatic refund/write off instruction is earlier than or equal to the batch business date, the system checks whether the status of the corresponding refund/write off request is **Processed**. If so, the system changes the status of the automatic refund/write off instruction to **Completed**.

Rollback Automatic Refund/Write Off on Reinstating a Group Policy or Individual Membership

If a terminated fully-insured group policy or individual membership is reinstated, the system checks whether an automatic refund/write off instruction exists for the policy or membership. If an automatic refund/write off instruction exists for the policy or membership, the system behaves in the following manner:

Refund/Write Off Request Exists (Y or N)	Automatic Refund/Write Off Instruction Status	System Behavior
N	Pending or Valid	<p>The system does the following:</p> <ul style="list-style-type: none">• Changes the status of the automatic refund/write off instruction to Canceled• Sets the automatic refund/write off instruction reason to the reason code which is specified in the Instruction Cancel Reason on Reinstatement attribute of the automatic refund/write off field mapping.
Y	Pending Completion	<p>The system does the following:</p> <ul style="list-style-type: none">• Changes the status of the automatic refund/write off instruction to Canceled• Sets the automatic refund/write off instruction reason to the reason code which is specified in the Instruction Cancel Reason on Reinstatement attribute of the automatic refund/write off field mapping.• If the refund/write off request is in the Processed or Approval in Progress status, then<ul style="list-style-type: none">• The appropriate log entry is added to the refund/write off request.• The status of the refund/write off request is changed to Rejected.• The automatic refund/write off instruction reason is set to the reason code which is specified in the Refund Request Reject Reason on Reinstatement or Write Off Request Reject Reason on Reinstatement attribute of the automatic refund/write off field mapping, respectively.• If the refund request is in the Hold status, then<ul style="list-style-type: none">• The appropriate log entry is added to the refund request.

Refund/Write Off Request Exists (Y or N)	Automatic Refund/Write Off Instruction Status	System Behavior
		<ul style="list-style-type: none"> The status of the refund request is changed to Voided. The automatic refund instruction reason is set to the reason code which is specified in the Void Status Reason for Refund Request on Reinstatement attribute of the automatic refund/write off field mapping.
Y	Completed	<p>The system does the following:</p> <ul style="list-style-type: none"> If the write off request is in the Processed status, then <ul style="list-style-type: none"> The appropriate log entry is added to the write off request. The status of the write off request is changed to Canceled. The status of the automatic write off instruction is changed to Canceled The automatic write off instruction reason is set to the reason code which is specified in the Instruction Cancel Reason on Reinstatement attribute of the automatic refund/write off field mapping. If the refund request is in the Processed status, then no action is taken against the refund request and automatic refund instruction.

Automatic Refund/Write Off Preference

The Automatic Refund/Write Off Preference enables you to set the attributes which are used while generating automatic refund and/or write off requests for the accounts during fully-insured group policy and individual membership termination. You should define two separate field mappings of the **Automatic Refund/Write-Off** preference category - one for each line of business (i.e. fully-insured group business and fully-insured individual business).

You can define, edit, delete, and copy an automatic refund/write off preference through the **Field Mapping** screen.

Searching for an Automatic Refund/Write Off Preference

Procedure

To search for an automatic refund/write off preference:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Field Mapping**.
A sub-menu appears.
3. Click the **Search** option from the **Field Mapping** sub-menu.
The **Field Mapping** screen appears.
4. Select the **Automatic Refund/Write Off** option from the **Preference Category** list.
5. Enter the additional search criteria in the **Search Field Mapping** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

6. Click **Search**.
A list of automatic refund/write off preferences that meet the search criteria appears in the **Search Results** section.

Viewing the Automatic Refund/Write Off Preference Details

Procedure

To view the details of an automatic refund/write off preference:

1. Search for an automatic refund/write off preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Broadcast** (📡) icon corresponding to the automatic refund/write off preference whose details you want to view.
The **Field Mapping** zone appears.
3. View the details of the automatic refund/write off preference in the **Field Mapping** zone.

Defining an Automatic Refund/Write Off Preference

Prerequisites

To define an automatic refund/write off preference, you should have:

- Field mapping business objects defined in the application.
- Required characteristic types defined in the application (where the characteristic entity is set to **Membership**)
- Status reasons defined for the **C1-RefundReq** business object.
- Values defined for the **Field Mapping Preference for Individual Membership** and **Field Mapping Preference for Policy (Small Group)** option type in the **C1_REFWO** feature configuration.

Procedure

To define an automatic refund/write off preference:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Field Mapping**.
A sub-menu appears.
3. Click the **Add** option from the **Field Mapping** sub-menu.

The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Field Mapping Business Object	<p>Used to indicate the business object using which you want to create an automatic refund/write off preference. The valid values are:</p> <ul style="list-style-type: none"> • Bill Route Method - Contact Method Mapping (i.e., C1_BillRouteCntMethMap) - Enables you to maintain a routing method - contact method mapping preference. • Field Mapping (i.e., C1-FieldMapping) - Enables you to maintain the following: <ul style="list-style-type: none"> • Automatic Refund/Write-Off Preference • Billing Preference • Binder Payment Preference • Configuration for Match Type - Handling Overpayment Preference • Delinquency Process Preference • Delinquency Process Type Preference • Geographic Rating Area Preference • Individual Membership Preference • Medicare Preference • Member Reconciliation Preference • Member Relationship and Subscription Tier Preference • Membership Repricing Reasons Preference • Statement Construct Preference • Medicare Plan Benefit Package (i.e., C1-BenefitPackage) - Enables you to maintain a Medicare plan benefit package. • Membership Status Reason Mapping (i.e., C1-MemStatusReasonMapping) - Enables you to maintain an individual membership status reason preference. 	Yes

Note: Alternatively, you can access the **Select Business Object** screen by clicking the **Add** button in the **Page Title** area of the **Field Mapping** screen.

4. Select the **Field Mapping** option from the **Field Mapping Business Object** list.
5. Click **OK**.

The **Field Mapping** screen appears. It contains the following sections:

- **Main** - Used to specify basic details of the automatic refund/write off preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the automatic refund/write off preference.	Yes
Description	Used to specify the description for the automatic refund/write off preference.	Yes
Detailed Description	Used to specify additional information about the automatic refund/write off preference.	No

Field Name	Field Description	Mandatory (Yes or No)
Status	Used to indicate the status of the automatic refund/write off preference. The valid values are: <ul style="list-style-type: none"> Active Inactive 	Yes

- **Preference Category** - Used to specify the preference category. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Preference Category	Used to indicate the category to which the preference belongs. The valid values are: <ul style="list-style-type: none"> Automatic Refund/Write-Off Billing Binder Payment Configuration for Match Type - Handling Overpayment Delinquency Process Delinquency Process Type Geographic Rating Area Individual Membership Medicare Medicare Plan Benefit Member Reconciliation Member Relationship and Subscription Tier Membership Repricing Reasons Membership Status Reason Routing Method - Contact Method Mapping Statement Construct <p>Note:</p> <p>The list includes only those values which are defined in the FIELD_CAT_FLG lookup field.</p> <p>You must select Automatic Refund/Write Off option as the preference category while creating an automatic refund/write off preference.</p>	Yes

- **Preference Settings** - Used to set the attributes in the hold request preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute which you want to set in the automatic refund/write off preference.	Yes
	Note: The attribute list appears only when the preference category is selected from the respective list.	
Value	Used to specify the attribute value.	Yes

Field Name	Field Description	Mandatory (Yes or No)
	Note: The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the automatic refund/write off preference.	
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: <ul style="list-style-type: none"> • Account • Adjustment • Billable Charge • Membership • Payment • Policy Note: At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types to the MAP_ENTITY_FLG lookup field.	No

Note: While defining an automatic refund/write off preference, you must set at least one attribute in the automatic refund/write off preference.

6. Select the **Automatic Refund/Write Off** option from the **Preference Category** list.
The **Preference Category** section disappears and the **Preference Category** field appears in the **Main** section.
7. Enter the required details in the **Main** section.
8. Set the required attributes in the automatic refund/write off preference.
9. If you want to set more than one attribute in the automatic refund/write off preference, click the **Add (+)** icon and then repeat step 8.

Note: However, if you want to remove an attribute from the automatic refund/write off preference, click the **Delete** (🗑️) icon corresponding to the attribute.

10. Click **Save**.
The automatic refund/write off preference is defined.

Editing an Automatic Refund/Write Off Preference

Prerequisites

To edit an automatic refund/write off preference, you should have:

- Required characteristic types defined in the application (where the characteristic entity is set to **Membership**)
- Values defined for the **Field Mapping Preference for Individual Membership** and **Field Mapping Preference for Policy (Small Group)** option type in the **C1_REFWO** feature configuration.
- Values defined in the **FIELD_CAT_FLG** and **FIELD_NAME_FLG** lookup field.

Procedure

To edit an automatic refund/write off preference:

1. Search for an automatic refund/write off preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Edit** (✎) icon in the **Edit** column corresponding to the automatic refund/write off preference whose details you want to edit.

The **Field Mapping** screen appears. It contains the following sections:

- **Main** - Used to specify basic details for the automatic refund/write off preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Displays the automatic refund/write off preference.	Not applicable
Description	Used to specify the description for the automatic refund/write off preference.	Yes
Detailed Description	Used to specify additional information about the automatic refund/write off preference.	No
Status	Used to indicate the status of the automatic refund/write off preference. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	Yes
Preference Category	Indicates the category to which the preference belongs. The valid value is: <ul style="list-style-type: none"> • Automatic Refund/Write Off 	Not applicable

- **Preference Settings** - Used to set the attributes in the automatic refund/write off preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute which you want to set in the automatic refund/write off preference.	Yes
	Note: The attribute list appears only when the preference category is selected from the respective list.	
Value	Used to specify the attribute value.	Yes
	Note: The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the automatic refund/write off preference.	
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: <ul style="list-style-type: none"> • Account • Adjustment • Billable Charge • Membership 	No

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> Payment Policy 	
	Note: At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types in the MAP_ENTITY_FLG lookup field.	

Tip: Alternatively, you can click the **Edit** button in the **Field Mapping** zone to edit the details of the automatic refund/write off preference.

3. Modify the required details in the **Main** section.
4. Define, edit, or remove the attribute from the automatic refund/write off preference, if required.

Note: You must set at least one attribute in an automatic refund/write off preference.

5. Click **Save**.
The changes made to the automatic refund/write off preference are saved.

Copying an Automatic Refund/Write Off Preference

Instead of creating an automatic refund/write off preference from scratch, you can create a new automatic refund/write off preference using an existing automatic refund/write off preference. This is possible through copying an automatic refund/write off preference. On copying an automatic refund/write off preference, the details including the attributes are copied to the new automatic refund/write off preference. You can then edit the details, if required.

Prerequisites

To copy an automatic refund/write off preference, you should have:

- Automatic refund/write off preference (whose copy you want to create) defined in the application
- Required characteristic types defined in the application (where the characteristic entity is set to **Membership**)
- Status reasons defined for the **C1-RefundReq** business object.
- Values defined for the **Field Mapping Preference for Individual Membership** and **Field Mapping Preference for Policy (Small Group)** option type in the **C1_REFWO** feature configuration.

Procedure

To copy an automatic refund/write off preference:

1. Search for an automatic refund/write off preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Duplicate** (📄) icon in the **Duplicate** column corresponding to the automatic refund/write off preference whose copy you want to create.
3. Click **OK**.

The **Field Mapping** screen appears. It contains the following sections:

- **Main** - Used to specify basic details of the automatic refund/write off preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the automatic refund/write off preference.	Yes
Description	Used to specify the description for the automatic refund/write off preference.	Yes
Detailed Description	Used to specify additional information about the automatic refund/write off preference.	No
Status	Used to indicate the status of the automatic refund/write off preference. The valid values are: <ul style="list-style-type: none"> Active Inactive 	Yes
Preference Category	Indicates the feature for which the preference is designed. The valid values is: <ul style="list-style-type: none"> Automatic Refund/Write Off 	Not applicable

- **Preference Settings** - Used to set the attributes in the automatic refund/write off preference.

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute which you want to set in the automatic refund/write off preference.	Yes
	Note: The attribute list appears only when the preference category is selected from the respective list.	
Value	Used to specify the attribute value.	Yes
	Note: The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the automatic refund/write off preference.	
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: <ul style="list-style-type: none"> Account Adjustment Billable Charge Membership Payment Policy 	No
	Note: At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types in the MAP_ENTITY_FLG lookup field.	

Note: While defining an automatic refund/write off preference, you must set at least one attribute in the automatic refund/write off preference.

Tip: Alternatively, you can click the **Duplicate** button in the **Field Mapping** zone to create a copy of the automatic refund/write off preference.

- 4. Enter the required details in the **Main** section.
- 5. Define, edit, or remove the attribute from the automatic refund/write off preference, if required.
- 6. Click **Save**.
The new automatic refund/write off preference is defined.

Search Refund/Write Off Instruction

The **Search Refund/Write off Instruction** zone allows you to search for a refund/write off instruction using various search criteria. This zone contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Search By	Used to indicate whether you want to search for a refund or write off instruction using the policy or individual membership details. The valid values are: <ul style="list-style-type: none"> • Policy Details • Individual Membership Details Note: By default, the Policy Details option is selected.	Yes
Policy ID	Used to search refund or write off instructions which are created using a particular policy. Note: <p>The Search (🔍) icon appears corresponding to this field. On clicking the Search icon, the Search Policy window appears.</p> <p>This field appears when the Policy Details option is selected from the Search By list.</p>	No
Account ID	Used to search refund or write off instructions which are created for particular account. Note: The Search (🔍) icon appears corresponding to this field. On clicking the Search icon, the Account Search window appears.	No
Membership ID	Used to search refund or write off instructions which are created for particular membership. Note: This field appears when the Individual Membership Details option is selected from the Search By list.	No
Created From	Used to search refund or write off instructions which are created from a particular date onwards.	No
Status	Used to search refund or write off instructions with a particular status. The valid values are: <ul style="list-style-type: none"> • Canceled • Completed • Error • Invalid 	No

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> Pending Pending Completion Valid 	
Created Until	Used to search refund or write off instructions which are created till a particular date.	No
Action	Used to indicate whether the instructions are created for refund or write off. The valid values are: <ul style="list-style-type: none"> Refund Write Off 	No

Note: You must specify at least one search criterion while searching for a refund or write off instruction.

- Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Policy Information	Displays information about the policy for which the refund or write off instruction is created.
	Note: It has a link. On clicking the link, the Policy screen appears where you can view the details of the respective policy. This column appears when you select the Policy Details option from the Search By list.
Membership Information	Displays information about the membership for which the refund or write off instruction is created.
	Note: It has a link. On clicking the link, the Membership screen appears where you can view the details of the individual membership. This column appears when you select the Individual Membership Details option from the Search By list.
Account Information	Displays the account for which the refund or write off instruction is created. In addition, this column has a context menu which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Account screen appears where you can view the details of the respective account.
Creation Date Time	Displays the date and time when the refund or write off instruction is created.
Status	Indicates the status of the refund or write off instruction. The valid values are: <ul style="list-style-type: none"> Canceled Completed Error Invalid

Column Name	Column Description
	<ul style="list-style-type: none"> Pending Pending Completion Valid
Reason	Displays the reason for which the refund or write off instruction is created in the system.
Action	Indicates whether the instruction is created for refund or write off. The valid values are: <ul style="list-style-type: none"> Refund Write Off
Request Creation Date	Displays the date when the request is created.
Refund/Write Off Request Information	Displays information about the refund or write off request.
	Note: It has a link. On clicking the link, the Refund Request or Write Off Request screen appears depending on whether the request is for refund or write off.

Searching for a Refund/Write off Instruction

Prerequisites

To search for a refund/write off instruction, you should have:

- Refund or Write Off Instruction defined in the application

Procedure

To search for a refund/write off instruction:

- Click the **Menu** link in the **Application** toolbar.
A list appears.
- From the **Main** menu, select **Accounting and Receivable** and then click **Refund/Write off Instruction**.
The **Refund/Write off Instruction** screen appears.
- Enter the search criteria in the **Refund/Write off Instruction** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- Click **Search**.
A list of refund or write off instructions that meets the search criteria appears in the **Search Results** section.

- [Delinquency Event \(Manual or Automatic Process\) Status Transition](#)
- [Delinquency Process Status Transition](#)
- [Group Delinquency Process Status Transition for an Account](#)

Most often, the fully insured group, direct billed group membership, and fully insured individual lines of business come across scenarios wherein customers fail to pay premium for their policy or health plans, respectively, on time, resulting in delinquency. For the fully insured group business, ORMB enables you to establish a delinquency process at the person (i.e. parent customer or bill group) level to whom the policies are billed or at the account (i.e. parent customer's or bill group's account) level to which the policies are billed. However, for the direct billed group membership and fully insured individual lines of business, ORMB enables you to establish a delinquency process only at the account level to which the direct billed group memberships or individual memberships are billed. A delinquency process signifies a set of procedures and policies that are in place to manage overdue or unpaid insurance premiums.

The system refers the collection class of the person or account, respectively, to control its collection lifecycle. The system monitors the account's debt using the bills of the account as the collection objects. However, the system monitors the person's debt using the bills of all its accounts in its hierarchy as the collection objects. The following screens are introduced for the **Delinquency Management** feature:

- [Delinquency Control \(Screen\)](#) on page 4002
- [Delinquency Event Type \(Screen\)](#) on page 4009
- [Delinquency Process Type \(Screen\)](#) on page 4017
- [Delinquency Process \(Used for Searching\)](#) on page 4057
- [Delinquency Process \(Used for Viewing\)](#) on page 4062

The system can create a delinquency process only when the following prerequisites are configured:

- If you want to create a delinquency process for a person or an account, you need to set the collection method of the respective collection class to **Self-Control Delinquency**. If you want to evaluate the debt of a person or an account while monitoring the parent person's delinquency, you need to set the collection method of the respective collection class to **Parental Delinquency**. However, if you want to ignore a person or an account while monitoring the delinquency, you need to set the collection method of the respective collection class to **Not Eligible for Collection**. For more information, see [Collection Class](#) on page 3894.
- A delinquency control is defined for the required collection classes. For more information, see [Delinquency Control \(Screen\)](#) on page 4002.
- The required delinquency event types and delinquency process types are defined in the system. For more information about the delinquency event type and delinquency process type, see [Delinquency Event Type \(Screen\)](#) on page 4009 and [Delinquency Process Type \(Screen\)](#) on page 4017.
- A preference of the following preference categories is defined in the system:

 - [Delinquency Miscellaneous Options Business Rule](#) on page 3509
 - [Delinquency Termination Date Rule Business Rule](#) on page 3508
- Required rule types and rules are defined to determine whether the delinquency event is eligible to be included in the delinquency process of a person or an account. For more information, see [Delinquency Event Eligibility Evaluation and Trigger Date Calculation](#) on page 3958.
- The outbound message types are defined for the following business objects:
 - **C1-MemberTermRequest** (required only for the fully insured individual and direct billed group membership lines of business)
 - **C1-MemberCancRequest** (required only for the fully insured individual and direct billed group membership lines of business)
 - **C1-PolicyTerminateRequest** (required only for the fully insured group business)
 - **C1-PolicyReinstateRequest** (required only for the fully insured group business)
- The following option types are defined in the **C1-ASOBLNG** feature configuration:
 - **Individual Membership Configurations** (required only for the fully insured individual business)
 - **Membership Active Status** (required only for the fully insured individual and direct billed group membership lines of business)
 - **Membership Terminated Status** (required only for the fully insured individual and direct billed group membership lines of business)
 - **Policy Active Status** (required only for the fully insured group business)
 - **Policy Pending Reinstatement Status** (required only for the fully insured group business)
 - **Policy Pending Termination Status** (required only for the fully insured group business)

For more information about these option types, see [Setting the C1-ASOBLNG Feature Configuration](#) on page 4193.

- Set the batch control type of the following batches to **Timed** and execute them in the below given sequence:
 1. **C1-DPMON**
 2. **C1-PRDLQ** (required only for the fully insured group business)
 3. **C1-ACDLQ**
 4. **C1-DPEVL**
 5. **C1-MBRNT** (required only for the fully insured group business)
 6. **C1-HLMON**
 7. **C1-ADMON** (required only if the advance deposit feature is opted for the fully insured group business)

- [Delinquency Process Type Preference](#)
 - [Delinquency Process Preference](#)
 - [Routing Method – Contact Method Mapping Preference](#)
8. **C1-MTOMT** (required only for the fully insured individual and direct billed group membership lines of business)

Group Health Insurance Delinquency

The system enables you to create a delinquency process at the person or account level for the fully insured group business. You can create a delinquency process at the person or account level only when the collection method in the person's or account's collection class is set to **Self-Control Delinquency**.

In the account level delinquency process, the system monitors the debt of the account at predefined system events and commences the delinquency process whenever the account's debt is overdue. The system creates a delinquency process for an account only when at least one bill of the account is overdue. Note that the system ignores the account while monitoring the delinquency when the collection method in the respective collection class is set to **Not Eligible for Collection**.

However, in the person level delinquency process, the system considers all its accounts and its child persons' accounts where the collection method in their respective collection class is set to **Parental Delinquency**. It then monitors the debt of the person's and its child persons' accounts at predefined system events and commences the delinquency process whenever any of its account's debt is overdue. Note that, in the person's hierarchy, if the collection method in the collection class of any account is set to **Self-Control Delinquency**, then such account is not considered while monitoring the parent person's delinquency. The system creates a distinct delinquency process for each such account where the collection method in the respective collection class is set to **Self-Control Delinquency**. Similarly, in the person's hierarchy, if the collection method in the collection class of any child person is set to **Self-Control Delinquency**, then all the child person's accounts and its grandchild persons' accounts are not considered in the parent person's delinquency. The system creates a distinct delinquency process for each such person (i.e. bill group) where the collection method in the respective collection class is set to **Self-Control Delinquency**. The system creates a delinquency process for a person only when at least one bill of any account (considered) in its hierarchy is overdue.

Note that the system ignores the persons and accounts in the person's hierarchy while monitoring the delinquency when the collection method in the respective collection class is set to **Not Eligible for Collection**.

Individual Health Insurance Delinquency

The system enables you to create a delinquency process at the account level for the fully insured individual business. You can create a delinquency process at the account level only when the collection method in the respective collection class is set to **Self-Control Delinquency**. In the account level delinquency process, the system monitors the debt of the account at predefined system events and commences the delinquency process whenever the account's debt is overdue.

Note that the system ignores the account while monitoring the delinquency when the collection method in the respective collection class is set to **Not Eligible for Collection**.

Direct Billed Group Membership Delinquency

The system enables you to create a delinquency process at the account level for the direct billed group membership business. You can create a delinquency process at the account level only when the collection method in the respective collection class is set to **Self-Control Delinquency**. In the account level delinquency process, the system monitors the debt of the account at predefined system events and commences the delinquency process whenever the account's debt is overdue.

Note that the system ignores the account while monitoring the delinquency when the collection method in the respective collection class is set to **Not Eligible for Collection**.

Account Level Delinquency Process

To create a delinquency process at the account level, the system requires the following collection details of the account:

- **Collection Class** – Used to control how the account's debt is compared against collection criteria (i.e. tolerance limit) to determine whether a collection process (such as delinquency process) should be initiated for the account. A new collection method named **Self-Control Delinquency** is available while defining a collection class. It is used to create a distinct or separate delinquency process for the accounts which belong to the collection class. You can specify the collection class for an account from the user interface or through a health care inbound message.

Note:

If you do not want to initiate delinquency process for an account, ensure that the account belongs to a collection class where the collection method is set to **Not Eligible for Collection**.

If the collection class is not specified for an account, the system, by default, sets it to the one specified in the respective customer class when you create the account through a health care inbound message.

- **Credit Review Grace Days** – Used to indicate the number of days from the bill due date or the processing date after which the account's debt should be monitored for delinquency. For example, if the bill due date is 07-Jan-2024 and credit review grace days is set to 10, then the system will consider the account for monitoring the delinquency on or after 17-Jan-2024. You can specify the credit review grace days for the customer class to which the account belongs from the user interface.

Note: The system considers the bill due date in case of bill events and the processing date in case of non-bill events while monitoring the delinquency of an account.

- **Next Credit Review Date** – Used to indicate the date when the account should be considered for monitoring the delinquency. The system calculates the next credit review date for the account using the bill due date or the processing date and the credit review grace days. The next credit review date of the account is stored in the **CI_ADM_RVW_SCH** table. The system calculates the next credit review date for the account on the following system events:
 - Bill Completion
 - Payment Cancellation (due to Non-Sufficient Funds)
 - Active Overdue Process Review
 - Match Event is Added, Changed, or Deleted
 - Payment Freeze
 - Payment Agreement Request or Promise to Pay is Broken or Canceled
 - Written Off Bill is Reversed
- **Postpone Credit Review Until** – Used when you want to review the account's debt after a particular date. The system will consider the account for monitoring the delinquency only after the specified date. You can specify the postpone credit review until date for an account from the user interface or through a health care inbound message.
- **Credit Rating** – Used to indicate the credit rating of the account. It is calculated by the system using the credit rating transactions which are effective on the system date. The system then considers the sum of account's credit rating and credit rating threshold (defined in the installation options) to determine whether the account's debt should be monitored for delinquency.
- **Minimum Credit Review Frequency** – Used to indicate the frequency at which the accounts belonging to the respective collection class should be monitored for delinquency. In other words, it indicates in how many days the system should review whether the bills of the accounts are overdue. You can specify the minimum credit review frequency for a delinquency control of a collection class from the user interface.
- **Last Credit Review Date** – Used to indicate the date when the account's debt was last reviewed. The system stamps the last credit review date against an account when a delinquency process is initiated for the account through the **C1-ACDLQ** batch.
- **Drag Days** – Used to specify additional grace days (if any) offered at the account level. These drag days are considered while calculating the grace end date when the trigger date calculation mode (in the respective delinquency process type) is set to either **Latest Bill Due Date with Grace Period** or **Usage Basis**. For example, if the latest bill due date is 05-Jan-2024, grace period is set to 5 days (in the respective delinquency process type), and drag days is to 10 days (for the respective account), then the grace end date for the account is set to 20-Jan-2024.

Account Level Delinquency Process Creation

The **C1-ACDLQ** batch is used to create a delinquency process for an account when its overdue bills do not meet the tolerance limit. It considers the accounts which meet the following conditions:

- Collection method of the collection class to which the account belongs is set to **Self-Control Delinquency**
- Next credit review date is either not calculated for the account or is earlier than or equal to the batch business date
- Postpone credit review until date is either not defined for the account or is earlier than or equal to the batch business date
- The date derived using the last credit review date + minimum credit review frequency(defined in the delinquency control) is either blank or is earlier than or equal to the batch business date

Note: The next credit review date of an account is stored in the **CI_ADM_RVW_SCH** table and the postpone credit review until date of an account is stored in the **CI_ACCT** table.

Once the list of accounts are derived, the system executes the delinquency monitor rule algorithm which is attached to the delinquency control of the respective account’s collection class. If the system is not able to derive the delinquency monitor rule algorithm for an account, an appropriate error message is shown in the batch run tree. If the system is able to derive the delinquency monitor rule algorithm for an account and if the new delinquency process is successfully created for an account or if an existing delinquency process is updated for an account, this batch sets the last credit review date of the account in the **CI_ACCT** table to the processing date.

For more information on how the **C1-DLNQMNRL** algorithm (attached to the delinquency control) derives the overdue bills, see [Delinquency Monitoring for a Person or an Account](#) on page 3880.

This batch is a multi-threaded batch. The multi-threading is based on account ID and chunks for multi-threading are created based on numerical distribution of account ID. For more information, see the *Oracle Revenue Management and Billing Batch Guide*.

If a new delinquency process is successfully created for an account, the status of the delinquency process is set to the value (for example, **Initiated**) specified in the **Delinquency Process Initiated Status** attribute of the delinquency process preference. Note that the system considers the preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

The system then invokes the **C1-DPEVTCR** algorithm is attached to the **Initiated** status. The **C1-DPEVTCR** algorithm creates a delinquency event of each delinquency event type that is added in the delinquency process type using which the delinquency process is created. If the delinquency event trigger mode is set to **Manual** in the delinquency process type, the status of the delinquency event is set to **Pending**. However, if the delinquency event trigger mode is set to **Automatic or Manual** or **Automatic** in the delinquency process type, the status of the delinquency event is set to **Pending Evaluation**.

Once the delinquency events are created for the delinquency process, this algorithm does the following:

- Sets the delinquency due date of the delinquency process to the latest bill due date
- Derives the grace period from the delinquency process type or using an algorithm attached to the **Grace Period Derivation** system event depending on the grace period source which is specified in the delinquency process type
- Sets the grace start date in the following manner:

Trigger Date Calculation Mode	Usage Basis	Grace Start Date Basis	Grace Start Date is set to...
Latest Bill Due Date with Grace Period	-	-	Latest Bill Due Date
Usage Basis	Delinquency Process Creation Date	-	Delinquency Process Creation Date

Trigger Date Calculation Mode	Usage Basis	Grace Start Date Basis	Grace Start Date is set to...
Usage Basis	Grace Start Date	Latest Bill Due Date	Latest Bill Due Date
Usage Basis	Grace Start Date	X Days after Latest Bill Due Date	Latest Bill Due Date + Add Days To Due Date
Usage Basis	Grace Start Date	Delinquency Process Creation Date	Delinquency Process Creation Date
Usage Basis	Latest Bill Date	-	Latest Bill Date
Usage Basis	Latest Bill Due Date	-	Latest Bill Due Date

- Calculates the grace end date in the following manner:

Trigger Date Calculation Mode	Usage Basis	Grace Start Date Basis	Grace Start Date	Grace End Date is set to...
Latest Bill Due Date with Grace Period	-	-	Latest Bill Due Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Delinquency Process Creation Date	-	Delinquency Process Creation Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Grace Start Date	Latest Bill Due Date	Latest Bill Due Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Grace Start Date	X Days after Latest Bill Due Date	Latest Bill Due Date + Add Days To Due Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Grace Start Date	Delinquency Process Creation Date	Delinquency Process Creation Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Latest Bill Date	-	Latest Bill Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Latest Bill Due Date	-	Latest Bill Due Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))

Note: This algorithm does not calculate the trigger date and preview date for the events when delinquency event trigger mode is set to **Manual** in the delinquency process type. However, the system calculates the trigger date and preview date for the events when delinquency event trigger mode is set to **Automatic or Manual** or **Automatic** in the delinquency process type while executing the **C1-DPEVL** batch.

Once a delinquency process is created for an account, you can perform the following actions on the delinquency process from the user interface:

- Add additional information in the form of comments or characteristics
- Manually hold a delinquency process and edit the hold details (if required)
- Manually release a hold on the delinquency process
- Manually cancel a delinquency process
- Edit the trigger date of the delinquency events in the delinquency process
- Trigger or skip the delinquency events in the delinquency process
- Request to reinstate the delinquency process (only applicable for the fully insured group business)
- Approve, reject, or withdraw an approval record of the delinquency process

For more information about the manual actions, see [Delinquency Process Maintenance](#) on page 3959. The system also enables you to do the following:

- Automatically hold a delinquency process when the certain conditions are met
- Automatically release a hold on the delinquency process when the certain conditions are met
- Automatically cancel a delinquency process when the certain conditions are met
- Automatically resume a cancelled delinquency process when the certain conditions are met
- Automatically reinstate a delinquency process when the certain conditions are met (only applicable for the fully insured group business)

To enable the automatic process for the above actions, you need to accordingly configure the delinquency process type. The system also enables you to optionally configure the approval process for various manual actions that you can perform on the delinquency event or delinquency process. For more information, see [Delinquency Process Approval](#) on page 3964.

A delinquency event and process goes through various statuses in its lifecycle. The delinquency process status also accordingly changes when the policies, direct billed group memberships, or individual memberships billed to the account are terminated or reinstated.

Person Level Delinquency Process

To create a delinquency process at the person level, the system requires the following collection details of the person:

- **Collection Class** - Used to control how the person's debt is compared against collection criteria (i.e. tolerance limit) to determine whether a collection process (such as delinquency process) should be initiated for the person. A new collection method named **Self-Control Delinquency** is available while defining a collection class. It is used to create a distinct or separate delinquency process for the persons who belong to the collection class. You can specify the collection class for a person from the user interface or through a health care inbound message.

If you want to evaluate the debt of the person's accounts, its child persons, and the child persons' accounts while monitoring the person's delinquency, you must set the collection method of their respective collection class to **Parental Delinquency**. If you set the collection method of the collection class for any of the person's account, any of its child person, or child persons' accounts to **Self-Control Delinquency**, the system does not consider the debt of the respective entity while monitoring the delinquency of the parent person.

Note:

If you do not want to initiate delinquency process for a child person or an account, ensure that the person or account belongs to a collection class where the collection method is set to **Not Eligible for Collection**.

If the collection class is not defined for a person, the system skips the person while monitoring the delinquency.

- **Next Credit Review Date** - Used to indicate the date when the person should be considered for monitoring the delinquency. The system calculates the next credit review date for the account on the following system events:
 - Bill Completion
 - Payment Cancellation (due to Non-Sufficient Funds)
 - Active Overdue Process Review
 - Match Event is Added, Changed, or Deleted
 - Payment Freeze
 - Payment Agreement Request or Promise to Pay is Broken or Canceled
 - Written Off Bill is Reversed

If the collection method in the account's collection class is set to **Parental Delinquency**, the system automatically traverses up the hierarchy and checks whether the collection method in the collection class of its main customer or any of its parent person in the hierarchy is set to **Self-Control Delinquency**. If so, the system sets the next credit review date of the person to the account's next credit review date. The next credit review date of the person is stored in the **C1_PER_RVW_SCH** table.

- **Postpone Credit Review Until** - Used when you want to review the person's debt after a particular date. The system will consider the person for monitoring the delinquency only after the specified date. You can specify the postpone credit review until date for a person through a health care inbound message.
- **Credit Rating** - Used to indicate the credit rating of the person. It is calculated by adding the credit rating of all the accounts where the person is the main customer. The system then considers the sum of person's credit rating and credit rating threshold (defined in the installation options) to determine whether the person's debt should be monitored for delinquency.
- **Minimum Credit Review Frequency** - Used to indicate the frequency at which the persons belonging to the respective collection class should be monitored for delinquency. In other words, it indicates in how many days the system should review whether the bills of the persons are overdue. You can specify the minimum credit review frequency for a delinquency control of a collection class from the user interface.
- **Last Credit Review Date** - Used to indicate the date when the person's debt was last reviewed. The system stamps the last credit review date against a person when a delinquency process is initiated for the person through the **C1-PRDLQ** batch.
- **Drag Days** - Used to specify additional grace days (if any) offered at the person level. These drag days are considered while calculating the grace end date when the trigger date calculation mode (in the respective delinquency process type) is set to either **Latest Bill Due Date with Grace Period** or **Usage Basis**. For example, if the latest bill due date is 05-Jan-2024, grace period is set to 5 days (in the respective delinquency process type), and drag days is to 10 days (for the respective person), then the grace end date for the person is set to 20-Jan-2024.

Person Level Delinquency Process Creation

The **C1-PRDLQ** batch is used to create a delinquency process for a person when its overdue bills do not meet the tolerance limit. It considers the persons which meet the following conditions:

- Collection method of the collection class to which the person belongs is set to **Self-Control Delinquency**
- Next credit review date is either not derived for the person or is earlier than or equal to the batch business date
- Postpone credit review until date is either not defined for the person or is earlier than or equal to the batch business date
- The date derived using the last credit review date + minimum credit review frequency (defined in the delinquency control) is either blank or is earlier than or equal to the batch business date

Note: The next credit review date of a person is stored in the **C1_PER_RVW_SCH** table and the postpone credit review until date of a person is stored in the **CI_PER** table.

Once the list of persons are derived, the system executes the delinquency monitor rule algorithm which is attached to the delinquency control of the respective person's collection class. If the system is not able to derive the delinquency monitor rule algorithm for a person, an appropriate error message is shown in the batch run tree. If the system is able to derive the delinquency monitor rule algorithm for a person and if the new delinquency process is successfully created for a person or if an existing delinquency process is updated for a person, this batch sets the last credit review date of the person in the **CI_PER** table to the processing date.

For more information on how the **C1-DLNQMNRL** algorithm (attached to the delinquency control) derives the overdue bills, see [Delinquency Monitoring for a Person or an Account](#) on page 3880.

This batch is a multi-threaded batch. The multi-threading is based on person ID and chunks for multi-threading are created based on numerical distribution of person ID. For more information, see the *Oracle Revenue Management and Billing Batch Guide*.

If a new delinquency process is successfully created for a person, the status of the delinquency process is set to the value (for example, **Initiated**) specified in the **Delinquency Process Initiated Status** attribute of the delinquency process preference. Note that the system considers the preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

The system then invokes the **C1-DPEVTCR** algorithm which is attached to the **Initiated** status. The **C1-DPEVTCR** algorithm creates a delinquency event of each delinquency event type that is added in the delinquency process type using which the delinquency process is created. If the delinquency event trigger mode is set to **Manual** in the delinquency process type, the status of the delinquency event is set to **Pending**. However, if the delinquency event trigger mode is set to **Automatic or Manual** or **Automatic** in the delinquency process type, the status of the delinquency event is set to **Pending Evaluation**.

Once the delinquency events are created for the delinquency process, this algorithm does the following:

- Sets the delinquency due date of the delinquency process to the latest bill due date
- Derives the grace period from the delinquency process type or using an algorithm attached to the **Grace Period Derivation** system event depending on the grace period source which is specified in the delinquency process type
- Sets the grace start date in the following manner:

Trigger Date Calculation Mode	Usage Basis	Grace Start Date Basis	Grace Start Date is set to...
Latest Bill Due Date with Grace Period	-	-	Latest Bill Due Date
Usage Basis	Delinquency Process Creation Date	-	Delinquency Process Creation Date
Usage Basis	Grace Start Date	Latest Bill Due Date	Latest Bill Due Date
Usage Basis	Grace Start Date	X Days after Latest Bill Due Date	Latest Bill Due Date + Add Days To Due Date
Usage Basis	Grace Start Date	Delinquency Process Creation Date	Delinquency Process Creation Date
Usage Basis	Latest Bill Date	-	Latest Bill Date
Usage Basis	Latest Bill Due Date	-	Latest Bill Due Date

- Calculates the grace end date in the following manner:

Trigger Date Calculation Mode	Usage Basis	Grace Start Date Basis	Grace Start Date	Grace Start Date is set to...
Latest Bill Due Date with Grace Period	-	-	Latest Bill Due Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Delinquency Process Creation Date	-	Delinquency Process Creation Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Grace Start Date	Latest Bill Due Date	Latest Bill Due Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Grace Start Date	X Days after Latest Bill Due Date	Latest Bill Due Date + Add Days To Due Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Grace Start Date	Delinquency Process Creation Date	Delinquency Process Creation Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Latest Bill Date	-	Latest Bill Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Latest Bill Due Date	-	Latest Bill Due Date	Grace Start Date + Grace Period + Drag Days (if any, defined at the respective level (i.e. account or person))

Note: This algorithm does not calculate the trigger date and preview date for the events when delinquency event trigger mode is set to **Manual** in the delinquency process type. However, the system calculates the trigger date and preview date for the events when delinquency event trigger mode is set to **Automatic or Manual** or **Automatic** in the delinquency process type while executing the **C1-DPEVL** batch.

Once a delinquency process is created for a person, you can perform the following actions on the delinquency process from the user interface:

- Add additional information in the form of comments or characteristics
- Manually hold a delinquency process and edit the hold details (if required)
- Manually release a hold on the delinquency process
- Manually cancel a delinquency process
- Edit the trigger date of the delinquency events in the delinquency process

- Trigger or skip the delinquency events in the delinquency process
- Request to reinstate the delinquency process (only applicable for the fully insured group business)

For more information about the manual actions, see [Delinquency Process Maintenance](#) on page 3959. The system also enables you to do the following:

- Automatically hold a delinquency process when the certain conditions are met
- Automatically release a hold on the delinquency process when the certain conditions are met
- Automatically cancel a delinquency process when the certain conditions are met
- Automatically resume a cancelled delinquency process when the certain conditions are met
- Automatically reinstate a delinquency process when the certain conditions are met (only applicable for the fully insured group business)

To enable the automatic process for the above actions, you need to accordingly configure the delinquency process type. The system also enables you to optionally configure the approval process for various manual actions that you can perform on the delinquency event or delinquency process. For more information, see [Delinquency Process Approval](#) on page 3964.

A delinquency event and process goes through various statuses in its lifecycle. The delinquency process status also accordingly changes when the policies billed to the person are terminated or reinstated.

Types of Delinquency Processes

You can design different types of delinquency processes for each line of business (i.e. fully insured group, direct billed group membership, and fully insured individual business). For example,

- Some may be used to just send warning or harsh letters and/or notifications. Such delinquency processes are applicable to the fully insured group, direct billed group membership, and fully insured individual lines of business.
- Some may be used to initiate the termination request for the direct billed group memberships or individual memberships which are billed to a delinquent account. Such delinquency processes are applicable for the direct billed group membership and fully insured individual lines of business.
- Some may be used to initiate the cancellation request for the direct billed group memberships or individual memberships which are billed to a delinquent account. Such delinquency processes are applicable only for the direct billed group membership and fully insured individual lines of business.
- Some may be used to initiate the termination request for the policies which are billed to a delinquent customer or account. Such delinquency processes are applicable only for the fully insured group business.
- Some may be used to initiate the reinstatement request for the policies which are billed to a delinquent customer or account. Such delinquency processes are applicable only for the fully insured group business.
- Some may be used to settle the unpaid dues for a delinquent customer or account using the advance deposit maintained at the person or policy level. Such delinquency processes are applicable only for the fully insured group business.

The system enables you to send different warning letters or To Do notifications, initiate the termination or cancellation request for the direct billed group memberships or individual memberships, initiate the termination or reinstatement request for the policies, or apply advance deposit to settle the unpaid dues by triggering different delinquency events at predefined intervals through a different delinquency process. The system creates a delinquency process for a person or an account using a delinquency process type. The system determines the delinquency process type using which the delinquency process should be created for a person or an account through the delinquency control. Note that the system considers the delinquency control that is defined for the collection class to which the person or account belongs. For more information about the delinquency control and delinquency process type, see [Delinquency Control \(Screen\)](#) on page 4002 and [Delinquency Process Type \(Screen\)](#) on page 4017.

The system enables you to configure the events that should be triggered in a delinquency process by adding appropriate delinquency event types in a delinquency process type. For more information about the delinquency event type, see [Delinquency Event Type](#) on page 3884. The different types of events are triggered in different types of delinquency processes. The system enables you to design the following types of delinquency processes for different set of customers:

- [Debt Notification Delinquency Process](#) on page 3871 (applicable to the fully insured group, direct billed group membership, and fully insured individual customers)
- [Debt Collection Letters Delinquency Process](#) on page 3872 (applicable to the fully insured group, direct billed group membership, and fully insured individual customers)
- [Individual Membership Cancellation Delinquency Process](#) on page 3874 (applicable to the direct billed group membership and fully insured individual customers)
- [Individual Membership Termination Delinquency Process](#) on page 3875 (applicable to the direct billed group membership and fully insured individual customers)
- [Advance Deposit Delinquency Process](#) on page 3879 (applicable only to the fully insured group customers)

Debt Notification Delinquency Process

There might be scenarios wherein the group, direct billed group membership, or individual customers fail to pay premium for their policy plan or health plan coverage, respectively. In such cases, you may want to send reminder notifications to the group, direct billed group membership, or individual customers to pay their premium immediately without any delay. Oracle Revenue Management and Billing enables you to send one or more To Do notifications at regular intervals to:

- The person (i.e. parent customer or bill group) when the delinquency process is created for a person
- The main customer of the account when the delinquency process is created for an account

To create a delinquency process to send To Do notifications, you need to design the delinquency process type using which you want to create the delinquency process in a particular manner.

The following table illustrates how you can design the delinquency process type using which you want to create the delinquency process to send To Do notifications.

Delinquency Process Type	Delinquency Event Type	System Event	Algorithm	Algorithm Purpose
DP1	Send First Reminder Notification	Event Activation	C1-DLQCRTODO1	Creates a To Do using the given To Do type
	Send Second Reminder Notification	Event Activation	C1-DLQCRTODO2	Creates a To Do using the given To Do type
	Send Third Reminder Notification	Event Activation	C1-DLQCRTODO3	Creates a To Do using the given To Do type

Note that the **C1-DLQCRTODO** algorithm is shipped with the product. However, you can create different algorithms (for example, **C1-DLQCRTODO1**, **C1-DLQCRTODO2**, and **C1-DLQCRTODO3**) using the **C1-DLQCRTODO** algorithm type when you want to send different reminder notifications at regular intervals to the person or the main customer of the account. For more information about the algorithm, see [C1-DLQCRTODO](#) on page 3885.

Note: If you want to send the same reminder notification (i.e. the same message) multiple times at different intervals, you can use the **C1-DLQCRTODO** algorithm in all the delinquency event types. However, if you want to send different reminder notifications (i.e. the different message) at different intervals, you can create different algorithms (for example, **C1-DLQCRTODO1**, **C1-DLQCRTODO2**, and **C1-DLQCRTODO3** as shown above) and attach it to the delinquency event type in the sequence in which you want to send the reminders.

Once a delinquency process is created for a person or an account to send To Do notifications, the status of the delinquency process is set to the value (for example, **Initiated**) specified in the **Delinquency Process Initiated Status** attribute of the delinquency process preference. Once the first event in the delinquency process is triggered, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress**) specified in the **Delinquency Process InProgress Status** attribute of the delinquency process preference. Once a To Do is created for the person or the main customer of the account, the status of the delinquency event is changed to **Completed**. Once all the delinquency events are triggered successfully, the status of the delinquency process is changed to the value (for example, **Completed**) specified in the **Delinquency Process Completed Status** attribute of the delinquency process preference.

The system may receive a payment or an adjustment against the overdue bill for which a delinquency process is created to send To Do notifications. In such case, the system behaves in the following manner depending on the status of the delinquency process:

- If a payment or an adjustment is made when a delinquency process is in the **Initiated, Delinquency In Progress, On Hold** status, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference. For more information on how the delinquency process is automatically canceled, see [Canceling a Delinquency Process](#) on page 3965.
- If a payment or an adjustment is made when a delinquency process is in the **Pending Termination** status, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference. For more information on how the delinquency process is automatically canceled, see [Canceling a Delinquency Process](#) on page 3965. This scenario is valid only for the fully insured individual business. This scenario is addressed only when such delinquency processes are automatically canceled through the **C1-DPMON** batch.
- If a payment or an adjustment is made when a delinquency process is in the **Completed** status, no action takes place on the debt notification delinquency process.

However, if the payment or adjustment is canceled due to any reason, the system executes the **C1-CDPPAYCAN** or **C1-DPADJCAN** algorithm attached to the customer class or adjustment type, respectively, to resume the delinquency process. For more information on how the delinquency process is automatically resumed, see [Resuming a Delinquency Process](#) on page 3966.

Note:

If a payment or an adjustment is canceled when a debt notification delinquency process is in the **Completed** status, no action takes place on the debt notification delinquency process.

The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

Debt Collection Letters Delinquency Process

There might be scenarios wherein the group, direct billed group membership, or individual customers fail to pay premium for their policy plan or health plan coverage, respectively, even after sending continuous reminders through To Do notifications. In such scenarios, you may want to send them dunning or warning letters (i.e. delinquency notices). Oracle Revenue Management and Billing enables you to send one or more warning or dunning letters via customer contact to:

- Parent Customer, Bill Group, and/or Billing accounts when the delinquency process is created for a person
- All the persons (that can receive notification) associated with the account when the delinquency process is created for an account

To create a delinquency process to send warning or dunning letters, you need to design the delinquency process type using which you want to create the delinquency process in a particular manner.

The following table illustrates how you can design the delinquency process type using which you want to create the delinquency process to send warning or dunning letters.

Delinquency Process Type	Delinquency Event Type	System Event	Algorithm	Algorithm Purpose
DP1	Send First Reminder Notification	Event Activation	C1-DLQCRTODO	Creates a To Do using the given To Do type
	Send a Warning Letter	Event Activation	C1-DLQSENDCC1	Sends a warning letter via a customer contact
		Monitor Completed Event	C1-RCLTRGDM	Recalculates trigger dates for remaining

Delinquency Process Type	Delinquency Event Type	System Event	Algorithm	Algorithm Purpose
				events based on document mail date
	Send a Dunning Letter	Event Activation	C1-DLQSENDCC2	Sends a dunning letter via a customer contact
DP2	Send a Warning Letter	Event Activation	C1-DLQSENDCC1	Sends a warning letter via a customer contact
	Recalculate Trigger Dates	Monitor Completed Event	C1-RCLTRGDMD	Recalculates trigger dates for remaining events based on document mail date
	Send a Dunning Letter	Event Activation	C1-DLQSENDCC2	Sends a dunning letter via a customer contact
DP3	Send a Warning Letter	Event Activation	C1-DLQSENDCC1	Sends a warning letter via a customer contact
	Send a Dunning Letter	Event Activation	C1-DLQSENDCC2	Sends a dunning letter via a customer contact

The **C1-DLQSENDCC** algorithm is shipped with the product. You can create different algorithms (for example, **C1-DLQSENDCC1** and **C1-DLQSENDCC2**) using the **C1-DLQSENDCC** algorithm type when you want to send different debt collection letters at different intervals. Note that sending a To Do notification before sending debt collection letters through a delinquency process is optional. You may or may not include these To Do notification event types while designing a delinquency process type to send debt collection letters. In addition, the **C1-RCLTRGDMD** algorithm attached to the **Monitor Completed Event** system event is optional. If required, you can recalculate the trigger dates for the remaining events in the delinquency process based on document mail date. For more information about these algorithms, see [C1-DLQSENDCC](#) on page 3885 and [C1-RCLTRGDMD](#) on page 3893.

Note: You can attach an algorithm to either or both of the system events (i.e. **Event Activation** and **Monitor Completed Event**) in a delinquency event type.

Once a delinquency process is created for a person or an account to send debt collection letters, the status of the delinquency process is set to the value (for example, **Initiated**) specified in the **Delinquency Process Initiated Status** attribute of the delinquency process preference. Once the first event in the delinquency process is triggered, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress**) specified in the **Delinquency Process InProgress Status** attribute of the delinquency process preference. A customer contact may be created when the first or subsequent event is triggered in the delinquency process. For more information about the person to whom a customer contact is sent, see [C1-DLQSENDCC](#) on page 3885. If the member level notification needs to be sent to all the derived group, direct billed group membership, or individual memberships, the system also creates a customer contact for the main subscriber of each membership. For more information about the member level notifications, see [Creating Customer Contacts for Group, Direct Billed Group Membership, or Individual Membership](#) on page 3983. Once all the required customer contacts are created, the status of the delinquency event is changed to **Completed**. Once all the delinquency events are triggered successfully, the status of the delinquency process is changed to the value (for example, **Completed**) specified in the **Delinquency Process Completed Status** attribute of the delinquency process preference.

The system may receive a payment or an adjustment against the overdue bill for which a delinquency process is created to send debt collection letters. In such case, the system behaves in the following manner depending on the status of the delinquency process:

- If a payment or an adjustment is made when a delinquency process is in the **Initiated**, **Delinquency In Progress**, or **On Hold** status, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in

- the **Delinquency Process Canceled Status** attribute of the delinquency process preference. For more information on how the delinquency process is automatically canceled, see [Canceling a Delinquency Process](#) on page 3965
- If a payment or an adjustment is made when a delinquency process is in the **Pending Termination** status, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference. For more information on how the delinquency process is automatically canceled, see [Canceling a Delinquency Process](#) on page 3965. This scenario is valid only for the fully insured individual business. This scenario is addressed only when such delinquency processes are automatically canceled through the **C1-DPMON** batch.
 - If a payment or an adjustment is made when a delinquency process is in the **Completed** status, no action takes place on the debt collection letters delinquency process.

However, if the payment or adjustment is canceled due to any reason, the system executes the **C1-CDPPAYCAN** or **C1-DPADJCAN** algorithm attached to the customer class or adjustment type, respectively, to resume the delinquency process. For more information on how the delinquency process is automatically resumed, see [Resuming a Delinquency Process](#) on page 3966.

Note:

If a payment or an adjustment is canceled when a debt collection letters delinquency process is in the **Completed** status, no action takes place on the debt collection letters delinquency process.

The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218

Individual Membership Cancellation Delinquency Process

There might be scenarios wherein the individual customers fail to pay the binder payment for their health plan coverage. As a result, their individual memberships cannot be activated in the system. Such individual memberships should be canceled in the system in a timely manner. To adhere to this requirement, you can now configure the system such that a delinquency process is created for the individual membership's account to send a cancellation outbound message to the enrollment system when the payment for the first bill (i.e. binder payment) is not made within the due date. This enables you to initiate the cancellation process for an individual membership through the **Delinquency Management** feature. Only when an inbound message is received from the enrollment system to cancel an individual membership, the system changes the status of the individual membership to **Canceled**.

To create a delinquency process to initiate cancellation request for an individual membership through an outbound message, you need to design the delinquency process type using which you want to create the delinquency process in a particular manner.

Delinquency Process Type	Delinquency Type	Event	System Event	Algorithm	Algorithm Purpose
DP1	Update Individual Membership Cancellation Reason		Event Activation	C1-DLEVMBNCNC	Updates the status reason of the individual memberships billed to the delinquent account

You need to attach the **C1-DLEVMBNCNC** algorithm to initiate cancellation request for individual memberships billed to the delinquent account. The **C1-DLEVMBNCNC** algorithm updates the status reason of the individual memberships which are billed to the delinquent account. It considers the status reason which is specified in the **Awaiting Membership Cancellation Reason** attribute of the delinquency process preference. Before updating the status reason of the individual membership, the system validates whether the status reason is defined for the **Active** status of the **C1-IndMembership** business object. For more information about this algorithm, see [C1-DLEVMBNCNC](#) on page 3890.

Once a delinquency process is created for an account, the status of the delinquency process is set to the value (for example, **Initiated**) specified in the **Delinquency Process Initiated Status** attribute of the delinquency process

preference. Once the first event in the delinquency process is triggered, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress**) specified in the **Delinquency Process InProgress Status** attribute of the delinquency process preference. Once the status reason of the active individual memberships is updated, the status of the delinquency event is changed to **Complete**. If all the events in the delinquency process are triggered successfully, the status of the delinquency process is changed to the value (for example, **Completed**) specified in the **Delinquency Process Completed Status** attribute of the delinquency process preference. However, if there are any more events that are yet to be triggered, the status of the delinquency process remains as **Delinquency In Progress**.

You need to then execute the **C1-MTOMT** batch to generate the cancellation outbound messages for the individual memberships. For more information about the batch, see to the [Outbound Message Generation for Delinquency Management](#) on page 3984. Before creating the cancellation outbound messages for the individual memberships, you need to setup some pre-requisites for the cancellation outbound message generation. For more information about the pre-requisites, see [Membership Cancellation Outbound Message](#) on page 3977.

Once the cancellation outbound message is sent to the enrollment system, you need to wait for the enrollment system to send the inbound message to cancel the individual membership in ORMB. Once the inbound message to cancel an individual membership is processed, the status of the individual membership is changed to **Canceled**. Once the individual membership is canceled in ORMB, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference when the **C1-DPMON** batch is executed.

The system may receive a payment or an adjustment against the overdue bill for which a delinquency process is created to initiate the cancellation request for an individual membership through an outbound message. In such case, the system behaves in the following manner depending on the status of the delinquency process:

- If a payment or an adjustment is made when a delinquency process is in the **Initiated**, **Delinquency In Progress**, or **On Hold** status, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference. For more information on how the delinquency process is automatically canceled, see [Canceling a Delinquency Process](#) on page 3965
- If a payment or an adjustment is made when a delinquency process is in the **Pending Termination** status, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference. For more information on how the delinquency process is automatically canceled, see [Canceling a Delinquency Process](#) on page 3965. This scenario is addressed only when such delinquency processes are automatically canceled through the **C1-DPMON** batch.
- If a payment or an adjustment is made when a delinquency process is in the **Completed** status, no action takes place on the individual membership cancellation delinquency process.

However, if the payment or adjustment is canceled due to any reason, the system executes the **C1-CDPPAYCAN** or **C1-DPADJCAN** algorithm attached to the customer class or adjustment type, respectively, to resume the delinquency process. For more information on how the delinquency process is automatically resumed, see [Resuming a Delinquency Process](#) on page 3966.

Note:

If a payment or an adjustment is canceled when an individual membership cancellation delinquency process is in the **Completed** status, no action takes place on the delinquency process.

The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

Individual Membership Termination Delinquency Process

There might be scenarios wherein the individual customers fail to pay premium for their health plan coverage even after sending continuous reminders. In such scenarios, you may want to terminate their individual memberships in the system. Oracle Revenue Management and Billing enables you to initiate the termination process for an individual membership through the **Delinquency Management** feature. You can configure the system such that a delinquency process is created for the individual membership's account to send a termination outbound message to the enrollment system when the

overdue bills do not meet the tolerance limit. Only when an inbound message is received from the enrollment system to terminate an individual membership, the system changes the status of the individual membership to **Terminated**.

To create a delinquency process to initiate termination request for an individual membership through an outbound message, you need to design the delinquency process type using which you want to create a delinquency process in a particular manner.

The following table illustrates how you can design the delinquency process type using which you want to create the delinquency process to initiate cancellation request for an individual membership through an outbound message.

Delinquency Process Type	Delinquency Event Type	System Event	Algorithm	Algorithm Purpose
DP1	Send First Reminder Notification	Event Activation	C1-DLQCRTODO	Updates the status reason of the individual memberships billed to the delinquent account
	Send a Warning Letter	Event Activation	C1-DLQSENDCC	Sends a warning letter via a customer contact
	Send a Termination Request	Event Activation	C1-DETTERMDT	Calculates the termination date for an individual membership
		Event Activation	C1-DETTRTGDT	Calculates the termination request date
		Monitor Completed Event	C1-TRNTERTRG	Updates the status of the delinquency process on the termination request date
DP2	Send a Warning Letter	Event Activation	C1-DLQSENDCC	Sends a warning letter via a customer contact
	Calculate Termination Date	Event Activation	C1-DETTERMDT	Calculates the termination date for an individual membership
	Send Termination Request	Event Activation	C1-DETTRTGDT	Calculates the termination request date
		Monitor Completed Event	C1-TRNTERTRG	Updates the status of the delinquency process on the termination request date

Note that sending a To Do notification and a warning or dunning letter before initiating the termination request for an individual membership through a delinquency process is optional. You may or may not include these event types while designing a delinquency process type to initiate termination request for individual memberships billed to the delinquent account. However, you need to attach the **C1-DETTERMDT**, **C1-DETTRTGDT**, and **C1-TRNTERTRG** algorithms to the above-mentioned system events to initiate termination request for an individual membership. For more

information about these algorithms, see [C1-DETERMDT](#) on page 3888, [C1-DETRTGDT](#) on page 3892, and [C1-TRNTERTRG](#) on page 3893.

Note:

A delinquency event type where the **C1-DETRTGDT** and/or **C1-TRNTERTRG** algorithms are attached should be added at the last in the delinquency process type (as shown in the above examples – DP1 and, DP2).

You can attach an algorithm to either or both of the system events (i.e. **Event Activation** and **Monitor Completed Event**) in a delinquency event type.

Once a delinquency process is created for an account, the status of the delinquency process is set to the value (for example, **Initiated**) specified in the **Delinquency Process Initiated Status** attribute of the delinquency process preference. Once the first event in the delinquency process is triggered, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress**) specified in the **Delinquency Process InProgress Status** attribute of the delinquency process preference. After calculating the termination date and termination request date, the status of the respective delinquency events is changed to **Completed**. However, the status of the delinquency process changes to a status which is specified in the **Delinquency Process Pending Termination Status** attribute of the delinquency process preference only on or after the termination request date when the **C1-DPMON** batch is executed. Once the status of the delinquency process is changed to **Pending Termination**, the system executes the **C1-MEMTRMRSN** algorithm attached to the **Pending Termination** status in the lifecycle of the **C1-DelinquencyProcess** business object.

The **C1-MEMTRMRSN** algorithm updates the status reason of the active individual memberships which are billed to the delinquent account. The system considers the active individual memberships depending on the value defined for the **Skip Termination of Guaranteed Available Memberships(Valid Values-Y,N)** parameter. If the **Skip Termination of Guaranteed Available Memberships(Valid Values-Y,N)** parameter is set to **Y**, the system does not consider the active individual memberships where the **Evaluate Guaranteed Availability** flag is set to **true**. However, if the **Skip Termination of Guaranteed Available Memberships(Valid Values-Y,N)** parameter is set to **N**, the system considers the active individual memberships irrespective of whether the **Evaluate Guaranteed Availability** flag is set to **true** or **false**.

If the individual membership's start date is later than the respective termination date, this algorithm does the following:

- Updates the status reason of the individual membership. It considers the status reason which is specified in the **Awaiting Membership Cancellation Reason** attribute of the delinquency process preference. Before updating the status reason of the individual membership, the system validates whether the status reason is defined for the **Active** status of the **C1-IndMembership** business object
- Creates a log entry for each individual membership in the delinquency process

However, if the individual membership's start date is earlier than the respective termination date and if the individual membership's end date is later than the respective termination date, this algorithm does the following:

- Updates the status reason of the individual membership. It considers the status reason which is specified in the **Membership Termination Reason for Delinquency** attribute of the delinquency process preference. Before updating the status reason of the individual membership, the system validates whether the status reason is defined for the **Active** status of the **C1-IndMembership** business object.
- Adds the termination date and termination reason (i.e. status reason) corresponding to the individual membership in the **CI_MEMBERSHIP** table.
- Sets the individual membership's end date to the termination date corresponding to the individual membership in the **CI_MEMBERSHIP** table.
- Creates a log entry in each individual membership indicating that it is terminated due a delinquency process.
- Creates a log entry for each individual membership in the delinquency process.
- Stamps the delinquency process ID as a characteristic using the **C1-DELPO** characteristic type on the individual membership.

Once the status reason of the individual memberships is changed, you need to execute the **C1-MTOMT** batch to generate the cancellation or termination outbound messages for the individual memberships. For more information about the batch, see [Outbound Message Generation for Delinquency Management](#) on page 3984. Before creating the cancellation or termination outbound messages for the individual memberships, you need to setup some pre-requisites

for the cancellation or termination outbound message generation. For more information about the pre-requisites, see [Membership Cancellation Outbound Message](#) on page 3977 and [Membership Termination Outbound Message](#) on page 3971, respectively.

Once the cancellation or termination outbound message is sent to the enrollment system, you need to wait for the enrollment system to send the inbound message request to cancel or terminate the individual membership in ORMB. Once the inbound message to cancel or terminate an individual membership is processed, the status of the individual membership is changed to **Canceled** or **Terminated**, respectively. Once the individual membership is canceled in ORMB, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference when the **C1-DPMON** batch is executed. Similarly, once the individual membership is terminated in ORMB, the status of the delinquency process is changed to the value (for example, **Customer Terminated**) specified in the **Delinquency Process Terminated Status** attribute of the delinquency process preference when the **C1-DPMON** batch is executed.

Once the status of the delinquency process is changed to Customer Terminated, the system executes the following algorithms (if configured) attached to the respective status of the **C1-DelinquencyProcess** business object:

- **C1-CRDPTERM** - It creates a subsequent delinquency process for the terminated customer. A subsequent delinquency process includes all the unpaid bills which were present in the primary delinquency process through which the individual membership is terminated. In ORMB, the primary delinquency process is referred to as the related delinquency process for the subsequent delinquency process. This algorithm stores the related delinquency process ID in the **REL_DELIN_PROC_ID** column corresponding to the subsequent delinquency process in the **C1_DELIN_PROC** table.
- **C1-DLQCCDPS** - It creates a customer contact to send a letter (for example, a harsh letter) to the terminated customer to communicate any penalty or legal notice on defaulting or delaying payments. If the delinquency process is created for an account, this algorithm checks whether the **Receives Notification** option is selected in the bill routing information of any person associated with the account. If the **Receives Notification** option is selected in the bill routing information of a person, this algorithm creates a customer contact for the person. Note that if the value is specified for the **Account Relationship Type** parameter, this algorithm will consider only those persons who are associated with the account using the given relationship type.

In addition, this algorithm does the following:

- Creates a log entry for each customer contact in the delinquency process.
- Stamps the delinquency process ID as a characteristic using the **C1-DELPO** characteristic type on the customer contact.
- Stamps the account ID as a characteristic using the given characteristic type on the customer contact.

The system may receive a payment or an adjustment against the overdue bill for which a delinquency process is created to initiate the termination request for an individual membership through an outbound message. In such case, the system behaves in the following manner depending on the status of the delinquency process:

- If a payment or an adjustment is made when a delinquency process is in the **Initiated**, **Delinquency In Progress**, **On Hold**, or **Pending Termination** status, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference. For more information on how the delinquency process is automatically canceled, see [Canceling a Delinquency Process](#) on page 3965. However, if the payment or adjustment is canceled due to any reason, the system executes the **C1-CDPPAYCAN** or **C1-DPADJCAN** algorithm attached to the customer class or adjustment type, respectively, to resume the delinquency process. For more information on how the delinquency process is automatically resumed, see [Resuming a Delinquency Process](#) on page 3966.
- If a payment or an adjustment is made when a delinquency process is in the **Customer Terminated** status, you need to wait till an inbound message request is received from the enrollment system to reinstate an individual membership. Once the status of the individual membership is changed to **Active**, the system does the following:
 - Changes the status of the primary delinquency process through which the termination request was initiated to a status (for example, **Customer Reinstated**) which is specified in the **Delinquency Process Customer Reinstated Status** attribute of the delinquency process preference.

- Changes the status of the subsequent delinquency process to a status (for example, **Canceled**) which is specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference if it meets the cancel criteria.

Note that the status of the primary and subsequent delinquency processes is changed only through **C1-DPMON** batch. For more information on how the delinquency process is automatically canceled, see [Canceling a Delinquency Process](#) on page 3965.

If the payment or adjustment is canceled due to any reason, the system executes the **C1-RODPDUEPX** or **C1-RODPONADX** algorithm attached to the customer class or adjustment type, respectively, to resume the delinquency process. For more information on how the delinquency process is automatically resumed, see [Resuming a Delinquency Process](#) on page 3966.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

Advance Deposit Delinquency Process

There might be scenarios wherein the group customers want to settle their unpaid dues using the advance deposit. Oracle Revenue Management and Billing enables you to settle the unpaid bill amount of a person or an account using the advance deposit available at the parent customer or policy level through a delinquency process. Note that this feature is offered only for the fully insured group business.

To create a delinquency process through which you can apply advance deposit to settle the overdue bills of a person or an account, you need to design the delinquency process type using which you want to create the delinquency process in a particular manner.

The following table illustrates how you can design the delinquency process type using which you want to create the delinquency process for applying advance deposit to settle the overdue bills of a person or an account.

Delinquency Process Type	Delinquency Type	Event	System Event	Algorithm	Algorithm Purpose
DP1	Apply Deposit	Advance	Event Activation	C1-APPADVDEP	Transfers Advance Deposit to Pay Off Overdue Bills

The **C1-APPADVDEP** algorithm is shipped with the product. For more information about the algorithm, see [C1-APPADVDEP](#) on page 3890.

Once a delinquency process is created for a person or an account to apply advance deposit to settle the overdue bills, the status of the delinquency process is set to the value (for example, **Initiated**) specified in the **Delinquency Process Initiated Status** attribute of the delinquency process preference. Once the first event in the delinquency process is triggered, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress**) specified in the **Delinquency Process InProgress Status** attribute of the delinquency process preference. The status remains as **Delinquency In Progress** even after the offset request adjustments are created through the first or subsequent event in the delinquency process. On executing the **C1-DPMON** batch, the system checks whether the delinquency process meets the cancel criteria. If so, the system will change the status of the delinquency process to a status (for example, **Canceled**) which is specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference.

The system may receive a payment or an adjustment against the overdue bill for which an advance deposit delinquency process is created. In such case, the system behaves in the following manner depending on the status of the delinquency process:

- If a payment or an adjustment is made when a delinquency process is in the **Initiated**, **Delinquency In Progress**, or **On Hold** status, the status of debit adjustments (if any) made against the payments, the status of the credit adjustment (if any) used to offset the overdue bills, and the status of the offset request adjustments (if any) is changed to **Canceled**. The status of the delinquency process is changed to the value (for example, **Canceled**) specified in the

Delinquency Process Canceled Status attribute of the delinquency process preference. In addition, the status of the offset request (if any) is changed to **Unapplied Offset** or **Defer Unapplied**. For more information, see [Canceling a Delinquency Process](#) on page 3965 and [Notification on Advance Deposit Cancellation](#) on page 3990.

- If a payment or an adjustment is made when an advance deposit delinquency process is in the **Canceled** status, no action takes place on the advance deposit delinquency process.

However, if the payment or adjustment is canceled due to any reason, the system executes the **C1-CDPPAYCAN** or **C1-DPADJCAN** algorithm attached to the customer class or adjustment type, respectively, to resume the delinquency process. For more information on how the delinquency process is automatically resumed, see [Resuming a Delinquency Process](#) on page 3966.

Note:

If a payment or an adjustment is canceled when an advance deposit delinquency process is in the **Canceled** status, no action takes place on the advance deposit delinquency process.

The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

Delinquency Monitoring for a Person or an Account

You need to define a delinquency control for each collection class where the collection method is set to **Self-Control Delinquency**. A new maintenance object named **C1-DELIN-CTR**, a new business object named **C1-DelinControl**, and a new screen named **Delinquency Control** are introduced in this release.

The **Delinquency Control** screen enables you to create, edit, and delete a delinquency control. Note that this screen enables you to define a delinquency control only for those collection classes where the collection method is set to **Self-Control Delinquency**.

A delinquency control enables the system to determine the following:

- A minimum credit review frequency at which the persons or accounts belonging to the respective collection class should be monitored for delinquency. In other words, it indicates in how many days the system should review whether the bills of the persons or accounts are overdue.
- A delinquency monitor rule algorithm that you want to invoke for the collection class while executing the **C1-PRDLQ** or **C1-ACDLQ** batch.

The **C1-DLNQMNR** algorithm creates a new delinquency process for a person or an account when the person's or account's debt is overdue and does not meet the tolerance limit. Before creating a new delinquency process for a person or an account, it checks whether a delinquency process in the given status already exists for the person or the account. If a delinquency process already exists for the person or the account in the given status, the system will add new overdue bills in the existing delinquency process and will not create a new delinquency process for the person or the account. While adding a bill to an existing delinquency process, the system enables you to create a To Do for the delinquency process.

While executing the **C1-PRDLQ** or **C1-ACDLQ** batch, the system derives the delinquency monitor rule algorithm attached to the delinquency control of the respective collection class for each derived person or account, respectively. This algorithm then determines whether the person's or account's debt should be monitored for delinquency based on their respective credit rating. The system considers the sum of account's credit rating and credit rating threshold (defined in the installation options) to determine whether the account's debt should be monitored for delinquency. However, the system considers the sum of person's credit rating and credit rating threshold (defined in the installation options) to determine whether the person's debt should be monitored for delinquency.

If you specify the value for the **Only Process Customers with Credit Rating Less than or Equal to This Value** parameter, the system checks whether person's or account's credit rating is less than or equal to the specified value. If the person's or account's credit rating is greater than the specified value, the system does not monitor the person's or account's debt for delinquency. However, if the person's or account's credit rating is less than or equal to the specified

value or if the value is not specified for the **Only Process Customers with Credit Rating Less than or Equal to This Value** parameter, the system monitors the person's or account's debt for delinquency.

While monitoring the account's debt for delinquency, this algorithm fetches all the completed bills of the account which are unpaid and not yet linked to any delinquency process of the account. Here, the system considers the delinquency process of the account which is in the non-final status. While monitoring the person's debt for delinquency, this algorithm fetches all the unpaid bills of the person's accounts and all the unpaid bills of the child persons' accounts. It considers only those accounts of the person, its child persons, and the child persons' accounts where the collection method in the respective collection class is set to **Parental Delinquency** and not where the collection method in the respective collection class is set to **Self-Control Delinquency** or **Not Eligible for Collection**. In addition, it considers only those child persons who are associated with the parent person using a person relationship type which is not specified in the **Person Relationship Type Exclusion List** parameter. Note that if an active promise to pay exists for an account, the system does not monitor the delinquency of the account.

While fetching the unpaid bills of the accounts, the system checks the following:

- Whether the bill is included in any payment agreement request which is in the non-final status. If the bill is included in any payment agreement request which is in the non final status, the system does not consider the overdue bill for monitoring the person or account's debt. However, if the bill is not included in any payment agreement request which is in the non-final status, the system considers the overdue bill for monitoring the person or account's debt.
- Whether a characteristic using the characteristic type specified in the **Postpone Date Characteristic Type** parameter is defined for a bill. If the postpone overdue review until date is specified for the bill, the system checks whether postpone overdue review date of the bill is later than the batch business date. If the postpone overdue review date of the bill is later than the batch business date, the system does not consider the overdue bill for monitoring the person or account's debt. However, if the postpone overdue review until date is not specified for the bill or if the postpone overdue review date of the bill is earlier than or equal to the batch business date, the system considers the overdue bill for monitoring the person or account's debt.
- Whether the age of a bill is greater than or equal to the value specified in the **Only Process Bills with an Age Greater than or Equal to This value** parameter. The system calculates the age of a bill using the value specified in the **Which Date Determines Age ('D' – Due Date or 'B' – Bill Date)** parameter. If the parameter value is set to **B**, the system calculates the invoice age from the bill date until the system date. However, if the parameter value is set to **D**, the system calculates the invoice age from the bill due date until the system date. If the invoice age is greater than or equal to the value specified in the **Only Process Bills with an Age Greater than or Equal to This value** parameter, the system considers the overdue bill for monitoring the person or account's debt. However, if the invoice age is less than the value specified in the **Only Process Bills with an Age Greater than or Equal to This value** parameter, the system does not consider the overdue bill for monitoring the person or account's debt.

Note that the system validates the former two conditions on both the debit and credit bills of the account. However, the system validates the age of a debit bill and not of a credit bill.

Once the list of overdue bills is finalized, the system derives the original and unpaid amounts for each overdue bill of the person or account whose debt is monitored. While monitoring the debt of an account, the system calculates the following:

- Sum of the unpaid amounts of the account's bills (that meet the above criteria)
- Sum of the original amounts of the account's bills (that meet the above criteria)

However, while monitoring the debt of a person, the system calculates the following:

- Sum of the unpaid amounts of the bills (that meet the above criteria) of the person's derived accounts (including the ones from its hierarchy)
- Sum of the original amounts of the bills (that meet the above criteria) of the person's derived accounts (including the ones from its hierarchy)

While monitoring the debt of a person, the system also checks whether the **Include On Account Payments In Threshold Evaluation - Y/N** parameter is set to **Y** or **N**. If the **Include On Account Payments In Threshold Evaluation - Y/N** parameter is set to **Y**, the system derives all the on account payments which are made against the on account payment contracts. The system considers the on account payment contracts which are created using the contract types that are specified in the **On Account Payment Contract Types** parameter. Once the on account payments (if any) are derived for the person, the system deducts the on account payments of the customer from the total unpaid amount of the customer.

Note that, while calculating the sum of the original amounts, the system considers the **Use Current Revenue Period Billed For Latest Overdue Due Date – Y/N** parameter. If the **Use Current Revenue Period Billed For Latest Overdue Due Date – Y/N** parameter is set to **Y**, the system considers all those financial transactions of the account whose coverage start date is earlier than or equal to the bill due date while calculating the total billed (i.e. original) amount. This option helps to handle the scenario wherein an individual short pays by just enough each month but still does not become delinquent. This is because, in this case, the system calculates the unpaid percentage or amount based on the total amount billed for the coverage period rather than the total amount billed for the overdue bills.

Once the total unpaid amount and the total billed amount is calculated for the person or account, the system checks the value of the **Unpaid Amount and Percentage Required ('Y' or 'N')** parameter. If the **Unpaid Amount and Percentage Required ('Y' or 'N')** parameter is set to **Y** or **N**, the system checks the following:

- Total unpaid amount is greater than or equal to the tolerance limit
- Unpaid percentage value (i.e. unpaid amount with respect to original amount) is greater than or equal to the tolerance limit

If the **Unpaid Amount and Percentage Required ('Y' or 'N')** parameter is set to **Y**, the person or account should meet both the above two conditions. The system then considers the person or account as delinquent. However, if the **Unpaid Amount and Percentage Required ('Y' or 'N')** parameter is set to **N**, the person or account should meet either of the above two conditions. The system then considers the person or account as delinquent.

Once the person or account is considered as delinquent, this algorithm creates a new delinquency process using the delinquency process type which is specified in the given delinquency process type preference. You can specify two separate delinquency process type preference – one for the fully insured group business and another for the fully insured individual business. Depending on whether the person or account is linked to policies or individual memberships, the system will accordingly refer the given delinquency process type preference. For more information about the delinquency process type preference, see [Delinquency Process Type Preference](#) on page 4077. The status of the new delinquency process is set to the value (for example, **Initiated**) specified in the **Delinquency Process Initiated Status** attribute of the delinquency process preference. Note that if the delinquency process already exists for the person or account in the given status, then the system will add new overdue bills in the existing delinquency process and will not create a new delinquency process for the person or account. While adding a bill to an existing delinquency process, the system enables you to create a To Do for the delinquency process. Once the To Do is created for a delinquency process, the system creates a log entry for the respective delinquency process indicating that a new bill is added to the delinquency process.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

In addition, this algorithm adds a log entry for each overdue bill in the delinquency process. This algorithm contains the following parameters:

- **Only Process Customers with Credit Rating Less than or Equal to This Value** – Used when you want to initiate the delinquency process for only those persons or accounts whose credit rating is less than or equal to the specified value. This parameter is optional.
- **Only Process Bills with an Age Greater than or Equal to This value** – Used to specify the number of days. The system considers a bill while monitoring the person or account's debt when its age is greater than or equal to the specified number of days. This parameter is optional.
- **Which Date Determines Age ('D' - Due Date or 'B' - Bill Date)** – Used to indicate whether you want the system to determine the age of the invoice (i.e. bill) using the due date or the bill date. The valid values are **D** and **B**. This parameter is mandatory.
- **Use Current Revenue Period Billed For Latest Overdue Due Date - Y/N** – Used when you want to consider all those financial transactions of the account whose coverage start date is earlier than or equal to the bill due date while calculating the total billed (i.e. original) amount. The valid values are **Y** and **N**. This parameter is optional. If you do not specify the parameter value, by default, it is set to **N**.
- **Include On Account Payments In Threshold Evaluation - Y/N** – Used to indicate whether you want to consider the payments made against the on account contracts of the account while calculating the unpaid amount. The valid values are **Y** and **N**. This parameter is optional. If you do not specify the parameter value, by default, it is set to **N**.

- **On Account Payment Contract Types** – Used to indicate the on account contract types that you want to consider while determining the total unpaid amount. Here, you must specify a contract type which is already defined in the system. You can specify maximum twenty comma-separated values for this parameter. This parameter is only required when the **Include On Account Payments In Threshold Evaluation - Y/N** parameter is set to **Y**.
- **Only Process Person/Account with an Unpaid Percentage Greater Than or Equal to This Value** – Used to specify the unpaid percentage value (i.e. unpaid amount with respect to original amount). The system then considers a person or an account as delinquent only when the unpaid percentage of its overdue bills is greater than or equal to the specified value. This parameter is required.
- **Only Process Person/Account with an Unpaid Amount Greater Than or Equal to This Value** - Used to specify the flat unpaid amount. The system then considers a person or an account as delinquent only when the unpaid amount of its overdue bills is greater than or equal to the specified value. This parameter is required.
- **Person Relationship Type Exclusion List** – Used when you do not want to consider the child persons who are associated with the parent person using a particular person relationship type while fetching the unpaid bills from the person's hierarchy. Here, you must specify a person relationship type which is already defined in the system. You can specify maximum 10 comma-separated values for this parameter. This parameter is only applicable for the fully insured group business and not for the fully insured individual business.
- **To Do Entry Required For Delinquency** – Used to indicate whether you want the system to create a To Do when a new overdue bill is added to an existing delinquency process. The valid values are **Y** and **N**. This parameter is mandatory.
- **To Do Type of To Do Entry for Delinquency** – Used to indicate the To Do type using which you want to create the To Do for the existing delinquency process. Here, you must specify a To Do type which is already defined in the system. This parameter is only required when the **To Do Entry Required For Delinquency** parameter is set to **Y**.
- **Delinquency Process Status For Existing Delinquency Process** – Used to specify the status of the delinquency process. The system then checks whether any delinquency process exists for the person or account in the specified status. If so, the system adds a new overdue bill in the respective delinquency process and does not create a new delinquency process for the person or account. You can specify comma-separated values for this parameter. This parameter is mandatory.

Note: The system allows you to add new bills to a delinquency process when it is in any of the following three statuses – **INITIATED** (i.e. **Initiated**), **INPROGRESS** (i.e. **Delinquency In Progress**), and **HOLD** (i.e. **On Hold**). Therefore, you need to accordingly specify the value in the **Delinquency Process Status For Existing Delinquency Process** parameter.

- **Postpone Date Characteristic Type** – Used to indicate a characteristic type which is used to store the postpone overdue review until date for a bill. Here, you must specify a characteristic type where the characteristic entity is set to **Bill**. The **ADMRVWDT** characteristic type is shipped with the product. This parameter is optional.

Note: You have an option to set the specified characteristic type on the bill if you want to postpone the overdue review date of the bill. If the specified characteristic type is defined on the unpaid bill and if the postpone overdue review until date is later than the batch business date, the system does not consider the overdue bill for monitoring the person or account's debt.

- **Unpaid Amount and Percentage Required ('Y' or 'N')** – Used to indicate whether you want to consider both the unpaid amount and the unpaid percentage to check whether the person or account is delinquent. The valid values are:
 - **Y** - If you set the value to **Y**, the system considers both the unpaid amount and the unpaid percentage to check whether the person or account is delinquent.
 - **N** - If you set the value to **N**, the system considers either the unpaid amount or the unpaid percentage to check whether the person or account is delinquent.

This parameter is mandatory.

- **Delinquency Process Type Field Mapping – Individual** – Used to specify a preference where the preference category is set to **Delinquency Process Type**. The system uses the preference to determine the delinquency process type using which the delinquency process should be created for an account to which individual memberships are billed. This parameter is mandatory. It is not applicable for the fully insured group business. For more information about the delinquency process type preference, see [Delinquency Process Type Preference](#) on page 4077.

- **Delinquency Process Type Field Mapping – Group** – Used to specify a preference where the preference category is set to **Delinquency Process Type**. The system uses the preference to determine the delinquency process type using which the delinquency process should be created for a person or an account to which policies are billed. This parameter is mandatory. It is not applicable for the fully insured individual business. For more information about the delinquency process type preference, see [Delinquency Process Type Preference](#) on page 4077.

Delinquency Event Type

Once you create a delinquency control for each collection class where the collection method is set to **Self-Control Delinquency**, you need to create the required delinquency event types using which you want the system to create delinquency events in the delinquency process. If an account is delinquent, you may want to send different kinds of letters such as dunning letter, warning letter, etc., send a To Do notification, initiate the termination or cancellation request for the individual memberships which are billed to the delinquent account, or initiate the termination or reinstatement request for the policies which are billed to the delinquent account. However, if a person is delinquent, you may want to send different kinds of letters such as dunning letter, warning letter, etc., send a To Do notification, or initiate the termination or reinstatement request for the policies which are billed to the delinquent person. The system enables you to send different kinds of letters, send To Do notification, or initiate the termination, cancellation, or reinstatement request by triggering different delinquency events at predefined intervals in the delinquency process.

A new maintenance object named **C1-DLQ-EV-TP** and a new business object named **C1-DelinEventType** are introduced to create the delinquency event types. The **Delinquency Event Type** screen enables you to create, edit, delete, and copy a delinquency event type. A delinquency event type enables the system to determine the following:

- The primary actions that you want to perform when the delinquency event of the respective delinquency event type is triggered manually (on or before the trigger date from the user interface) or automatically (on the trigger date through the **C1-DPMON** batch). For example, a primary action can be sending a letter, sending a To Do notification, initiating a cancellation, termination, or reinstatement request, etc. You can configure the system to perform the primary actions on the **Event Activation** system event.
- The secondary actions are those actions that you want to perform when the primary actions are completed. For example, a secondary action can be changing the delinquency process status, recalculating the trigger dates of the remaining events in the delinquency process, etc. You can configure the system to perform the secondary actions on the **Monitor Completed Event** system event.

Note that you can attach an algorithm to either or both of the system events while defining a delinquency event type. Once the algorithms attached to the **Event Activation** system event are executed, the status of the delinquency event is changed to **Completed**. The algorithms attached to the **Monitor Completed Event** system event are not executed in the online mode when the status of the current or prior delinquency event is changed to **Completed**. These algorithms are triggered when you execute the **C1-DPMON** batch.

Whenever you manually execute the subsequent events (non-first event) in the delinquency process, the system first checks whether the algorithms attached to the **Monitor Completed Event** system event of the previous delinquency event is successfully executed or not. If an algorithm attached to the **Monitor Completed Event** system event of the previous delinquency event is not executed successfully, the system displays a warning message that indicates the previous event's monitoring algorithms are not executed successfully and confirms whether you want to continue in such scenario. If you click **Yes**, the system ignores the previous event's monitoring algorithm and executes the algorithms attached to the **Event Activation** system event of the current delinquency event (which is triggered). However, if you click **No**, the system does not execute the algorithms attached to the **Event Activation** system event of the current delinquency event. Note that if there are no algorithms attached to the **Monitor Completed Event** system event of the previous delinquency event, the system will directly execute the algorithms attached to the **Event Activation** system event of the current delinquency event.

Delinquency Event Activation

The following table lists the primary actions that you can perform using the respective algorithm shipped with the product:

Action	Algorithm	Algorithm Description
Create a To Do Notification	C1-DLQCRTODO	See C1-DLQCRTODO on page 3885
Send Letter via Customer Contact	C1-DLQSENDCC	See C1-DLQSENDCC on page 3885
Calculate Termination Date	C1-DETERMDT	See C1-DETERMDT on page 3888
Send Termination Request	C1-DETRTGDT	See C1-DETRTGDT on page 3892
Send Cancellation Request	C1-DLEVMBNC	See C1-DLEVMBNC on page 3890
Apply Advance Deposit	C1-APPADVDEP	See C1-APPADVDEP on page 3890

C1-DLQCRTODO

This algorithm creates a To Do for the following:

- Person (i.e. parent customer or bill group) when the delinquency process is created for a person
- Main customer of the account when the delinquency process is created for an account

It also creates a log entry for each To Do notification in the delinquency process. This algorithm is invoked when the event is triggered manually from the user interface or automatically through the **C1-DPMON** batch.

You can use this algorithm in a delinquency process type using which you want to create a delinquency process through which To Do notifications are sent to the delinquent customer or account. It should be attached to the delinquency event type which sends a To Do notification to the person or the main customer of the account.

Note: Once a To Do notification is created, a record is added in the **C1_DELIN_PROC_EVT_NOTIF** table where the **DP_EVT_NOTIF_TYPE_FLG** column is set to TO DO and the **DP_EVT_NOTIF_ID** column is set to the To Do Entry ID.

This algorithm contains the following parameters:

- **To Do Role Person** – Used to indicate that users with the specified To Do role must receive the To Do notification when the delinquency process is created for a person. This parameter is optional. If you do not specify this parameter, the system considers the default To Do role associated with the To Do type. This parameter is only applicable for the fully insured group business.
- **To Do Type Person** – Used to indicate the To Do type using which you want to create a To Do when the delinquency process is created for a person. The **C1-DLQEV** To Do type is shipped with the product to create To Dos for the person level delinquency process. This parameter is mandatory. This parameter is only applicable for the fully insured group business.
- **To Do Role Account** – Used to indicate that users with the specified To Do role must receive the To Do notification when the delinquency process is created for an account. This parameter is optional. If you do not specify this parameter, the system considers the default To Do role associated with the To Do type. This parameter is applicable for both the fully insured group and fully insured individual businesses.
- **To Do Type Account** – Used to indicate the To Do type using which you want to create a To Do when the delinquency process is created for an account. The **C1-DLQAC** To Do type is shipped with the product to create To Dos for the account level delinquency process. This parameter is mandatory. This parameter is applicable for both the fully insured group and fully insured individual businesses.

C1-DLQSENDCC

This algorithm creates a customer contact to send a letter (for example, dunning letter, warning letter, etc.). If the delinquency process is created for a person, this algorithm checks whether the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter is set to **PG**, **BG**, or **BA**. Depending on the value defined for the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter, this algorithm does the following:

- If the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter is set to **PG**, this algorithm checks whether the person type of the person is set to **Parent Customer** or **Bill Group**. If the person type of the person is

set to **Parent Customer**, this algorithm creates a customer contact for the parent customer. However, if the person type of the person is set to **Bill Group**, this algorithm derives the parent customer of the bill group (using the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration) and then creates a customer contact for the parent customer.

- If the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter is set to **BG**, this algorithm checks whether the person type of the person is set to **Parent Customer** or **Bill Group**. If the person type of the person is set to **Parent Customer**, this algorithm creates a customer contact for the parent customer and for all those bill groups of the parent customer who are associated with the parent customer using the relationship type which is specified in the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration.

However, if the person type of the person is set to **Bill Group**, this algorithm derives the parent customer of the bill group (using the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration) and then creates a customer contact for the parent customer and for the respective bill group.

- If the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter is set to **BA**, this algorithm checks whether the person type of the person is set to **Parent Customer** or **Bill Group**. If the person type of the person is set to **Parent Customer**, this algorithm creates a customer contact for each account to which the parent customer and its bill groups are associated as the main customer. The system considers those bill groups of the parent customer who are associated with the parent customer using the relationship type which is specified in the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration. However, if the person type of the person is set to **Bill Group**, this algorithm derives the parent customer of the bill group (using the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration) and then creates a customer contact for each account to which the parent customer and the respective bill group are associated as the main customer.

However, if the delinquency process is created for an account, this algorithm checks whether the **Receives Notification** option is selected in the bill routing information of any person associated with the account. If the **Receives Notification** option is selected in the bill routing information of a person, this algorithm creates a customer contact for the person. Note that if the value is specified for the **Account Relationship Type** parameter, this algorithm will consider only those persons who are associated with the account using the given relationship type. Irrespective of whether the delinquency process is created for a person or an account, this algorithm also checks whether the **Send Membership Level Notification Source** field corresponding to the respective delinquency event type in the respective delinquency process type is set to **Delinquency Process Type** or **Algorithm**. If the **Send Membership Level Notification Source** field is set to **Delinquency Process Type**, this algorithm checks whether the **Send Membership Level Notification** field corresponding to the respective delinquency event type in the respective delinquency process type is set to **Send Membership Level Notification Required** or **Send Membership Level Notification Not Required**.

However, if the **Send Membership Level Notification Source** field is set to **Algorithm**, this algorithm invokes the **C1-DERMLNBR** algorithm attached to the **Send Member Level Notification Option Derivation** system event in the respective delinquency process type. For more information about the algorithm, see [C1-DERMLNBR](#) on page 3951. If the value of the **Send Membership Level Notification** field is set to **Send Membership Level Notification Required** either in the delinquency process type or in the business rule depending on the send membership level notification source, this algorithm derives the memberships billed to the delinquent customer or account. It then checks whether the number of memberships derived is less than or equal to the number specified in the **Member Level Notification Deferred Processing Threshold** parameter. If the number of memberships derived is less than or equal to the specified value, this algorithm creates a customer contact for the main subscriber of each derived membership in the real time (i.e. immediately). In addition, the status of the delinquency event is changed to **Complete**.

However, if no value is defined for the **Member Level Notification Deferred Processing Threshold** parameter or if the number of memberships derived is greater than the specified value, this algorithm changes the status of the delinquency event to **Pending Contact Creation**. For more information on how the customer contacts are created at the membership level for such events, see [Creating Customer Contacts for Group, Direct Billed Group Membership, or Individual Membership](#) on page 3983.

In addition, this algorithm does the following:

- Creates a log entry for each customer contact in the delinquency process.
- Stamps the delinquency process ID as a characteristic using the **C1-DELPO** characteristic type on the customer contact.
- Stamps the account ID as a characteristic using the given characteristic type on the customer contact.

Note:

The account ID is stamped as a characteristic on the customer contact only when either of the following condition is met:

- The delinquency process is created for a person and the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter is set to **BA**.
- The delinquency process is created for an account.

- Stamps the membership ID as a characteristic using the given characteristic type on the customer contact.

Note: The membership ID is stamped as a characteristic on the customer contact only when the customer contact is created for the main subscriber of the membership.

This algorithm is invoked when the event is triggered manually from the user interface or automatically through the **C1-DPMON** batch. You can use this algorithm in a delinquency process type using which you want to create a delinquency process through which debt collection letters are sent to the delinquent customer or account. It should be attached to the delinquency event type which sends a warning or dunning letter.

Note: Once a customer contact is created, a record is added in the **C1_DELIN_PROC_EVT_NOTIF** table where the **DP_EVT_NOTIF_TYPE_FLG** column is set to CC and the **DP_EVT_NOTIF_ID** column is set to the customer contact ID.

This algorithm derives the preferred contact method for the customer contact. While deriving the preferred contact method, the algorithm first fetches the main customer's bill route type on the account and then fetches the bill routing method of the bill route type. Once the bill routing method is derived, the system considers the preference which is specified in the **Routing Method – Contact Method Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

It then checks whether any preferred contact method is mapped to the bill routing method in the preference. If the preferred contact method is mapped to the bill routing method in the preference, the system stamps it on the customer contact. However, if the preferred contact method is not mapped to the bill routing method in the preference, the system considers the default contact method as the preferred contact method and stamps it on the customer contact.

This algorithm contains the following parameters:

- **Customer Contact Type** – Used to indicate the customer contact type using which you want to create the customer contact. This parameter is mandatory. Here, you must specify a customer contact type with the appropriate letter template depending on the type of letter you want to send to the customer.
- **Customer Contact Class** – Used to indicate the customer contact class to which the customer contact type belongs. This parameter is mandatory.
- **Default Contact Method** – Used to indicate the contact method that you want to use when the preferred contact method cannot be derived for the routing method from the preference. This parameter is mandatory.
- **Notify Group Customer Or Bill Groups Or Bill Accounts** – Used to indicate whether a customer contact should be created for a parent customer, bill group, and/or for each billing account (that meets the criteria). The valid values are:
 - **PG** – Used when you want to create a customer contact only for the parent customer.
 - **BG** – Used when you want to create a customer contact for the parent customer and for the bill groups of the parent customer. If the person type of the person is set to **Parent Customer**, the system creates a customer contact for the parent customer and for all those bill groups that are associated with the parent customer using the relationship type specified in the **Person Relationship Type** option type of the **C1-ASOBLNG** feature configuration. However, if the person type of the person is set to **Bill Group**, the system creates a customer contact for the parent customer and the respective bill group.
 - **BA** – Used when you want to create a customer contact for the main customer of the account. If the person type of the person is set to **Parent Customer**, the system creates a customer contact for each account to which the parent customer and its bill groups are associated as the main customer. However, if the person type of the person is set to **Bill Group**, the system creates a customer contact for each account to which the parent customer and

the respective bill group are associated as the main customer. Note that this parameter is only applicable for the fully insured group business.

- **Account Characteristic Type** – Used to indicate the characteristic type using which you want to store the account ID on the customer contact. Here, you must specify a characteristic type where the characteristic entity is set to **Customer Contact**.
- **Membership Characteristic Type** – Used to indicate the characteristic type using which you want to store the membership ID on the customer contact. Here, you must specify a characteristic type where the characteristic entity is set to **Customer Contact**.
- **Account Relationship Type** – Used to indicate the relationship type using which the person is associated with the account. The system will then create the customer contacts only for those persons who are associated with the account using the specified relationship type. This parameter is optional. You can specify maximum ten comma-separated values for this parameter. If you do not specify the parameter value, the system will create customer contacts for all the persons who are associated with the account irrespective of their relationship type. Note that this parameter is only applicable for the fully insured individual business.
- **Member Level Notification Deferred Processing Threshold** – Used to specify the maximum number of memberships for which customer contacts can be created in the real time (i.e. immediately). If the number of memberships billed to the delinquent customer or account exceeds the specified limit, a customer contact is created for the main subscriber of each derived membership in the deferred mode (i.e. through the **C1-MBRNT** batch control).

C1-DETERMDT

This algorithm is used to calculate the termination date for the policies or individual memberships. This date is sent to the enrollment system through the termination outbound message. This algorithm is invoked when the event is triggered manually from the user interface or automatically through the **C1-DPMON** batch.

You must use this algorithm in a delinquency process type using which you want to create a delinquency process to initiate termination request for a policy or individual membership through an outbound message. It should be attached to the delinquency event type which requests to terminate the following:

- Policies billed to the delinquent person or account
- Individual memberships billed to the delinquent account

It calculates the termination date based on the termination date rule. The system derives the termination date rule using an algorithm which is attached to the **Termination Date Rule Derivation** system event of the delinquency process type.

In addition, this algorithm retrieves the business rules of the **Delinquency Miscellaneous Options Business Rule** category which are effective on the trigger date. Note that the system considers only those effective business rules which are in the **Active** status. Once the effective business rules are identified, the system executes these business rules in the order of their priority.

Once a policy or individual membership meets the criteria defined in the business rule, the system refers the value of either the following parameter depending on the termination date rule (as listed in the below table) for the policy or individual membership from the business rule:

- Add Days to Coverage End Date
- Add Days to Paid Through Date
- Add Months to Paid Through Date
- Add Days to Grace End Date
- Add Days to Date of Processing of Termination Request

Note:

The system derives the policies using an algorithm which is attached to the **Policies Derivation** system event of the delinquency process type.

The system derives the individual memberships using an algorithm which is attached to the **Memberships Derivation** system event of the delinquency process type.

While deriving an active individual membership, the system considers the status code which is specified in the **Membership Active Status** option type of the **C1-ASOBLLNG** feature configuration. Similarly, while deriving an active policy, the system considers the status code which is specified in the **Policy Active Status** option type of the **C1-ASOBLLNG** feature configuration.

Once the system derives the termination date rule and the required parameter from the delinquency miscellaneous options business rule, the system calculates the termination date for each policy or individual membership in the following manner:

Termination Date Rule is set to...	Parameter which is used from the business rule...	Termination date is set to...
Latest Billed Coverage End Date	Add Days to Coverage End Date	Latest Billed Coverage End Date (i.e. coverage end date that falls on or prior to the grace end date) + Add Days to Coverage End Date
Latest Due Coverage End Date	Add Days to Coverage End Date	Latest Due Coverage End Date (i.e. coverage end date that falls prior to the latest due date) + Add Days to Coverage End Date
X days After Paid Through Date	Add Days to Paid Through Date	Paid Through Date + Add Days to Paid Through Date
X Months After Paid Through Date	Add Months to Paid Through Date	Paid Through Date + Add Months to Paid Through Date
Month End of Grace Period Start	-	Last Day of Grace Period Start Month
Month End of Termination Letter Creation	-	Last Day of Termination Letter Creation Event Trigger Month
Month End of Termination Request Event	-	Last Day of Send Termination Request Event Trigger Month
X days After Grace End Date	Add Days to Grace End Date	Grace End Date + Add Days to Grace End Date
X days After Termination Request Event	Add Days to Date of Processing of Termination Request	Send Termination Request Event Trigger Date + Add Days to Date of Processing of Termination Request

Note: The system retrieves the grace start date and grace end date of the delinquency process from the **C1_DELIN_PROC** table.

Once the termination date is calculated for each policy or individual membership, the system checks whether the termination date is earlier than the respective policy or individual membership start date. If the termination date is earlier than the respective policy or individual membership start date, the system sets the termination date to the respective policy or individual membership start date. In addition, if the delinquency category of the delinquency process is set to **GRUP**, this algorithm derives the status reason from the **Policy Termination Reason for Delinquency Process** attribute of the delinquency process preference.

It validates whether the status reason is defined for the **Terminated** status of the **C1-POLICY** business object. Similarly, if the delinquency category of the delinquency process is set to **INDV**, this algorithm derives the status reason from the **Membership Termination Reason for Delinquency** attribute of the delinquency process preference. It validates whether the status reason is defined for the **Active** status of the **C1-IndMembership** business object.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

Finally, it stores the terminate date rule, termination date, and the termination reason of each delinquency process corresponding to the record in the **C1_DELIN_PROC** table.

C1-DLEVMBCNC

This algorithm is used to update the status reason of an individual membership when its cancellation process is initiated through a delinquency process. Once the status reason of an individual membership is updated, this algorithm creates a log entry for the respective membership in the delinquency process. This algorithm is invoked when the cancellation event is triggered manually from the user interface or automatically through the **C1-DPMON** batch.

You must use this algorithm in a delinquency process type using which you want to create a delinquency process to initiate cancellation request for an individual membership through an outbound message. It should be attached to the delinquency event type which requests to cancel the individual memberships billed to the delinquent account.

Note:

The system derives the active individual memberships using an algorithm which is attached to the **Memberships Derivation** system event of the delinquency process type.

While deriving an active individual membership, the system considers the status code which is specified in the **Membership Active Status** option type of the **C1-ASOBLLNG** feature configuration. For more information about the feature configuration, see [Setting the C1-ASOBLLNG Feature Configuration](#) on page 4193.

After the status reason of an individual membership is updated, the cancellation outbound message is sent to the enrollment system when the **C1-MTOMT** batch is executed.

The system considers the status reason which is specified in the **Awaiting Membership Cancellation Reason** attribute of the delinquency process preference. Before updating the status reason of the individual membership, the system validates whether the status reason is defined for the **Active** status of the **C1-IndMembership** business object.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

C1-APPADVDEP

This algorithm transfers the required payment amount from the advance deposit contract to the delinquent bills by creating adjustments. It checks whether the delinquency process is created at the parent customer, bill group, or at the parent customer's or bill groups' account level. It then accordingly derives the parent customer and checks whether the advance deposit level of the parent customer is set to **PG** or **POLI**. If the advance deposit level of the parent customer is set to **PG**, the system derives the advance deposit account and advance deposit contract using the **Advance Deposit Account Relationship Type** and **Advance Deposit Contract Type** attribute, respectively, of the delinquency process preference. It then derives the sum of all the unmatched payments on the advance deposit contract. However, if the advance deposit level of the parent customer is set to **POLI**, the system derives the advance deposit account linked to the policy and the advance deposit contract using the **Advance Deposit Contract Type** attribute of the delinquency process preference. Once the advance deposit account and contract are derived for each policy, the system derives the sum of all the unmatched payments on the advance deposit contract for the respective policy.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

It creates debit adjustments against the unmatched payments on the advance deposit contract and a single credit adjustment of the equivalent amount. The debit adjustments are created using the given debit adjustment type and a credit adjustment is created using the given credit adjustment type.

The debit adjustments are matched against the payment segments and their match event status is set to **Balanced**. The system then creates an offset request using the given offset request type and includes the credit adjustment and delinquent bills in the offset request. It then automatically submits the offset request and creates the offset request adjustments against the credit adjustment and delinquent bills' bill segments. The offset request adjustments which are created against the bill segments are matched to the bill segments and their match event status is set to **Balanced**. The offset request adjustment which is created against the credit adjustment is matched to the credit adjustment and their match event status is set to **Balanced**. Finally, the status of the offset request is set to **Processed**. For more information, see [Settling Unpaid Dues Against Advance Deposit through a Delinquency Process](#) on page 3987.

This algorithm also derives the preferred contact method for the customer contact. While deriving the preferred contact method, this algorithm first fetches the main customer's bill route type on the advance deposit account and then fetches the bill routing method of the bill route type. Once the bill routing method is derived, the system considers the preference which is specified in the **Routing Method – Contact Method Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

It then checks whether any preferred contact method is mapped to the bill routing method in the preference. If the preferred contact method is mapped to the bill routing method in the preference, the system stamps it on the customer contact. However, if the preferred contact method is not mapped to the bill routing method in the preference, the system considers the default contact method as the preferred contact method and stamps it on the customer contact.

This algorithm creates a customer contact depending on whether the advance deposit is fully or partially utilized to pay the delinquent bills. The customer contact is created for the person or for the main customer of the account depending on whether the delinquency process is created at the person or account level. In addition, the system stamps the delinquency process ID as a characteristic using the given characteristic type on the customer contact and on the advance deposit payments (used for offsetting).

Note: This algorithm is only applicable for the fully insured group business.

This algorithm contains the following parameters:

- **Debit Adjustment Type** – Used to specify the adjustment type using which you want to create the debit adjustments against the payments on the advance deposit contract.
- **Credit Adjustment Type** – Used to specify the adjustment type using which you want to create a credit adjustment that will be used to offset the overdue bills for which the delinquency process is created.
- **Offset Request Type** – Used to specify the offset request type using which you want to create the offset request to offset the credit adjustment against the delinquent bills. Here, you must specify an offset request type where the offset category is set to **Advance Deposit**.
- **Customer Contact Type For Partial Usage Of Deposit** – Used to indicate the customer contact type using which you want to create the customer contact when the advance deposit amount is partially utilized to pay the delinquent bills. Here, you must specify a customer contact type with the appropriate letter template depending on the type of letter you want to send to the customer.
- **Customer Contact Class For Partial Usage Of Deposit** – Used to indicate the customer contact class to which the customer contact type specified in the **Customer Contact Type For Partial Usage Of Deposit** parameter belongs.
- **Customer Contact Type For Depletion Of Deposit** – Used to indicate the customer contact type using which you want to create the customer contact when the advance deposit amount is fully utilized to pay the delinquent bills. Here, you must specify a customer contact type with the appropriate letter template depending on the type of letter you want to send to the customer.
- **Customer Contact Class For Depletion Of Deposit** – Used to indicate the customer contact class to which the customer contact type specified in the **Customer Contact Type For Depletion Of Deposit** parameter belongs.

- **Default Contact Method** – Used to indicate the contact method that you want to use when the preferred contact method cannot be derived for the routing method from the preference.
- **Delinquency Process Characteristic Type** – Used to indicate the characteristic type using which you want to store the delinquency process ID on the customer contact and payments. Here, you must specify a characteristic type where the characteristic entity is set to **Customer Contact** and **Payment**.

All these parameters are mandatory.

C1-DETRTGDT

This algorithm is used to calculate the termination request date for the delinquency event. The termination request date is the date when the termination request is initiated for the policies or individual memberships in the system and thereby the termination outbound message is sent to the enrollment system. This algorithm is invoked when the event is triggered manually from the user interface or automatically through the **C1-DPMON** batch.

You must use this algorithm in a delinquency process type using which you want to create a delinquency process to initiate termination request for a policy or individual membership through an outbound message. It should be attached to the delinquency event type which requests to terminate the following:

- Policies billed to the delinquent person or account
- Individual memberships billed to the delinquent account

Note:

The system does the following on the termination request date when you execute the **C1-DPMON** batch:

- Changes the status of the delinquency process to the status (for example, **Pending Termination**) which is specified in the **Delinquency Process Pending Termination Status** attribute of the delinquency process preference.
- Updates the status reason of the individual memberships billed to the delinquent account.
- Updates the status of the policies billed to the delinquent person or account.

After the status reason of an individual membership is updated, the termination outbound message is sent to the enrollment system when the **C1-MTOMT** batch is executed. On the other hand, after the status of the policy is updated, the termination outbound message is immediately sent to the enrollment system.

The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

This algorithm calculates the termination request date based on the termination trigger process and termination wait days (required if the **Termination Trigger Process** field is set to **After X Days**). The system derives the value of the **Trigger Termination Process** field and termination wait days from the delinquency process type or using an algorithm attached to the **Termination and Reinstatement Configuration Derivation** system event depending on the termination reinstatement configuration source that is specified in the delinquency process type.

The following table explains how the termination request date is calculated for the delinquency event when the trigger termination process is set to:

Trigger Termination Process is set to...	Termination Request Date is set to...
Immediate	Send Termination Request Event Trigger Date
Month End	Last Day of Send Termination Request Event Trigger Month
After X Days	Send Termination Request Event Trigger Date + Termination Wait Days

Note: The Send Termination Request event trigger date is calculated when you execute the **C1-DPEVL** batch.

Finally, this algorithm stores the termination request date of each delinquency process corresponding to the record in the **C1_DELIN_PROC** table.

Delinquency Event Completion

The following table lists the secondary actions that you can perform using the respective algorithm shipped with the product:

Action	Algorithm	Algorithm Description
Change the Delinquency Process Status	C1-TRNTERTRG	See C1-TRNTERTRG on page 3893
Recalculate Trigger Dates Based on Document Mail Date	C1-RCLTRGDMD	See C1-RCLTRGDMD on page 3893

C1-TRNTERTRG

This algorithm updates the status of the delinquency process on the termination request date. It is invoked in the **C1-DPMON** batch. The system considers the status which is specified in the **Delinquency Process Pending Termination Status** attribute of the delinquency process preference.

Note:

The termination request date is calculated through the **C1-DETTTRTGDT** algorithm.

The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

You must use this algorithm in a delinquency process type using which you want to create a delinquency process to initiate termination request for a policy or individual membership through an outbound message. It should be attached to the delinquency event type which requests to terminate the following:

- Policies billed to the delinquent person or account
- Individual memberships billed to the delinquent account

C1-RCLTRGDMD

This algorithm fetches the customer contact which is created in the delinquency event and then retrieves its document mail date. If multiple customer contacts are created in the delinquency event, the system derives the latest document mail date. It then calculates the additional days required to deliver the document to the individual customer by finding the difference between the document mail date and the customer contact date.

Once the additional days are derived, the system adds the additional days to the remaining events' trigger date and thereby derives the new trigger date for each remaining event in the delinquency process. If the **Consider Work Days** option is selected in the respective delinquency process type, the system ensures that the new trigger date falls on a business day and not on a holiday.

This algorithm is invoked in the **C1-DPMON** batch. You can use this algorithm in a delinquency process type using which you want to create a delinquency process to send debt collection letters. It should be attached to the delinquency event type which sends a warning or dunning letter.

This algorithm contains the following parameters:

- **Document Composition Date Characteristic Type** – Used to indicate the characteristic type which stores the document mail date on the customer contact. This parameter is mandatory. Here, you must specify characteristic type where the characteristic entity is set to **Customer Contact**.
- **Evaluate Document Mail Date For Primary Contact Only** – Used to indicate whether the document mail date should be derived only from the delinquent account's main customer's customer contact. The valid values are **Y** and **N**. If you set the parameter value to **N**, the system derives the document mail date from all persons' customer contacts

who are associated with the delinquent account and then considers the latest document mail date. This parameter is optional. If you do not specify the parameter value, by default, it is set to N.

Collection Class

To introduce a delinquency process at different levels (i.e. person or account) in a person's hierarchy, the following three collection methods are available while defining a collection class:

- **Self-Control Delinquency** - Used when you want to create a distinct delinquency process for a person or an account that belongs to the collection class. You can use this collection method for fully insured group, fully insured individual, and direct billed group membership lines of business.
- **Parental Delinquency** - Used when you want to evaluate the debt of a person or an account that belongs to the collection class while monitoring the parent person's delinquency. You can use this collection method only for the fully insured group business.
- **Not Eligible for Collection** - Used when you want to ignore a person or an account that belongs to the collection class while monitoring the delinquency. You can use this collection method for fully insured group, fully insured individual, and direct billed group membership lines of business.

Let us understand this with the help of an example.

The following table explains how the system behaves when different collection method is used in a collection class to which different types of entity belong:

Entity Type	Entity	Collection Class	Collection Method	System Behavior...
Account	A1	CC1	Self-Control Delinquency	<ul style="list-style-type: none">• The system creates a distinct delinquency process for the A1 account.• The bills of the A1 account are considered while monitoring the delinquency of the A1 account and not while monitoring the delinquency of the account's main customer or any of its parent person in the hierarchy.
	A2	CC2	Parental Delinquency	<ul style="list-style-type: none">• The system does not create a distinct delinquency process for the A2 account.• The bills of the A2 account are considered while monitoring the delinquency of the account's main customer or any of its parent person in the hierarchy.
	A3	CC3	Not Eligible for Collection	<ul style="list-style-type: none">• The system does not monitor the delinquency of the A3 account.• The bills of the A3 account are not considered while monitoring the delinquency of the account's main customer or any of its parent person in the hierarchy.
Person	P1	CC4	Self-Control Delinquency	<ul style="list-style-type: none">• The system creates a distinct delinquency process for the P1 person.• The bills of the P1's accounts and its child persons' accounts are considered while monitoring the delinquency of the P1 person and not while monitoring the delinquency of any of its parent person in the hierarchy.

Entity Type	Entity	Collection Class	Collection Method	System Behavior...
	P2	CC5	Parental Delinquency	<ul style="list-style-type: none"> If the P2 person has a parent person, the system does not create a distinct delinquency process for the P2 person. The bills of the P2's accounts and its child persons' accounts are considered while monitoring the delinquency of any of its parent person in the hierarchy. If the P2 person does not have a parent person, the system creates a distinct delinquency process for the P2 person. The bills of the P2's accounts and its child persons' accounts are considered while monitoring the delinquency of the P2 person.
	P3	CC6	Not Eligible for Collection	<ul style="list-style-type: none"> The system does not monitor the delinquency of the P3 person. But the system monitors the delinquency of the P3's accounts and its child person's when the collection method in the respective collection class is set to Self-Control Delinquency.

Prerequisites for Individual Delinquency

To setup the individual delinquency feature, you need to do the following:

- Define the required business rules using the following business rule categories:
 - Delinquency Grace Period Business Rule
 - Delinquency Event Attributes Business Rule
 - Delinquency Termination Date Rule Business Rule
 - Delinquency Miscellaneous Options Business Rule

Note: You can define the above business rules through the **Business Rules** screen.

- Define the required access permissions for the **Account** entity in the delinquency process.
- Define the **Membership Terminate Request (C1-MemberTermRequest)** business object which is used to setup the outbound message type for creating the membership termination request in the XML format.

Note: The outbound message type is configured in the **Membership Termination Outbound Message Trigger (C1-MTOMT)** batch which creates an outbound message whenever the membership termination process request is initiated.

- Define an algorithm of the **C1-EVALDPAPP** algorithm type to evaluate the approval configuration on the delinquency process type when a manual intervention happens in the delinquency process.
- Define the appropriate collection method in the collection class of a person or an account whose overdue debt you want to monitor through the delinquency management. For more information, see [Collection Class](#) on page 3894
- Define the required collection methods, such as, **Self-Control Delinquency (SDEL)** and **Parental Delinquency (DELP)** in the **COLL_METH_FLG** lookup field.

Note: You must define a collection class for an account and a person with the respective collection method through the **Collection Class** screen.

The following table describes how you can setup the system for an account or a person based on the respective collection method:

Scenario	System Behavior
A collection class is defined for an Account entity where the collection method is set to Self-Control Delinquency .	<ul style="list-style-type: none"> The account entity has its own delinquency process. Bills belonging to the respective account are skipped when the person of the respective account is evaluated for delinquency.
A collection class is defined for an Account entity where the collection method is set to Parental Delinquency .	<ul style="list-style-type: none"> The account simply follows the collection class configuration defined for the main person of the account. Bills belonging to the respective account are considered only when a person or any parent within the person's hierarchy is evaluated for delinquency.
A collection class is defined for a Person entity where the collection method is set to Self-Control Delinquency .	<ul style="list-style-type: none"> The person entity has its own delinquency process. Bills belonging to the respective person's account or any account falling under its hierarchy are not considered when any of the parent persons within the hierarchy is evaluated for delinquency.
	Note: When you skip a person from its parent person's delinquency process, the system always skips that particular person along with the hierarchy that resides under that person.
A collection class is defined for a Person entity where the collection method is set to Parental Delinquency .	<ul style="list-style-type: none"> The person simply follows the collection class configuration defined for its parent person. The system also checks the following conditions: <ul style="list-style-type: none"> If a parent person is not defined: <ul style="list-style-type: none"> The person entity has its own delinquency process. Bills belonging to the respective person's account or any account falling under its hierarchy are not considered when any of the parent persons within the hierarchy is evaluated for delinquency. If a parent person is defined: <ul style="list-style-type: none"> The person and hierarchy falling under the person is considered under that parent person's delinquency management.

- Define the following fields in the XML schema of the **Health Care Inbound Message (C1-HCInboundMessage)** business object:
 - Collection Class
 - Postpone Credit Review Until
 - Drag Days

Note: You can specify the values for the above fields while creating the health care inbound message.

- Configure the delinquency control along with its respective algorithms in the system.
- Configure the delinquency event type along with its respective algorithms in the system.
- Configure the delinquency process type along with its respective algorithms in the system.
- Define the required field mapping preference categories in the system
 - Routing Method - Contact Method Mapping
 - Delinquency Process Type
 - Delinquency Process

- Define a delinquency process type preference for the fully insured individual and specify the preference code in the **Delinquency Process Type Field Mapping – Individual Membership** parameter of the **C1-DLNQMNRAC** algorithm.
- Attach the **C1-DLNQMNRAC** algorithm to the **Delinquency Monitor Rule** system event in the **Delinquency Control** screen for creating an individual delinquency process at **Account** level.
- Set the rule type category as **Parameter Based** if you have selected **Delinquency Event Type Eligibility** as the rule type usage while defining a rule type.
- Attach the **C1-TRNTERTRG** algorithm to the **Delinquency Monitor Rule** system event in the **Delinquency Event Type** screen for transitioning the delinquency process to pending termination.
- Assign the **Delinquency Process Approval Notification (C1-DPAPR)** To Do type to a To Do role which is also specified as the Submitter and Approval To Do role.
- Define the algorithms of the **C1-DETTERMDT** and **C1-DETTTRTGDT** algorithm type as the event activation algorithm if you want to calculate the termination date and termination trigger date in a single event.

Note: To calculate the termination date and termination trigger date separately, you need to configure the above algorithms under respective events separately as the event activation algorithm.

- Define a new characteristic type named **Active Selection Characteristics** and set it as an attribute where the preference category is **Individual Membership**.
- Set the values for the following option types in the **C1-ASOBLLNG** feature configuration:
 - Individual Membership Configurations
 - Membership Active Status
 - Membership Terminated Status
 - Policy Active Status
 - Policy Pending Termination Status
 - Policy Pending Reinstatement Status
- Define the required customer contact type where the **Membership (C1MMBRSH)** characteristic type is mapped in the customer contact type's characteristic type.
- Define the required third party payor for payment agreement purposes.
- Set the default value **Y** for the **Skip Termination of Guaranteed Available Memberships(Valid Values - Y, N)** parameter of the **C1-MEMTRMRSN** algorithm.
- Define values for the **Delinquency Process Field Mapping**, **Policy Characteristic Type for Customer Contact**, and **Routing Method - Contact Method Mapping** option types in the **DELINPROC** feature configuration.
- Attach the **C1-CDPPAYCAN** and **C1-RODPDUEPX** algorithms to the [Algorithm Types for Payment Cancellation System Event](#) on page 4001 system event of a customer class to resume the delinquency process for the respective accounts on the payment cancellation. For more information about the algorithms, see the [Resuming a Delinquency Process on Payment Cancellation](#) on page 3966.

How to define a delinquency process type	Defining a Delinquency Process Type on page 4029

Prerequisites for Group Delinquency

To setup the group delinquency feature, you need to do the following:

- Define the required business rules using the following business rule categories:
 - Delinquency Grace Period Business Rule
 - Delinquency Event Attributes Business Rule
 - Delinquency Termination Date Rule Business Rule
 - Delinquency Miscellaneous Options Business Rule

Note: You can define the above business rules through the **Business Rules** screen.

- Define the required access permissions for the **Account** and **Person** entities in the delinquency process.
- Define a fully insured group customer with the following information:
 - A fully insured group policy using a policy type where the policy category is set to **Fully Insured Group**.
 - Different types of plans defined in a fully insured group policy.
 - Different types of memberships defined for a fully insured group policy plan.
- Define the **Membership Terminate Request (C1-MemberTermRequest)** business object which is used to setup the outbound message type for creating the membership termination request in the XML format.

Note: The outbound message type is configured in the **Membership Termination Outbound Message Trigger (C1-MTOMT)** batch which creates an outbound message whenever the membership termination process request is initiated.

- Define an algorithm of the **C1-EVALDPAPP** algorithm type to evaluate the approval configuration on the delinquency process type when a manual intervention happens in the delinquency process.
- Define the algorithms of the **C1-DETTTMDT** and **C1-DETTTGT** algorithm type as the event activation algorithm if you want to calculate the termination date and termination trigger date in a single event.

Note: To calculate the termination date and termination trigger date separately, you need to configure the above algorithms under respective events separately as the event activation algorithm.

- Define the appropriate collection method in the collection class of a person or an account whose overdue debt you want to monitor through the delinquency management. For more information, see [Collection Class](#) on page 3894
- Define the required collection methods, such as, **Self-Control Delinquency (SDEL)** and **Parental Delinquency (DELP)** in the **COLL_METH_FLG** lookup field.

Note: You must define a collection class for an account and a person with the respective collection method through the **Collection Class** screen.

The following table describes how you can setup the system for an account or a person based on the respective collection method:

Scenario	System Behavior
A collection class is defined for an Account entity where the collection method is set to Self-Control Delinquency .	<ul style="list-style-type: none">The account entity has its own distinct delinquency process.The debt of the account is monitored at predefined system events and the delinquency process is commenced whenever the account’s debt is overdue.
	Note: The system creates a delinquency process for an account only when at least one bill of the account is overdue.
A collection class is defined for a Person entity where the	<ul style="list-style-type: none">The person entity has its own distinct delinquency process.The child person’s accounts and its grandchild’s accounts are not considered in the parent person’s delinquency.

Scenario	System Behavior
collection method is set to Self-Control Delinquency .	Note: The system creates a delinquency process for a person only when at least one bill of any account (considered) in its hierarchy is overdue.
A collection class is defined for a Person entity where the collection method is set to Parental Delinquency .	<ul style="list-style-type: none"> The person entity has its own distinct delinquency process. The persons, child person, and grandchild accounts are considered in the parent person's delinquency. Any such account in the person's hierarchy where the collection is set to Self-Control Delinquency is not considered in the parent person's delinquency.

- Define the following fields in the XML schema of the **Health Care Inbound Message (C1-HCInboundMessage)** business object:
 - Collection Class
 - Postpone Credit Review Until
 - Drag Days

Note: You can specify the values for the above fields while creating the health care inbound message.

- Configure the delinquency control along with its respective algorithms in the system.
- Configure the delinquency event type along with its respective algorithms in the system.
- Configure the delinquency process type along with its respective algorithms in the system.
- Define the required field mapping preference categories in the system
 - Routing Method - Contact Method Mapping
 - Delinquency Process Type
 - Delinquency Process
- Create a delinquency event type for advance deposit, attach the **C1-APPADVDEP** algorithm to the **Event Activation** system event, and configure the delinquency event type while creating a delinquency process type for advance deposit purposes.
- Define values for the **Delinquency Process Field Mapping**, **Policy Characteristic Type for Customer Contact**, and **Routing Method - Contact Method Mapping** option types in the **DELINPROC** feature configuration.
- Define a delinquency process type preference for the fully insured group business and specify the preference code in the **Delinquency Process Type Field Mapping – Group** parameter of the **C1-DLNQMNRL** and **C1-DLNQMNRAC** algorithm.
- Attach the **C1-DLNQMNRL** algorithm to the **Delinquency Monitor Rule** system event in the **Delinquency Control** screen for creating a group delinquency process at **Person** level.
- Attach the **C1-DLNQMNRAC** algorithm to the **Delinquency Monitor Rule** system event in the **Delinquency Control** screen for creating a group delinquency process at **Account** level.
- Set the rule type category as **Parameter Based** if you have selected **Delinquency Event Type Eligibility** as the rule type usage while defining a rule type.
- Attach the **C1-TRNTERTRG** algorithm to the **Delinquency Monitor Rule** system event in the **Delinquency Event Type** screen for transitioning the delinquency process to pending termination.
- Assign the **Delinquency Process Approval Notification (C1-DPAPR)** To Do type to a To Do role which is also specified as the Submitter and Approval To Do role.
- Set the values for the following option types in the **C1-ASOBLNG** feature configuration:
 - Membership Active Status
 - Membership Terminated Status
 - Policy Active Status
 - Policy Pending Termination Status
 - Policy Pending Reinstatement Status
- Define the required parameter configurations for the delinquency business rules.
- Define the required customer contact event to create a customer contact.

- To setup the advance deposit feature, define the following entities:
 - Define the required account relationship type and advance deposit contract type in the system.
 - Define the **Advance Deposit Account Relationship Type** and **Advance Deposit Contract Type** field mapping attributes in the **Delinquency Process** field mapping preference.
 - Define an algorithm of the **C1-FIACCPP** algorithm type and attach it to the **Post-Processing** system event of the **C1-AccountBO** business object.
 - Define an algorithm of the **C1-ACTPOSP** algorithm type and attach it to the **Post-Processing** system event of the **C1-AccountBO** business object.
 - Define an algorithm of the **C1-FIPOLPP** algorithm type and attach it to the **Post-Processing** system event of the **C1-POLICY** business object.
 - Define a new offset request type where the offset category is set to **Advance Deposit**.
 - Define an offset request type as a soft parameter in the **C1-APPADVDEP** algorithm.
 - Define the debit adjustment type and credit adjustment as soft parameters in the **C1-APPADVDEP** algorithm and attach both the adjustment types in the **Adjustment Type Profile** tab of the **Contact Type** screen.
- Define the following customer contacts in the system:
 - Configure the **Customer Contact Type**, **Customer Contact Class**, and **Default Contact Method** parameters in the **Advance Deposit Monitor (C1-ADMON)** batch to create a customer contact when the payment is not received.
 - Configure the **Customer Contact Type**, **Customer Contact Class**, and **Default Contact Method** parameters in the **C1-NOTADREC** algorithm to create a customer contact when the advance deposit payment is received.
 - Configure the **Customer Contact Type**, **Customer Contact Class**, and **Default Contact Method** parameters in the **C1-NOTADCAN** algorithm to create a customer contact when the advance deposit payment is canceled.
 - Configure the **Customer Contact Type For Partial Usage Of Deposit**, **Customer Contact Class For Partial Usage Of Deposit** and parameters in the **C1-APPADVDEP** algorithm to create a customer contact when the advance deposit is partially considered.
 - Configure the **Customer Contact Type For Partial Usage Of Deposit**, **Customer Contact Class For Partial Usage Of Deposit**, and **Default Contact Method** parameters in the **C1-APPADVDEP** algorithm to create a customer contact when the advance deposit amount is depleted.
- Define a match type for advance deposit and configure the payment distribution override algorithm (in the match type) using the **C1-MATSATYP** algorithm type.
- Define the required third party payor for payment agreement purposes.
- Attach the **C1-CDPPAYCAN** and **C1-RODPDUEPX** algorithms to the [Algorithm Types for Payment Cancellation System Event](#) on page 4001 system event of a customer class to resume the delinquency process for the respective accounts on the payment cancellation. For more information about the algorithms, see the [Resuming a Delinquency Process on Payment Cancellation](#) on page 3966.

How to define a delinquency process type	Defining a Delinquency Process Type on page 4029

Prerequisites for Direct Billed Group Membership Delinquency Management

To setup the direct billed group membership delinquency feature, you need to do the following:

- Define the required business rules using the following business rule categories:
 - Delinquency Grace Period Business Rule
 - Delinquency Event Attributes Business Rule
 - Delinquency Termination Date Rule Business Rule
 - Delinquency Miscellaneous Options Business Rule

Note: You can define the above business rules through the **Business Rules** screen.

- Define the required access permissions for the **Account** entity in the delinquency process.
- Define an algorithm of the **C1-EVALDPAPP** algorithm type to evaluate the approval configuration on the delinquency process type when a manual intervention happens in the delinquency process.
- Define the appropriate collection method in the collection class of a person or an account whose overdue debt you want to monitor through the delinquency management. For more information, see [Collection Class](#) on page 3894
- Define the **Membership Terminate Request (C1-MemberTermRequest)** business object which is used to setup the outbound message type for creating the membership termination request in the XML format.

Note: The outbound message type is configured in the **Membership Termination Outbound Message Trigger (C1-MTOMT)** batch which creates an outbound message whenever the membership termination process request is initiated.

- Define the algorithms of the **C1-DETTTMDT** and **C1-DETTTGT** algorithm type as the event activation algorithm if you want to calculate the termination date and termination trigger date in a single event.

Note: To calculate the termination date and termination trigger date separately, you need to configure the above algorithms under respective events separately as the event activation algorithm.

- Define the required collection methods, such as, **Self-Control Delinquency (SDEL)** and **Parental Delinquency (DELP)** in the **COLL_METH_FLG** lookup field.

Note: You must define a collection class for an account and a person with the respective collection method through the **Collection Class** screen.

The following table describes how you can setup the system for an account or a person based on the respective collection method:

Scenario	System Behavior
A collection class is defined for an Account entity where the collection method is set to Self-Control Delinquency .	<ul style="list-style-type: none">• The account entity has its own delinquency process.• Bills belonging to the respective account are skipped when the person of the respective account is evaluated for delinquency.
A collection class is defined for an Account entity where the collection method is set to Parental Delinquency .	<ul style="list-style-type: none">• The person entity has its own distinct delinquency process.• The child person’s accounts and its grandchild’s accounts are not considered in the parent person’s delinquency. <p>Note: The system creates a delinquency process for a person only when at least one bill of any account (considered) in its hierarchy is overdue.</p>

Scenario	System Behavior
A collection class is defined for a Person entity where the collection method is set to Self-Control Delinquency .	<ul style="list-style-type: none"> The person entity has its own delinquency process. Bills belonging to the respective person's account or any account falling under its hierarchy are not considered when any of the parent persons within the hierarchy is evaluated for delinquency.
	Note: When you skip a person from its parent person's delinquency process, the system always skips that particular person along with the hierarchy that resides under that person.
A collection class is defined for a Person entity where the collection method is set to Parental Delinquency .	<ul style="list-style-type: none"> The person simply follows the collection class configuration defined for its parent person. The system also checks the following conditions: <ul style="list-style-type: none"> If a parent person is not defined: <ul style="list-style-type: none"> The person entity has its own delinquency process. Bills belonging to the respective person's account or any account falling under its hierarchy are not considered when any of the parent persons within the hierarchy is evaluated for delinquency. If a parent person is defined: <ul style="list-style-type: none"> The person and hierarchy falling under the person is considered under that parent person's delinquency management.

- Define a delinquency process type preference for the fully insured group direct billed membership business and specify the preference code in the **Delinquency Process Type Field Mapping – Direct Billed** parameter of the **C1-DLNQMNRDR** algorithm.
- Define values for the **Delinquency Process Field Mapping, Policy Characteristic Type for Customer Contact**, and **Routing Method - Contact Method Mapping** option types in the **DELINPROC** feature configuration.
- Attach the **C1-DLNQMNRDR** algorithm to the **Delinquency Monitor Rule** system event in the **Delinquency Control** screen for creating a fully insured group direct billed membership delinquency process at **Account** level.
- Set the rule type category as **Parameter Based** if you have selected **Delinquency Event Type Eligibility** as the rule type usage while defining a rule type.
- Attach the **C1-TRNTERTRG** algorithm to the **Delinquency Monitor Rule** system event in the **Delinquency Event Type** screen for transitioning the delinquency process to pending termination.
- Assign the **Delinquency Process Approval Notification (C1-DPAPR)** To Do type to a To Do role which is also specified as the Submitter and Approval To Do role.
- Define a new characteristic type named **Active Selection Characteristics** and set it as an attribute where the preference category is **Individual Membership**.
- Set the default value **Y** for the **Skip Termination of Guaranteed Available Memberships(Valid Values-Y,N)** parameter of the **C1-MEMTRMRSN** algorithm.
- Define the required field mapping preference categories in the system
 - Routing Method - Contact Method Mapping
 - Delinquency Process Type
 - Delinquency Process
- Define the following fields in the XML schema of the **Health Care Inbound Message (C1-HCInboundMessage)** business object:
 - Collection Class
 - Postpone Credit Review Until
 - Drag Days

Note: You can specify the values for the above fields while creating the health care inbound message.

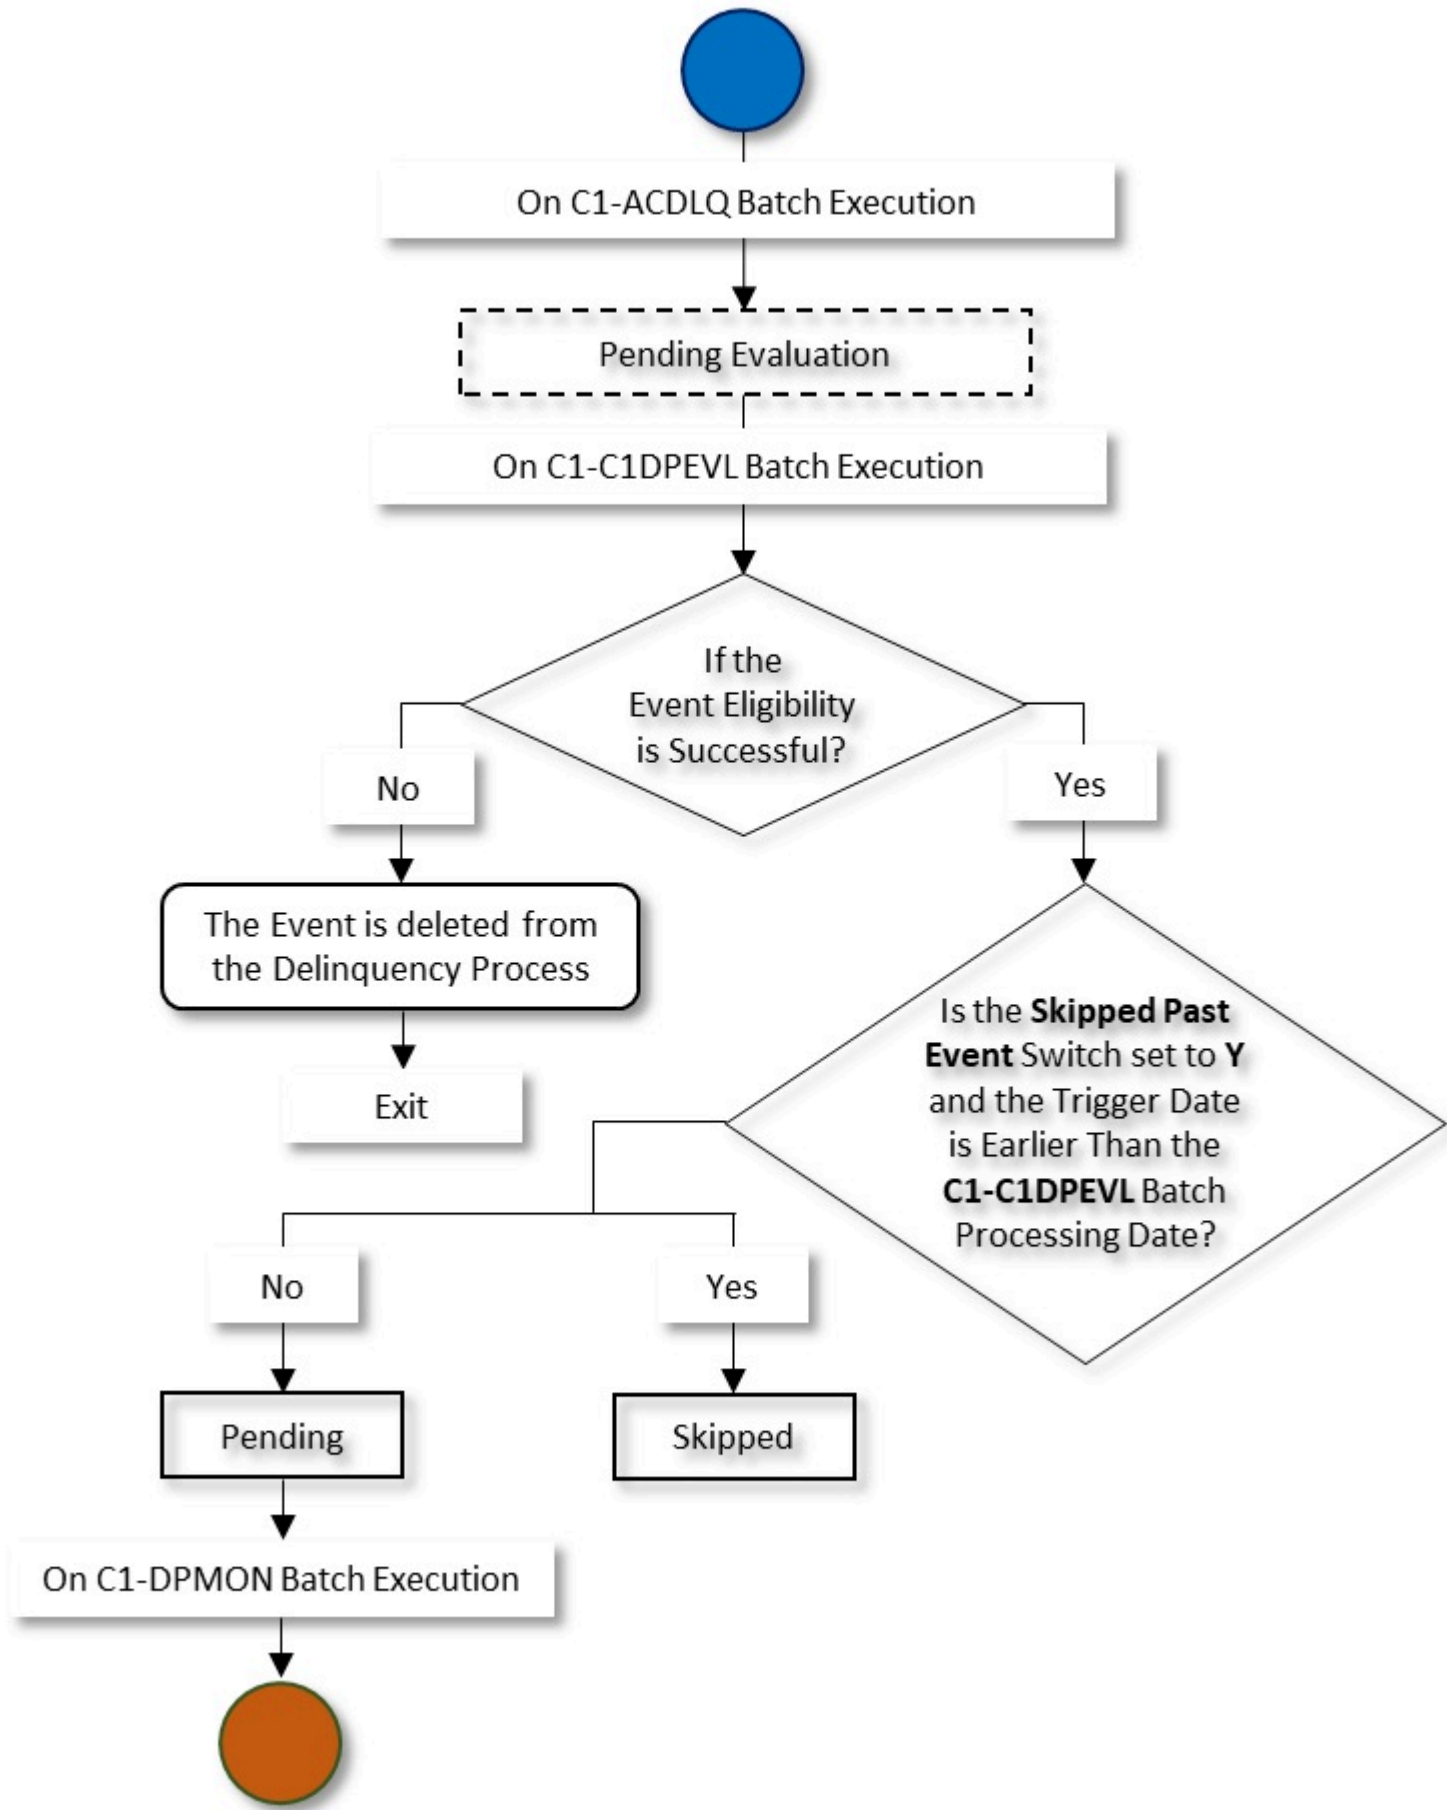

- Set the values for the following option types in the **C1-ASOBLNG** feature configuration:
 - Individual Membership Configurations
 - Membership Active Status
 - Membership Terminated Status
 - Policy Active Status
 - Policy Pending Termination Status
 - Policy Pending Reinstatement Status
- Configure the delinquency control along with its respective algorithms in the system.
- Configure the delinquency event type along with its respective algorithms in the system.
- Configure the delinquency process type along with its respective algorithms in the system.
- Define the required parameter configurations for the delinquency business rules.
- Define the required customer contact event to create a customer contact.
- Define the required customer contact type where the **Membership (C1MMBRSH)** characteristic type is mapped in the customer contact type's characteristic type.
- Define the required third party payor for payment agreement purposes.
- Attach the **C1-CDPPAYCAN** and **C1-RODPDUEPX** algorithms to the [Algorithm Types for Payment Cancellation System Event](#) on page 4001 system event of a customer class to resume the delinquency process for the respective accounts on the payment cancellation. For more information about the algorithms, see the [Resuming a Delinquency Process on Payment Cancellation](#) on page 3966.

Delinquency Process Status Transition for Group Direct Billed Membership Delinquency Management

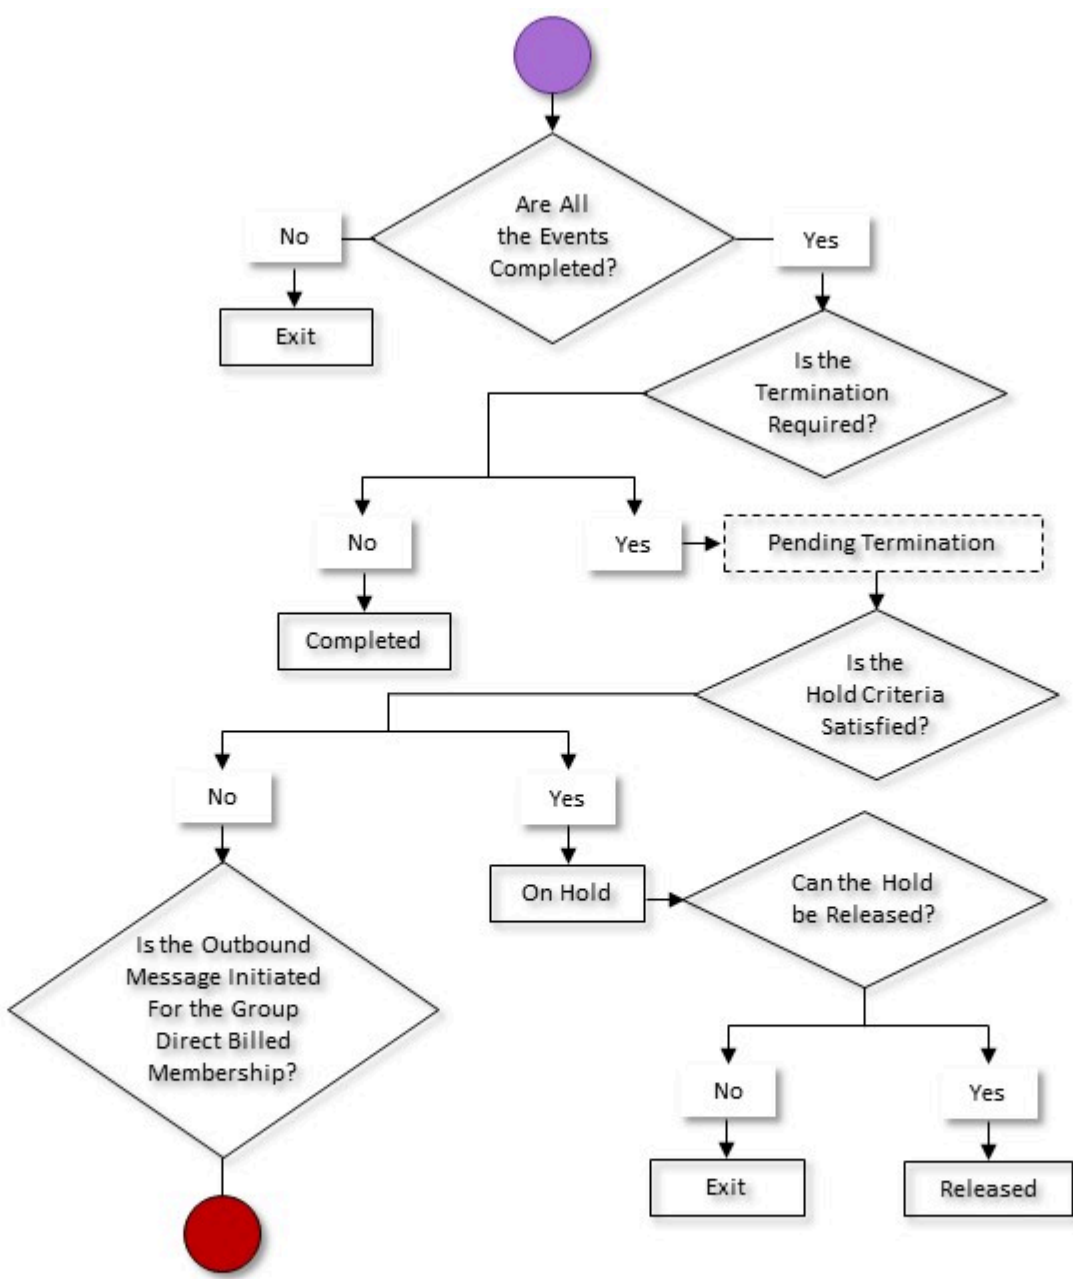

The following figure graphically indicates how a delinquency process for a group direct billed membership moves from one status to another in its lifecycle:

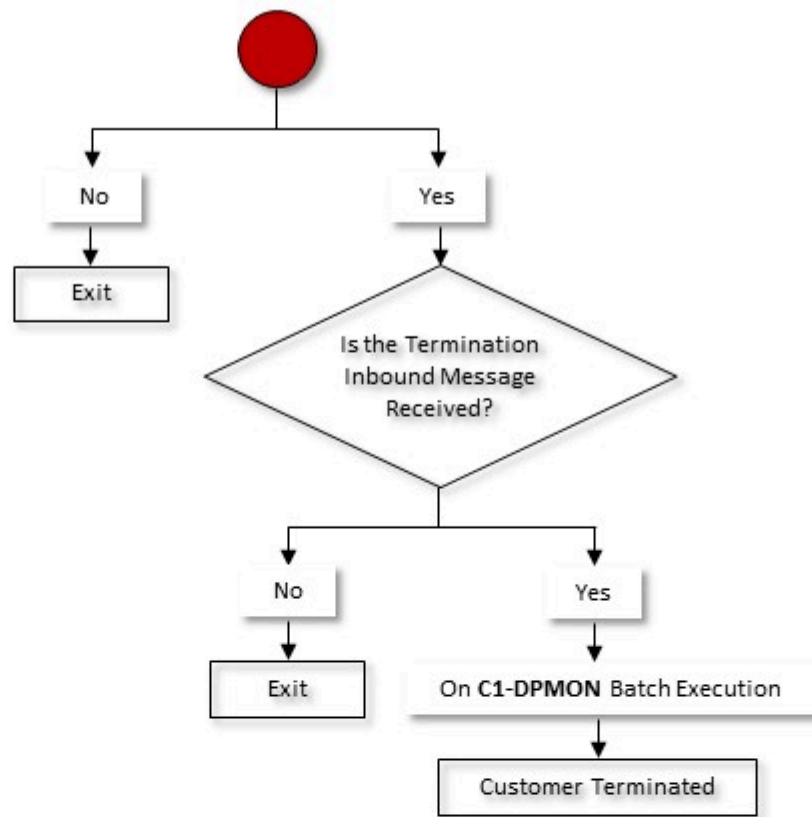

Delinquency Process Type

Once you create the delinquency event types, you need to create the required delinquency process types using which you want the system to create a delinquency process for a person or an account. You can design various delinquency process types that trigger different types of events for the different types of insurance coverages. For example, you can define different delinquency process types for the following:

- Active health plan coverages
- Inactive health plan coverages

- Medical health plan coverages with benefits
- Medical health plan coverages without benefits
- Non-medical health plan coverages
- Non-effectuated health plan coverages

You can then configure the delinquency process type for each type of insurance coverage through the delinquency process type preference. For more information, see [Delinquency Process Types Based on Insurance Coverage](#) on page 3956. The system considers the delinquency process type preference which is specified in the **C1-DLNQMNRL** algorithm attached to the respective delinquency control. Depending on the following line of business, the system considers the delinquency process type preference specified in the respective parameter of the **C1-DLNQMNRL** algorithm:

Line of Business	Algorithm Parameter
Fully Insured Group	Delinquency Process Type Field Mapping – Group
Fully Insured Individual	Delinquency Process Type Field Mapping – Individual
Group Direct Billed Membership	Delinquency Process Type Field Mapping – Individual

A new maintenance object named **C1-DLQ-PRC-T** and a new business object named **C1-DelinProcType** are introduced to create the delinquency process types. The **Delinquency Process Type** screen enables you to create, edit, delete, and copy a delinquency process type. While creating a delinquency process type, you can specify the following:

- Basic details for the delinquency process type
- Details for the delinquency event trigger date calculation
- Types of delinquency events that you want to trigger in a delinquency process which is created using the delinquency process type
- Algorithms that you want to attach to the delinquency process type
- Details for the grace period calculation
- Details for the termination request (outbound message) trigger process
- Details for the termination date calculation
- Priority for each termination date rule
- Details for the trigger date recalculation when a delinquency process which is on hold is released and when a delinquency process which is canceled is resumed
- Actions for which you want to configure the approval process

Delinquency Process Type Details

While creating a delinquency process type, you need to specify the following details:

- The entity type (for example, **Account** or **Person**) for which the delinquency process type is applicable. Note that the account level delinquency process is applicable for both the fully insured individual and fully insured group businesses whereas the person level delinquency process is applicable only for the fully insured group business.
- The business object using which the delinquency process should be created in the system.

Note: A new maintenance object named **C1-DLN-PROC** and a new business object named **C1-Delinquency Process** are introduced to create the delinquency processes.

- The type of object (for example, bill) for which you want to manage collections through the delinquency process. Note that the system enables you select only those objects as the collection objects for which the **Eligible for Delinquency (Y/N)** option type is selected in the respective maintenance object. At present, the **Eligible for Delinquency (Y/N)** option type is only selected for the **BILL** maintenance object.
- Whether the termination process should be automatically initiated for the following:
 - Policies billed to the delinquent person or account
 - Individual memberships billed to the delinquent account

- Whether the reinstatement process should be automatically initiated for the policies billed to the delinquent person or account. The automatic reinstatement is applicable only for the fully insured group business.
- The way in which you want to trigger the delinquency events in the delinquency process. The system supports the following ways:
 - **Automatic** - Used when you want the system to automatically trigger delinquency events on the trigger date through the **C1-DPMON** batch. The trigger dates are calculated for the delinquency events when you execute the **C1-DPEVL** batch. The trigger dates of the delinquency events are calculated using the given trigger date calculation details, such as trigger date calculation mode, wait period, etc. If you set the delinquency event trigger mode to **Automatic**, the system does not allow you to trigger the delinquency events manually from the user interface. The **Trigger** icon corresponding to a delinquency event in the **Delinquency Process** screen is disabled.
 - **Manual** - Used when you want to manually trigger delinquency events in the delinquency process at the desired interval. In this case, the trigger dates are not calculated for the delinquency events. The **Trigger** icon appears corresponding to a delinquency event in the **Delinquency Process** screen. You can trigger a delinquency event by clicking the **Trigger** icon corresponding to the delinquency event in any order irrespective of its sequence in the delinquency process. If you set the delinquency event trigger mode to **Manual**, the system does not automatically trigger delinquency events on the trigger date through the **C1-DPMON** batch.
 - **Manual or Automatic** – Used when you want the system to automatically trigger delinquency events on the trigger date through the **C1-DPMON** batch. The trigger dates are calculated for the delinquency events when you execute the **C1-DPEVL** batch. The trigger dates of the delinquency events are calculated using the given trigger date calculation details, such as trigger date calculation mode, wait period, etc. Here, you also have an option to manually trigger a delinquency event in the delinquency process whenever required before the trigger date to expedite the collections process. The **Trigger** icon appears corresponding to a delinquency event in the **Delinquency Process** screen. You can trigger a delinquency event by clicking the **Trigger** icon corresponding to the delinquency event. Ideally, you must trigger a delinquency event in the ascending order of its sequence. However, if you manually trigger a delinquency event in any order, all the delinquency events in the **Pending** status before the manually triggered delinquency event will be skipped in the delinquency process. The status of such delinquency events is changed to **Skipped**.

Delinquency Event Trigger Date Calculation Details

While creating a delinquency process type, you need to specify the following details:

- Whether you want to delay a delinquency event for a specific period that can be specified either in days or months.
- Whether the trigger date of a delinquency event should fall on a business day
- The method in which you want to calculate the trigger date for the delinquency events. The system supports the following methods:
 - **Latest Bill Due Date with Grace Period** – Used when you want to derive trigger date using the latest bill due date and grace period. The system considers the latest bill due date as the grace start date. It then derives the grace end date using the grace start date and grace period (in days). Once the grace start and end dates are derived, the system calculates the trigger date based on the trigger period and wait period configuration of the delinquency event type as shown below:

Trigger Period	Wait Period	Wait Days	Trigger Date is set to...
After Grace End Date	Wait Days	10	Grace End Date + 10 days
Before Grace End Date	Wait Days	5	Grace End Date - 5 days

Note:

The system supports only wait days when the trigger date calculation mode is set to **Latest Bill Due Date with Grace Period**.

The system derives the wait days from the delinquency process type or using an algorithm attached to the **Wait Days Derivation** system event depending on the wait period source which is specified in the delinquency process type.

The system derives the grace period from the delinquency process type or using an algorithm attached to the **Grace Period Derivation** system event depending on the grace period source which is specified in the delinquency process type.

- **Paid Through Date** – Used when you want to derive trigger date using the paid through date of the account and the wait period. The system calculates the trigger date based on the wait period configuration of the delinquency event type as shown below:

Wait Period	Wait Days	Wait Months	Day of Month	Trigger Month is set to...	Trigger Date is set to...
Monthly Cyclic	-	1	5	Paid Through Date + 1 Month	5th of Trigger Month
Wait Days	5	-	-	-	Paid Through Date + 5 days

If the wait period is set to **Monthly Cyclic**, you need to specify the wait months and the day of the month for each delinquency event type in the delinquency process type. However, if the wait period is set to **Wait Days**, you need to specify the wait days for each delinquency event type in the delinquency process type.

Note: The system derives the wait days or wait month and the day of the month from the delinquency process type or using an algorithm attached to the **Wait Days Derivation** system event depending on the wait period source which is specified in the delinquency process type.

If the calculated trigger date of an event is past dated, the system enables you to move the trigger date of the event to the next month. If the new trigger date is also past dated, the system keeps moving the trigger date by one month until it is a future date. You can avail this functionality for the delinquency events by selecting the **Move Past Dated Event To Future** option corresponding to the respective delinquency event type in the delinquency process type. Note that if the trigger date of an event is moved to a future date, the trigger date of the subsequent events in the delinquency process is also moved accordingly.

This is because the system is designed to trigger only one event at a time in a month. While calculating the new trigger date, the system ensures that the delinquency events are triggered in the given sequence.

Note: You can enable the **Move Past Dated Event To Future** option only when the wait period is set to **Monthly Cyclic**.

- **Usage Basis** – Used when you want to derive trigger date using either of the following dates:
 - **Delinquency Process Creation Date** – Used when you want to derive trigger date using the delinquency process creation date and the wait period. The system calculates the trigger date based on the wait period configuration of the delinquency event type as shown below:

Wait Period	Wait Days	Wait Months	Day of Month	Trigger Month is set to	Trigger Date is set to...
Monthly Cyclic	-	1	5	Delinquency Process Creation Date + 1 Month	5th of Trigger Month

Wait Period	Wait Days	Wait Months	Day of Month	Trigger Month is set to	Trigger Date is set to...
Wait Days	15	-	-	-	Delinquency Process Creation Date + 15 days

If the wait period is set to **Monthly Cyclic**, you need to specify the wait months and the day of the month for each delinquency event type in the delinquency process type. However, if the wait period is set to **Wait Days**, you need to specify the wait days for each delinquency event type in the delinquency process type.

Note: The system derives the wait days or wait month and the day of the month from the delinquency process type or using an algorithm attached to the **Wait Days Derivation** system event depending on the wait period source which is specified in the delinquency process type.

If the calculated trigger date of an event is past dated, the system enables you to move the trigger date of the event to the next month. If the new trigger date is also past dated, the system keeps moving the trigger date by one month until it is a future date. You can avail this functionality for the delinquency events by selecting the **Move Past Dated Event To Future** option corresponding to the respective delinquency event type in the delinquency process type. Note that if the trigger date of an event is moved to a future date, the trigger date of the subsequent events in the delinquency process is also moved accordingly. This is because the system is designed to trigger only one event at a time in a month. While calculating the new trigger date, the system ensures that the delinquency events are triggered in the given sequence.

Note: You can enable the **Move Past Dated Event To Future** option only when the wait period is set to **Monthly Cyclic**.

- **Grace Start Date** - Used when you want to derive trigger date using the grace start date and the wait period. You can set the grace start date to either of the following - **Delinquency Process Creation Date**, **Latest Bill Due Date**, or **X Days after Latest Bill Due Date**. The system calculates the trigger date based on the wait period configuration of the delinquency event type.

The following table illustrates how the trigger date is calculated using the respective grace start date and wait period combination:

Grace Start Date Basis	Wait Period	Wait Days	Wait Months	Day of Month	Add Days to Due Date	Trigger Month is set to...	Trigger Date is set to...
Delinquency Process Creation Date	Monthly Cyclic	-	1	5	-	Grace Start Date (i.e. Delinquency Process Creation Date) + 1 Month	5th of Trigger Month
Delinquency Process Creation Date	Wait Days	15	-	-	-	-	Grace Start Date (i.e. Delinquency Process Creation Date) + 15 days
Latest Bill Due Date	Monthly Cyclic	-	2	7	-	Grace Start Date (i.e. Latest Bill	7th of Trigger Month

Grace Start Date Basis	Wait Period	Wait Days	Wait Months	Day of Month	Add Days to Due Date	Trigger Month is set to...	Trigger Date is set to...
						Due Date) + 2 Month	
Latest Bill Due Date	Wait Days	20	-	-	-	-	Grace Start Date (i.e. Latest Bill Due Date) + 20 days
X Days after Latest Bill Due Date	Monthly Cyclic	-	1	10	10	Grace Start Date (i.e. Latest Bill Due Date + 10 days) + 1 Month	10th of Trigger Month
X Days after Latest Bill Due Date	Wait Days	20	-	-	10	-	Grace Start Date (i.e. Latest Bill Due Date + 10 days) + 20 days

If the wait period is set to **Monthly Cyclic**, you need to specify the wait months and the day of the month for each delinquency event type in the delinquency process type. However, if the wait period is set to **Wait Days**, you need to specify the wait days for each delinquency event type in the delinquency process type.

Note: The system derives the wait days or wait month and the day of the month from the delinquency process type or using an algorithm attached to the **Wait Days Derivation** system event depending on the wait period source which is specified in the delinquency process type.

If the calculated trigger date of an event is past dated, the system enables you to move the trigger date of the event to the next month. If the new trigger date is also past dated, the system keeps moving the trigger date by one month until it is a future date. You can avail this functionality for the delinquency events by selecting the **Move Past Dated Event To Future** option corresponding to the respective delinquency event type in the delinquency process type.

Note that if the trigger date of an event is moved to a future date, the trigger date of the subsequent events in the delinquency process is also moved accordingly. This is because the system is designed to trigger only one event at a time in a month.

While calculating the new trigger date, the system ensures that the delinquency events are triggered in the given sequence.

Note: You can enable the **Move Past Dated Event To Future** option only when the wait period is set to **Monthly Cyclic**.

- **Latest Bill Due Date** – Used when you want to derive trigger date using the latest bill due date and the wait period. The system calculates the trigger date based on the wait period configuration of the delinquency event type.

The following table illustrates how the trigger date is calculated using the latest bill due date and wait period combination:

Wait Period	Wait Days	Wait Months	Day of Month	Trigger Month is set to...	Trigger Date is set to...
Monthly Cyclic	-	2	15	Latest Bill Due Date + 2 Month	15th of Trigger Month
Wait Days	25	-	-	-	Latest Bill Due Date + 25 days

If the wait period is set to **Monthly Cyclic**, you need to specify the wait months and the day of the month for each delinquency event type in the delinquency process type. However, if the wait period is set to **Wait Days**, you need to specify the wait days for each delinquency event type in the delinquency process type.

Note: The system derives the wait days or wait month and the day of the month from the delinquency process type or using an algorithm attached to the **Wait Days Derivation** system event depending on the wait period source which is specified in the delinquency process type.

If the calculated trigger date of an event is past dated, the system enables you to move the trigger date of the event to the next month. If the new trigger date is also past dated, the system keeps moving the trigger date by one month until it is a future date. You can avail this functionality for the delinquency events by selecting the **Move Past Dated Event To Future** option corresponding to the respective delinquency event type in the delinquency process type. Note that if the trigger date of an event is moved to a future date, the trigger date of the subsequent events in the delinquency process is also moved accordingly. This is because the system is designed to trigger only one event at a time in a month. While calculating the new trigger date, the system ensures that the delinquency events are triggered in the given sequence.

Note: You can enable the **Move Past Dated Event To Future** option only when the wait period is set to **Monthly Cyclic**.

Delinquency Event Types

While adding the delinquency event types in a delinquency process type, you need to specify the following:

- The delinquency event types using which you want to create the delinquency events in a delinquency process which is created using the delinquency process type
- The order in which you want to create the delinquency event using the delinquency event type
- The time period (i.e. either before or after grace end date) during which you want to trigger the delinquency events when the trigger date calculation mode is set to **Latest Bill Due Date with Grace Period**
- Whether you want the system to derive the wait days, wait months, and day of month during the trigger date calculation from the delinquency process type or through an algorithm
- The number of days for which you want to delay the delinquency event in a delinquency process
- The number of months for which you want to delay the delinquency event in a delinquency process
- The day of the month when you want to trigger the delinquency event of a delinquency process
- Whether you want the system to recalculate the trigger date of a delinquency event if it is a past dated until it is a future date
- Whether you want to preview a delinquency event which helps the relationship manager to inform the customer in advance that he will receive the To Do notification or customer contact within the specified number of days
- The number of days before the trigger date when you want to schedule a preview of a delinquency event
- Whether you want the system to skip the delinquency event in a delinquency process which is past dated
- Whether you want the system to check whether a delinquency event type is eligible for an account and then accordingly create the delinquency event using the delinquency event type

Note: The list includes only those rule types where the rule type usage is set to **Delinquency Event Type Eligibility**.

Delinquency Process Type Algorithms

While creating a delinquency process type, you need to attach the following algorithms to the respective system event:

System Event	Algorithm	Algorithm Description
Calculate Unpaid and Original Amounts	C1-CUAOAB	Refer to C1-CUAOAB on page 3945
Cancel Criteria	C1-CANDELPRC	Refer to C1-CANDELPRC on page 3945
Cancel Criteria	C1-CANDPAPTC	Refer to C1-CANDPAPTC on page 3947
Grace Period Derivation	C1-DERGRBR	Refer to C1-DERGRBR on page 3947
Hold Delinquency Process Criteria	C1-HLDDELPRC	Refer to C1-HLDDELPRC on page 3948
Memberships Derivation	C1-MEMBDLQ	Refer to C1-MEMBDLQ on page 3949
Policies Derivation	C1-POLDLQPA	Refer to C1-POLDLQPA on page 3950
Release Delinquency Process Criteria	C1-RELDELPRC	Refer to C1-RELDELPRC on page 3950
Send Member Level Notification Option Derivation	C1-DERMLNBR	Refer to C1-DERMLNBR on page 3951
Termination Date Rule Derivation	C1-DERTRBR	Refer to C1-DERTRBR on page 3952
Termination and Reinstatement Configuration Derivation	C1-DERTROBR	Refer to C1-DERTROBR on page 3952
Trigger Date Recalculation Option Derivation	C1-DERRTDBR	Refer to C1-DERRTDBR on page 3953
Wait Days Derivation	C1-DERWDBR	Refer to C1-DERWDBR on page 3953

C1-CUAOAB

This algorithm derives the original and unpaid amounts for each overdue bill of the person or account whose debt is monitored. It invokes an algorithm created using the **C1-OI-BI-AMT** algorithm type attached to the **Determine Open Item Bill Amounts** system event in the installation options to calculate the original and unpaid amounts for a bill.

Note: This algorithm is required when the collection object in the delinquency process type is set to **Bill**. The **C1-CUAOAB** algorithm is invoked from the following algorithms - **C1-DLNQMNRL**, **C1-RODPDUEPX**.

C1-CANDELPRC

This algorithm cancels the delinquency process when either of the following condition is met:

- Payments or adjustments are made against the overdue bills, for which the delinquency process is created, and as a result the unpaid balance of the overdue bills is within the tolerance limit
- Collection class of the account, for which the delinquency process is created, is changed

- Voluntary termination is received for an individual membership (which is billed to the delinquent account) with a termination date that is earlier than or equal to the calculated termination date
- Voluntary cancellation is received for an individual membership (which is billed to the delinquent account)
- Individual membership is canceled through an inbound message but its corresponding delinquency process is still in the **Delinquency In Progress** status

It contains the following parameters:

- **Tolerance Percentage** - Used to specify the unpaid percentage value (i.e. unpaid amount with respect to original amount). The system cancels the delinquency process when the unpaid percentage of the overdue bills is within the tolerance limit. This parameter is required.
- **Tolerance Amount** - Used to specify the flat unpaid amount. The system cancels the delinquency process when the unpaid amount of the overdue bills is within the tolerance limit. This parameter is required.
- **Tolerance Amount and Percentage Required (Y / N)** - Used to indicate whether you want to consider both the unpaid amount and unpaid percentage to check whether the delinquency process should be canceled or not. The valid values are:
 - **Y** - If you set the value to **Y**, the system considers both the unpaid amount and the unpaid percentage to check whether the delinquency process should be canceled or not.
 - **N** - If you set the value to **N**, the system considers either the unpaid amount or the unpaid percentage to check whether the delinquency process should be canceled or not.

This parameter is mandatory.

- **Include On Account Payments In Threshold Evaluation - (Y/N)** - Used to indicate whether you want to consider the payments made against the on account contracts of the account while calculating the unpaid amount. The valid values are **Y** and **N**.
- **On Account Payment Contract Type (Comma separated valid values)** - Used to indicate the on account contract types that you want to consider while determining the total unpaid amount. You can specify maximum twenty comma-separated values for this parameter. This parameter is only required when the **Include On Account Payments In Threshold Evaluation - (Y/N)** parameter is set to **Y**.
- **Use Current Revenue Period Billed For Latest Overdue Due Date In Threshold Evaluation - (Y/N)** - Used to indicate whether the system should calculate the unpaid percentage or amount based on the total amount billed for the coverage period or based on the total amount billed for the overdue bills. The valid values are:
 - **Y** - Used when you want to calculate the unpaid percentage or amount based on the total amount billed for the coverage period.
 - **N** - Used when you want to calculate the unpaid percentage or amount based on the total amount billed for the overdue bills.

This parameter is optional. If you do not specify the parameter value, by default, it is set to **N**.

- **Which Date Determines Age ('D' - Due Date or 'B' - Bill Date)** - Used to indicate whether you want the system to determine the age of the invoice (i.e. bill) using the bill date or the due date. The valid values are **D** and **B**. This parameter is mandatory.
- **Only Process Bills with an Age >= This Value** - Used to specify the number of days. The system considers an overdue bill of the delinquency process only when the invoice age is greater than or equal to the specified number of days. This parameter is optional.
- **Delinquency Process Cancel Reason for Unpaid Amount Reduction** - Used to indicate the cancel reason that you want to use while canceling a delinquency process when the unpaid amount and/or percentage is within the tolerance limit. Here, you must specify a reason which is defined for the **Canceled** status of the **C1-DelinquencyProcess** business object through the **Status Reason** screen.
- **Delinquency Process Cancel Reason for Collection Class Change** - Used to indicate the cancel reason that you want to use while canceling a delinquency process when the collection class of the account is changed. Here, you must specify a reason which is defined for the **Canceled** status of the **C1-DelinquencyProcess** business object through the **Status Reason** screen.
- **Delinquency Process Cancel Reason for Voluntary Termination** - Used to indicate the cancel reason that you want to use while canceling a delinquency process when an individual membership billed to the account is voluntarily

terminated by the customer on or before the calculated termination date. Here, you must specify a reason which is defined for the **Canceled** status of the **C1-DelinquencyProcess** business object through the **Status Reason** screen.

- **Delinquency Process Cancel Reason for Membership Cancellation** - Used to indicate the cancel reason that you want to use while canceling a delinquency process when an individual membership billed to the account is voluntarily canceled by the customer. Here, you must specify a reason which is defined for the **Canceled** status of the **C1-DelinquencyProcess** business object through the **Status Reason** screen.
- **Evaluate Customer Status when all Events are Completed** – Used when you want the system to evaluate whether an individual membership billed to the delinquent account is voluntarily terminated or canceled by the customer even when all the events in the delinquency process are in the **Completed** status. The valid values are **Y** and **N**. This parameter is mandatory.

If you set this parameter value to **N**, the system will evaluate whether an individual membership billed to the delinquent account is voluntarily terminated or canceled by the customer until all the events in the delinquency process are in the **Completed** status and not after all the events in the delinquency process are in the **Completed** status.

Note: The cancellation criteria only consider the bills that were due on or before the delinquency process was created. This is because the grace period is determined based on the latest due date. From a business perspective, the system should ensure that a customer is given sufficient grace period for the unpaid invoices.

C1-CANDPAPTC

This algorithm is used only for the fully insured individual business. It considers a delinquency process for cancellation when either of the following condition is met:

- Membership benefit charges is billed in the earliest unpaid coverage period and now the benefit charge is no longer applicable from the earliest unpaid coverage period.
- Membership benefit charges was not billed in the earliest unpaid coverage period, but the benefit charge is now applicable from the earliest unpaid coverage period.

Note: This algorithm is invoked by the **C1-DPMON** batch. If any of the above cancel criteria is met, the system changes the status of the delinquency process to **Canceled** when the **C1-DPMON** batch is executed.

This algorithm checks whether there is any bill in the delinquency process with the due date earlier than the delinquency due date. If so, the system does the following:

- Add a record for the delinquent account in **CI_ADM_RVW_SCH** table.
- The next credit review date of the account is set to the processing date (i.e., batch business date).

Note: The system will create a delinquency process for the account using the appropriate delinquency process type when the **C1-ACDLQ** batch is executed subsequently.

It contains the following parameters:

- **Delinquency Process Cancel Reason For APTC Benefit Update** – Used to indicate the cancel reason that you want to use while canceling a delinquency process. This parameter is optional. Here, you must specify a reason which is defined for the **Canceled** status of the **C1-DelinquencyProcess** business object through the **Status Reason** screen.
- **Delinquency Process Type Field Mapping – Individual** – Used to specify a preference where the preference category is set to **Delinquency Process Type**. The system uses the preference to determine the benefit sub type whose benefits should be monitored for applicability in the earliest unpaid coverage period. This parameter is mandatory. For more information about the delinquency process type preference, see [Delinquency Process Preference](#) on page 4086.

C1-DERGRBR

This algorithm is required when the **Grace Period Source** flag in the delinquency process type is set to **Algorithm**. It retrieves the business rules of the **Delinquency Grace Period Business Rule** category which are effective on the processing date when the **C1-DPEVTCR** algorithm is invoked. Note that the system considers only those effective business rules which are in the **Active** status.

Once the effective business rules are identified, the system executes these business rules in the order of their priority. Once an individual membership meets the criteria defined in the business rule, the business rule is stamped against the individual membership. The system then derives the **Grace Period (Days)** flag from the business rule.

The system then checks the grace period of each active individual membership and sets the grace period of the delinquency event to the value derived for the membership with the maximum grace days.

Note: The system derives the individual memberships using an algorithm which is attached to the **Memberships Derivation** system event of the delinquency process type.

C1-HLDELPRC

This algorithm holds a delinquency process when any of the following conditions are met:

- Postpone credit review date stamped on the delinquent account is later than the system date
- One or more promise to pay are active for the delinquent account
- A payment agreement request is active for the delinquent account

It is invoked by the **C1-DPMON** batch. If the postpone credit review date of the account is later than the system date, and/or if an active payment agreement request exists for the delinquent account, and/or if one or more promise to pay are active for the delinquent account, the system determines the hold end date. While determining the hold end date, it considers the date which is the latest of the following:

- Postpone credit review date
- Latest schedule date specified in the payment agreement request
- Latest schedule date specified among all the active promise to pay
- Hold end date manually specified in the delinquency process

If the derived hold end date is later than the system date, then the system does the following:

- Sets the status of the delinquency process to the value specified in the **Delinquency Process Hold Status** attribute of the delinquency process preference.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

- Sets the hold start date to a date which is earliest of the following:
 - If the postpone credit review date of the account is later than the system date, the system uses the processing date as the hold start date.
 - If an active payment agreement request exists for the delinquent account, the system uses the date when the payment agreement request was set to the **Active** status as the hold start date.
 - If one or more promise to pay are active for the delinquent account, the system uses the earliest schedule date among all the active promise to pay as the hold start date.
- Sets the hold reason depending on whether the system considers either of the following as the hold end date:
 - Postpone credit review date
 - Latest schedule date specified in the payment agreement request
 - Latest schedule date specified among all the active promise to pay
 - Hold end date manually specified in the delinquency process
- Sets the mode of hold for the delinquency process to **Systematic**

This algorithm contains the following parameters:

- **Hold Request Reason** – Used to indicate the reason that you want to use while holding a delinquency process. The system considers this reason when the hold end date is to set to the postpone credit review date of the account.

Note: Here, you must specify the reason which is defined for the **On Hold** status of the **C1-DelinquencyProcess** business object.

- **Promise To Pay Reason** – Used to indicate the reason that you want to use while holding a delinquency process. The system considers this reason when the hold end date is set to the latest schedule date specified in the payment agreement request.

Note: Here, you must specify the reason which is defined for the **On Hold** status of the **C1-DelinquencyProcess** business object.

- **Payment Agreement Reason** – Used to indicate the reason that you want to use while holding a delinquency process. The system considers this reason when the hold end date is set to the latest schedule date specified among all the active promise to pay.

Note: Here, you must specify the reason which is defined for the **On Hold** status of the **C1-DelinquencyProcess** business object.

All the parameters are mandatory.

C1-MEMBDLQ

This algorithm fetches those individual memberships where details of the account, for which the delinquency process is created, are stored as the characteristics on the individual memberships. While fetching the individual memberships which are billed to delinquent account, the system considers the characteristic types which are specified in the **Account Identifier Type Char Type** and **Account Identifier Type Char Value** option types of the **C1-ASOBLLNG** feature configuration.

Once the individual memberships are derived, the system considers only those memberships where the status is set to the value specified in the **Membership Active Status** or **Membership Terminated Status** option type of the **C1-ASOBLLNG** feature configuration depending on from where the algorithm is invoked.

This algorithm then derives a preference where the preference category is set to **Individual Membership**. It checks whether the characteristic type specified in the **Active Selection Characteristics** attribute of the preference is defined on any of the derived active individual memberships.

Note: If a characteristic of the specified characteristic type exists on an individual membership, it means that the individual membership is created for the next year's coverage. However, if a characteristic of the specified characteristic type does not exist on an individual membership, it means that the individual membership is created for the current year's coverage.

If the account selection characteristic exists on the active individual membership, the system checks whether the characteristic's effective date is later than or equal to the membership start date. If the characteristic's effective date is later than or equal to the membership start date, the system checks whether the paid through date is stamped on the account.

If the paid through date is stamped on the account, the system checks whether the membership start date is later than the paid through date. If the membership start date is later than the paid through date, the system derives the following:

- Sum of the following payments
 - Payment made against the on account contracts
 - Payments made against the coverage period that falls after the paid through date
- Premium for the first coverage period of the individual membership (which is created for the next year's coverage)

The system then compares the premium of the first coverage period against the sum of payments. If the payment is sufficient to pay the first coverage period premium, the system sets the **Evaluate Guaranteed Availability** flag of the individual membership to **true**.

However, if the account selection characteristic is not defined on the individual membership or if the account selection characteristic's effective date is earlier than the membership start date or if the paid through date is not stamped on the account or if the individual membership start date is earlier than or equal to the paid through date, or if the payment is not sufficient to pay the first coverage premium for the next year's membership, then the system sets the **Evaluate Guaranteed Availability** flag of the individual membership to **false**.

This algorithm contains the following parameter:

- **On Account Payment Contract Types** – Used to indicate the contract types whose contracts you want to consider while deriving the on account payments. This parameter is required.

Note: This algorithm is only applicable for the fully insured individual business.

C1-POLDLQPA

This algorithm derives the list of policies for a delinquency process. If the delinquency process is created at the account level, this algorithm derives the main customer of the account and then fetches all the policies where the main customer is added as a policy person in the policy.

If the delinquency process is created at the person level, this algorithm derives all the policies where the person and its child persons are added as a policy person in the policy. Note that the algorithm considers only those child persons in the person's hierarchy for whom the collection method in the respective collection class is set to **Parental Delinquency**.

Note: If the status is passed through the calling algorithm, the policy list is filtered based on the given status. This algorithm is applicable only for the fully insured group business.

C1-RELDELPRC

This algorithm monitors a delinquency process which is on hold and determines whether the hold end date of the delinquency process should be updated or whether the hold on the delinquency process should be released. It is invoked by the **C1-DPMON** batch.

If the postpone credit review date of the account is earlier than or equal to the system date, and if an active payment agreement request does not exist for the delinquent account, and if none of the promise to pay are active for the delinquent account, the system determines whether the hold end date is manually updated by the user. If the hold end date is manually updated by the user, the system sets the mode of hold for the delinquency process to **Manual**. However, if the hold end date is not updated manually by the user or if the manually specified hold end date is earlier than or equal to the system date, the system sets the status of the delinquency process to the value specified in the **Delinquency Process Released Status** attribute of the delinquency process preference.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

If the postpone credit review date of the account is later than the system date, and/or if an active payment agreement request exists for the delinquent account, and/or if one or more promise to pay are active for the delinquent account, the system determines the hold end date. While determining the hold end date, it considers the date which is the latest of the following:

- Postpone credit review date
- Latest schedule date specified in the payment agreement request
- Latest schedule date specified among all the active promise to pay
- Hold end date manually specified in the delinquency process

If the derived hold end date is later than the system date and if the derived hold end date is later than the existing hold end date, then the existing hold end date is updated to the derived hold end date. The hold reason is also updated depending on whether the system considers either of the following as the hold end date:

- Postpone credit review date
- Latest schedule date specified in the payment agreement request
- Latest schedule date specified among all the active promise to pay

In addition, the system sets the mode of hold for the delinquency process to **Systematic**.

This algorithm contains the following parameters:

- **Hold Request Reason** - Used to indicate the reason that you want to use while holding a delinquency process. The system considers this reason when the hold end date is set to the postpone credit review date of the account. Here, you must specify the reason which is defined for the **On Hold** status of the **C1-DelinquencyProcess** business object.
- **Promise To Pay Reason** - Used to indicate the reason that you want to use while holding a delinquency process. The system considers this reason when the hold end date is set to the latest schedule date specified in the payment agreement request. Here, you must specify the reason which is defined for the **On Hold** status of the **C1-DelinquencyProcess** business object.
- **Payment Agreement Reason** - Used to indicate the reason that you want to use while holding a delinquency process. The system considers this reason when the hold end date is set to the latest schedule date specified among all the active promise to pay. Here, you must specify the reason which is defined for the **On Hold** status of the **C1-DelinquencyProcess** business object.

All the parameters are mandatory.

C1-DERMLNBR

This algorithm is required when the **Send Membership Level Notification Source** field corresponding to the respective delinquency event type in the respective delinquency process type is set to **Algorithm**.

If the delinquency process is created at the account level, this algorithm derives the main customer of the respective account. However, if the delinquency process is created at the person level, this algorithm derives the respective person. It then derives all the active individual memberships where the main customer is added as the member person.

If no active individual membership is derived for the main customer, this algorithm derives all the active policies where the main customer or the person is added as the policy person in the respective policies. If the person is a bill group, the system considers the policies where the bill group is added as a policy person using the role which is specified in the **Bill Group Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration. However, if no active policy is derived for the bill group, this algorithm considers all the active policies where the parent customer of the bill group is added as a policy person using the role which is specified in the **Parent Customer Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration.

However, if the person is a parent customer, the system considers all the active policies where the parent customer is added as a policy person using the role which is specified in the **Parent Customer Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration.

Note:

While deriving an active individual membership, the system considers the status code which is specified in the **Membership Active Status** option type of the **C1-ASOBLLNG** feature configuration.

Similarly, while deriving an active policy, the system considers the status code which is specified in the **Policy Active Status** option type of the **C1-ASOBLLNG** feature configuration.

Once the list of active policies or individual memberships is derived, this algorithm retrieves the business rules of the **Delinquency Event Attributes Business Rule** category which are effective when the event is triggered manually from the user interface or automatically through the **C1-DPMON** batch. Note that the algorithm considers only those effective business rules which are in the **Active** status.

Once the effective business rules are identified, this algorithm executes these business rules in the order of their priority. Once a policy or individual membership meets the criteria defined in the business rule, the system refers the business rule for the policy or individual membership. This algorithm then derives the value of the **Send Membership Level Notification** parameter from the business rule.

It then checks whether the **Send Membership Level Notification** parameter is set to **Send Membership Level Notification Required** for at least one policy or individual membership billed to the delinquent customer or account. If so, the algorithm sets the **Send Membership Level Notification** parameter for the delinquency event to **Send Membership Level Notification Required**. However, if the **Send Membership Level Notification** parameter is set to **Send Membership Level Notification Not Required** for all the policies or individual memberships billed to the delinquent customer or account, the algorithm sets the **Send Membership Level Notification** parameter for the delinquency event to **Send Membership Level Notification Not Required**.

C1-DERTBR

This algorithm is invoked by the **C1-DETERMDT** algorithm when the event is triggered to send a termination request manually from the user interface or automatically through the **C1-DPMON** batch.

If the delinquency process is created at the account level, this algorithm derives the main customer of the respective account. However, if the delinquency process is created at the person level, this algorithm derives the respective person. It then derives all the active individual memberships where the main customer is added as the member person.

If no active individual membership is derived for the main customer, this algorithm derives all the active policies where the main customer or the person is added as the policy person in the respective policies. If the person is a bill group, the system considers the policies where the bill group is added as a policy person using the role which is specified in the **Bill Group Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration.

However, if no active policy is derived for the bill group, this algorithm considers all the active policies where the parent customer of the bill group is added as a policy person using the role which is specified in the **Parent Customer Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration.

However, if the person is a parent customer, the system considers all the active policies where the parent customer is added as a policy person using the role which is specified in the **Parent Customer Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration.

Note:

While deriving an active individual membership, the system considers the status code which is specified in the **Membership Active Status** option type of the **C1-ASOBLLNG** feature configuration.

Similarly, while deriving an active policy, the system considers the status code which is specified in the **Policy Active Status** option type of the **C1-ASOBLLNG** feature configuration.

Once the list of active policies or individual memberships is derived, this algorithm retrieves the business rules of the **Delinquency Termination Date Rule Business Rule** category which are effective on the trigger date. Note that the system considers only those effective business rules which are in the **Active** status. Once the effective business rules are identified, the system executes these business rules in the order of their priority.

Once a policy or individual membership meets the criteria defined in the business rule, the system refers the business rule for the policy or individual membership. This algorithm then derives the value of the **Termination Date Rule** parameter from the business rule. For each active policy which is billed to the delinquent person or account, the system derives the value of the **Termination Date Rule** parameter. Similarly, for each active individual membership which is billed to the delinquent account, the system derives the value of the **Termination Date Rule** parameter.

Among the termination date rules derived for different policies or individual memberships, this algorithm considers the termination date rule which is given the highest priority in the respective delinquency process type and uses it for further processing in the delinquency event.

C1-DERTROBR

This algorithm is invoked by the **C1-DETRTGD** and **C1-RECALCHLD** algorithms when the **Termination Reinstatement Configuration Source** flag in the delinquency process type is set to **Algorithm**. It retrieves the business rules of the **Delinquency Miscellaneous Options Business Rule** category which are effective on the batch business date. Note that the system considers only those effective business rules which are in the **Active** status. Once the effective business rules are identified, the system executes these business rules in the order of their priority. Once an individual membership meets the criteria defined in the business rule, the business rule is stamped against the individual membership. The system then derives the value for the **Trigger Termination Process** flag and the termination wait days from the business rule.

The system checks whether the **Trigger Termination Process** flag is set to **Immediate** for all the active individual memberships which are billed to the delinquent account. If so, the system sets the termination request date of the delinquency event to the termination event trigger date and the **Trigger Termination Process** flag of the delinquency event to **Immediate**.

However, if the **Trigger Termination Process** flag is set to **Month End** or **After X Days** for any or all the active memberships, the system calculates the termination request date for each active membership and then considers the latest termination request date of the individual membership.

The system sets the termination request date of the delinquency event to the latest termination request date of an active membership and sets the **Trigger Termination Process** flag of the delinquency event to the value derived for the membership with the latest termination request date.

Note: The system derives the individual memberships using an algorithm which is attached to the **Memberships Derivation** system event of the delinquency process type.

C1-DERRTDBR

This algorithm is required when the **Trigger Date Recalculation on Hold Release Source** flag or **Trigger Date Recalculation on Resume Source** flag in the delinquency process type is set to **Algorithm**. It retrieves the business rules of the **Delinquency Miscellaneous Options Business Rule** category which are effective on the batch business date while executing the **C1-DPMON** batch. Note that the system considers only those effective business rules which are in the **Active** status.

Once the effective business rules are identified, the system executes these business rules in the order of their priority. Once an individual membership meets the criteria defined in the business rule, the business rule is stamped against the individual membership. The system then derives the value for the **Trigger Date Recalculation on Hold Release** or **Trigger Date Recalculation on Resume** flag, respectively, from the business rule.

For each active individual membership which is billed to the delinquent account, the system checks the value of the **Trigger Date Recalculation on Hold Release** flag while releasing the hold on the delinquency process. If the **Trigger Date Recalculation on Hold Release** flag is set to **Yes** for at least one active membership, the system sets the **Trigger Date Recalculation on Hold Release** flag of the delinquency event to **Yes**. However, if the **Trigger Date Recalculation on Hold Release** flag is set to **No** for all active memberships, the system sets the **Trigger Date Recalculation on Hold Release** flag of the delinquency event to **No**.

Similarly, for each active individual membership which is billed to the delinquent account, the system checks the value of the **Trigger Date Recalculation on Resume** flag while resuming the delinquency process. If the **Trigger Date Recalculation on Resume** flag is set to **Yes** for at least one active membership, the system sets the **Trigger Date Recalculation on Resume** flag of the delinquency event to **Yes**. However, if the **Trigger Date Recalculation on Resume** flag is set to **No** for all active memberships, the system sets the **Trigger Date Recalculation on Resume** flag of the delinquency event to **No**.

Note: The system derives the individual memberships using an algorithm which is attached to the **Memberships Derivation** system event of the delinquency process type.

C1-DERWDBR

This algorithm is required when the **Wait Period Source** field corresponding to the respective delinquency event type in the respective delinquency process type is set to **Algorithm**. If the delinquency process is created at the account level, this algorithm derives the main customer of the respective account. However, if the delinquency process is created at the person level, this algorithm derives the respective person. It then derives all the active individual memberships where the main customer is added as the member person. If no active individual membership is derived for the main customer, this algorithm derives all the active policies where the main customer or the person is added as the policy person in the respective policies.

If the person is a bill group, the system considers the policies where the bill group is added as a policy person using the role which is specified in the **Bill Group Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration. However, if no active policy is derived for the bill group, this algorithm considers all the active policies where the parent customer of the bill group is added as a policy person using the role which is specified in the **Parent Customer Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration.

However, if the person is a parent customer, the system considers all the active policies where the parent customer is added as a policy person using the role which is specified in the **Parent Customer Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration.

Note:

While deriving an active individual membership, the system considers the status code which is specified in the **Membership Active Status** option type of the **C1-ASOBLLNG** feature configuration.

Similarly, while deriving an active policy, the system considers the status code which is specified in the **Policy Active Status** option type of the **C1-ASOBLLNG** feature configuration.

Once the list of active policies or individual memberships is derived, this algorithm retrieves the business rules of the **Delinquency Event Attributes Business Rule** category which are effective on the batch business date while executing the **C1-DPEVL** batch. Note that the system considers only those effective business rules which are in the **Active** status.

Once the effective business rules are identified, this algorithm executes these business rules in the order of their priority. Once a policy or individual membership meets the criteria defined in the business rule, the system refers the business rule for the policy or individual membership. This algorithm then derives the wait days or wait month and day of month from the business rule depending on the wait period that is configured in the respective delinquency process type.

For each active policy which is billed to the delinquent person or account, the system derives the wait days or wait month and day of month. Similarly, for each active individual membership which is billed to the delinquent account, the system derives the wait days or wait month and day of month. Among the wait days or wait months derived for different policies or individual memberships, this algorithm considers the wait days or wait months which is maximum and uses it for further processing in the delinquency event.

C1-DERMNDAYS

This algorithm will invoke the delinquency process Business Rules to derive the Member Notification Days for the delinquency process.

Note: The **C1-DERMNDAYS** algorithm type is shipped with the product. You must attach an algorithm created using the **C1-DERMNDAYS** algorithm type to the **Membership Notification Days Derivation** system event defined for the delinquency process type.

Grace Period Configuration

While creating a delinquency process type, you need to specify the following grace details using which the system calculates the trigger date for a delinquency event in the delinquency process:

- Whether you want the system to derive the grace period (in days) to calculate grace end date from the delinquency process type or through an algorithm
- The number of days of grace you want to offer from the grace start date
- Whether you want the system to set either of the following as the grace start date when the **Trigger Date Calculation Mode** flag is set to **Usage Basis** and the **Usage Basis** flag is set to **Grace Start Date**:
 - **Delinquency Process Creation Date** – Used when you want to set the grace start date to the date when the delinquency process is created in the system.
 - **Latest Bill Due Date** – Used when you want to set the grace start date to the latest due date of a bill when there are one or more overdue bills for which the delinquency process is initiated.
 - **X Days after Latest Bill Due Date** – Used when you want to set the grace start date after X number of days from the latest bill due date. You can specify the X number of days in the **Add Days To Due Date** field.

Termination and Reinstatement Configuration

While creating a delinquency process type, you need to specify the following details using which you want to calculate the termination request date:

- Whether you want the system to derive the value for the **Trigger Termination Process** flag and the termination wait days from the delinquency process type or through an algorithm
- Whether you want to send an outbound message to the enrollment system for terminating the individual memberships billed to the delinquent account immediately, at the end of the month when the termination event is triggered, or after X number of days (i.e. termination wait days)

Note:

The **Allow Automatic Reinstatement, Maximum Automatic Reinstatement Count, Trigger Reinstatement Process, Reinstatement Wait Days, Reinstatement Threshold, Days Since Termination, Membership Notification Days Source, and Member Notification Days** fields are not applicable for the fully insured individual business.

Also, the **Termination Reasons For Automatic Reinstatement** section is not applicable for the fully insured individual business.

Termination Date Rule Priority

While creating a delinquency process type, you need to define the priority for each termination date rule based on the requirements. The system will then consider the termination date rule in the order of its priority. For example, if you have set the following priority in the DT1 delinquency process type:

Termination Date Rule	Priority
Latest Billed Coverage End Date	10
Latest Due Coverage End Date	20
X days After Paid Through Date	30
X Months After Paid Through Date	40
Month End of Grace Period Start	50
Month End of Termination Letter Creation	60
Month End of Termination Request Event	70
X days After Grace End Date	80
X days After Termination Request Event	90

Let us assume that the A1 account is used to bill the M1 and M2 individual memberships. Now, when the A1 account is delinquent, the system derives the **X days After Paid Through Date** terminate date rule for the M1 membership and the **X days After Grace End Date** termination date rule for the M2 membership using the business rules. The system then considers the termination date rule with the highest priority defined in the respective delinquency process type. In this case, the **X days After Paid Through Date** termination date rule has higher priority than the **X days After Grace End Date** termination date rule, and therefore the system sets the termination date rule of the delinquency event to **X days After Paid Through Date**.

Trigger Date Recalculation Configuration

The system enables you to recalculate trigger dates of the events when a delinquency process which is on hold is released. To enable this feature, you need to specify the following details while creating the respective delinquency process type:

- Whether you want the system to derive the value for the **Trigger Date Recalculation on Hold Release** flag from the delinquency process type or through an algorithm
- Whether you want to recalculate trigger dates of the events when a delinquency process which is on hold is released

Similarly, the system enables you to recalculate trigger dates of the events when a delinquency process which is canceled is resumed. To enable this feature, you need to specify the following details while creating the respective delinquency process type:

- Whether you want the system to derive the value for the **Trigger Date Recalculation on Resume** flag from the delinquency process type or through an algorithm
- Whether you want to recalculate trigger dates of the events when a delinquency process which is canceled is resumed

Approval Configuration

The system enables you to configure the approval process for various actions that you can perform for a delinquency process. For example, the system can initiate the approval process when a user manually holds a delinquency process. Note that you can configure the approval process only for any manual intervention in the delinquency process. To configure the approval process, you need to specify the following details while creating a delinquency process type:

- Whether the approval process must be initiated or not when a user performs certain actions
- The To Do type using which you want to create a To Do for the approver
- The To Do role which indicates the users for whom the To Do should be created
- The user actions for which you want to configure the approval process

You can configure the approval process for the following actions which can be manually performed by a user:

- Cancel
- Edit Hold
- Edit Trigger Date
- Hold
- Release Hold
- Request Reinstatement
- Skip Event
- Trigger Event

Delinquency Process Types Based on Insurance Coverage

The system enables you to configure a delinquency process type for each insurance coverage type through the delinquency process type preference. The system then creates a delinquency process using the respective delinquency process type whenever the person's or account's debt is overdue.

The system enables you to specify a delinquency process type for each insurance coverage type in the respective attribute of a delinquency process type preference:

The following table lists how you can specify a delinquency process type for each insurance coverage type in the respective attribute of a delinquency process type preference:

Line of Business	Insurance Coverage Type	Attribute
Fully Insured Group	Active Health Plan Coverages	Active Group Customers – Account Level (used when the delinquency is monitored at the account level)
		Active Group Customers – Person Level (used when the delinquency is monitored at the person level)
	Inactive Health Plan Coverages	Inactive Group Customers – Account Level (used when the delinquency is monitored at the account level)
		Inactive Group Customers – Person Level (used when the delinquency is monitored at the person level)
Fully Insured Individual	Active Health Plan Coverages	Active Individual Delinquency
	Non-Medical Health Plan Coverages	Effectuated Individual Delinquency for Ancillary
	Medical Health Plan Coverages without Benefits	Effectuated Individual without Benefit
	Medical Health Plan Coverages with Benefits	Effectuated Individual with Benefit
		Note: The system considers this delinquency process type only when the membership benefits created using the benefit sub type specified in the delinquency process type preference are billed for the earliest unpaid coverage period.
	Non-Effectuated Health Plan Coverages	Non-Effectuated Individual Delinquency
Direct Billed Group Membership	Inactive Health Plan Coverages	Termed Individual Delinquency
	Non-Effectuated Health Plan Coverages	Non-Effectuated Individual Delinquency
	Active Health Plan Coverages	Active Group Customers – Account Level
	Inactive Health Plan Coverages	Inactive Group Customers – Account Level

For more information, see [Delinquency Process Type Preference](#) on page 4077. You need to create a separate delinquency process type preference for each line of business (i.e., Fully Insured Group, Fully Insured Individual, and Direct Billed Group Membership).

In the fully insured individual business, there might be scenarios wherein an individual customer may shift from to a medical health plan coverage without benefits to a medical health plan coverage with benefits and vice versa. In such cases, the system enables you to send the revised benefit data through a health care inbound message. On repricing, either the new billable charges are created for the membership benefit, or the existing billable charges of the membership benefit are updated. The system automatically cancels a delinquency process when either of the following condition is met:

- Membership benefit charges is billed in the earliest unpaid coverage period and now the benefit charge is no longer applicable from the earliest unpaid coverage period.
- Membership benefit charges was not billed in the earliest unpaid coverage period, but the benefit charge is now applicable from the earliest unpaid coverage period.

The above two cancel criteria are validated by the **C1-CANDPAPTC** algorithm that is attached to the **Cancel Criteria** system event of the respective delinquency process type. This algorithm is invoked when the **C1-DPMON** batch is executed. If any of the above two conditions is met, the system cancels the existing delinquency process in the **C1-DPMON** batch.

The **C1-CANDPAPTC** algorithm also checks whether there is any bill in the delinquency process with the due date earlier than the delinquency due date. If so, the system does the following:

- Add a record for the delinquent account in the **CI_ADM_RVW_SCH** table.
- The next credit review date of the account is set to the processing date (i.e., batch business date).

The system will create a delinquency process for the account using the appropriate delinquency process type when the **C1-ACDLQ** batch is executed subsequently.

Delinquency Event Eligibility Evaluation and Trigger Date Calculation

After executing the **C1-ACDLQ** batch, you need to execute the **C1-DPEVL** batch. The **C1-DPEVL** batch is used to monitor or check whether there is any delinquency process in the status (for example, **Initiated**) which is specified in the **Delinquency Process Initiated Status** attribute of the delinquency process preference. Note that this batch considers the preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

If there is a delinquency process in the **Initiated** status, the system checks whether its delinquency event trigger mode is set to **Automatic** or **Manual or Automatic** in the respective delinquency process type. If its delinquency event trigger mode is set to **Manual** in the respective delinquency process type, the batch does not consider the delinquency process for the delinquency event eligibility evaluation and trigger date calculation. However, if its delinquency event trigger mode is set to **Automatic** or **Manual or Automatic** in the respective delinquency process type, the system checks whether the trigger dates exist for the delinquency events. If the trigger dates exist for the delinquency events of a delinquency process, the batch does not consider the delinquency process for the delinquency event eligibility evaluation and trigger date calculation. However, if the trigger dates does not exist for the delinquency events of a delinquency process, the batch continues with the delinquency event eligibility evaluation for each delinquency event in the delinquency process.

While evaluating whether the delinquency event is eligible to be included in the delinquency process, the system checks whether the rule type is specified corresponding to the delinquency event type in the respective delinquency process type. If the rule type is specified corresponding to the delinquency event type, the system checks whether the delinquency entity type of the delinquency process is set to **Account** and the delinquency category is set to **Individual**. If so, the system derives the individual memberships which are billed to the delinquent account using an algorithm which is attached to the **Memberships Derivation** system event of the respective delinquency process type.

Once the individual memberships are derived for the account, the system derives the health plan for which the individual membership is availed. Once the health plan is derived for each individual membership, the system derives the rules created using the rule type (which is specified to corresponding to the delinquency event type) from the rules engine which are effective on the batch business date. The effective rules are executed in the order of their priority. If at least one individual membership satisfies the rule, the delinquency event is retained in the delinquency process. However, if none of the individual memberships satisfy the rule, the delinquency event is removed from the delinquency process.

Once the delinquency event eligibility evaluation is done for each delinquency event, the system does the following:

- Derives the wait days or wait month and the day of the month from the delinquency process type or using an algorithm attached to the **Wait Days Derivation** system event depending on the wait period source which is specified in the delinquency process type

- Calculates the trigger date for the delinquency event based on the trigger date calculation mode, usage basis, and wait period defined in the delinquency process type
- Sets the delinquency due date of the delinquency process to the latest bill due date

If the **Consider Work Days** option is selected in the respective delinquency process type, the system derives the work calendar of the division to which the account belongs. The system then checks whether the calculated trigger date falls on the working (i.e. business) day. If the calculated trigger date does not fall on the working (i.e. business) day, the system will accordingly add days to the calculated trigger date to ensure that it falls on the next working day.

If the calculated trigger date of a delinquency event is later than or equal to the batch business date, the status of the delinquency event is changed from **Pending Evaluation** to **Pending**. But, if the calculated trigger date of a delinquency event is earlier than the batch business date and if the **Skip Past Event** option is selected corresponding to the respective delinquency event type, the system sets the status of the delinquency event to **Skipped**. However, if the calculated trigger date of a delinquency event is earlier than the batch business date and if the **Skip Past Event** option is not selected corresponding to the respective delinquency event type, the system checks whether the **Move Past Dated Event to Future** option is selected corresponding to the respective delinquency event type.

Note: You can select the **Move Past Dated Event to Future** option only when the wait period is set to **Monthly Cyclic** in the respective delinquency process type.

If the **Move Past Dated Event to Future** option is selected corresponding to the respective delinquency event type, the system moves the trigger date by adding one month until the trigger date is later than or equal to the batch business date. But, if the **Move Past Dated Event to Future** option is not selected corresponding to the respective delinquency event type, the system makes no changes to the trigger date even if it is past dated. Finally, the system sets the status of the delinquency event to **Pending**.

Note:

If the trigger date of an event is moved to a future date, the trigger date of the subsequent events in the delinquency process is also moved accordingly. This is because the system is designed to trigger only one event at a time in a month.

Usually, this batch changes the status of the delinquency event from **Pending Evaluation** to **Pending**. But, if the wait period in the respective delinquency process type is set to **Monthly Cyclic** and if the **Move Past Dated Event to Future** option is selected corresponding to the respective delinquency event type, the **C1-ADJTGDT** algorithm attached to the **Post-Processing** system event of the **C1-DPEVL** batch moves the past dated trigger date to a future date and changes the status of the delinquency event to **Pending**.

If the **Preview Required** option is not selected corresponding to the delinquency event type in the respective delinquency process type, the system sets the preview status of the delinquency event to **Not Required**. However, if the **Preview Required** option is selected corresponding to the delinquency event type in the respective delinquency process type, the system does the following:

- Derives the preview days specified corresponding to the delinquency event type in the delinquency process type
- Calculates the preview date (i.e. Trigger Date – Preview Days) for the delinquency event
- Sets the preview status of the delinquency event to **Pending**

The **C1-DPEVL** batch is a multi-threaded batch. The multi-threading is based on delinquency event ID and chunks for multi-threading are created based on numerical distribution of delinquency event ID. For more information about the batch, see *Oracle Revenue Management and Billing Batch Guide*.

Delinquency Process Maintenance

Once the delinquency process is created in the **Initiated** status, the system enables you to view the details of the delinquency process. Two new screens named **Delinquency Process Search** and **Delinquency Process** are introduced in this release. The **Delinquency Process Search** screen enables you to search for a delinquency process either using the details of the delinquency process or using the details of the account, person, or membership for which the delinquency process is created.

Note: The **Person ID** field while searching for a delinquency process is only applicable for the fully insured group business.

The **Delinquency Process** screen enables you to view the details of a delinquency process. It contains the following zones:

- **Delinquency Process Details** – Display the basic details of the delinquency process.
- **Additional Attributes** – Display the characteristics of the delinquency process.
- **Bills** – Lists the overdue bills of the account for which the delinquency process is created.
- **Events** – List all events that are included in the delinquency process.
- **Event Notifications** – Lists the notifications (i.e. To Do, customer contact), if any, created for the delinquency event.
- **Approval Details** – Lists the approval records that are created while performing manual actions at the delinquency process or delinquency event level.
- **Hold Details** – Lists the hold records that are created whenever you hold the delinquency process.
- **Log** – Lists the complete trail of actions performed on the delinquency process.

Manual Actions at the Delinquency Process Level

The **Delinquency Process** screen enables you to perform the following actions at the delinquency process level:

- **Edit** – Used when you want to add additional information for the delinquency process in the form of comments or characteristics.
- **Hold** – Used when you want to manually hold the delinquency process. The **Hold** button appears only when the delinquency process is in the **Initiated**, **Delinquency In Progress**, or **Pending Termination** status. While manually holding a delinquency process, you need to specify the following:
 - A hold end date which is later than the system date
 - The reason why you want to hold the delinquency process. Note that the list includes only those reasons which are defined for the **Initiate Hold** status of the **C1-DelinquencyProcess** business object.

The hold start date is set to the system date when you manually hold the delinquency process. On saving the changes, the status of the delinquency process is changed to the value (for example, **Initiate Hold**) specified in the **Delinquency Process Initiate Hold Status** attribute of the delinquency process preference. The system then checks whether the approval is required for the **Hold** action in the respective delinquency process type.

If the approval is not required while manually holding the delinquency process, the status of the delinquency process is immediately changed to the value (for example, **On Hold**) specified in the **Delinquency Process Hold Status** attribute of the delinquency process preference. A hold record is created for the delinquency process in the **Active** status. However, if the approval is required while manually holding the delinquency process, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the manual hold and assigned to the users with the approval To Do role. In addition, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress – Exception Raised**) specified in the **Delinquency Process Approval In Progress Status** attribute of the delinquency process preference. Note that the system continues to trigger the delinquency events on the trigger date even when the approval is in progress until the approver approves the manual hold.

If the approver approves the manual hold, the status of the delinquency process is changed to the value (for example, **On Hold**) specified in the **Delinquency Process Hold Status** attribute of the delinquency process preference. In addition, the system does the following:

- The hold start date is changed to the date when the approver approves the manual hold.
- The status of the approval record is changed to **Approved**.
- A hold record is created for the delinquency process in the **Active** status.

However, if the approver rejects the manual hold, the status of the approval record is changed to **Rejected** and the status of the delinquency process is changed to its previous status (i.e. **Initiated**, **Delinquency In Progress**, or **Pending Termination**).

- **Cancel** – Used when you want to manually cancel the delinquency process. The **Cancel** button appears only when the delinquency process is in the **Initiated**, **Delinquency In Progress**, or **On Hold** status. While manually canceling a delinquency process, you need to specify the cancel reason and comments, if any. You must specify a reason which is defined for the **Initiate Cancel** status of the **C1-DelinquencyProcess** business object in the **Status Reason** screen.

On manually canceling a delinquency process, the status of the delinquency process is set to the value (for example, **Initiate Cancel**) specified in the **Delinquency Process Initiate Cancel Status** attribute of the delinquency process preference. The system then checks whether the approval is required for the **Cancel** action in the respective delinquency process type. If the approval is not required while manually canceling the delinquency process, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference.

However, if the approval is required while manually canceling the delinquency process, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the manual cancellation and assigned to the users with the approval To Do role.

In addition, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress – Exception Raised**) specified in the **Delinquency Process Approval In Progress Status** attribute of the delinquency process preference. Note that the system continues to trigger the delinquency events on the trigger date even when the approval is in progress until the approver approves the manual cancellation of the delinquency process.

If the approver approves the manual cancellation of the delinquency process, the status of the delinquency process is set to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference. In addition, the status of the approval record is changed to **Approved**. However, if the approver rejects the manual cancellation of the delinquency process, the status of the approval record is changed to **Rejected** and the status of the delinquency process is changed to its previous status (i.e. **Initiated**, **Delinquency In Progress**, or **On Hold**).

- **Release** – Used when you want to manually release the hold on the delinquency process. The **Release** button appears only when the delinquency process is in the **On Hold** status. While manually releasing the hold on the delinquency process, you are prompted to confirm the hold release. On confirming the hold release, the status of the delinquency process is changed to the value (for example, **Initiate Release**) specified in the **Delinquency Process Initiate Release Status** attribute of the delinquency process preference. The system then checks whether the approval is required for the **Release Hold** action in the respective delinquency process type. If the approval is not required while manually releasing the hold on the delinquency process, the status of the delinquency process is immediately changed to its previous status (i.e. **Initiated**, **Delinquency In Progress**, or **Pending Termination**). In addition, the hold end date is set to the date when you manually release the hold on the delinquency process. Finally, the status of hold record is changed to **Completed**.

However, if the approval is required while manually releasing the hold on the delinquency process, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the manual hold release and assigned to the users with the approval To Do role. In addition, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress – Exception Raised**) specified in the **Delinquency Process Approval In Progress Status** attribute of the delinquency process preference. If the approver approves the hold release, the status of the delinquency process is changed to its previous status (i.e. **Initiated**, **Delinquency In Progress**, or **Pending Termination**). The hold end date is set to the date when the approver approves the hold release. In addition, the status of the approval record is changed to **Approved** and the status of hold record is changed to **Completed**. However, if the approver rejects the hold release, the status of the approval record is changed to **Rejected** and the status of the delinquency process is changed to its previous status (i.e. **On Hold**).

- **Request Reinstatement** – This button is not applicable for the delinquency processes which are created for the fully insured individual business.
- **Edit Hold** – On clicking the **Edit** icon corresponding to the hold record of the delinquency process, you can edit the hold end date and hold reason. Note that the **Edit** icon appears only when following conditions are met:
 - The delinquency process is in the **On Hold** status.
 - The delinquency process is kept on hold manually and not automatically.
 - The hold record is in the **Active** status.

While editing the hold details, you can specify the following:

- A hold end date which is later than the system date and which is later than the date which is the latest of the following:
 - Postpone credit review date
 - Latest schedule date specified in the payment agreement request
 - Latest schedule date specified among all the active promise to pay
- The reason why you want to hold the delinquency process. Note that the list includes only those reasons which are defined for the **Initiate Hold** status of the **C1-DelinquencyProcess** business object.

On saving the changes, the system checks whether the approval is required for the **Edit Hold** action in the respective delinquency process type. If the approval is not required while manually editing the hold details, the hold end date and hold reason of the delinquency process are updated immediately.

However, if the approval is required while manually editing the hold details, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the changes and assigned to the users with the approval To Do role. The status of the delinquency process remains as **On Hold**. If the approver approves the changes, the hold end date and hold reason of the delinquency process are updated. In addition, the status of the approval record is changed to **Approved**. However, if the approver rejects the hold changes, the status of the approval record is changed to **Rejected** and the hold changes are not reflected in the delinquency process.

Note:

The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

If the required attributes are not defined in the delinquency process preference, erroneous results will occur.

The system considers the approval To Do type and approval To Do role specified in the respective delinquency process type. If the approval To Do role is not specified in the respective delinquency process type, the system considers the default To Do role associated with the approval To Do type.

Manual Actions at the Delinquency Event Level

You can also perform the following actions for each delinquency event of the delinquency process from the **Delinquency Process** screen:

- **Edit Trigger Date** – On clicking the **Edit Trigger Date** icon corresponding to a delinquency event, you can specify a new trigger date for the delinquency event. Note that the **Edit Trigger Date** icon appears only when the following conditions are met:
 - The delinquency process is in the **Initiated** or **Delinquency In Progress** status
 - The delinquency event trigger mode is set to **Manual** or **Automatic** in the respective delinquency process type
 - The delinquency event is in the **Pending** status

Once you specify the new trigger date and save the changes, the system checks whether the approval is required for the **Edit Trigger Date** action in the respective delinquency process type. If the approval is not required while manually editing the trigger date, the trigger date of the delinquency event is updated immediately.

However, if the approval is required while manually editing the trigger date, an approval record is created for the delinquency event in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the changes and assigned to the users with the approval To Do role. Note that the icons in the **Trigger Events** and **Skip Event** columns (if any) corresponding to the delinquency event are removed immediately, so that users should not be able to perform any other actions on the delinquency event. The status of the delinquency process remains as **Initiated** or **Delinquency In Progress**. Note that the system continues to trigger the delinquency events on the trigger date even when the approval is in progress. If a delinquency event is triggered before the approval is received for the delinquency event, the status of the approval record is changed to **Expired**.

If the approver approves the changes, the trigger date of the delinquency event is updated. The icons in the **Trigger Events** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are displayed again. In addition, the status of the approval record is changed to **Approved**. However, if the approver rejects the changes, the status of the approval record is changed to **Rejected** and the trigger date of the delinquency event is not updated. However, the icons in the **Trigger Events** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are displayed again.

- **Skip Event** – On clicking the **Skip Event** icon corresponding to a delinquency event, the system checks whether the approval is required for the **Skip Event** action in the respective delinquency process type. Note that the **Skip Event** icon appears only when the following conditions are met:
 - The delinquency process is in the **Initiated** or **Delinquency In Progress** status
 - The delinquency event trigger mode is set to **Manual** or **Manual or Automatic** in the respective delinquency process type
 - The delinquency event is in the **Pending** status

If the approval is not required while manually skipping the delinquency events, the status of the delinquency event is changed to **Skipped** immediately. In addition, the icons in the **Trigger Events** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are also removed. However, if the approval is required while manually skipping the delinquency events, an approval record is created for the delinquency event in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the changes and assigned to the users with the approval To Do role. Note that the icons in the **Trigger Events** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are removed immediately, so that users should not be able to perform any other actions on the delinquency event.

The status of the delinquency process remains as **Initiated** or **Delinquency In Progress**. Note that the system continues to trigger the delinquency events on the trigger date even when the approval is in progress. If a delinquency event is triggered before the approval is received for the delinquency event, the status of the approval record is changed to **Expired**.

If the approver approves the skip action, the status of the delinquency event is changed to **Skipped** immediately. In addition, the status of the approval record is changed to **Approved**. Note that the icons in the **Trigger Events** and **Edit Trigger Date** columns corresponding to the delinquency event are not displayed again. However, if the approver rejects the skip action, the status of the approval record is changed to **Rejected**. The status of the delinquency event remains as **Pending**. In addition, the icons in the **Trigger Events** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are displayed again.

- **Trigger Event** - On clicking the **Trigger Event** icon corresponding to a delinquency event, the system checks whether the approval is required for the **Trigger Event** action in the respective delinquency process type. Note that the **Trigger Event** icon appears only when the following conditions are met:
 - The delinquency process is in the **Initiated** or **Delinquency In Progress** status
 - The delinquency event trigger mode is set to **Manual** or **Manual or Automatic** in the respective delinquency process type
 - The delinquency event is in the **Pending** status

If the approval is not required while manually triggering the delinquency events, the algorithms attached to the **Event Activation** system event of the respective delinquency event type are executed immediately in the specified order. The status of the delinquency event is changed to **Completed** when all algorithms attached to the **Event Activation** system event are successfully executed. In addition, the icons in the **Skip Event** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are also removed. However, if the approval is required while manually triggering the delinquency events, an approval record is created for the delinquency event in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the changes and assigned to the users with the approval To Do role. Note that the icons in the **Skip Event** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are removed immediately, so that users should not be able to perform any other actions on the delinquency event.

The status of the delinquency process remains as **Initiated** or **Delinquency In Progress**. Note that the system continues to trigger the delinquency events on the trigger date even when the approval is in progress. If a delinquency event is triggered before the approval is received for the delinquency event, the status of the approval record is

changed to **Expired**. If the approver approves the manual trigger action, the algorithms attached to the **Event Activation** system event of the respective delinquency event type are executed immediately in the specified order.

The status of the delinquency event is changed to **Completed** when all algorithms attached to the **Event Activation** system event are successfully executed. In addition, the status of the approval record is changed to **Approved**. Note that the icons in the **Skip Event** and **Edit Trigger Date** columns corresponding to the delinquency event are not displayed again. However, if the approver rejects the manual trigger action, the status of the approval record is changed to **Rejected**. The status of the delinquency event remains as **Pending**. In addition, the icons in the **Skip Event** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are displayed again.

Note that the algorithms attached to the **Monitor Completed Event** system event of the respective delinquency event type are not executed in the online mode when the status of the delinquency event is changed to **Completed**. These algorithms are executed when you invoke the **C1-DPMON** batch.

Whenever you manually execute the subsequent events (non-first event) in the delinquency process, the system first checks whether the algorithms attached to the **Monitor Completed Event** system event of the previous delinquency event is successfully executed or not. If an algorithm attached to the **Monitor Completed Event** system event of the previous delinquency event is not executed successfully, the system displays a warning message that indicates the previous event's monitoring algorithms are not executed successfully and confirms whether you want to continue in such scenario. If you click **Yes**, the system ignores the previous event's monitoring algorithm and executes the algorithms attached to the **Event Activation** system event of the current delinquency event (which is triggered). However, if you click **No**, the system does not execute the algorithms attached to the **Event Activation** system event of the current delinquency event. Note that if there are no algorithms attached to the **Monitor Completed Event** system event of the previous delinquency event, the system will directly execute the algorithms attached to the **Event Activation** system event of the current delinquency event.

Note: The system considers the approval To Do type and approval To Do role specified in the respective delinquency process type. If the approval To Do role is not specified in the respective delinquency process type, the system considers the default To Do role associated with the approval To Do type.

Delinquency Process Approval

At a time, the system creates an approval record for only one manual action at the delinquency process or delinquency event level. Therefore, if an approval record exists for a delinquency process, the system does not allow you to perform other manual action on the delinquency process until the respective approval record's status changes to **Approved** or **Rejected**. Similarly, if an approval record exists for a delinquency event, the system does not allow you to perform other manual action on the delinquency event until the respective approval record's status changes to **Approved** or **Rejected**. However, you can still perform a manual action for other delinquency events of the delinquency process.

The system enables you to withdraw an approval request for any manual action at the delinquency process or delinquency event level. Only the users of the user group to which the submitter belongs can withdraw the approval request which is in the **Approval In Progress** status. On confirming the withdrawal of an approval request, the status of the approval record is changed to **Withdrawn**.

The system enables you to perform the following actions for an approval record from the **Delinquency Process** screen:

- **Add Comments** – Used when you want to add additional information about the approval record. Both the submitter and approver can add the comments.
- **View Details** – Used to view the details of the manual action which is performed by the submitter. If the approval record is created while manually editing the trigger date of a delinquency event, the system enables you to view the old and new trigger date of the delinquency event. If the approval record is created while manually holding a delinquency process, the system enables you to view the hold end date and hold reason. However, if the approval record is created while manually editing the hold details of the delinquency process, the system enables you to view the old and new hold end dates and hold reasons. Both the submitter and approver can view the details of an approval record.
- **Approve** – Used when you want to approve the manual action performed at the delinquency process or delinquency event level. Only users with the approver To Do role can approve the approval request.

- **Reject** – Used when you want to reject the manual action performed at the delinquency process or delinquency event level. Only users with the approver To Do role can reject the approval request.
- **Withdraw** – Used when you want to withdraw the approval request. Only the users of the user group to which the submitter belongs can withdraw the approval request which is in the **Approval In Progress** status.

Note:

If the delinquency process is in the **On Hold** status, you cannot approve or reject any other manual actions except the **Release Hold** and **Edit Hold** actions. All other manual actions can be reviewed and accordingly approved or rejected by the approver only after the hold on the delinquency process is released.

When a delinquency process is canceled, the status of the pending approval records is changed to **Expired**.

Canceling a Delinquency Process

Oracle Revenue Management and Billing enables you to cancel a delinquency process of a person or an account manually or automatically. You can manually cancel a delinquency process whenever required. In addition, the system automatically cancels a delinquency process when either of the following condition is met:

- Payments or adjustments are made against the overdue bills, for which the delinquency process is created, and as a result the unpaid balance of the overdue bills is within the tolerance limit
- Collection class of the account, for which the delinquency process is created, is changed
- Voluntary termination is received for an individual membership (which is billed to the delinquent account) with a termination date that is earlier than or equal to the calculated termination date
- Voluntary cancellation is received for an individual membership (which is billed to the delinquent account)
- Membership benefit charges is billed in the earliest unpaid coverage period and now the benefit charge is no longer applicable from the earliest unpaid coverage period.
- Membership benefit charges was not billed in the earliest unpaid coverage period, but the benefit charge is now applicable from the earliest unpaid coverage period.

To enable the automatic cancellation process for the delinquency processes which are created using a particular delinquency process type, you need to attach the following algorithms to the **Cancel Criteria** system event of the respective delinquency process type:

- [C1-CANDELPRC](#) on page 3945 (used for all the lines of business)
- [C1-CANDPAPTC](#) on page 3947 (used for the fully insured individual business)

The above algorithms are invoked when you execute the **C1-DPMON** batch.

The **Cancel** button in the **Delinquency Process** screen enables you to manually cancel a delinquency process. It appears only when the delinquency process is in the **Initiated**, **Delinquency In Progress**, or **On Hold** status. On manually canceling a delinquency process, the status of the delinquency process is changed to the value (for example, **Initial Cancel**) specified in the **Delinquency Process Initiate Cancel Status** attribute of the delinquency process preference. For more information about the manual cancellation process, see [Manual Actions at the Delinquency Process Level](#) on page 3960.

Once a delinquency process is manually or automatically canceled, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference. Note that a delinquency process in the **Pending Termination** status cannot be canceled manually but only automatically through the **C1-DPMON** batch.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

Once the status of the delinquency process is changed to **Canceled**, the system then executes the **C1-DPCAN** algorithm attached to the **Canceled** status in the lifecycle of the **C1-DelinquencyProcess** business object. The **C1-DPCAN** algorithm does the following:

- Creates a To Do notification with the cancel reason
- If there is any hold record for the delinquency process in the **Active** status, this algorithm changes the status of the hold record to **Complete**.
- If there is any pending record for approval at the delinquency event or process level, this algorithm changes the status of pending approval records to **Expired**.

This algorithm contains the following parameters:

- **To Do Type** – Used to indicate the To Do type using which you want to create a To Do when the delinquency process is canceled. This parameter is required.
- **To Do Role** – Used to indicate that users with the specified To Do role must receive the To Do notification. This parameter is optional. If you do not specify this parameter, this algorithm considers the default To Do role associated with the To Do type.
- **To Do Entry required for Individual Delinquency (Valid Values - Y/N)** – Used to indicate whether the To Do notification should be created on canceling a delinquency process for the fully insured individual business. The valid values are **Y** and **N**. Note that this parameter is not applicable for the fully insured group business. This algorithm will create a To Do notification on canceling a delinquency process for the fully insured group business irrespective of whether this parameter is set to **Y** or **N**.

Resuming a Delinquency Process

Oracle Revenue Management and Billing enables you to resume a delinquency process which was canceled due to a payment or adjustment made against the overdue bill for which the delinquency process was created. The system enables you to resume a delinquency process only when the respective payment or adjustment is canceled due to non-sufficient funds. The insurance company may come across the following scenarios:

- Scenarios wherein the delinquency process is canceled in between events when the status of the delinquency process is **Initiated**, **Delinquency In Progress**, or **On Hold**
- Scenarios wherein the delinquency process is canceled after the delinquency process moves to the **Customer Reinstated** status due the individual membership reinstatement

The system enables you to handle both these scenarios when a payment or adjustment made against a bill is canceled.

Resuming a Delinquency Process on Payment Cancellation

To automatically resume a delinquency process when a payment made against the respective overdue bill is canceled, you need to attach the following algorithms to the **Payment Cancellation** system event of the required customer classes:

- **C1-CDPPAYCAN** - This algorithm is invoked when a payment is canceled. It checks whether the **Delinquency Process (C1-DELPO)** characteristic is defined on the payment. If the **C1-DELPO** characteristic is not defined on the payment, the system creates a customer contact for the main customer of the account for which the payment was made. In addition, the system stamps the payment ID as a characteristic using the given characteristic type on the customer contact and the customer contact ID as a characteristic using the given characteristic type on the payment.

However, if the **C1-DELPO** characteristic is defined on the payment, the system derives the delinquency process ID from characteristic value. It then validates whether the delinquency process exist with the given ID in the system. Note that if the delinquency process does not exist, no further action takes place on the payment cancellation. However, if the delinquency process ID is successfully validated, the system checks the following:

- The status of the delinquency process is set to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference.
- The related delinquency process does not exist for the delinquency process.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

If either or both the conditions are not satisfied, no further action takes place on the payment cancellation. However, if both the conditions are satisfied, the system invokes the **C1-CANDELPRC** algorithm attached to the **Cancel Criteria** system event of the respective delinquency process type. If the cancel criteria is met, the delinquency process remains in the existing status and no further action takes place on the payment cancellation. However, if the cancel criteria is not met, the status of the delinquency process is set to the status prior to cancellation (i.e. **Initiated**, **Delinquency In Progress**, or **On Hold**). If the status of the delinquency process before cancellation was **On Hold**, then the status of the hold record is changed to **Active**. The system also creates a customer contact for the main customer of the account for which the payment was made. In addition, the system does the following:

- Adds a log entry for the customer contact in the delinquency process
- Stamps the customer contact ID as a characteristic using the given characteristic type on the payment
- Stamps the payment ID as a characteristic using the given characteristic type on the customer contact
- Stamps the delinquency process ID using the **C1-DELPO** characteristic type on the customer contact

This algorithm derives the preferred contact method for the customer contact. While deriving the preferred contact method, the algorithm first fetches the main customer's bill route type on the account and then fetches the bill routing method of the bill route type. Once the bill routing method is derived, the system considers the preference which is specified in the **Routing Method – Contact Method Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218. It then checks whether any preferred contact method is mapped to the bill routing method in the preference.

If the preferred contact method is mapped to the bill routing method in the preference, the system stamps it on the customer contact. However, if the preferred contact method is not mapped to the bill routing method in the preference, the system considers the default contact method as the preferred contact method and stamps it on the customer contact.

This algorithm contains the following parameters:

- **Customer Contact Type** - Used to indicate the customer contact type using which you want to create the customer contact.
- **Customer Contact Class** - Used to indicate the customer contact class to which the customer contact type belongs.
- **Default Contact Method** - Used to indicate the contact method that you want to use when the preferred contact method cannot be derived for the routing method from the preference.
- **Customer Contact Characteristic Type** - Used to indicate the characteristic type using which you want to store the customer contact ID on the payment. Here, you must specify a characteristic type where the characteristic entity is set to **Payment**.
- **Payment Characteristic For Customer Contact** - Used to indicate the characteristic type using which you want to store the payment ID on the customer contact. Here, you must specify a characteristic type where the characteristic entity is set to **Customer Contact**.

All the above parameters are mandatory.

- **C1-RODPDUEPX** - This algorithm is invoked when a payment is canceled. It derives the reason why the payment was canceled and validates whether it is listed as a value in the **Excluded Payment Cancel Reason List** parameter. If the payment cancel reason is listed in the **Excluded Payment Cancel Reason List** parameter, no further action takes place on the payment cancellation. However, if the payment cancel reason is not listed in the **Excluded Payment Cancel Reason List** parameter, the system checks whether the **Delinquency Process (C1-DELPO)** characteristic is defined on the payment. If the **C1-DELPO** characteristic is not defined on the payment, no further action takes place on the payment cancellation.

However, if the **C1-DELPO** characteristic is defined on the payment, the system derives the delinquency process ID from characteristic value. It then validates whether the delinquency process exist with the given ID in the system. If the delinquency process does not exist, no further action takes place on the payment cancellation. However, if the

delinquency process ID is successfully validated, the system checks whether the status of the delinquency process is set to the value (for example, **Customer Reinstated**) specified in the **Delinquency Process Customer Reinstated Status** attribute of the delinquency process preference. If so, the system checks the value of the **Delinquency Process Resume Switch (Valid Values – Y,N)** parameter. If the **Delinquency Process Resume Switch (Valid Values – Y,N)** parameter is set to **Y**, the system does the following:

- Sets the status of the delinquency process to the value (for example, **Reinstatement Payment/Adjustment Canceled**) specified in the **Delinquency Reinstatement Payment/Adjustment Canceled Status** attribute of the delinquency process preference

However, if the **Delinquency Process Resume Switch (Valid Values – Y,N)** parameter is set to **N**, the system does the following:

- If a delinquency process created using the given delinquency process type already exists for the account, the system adds the overdue bill for which the payment is canceled in the existing delinquency process. In addition, a log entry is created for the overdue bill which is added in the existing delinquency process. Note that the system considers an existing delinquency process which is in the status that is listed in the **Delinquency Process Status For Existing Delinquency Process** parameter of the **C1-DLNQMNRL** algorithm attached to the delinquency control of the person's or account's collection class, respectively.
- If a delinquency process does not exist for the account, the system creates a new delinquency process using the given delinquency process type. It adds the overdue bill for which the payment is canceled in the new delinquency process. Also, if there are any other overdue bills of the account that do not meet the tolerance limit are also added in the delinquency process. The status of the delinquency process is set to the value (for example, **Initiated**) specified in the **Delinquency Process Initiated Status** attribute of the delinquency process preference. In addition, a log entry is created for each overdue bill which is added in the delinquency process.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

This algorithm contains the following parameters:

- **Excluded Payment Cancel Reason List** – Used to specify a list of comma-separated payment cancel reasons. The system will then skip the payments which are canceled using the given payment cancel reason and will not take any actions on the payment cancellation. You can specify maximum five comma-separated values for this parameter. Here, you must specify a payment cancel reason which is already defined in the system.
- **Delinquency Process Resume Switch (Valid Values – Y,N)** – Used to indicate whether the original delinquency process which was canceled due to the payment should be resumed when the payment is canceled. The valid values are – **Y** and **N**. This parameter is mandatory.
- **Delinquency Process Type** – Used to indicate the delinquency process type using which a new process delinquency process should be created for the account when the payment is canceled. It is also used to check whether any existing delinquency process created using the given delinquency process type already exists in the system. Here, you must specify a delinquency process type which is already defined in the system. This parameter is required only when the **Delinquency Process Resume Switch (Valid Values – Y,N)** parameter is set to **N**.

Resuming a Delinquency Process on Adjustment Cancellation

To automatically resume a delinquency process when an adjustment made against the respective overdue bill is canceled, you need to attach the following algorithms to the **Adjustment Cancellation** system event of the required adjustment types:

- **C1-DPADJCAN** - This algorithm is invoked when an adjustment is canceled. It checks whether the **Delinquency Process (C1-DELPO)** characteristic is defined on the adjustment. If the **C1-DELPO** characteristic is not defined on the adjustment, the system creates a customer contact for the main customer of the account for which the adjustment was created. In addition, the system stamps the adjustment ID as a characteristic using the given characteristic type on the customer contact and the customer contact ID as a characteristic using the given characteristic type on the adjustment.

However, if the **C1-DELPO** characteristic is defined on the adjustment, the system derives the delinquency process ID from characteristic value. It then validates whether the delinquency process exist with the given ID in the system. Note that if the delinquency process does not exist, no further action takes place on the adjustment cancellation. However, if the delinquency process ID is successfully validated, the system checks the following:

- The status of the delinquency process is set to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference.
- The related delinquency process does not exist for the delinquency process.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

If either or both the conditions are not satisfied, no further action takes place on the adjustment cancellation. However, if both the conditions are satisfied, the system invokes the **C1-CANDELPRC** algorithm attached to the **Cancel Criteria** system event of the respective delinquency process type. If the cancel criteria is met, the delinquency process remains in the existing status and no further action takes place on the adjustment cancellation. However, if the cancel criteria is not met, the status of the delinquency process is set to the status prior to cancellation (i.e. **Initiated**, **Delinquency In Progress**, or **On Hold**). If the status of the delinquency process before cancellation was **On Hold**, then the status of the hold record is changed to **Active**. The system also creates a customer contact for the main customer of the account for which the adjustment was created. In addition, the system does the following:

- Adds a log entry for the customer contact in the delinquency process
- Stamps the customer contact ID as a characteristic using the given characteristic type on the adjustment
- Stamps the adjustment ID as a characteristic using the given characteristic type on the customer contact
- Stamps the delinquency process ID using the **C1-DELPO** characteristic type on the customer contact

This algorithm derives the preferred contact method for the customer contact. While deriving the preferred contact method, the algorithm first fetches the main customer's bill route type on the account and then fetches the bill routing method of the bill route type. Once the bill routing method is derived, the system considers the preference which is specified in the **Routing Method – Contact Method Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218. It then checks whether any preferred contact method is mapped to the bill routing method in the preference.

If the preferred contact method is mapped to the bill routing method in the preference, the system stamps it on the customer contact. However, if the preferred contact method is not mapped to the bill routing method in the preference, the system considers the default contact method as the preferred contact method and stamps it on the customer contact.

This algorithm contains the following parameters:

- **Customer Contact Type** - Used to indicate the customer contact type using which you want to create the customer contact.
- **Customer Contact Class** - Used to indicate the customer contact class to which the customer contact type belongs.
- **Default Contact Method** - Used to indicate the contact method that you want to use when the preferred contact method cannot be derived for the routing method from the preference.
- **Customer Contact Characteristic Type** - Used to indicate the characteristic type using which you want to store the customer contact ID on the adjustment. Here, you must specify a characteristic type where the characteristic entity is set to **Adjustment**.
- **Adjustment Characteristic For Customer Contact** - Used to indicate the characteristic type using which you want to store the adjustment ID on the customer contact. Here, you must specify a characteristic type where the characteristic entity is set to **Customer Contact**.

All the above parameters are mandatory.

- **C1-RODPONADX** - This algorithm is invoked when an adjustment is canceled. It derives the reason why the adjustment was canceled and validates whether it is listed as a value in the **Excluded Adjustment Cancel Reason**

List parameter. If the adjustment cancel reason is listed in the **Excluded Adjustment Cancel Reason List** parameter, no further action takes place on the adjustment cancellation. However, if the adjustment cancel reason is not listed in the **Excluded Adjustment Cancel Reason List** parameter, the system checks whether the **Delinquency Process (C1-DELPO)** characteristic is defined on the adjustment. If the **C1-DELPO** characteristic is not defined on the adjustment, no further action takes place on the adjustment cancellation.

However, if the **C1-DELPO** characteristic is defined on the adjustment, the system derives the delinquency process ID from characteristic value. It then validates whether the delinquency process exist with the given ID in the system. If the delinquency process does not exist, no further action takes place on the adjustment cancellation. However, if the delinquency process ID is successfully validated, the system checks whether the status of the delinquency process is set to the value (for example, **Customer Reinstated**) specified in the **Delinquency Process Customer Reinstated Status** attribute of the delinquency process preference. If so, the system checks the value of the **Delinquency Process Resume Switch** parameter. If the **Delinquency Process Resume Switch** parameter is set to **Y**, the system does the following:

- Sets the status of the delinquency process to the value (for example, **Reinstatement Payment/Adjustment Canceled**) specified in the **Delinquency Reinstatement Payment/Adjustment Canceled Status** attribute of the delinquency process preference

However, if the **Delinquency Process Resume Switch** parameter is set to **N**, the system does the following:

- If a delinquency process created using the given delinquency process type already exists for the account, the system adds the overdue bill for which the adjustment is canceled in the existing delinquency process. In addition, a log entry is created for the overdue bill which is added in the existing delinquency process. Note that the system considers an existing delinquency process which is in the status that is listed in the **Delinquency Process Status For Existing Delinquency Process** parameter of the **C1-DLNQMNRL** algorithm attached to the delinquency control of the person's or account's collection class.
- If a delinquency process does not exist for the account, the system creates a new delinquency process using the given delinquency process type. It adds the overdue bill for which the adjustment is canceled in the new delinquency process. Also, if there are any other overdue bills of the account that do not meet the tolerance limit are also added in the delinquency process. The status of the delinquency process is set to the value (for example, **Initiated**) specified in the **Delinquency Process Initiated Status** attribute of the delinquency process preference. In addition, a log entry is created for each overdue bill which is added in the delinquency process.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

This algorithm contains the following parameters:

- **Excluded Adjustment Cancel Reason List** – Used to specify a list of comma-separated adjustment cancel reasons. The system will then skip the adjustments which are canceled using the given adjustment cancel reason and will not take any actions on the adjustment cancellation. You can specify maximum five comma-separated values for this parameter. Here, you must specify an adjustment cancel reason which is already defined in the system.
- **Delinquency Process Resume Switch** – Used to indicate whether the original delinquency process which was canceled due to the adjustment should be resumed when the adjustment is canceled. The valid values are – **Y** and **N**. This parameter is mandatory.
- **Delinquency Process Type** – Used to indicate the delinquency process type using which a new process delinquency process should be created for the account when the adjustment is canceled. It is also used to check whether any existing delinquency process created using the given delinquency process type already exists in the system. Here, you must specify a delinquency process type which is already defined in the system. This parameter is required only when the **Delinquency Process Resume Switch** parameter is set to **N**.

Recalculating Trigger Dates for Pending Events

Whenever a delinquency process moves from the **Canceled** status to **Initiated**, **Delinquency In Progress**, or **On Hold** on the payment or adjustment cancellation, the system executes the **C1-RECALCTG** algorithm attached to the

Canceled status of the **C1-DelinquencyProcess** business object. This algorithm recalculates the trigger date for the delinquency events which are in the **Pending** status. It derives the difference between the delinquency process resume date and delinquency process cancellation date. These extra days are then added to the existing trigger date of the pending delinquency events and thereby the new trigger dates are calculated for the remaining events. If the **Consider Work Days** option is selected in the respective delinquency process type, the system derives the work calendar of the division to which the account belongs. The system then checks whether the new trigger date falls on the working (i.e. business) day. If the new trigger date does not fall on the working (i.e. business) day, the system will accordingly add days to the new trigger date to ensure that it falls on the next working day.

Membership Termination Outbound Message

The **C1-MemberTermRequest** business object is newly introduced in this release. It enables you to create a termination outbound message for an individual membership. Note that this business object is only applicable for the fully insured individual business.

To create the termination outbound messages for individual memberships through the **Delinquency Management** feature, you need to do the following:

- Create an external system to which you want to send the outbound messages. Note that the implementation team needs to design how the outbound message should be sent to the external system based on the customer requirements (i.e. through a batch control or a real-time service). Also, any response from the external system on receiving the outbound message should be captured in ORMB.
- Add the external system in the **C1-SourceSystemLookup** extendable lookup
- Create an outbound message type using which you want to create a termination outbound message for an individual membership. Here, you must specify the following:
 - The **C1-MemberTermRequest** business object using which you want to create the termination outbound messages for the individual memberships.
 - An external system to which you want to send the termination outbound messages that are created using the outbound message type.
- Create a delinquency process type using which you want to create a delinquency process to initiate termination request through an outbound message. For more information on how to design a delinquency process type to initiate termination request for an individual membership, see [Individual Membership Termination Delinquency Process](#) on page 3875.

Once the status reason of the individual memberships is set to the status reason which is specified in the **Membership Termination Reason for Delinquency** attribute of the delinquency process preference, you need to execute the **C1-MTOMT** batch to generate the termination outbound messages for the individual memberships. For more information about the batch, see [Outbound Message Generation for Delinquency Management](#) on page 3984.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

Membership Termination Outbound Message XML Format

Note:

We recommend you to refer the membership termination outbound message schema in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the schema.

At present, the membership termination outbound message is not delivered to the external system. The mechanism to deliver the membership termination outbound message is handled by the implementation team.

Tag Name	Tag Description	Mandatory (Yes or No)
schema	Used to specify the tags of a membership termination outbound message.	Yes
xmlRaw	Displays the unchanged information from an external source system when:	Not Applicable

Tag Name	Tag Description	Mandatory (Yes or No)
Response	<ul style="list-style-type: none"> A response XSL file is defined on the external system. An outbound message type is associated with the outbound message. 	
	Note: At present, this tag does not contain any information.	
xmlResponse	Displays the information from an external source system which is invoked by the real-time message.	Not Applicable
	Note: At present, this tag does not contain any information.	
outbound MessageId	Used to specify the outbound message ID.	Not Applicable
notification ExternalId	Used to specify the external source system ID.	Not Applicable
type	Used to specify the outbound message type using which you want to create the membership termination outbound message.	Not Applicable
	Note: You must specify an outbound message type which is already defined in the system.	
processingMethod	Used to specify the method implemented in processing the membership termination outbound message. The valid value is: <ul style="list-style-type: none"> Batch 	Not Applicable
status	Indicates the status of the outbound message.	Not Applicable
extract	Indicates the action for processing the records in the batch. The valid values are: <ul style="list-style-type: none"> Can be Extracted - Used when the records are created with a processing method of a batch. Not to be Extracted - Used when the processing should be held for some reason. 	Not Applicable
batchControl	Used to indicate the batch control for the membership termination outbound message.	Not Applicable
batchNumber	Used to specify the batch number.	Not Applicable
creation DateTime	Used to specify the date and time when the membership termination outbound message is processed.	Not Applicable
messageCategory	Used to specify the category to which the error message belongs.	Not Applicable
messageNumber	Used to specify the error code.	Not Applicable
processSignature	Used to specify the process signature.	Not Applicable
version	Used to specify the version.	Not Applicable

Tag Name	Tag Description	Mandatory (Yes or No)
xmlSource	Used to specify the tag information for the membership termination outbound message.	Yes
delinquency ProcessId	Used to specify the delinquency process ID.	Yes
health PlanCode	Used to specify the unique identifier for the health plan.	Yes
external MembershipId	Used to specify the external membership ID. Note: Here, you need to specify a membership ID which is maintained in the external source system.	No
membershipId	Used to specify the membership ID.	Yes
mainSubscriber PersonId	Used to specify the person ID who is the main subscriber of the membership.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
mainSubscriber PersonIdentifier Type	Used to specify the primary person identifier of the main subscriber of the membership.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
mainSubscriber PersonIdentifier	Used to specify the value of the main subscriber person identifier type.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
main SubscriberName	Used to specify the name of the main subscriber.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
mainSubscriber RelationshipType	Used to specify the member person relationship type of the main subscriber of the membership.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
startDate	Used to indicate the date from when the membership is effective.	Yes

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: The startDate cannot be later than the endDate.	
endDate	Used to indicate the date till when the membership is effective. Note: The endDate cannot be later than the startDate.	No
paidThrough Date	Used to indicate the paid through date of the account on which the membership is billed.	Yes
terminateDate	Used to indicate the membership termination date.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
terminateReason	Used to specify the reason for membership termination.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
terminate Reason Description	Used to specify additional information on membership termination.	No
billedAmount	Used to specify the sum of all original amounts of the bills involved in the delinquency process.	Yes
paidAmount	Used to specify the sum of all unpaid amounts of the bills involved in the delinquency process.	Yes
errorDetails	Displays the error information. Note: At present, this tag does not contain any information.	No
ilmDate	Displays the ilm date. Note: At present, this tag does not contain any information.	No
isEligibleForArchiving	Displays the ilm archiving switch. The valid values are: • Y • N Note: At present, this tag does not contain any information.	No

    <terminateReason>INDV_MEM_TERM</terminateReason>
    <terminateReasonDescription>
      Membership Awaiting Termination
    </terminateReasonDescription>
    <billedAmount>5000.00</billedAmount>
    <paidAmount>0.00</paidAmount>
  </xmlSource>
  <errorDetails></errorDetails>
  <ilmDate></ilmDate>
  <isEligibleForArchiving></isEligibleForArchiving>
</schema>
```

Note: We have given the above sample to illustrate how the tags should be nested while sending an membership termination outbound message to the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Membership Cancellation Outbound Message

The **C1-MemberCancRequest** business object is newly introduced in this release. It enables you to create a cancellation outbound message for an individual membership. Note that this business object is only applicable for the fully insured individual business.

To create the cancellation outbound messages for individual memberships through the **Delinquency Management** feature, you need to do the following:

- Create an external system to which you want to send the outbound messages. Note that the implementation team needs to design how the outbound message should be sent to the external system based on the customer requirements (i.e. through a batch control or a real-time service). Also, any response from the external system on receiving the outbound message should be captured in ORMB.
- Add the external system in the **C1-SourceSystemLookup** extendable lookup
- Create an outbound message type using which you want to create a cancellation outbound message for an individual membership. Here, you must specify the following:
 - The **C1-MemberCancRequest** business object using which you want to create the cancellation outbound messages for the individual memberships.
 - An external system to which you want to send the cancellation outbound messages that are created using the outbound message type.
- Create a delinquency process type using which you want to create a delinquency process to initiate cancellation request through an outbound message. For more information on how to design a delinquency process type to initiate cancellation request for an individual membership, see [Individual Membership Cancellation Delinquency Process](#) on page 3874.

Once the status reason of the individual memberships is set to the status reason which is specified in the **Awaiting Membership Cancellation Reason** attribute of the delinquency process preference, you need to execute the **C1-MTOMT** batch to generate the cancellation outbound messages for the individual memberships. For more information about the batch, see [Outbound Message Generation for Delinquency Management](#) on page 3984.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

Membership Cancellation Outbound Message XML Format

Note:

We recommend you to refer the membership cancellation outbound message schema in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the schema.

At present, the membership cancellation outbound message is not delivered to the external system. The mechanism to deliver the membership termination outbound message is handled by the implementation team.

Tag Name	Tag Description	Mandatory (Yes or No)
schema	Used to specify the tags of a membership cancellation outbound message.	Yes
xmlRaw	Displays the unchanged information from an external source system when:	Not Applicable

Tag Name	Tag Description	Mandatory (Yes or No)
Response	<ul style="list-style-type: none"> A response XSL file is defined on the external system. An outbound message type is associated with the outbound message. 	
	Note: At present, this tag does not contain any information.	
xmlResponse	Displays the information from an external source system which is invoked by the real-time message.	Not Applicable
	Note: At present, this tag does not contain any information.	
outbound MessageId	Used to specify the outbound message ID.	Not Applicable
notification ExternalId	Used to specify the external source system ID.	Not Applicable
type	Used to specify the outbound message type using which you want to create the membership cancellation outbound message.	Not Applicable
	Note: You must specify an outbound message type which is already defined in the system.	
processingMethod	Used to specify the method implemented in processing the membership cancellation outbound message. The valid value is: <ul style="list-style-type: none"> Batch 	Not Applicable
status	Indicates the status of the outbound message.	Not Applicable
extract	Indicates the action for processing the records in the batch. The valid values are: <ul style="list-style-type: none"> Can be Extracted - Used when the records are created with a processing method of a batch. Not to be Extracted - Used when the processing should be held for some reason. 	Not Applicable
batchControl	Used to indicate the batch control for the membership termination outbound message.	Not Applicable
batchNumber	Used to specify the batch number.	Not Applicable
creation DateTime	Used to specify the date and time when the membership cancellation outbound message is processed.	Not Applicable
messageCategory	Used to specify the category to which the error message belongs.	Not Applicable
messageNumber	Used to specify the error code.	Not Applicable
processSignature	Used to specify the process signature.	Not Applicable
version	Used to specify the version.	Not Applicable

Tag Name	Tag Description	Mandatory (Yes or No)
xmlSource	Used to specify the tag information for the membership termination outbound message.	Yes
delinquency ProcessId	Used to specify the delinquency process ID.	Yes
health PlanCode	Used to specify the unique identifier for the health plan.	Yes
external MembershipId	Used to specify the external membership ID. Note: Here, you need to specify a membership ID which is maintained in the external source system.	No
membershipId	Used to specify the membership ID.	Yes
mainSubscriber PersonId	Used to specify the person ID who is the main subscriber of the membership.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
mainSubscriber PersonIdentifier Type	Used to specify the primary person identifier of the main subscriber of the membership.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
mainSubscriber PersonIdentifier	Used to specify the value of the main subscriber person identifier type.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
main SubscriberName	Used to specify the name of the main subscriber.	Yes (Conditional) Note: This data is required while defining or editing the respective information.
mainSubscriber RelationshipType	Used to specify the member person relationship type of the main subscriber of the membership.	Yes (Conditional)

Tag Name	Tag Description	Mandatory (Yes or No)
		Note: This data is required while defining or editing the respective information.
startDate	Used to indicate the date from when the membership is effective.	Yes
	Note: The startDate cannot be later than the endDate.	
endDate	Used to indicate the date till when the membership is effective.	No
	Note: The endDate cannot be later than the startDate.	
paidThrough Date	Used to indicate the paid through date of the account on which the membership is billed.	Yes
cancelReason	Used to specify the reason for membership cancellation.	Yes (Conditional)
		Note: This data is required while defining or editing the respective information.
cancel Reason Description	Used to specify additional information on membership cancellation.	No
billedAmount	Used to specify the summary of all the original amounts of the bills involved in the delinquency process.	Yes
paidAmount	Used to specify the summary of all the unpaid amounts of the bills involved in the delinquency process.	Yes
errorDetails	Displays the error information.	No
	Note: At present, this tag does not contain any information.	
ilmDate	Displays the ilm date.	No
	Note: At present, this tag does not contain any information.	
isEligibleForArchiving	Displays the ilm archiving switch. The valid values are:	No
	<ul style="list-style-type: none"> • Y • N 	
	Note: At present, this tag does not contain any information.

    <billedAmount>2500.00</billedAmount>
    <paidAmount>0.00</paidAmount>
  </xmlSource>
  <errorDetails></errorDetails>
  <ilmDate></ilmDate>
  <isEligibleForArchiving></isEligibleForArchiving>
</schema>
```

Note: We have given the above sample to illustrate how the tags should be nested while sending an membership cancellation outbound message to the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Creating Customer Contacts for Group, Direct Billed Group Membership, or Individual Membership

If you send a debt collection letter to a delinquent customer or account through a delinquency process, you can configure the system to create a customer contact for the main subscriber of each membership which is billed to the delinquent customer or account. The system creates a customer contact for the main subscriber of each membership whenever an event is triggered in the delinquency process to send a debt collection letter.

Two fields named **Send Membership Level Notification Source** and **Send Membership Level Notification** field are available when you add a delinquency event type in a delinquency process type. You can set the **Send Membership Level Notification Source** field to either **Delinquency Process Type** or **Algorithm**. If you set the **Send Membership Level Notification Source** field to **Delinquency Process Type**, the system derives the value for the **Send Membership Level Notification** field corresponding to the respective event type from the delinquency process type. However, if you set the **Send Membership Level Notification Source** field to **Algorithm**, the system derives the value for the **Send Membership Level Notification** field from a business rule. To derive the value from the business rule, the system uses the **C1-DERMLNBR** algorithm attached to the **Send Member Level Notification Option Derivation** system event in the respective delinquency process type. For more information, see [C1-DERMLNBR](#) on page 3951. Note that these fields are applicable only when the delinquency event is triggered in the delinquency process to send a debt collection letter (such as, warning, dunning, or harsh letters) to the delinquent customer or account.

If the value of the **Send Membership Level Notification** field is set to **Send Membership Level Notification Required** either in the delinquency process type or in the business rule depending on the send membership level notification source, the system derives the memberships billed to the delinquent customer or account. It then checks whether the number of memberships derived is less than or equal to the value specified in the **Member Level Notification Deferred Processing Threshold** parameter of the **C1-DLQSENDCC** algorithm. If the number of memberships derived is less than or equal to the specified value, the system creates a customer contact for the main subscriber of each derived membership in the real time (i.e. immediately). In addition, the status of the delinquency event is changed to **Complete**.

However, if no value is defined for the **Member Level Notification Deferred Processing Threshold** parameter or if the number of memberships derived is greater than the specified value, the system changes the status of the delinquency event to **Pending Contact Creation**.

The **C1-MBRNT** batch considers the delinquency processes which have at least one delinquency event in the **Pending Contact Creation** status. It then derives the memberships billed to the delinquent customer or account and creates a customer contact for the main subscriber of each derived membership.

In addition, this algorithm does the following:

- Creates a log entry for each customer contact in the delinquency process.
- Stamps the delinquency process ID as a characteristic using the given characteristic type on the customer contact.
- Stamps the membership ID as a characteristic using the given characteristic type on the customer contact.

Note: Once a customer contact is created, a record is added in the **C1_DELIN_PROC_EVT_NOTIF** table where the **DP_EVT_NOTIF_TYPE_FLG** column is set to CC and the **DP_EVT_NOTIF_ID** column is set to the customer contact ID.

This batch derives the preferred contact method for the customer contact. While deriving the preferred contact method, the batch first fetches the main customer's bill route type on the account and then fetches the bill routing method of the bill route type. Once the bill routing method is derived, the system considers the preference which is specified in the **Routing Method – Contact Method Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218. It then

checks whether any preferred contact method is mapped to the bill routing method in the preference. If the preferred contact method is mapped to the bill routing method in the preference, the system stamps it on the customer contact. However, if the preferred contact method is not mapped to the bill routing method in the preference, the system considers the default contact method as the preferred contact method and stamps it on the customer contact.

This batch is a multi-threaded batch. The multi-threading is based on membership ID and chunks for multi-threading are created based on numerical distribution of membership ID. For more information about the batch, see *Oracle Revenue Management and Billing Batch Guide*.

Outbound Message Generation for Delinquency Management

The **C1-MTOMT** batch is used to create the termination and cancellation outbound messages whenever the termination or cancellation process is initiated for the individual memberships through the **Delinquency Management** feature. It creates the termination and cancellation outbound messages using the given outbound message types for the individual memberships which have the given status and status reasons. In addition, it adds a log for the outbound message in the respective individual membership and delinquency process.

This batch is a multi-threaded batch. The multi-threading is based on membership ID and chunks for multi-threading are created based on numerical distribution of membership ID. For more information about the batch, see *Oracle Revenue Management and Billing Batch Guide*.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

Allocate Advance Deposit for Delinquent Customers

In the fully insured group business, the group customers may opt to pay the advance deposit upfront so that it can be used in case of delinquency to settle unpaid amount. The group customer may pay the advance deposit at the parent customer or policy level. Oracle Revenue Management and Billing enables you to park the advance deposit received from the group customers at the parent customer or policy level.

If you create a bill with charges from multiple policies, then the system should receive advance deposit at the parent customer level. The system will then use the advance deposit to pay unpaid bills of all the policies of the parent customer where he is the policy holder. The system enables you to create an account at the parent customer level to park the advance deposit. However, if you create a bill with charges from a single policy, then the system should receive advance deposit at the policy level. The system will then use the advance deposit to pay unpaid bills of the respective policy. The system enables you to create a policy-specific account at the parent customer level to park the advance deposit.

Maintaining Advance Deposit Details

The system enables you to provide the advance deposit details for a parent customer through a health care inbound message or through a membership repricing request. Similarly, the system enables you to provide the advance deposit details for a policy from the **Policy** screen or through a health care inbound message. You need to provide the following advance deposit details at the parent customer level:

- **Advance Deposit Level** - Used to indicate whether you want to park the advance deposit received from the group customer at the parent customer or policy level. The valid values are:
 - **PG** - Used when you want to park the advance deposit at the parent customer level.
 - **POLI** - Used when you want to park the advance deposit at the policy level.

The advance deposit level is only applicable for the person whose person type is set to **Parent Customer**. If you do not specify the advance deposit level, then the parent customer is not eligible for the advance deposit either at the parent customer or policy level.

- **Advance Deposit Amount** - Used to specify the advance deposit amount. It is required when the advance deposit level is set to **PG**.
- **Advance Deposit Grace Days** - Used to specify the grace days. The system then uses the grace days to derive the grace period within which the advance deposit should be received from the group customer. While calculating the grace period, the system derives the earliest start date among all the policies where the parent customer is the policy holder and considers it as the grace start date. Once the grace start date is derived, the system calculates the grace end date (i.e. grace start date + grace days). For example, if a parent customer is the policy holder of two policies - P1 (01-Jan-2022 to 31-Dec-2022) and P2 (01-Jun-2022 to 31-Dec-2022) and advance deposit grace days is set to 6 days, then the system considers 01-Jan-2022 as the grace start date (as it is the earliest start date) and sets the grace end date to 07-Jan-2022. The advance deposit grace days is required when the advance deposit level is set to **PG**.
- **Advance Deposit Account Details** - Used to specify the account details for the parent customer when the advance deposit is parked at the parent customer level.
 - **Account Identifier Type** - Used to specify the account identifier type.
 - **Account Identifier** - Used to specify the account identifier.
 - **Account Relationship Type** - Used to specify the account relationship type using which you want to associate the parent customer with the account. Here, you must specify an account relationship type which is specified in the **Advance Deposit Account Relationship Type** attribute of the delinquency process preference.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

The respective tags are added to provide the above advance deposit details at the parent customer level in the **C1-HCInboundMessage** business object schema and in the **C1-MembershipRepricing** business service schema. For more information, see [Inbound Message](#) on page 2147 and [C1-MembershipRepricing Business Service](#) on page 3365

If the advance deposit level of a policy holder (i.e. parent customer) is set to **POLI**, you need to specify the following advance deposit details at the policy level:

- **Advance Deposit Applicability** - Used to indicate whether the advance deposit is applicable for the policy. The valid values are **Y** and **N**. If you do not specify the value, the system, by default, sets it to **N**.
- **Advance Deposit Amount** - Used to specify the advance deposit amount. It is required when the advance deposit applicability is set to **Y**.
- **Advance Deposit Grace Days** - Used to specify the grace days. The system then uses the grace days to derive the grace period within which the advance deposit should be received from the group customer for the policy. While calculating the grace period, the system considers the policy start date as the grace start date. Once the grace start date is derived, the system calculates the grace end date (i.e. grace start date + grace days). For example, if a parent customer is the policy holder of the P1 policy (01-Jan-2022 to 31-Dec-2022) and advance deposit grace days is set to 6 days, then the system considers 01-Jan-2022 as the grace start date and sets the grace end date to 07-Jan-2022. The advance deposit grace days is required when the advance deposit applicability is set to **Y**.
- **Advance Deposit Account Identifier Type** - Used to specify the account identifier type. It is required when the advance deposit applicability is set to **Y**.
- **Advance Deposit Account Identifier** - Used to specify the account identifier. Here, you must specify an account of the policy holder where the account relationship type is set to the value that is specified in the **Advance Deposit Account Relationship Type** attribute of the delinquency process preference. It is required when the advance deposit applicability is set to **Y**.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

The respective tags are added to provide the above advance deposit details at the policy level in the **C1-HCInboundMessage** business object schema. For more information, see [Inbound Message](#) on page 2147.

Applying Advance Deposit Payments

You can apply the advance deposit payment on the advance deposit account of the parent customer from the user interface or through an inbound web service. Note that the system distinguishes an account as the advance deposit account when the parent customer is associated with the account using the account relationship type which is specified in the **Advance Deposit Account Relationship Type** attribute of the delinquency process preference. While applying the advance deposit payment against the advance deposit account, you must specify a match type where an algorithm created using the **C1-MATSATYP** algorithm type is attached to the **Payment Distribution Override** algorithm spot.

In the **C1-MATSATYP** algorithm, you must specify a contract type that is specified in the **Advance Deposit Contract Type** attribute of the delinquency process preference. The system then applies the advance deposit payment against an active advance deposit contract of the specified contract type on the advance deposit account. If an active contract of the specified contract type does not exist on the advance deposit account, the system creates an advance deposit contract using the specified contract type and then applies the advance deposit payment against the advance deposit contract.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218

Monitoring Advance Deposit of a Parent Customer

The **C1-ADMON** batch considers all the parent customers where the advance deposit level is set to **PG** or **POLI**. For a parent customer where advance deposit level is set to **PG**, the batch checks whether any customer contact is created using the given customer contact type for the given customer contact class where the respective person ID is stored as a characteristic on the customer contact. The system considers the characteristic type which is specified in the **Person ID Characteristic for Inbound Log** option type of the **C1-ASOBLLNG** feature configuration. If a customer contact exists for the parent customer, the batch does not consider the parent customer for further processing.

However, if a customer contact does not exist for the parent customer, the batch derives the advance deposit amount and advance deposit grace days from the parent customer level. It then calculates the grace end date and checks whether the grace end date is earlier than or equal to batch business date. If so, the system derives the advance deposit account relationship type and advance deposit contract type from the delinquency process preference. The system then derives the parent customer's advance deposit account and advance deposit contract using the advance deposit account relationship type and advance deposit contract type, respectively. The batch then checks whether the payments received against the advance deposit contract exceeds the advance deposit amount. If the sum of payments does not exceed the advance deposit amount, the system creates a customer contact using the given customer contact type for the given customer contact class. In addition, the system considers the characteristic type that is specified in the **Person ID Characteristic for Inbound Log** option type of the **C1-ASOBLLNG** feature configuration and then stamps the person ID using the respective characteristic type on the customer contact. However, if the grace end date is later than the batch business date or if the sum of payments exceeds the advance deposit amount, the system does not consider the parent customer for further processing.

Similarly, for a parent customer where advance deposit level is set to **POLI**, this batch fetches all the policies where the parent customer is the policy holder and where the advance deposit applicability is set to **Y**. The system considers those policies where the parent customer is associated using the policy person role that is specified in the **Parent Customer Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration.

For each such policy, this batch checks whether any customer contact is created using the given customer contact type for the given customer contact class where the respective policy ID is stored as a characteristic on the customer contact. The system considers the characteristic type which is specified in the **Policy Characteristic Type for Customer Contact** attribute of the delinquency process preference. If a customer contact exists for the policy, the batch does not consider the policy for further processing.

However, if a customer contact does not exist for the policy, the batch derives the advance deposit amount and advance deposit grace days from the policy. It then calculates the grace end date and checks whether the grace end date is earlier than or equal to batch business date. If so, the system derives the advance deposit account linked to the policy and

the advance deposit contract using the advance deposit contract type specified in the delinquency process preference. The batch then checks whether the payments received against the advance deposit contract exceeds the advance deposit amount. If the sum of payments does not exceed the advance deposit amount, the system creates a customer contact using the given customer contact type for the given customer contact class. In addition, the system considers the characteristic type that is specified in the **Policy Characteristic Type for Customer Contact** attribute of the delinquency process preference and then stamps the policy ID using the respective characteristic type on the customer contact. However, if the grace end date is later than the batch business date or if the sum of payments exceeds the advance deposit amount, the system does not consider the policy for further processing.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

This batch also derives the preferred contact method for the customer contact. While deriving the preferred contact method, the batch first fetches the main customer's bill route type on the advance deposit account and then fetches the bill routing method of the bill route type. Once the bill routing method is derived, this batch considers the preference which is specified in the **Routing Method - Contact Method Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

It then checks whether any preferred contact method is mapped to the bill routing method in the preference. If the preferred contact method is mapped to the bill routing method in the preference, the system stamps it on the customer contact. However, if the preferred contact method is not mapped to the bill routing method in the preference, the system considers the default contact method as the preferred contact method and stamps it on the customer contact.

This batch is a multi-threaded batch. The multi-threading is based on person ID and chunks for multi-threading are created based on numerical distribution of person ID. For more information, see *Oracle Revenue Management and Billing Batch Guide*.

Settling Unpaid Dues Against Advance Deposit through a Delinquency Process

Oracle Revenue Management and Billing enables you to settle the unpaid bill amount of a parent customer using the advance deposit available at the parent customer or policy level through a delinquency process. For example, an advance deposit of \$1000 is received from the parent customer through multiple payments as shown below:

The following table lists the advance deposit that is received from the parent customer through multiple payments.

Advance Deposit Payments							
Payment Event ID	Payment ID	Payment Date	Payment Amount	Payment (SA1)	Segment	Match Event	Match Status
PE1	P1	01-Jan-2020	200	-200		ME1	Open
PE2	P2	05-Jan-2020	200	-200		ME2	Open
PE3	P3	10-Jan-2020	200	-200		ME3	Open
PE4	P4	11-Jan-2020	200	-200		ME4	Open
PE5	P5	15-Jan-2020	200	-200		ME5	Open
Actual Deposit				-1000			
SA1 Contract Balance				-1000			

An advance deposit delinquency process is created for the parent customer which includes two bills - B1 and B2 with the bill segments as shown below:

The following table lists the bill segments of two bills - B1 and B2.

Bill	Bill Segment	Amount
B1	-	300
	BSEG1 (SA2)	200
	BSEG2 (SA3)	100
B2	-	400
	BSEG1 (SA2)	250
	BSEG2 (SA3)	150

When the apply advance deposit delinquency event is triggered, the system will create four debit adjustments and one credit adjustment as shown in the below table. Note that the system will create the debit adjustments against the payment segments on the advance deposit contract using the debit adjustment type given in the **C1-APPADVDEP** algorithm. While creating the debit adjustments, the system will consider the payments in the ascending order of the payment date. In addition, the system will create one credit adjustment using the credit adjustment type given in the **C1-APPADVDEP** algorithm. This credit adjustment would be matched later in the delinquency process.

The following table illustrates the debit and credit adjustments that are created when the apply advance deposit delinquency event is triggered.

Advance Deposit Payments							Adjustment				
Payment Event ID	Payment ID	Payment Date	Payment Amount	Payment Segment (SA1)	Match Event	Match Status	Event	Adjustment	Match Event	Match Status	Event
PE1	P1	01-Jan-2020	200	-200	ME1	Open		200 (SA1)	ME1	Balanced	
PE2	P2	05-Jan-2020	200	-200	ME2	Open		200 (SA1)	ME2	Balanced	
PE3	P3	10-Jan-2020	200	-200	ME3	Open		200 (SA1)	ME3	Balanced	
PE4	P4	11-Jan-2020	200	-200	ME4	Open		100 (SA1)	ME4	Open	
PE5	P5	15-Jan-2020	200	-200	ME5	Open					
Actual Deposit				-1000							
SA1 Contract Balance				-1000							
Credit Adjustment (SA1)								-700	-	-	

The system will then create an offset request using the offset request type given in the **C1-APPADVDEP** algorithm. In the offset request, the system will include the credit adjustment (-\$700) and two bills - B1 and B2 for which the delinquency process is created. The system will then automatically process the offset request and create the offset request adjustments as shown in the below table. Note that the advance deposit is applied in the ascending order of the bill date. If two or more bills have the same bill date, the system applies the advance deposit in the ascending order of the unpaid amount (i.e. lowest unpaid amount is paid first).

The following table lists the adjustments that are created through an offset request.

Offset Request											
Credit Items					Debit Items						
Adjustment	Offset Request Adjustment	Offset Adjustment Amount	Match Event	Match Status	Event	Bill	Bill Segment	Offset Request Adjustment	Offset Adjustment Amount	Match Event	Match Status
CA1 (SA1)	OA11	300	ME10	Balanced		B1	BSEG1 (SA2)	OA2 (SA2)	-200	ME6	Balanced
							BSEG2 (SA3)	OA3 (SA3)	-100	ME7	Balanced
	OA12	400	ME10	Balanced		B2	BSEG1 (SA2)	OA4 (SA2)	-250	ME8	Balanced
							BSEG2 (SA3)	OA5 (SA3)	-150	ME9	Balanced

Once the offset request adjustments are created, the system creates a customer contact depending on whether the advance deposit is fully or partially utilized to pay the delinquent bills. The customer contact is created for the parent customer or for the main customer of the account depending on whether the delinquency process is created at the person or account level. In addition, the system stamps the delinquency process ID as a characteristic on the customer contact and on the advance deposit payments (used for offsetting; in this case P1, P2, P3, and P4). The system considers the characteristic

type given in the **C1-APPADVDEP** algorithm. For more information about the algorithm, see [C1-APPADVDEP](#) on page 3890.

The status of the delinquency process will remain as **Delinquency In Progress**. On executing the **C1-DPMON** batch, the system checks whether the delinquency process meets the cancel criteria. If so, the system will change the status of the delinquency process to **Canceled**.

For more information about the advance deposit delinquency process, see [Advance Deposit Delinquency Process](#) on page 3879.

Notification on Receiving Advance Deposit

Oracle Revenue Management and Billing enables you to send notification via a customer contact when the advance deposit payment is received fully for a customer at the parent customer or policy level. To enable this feature, you need to attach an algorithm created using the **C1-NOTADREC** algorithm type to the **Payment Freeze** system event of the parent customer's customer class.

This algorithm checks whether the payment is made on a contract which is created using a contract type specified in the **Advance Deposit Contract Type** attribute of the delinquency process preference. If the payment is not made on a contract of the advance deposit contract type, no action takes place while freezing the payment. However, if the payment is made on a contract of the advance deposit contract type, this algorithm checks whether the advance deposit contract is linked to any policy. If so, the system derives the advance deposit amount specified on the policy and then checks whether the sum of payments received on the advance deposit contract is greater than or equal to the advance deposit amount specified on the policy. If so, the system creates a customer contact using the given customer contact type for the given customer contact class. In addition, the system stamps the policy ID as a characteristic on the customer contact using the characteristic type which is specified in the **Policy Characteristic Type for Customer Contact** option type of the **DELINPROC** feature configuration. However, if the sum of payments received on the advance deposit contract is less than the advance deposit amount, no action takes place while freezing the payment.

If the advance deposit contract is not linked to any policy, the system derives the account for which the advance deposit contract is created. The system then derives the person who is associated with the account using the relationship type which is specified in the **Advance Deposit Account Relationship Type** attribute of the delinquency process preference. Once the person is derived, the system derives the advance deposit amount specified at the parent customer level. The system then checks whether the sum of payments received on the advance deposit contract is greater than or equal to the advance deposit amount specified at the parent customer level. If so, the system creates a customer contact using the given customer contact type for the given customer contact class. However, if the sum of payments received on the advance deposit contract is less than the advance deposit amount, no action takes place while freezing the payment.

This algorithm also derives the preferred contact method for the customer contact. While deriving the preferred contact method, this algorithm first fetches the main customer's bill route type on the advance deposit account and then fetches the bill routing method of the bill route type. Once the bill routing method is derived, the system considers the preference which is specified in the **Routing Method - Contact Method Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

It then checks whether any preferred contact method is mapped to the bill routing method in the preference. If the preferred contact method is mapped to the bill routing method in the preference, the system stamps it on the customer contact. However, if the preferred contact method is not mapped to the bill routing method in the preference, the system considers the default contact method as the preferred contact method and stamps it on the customer contact.

Note: The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

This algorithm contains the following parameters:

- **Customer Contact Type** - Used to indicate the customer contact type using which you want to create the customer contact. Here, you must specify a customer contact type with the appropriate letter template depending on the type of letter you want to send to the customer.

- **Customer Contact Class** - Used to indicate the customer contact class to which the customer contact type belongs.
- **Default Contact Method** - Used to indicate the contact method that you want to use when the preferred contact method cannot be derived for the routing method from the preference.

All these parameters are mandatory.

Notification on Advance Deposit Cancellation

Oracle Revenue Management and Billing enables you to send notification via a customer contact when the payment on the advance deposit contract is canceled. To enable this feature, you need to attach an algorithm created using the **C1-NOTADCAN** algorithm type to the **Payment Cancellation** system event of the parent customer's customer class.

This algorithm checks whether the payment is made on a contract which is created using a contract type specified in the **Advance Deposit Contract Type** attribute of the delinquency process preference. The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218

If the payment is not made on a contract of the advance deposit contract type, no action takes place while canceling the payment. However, if the payment is made on a contract of the advance deposit contract type, this algorithm checks whether the cancel reason specified while canceling a payment is listed in the **Advanced Deposit Payment Cancel Reason List** parameter. If so, the system creates a customer contact using the given customer contact type for the given customer contact class. If the advance deposit contract is linked to a policy, the system stamps the policy ID as a characteristic on the customer contact using the characteristic type which is specified in the **Policy Characteristic Type for Customer Contact** option type of the **DELINPROC** feature configuration.

However, if the cancel reason specified while canceling a payment is not listed in the **Advanced Deposit Payment Cancel Reason List** parameter, no action takes place while canceling the payment. If the advance deposit payment is already used to settle an overdue bill through a delinquency process, the system does the following:

- Cancels the debit adjustments created against the advance deposit payment.
- Cancels the credit adjustments used to offset the overdue bills through a delinquency process.
- Unapplies or cancels the offset request. If the number of transfer or offset adjustments does not exceed the online record process limit (defined in the **C1-DFRUNAPLY** algorithm), the system cancels the frozen transfer or offset adjustments immediately and then changes the status of the offset request to **Unapplied Offset**. However, if the number of transfer or offset adjustments exceeds the online record process limit (defined in the **C1-DFRUNAPLY** algorithm), the system changes the status of the offset request to **Defer Unapplied**.

Note:

On executing the **Offset Request Periodic Monitor (C1-OFSRQ)** batch, the system considers the offset requests which are in the **Defer Unapplied** status. The system then cancels the frozen transfer or offset adjustments of the offset request and changes the status of the offset request to **Unapplied Offset**.

The system then executes the **C1-CDPPAYCAN** algorithm attached to the **Payment Cancellation** system event of the parent customer's customer class. It changes the status of the delinquency process. For more information about the algorithm, see [Resuming a Delinquency Process on Payment Cancellation](#) on page 3966

Always ensure that you attach the following algorithms to the **Payment Cancellation** system event in the specified sequence:

1. C1-NOTADCAN
2. C1-CDPPAYCAN

This algorithm contains the following parameters:

- **Customer Contact Type** - Used to indicate the customer contact type using which you want to create the customer contact. Here, you must specify a customer contact type with the appropriate letter template depending on the type of letter you want to send to the customer.

- **Customer Contact Class** - Used to indicate the customer contact class to which the customer contact type belongs.
- **Default Contact Method** - Used to indicate the contact method that you want to use when the preferred contact method cannot be derived for the routing method from the preference.
- **Advanced Deposit Payment Cancel Reason List** - Used to specify a comma-separated list of payment cancel reasons that the system should consider while notifying customers on payment cancellation. The system uses this parameter to distinguish between advance deposit transfer and advance deposit cancellation. You can specify maximum five comma-separated values for this parameter. Here, you must specify a payment cancel reason which is already defined in the system.
- **Offset Request Defer Unapply Status Code** - Used to specify the status to which you want to transition the offset request when an advance deposit payment is canceled. You must specify a status code which is already defined in the lifecycle of the **C1-OffsetRequest** business object.
- **Offset Request Defer Unapply Status Reason** - Used to specify the reason why you want to unapply or cancel the offset request. You must specify a reason which is already defined for the **Defer Unapplied** status of the **C1-OffsetRequest** business object in the **Status Reason** screen.

All these parameters are mandatory.

Algorithm Used in Delinquency Control

The following table lists the algorithms which are attached to the **C1-DelinControl** business object:

System Event	Algorithm	Algorithm Type	Description
Validation	C1-VALDQCL	C1-VALDQCL	See C1-VALDQCL on page 3991

C1-VALDQCL

This algorithm validates that at least one algorithm should be plugged in for a delinquency control monitor rule.

Algorithms Used in Delinquency Process Type

The following table lists the algorithms which are attached to the **C1-DelinProcType** business object:

System Event	Algorithm	Algorithm Type	Description
Validation	C1-VALDQPT	C1-VALDQPT	See C1-VALDQPT on page 3991

C1-VALDQPT

This algorithm validates the **Delinquency Process Type (C1-DelinProcType)** business object. It will check whether the calculate unpaid and original amount, and the cancel criteria algorithm is configured. It also checks whether the duplicate algorithms is configured in the delinquency process type.

Algorithm Used in C1-DelinquencyProcess

The following table lists the algorithms which are used in the lifecycle of the **C1-DelinquencyProcess** business object.

Status	System Event	Algorithm	Algorithm Type	Description
Initiated	Enter	C1-DPEVTCR	C1-DPEVTCR	Refer to C1-DPEVTCR on page 3993
Initiate Hold	Enter	C1-EVALDPAPP	C1-EVALDPAPP	Refer to C1-EVALDPAPP on page 3994

Customer Reinstated	Enter	C1-UPDDLQRC	C1-UPDDLQRC	Refer to C1-UPDDLQRC on page 4001

C1-VALDQPR

This algorithm validates the following in the delinquency process business object:

- Validates whether the delinquency entity ID in the primary table is a valid PER_ID or ACCT_ID depending on the delinquency entity type on the delinquency process type.
- Validates that the collection method on the collection class linked this PER_ID or ACCT_ID is **Self-Control Delinquency**.
- Validates that if the collection object on the process type is 'BILL' then the pk_value1 for each record in the delinquency process related objects list is a valid BILL_ID.
- Objects collected on must belong to the same Person/Account defined on the delinquency process.

C1-DPEVTCR

This algorithm is invoked when the status of a delinquency process is set to **Initiated**. It creates a delinquency event of each delinquency event type that is added in the delinquency process type using which the delinquency process is created. If the delinquency event trigger mode is set to **Manual** in the delinquency process type, the status of the delinquency event is set to **Pending**. However, if the delinquency event trigger mode is set to **Automatic or Manual** or **Automatic** in the delinquency process type, the status of the delinquency event is set to **Pending Evaluation**.

Once the delinquency events are created for the delinquency process, this algorithm does the following:

- Sets the delinquency due date of the delinquency process to the latest bill due date
- Derives the grace period from the delinquency process type or using an algorithm attached to the **Grace Period Derivation** system event depending on the grace period source which is specified in the delinquency process type

Note: For more information about the **C1-DERGRBR** algorithm attached to the **Grace Period Derivation** system event, see [Algorithms Used in Delinquency Process Type](#) on page 3991.

- Sets the grace start date in the following manner:

The following table lists the trigger date calculation mode, usage basis, and grace start date basis which are used in defining the grace start date for the delinquency process.

Trigger Date Calculation Mode	Usage Basis	Grace Start Date Basis	Grace Start Date is set to...
Latest Bill Due Date with Grace Period	-	-	Latest Bill Due Date
Usage Basis	Delinquency Process Creation Date	-	Delinquency Process Creation Date
Usage Basis	Grace Start Date	Latest Bill Due Date	Latest Bill Due Date
Usage Basis	Grace Start Date	X Days after Latest Bill Due Date	Latest Bill Due Date + Add Days To Due Date
Usage Basis	Grace Start Date	Delinquency Process Creation Date	Delinquency Process Creation Date
Usage Basis	Latest Bill Date	-	Latest Bill Date
Usage Basis	Latest Bill Due Date	-	Latest Bill Due Date

- Calculates the grace end date in the following manner:

The following table lists the trigger date calculation mode, usage basis, grace start date basis, and grace start date which are used in defining the grace end date for the delinquency process.

Trigger Date Calculation Mode	Usage Basis	Grace Start Date Basis	Grace Start Date	Grace End Date is set to...
Latest Bill Due Date with Grace Period	-	-	Latest Bill Due Date	Grace Start Date + Grace Period + Drag

Trigger Date Calculation Mode	Usage Basis	Grace Start Date Basis	Grace Start Date	Grace End Date is set to...
				Days (if any, defined at the respective level (i.e. account or person))
Usage Basis	Delinquency Process Creation Date	-	Delinquency Process Creation Date	Grace Start Date + Grace Period
Usage Basis	Grace Start Date	Latest Bill Due Date	Latest Bill Due Date	Grace Start Date + Grace Period
Usage Basis	Grace Start Date	X Days after Latest Bill Due Date	Latest Bill Due Date + Add Days To Due Date	Grace Start Date + Grace Period
Usage Basis	Grace Start Date	Delinquency Process Creation Date	Delinquency Process Creation Date	Grace Start Date + Grace Period
Usage Basis	Latest Bill Date	-	Latest Bill Date	Grace Start Date + Grace Period
Usage Basis	Latest Bill Due Date	-	Latest Bill Due Date	Grace Start Date + Grace Period

Note:

This algorithm adds the delinquency event records in the **C1_DELIN_PROC_EVT** table.

This algorithm does not calculate the trigger date and preview date for the events when delinquency event trigger mode is set to **Manual** in the delinquency process type. However, the system calculates the trigger date and preview date for the events when delinquency event trigger mode is set to **Automatic** or **Manual** or **Automatic** in the delinquency process type while executing the **C1-DPEVL** batch.

This algorithm maintains the delinquency due date, grace start date, grace period, and grace end date for a delinquency process in the **C1_DELIN_PROC** table.

This algorithm is applicable for both the fully insured group and fully insured individual businesses.

C1-EVALDPAPP

This algorithm is invoked when you manually perform the following actions:

- **Hold a Delinquency Process** - This algorithm is invoked when the status of a delinquency process is set to **Initiate Hold**. It checks whether the approval is required for the **Hold** action in the respective delinquency process type. If the approval is not required while manually holding the delinquency process, the status of the delinquency process is immediately changed to the value (for example, **On Hold**) specified in the **Delinquency Process Hold Status** attribute of the delinquency process preference. A hold record is created for the delinquency process in the **Active** status. However, if the approval is required while manually holding the delinquency process, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the manual hold and assigned to the users with the approval To Do role. In addition, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress - Exception Raised**) specified in the **Delinquency Process Approval In Progress Status** attribute of the delinquency process preference.
- **Cancel a Delinquency Process** - This algorithm is invoked when the status of a delinquency process is set to **Initiate Cancel**. It checks whether the approval is required for the **Cancel** action in the respective delinquency process type. If the approval is not required while manually canceling the delinquency process, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status**

attribute of the delinquency process preference. However, if the approval is required while manually canceling the delinquency process, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the manual cancellation and assigned to the users with the approval To Do role. In addition, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress - Exception Raised**) specified in the **Delinquency Process Approval In Progress Status** attribute of the delinquency process preference.

- **Release Hold on a Delinquency Process** - This algorithm is invoked when the status of a delinquency process is set to **Initiate Release**. It checks whether the approval is required for the **Release Hold** action in the respective delinquency process type. If the approval is not required while manually releasing the hold on the delinquency process, the status of the delinquency process is immediately changed to its previous status (i.e. **Initiated**, **Delinquency In Progress**, or **Pending Termination**). In addition, the hold end date is set to the date when you manually release the hold on the delinquency process. Finally, the status of hold record is changed to **Completed**. However, if the approval is required while manually releasing the hold on the delinquency process, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the manual hold release and assigned to the users with the approval To Do role. In addition, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress - Exception Raised**) specified in the **Delinquency Process Approval In Progress Status** attribute of the delinquency process preference.
- **Reinstate a Delinquency Process** - This algorithm is invoked when the status of a delinquency process is set to **Initiate Reinstate**. It checks whether the approval is required for the **Request Reinstatement** action in the respective delinquency process type. If the approval is not required while manually reinstating the delinquency process, the status of the delinquency process is changed to the value (for example, **Reinstate**) specified in the **Delinquency Process Reinstate Status** attribute of the delinquency process preference. However, if the approval is required while manually reinstating the delinquency process, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the manual reinstatement and assigned to the users with the approval To Do role. In addition, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress - Exception Raised**) specified in the **Delinquency Process Approval In Progress Status** attribute of the delinquency process preference.

Note:

Reinstating a delinquency process is only applicable for the fully insured group business.

The system considers the approval To Do type and approval To Do role specified in the respective delinquency process type. If the approval To Do role is not specified in the respective delinquency process type, the system considers the default To Do role associated with the approval To Do type.

This algorithm is applicable for both the fully insured group and fully insured individual businesses.

C1-DPLGHLDR

This algorithm creates a delinquency process log entry when Delinquency Process record enters Hold and Release status.

It is applicable for both Fully Insured Group and Individual line of business.

C1-RECALCHLD

This algorithm is configured on the 'Released' status on the Delinquency Process Business Object. Whenever a delinquency process is released after hold, the trigger dates for the non-triggered events should be recalculated by adding the hold days.

It is applicable for both Fully Insured Group and Individual line of business.

Determine Hold days = delinquency process release date - delinquency process hold date

New trigger Date (for remaining events) = Old Trigger Date + Hold Days

C1-TRANSPRV

This algorithm is configured on the 'Released' status on the Delinquency Process Business Object.

Whenever a delinquency process is released after hold, the delinquency process needs to be moved to the status in which it was earlier (before hold).

It is applicable for both Fully Insured Group and Individual line of business.

C1-DPCAN

This algorithm is invoked when the status of a delinquency process is changed to **Canceled**. It does the following:

- Creates a To Do notification with the cancel reason
- If there is any hold record for the delinquency process in the **Active** status, this algorithm changes the status of the hold record to **Complete**.
- If there is any pending record for approval at the delinquency event or process level, this algorithm changes the status of pending approval records to **Expired**.

This algorithm contains the following parameters:

- **To Do Type** - Used to indicate the To Do type using which you want to create a To Do when the delinquency process is canceled. This parameter is required.
- **To Do Role** - Used to indicate that users with the specified To Do role must receive the To Do notification. This parameter is optional. If you do not specify this parameter, this algorithm considers the default To Do role associated with the To Do type.
- **To Do Entry required for Individual Delinquency (Valid Values - Y/N)** - Used to indicate whether the To Do notification should be created on canceling a delinquency process for the fully insured individual business. The valid values are **Y** and **N**. Note that this parameter is not applicable for the fully insured group business. This algorithm will create a To Do notification on canceling a delinquency process for the fully insured group business irrespective of whether this parameter is set to **Y** or **N**.

Note: This algorithm is applicable for both the fully insured group and fully insured individual businesses.

C1-RECALCTG

This algorithm is invoked when the status of a delinquency process is changed from **Canceled** to **Initiated**, **Delinquency In Progress**, or **On Hold**. This happens when the payment or adjustment made against the overdue bill, for which the delinquency process is created, is canceled due to any reason.

This algorithm recalculates the trigger date for the delinquency events which are in the **Pending** status. It derives the difference between the delinquency process resume date and delinquency process cancellation date. These extra days are then added to the existing trigger date of the pending delinquency events and thereby the new trigger dates are calculated for the remaining events. If the **Consider Work Days** option is selected in the respective delinquency process type, the system derives the work calendar of the division to which the person or account belongs. The system then checks whether the new trigger date falls on the working (i.e. business) day. If the new trigger date does not fall on the working (i.e. business) day, the system will accordingly add days to the new trigger date to ensure that it falls on the next working day.

Note: This algorithm is applicable for both the fully insured group and fully insured individual businesses.

C1-TRPOLPTRM

This algorithm is invoked when the status of a delinquency process is changed to **Pending Termination**. It changes the status of all active policies which are billed to the delinquent person or account to a status (i.e. **Pending Termination**) which is specified in the **Pending Termination Policy Status** parameter. While deriving an active policy, the system considers the active status code which is specified in the **Active Policy Status** parameter.

In addition, this algorithm does the following:

- Stamps the termination date and termination reason corresponding to the respective policy
- Creates a log entry in each policy indicating that it is terminated due a delinquency process
- Creates a log entry for each policy in the delinquency process
- Stamps the delinquency process ID as a characteristic using the **C1-DELPO** characteristic type on the policy

It contains the following parameters:

- **Active Policy Status** - Used to specify the active status code of a fully insured group policy. Here, you must specify the status code which is defined in the lifecycle of the **C1-POLICY** business object.
- **Pending Termination Policy Status** - Used to specify the pending termination status code of a fully insured group policy. Here, you must specify the status code which is defined in the lifecycle of the **C1-POLICY** business object.

Both these parameters are mandatory.

Note:

The system derives the policies using an algorithm which is attached to the **Policies Derivation** system event of the respective delinquency process type.

This algorithm is only applicable for the fully insured group business.

C1-MEMTRMRSN

This algorithm is invoked when the status of a delinquency process is changed to **Pending Termination**. It updates the status reason of the active individual memberships which are billed to the delinquent account. The system considers the active individual memberships depending on the value defined for the **Skip Termination of Guaranteed Available Memberships(Valid Values-Y,N)** parameter. If the **Skip Termination of Guaranteed Available Memberships(Valid Values-Y,N)** parameter is set to **Y**, the system does not consider the active individual memberships where the **Evaluate Guaranteed Availability** flag is set to **true**. However, if the **Skip Termination of Guaranteed Available Memberships(Valid Values-Y,N)** parameter is set to **N**, the system considers the active individual memberships irrespective of whether the **Evaluate Guaranteed Availability** flag is set to **true** or **false**.

If the individual membership's start date is later than the respective termination date, this algorithm does the following:

- Updates the status reason of the individual membership. It considers the status reason which is specified in the **Awaiting Membership Cancellation Reason** attribute of the delinquency process preference. Before updating the status reason of the individual membership, the system validates whether the status reason is defined for the **Active** status of the **C1-IndMembership** business object.
- Creates a log entry for each individual membership in the delinquency process

However, if the individual membership's start date is earlier than the respective termination date and if the individual membership's end date is later than the respective termination date, this algorithm does the following:

- Updates the status reason of the individual membership. It considers the status reason which is specified in the **Membership Termination Reason for Delinquency** attribute of the delinquency process preference. Before updating the status reason of the individual membership, the system validates whether the status reason is defined for the **Active** status of the **C1-IndMembership** business object.
- Adds the termination date and termination reason (i.e. status reason) corresponding to the individual membership in the **CI_MEMBERSHIP** table.

- Sets the individual membership's end date to the termination date corresponding to the individual membership in the **CI_MEMBERSHIP** table.
- Creates a log entry in each individual membership indicating that it is terminated due a delinquency process
- Creates a log entry for each individual membership in the delinquency process
- Stamps the delinquency process ID as a characteristic using the **C1-DELPO** characteristic type on the individual membership

It contains the following parameters:

- **Membership Active Status** - Used to specify the active status code of an individual membership. Here, you must specify the status code which is defined in the lifecycle of the **C1-IndMembership** business object.
- **Skip Termination of Guaranteed Available Memberships(Valid Values-Y,N)** - Used to indicate whether you want to skip the active individual memberships where the **Evaluate Guaranteed Availability** flag is set to **true**. The valid values are **Y** and **N**.

Note:

The system derives the individual memberships using an algorithm which is attached to the **Memberships Derivation** system event of the delinquency process type.

The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration.

This algorithm is only applicable for the fully insured individual business.

C1-CRDPTERM

This algorithm is invoked when the status of a delinquency process is changed from **Canceled** to **Initiated**, **Delinquency In Progress**, or **On Hold**. This happens when the payment or adjustment made against the overdue bill, for which the delinquency process is created, is canceled due to any reason.

This algorithm recalculates the trigger date for the delinquency events which are in the **Pending** status. It derives the difference between the delinquency process resume date and delinquency process cancellation date. These extra days are then added to the existing trigger date of the pending delinquency events and thereby the new trigger dates are calculated for the remaining events. If the **Consider Work Days** option is selected in the respective delinquency process type, the system derives the work calendar of the division to which the person or account belongs. The system then checks whether the new trigger date falls on the working (i.e. business) day. If the new trigger date does not fall on the working (i.e. business) day, the system will accordingly add days to the new trigger date to ensure that it falls on the next working day.

Note: This algorithm is applicable for both the fully insured group and fully insured individual businesses.

C1-DLQCCDPS

This algorithm is invoked when the status of a delinquency process is changed to **Customer Terminated**. It creates a customer contact to send a letter (for example, a harsh letter) to the terminated customer to communicate any penalty or legal notice on defaulting or delaying payments.

If the delinquency process is created for a person, this algorithm checks whether the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter is set to **PG**, **BG**, or **BA**. Depending on the value defined for the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter, this algorithm does the following:

- If the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter is set to **PG**, this algorithm checks whether the person type of the person is set to **Parent Customer** or **Bill Group**. If the person type of the person is set to **Parent Customer**, this algorithm creates a customer contact for the parent customer. However, if the person type of the person is set to **Bill Group**, this algorithm derives the parent customer of the bill group (using the **Person**

Relationship Type option type of the **C1-ASOBLLNG** feature configuration) and then creates a customer contact for the parent customer.

- If the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter is set to **BG**, this algorithm checks whether the person type of the person is set to **Parent Customer** or **Bill Group**. If the person type of the person is set to **Parent Customer**, this algorithm creates a customer contact for the parent customer and for all those bill groups of the parent customer who are associated with the parent customer using the relationship type which is specified in the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration. However, if the person type of the person is set to **Bill Group**, this algorithm derives the parent customer of the bill group (using the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration) and then creates a customer contact for the parent customer and for the respective bill group.
- If the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter is set to **BA**, this algorithm checks whether the person type of the person is set to **Parent Customer** or **Bill Group**. If the person type of the person is set to **Parent Customer**, this algorithm creates a customer contact for each account to which the parent customer and its bill groups are associated as the main customer. The system considers those bill groups of the parent customer who are associated with the parent customer using the relationship type which is specified in the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration. However, if the person type of the person is set to **Bill Group**, this algorithm derives the parent customer of the bill group (using the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration) and then creates a customer contact for each account to which the parent customer and the respective bill group are associated as the main customer.

However, if the delinquency process is created for an account, this algorithm checks whether the **Receives Notification** option is selected in the bill routing information of any person associated with the account. If the **Receives Notification** option is selected in the bill routing information of a person, this algorithm creates a customer contact for the person. Note that if the value is specified for the **Account Relationship Type** parameter, this algorithm will consider only those persons who are associated with the account using the given relationship type. In addition, this algorithm does the following:

- Creates a log entry for each customer contact in the delinquency process.
- Stamps the delinquency process ID as a characteristic using the **C1-DELPO** characteristic type on the customer contact.
- Stamps the account ID as a characteristic using the given characteristic type on the customer contact.

Note:

The account ID is stamped as a characteristic on the customer contact only when either of the following condition is met:

The delinquency process is created for a person and the **Notify Group Customer Or Bill Groups Or Bill Accounts** parameter is set to **BA**.

The delinquency process is created for an account.

Once a customer contact is created, a record is added in the **C1_DELIN_PROC_EVT_NOTIF** table where the **DP_EVT_NOTIF_TYPE_FLG** column is set to **CC** and the **DP_EVT_NOTIF_ID** column is set to the customer contact ID.

This algorithm derives the preferred contact method for the customer contact. While deriving the preferred contact method, the algorithm first fetches the main customer's bill route type on the account and then fetches the bill routing method of the bill route type. Once the bill routing method is derived, the system considers the preference which is specified in the **Routing Method - Contact Method Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218. It then checks whether any preferred contact method is mapped to the bill routing method in the preference. If the preferred contact method is mapped to the bill routing method in the preference, the system stamps it on the customer contact. However, if the preferred contact method is not mapped to the bill routing method in the preference, the system considers the default contact method as the preferred contact method and stamps it on the customer contact. This algorithm contains the following parameters:

- **Customer Contact Type** - Used to indicate the customer contact type using which you want to create the customer contact. This parameter is mandatory. Here, you must specify a customer contact type with the appropriate letter template depending on the type of letter you want to send to the customer.

- **Customer Contact Class** - Used to indicate the customer contact class to which the customer contact type belongs. This parameter is mandatory.
- **Default Contact Method** - Used to indicate the contact method that you want to use when the preferred contact method cannot be derived for the routing method from the preference. This parameter is mandatory.
- **Notify Group Customer Or Bill Groups Or Bill Accounts** - Used to indicate whether a customer contact should be created for a parent customer, bill group, and/or for each billing account (that meets the criteria). The valid values are:
 - **PG** - Used when you want to create a customer contact only for the parent customer.
 - **BG** - Used when you want to create a customer contact for the parent customer and for the bill groups of the parent customer. If the person type of the person is set to **Parent Customer**, the system creates a customer contact for the parent customer and for all those bill groups that are associated with the parent customer using the relationship type specified in the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration. However, if the person type of the person is set to **Bill Group**, the system creates a customer contact for the parent customer and the respective bill group.
 - **BA** - Used when you want to create a customer contact for the main customer of the account. If the person type of the person is set to **Parent Customer**, the system creates a customer contact for each account to which the parent customer and its bill groups are associated as the main customer. However, if the person type of the person is set to **Bill Group**, the system creates a customer contact for each account to which the parent customer and the respective bill group are associated as the main customer.
- **Account Characteristic Type** - Used to indicate the characteristic type using which you want to store the account ID on the customer contact. Here, you must specify a characteristic type where the characteristic entity is set to **Customer Contact**.
- **Account Relationship Type** - Used to indicate the relationship type using which the person is associated with the account. The system will then create the customer contacts only for those persons who are associated with the account using the specified relationship type. This parameter is optional. You can specify maximum ten comma-separated values for this parameter. If you do not specify the parameter value, the system will create customer contacts for all the persons who are associated with the account irrespective of their relationship type. Note that this parameter is only applicable for the fully insured individual business. Note that this parameter is only applicable for the fully insured group business.

Note: This algorithm is applicable for both the fully insured group and fully insured individual businesses.

C1-CHKREIRUL

This algorithm is applicable for both Fully Insured Group and Individual line of business and attached on the 'Reinstate' status.

Checks the Allow Automatic Reinstatement and the Maximum Automatic Reinstatement Count configurations set on the Delinquency Process Type, if the Delinquency Process's Automatic Reinstatement Count > Maximum Automatic Reinstatement Count, or if the automatic reinstatement is not allowed, the algorithm creates a To Do Entry.

It also checks for the Reinstatement Threshold (Paid amount percentage should be greater than or equal to the threshold for automatic reinstatement), the Days Since Termination automatic reinstatement is allowed only if is happening within the specified number of days since the termination effective date) and the termination reason.

If Automatic Reinstatement is not possible, then the Delinquency Process will be in 'Automatic Reinstatement Stopped'.

C1-EVALCUSST

This algorithm attached on the 'Reinstate' status of delinquency process business object will evaluate the status of the policies that were terminated via the Delinquency Process and decides whether the process is to be transitioned to the Request Reinstatement status or Customer Reinstated status.

This will work for fully insured groups.

C1-TRPOLPREI

This algorithm is configured on the 'Pending Reinstatement' status on the Delinquency Process Business Object.

It transitions terminated policies of the customer to the pending reinstatement status.

It is applicable only for Fully Insured Group line of business.

C1-UPDDLQRC

This algorithm is configured on the 'Customer Reinstated' status on the Delinquency Process Business Object.

It updates the automatic reinstatement count on the Delinquency Process. It also clears the Reinstatement Trigger Date on the Delinquency Process.

It is applicable for both Fully Insured Group and Individual line of business.

Algorithm Types for Payment Cancellation System Event

Following algorithm types are available for the **Payment Cancellation** system event.

Algorithm Type	Description	Detailed Description
C1-BNDPYCNCL	Binder Payment Cancellation Check Handler Algorithm	This algorithm checks whether the cancelled payment is binder payment or not by verifying the payment characteristics. For more information, see To Do Notification on Binder Payment Cancellation on page 390
C1-CDPPAYCAN	Continue Delinquency Process due to Cancelled Payments	This algorithm resumes the cancelled delinquency processes during the payment cancellations. For more information, see Resuming a Delinquency Process on Payment Cancellation on page 3966
C1-NOTADCAN	Notify Customer on Advance Deposit Cancellation	This algorithm creates a customer contact when an advance deposit payment is cancelled. For more information, see Notification on Advance Deposit Cancellation on page 3990
C1-PXPTDCAL	Paid Through Date Calculation for Payment Cancellation	This algorithm will be responsible for calculating and stamping paid through date in Policy and Membership tables based on parameter specified. For more information, see Policy on page 228
C1-RODPDUEPX	Reopen Delinquency Process due to Cancelled Payments	This algorithm checks for any Delinquency Process related to the FTs matched to the cancelled Payment. For more information, see Resuming a Delinquency Process on Payment Cancellation on page 3966
C1-VALMRPYCN	Validate Member Reconciliation Payment Cancellation	This algorithm transits reconciliation status which is in open/complete status to the pending cancellation status if related tender is cancelled. For more information, see Reconciliation of Individual Health Insurance Subsidy Payments on page 2624

Algorithm Type	Description	Detailed Description
PYCN-EMPTY	An empty sample algorithm for payment cancellation	This is a payment cancellation algorithm, however it does not perform any logic. It exists simply as a sample algorithm available to implementers to use as a base for creating an actual payment cancellation algorithm.

Delinquency Control (Screen)

You need to define a delinquency control for each collection class where the collection method is set to **Self-Control Delinquency**. A new maintenance object named **C1-DELIN-CTR**, a new business object named **C1-DelinControl**, and a new screen named **Delinquency Control** are introduced in this release.

The **Delinquency Control** screen enables you to create, edit, and delete a delinquency control. Note that this screen enables you to define a delinquency control only for those collection classes where the collection method is set to **Self-Control Delinquency**.

A delinquency control enables the system to determine the following:

- A minimum credit review frequency at which the persons or accounts belonging to the respective collection class should be monitored for delinquency. In other words, it indicates in how many days the system should review whether the bills of the persons or accounts are overdue.
- A delinquency monitor rule algorithm that you want to invoke for the collection class while executing the **C1-PRDLQ** or **C1-ACDLQ** batch.

The **Delinquency Control** screen contains the following zones:

- [Delinquency Control List](#) on page 4002
- [Delinquency Control](#) on page 4003

Delinquency Control List

The **Delinquency Control List** zone lists the delinquency controls that are already defined in the system. It contains the following columns:

Column Name	Column Description
Collection Class	Indicates the collection class associated with the delinquency control.
	Note: You can create only one delinquency control for every collection class in the system. You need to set the collection method as Self-Control Delinquency in the collection class while associating the collection class with the delinquency control.
Minimum Credit Review Frequency (Days)	Displays the minimum number of days after which the credit review process should be conducted.
	Note: Based on the specified frequency, the system executes the credit review process in a repetitive manner.
Edit Delinquency Control	On clicking the Edit (✎) icon, the Delinquency Control screen appears where you can edit the details of the delinquency control.

Column Name	Column Description
Delete Delinquency Control	On clicking the Delete (🗑️) icon, you can delete the delinquency control.
	Note: You can delete a delinquency control when the associated collection class is not referred in a delinquency process.

On clicking the **Broadcast** (📡) icon corresponding to a delinquency control, the **Delinquency Control** zone appears with the details of the respective delinquency control.

Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

You can filter the list using **Status** available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (🔍) icon in the upper right corner of this zone.

Delinquency Control

The **Delinquency Control** zone displays the details of the delinquency control. It contains the following sections:

- **Main** - Displays basic information about the delinquency control. It contains the following fields:

Field Name	Field Description
Collection Class	Indicates the collection class associated with the delinquency control.
	Note: It has a link. On clicking the link, the Collection Class screen appears where you can view the details of the respective collection class. You can create only one delinquency control for every collection class in the system. You need to set the collection method as Self-Control Delinquency in the collection class while associating the collection class with the delinquency control.
Minimum Credit Review Frequency (Days)	Displays the minimum number of days after which the credit review process should be conducted.
	Note: Based on the specified frequency, the system executes the credit review process in a repetitive manner.
Status	Indicates the status of the delinquency control. The valid values are: <ul style="list-style-type: none">• Active• Inactive

- **Record Actions** - This section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the delinquency control.
Delete	Used to delete the delinquency control.

Button Name	Button Description
	Note: You can delete a delinquency control when the associated collection class is not referred in a delinquency process.

- **Algorithms** - This section lists the algorithms defined for the delinquency control. It contains the following columns:

Column Name	Column Description
Sequence	Indicates the order in which the algorithms with the same system event must be triggered.
System Event	Indicates the system event when the algorithm must be triggered. The valid value is: <ul style="list-style-type: none"> • Delinquency Monitor Rule - Used when you want to trigger the attached algorithm while executing the following batches: <ul style="list-style-type: none"> • Account Level Delinquency Monitor (C1-ACDLQ) batch • Person Level Delinquency Monitor (C1-PRDLQ) batch
Algorithm	Indicates the algorithm attached to the system event. <p>Note: It has a link. On clicking the link, the Algorithm screen appears where you can view the details of the respective algorithm.</p>

- **Record Information** - This section contains the following field:

Field Name	Field Description
Business Object	Indicates the business object using which the delinquency control is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application. <p>Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.</p>

By default, the **Delinquency Control** zone does not appear in the **Delinquency Control** screen. It appears when you click the **Broadcast** (📡) icon corresponding to a delinquency control in the **Delinquency Control List** zone.

Defining a Delinquency Control

Prerequisites

To define a delinquency control, you should have:

- Delinquency control business object defined in the application.
- Collection class defined where the collection method set to **Self-Control Delinquency**.

Procedure

To define a delinquency control:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **D** and then click **Delinquency Control**.
A sub-menu appears.
3. Click the **Add** option from the **Delinquency Control** sub-menu.

The **Delinquency Control** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the delinquency control.
- **Algorithms** - Used to associate an algorithm with the delinquency control.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Collection Class	Used to indicate the collection class which is associated with the delinquency control.	Yes
	Note: This list displays only those options where the collection method is set as Self-Control Delinquency .	
Business Object	Indicates the business object using which you are defining the delinquency control.	Not applicable
Minimum Credit Review Frequency (Days)	Used to indicate a minimum credit review frequency at which the persons or accounts belonging to the respective collection class should be monitored for delinquency. In other words, it indicates in how many days the system should review whether the bills of the persons or accounts are overdue.	No
Status	Used to indicate the status of the delinquency control. The valid value is: <ul style="list-style-type: none"> • Active • Inactive 	Yes

4. Enter the required details in the **Main** section.
5. Associate the required algorithms with the delinquency control.
6. Click **Save**.
The delinquency control is defined.

How to associate an algorithm with a delinquency control	Associating an Algorithm with a Delinquency Control on page 4005

Associating an Algorithm with a Delinquency Control

Prerequisites

To associate an algorithm with a delinquency control, you should have:

- Algorithm and Algorithm Type defined in the application.
- System event defined in the application.

Procedure

To associate an algorithm with a delinquency control:

1. Ensure that the **Algorithms** section is expanded when you are defining or editing the delinquency control.

The **Algorithms** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to execute the algorithm. The valid values are: <ul style="list-style-type: none">Delinquency Monitor Rule - Used to attach an algorithm that you want to invoke for the collection class while executing the C1-PRDLQ or C1-ACDLQ batch.	Yes (Conditional)
	Note: The C1-DLNQMNRL algorithm type is shipped with the product. You must attach an algorithm created using the C1-DLNQMNRL algorithm type to the Delinquency Monitor Rule system event defined for the delinquency control. For more information see, Algorithm Used in Delinquency Control on page 3991	Note: This field is required while associating an algorithm with the delinquency control.
Sequence	Used to specify the order in which the algorithms for each system event must be executed.	Yes (Conditional)
		Note: This field is required while associating an algorithm with the delinquency control.
Algorithm	Used to specify the algorithm.	Yes (Conditional)
	Note: If you select the system event option, the Search (🔍) icon appears corresponding to the Algorithm field. On clicking the Search (🔍) icon, the Algorithm Search window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the Algorithm field.	Note: This field is required while associating an algorithm with the delinquency control.

2. If you want to associate more than one algorithm with the delinquency control, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to disassociate an algorithm from the delinquency control, click the **Delete** (🗑) icon corresponding to the algorithm.

3. Click **Save**.
The algorithms are associated with the delinquency control.

Editing a Delinquency Control

Prerequisites

To edit a delinquency control, you should have:

- Delinquency control business object defined in the application.
- Collection class defined where the collection method set to **Self-Control Delinquency**.

Procedure

To edit a delinquency control:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **D** and then click **Delinquency Control**.
A sub-menu appears.
3. Click the **Search** option from the **Delinquency Control** sub-menu.
The **Delinquency Control** screen appears.
4. In the **Delinquency Control List** zone, click the **Edit** (✎) icon in the **Edit Delinquency Control** column corresponding to the *delinquency control* whose details you want to edit.

The **Delinquency Control** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the delinquency control.
- **Algorithms** - Used to associate an algorithm with the delinquency control.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Collection Class	Indicates the collection class which is associated with the delinquency control.	Not applicable
Business Object	Indicates the business object using which you are defining the delinquency control.	Not applicable
Minimum Credit Review Frequency (Days)	Used to indicate a minimum credit review frequency at which the persons or accounts belonging to the respective collection class should be monitored for delinquency. In other words, it indicates in how many days the system should review whether the bills of the persons or accounts are overdue.	No
Status	Used to indicate the status of the delinquency control. The valid value is: <ul style="list-style-type: none"> • Active • Inactive 	Yes

5. Modify the details in the **Main** section, if required.
6. Associate the required algorithms with the delinquency control.
7. Click **Save**.
The changes made to the delinquency control are saved.

Deleting a Delinquency Control

Procedure

To delete a delinquency control:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **D** and then click **Delinquency Control**.
A sub-menu appears.
3. Click the **Search** option from the **Delinquency Control** sub-menu.
The **Delinquency Control** screen appears.
4. In the **Delinquency Control** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the *delinquency* control that you want to delete.

A message appears confirming whether you want to delete the delinquency control.

Note: You can delete a delinquency control when the associated collection class is not referred in a delinquency process.

Tip: Alternatively, you can delete a delinquency control by clicking the **Delete** button in the **Delinquency Control List** zone.

5. Click **OK**.
The delinquency control is deleted.

Delinquency Event Type (Screen)

The Delinquency event type screen allows you to define, edit, copy, and delete a delinquency event type. It contains the following zones:

- [Delinquency Event Type List](#) on page 4009
- [Delinquency Event Type](#) on page 4009

Delinquency Event Type List

The **Delinquency Event Type List** zone lists the delinquency event types that are already defined in the system. It contains the following columns:

Column Name	Column Description
Delinquency Event Type	Displays the delinquency event type.
Description	Displays the description of the delinquency event type.
Edit	On clicking the Edit (✎) icon, the Delinquency Event Type screen appears where you can edit the details of the delinquency event type.
Duplicate	On clicking the Duplicate (📄) icon, the Delinquency Event Type screen appears where you can define a new delinquency event type using an existing delinquency event type.
Delete	On clicking the Delete (🗑) icon, you can delete the delinquency event type.
	Note: You can delete a delinquency event type when a delinquency process is not created using the delinquency event type.

On clicking the **Broadcast** (📡) icon corresponding to a delinquency event type, the **Delinquency Event Type** zone appears with the details of the respective delinquency event type.

Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Delinquency Event Type

The **Delinquency Event Type** zone displays the details of the delinquency event type. It contains the following sections:

- **Main** - Displays basic information about the delinquency event type. It contains the following fields:

Field Name	Field Description
Delinquency Event Type	Displays the delinquency event type.
Customer Contact Event	Indicates the event created for customer contact.

Field Name	Field Description
Description	Displays the description of the delinquency event type.
Detailed Description	Displays additional information about the delinquency event type.

- **Record Actions** - This section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the delinquency event type.
Delete	Used to delete the delinquency event type. Note: You can delete a delinquency event type when a delinquency process is not created using the delinquency event type.
Duplicate	Used to create a new delinquency event type using an existing delinquency event type.

- **Algorithms** - This section lists the algorithms defined for the delinquency event type. It contains the following columns:

Column Name	Column Description
Sequence	Indicates the order in which the algorithms with the same system event must be triggered.
System Event	Indicates the system event when the algorithm must be triggered. The valid values are: <ul style="list-style-type: none"> • Event Activation - Used to configure the following algorithms: <ul style="list-style-type: none"> • C1-DLQCRTODO - Used to create a To Do for the main customer of the account when the delinquency event is triggered. This algorithm is invoked in the C1-DPMON batch. Note: The C1-DLQCRTODO algorithm type and algorithm are shipped with the product. You need to attach this algorithm to the Event Activation system event. For more information about the algorithm, refer to C1-DLQCRTODO on page 3885 • C1-DETERMDT - Used to calculate the termination effective date for the main customer of the account when the delinquency event is triggered. This algorithm is invoked in the C1-DPMON batch. Note: The C1-DETERMDT algorithm type and algorithm are shipped with the product. You need to attach this algorithm to the Event Activation system event. For more information about the algorithm, refer to C1-DETERMDT on page 3888 • C1-DLQSENDCC - Used to the create customer contacts for all the persons who are associated with the account that is configured to receive the notification when the delinquency event is triggered. This algorithm is invoked in the C1-DPMON batch. Note: The C1-DLQSENDCC algorithm type and algorithm are shipped with the product. You need to attach this algorithm to the Event Activation system event. For more information about the algorithm, refer to C1-DLQSENDCC on page 3885 • Monitor Completed Event - Used to configure the following algorithms: <ul style="list-style-type: none"> • C1-RCLTRGDMD - Used to retrieve the customer contact created for the event and recalculates the trigger date of the pending events in the delinquency process

Column Name	Column Description
	<p>based on the document mail date when the delinquency event is triggered. This algorithm is invoked in the C1-DPMON batch.</p> <p>Note: The C1-RCLTRGDMD algorithm type and algorithm are shipped with the product. You need to attach this algorithm to the Monitor Completed Event system event. For more information about the algorithm, refer to C1-RCLTRGDMD on page 3893</p> <ul style="list-style-type: none"> • C1-TRNTERTRG - Used to evaluate the termination trigger date configurations and decide the subsequent status of the delinquency process when the delinquency event is triggered. This algorithm is invoked in the C1-DPMON batch. <p>Note: The C1-TRNTERTRG algorithm type and algorithm are shipped with the product. You need to attach this algorithm to the Monitor Completed Event system event. For more information about the algorithm, refer to C1-TRNTERTRG on page 3893</p>
Algorithm	<p>Indicates the algorithm attached to the system event.</p> <p>Note: It has a link. On clicking the link, the Algorithm screen appears where you can view the details of the respective algorithm.</p>

- **Record Information** - This section contains the following field:

Field Name	Field Description
Business Object	<p>Indicates the business object using which the delinquency event type is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.</p> <p>Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.</p>

By default, the **Delinquency Event Type** zone does not appear in the **Delinquency Event Type** screen. It appears when you click the **Broadcast** (📡) icon corresponding to a delinquency event type in the **Delinquency Event Type List** zone.

Defining a Delinquency Event Type

Prerequisites

To define a delinquency event type, you should have:

- Delinquency event type business objects defined in the application

Procedure

To define a delinquency event type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **D** and then click **Delinquency Process Type**.
A sub-menu appears.
3. Click the **Add** option from the **Delinquency Event Type** sub-menu.

The **Delinquency Event Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the delinquency event type.
- **Algorithms** - Used to associate an algorithm with the delinquency event type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Delinquency Event Type	Displays the delinquency event type.	Not applicable
Business Object	Indicates the business object using which you are defining the delinquency event type.	Not applicable
Customer Contact Event		No
Description	Used to specify the description for the delinquency event type.	Yes
Detailed Description	Used to specify additional information about the delinquency event type.	No

4. Enter the required details in the **Main** section.
5. Associate an algorithm with a delinquency event type, if required.
6. Click **Save**.

The delinquency event type is defined.

How to associate an algorithm with a delinquency event type	Associating an Algorithm with a Delinquency Event Type on page 4012

Associating an Algorithm with a Delinquency Event Type

Prerequisites

To associate an algorithm with a delinquency event type, you should have:

- Algorithm and algorithm type defined in the application.
- Values defined for the **DELIN_EVT_TYPE_SEVT_FLG** lookup field.

Procedure

To associate an algorithm with a delinquency event type:

1. Ensure that the **Algorithms** section is expanded when you are defining or editing the delinquency event type.

The **Algorithms** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to execute the algorithm. The valid values are: <ul style="list-style-type: none"> • Event Activation 	Yes (Conditional)

Column Name	Column Description	Mandatory (Yes or No)																
	<ul style="list-style-type: none"> Monitor Completed Event 	Note: This field is required while associating an algorithm with the delinquency event type.																
	Note: The above system events are used when you want to trigger the attached algorithm while executing the Delinquency Process Monitor (C1-DPMON) batch. The Event Activation system event is invoked on the trigger date to perform the actions related to those events which are in the Pending status. Once all the actions are executed, the event status is changed from Pending to Completed . The Monitor Completed Event system event is invoked on those events which are in the Completed status, to determine whether the delinquency process can proceed to the next subsequent event.																	
	The following table lists the algorithms which must be attached to the above system events:																	
	<table border="1"> <thead> <tr> <th>System Event</th><th>Algorithm</th><th>Description</th></tr> </thead> <tbody> <tr> <td>Event Activation</td><td>C1-DLQCRTODO</td><td>Refer to C1-DLQCRTODO on page 3885</td></tr> <tr> <td>Event Activation</td><td>C1-DETERMDT</td><td>Refer to C1-DETERMDT on page 3888</td></tr> <tr> <td>Event Activation</td><td>C1-DLQSENDCC</td><td>Refer to C1-DLQSENDCC on page 3885</td></tr> <tr> <td>Monitor Completed Event</td><td>C1-RCLTRGDMD</td><td>Refer to C1-RCLTRGDMD on page 3893</td></tr> <tr> <td>Monitor Completed Event</td><td>C1-TRNTERTRG</td><td>Refer to C1-TRNTERTRG on page 3893</td></tr> </tbody> </table>		System Event	Algorithm	Description	Event Activation	C1-DLQCRTODO	Refer to C1-DLQCRTODO on page 3885	Event Activation	C1-DETERMDT	Refer to C1-DETERMDT on page 3888	Event Activation	C1-DLQSENDCC	Refer to C1-DLQSENDCC on page 3885	Monitor Completed Event	C1-RCLTRGDMD	Refer to C1-RCLTRGDMD on page 3893	Monitor Completed Event
System Event	Algorithm	Description																
Event Activation	C1-DLQCRTODO	Refer to C1-DLQCRTODO on page 3885																
Event Activation	C1-DETERMDT	Refer to C1-DETERMDT on page 3888																
Event Activation	C1-DLQSENDCC	Refer to C1-DLQSENDCC on page 3885																
Monitor Completed Event	C1-RCLTRGDMD	Refer to C1-RCLTRGDMD on page 3893																
Monitor Completed Event	C1-TRNTERTRG	Refer to C1-TRNTERTRG on page 3893																
Sequence	Used to specify the order in which the algorithms for each system event must be executed.	Yes (Conditional) Note: This field is required while associating an algorithm with the delinquency event type.																
Algorithm	Used to specify the algorithm.	Yes (Conditional)																

Column Name	Column Description	Mandatory (Yes or No)
	Note: If you select the system event option, the Search (🔍) icon appears corresponding to the Algorithm field. On clicking the Search (🔍) icon, the Algorithm Search window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the Algorithm field.	Note: This field is required while associating an algorithm with the delinquency event type.

2. If you want to associate more than one algorithm with the delinquency process type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to disassociate an algorithm from the delinquency process type, click the **Delete** (🗑) icon corresponding to the algorithm.

3. Click **Save**.
The algorithms are associated with the delinquency event type.

Editing a Delinquency Event Type

Prerequisites

To edit a delinquency event type, you should have:

- Delinquency event type business objects defined in the application

Procedure

To edit a delinquency event type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **D** and then click **Delinquency Process Type**.
A sub-menu appears.
3. Click the **Search** option from the **Delinquency Event Type** sub-menu.
The **Delinquency Event Type** screen appears.
4. In the **Delinquency Event Type** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the delinquency event type whose details you want to edit.

The **Delinquency Event Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the delinquency event type.
- **Algorithms** - Used to associate an algorithm with the delinquency event type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Delinquency Event Type	Used to specify the delinquency event type.	Yes
Business Object	Indicates the business object using which you are defining the delinquency event type.	Not applicable
Customer Contact Event		No
Description	Used to specify the description for the delinquency event type.	Yes

Field Name	Field Description	Mandatory (Yes or No)
Detailed Description	Used to specify additional information about the delinquency event type.	No

Tip: Alternatively, you can edit a delinquency event type by clicking the **Edit** button in the **Delinquency Event Type** zone.

- Enter the required details in the **Main** section.
- Associate the required algorithms with a delinquency event type.
- Click **Save**.
The changes made to the delinquency event type are saved.

Copying a Delinquency Event Type

Instead of creating a delinquency event type from scratch, you can create a new delinquency event type using an existing delinquency event type. This is possible through copying a delinquency event type. On copying a delinquency event type, the details including the algorithms are copied to the new delinquency event type. You can then edit the details, if required.

Prerequisites

To copy a delinquency event type, you should have:

- Delinquency event type business objects defined in the application

Procedure

To copy a delinquency event type:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **D** and then click **Delinquency Event Type**.
A sub-menu appears.
- Click the **Search** option from the **Delinquency Event Type** sub-menu.
The **Delinquency Event Type** screen appears.
- In the **Delinquency Event Type List** zone, click the **Duplicate** (🔗) icon in the **Duplicate** column corresponding to the delinquency event type whose copy you want to create.

The **Delinquency Event Type** screen appears. It contains the following sections:

- Main** - Used to specify basic details about the delinquency event type.
- Algorithms** - Used to associate an algorithm with the delinquency event type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Delinquency Event Type	Used to specify the delinquency event type.	Yes
Business Object	Indicates the business object using which you are defining the delinquency event type.	Not applicable
Customer Contact Event		No
Description	Used to specify the description for the delinquency event type.	Yes
Detailed Description	Used to specify additional information about the delinquency event type.	No

Tip: Alternatively, you can copy a delinquency event type by clicking the **Duplicate** button in the **Delinquency Event Type** zone.

- Enter the required details in the **Main** section.
- Associate the required algorithm with a delinquency event type.
- Click **Save**.
The new delinquency event type is defined.

Deleting a Delinquency Event Type

Procedure

To delete a delinquency event type:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **D** and then click **Delinquency Event Type**.
A sub-menu appears.
- Click the **Search** option from the **Delinquency Event Type** sub-menu.
The **Delinquency Event Type** screen appears.
- In the **Delinquency Event Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the delinquency event type that you want to delete.

A message appears confirming whether you want to delete the delinquency event type.

Note: You can delete a delinquency event type when the delinquency event type is not associated with a delinquency process type.

Tip: Alternatively, you can delete a delinquency event type by clicking the **Delete** button in the **Delinquency Event Type List** zone.

5. Click **OK**.
The delinquency event type is deleted.

Viewing the Delinquency Event Type Details

Procedure

To view the details of the delinquency event type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **D** and then click **Delinquency Event Type**.
A sub-menu appears.
3. Click the **Search** option from the **Delinquency Event Type** sub-menu.
The **Delinquency Event Type** screen appears.
4. In the **Delinquency Event Type List** zone, click the **Broadcast** (📡) icon corresponding to the delinquency event type whose details you want to view.
The **Delinquency Event Type** zone appears.
5. View the details of the delinquency event type in the **Delinquency Event Type** zone.

Delinquency Process Type (Screen)

Oracle Revenue Management and Billing allows you to define a delinquency process type using which you can create a delinquency process. It is the delinquency process type which helps the system to determine the following:

- The delinquency entity type which decides whether the delinquency process type is applicable for a person level or an account level delinquency.
- The collection object which defines the type of object managed by the delinquency process.
- The delinquency event trigger modes, such as **Manual**, **Automatic**, and **Manual or Automatic** are configured in the system. For more information, see [Defining a Delinquency Process Type](#) on page 4029
- The delinquency event trigger date calculation rules which are configured for the delinquency process using the delinquency process type. For more information, see [Defining a Delinquency Process Type](#) on page 4029

- The business object using which the delinquency process should be created in the system.
- The consider work days that verify the calculated trigger date in the system.
- The grace period configured for an individual membership. For more information, see [Configuring the Grace Period for a Delinquency Process Type](#) on page 4038
- Whether the trigger date recalculation is configured for the delinquency process that is kept on hold and resumed later for some reason. For more information, see [Configuring the Trigger Date Recalculation Method in a Delinquency Process Type](#) on page 4044
- The algorithms defined for the delinquency process. For more information, see [Associating an Algorithm with a Delinquency Process Type](#) on page 4036
- The delinquency process type events configured for the delinquency process. For more information, see [Configuring an Event for a Delinquency Process Type](#) on page 4032
- Whether an automatic termination is configured for the delinquency process. For more information, see [Configuring the Automatic Termination and Reinstatement Process in a Delinquency Process Type](#) on page 4040

Note: You can only configure the automatic termination (in a delinquency process type) for an individual membership.

- Whether an approval is configured for manual actions taken on the delinquency process. For more information, see [Configuring the Approval Process in a Delinquency Process Type](#) on page 4046
- Whether the termination date rule priority is configured for the delinquency process. For more information, see [Setting the Termination Date Rules in a Delinquency Process Type](#) on page 4043
- Whether a characteristic is defined for a delinquency process. For more information, see [Defining a Characteristic for a Delinquency Process Type](#) on page 4047

This screen consists of the following zones:

- [Delinquency Process Type List](#) on page 4018
- [Delinquency Process Type](#) on page 4019

Delinquency Process Type List

The **Delinquency Process Type List** zone lists the delinquency process types that are already defined in the system. It contains the following columns:

Column Name	Column Description
Delinquency Process Type	Displays the delinquency process type.
Description	Displays the description of the delinquency process type.
Delinquency Entity Type	Indicates the type of entity created for delinquency. The valid values are: <ul style="list-style-type: none">• Account• Person
	Note: At present, only the Account entity is applicable for an individual delinquency.
Status	Indicates the status of the delinquency process type. The valid values are: <ul style="list-style-type: none">• Active• Inactive
Edit	On clicking the Edit (✎) icon, the Delinquency Process Type screen appears where you can edit the details of the delinquency process type.
Delete	On clicking the Delete (🗑) icon, you can delete the delinquency process type.

Column Name	Column Description
	Note: You can delete a delinquency process type when a delinquency process is not created using the delinquency process type.

On clicking the **Broadcast** (📡) icon corresponding to a delinquency process type, the **Delinquency Process Type** zone appears with the details of the respective delinquency process type.

Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

You can filter the list using various search criteria (such as, **Delinquency Entity Type**, **Description**, and **Status**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (🔍) icon in the upper right corner of this zone.

Delinquency Process Type

The **Delinquency Process Type** zone displays the details of the delinquency process type. It contains the following sections:

- **Main** - Displays basic information about the delinquency process type. It contains the following fields:

Field Name	Field Description
Delinquency Process Type	Displays the delinquency process type.
Delinquency Entity Type	Displays the entity type for which the delinquency process type is created.
Delinquency Process Business Object	Indicates the business object using which the delinquency process should be created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.
Description	Displays the description of the delinquency process type.
Detailed Description	Displays additional information about the delinquency process type.
Status	Indicates the status of the delinquency process type. The valid values are: <ul style="list-style-type: none">• Active• Inactive
Collection Object	Indicates the entity on which the collection should take place in the delinquency process.
	Note: At present, the system supports Bill as the collection entity.
Automatic Termination and Reinstatement Required	Indicates whether the automatic termination and reinstatement is required or not for the delinquency process.
	Note: At present, automatic reinstatement is not applicable for individual delinquency.
Delinquency Event Trigger Mode	Indicates the mode in which the delinquency event must be triggered. The valid values are: <ul style="list-style-type: none">• Automatic

Field Name	Field Description
	<ul style="list-style-type: none"> Manual Manual or Automatic
Trigger Date Calculation Mode	<p>Indicates the mode in which the date calculation must be triggered. The valid values are:</p> <ul style="list-style-type: none"> Latest Bill Due Date with Grace Period Usage Basis
Wait Period	<p>Indicates the specific period considered for calculating the trigger dates for the events on the delinquency process. The valid values are:</p> <ul style="list-style-type: none"> Monthly Cyclic Wait Days
Usage Basis	<p>Indicates the option based on which the date calculation must be take place. The valid values are:</p> <ul style="list-style-type: none"> Delinquency Process Creation Date Grace Start Date Latest Bill Date Latest Bill Due Date
Consider Work Days	Indicates whether you want to consider work days for the trigger dates of the events on the delinquency process.

- **Record Actions** - This section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the delinquency process type.
Delete	Used to delete the delinquency process type.
	Note: You can delete a delinquency process type. when the delinquency process type is not created using the delinquency process type.
Duplicate	Used to create a new delinquency process type using an existing delinquency process type.

- **Record Information** - This section contains the following field:

Field Name	Field Description
Business Object	Indicates the business object using which the delinquency process type is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Business Object screen appears where you can view the details of the respective business object.

- **Characteristics** - This section lists the characteristics of the delinquency process type. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Delinquency Process Event Types** - This section lists the event types defined for the delinquency process type. It contains the following columns:

Column Name	Column Description
Sequence	Indicates the sequence of the field attribute.
Delinquency Event Type	Indicates the delinquency event type.
	Note: It has a link. On clicking the link, the Delinquency Event Type screen appears where you can view the details of the respective delinquency event type
Trigger Period	Indicates the period when you want to trigger the event using the delinquency event type. The valid values are: <ul style="list-style-type: none"> • After Grace End Date • Before Grace End Date
	Note: The system calculates the trigger date based on the trigger period. If you select the After Grace End Date option, the system calculates the trigger date using the following formula: $\text{Trigger Date} = \text{Grace End Date} + \text{Wait Days}$
	If you select the Before Grace End Date option, the system calculates the trigger date using the following formula: $\text{Trigger Date} = \text{Grace End Date} - \text{Wait Days}$
Wait Period Source	Indicates the source from where the wait period is received. The valid values are: <ul style="list-style-type: none"> • Algorithm • Delinquency Process Type
	Note: You need to configure the Derive Wait Period Details based on Business Rules (C1-DERWDBR) algorithm in the delinquency process type, if you select the Algorithm option from the Wait Period Source field.
Wait Days	Displays the wait period (in days) after which the delinquency event is triggered.
	Note: Data in this column appears only if you have selected the Wait Days option from the Wait Period field.
Wait Months	Displays the wait period (in months) after which the delinquency event is triggered.
	Note: Data in this column appears only if you have selected the Monthly Cyclic option from the Wait Period field.
Day of Month	Indicates the particular day of the month after which the delinquency event is triggered.
	Note: Data in this column appears only if you have selected the Monthly Cyclic option from the Wait Period field.

Column Name	Column Description
Move Past Dated Event To Future	Indicates whether you want to move the past dated event to a future date.
Defer to Next Cycle	Indicates whether you want to move the delinquency event to the next billing cycle.
Preview Required	Indicates whether an delinquency event requires a preview before it is actually triggered.
Preview Days	Displays the preview period (in days) prior to which the delinquency event is triggered for preview.
	<p>Note: The system calculates the preview date based on preview days. The preview date is calculated using the following formula:</p> $\text{Preview Date} = \text{Trigger Date} - \text{Preview Days}$
Skip Past Event	Indicates whether you want to skip any event if the calculated trigger date for the event is past dated.
Eligibility Rule Type	Indicates the rule type eligibility for the delinquency process type.
	<p>Note:</p> <p>To define the rule type eligibility, you need to do the following:</p> <ul style="list-style-type: none"> Define the required parameters using the following source entities: <ul style="list-style-type: none"> Account Health Plan Health Product Person and set the parameter usage to Rule Eligibility Criteria. Define a rule type where the rule type usage is set to Delinquency Process Event Eligibility. Define a rule using the rule type with a parameter configured using the above source entities. <p>For example, you configure a parameter (created using the Health Plan source entity) within a rule type and create a rule using the respective rule type. When the C1-DPEVL batch is executed, the system invokes the rules engine for each health plan associated with the memberships which are derived using the membership derivation algorithm. If the rules engine returns with a Success status at least for one health plan, the system includes the configured event in the delinquency process, else the event is deleted from the delinquency process.</p> <p>Once the C1-ACDLQ batch is executed, the system adds all the events irrespective of eligibility in the delinquency process, and later on the C1-DPEVL batch evaluates the eligibility for each event.</p>
Send Membership Level Notification Source	<p>Indicates the source from where the send membership level notification information is received. The valid values are:</p> <ul style="list-style-type: none"> Algorithm Delinquency Process Type

Column Name	Column Description
	<p>Note:</p> <p>You need to configure the Derive Send Member Level Notification based on Business Rules (C1-DERMLNBR) algorithm in the delinquency process type, if you select the Algorithm option from the Send Membership Level Notification Source field.</p> <p>This field is not applicable for Individual Delinquency purposes.</p>
Send Membership Level Notification	<p>Indicates whether you want to send membership level notification when customer contacts are created as part of the events in the delinquency process created using the delinquency process type. The valid values are:</p> <ul style="list-style-type: none"> Send Membership Level Notification Required Send Membership Level Notification Not Required <p>Note:</p> <p>You need to execute the Create Member Level Notifications (C1-MBRNT) batch to derive the list of memberships for the delinquent person or account.</p> <p>This field is not applicable for Individual Delinquency purposes.</p>

- **Algorithms** - This section lists the algorithms defined for the delinquency process type. It contains the following columns:

Column Name	Column Description
Sequence	Indicates the order in which the algorithms with the same system event must be triggered.
System Event	<p>Indicates the system event when the algorithm must be triggered. The valid values are:</p> <ul style="list-style-type: none"> Calculate Unpaid and Original Amounts Cancel Criteria Hold Delinquency Process Criteria Release Delinquency Process Criteria Policies Derivation Grace Period Derivation Termination Date Rule Derivation Trigger Date Recalculation Option Derivation Termination and Reinstatement Configuration Derivation Wait Days Derivation Send Member Level Notification Option Derivation Membership Notification Days Derivation <p>Note: For more information on each system event, refer to Associating an Algorithm with a Delinquency Process Type on page 4036</p>
Algorithm	<p>Indicates the algorithm attached to the system event.</p> <p>Note: It has a link. On clicking the link, the Algorithm screen appears where you can view the details of the respective algorithm.</p>

- **Grace Period Configuration** - This section lists the grace period configuration defined for the delinquency process type. It contains the following fields:

Field Name	Field Description
Grace Period Source	Indicates the source for grace period. The valid values are: <ul style="list-style-type: none"> • Algorithm • Delinquency Process Type
	Note: You need to configure the Derive Grace Period based on Business Rules (C1-DEGRBR) algorithm in the delinquency process type, if you select the Algorithm option from the Grace Period Source field.
Grace Period (Days)	Displays the number of days which are used to define the grace period end date for the delinquency process.
	Note: For example, if a delinquency process contains bills with the latest bill due date as 01-Jan-2023, the system considers the latest bill due date as the grace period start date which is 01-Jan-2023. Now, if you have configured the grace period as 30 days, the system determines the grace period end date as 31-Jan-2023 by using the following formula: $\text{Grace Period End Date} = \text{Grace Period Start Date} + \text{Grace Period}$
Grace Start Date Basis	Indicates the option based on which the grace date calculation is performed. The valid values are: <ul style="list-style-type: none"> • Delinquency Process Creation Date • Latest Bill Due Date • X Days after Latest Bill Due Date
	Note: The grace start date basis is used as the base date for performing the grace period calculation.
Add Days To Due Date	Displays the number of days by which the due date gets extended and is further used for calculating the grace end date.
	Note: For example, if the grace period start date is set as 01-Jan-2023 and you have configured the add days to due date as 7 days, the system adds the add days to due date to the grace period start date. Therefore, the new grace period start date is now set as 08-Jan-2023. The system then combines the grace period start date with the grace period to calculate the grace period end date using the following formula: $\text{Grace Period End Date} = \text{Grace Period Start Date} + \text{Grace Period}$

- **Termination and Reinstatement Configuration** - This section lists the termination and reinstatement configuration defined for the delinquency process type. It contains the following fields:

Field Name	Field Description
Termination Reinstatement Configuration Source	<p>Indicates the source for termination and reinstatement configuration. The valid values are:</p> <ul style="list-style-type: none"> Algorithm Delinquency Process Type <p>Note: You need to configure the Derive Termination and Reinstatement configuration based on Business Rules (C1-DERTROBR) algorithm in the delinquency process type, if you select the Algorithm option from the Termination Reinstatement Configuration Source field.</p>
Trigger Termination Process	<p>Indicates an option based on which the termination process is triggered. The valid values are:</p> <ul style="list-style-type: none"> After X Days Immediate Month End
Termination Wait Days	<p>Displays the wait period (in days) after which the termination process is triggered.</p> <p>Note:</p> <p>The system sets the termination wait days to zero, if you do not specify a value while defining or editing a delinquency process type.</p> <p>The data appears in this field only when you have selected the After X Days option from the Termination Wait Days field.</p>
Allow Automatic Reinstatement	<p>Indicates whether you want to allow automatic reinstatement of the individual membership. The valid values are:</p> <ul style="list-style-type: none"> Yes No <p>Note: This field is not applicable for Individual Delinquency purposes.</p>
Maximum Automatic Reinstatement Count	<p>Displays the maximum number of time the system allows automatic reinstatement.</p> <p>Note: This field is not applicable for Individual Delinquency purposes.</p>
Trigger Reinstatement Process	<p>Indicates an option based on which the reinstatement process must be triggered. The valid values are:</p> <ul style="list-style-type: none"> After X Days Immediate Month End <p>Note: This field is not applicable for Individual Delinquency purposes.</p>
Reinstatement Wait Days	<p>Displays the wait period (in days) after which the reinstatement process is triggered.</p>

Field Name	Field Description
	<p>Note:</p> <p>The system sets the reinstatement wait days to zero, if you do not specify a value while defining or editing a delinquency process type.</p> <p>This field is not applicable for Individual Delinquency purposes.</p>
Reinstatement Threshold	<p>Displays the value based on which the automatic reinstatement takes place.</p> <p>Note:</p> <p>The percentage of the amount paid must be greater than or equal to the threshold percentage based on which automatic reinstatement takes place.</p> <p>This field is not applicable for Individual Delinquency purposes.</p>
Days Since Termination	<p>Displays the number of days since the termination effective date for automatic reinstatement to take place.</p> <p>Note:</p> <p>If you configure the days since termination as 10 days for automatic reinstatement, the system adds days since termination to the termination effective date irrespective of whether termination effective date is elapsed or not. If the termination effective date is elapsed, the system does not perform the automatic reinstatement. In this case, you have to manually conduct the reinstatement process.</p> <p>The automatic reinstatement process is triggered only within the certain number of days once the termination has taken place.</p> <p>This field is not applicable for Individual Delinquency purposes.</p>
Membership Notification Days Source	<p>Indicates the source from where the membership notification days information is received. The valid values are:</p> <ul style="list-style-type: none"> Algorithm Delinquency Process Type <p>Note:</p> <p>You need to configure the Derive Member Notification Days based on Business Rules (C1-DETMNDAYS) algorithm in the delinquency process type, if you select the Algorithm option from the Membership Notification Days Source field.</p> <p>This field is not applicable for Individual Delinquency purposes.</p>
Member Notification Days	<p>Displays the number of days after which the member receives notification.</p> <p>Note: This field is not applicable for Individual Delinquency purposes.</p>

Note: This section appears only when the **Automatic Termination and Reinstatement Required** checkbox is selected. At present, the automatic reinstatement process is not applicable for individual delinquency purposes, hence this section displays fields related to automatic termination such as **Termination Reinstatement Configuration Source**, **Trigger Termination Process**, and **Termination Wait Days**.

- **Termination Date Rule Priority** - This section lists the priority and termination date rule defined for the delinquency process type. It contains the following columns:

Column Name	Column Description
Priority	Displays the order in which the termination date rule is considered while defining a delinquency process type.
	<p>Note:</p> <p>The system selects the termination date rule which has the highest priority.</p> <p>For example, let us assume that an individual customer exists in the system with different memberships, where the membership attributes are responsible to retrieve the termination date rules. If you want to terminate an individual customer who has different memberships, the system requires a termination date rule which calculates the termination effective date for the termination process.</p> <p>Now, the system goes through multiple memberships and derives different termination date rules for different memberships, making it difficult to select a particular termination date rule to calculate the termination effective date. Here, the system derives the priority sequence of each rule, and selects the termination date rule which has the highest priority.</p>
Termination Date Rule	Indicates the termination date rule used for calculating the termination effective date.

Note: This section appears only when the **Automatic Termination and Reinstatement Required** option is selected.

- **Termination Reasons For Automatic Reinstatement** - This section lists the termination reasons defined for automatic reinstatement in the delinquency process type. It contains the following column:

Column Name	Column Description
Termination Reason	Indicates the reason which is specified during the termination process.
	<p>Note:</p> <p>The automatic reinstatement takes place only when a reason is specified during the termination process, and the specified reason appears in the Termination Reason list. If the specified reason does not appear in the Termination Reason list, you have to manually perform the reinstatement process.</p> <p>This field is not applicable for individual delinquency purposes.</p>

Note: This section appears only when the **Automatic Termination and Reinstatement Required** option is selected.

- **Trigger Date Recalculation Configuration** - This section lists the termination reasons defined for automatic reinstatement in the delinquency process type. It contains the following fields:

Field Name	Field Description
Trigger Date Recalculation On Hold Release Source	<p>Indicates the source for recalculating the trigger date once the hold request is released. The valid values are:</p> <ul style="list-style-type: none"> • Algorithm • Delinquency Process Type

Field Name	Field Description
	Note: You need to configure the Derive Recalculate Trigger Date option based on Business Rules (C1-DERRTDBR) algorithm in the delinquency process type, if you select the Algorithm option from the Trigger Date Recalculation On Hold Release Source field.
Trigger Date Recalculation On Hold Release	Indicates whether you want to recalculate the trigger date once the hold request is released. The valid values are: <ul style="list-style-type: none"> • Yes • No
Trigger Date Recalculation On Resume Source	Indicates the source for recalculating the trigger date once the hold request is resumed. The valid values are: <ul style="list-style-type: none"> • Algorithm • Delinquency Process Type Note: You need to configure the Derive Recalculate Trigger Date option based on Business Rules (C1-DERRTDBR) algorithm in the delinquency process type, if you select the Algorithm option from the Trigger Date Recalculation On Resume Source field.
Trigger Date Recalculation On Resume	Indicates whether you want to recalculate the trigger date once the hold request is resumed. The valid values are: <ul style="list-style-type: none"> • Yes • No

Note: The system conducts trigger date recalculation in the following scenarios:

- When the delinquency process is kept on hold for certain days and is later released either on hold end date or through manual intervention, the system determines the total number of days (hold days) the delinquency process was kept on hold. The system adds the calculated days to the trigger date which was calculated earlier and calculates the trigger date once again. This recalculated trigger date is used to trigger those events which were not triggered as the delinquency process was kept on hold.
- When you make a payment against a bill for which a delinquency process is created, the system cancels the delinquency process. If the payment made against a bill gets canceled due to any reason after some days, the system checks whether there are any overdue bills for the respective account. If the overdue bills exist, the delinquency process which was canceled earlier is resumed. Once the delinquency process is resumed, the system determines the total number of days (extra days) the delinquency process was in canceled state. The system adds the extra days to the trigger date which was calculated earlier and calculates the trigger date once again. This recalculated trigger date is used to trigger those events which were not triggered as the delinquency process was canceled.

- **Approval Configuration** - This section lists the approval configuration defined for the delinquency process type. It contains the following fields:

Field Name	Field Description
Approval Required	Indicates whether an approval is required for certain manual actions performed on the delinquency process created using the delinquency process type.
Approval To Do Type	Indicates the To Do entry created of the specified To Do type.
	Note: This field appears when the Approval Required option is selected.

Field Name	Field Description
Approval To Do Role	Indicates that users with the specified To Do Role can only perform the following actions. The valid values are: <ul style="list-style-type: none"> • Approve • Reject • Withdraw
	Note: The list includes only those To Do roles which are associated with the approval To Do type. This field appears when the Approval Required option is selected.
Approval Action	Indicates the set of actions for which the approval process must be triggered. The valid values are: <ul style="list-style-type: none"> • Cancel • Edit Hold • Edit Trigger Date • Hold • Release Hold • Request Reinstatement • Skip Event • Trigger Event
	Note: This field appears when the Approval Required option is selected.

By default, the **Delinquency Process Type** zone does not appear in the **Delinquency Process Type** screen. It appears when you click the **Broadcast** (📡) icon corresponding to a delinquency process type in the **Delinquency Process Type List** zone.

Defining a Delinquency Process Type

Prerequisites

To define a delinquency process type, you should have:

- Delinquency event types defined in the application.
- Algorithms defined using the **C1-CUAOAB**, **C1-CANDELPRC**, **C1-MEMBDLQ**, **C1-HLDDELPRC**, **C1-RECALCHLD**, **C1-DERGRBR**, **C1-DERMLNBR**, **C1-DERTRBR**, **C1-DERWDBR**, **C1-DERTROBR**, **C1-DERMNDAYS**, and **C1-DERRTDBR** algorithm types.
- Delinquency process type business objects defined in the application.
- Delinquency process business objects defined in the application.
- Approval To Do Type and Approval To Do Role defined in the application.

Procedure

To define a delinquency process type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **D** and then click **Delinquency Process Type**.
A sub-menu appears.

3. Click the **Add** option from the **Delinquency Process Type** sub-menu.

The **Delinquency Process Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the delinquency process type.
- **Delinquency Process Type Events** - Used to define events for the delinquency process type.
- **Algorithms** - Used to associate an algorithm with the delinquency process type.
- **Grace Period Configuration** - Used to configure the grace period for the delinquency process type.
- **Termination and Reinstatement Configuration** - Used to configure the termination and reinstatement for the delinquency process type.
- **Termination Date Rule Priority** - Used to define the termination date rule priority for the delinquency process type.
- **Termination Reasons For Automatic Reinstatement** - Used to define the termination reason for an automatic reinstatement for the delinquency process type.
- **Trigger Date Recalculation Configuration** - Used to configure the trigger date recalculation for the delinquency process type.
- **Approval Configuration** - Used to configure an approval for the delinquency process type.
- **Characteristics** - Used to define the characteristics for the delinquency process type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Delinquency Process Type	Used to specify the delinquency process type.	Yes
Delinquency Entity Type	Used to specify the entity type for which the delinquency process type is created.	No
Delinquency Process Business Object	Indicates the business object using which you are defining the delinquency process type.	Yes
Description	Used to specify the description for the delinquency process type.	No
Detailed Description	Used to specify additional information about the delinquency process type.	No
Status	Used to indicate the status of the delinquency process type. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	No
	Note: By default, the Active option is selected.	
Collection Object	Used to indicate the entity on which the collection should take place in the delinquency process. The valid value is: <ul style="list-style-type: none"> • Bill 	No
	Note: At present, the system supports Bill as the collection entity.	
Automatic Termination and Reinstatement Required	Used to indicate whether automatic termination and reinstatement is required or not for the delinquency process.	No

Field Name	Field Description	Mandatory (Yes or No)
	Note: At present, automatic reinstatement is not applicable for individual delinquency.	
Delinquency Event Trigger Mode	Used to indicate the mode in which the delinquency event must be triggered. The valid values are: <ul style="list-style-type: none"> Automatic Manual Manual or Automatic Note: You must specify the delinquency event trigger mode which is already defined in the system.	No
Trigger Date Calculation Mode	Used to indicate the mode in which the date calculation must be triggered. The valid values are: <ul style="list-style-type: none"> Latest Bill Due Date with Grace Period Usage Basis Note: By default, this field is disabled. It is enabled only when you select the Automatic option from the Delinquency Event Trigger Mode list.	Yes (Conditional)
Wait Period	Used to indicate the specific period considered for calculating the trigger dates for the events on the delinquency process. The valid values are: <ul style="list-style-type: none"> Monthly Cyclic Wait Days 	Yes
Usage Basis	Used to indicate the option based on which the date calculation must be take place. The valid values are: <ul style="list-style-type: none"> Delinquency Process Creation Date Grace Start Date Latest Bill Date Latest Bill Due Date Note: By default, this field is disabled. It is enabled only when you select the Usage Basis option from the Trigger Date Calculation Mode list.	Yes (Conditional)
Consider Work Days	Used to indicate whether you want to consider work days for the trigger dates of the events on the delinquency process.	No

- Enter the required details in the **Main** section.
- Configure an event for the delinquency process type, if required.
- Associate an algorithm with a delinquency process type, if required.
- Configure the grace period for the delinquency process type, if required.
- Configuring the automatic termination and reinstatement process in a delinquency process type, if required.
- Set the termination date rules in a delinquency process type, if required.
- Set the termination reason for an automatic reinstated membership in a delinquency process type, if required.
- Configure the trigger date recalculation method in a delinquency process type, if required.

12. Configure the approval process in a delinquency process type, if required.

13. Define characteristics for the delinquency process type, if required.

14. Click **Save**.

The delinquency process type is defined.

Configuring an Event for a Delinquency Process Type

Procedure

To configure an event for a delinquency process type:

1. Ensure that the **Delinquency Process Event Types** section is expanded when you are defining or editing a delinquency process type.

The **Delinquency Process Event Types** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Sequence	Used to specify the order in which the events are executed.	Yes
	Note: The event execution is totally based on the sequence of trigger dates.	
Delinquency Event Type	Used to indicate the type of event configured in the delinquency process type.	No
	Note: The Search (🔍) icon appears corresponding to the Delinquency Event Type field. On clicking the Search icon, the Delinquency Event Type Search window appears.	
Trigger Period	Used to indicate the period when you want to trigger an event using the delinquency event type. The valid values are: <ul style="list-style-type: none"> • After Grace End Date • Before Grace End Date 	Yes (Conditional)
	Note: By default, this field is disabled. It is enabled only when you select the Latest Bill Due Date with Grace Period option from the Trigger Date Calculation Mode field. The system calculates the trigger date based on the trigger period. If you select the After Grace End Date option, the system calculates the trigger date using the following formula: $\text{Trigger Date} = \text{Grace End Date} + \text{Wait Days}$ If you select the Before Grace End Date option, the system calculates the trigger date using the following formula: $\text{Trigger Date} = \text{Grace End Date} - \text{Wait Days}$	Note: This field is required when you select the Latest Bill Due Date with Grace Period option from the Trigger Date Calculation Mode field.
Wait Period Source	Used to indicate the source from where the wait period is received. The valid values are: <ul style="list-style-type: none"> • Algorithm • Delinquency Process Type 	Yes
	Note: You need to configure the Derive Wait Period Details based on Business Rules (C1-DERWDBR) algorithm in the delinquency process type, if you select the Algorithm option from the Wait Days Source field. By default, the Delinquency Process Type option type is selected.	

Field Name	Field Description	Mandatory (Yes or No)
Wait Days	Used to specify the wait period (in days) after which the delinquency event is triggered.	Yes (Conditional)
	Note: This field is disabled only when you select the Monthly Cyclic option from the Wait Period field.	Note: This field is required when you have selected the Wait Days option from the Wait Period field.
Wait Months	Used to specify the wait period (in months) which is used to calculate the trigger date.	No
	Note: By default, this field is disabled. It is enabled only when you select the Monthly Cyclic option from the Wait Period field.	
Day of Month	Used to indicate the particular day of the month which is retrieved using the wait months.	Yes (Conditional)
	Note: By default, this field is disabled. It is enabled only when you select the Monthly Cyclic option from the Wait Period field.	Note: This field is required when you have selected the Monthly Cyclic option from the Wait Period field.
Move Past Dated Event To Future	Used to indicate whether you want to move the past dated event to a future date.	No
	Note: By default, this field is disabled. It is enabled only when you select the Monthly Cyclic option from the Wait Period field.	
Defer to Next Cycle	Used to indicate whether you want to move the delinquency event to the next billing cycle.	No
Preview Required	Used to indicate whether an delinquency event requires a preview before it is actually triggered.	No
Preview Days	Used to specify the preview period (in days) prior to which the delinquency event is triggered for preview.	No
	Note: The system calculates the preview date based on preview days. The preview date is calculated using the following formula: Preview Date = Trigger Date -- ' Preview Days	
Skip Past Event	Used to indicate whether you want to skip any event if the calculated trigger date for the event is past dated.	No
Eligibility Rule Type	Used to indicate the rule type eligibility for the delinquency process type.	No

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>To define the rule type eligibility, you need to do the following:</p> <ul style="list-style-type: none"> Define the required parameters using the following source entities: <ul style="list-style-type: none"> Account Health Plan Health Product Person <p>and set the parameter usage to Rule Eligibility Criteria.</p> <ul style="list-style-type: none"> Define a rule type where the rule type usage is set to Delinquency Process Event Eligibility. Define a rule using the rule type with a parameter configured using the above source entities. <p>For example, you configure a parameter (created using the Health Plan source entity) within a rule type and create a rule using the respective rule type. When the C1-DPEVL batch is executed, the system invokes the rules engine for each health plan associated with the memberships which are derived using the membership derivation algorithm. If the rules engine returns with a Success status at least for one health plan, the system includes the configured event in the delinquency process, else the event is deleted from the delinquency process.</p> <p>Once the C1-ACDLQ batch is executed, the system adds all the events irrespective of eligibility in the delinquency process, and later on the C1-DPEVL batch evaluates the eligibility for each event.</p>	
Send Membership Level Notification Source	Used to indicate the source from where the send membership level notification information is received. The valid values are: <ul style="list-style-type: none"> Algorithm Delinquency Process Type 	Yes (Conditional)
	<p>Note:</p> <p>By default, the Delinquency Process Type option type is selected.</p> <p>This field is not applicable for Individual Delinquency purposes.</p>	<p>Note: This field is required when you have selected an option from the Send Membership Level Notification field.</p>
Send Membership Level Notification	Used to indicate whether you want to send membership level notification when customer contacts are created as part	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	of the events in the delinquency process created using the delinquency process type. The valid values are: <ul style="list-style-type: none">Send Member Level Notification RequiredSend Member Level Notification Not Required	Note: This field is required when you have selected an option from the Send Membership Level Notification Source field.
	Note: This field is not applicable for Individual Delinquency purposes.	

- 2. Enter the required details in the **Delinquency Process Event Types** section.
- 3. If you want to add more than one event in a delinquency process type, click the **Add (+)** icon and then repeat step 2.

Note: However, if you want to remove an event from a delinquency process type, click the **Delete (X)** icon corresponding to the **Audit Event Type** field.

- 4. Click **Save**.
The event is configured in a delinquency process type.

Associating an Algorithm with a Delinquency Process Type

Prerequisites

To associate an algorithm with a delinquency process type, you should have:

- Algorithm and Algorithm Type defined in the application.
- System event defined in the application.

Procedure

To associate an algorithm with a delinquency process type:

- 1. Ensure that the **Algorithms** section is expanded when you are defining or editing the delinquency process type.

The **Algorithms** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)									
System Event	Used to indicate the system event when you want to execute the algorithm.	Yes (Conditional)									
	The following table lists the system events on which the algorithms must be attached:										
	The following table lists the algorithms that are associated with a delinquency process type:	Note: This field is required while associating an algorithm with the delinquency process type.									
	<table><tr><th>System Event</th><th>Algorithm</th><th>Description</th></tr><tr><td>Calculate Unpaid and Original Amounts</td><td>C1-CUAOAB</td><td>Refer to C1-CUAOAB on page 3945</td></tr><tr><td>Cancel Criteria</td><td>C1-CANDELPRC</td><td>Refer to C1-CANDELPRC on page 3945</td></tr></table>	System Event	Algorithm	Description	Calculate Unpaid and Original Amounts	C1-CUAOAB	Refer to C1-CUAOAB on page 3945	Cancel Criteria	C1-CANDELPRC	Refer to C1-CANDELPRC on page 3945	
	System Event	Algorithm	Description								
Calculate Unpaid and Original Amounts	C1-CUAOAB	Refer to C1-CUAOAB on page 3945									
Cancel Criteria	C1-CANDELPRC	Refer to C1-CANDELPRC on page 3945									

Column Name	Column Description			Mandatory (Yes or No)
	System Event	Algorithm	Description	
		C1-CANDPAPTC	Refer to C1-CANDPAPTC on page 3947	
	Memberships Derivation	C1-MEMBDLQ	Refer to C1-MEMBDLQ on page 3949	
	Hold Delinquency Process Criteria	C1-HLDELPRC	Refer to C1-HLDELPRC on page 3948	
	Release Delinquency Process Criteria	C1-REDELPRC	Refer to C1-REDELPRC on page 3950	
	Grace Period Derivation	C1-DERGRBR	Refer to C1-DERGRBR on page 3947	
	Send Member Level Notification Option Derivation	C1-DERMLNBR	Refer to C1-DERMLNBR on page 3951	
	Termination Date Rule Derivation	C1-DERTRBR	Refer to C1-DERTRBR on page 3952	
	Wait Days Derivation	C1-DERWDBR	Refer to C1-DERWDBR on page 3953	
	Termination and Reinstatement Configuration Derivation	C1-DERTROBR	Refer to C1-DERTROBR on page 3952	
	Membership Notification Days Derivation	C1-DERMNDAYS	Refer to C1-DERMNDAYS on page 3954	
	Trigger Date Recalculation Option Derivation	C1-DERRTDBR	Refer to C1-DERRTDBR on page 3953	
Sequence	Used to specify the order in which the algorithms for each system event must be triggered.			Yes (Conditional)
				Note: This field is required while associating an algorithm with the delinquency process type.
Algorithm	Used to specify the algorithm.			Yes (Conditional)

Column Name	Column Description	Mandatory (Yes or No)
	Note: If you select the system event option, the Search (🔍) icon appears corresponding to the Algorithm field. On clicking the Search (🔍) icon, the Algorithm Search window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the Algorithm field.	Note: This field is required while associating an algorithm with the delinquency process type.

2. If you want to associate more than one algorithm with the delinquency process type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to disassociate an algorithm from the delinquency process type, click the **Delete** (🗑) icon corresponding to the algorithm.

3. Click **Save**.
The algorithm is associated with a delinquency process type.

Configuring the Grace Period for a Delinquency Process Type

Procedure

To configure the grace period for a delinquency process type:

1. Ensure that the **Grace Period Configuration** section is expanded when you are defining or editing a delinquency process type.

The **Grace Period Configuration** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Grace Source Period	Used to indicate the source from where the grace period is received. The valid values are: <ul style="list-style-type: none">AlgorithmDelinquency Process Type	Yes
	Note: By default, the Delinquency Process Type is selected. You need to configure the Derive Grace Period based on Business Rules (C1-DERGRBR) algorithm in the delinquency process type, if you select the Algorithm option from the Grace Period Source field.	
Grace Period (Days)	Used to specify the number of days which are used to define the grace period end date for the delinquency process.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note: For example, if a delinquency process contains bills with the latest bill due date as 01-Jan-2023, the system considers the latest bill due date as the grace period start date which is 01-Jan-2023. Now, if you have configured the grace period as 30 days, the system determines the grace period end date as 31-Jan-2023 by using the following formula:</p> $\text{Grace Period End Date} = \text{Grace Period Start Date} + \text{Grace Period}$	<p>Note: This field is required if you have selected the Delinquency Process Type option from the Grace Source Period list.</p>
Grace Start Date Basis	<p>Used to indicate the option based on which the grace date calculation is performed. The valid values are:</p> <ul style="list-style-type: none"> Delinquency Process Creation Date Latest Bill Due Date X Days after Latest Bill Due Date <p>Note:</p> <p>By default, this field is disabled. It is enabled only when you select the Grace Start Date option from the Usage Basis list.</p> <p>The grace start date basis is used as the base date for performing the grace period calculation.</p>	<p>Yes (Conditional)</p> <p>Note: This field is required if you have selected the Grace Start Date option from the Usage Basis list.</p>
Add Days To Due Date	<p>Used to specify the number of days by which the due date gets extended and is further used for calculating the grace period end date.</p> <p>Note:</p> <p>This field appears only when you select the X Days after Latest Bill Due Date option from the Grace Start Date Basis list.</p> <p>If you do not specify any value, by default it is set to zero (0).</p> <p>For example, if the grace period start date is set as 01-Jan-2023 and you have configured the add days to due date as 7 days, the system adds the add days to due date to the grace period start date. Therefore, the new grace period start date is now set as 08-Jan-2023. The system then combines the grace period start date with the grace period to calculate the grace period end date using the following formula:</p> $\text{Grace Period End Date} = \text{Grace Period Start Date} + \text{Grace Period}$	No

2. Enter the required details in the **Grace Period Configuration** section.

3. Click **Save**.

The grace period is configured for a delinquency process type.

Configuring the Automatic Termination and Reinstatement Process in a Delinquency Process Type

Procedure

To configure the automatic termination and reinstatement process in a delinquency process type:

- 1. Ensure that the **Termination and Reinstatement Configuration** section is expanded when you are defining *or* editing a delinquency process type.

The **Termination and Reinstatement Configuration** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Termination Reinstatement Configuration Source	Used to indicate the source from where the termination and reinstatement configuration is received. The valid values are: <ul style="list-style-type: none">AlgorithmDelinquency Process Type	Yes
	Note: By default, the Delinquency Process Type option type is selected. You need to configure the Derive Termination and Reinstatement configuration based on Business Rules (C1-DERTROBR) algorithm in the delinquency process type, if you select the Algorithm option from the Termination Reinstatement Configuration Source field.	
Trigger Termination Process	Used to indicate an option based on which the termination process is triggered. The valid values are: <ul style="list-style-type: none">After X DaysImmediateMonth End	Yes (Conditional)
	Note: This field is enabled only when you select the Delinquency Process Type option from the Termination Reinstatement Configuration Source field.	Note: This field is required when you select the Delinquency Process Type option from the Termination Reinstatement Configuration Source field.
Termination Wait Days	Used to specify the wait period (in days) after which the termination process is triggered.	No
	Note: You cannot specify a negative value in the Termination Wait Days field. If you do not specify the termination wait days, by default, it is set to zero (0). This field is enabled only when you select the After X Days option from the Trigger Termination Process field.	
Allow Automatic Reinstatement	Used to indicate whether you want to allow automatic reinstatement of the individual membership. The valid values are: <ul style="list-style-type: none">Yes	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> No 	Note: This field is required when you select the Delinquency Process Type option from the Termination Reinstatement Configuration Source field.
	Note: This field is not applicable for Individual Delinquency purposes. This field is enabled only when you select the Delinquency Process Type option from the Termination Reinstatement Configuration Source field.	
Maximum Automatic Reinstatement Count	Used to specify the maximum number of time the system allows automatic reinstatement.	No
	Note: This field is not applicable for Individual Delinquency purposes. This field is enabled when you select the Yes option from the Allow Automatic Reinstatement field.	
Trigger Reinstatement Process	Used to indicate an option based on which the reinstatement process must be triggered. The valid values are: <ul style="list-style-type: none"> After X Days Immediate Month End 	Yes (Conditional)
	Note: This field is not applicable for Individual Delinquency purposes. This field is enabled only when you select the Delinquency Process Type option from the Termination Reinstatement Configuration Source field.	Note: This field is required when you select the Delinquency Process Type option from the Termination Reinstatement Configuration Source field.
Reinstatement Wait Days	Used to specify the wait period (in days) after which the reinstatement process is triggered.	No
	Note: This field is not applicable for Individual Delinquency purposes. This field is enabled only when you select the After X Days option from the Trigger Reinstatement Process field. You cannot specify a negative value in the Reinstatement Wait Days field. If you do not specify the reinstatement wait days, by default, it is set to zero (0).	
Reinstatement Threshold	Used to specify the value based on which the automatic reinstatement takes place.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>This field is not applicable for Individual Delinquency purposes.</p> <p>You must specify a value for reinstatement threshold which exists between 1 to 100.</p> <p>This field is enabled only when you select the Delinquency Process Type option from the Termination Reinstatement Configuration Source field.</p>	<p>Note: This field is required when you select the Delinquency Process Type option from the Termination Reinstatement Configuration Source field.</p>
Days Since Termination	<p>Used to specify the number of days since the termination effective date for automatic reinstatement to take place.</p> <p>Note:</p> <p>If you configure the days since termination as 10 days for automatic reinstatement, the system adds days since termination to the termination effective date irrespective of whether termination effective date is elapsed or not. If the termination effective date is elapsed, the system does not perform the automatic reinstatement. In this case, you have to manually conduct the reinstatement process. The automatic reinstatement process is triggered only within the certain number of days once the termination has taken place.</p> <p>This field is not applicable for Individual Delinquency purposes.</p> <p>This field is enabled only when you select the Delinquency Process Type option from the Termination Reinstatement Configuration Source field.</p>	No
Membership Notification Days Source	<p>Used to indicate the source from where the membership notification days information is received. The valid values are:</p> <ul style="list-style-type: none"> Algorithm Delinquency Process Type <p>Note:</p> <p>By default, the Delinquency Process Type option type is selected.</p> <p>You need to configure the Derive Member Notification Days based on Business Rules (C1-DERMNDAYS) algorithm in the delinquency process type, if you select the Algorithm option from the Membership Notification Days Source field.</p> <p>This field is not applicable for Individual Delinquency purposes.</p>	Yes
Member Notification Days	Used to specify the number of days after which the member receives notification.	No

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field is enabled only when you select the Delinquency Process Type option from the Termination Reinstatement Configuration Source field. You cannot specify a negative value in the Member Notification Days field. If you do not specify the member notification days, by default, it is set to zero (0). This field is not applicable for Individual Delinquency purposes.	

- 2. Enter the required details in the **Termination and Reinstatement Configuration** section.
- 3. Click **Save**.
The automatic termination and reinstatement process is configured in a delinquency process type.

Setting the Termination Date Rules in a Delinquency Process Type

Procedure

To set the termination date rules in a delinquency process type:

- 1. Ensure that the **Termination Date Rule Priority** section is expanded when you are defining or editing a delinquency process type.

The **Termination Date Rule Priority** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Priority	Used to specify the order in which the termination date rule is considered while defining a delinquency process type.	Yes (Conditional)
		Note: This field is required if you have selected an option from the Termination Date Rule field.
Termination Date Rule	Used to indicate the termination date rule used for calculating the termination effective date.	Yes (Conditional)
		Note: This field is required if you have specified a value in the Priority field.

- 2. Enter the required details in the **Termination Date Rule Priority** section.
- 3. If you want to set more than one termination date rule in a delinquency process type, click the **Add (+)** icon and then repeat step 2.

Note: However, if you want to remove a termination date rule from a delinquency process type, click the **Delete** (🗑️) icon corresponding to the **Priority** field.

- 4. Click **Save**.
The termination date rule is set in a delinquency process type.

Setting the Reasons for Termination of an Automatic Reinstated Membership in a Delinquency Process Type

Prerequisites

To set the reasons for termination of an automatic reinstated membership in a delinquency process type, you should have:

- Termination reasons for automatic reinstatement of a membership defined in the system

Procedure

To set the reasons for termination of an automatic reinstated membership in a delinquency process type:

1. Ensure that the **Termination Reasons For Automatic Reinstatement** section is expanded when you are defining or editing a delinquency process type.

The **Termination Reasons For Automatic Reinstatement** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Termination Reason	Used to indicate the reason which is specified during the termination process.	No
	Note: The automatic reinstatement takes place only when a reason is specified during the termination process, and the specified reason appears in the Termination Reason list. If the specified reason does not appear in the Termination Reason list, you have to manually perform the reinstatement process. This field is not applicable for Individual Delinquency purposes.	

2. Enter the required details in the **Termination Date Rule Priority** section.
3. If you want to set more than one termination reason for an automatically reinstated membership in a delinquency process type, click the **Add (+)** icon and then repeat step 2.

Note: However, if you want to remove a termination reason for an automatically reinstated membership from a delinquency process type, click the **Delete (⌫)** icon corresponding to the **Termination Reason** field.

4. Click **Save**.
The termination reason for an automatic reinstated membership is set in a delinquency process type.

Configuring the Trigger Date Recalculation Method in a Delinquency Process Type

Procedure

To configure the trigger date recalculation method in a delinquency process type:

1. Ensure that the **Trigger Date Recalculation Configuration** section is expanded when you are defining or editing a delinquency process type.

The **Trigger Date Recalculation Configuration** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Trigger Date Recalculation On Hold Release Source	Used to indicate the source for recalculating the trigger date once the hold request is released. The valid values are: <ul style="list-style-type: none"> Algorithm Delinquency Process Type 	Yes
	Note: By default, the Delinquency Process Type option is selected. You need to configure the Derive Recalculate Trigger Date option based on Business Rules (C1-DERRTDBR) algorithm in the delinquency process type, if you select the Algorithm option from the Trigger Date Recalculation On Hold Release Source field.	
Trigger Date Recalculation On Hold Release	Used to indicate whether you want to recalculate the trigger date once the hold request is released. The valid values are: <ul style="list-style-type: none"> Yes No 	Yes (Conditional)
	Note: By default, the No option is selected.	Note: This field is required if you have selected the Delinquency Process Type option from the Trigger Date Recalculation On Hold Release Source field.
Trigger Date Recalculation On Resume Source	Used to indicate the source for recalculating the trigger date once the hold request is resumed. The valid values are: <ul style="list-style-type: none"> Algorithm Delinquency Process Type 	Yes
	Note: By default, the Delinquency Process Type option is selected. You need to configure the Derive Recalculate Trigger Date option based on Business Rules (C1-DERRTDBR) algorithm in the delinquency process type, if you select the Algorithm option from the Trigger Date Recalculation On Resume Source field.	
Trigger Date Recalculation On Resume	Used to indicate whether you want to recalculate the trigger date once the hold request is resumed. The valid values are: <ul style="list-style-type: none"> Yes No 	Yes (Conditional)
	Note: By default, the No option is selected.	Note: This field is required if you have selected the Delinquency Process Type option from the Trigger Date Recalculation On Resume field.

Note: The system conducts trigger date recalculation in the following scenarios:

- When the delinquency process is kept on hold for certain days and is later released either on hold end date or through manual intervention, the system determines the total number of days (hold days) the delinquency process was kept on hold. The system adds the calculated days to the trigger date which was calculated earlier and calculates the trigger date once again. This recalculated trigger date is used to trigger those events which were not triggered as the delinquency process was kept on hold.
- When you make a payment against a bill for which a delinquency process is created, the system cancels the delinquency process. If the payment made against a bill gets canceled due to any reason after some days, the system checks whether there are any overdue bills for the respective account. If the overdue bills exist, the delinquency process which was canceled earlier is resumed. Once the delinquency process is resumed, the system determines the total number of days (extra days) the delinquency process was in canceled state. The system adds the extra days to the trigger date which was calculated earlier and calculates the trigger date once again. This recalculated trigger date is used to trigger those events which were not triggered as the delinquency process was canceled.

2. Enter the required details in the **Trigger Date Recalculation Configuration** section.

3. Click **Save**.
The trigger date recalculation method is configured in a delinquency process type.

Configuring the Approval Process in a Delinquency Process Type

Prerequisites

To configure an approval process in a delinquency process type, you should have:

- Required approval profiles defined in the application
- Approval To Do Type and Approval To Do Role defined in the application

Procedure

To configure an approval process in a delinquency process type:

1. Ensure that the **Approval Configuration** section is expanded when you are defining or editing a delinquency process type.

The **Approval Configuration** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Approval Required	Used to indicate whether an approval is required for certain manual actions performed on the delinquency process created using the delinquency process type.	No
Approval To Do Type	Used to indicate the To Do entry created of the specified To Do type.	Yes (Conditional)
	Note: The Search (🔍) icon appears corresponding to the Approval To Do Type field. On clicking the Search icon, the To Do Type Search window appears. On specifying the To Do type, the description of the To Do Type appears next to the Approval To Do Type field. This field appears when the Approval Required check box is selected.	Note: This field is required if you have selected the Approval Required check box.

Field Name	Field Description	Mandatory (Yes or No)
Approval To Do Role	Used to indicate that users with the specified To Do Role can only perform the following actions. The valid values are: <ul style="list-style-type: none"> • Approve • Reject • Withdraw 	No
	Note: The list includes only those To Do roles which are associated with the approval To Do type. This field appears when the Approval Required check box is selected.	
Approval Action	Used to indicate the set of actions for which the approval process must be triggered. The valid values are: <ul style="list-style-type: none"> • Cancel • Edit Hold • Edit Trigger Date • Hold • Release Hold • Request Reinstatement • Skip Event • Trigger Event 	No
	Note: This field appears when the Approval Required check box is selected.	

2. Enter the required details in the **Approval Configuration** section.
3. If you want to add more than one approval action for an approval process in a delinquency process type, click the **Add (+)** icon and then repeat step 2.

Note: However, if you want to remove an approval action from for an approval process in a delinquency process type, click the **Delete (■)** icon corresponding to the **Approval Action** field.

4. Click **Save**.
The approval process is configured in a delinquency process type.

Defining a Characteristic for a Delinquency Process Type

Prerequisites

To define a characteristic for a delinquency process type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Delinquency Process**).

Procedure

To define a characteristic for a delinquency process type:

1. Ensure that the **Characteristics** section is expanded when you are defining, editing, or copying a delinquency process type.

The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to Delinquency Process .	Note: This field is required when you are defining a characteristic for the delinquency process type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the Search (🔍) icon appears corresponding to the Characteristic Value field. On clicking the Search icon, the Predefined Characteristic Search window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the Characteristic Value field.	Note: This field is required when you are defining a characteristic for the delinquency process type.

- Enter the required details in the **Characteristics** section.
- If you want to define more than one characteristic for the delinquency process type, click the **Add (+)** icon and then repeat step 2.

Note: However, if you want to remove a characteristic from the delinquency process type, click the **Delete** (🗑️) icon corresponding to the characteristic.

Editing a Delinquency Process Type

Prerequisites

To edit a delinquency process type, you should have:

- Delinquency event types defined in the application.
- Algorithms defined using the **C1-CUAOAB**, **C1-CANDELPRC**, **C1-MEMBDLQ**, **C1-HLDDELPRC**, **C1-RECALCHLD**, **C1-DERGRBR**, **C1-DERMLNBR**, **C1-DERTRBR**, **C1-DERWDBR**, **C1-DERTROBR**, **C1-DERMNDAYS**, and **C1-DERRTDBR** algorithm types.
- Delinquency process type business objects defined in the application.
- Delinquency process business objects defined in the application.
- Approval To Do Type and Approval To Do Role defined in the application.

Procedure

To edit a delinquency process type:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **D** and then click **Delinquency Process Type**.
A sub-menu appears.
- Click the **Search** option from the **Delinquency Process Type** sub-menu.
The **Delinquency Process Type** screen appears.
- In the **Delinquency Process Type** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the delinquency process type whose details you want to edit.

The **Delinquency Process Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the delinquency process type.
- **Delinquency Process Type Events** - Used to define an event for the delinquency process type.
- **Algorithms** - Used to associate an algorithm with the delinquency process type.
- **Grace Period Configuration** - Used to configure the grace period for the delinquency process type.
- **Termination and Reinstatement Configuration** - Used to configure the termination and reinstatement for the delinquency process type.
- **Termination Date Rule Priority** - Used to define the termination date rule priority for the delinquency process type.
- **Termination Reasons For Automatic Reinstatement** - Used to define the termination reason for an automatic reinstatement for the delinquency process type.
- **Trigger Date Recalculation Configuration** - Used to configure the trigger date recalculation for the delinquency process type.
- **Approval Configuration** - Used to configure an approval for the delinquency process type.
- **Characteristics** - Used to define the characteristics for the delinquency process type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Delinquency Process Type	Displays the delinquency process type.	Not applicable
Delinquency Entity Type	Used to specify the entity type for which the delinquency process type is created.	No
Delinquency Process Business Object	Indicates the business object using which you are defining the delinquency process type.	Yes
Description	Used to specify the description for the delinquency process type.	No
Detailed Description	Used to specify additional information about the delinquency process type.	No
Status	Used to indicate the status of the delinquency process type. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	No
	Note: By default, the Active option is selected.	
Collection Object	Used to indicate those bills which are overdue on the basis of bill or due date. The valid value is: <ul style="list-style-type: none"> • Bill 	No
	Note: At present, the system supports Bill as the collection entity.	
Automatic Termination and Reinstatement Required	Used to indicate whether automatic termination and reinstatement is required or not for the delinquency process.	No
	Note: At present, automatic reinstatement is not applicable for individual delinquency.	

Field Name	Field Description	Mandatory (Yes or No)
Delinquency Event Trigger Mode	Used to indicate the mode in which the delinquency event must be triggered. The valid values are: <ul style="list-style-type: none"> Automatic Manual Manual or Automatic 	No
	Note: You must specify the delinquency event trigger mode which is already defined in the system.	
Trigger Date Calculation Mode	Used to indicate the mode in which the date calculation must be triggered. The valid values are: <ul style="list-style-type: none"> Latest Bill Due Date with Grace Period Usage Basis 	Yes (Conditional)
	Note: By default, this field is disabled. It is enabled only when you select the Automatic option from the Delinquency Event Trigger Mode list.	Note: This field is required when you select the Automatic option from the Delinquency Event Trigger Mode list.
Wait Period	Used to indicate the specific period considered for calculating the trigger dates for the events on the delinquency process. The valid values are: <ul style="list-style-type: none"> Monthly Cyclic Wait Days 	Yes
Usage Basis	Used to indicate the option based on which the date calculation must be take place. The valid values are: <ul style="list-style-type: none"> Delinquency Process Creation Date Grace Start Date Latest Bill Date Latest Bill Due Date 	Yes (Conditional)
	Note: By default, this field is disabled. It is enabled only when you select the Usage Basis option from the Trigger Date Calculation Mode list.	Note: This field is required when you select the Usage Basis option from the Trigger Date Calculation Mode list.
Consider Work Days	Used to indicate whether you want to consider the work days for delinquency process or not.	No

Tip: Alternatively, you can edit a delinquency process type by clicking the **Edit** button in the **Delinquency Process Type** zone.

- Enter the required details in the **Main** section.
- Configure an event for the delinquency process type, if required.
- Associate the required algorithms with a delinquency process type.
- Configure the grace period for the delinquency process type, if required.
- Configuring the automatic termination and reinstatement process in a delinquency process type, if required.
- Set the termination date rules in a delinquency process type, if required.
- Set the reasons for terminating an automatic reinstated membership in a delinquency process type, if required.
- Configure the trigger date recalculation method in a delinquency process type, if required.

13. Configure the approval process in a delinquency process type, if required.
14. Define characteristics for the delinquency process type, if required.
15. Click **Save**.

The changes made to the delinquency process type are saved.

Deleting a Delinquency Process Type

Procedure

To delete a delinquency process type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **D** and then click **Delinquency Process Type**.
A sub-menu appears.
3. Click the **Search** option from the **Delinquency Process Type** sub-menu
The **Delinquency Process Type** screen appears.
4. In the **Delinquency Process Type List** zone, click the **Delete** (🗑️) icon in the **Delete** column corresponding to the delinquency process type that you want to delete.

A message appears confirming whether you want to delete the delinquency process type.

Note: You can delete a delinquency process type when a delinquency process is not created using the delinquency process type.

Tip: Alternatively, you can delete a delinquency process type by clicking the **Delete** button in the **Delinquency Process Type List** zone.

5. Click **OK**.
The delinquency process type is deleted.

Viewing the Delinquency Process Type Details

Procedure

To view the details of the delinquency process type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **D** and then click **Delinquency Process Type**.
A sub-menu appears.
3. Click the **Search** option from the **Delinquency Process Type** sub-menu.
The **Delinquency Process Type** screen appears.
4. In the **Delinquency Process Type List** zone, click the **Broadcast** (📡) icon corresponding to the delinquency process type whose details you want to view.
The **Delinquency Process Type** zone appears.
5. View the details of the delinquency process type in the **Delinquency Process Type** zone.

Delinquency Process Maintenance

Once the delinquency process is created in the **Initiated** status, the system enables you to view the details of the delinquency process. Two new screens named **Delinquency Process Search** and **Delinquency Process** are introduced in this release. The **Delinquency Process Search** screen enables you to search for a delinquency process either using the details of the delinquency process or using the details of the account, person, or membership for which the delinquency process is created.

Note: The **Person ID** field while searching for a delinquency process is only applicable for the fully insured group business.

The **Delinquency Process** screen enables you to view the details of a delinquency process. It contains the following zones:

- **Delinquency Process Details** – Display the basic details of the delinquency process.
- **Additional Attributes** – Display the characteristics of the delinquency process.
- **Bills** – Lists the overdue bills of the account for which the delinquency process is created.
- **Events** – List all events that are included in the delinquency process.
- **Event Notifications** – Lists the notifications (i.e. To Do, customer contact), if any, created for the delinquency event.
- **Approval Details** – Lists the approval records that are created while performing manual actions at the delinquency process or delinquency event level.
- **Hold Details** – Lists the hold records that are created whenever you hold the delinquency process.
- **Log** – Lists the complete trail of actions performed on the delinquency process.

Manual Actions at the Delinquency Process Level

The **Delinquency Process** screen enables you to perform the following actions at the delinquency process level:

- **Edit** – Used when you want to add additional information for the delinquency process in the form of comments or characteristics.
- **Hold** – Used when you want to manually hold the delinquency process. The **Hold** button appears only when the delinquency process is in the **Initiated**, **Delinquency In Progress**, or **Pending Termination** status. While manually holding a delinquency process, you need to specify the following:
 - A hold end date which is later than the system date
 - The reason why you want to hold the delinquency process. Note that the list includes only those reasons which are defined for the **Initiate Hold** status of the **C1-DelinquencyProcess** business object.

The hold start date is set to the system date when you manually hold the delinquency process. On saving the changes, the status of the delinquency process is changed to the value (for example, **Initiate Hold**) specified in the **Delinquency Process Initiate Hold Status** attribute of the delinquency process preference. The system then checks whether the approval is required for the **Hold** action in the respective delinquency process type.

If the approval is not required while manually holding the delinquency process, the status of the delinquency process is immediately changed to the value (for example, **On Hold**) specified in the **Delinquency Process Hold Status** attribute of the delinquency process preference. A hold record is created for the delinquency process in the **Active** status. However, if the approval is required while manually holding the delinquency process, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the manual hold and assigned to the users with the approval To Do role. In addition, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress – Exception Raised**) specified in the **Delinquency Process Approval In Progress Status** attribute of the delinquency process preference. Note that the system continues to trigger the delinquency events on the trigger date even when the approval is in progress until the approver approves the manual hold.

If the approver approves the manual hold, the status of the delinquency process is changed to the value (for example, **On Hold**) specified in the **Delinquency Process Hold Status** attribute of the delinquency process preference. In addition, the system does the following:

- The hold start date is changed to the date when the approver approves the manual hold.
- The status of the approval record is changed to **Approved**.
- A hold record is created for the delinquency process in the **Active** status.

However, if the approver rejects the manual hold, the status of the approval record is changed to **Rejected** and the status of the delinquency process is changed to its previous status (i.e. **Initiated**, **Delinquency In Progress**, or **Pending Termination**).

- **Cancel** – Used when you want to manually cancel the delinquency process. The **Cancel** button appears only when the delinquency process is in the **Initiated**, **Delinquency In Progress**, or **On Hold** status. While manually canceling a delinquency process, you need to specify the cancel reason and comments, if any. You must specify a reason which is defined for the **Initiate Cancel** status of the **C1-DelinquencyProcess** business object in the **Status Reason** screen.

On manually canceling a delinquency process, the status of the delinquency process is set to the value (for example, **Initiate Cancel**) specified in the **Delinquency Process Initiate Cancel Status** attribute of the delinquency process preference. The system then checks whether the approval is required for the **Cancel** action in the respective delinquency process type. If the approval is not required while manually canceling the delinquency process, the status of the delinquency process is changed to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference.

However, if the approval is required while manually canceling the delinquency process, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the manual cancellation and assigned to the users with the approval To Do role.

In addition, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress – Exception Raised**) specified in the **Delinquency Process Approval In Progress Status** attribute of the delinquency process preference. Note that the system continues to trigger the delinquency events on the trigger date even when the approval is in progress until the approver approves the manual cancellation of the delinquency process.

If the approver approves the manual cancellation of the delinquency process, the status of the delinquency process is set to the value (for example, **Canceled**) specified in the **Delinquency Process Canceled Status** attribute of the delinquency process preference. In addition, the status of the approval record is changed to **Approved**. However, if the approver rejects the manual cancellation of the delinquency process, the status of the approval record is changed to **Rejected** and the status of the delinquency process is changed to its previous status (i.e. **Initiated**, **Delinquency In Progress**, or **On Hold**).

- **Release** – Used when you want to manually release the hold on the delinquency process. The **Release** button appears only when the delinquency process is in the **On Hold** status. While manually releasing the hold on the delinquency process, you are prompted to confirm the hold release. On confirming the hold release, the status of the delinquency process is changed to the value (for example, **Initiate Release**) specified in the **Delinquency Process Initiate Release Status** attribute of the delinquency process preference. The system then checks whether the approval is required for the **Release Hold** action in the respective delinquency process type. If the approval is not required while manually releasing the hold on the delinquency process, the status of the delinquency process is immediately changed to its previous status (i.e. **Initiated**, **Delinquency In Progress**, or **Pending Termination**). In addition, the hold end date is set to the date when you manually release the hold on the delinquency process. Finally, the status of hold record is changed to **Completed**.

However, if the approval is required while manually releasing the hold on the delinquency process, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the manual hold release and assigned to the users with the approval To Do role. In addition, the status of the delinquency process is changed to the value (for example, **Delinquency In Progress – Exception Raised**) specified in the **Delinquency Process Approval In Progress Status** attribute of the delinquency process preference. If the approver approves the hold release, the status of the delinquency process is changed to its previous status (i.e. **Initiated**, **Delinquency In Progress**, or **Pending Termination**). The hold end date is set to the date when the approver approves the hold release. In addition, the status of the approval record is changed to **Approved** and the status of hold record is changed to **Completed**. However, if the approver rejects the hold release, the status of the approval record is changed to **Rejected** and the status of the delinquency process is changed to its previous status (i.e. **On Hold**).

- **Request Reinstatement** – This button is not applicable for the delinquency processes which are created for the fully insured individual business.
- **Edit Hold** – On clicking the **Edit** icon corresponding to the hold record of the delinquency process, you can edit the hold end date and hold reason. Note that the **Edit** icon appears only when following conditions are met:
 - The delinquency process is in the **On Hold** status.
 - The delinquency process is kept on hold manually and not automatically.
 - The hold record is in the **Active** status.

While editing the hold details, you can specify the following:

- A hold end date which is later than the system date and which is later than the date which is the latest of the following:
 - Postpone credit review date
 - Latest schedule date specified in the payment agreement request
 - Latest schedule date specified among all the active promise to pay
- The reason why you want to hold the delinquency process. Note that the list includes only those reasons which are defined for the **Initiate Hold** status of the **C1-DelinquencyProcess** business object.

On saving the changes, the system checks whether the approval is required for the **Edit Hold** action in the respective delinquency process type. If the approval is not required while manually editing the hold details, the hold end date and hold reason of the delinquency process are updated immediately.

However, if the approval is required while manually editing the hold details, an approval record is created in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the changes and assigned to the users with the approval To Do role. The status of the delinquency process remains as **On Hold**. If the approver approves the changes, the hold end date and hold reason of the delinquency process are updated. In addition, the status of the approval record is changed to **Approved**. However, if the approver rejects the hold changes, the status of the approval record is changed to **Rejected** and the hold changes are not reflected in the delinquency process.

Note:

The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration. For more information about the feature configuration, see [Setting the DELINPROC Feature Configuration](#) on page 4218.

If the required attributes are not defined in the delinquency process preference, erroneous results will occur.

The system considers the approval To Do type and approval To Do role specified in the respective delinquency process type. If the approval To Do role is not specified in the respective delinquency process type, the system considers the default To Do role associated with the approval To Do type.

Manual Actions at the Delinquency Event Level

You can also perform the following actions for each delinquency event of the delinquency process from the **Delinquency Process** screen:

- **Edit Trigger Date** – On clicking the **Edit Trigger Date** icon corresponding to a delinquency event, you can specify a new trigger date for the delinquency event. Note that the **Edit Trigger Date** icon appears only when the following conditions are met:
 - The delinquency process is in the **Initiated** or **Delinquency In Progress** status
 - The delinquency event trigger mode is set to **Manual** or **Automatic** in the respective delinquency process type
 - The delinquency event is in the **Pending** status

Once you specify the new trigger date and save the changes, the system checks whether the approval is required for the **Edit Trigger Date** action in the respective delinquency process type. If the approval is not required while manually editing the trigger date, the trigger date of the delinquency event is updated immediately.

However, if the approval is required while manually editing the trigger date, an approval record is created for the delinquency event in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the changes and assigned to the users with the approval To Do role. Note that the icons in the **Trigger Events** and **Skip Event** columns (if any) corresponding to the delinquency event are removed immediately, so that users should not be able to perform any other actions on the delinquency event. The status of the delinquency process remains as **Initiated** or **Delinquency In Progress**. Note that the system continues to trigger the delinquency events on the trigger date even when the approval is in progress. If a delinquency event is triggered before the approval is received for the delinquency event, the status of the approval record is changed to **Expired**.

If the approver approves the changes, the trigger date of the delinquency event is updated. The icons in the **Trigger Events** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are displayed again. In addition, the status of the approval record is changed to **Approved**. However, if the approver rejects the changes, the status of the approval record is changed to **Rejected** and the trigger date of the delinquency event is not updated. However, the icons in the **Trigger Events** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are displayed again.

- **Skip Event** – On clicking the **Skip Event** icon corresponding to a delinquency event, the system checks whether the approval is required for the **Skip Event** action in the respective delinquency process type. Note that the **Skip Event** icon appears only when the following conditions are met:
 - The delinquency process is in the **Initiated** or **Delinquency In Progress** status
 - The delinquency event trigger mode is set to **Manual** or **Manual or Automatic** in the respective delinquency process type
 - The delinquency event is in the **Pending** status

If the approval is not required while manually skipping the delinquency events, the status of the delinquency event is changed to **Skipped** immediately. In addition, the icons in the **Trigger Events** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are also removed. However, if the approval is required while manually skipping the delinquency events, an approval record is created for the delinquency event in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the changes and assigned to the users with the approval To Do role. Note that the icons in the **Trigger Events** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are removed immediately, so that users should not be able to perform any other actions on the delinquency event.

The status of the delinquency process remains as **Initiated** or **Delinquency In Progress**. Note that the system continues to trigger the delinquency events on the trigger date even when the approval is in progress. If a delinquency event is triggered before the approval is received for the delinquency event, the status of the approval record is changed to **Expired**.

If the approver approves the skip action, the status of the delinquency event is changed to **Skipped** immediately. In addition, the status of the approval record is changed to **Approved**. Note that the icons in the **Trigger Events** and **Edit Trigger Date** columns corresponding to the delinquency event are not displayed again. However, if the approver rejects the skip action, the status of the approval record is changed to **Rejected**. The status of the delinquency event remains as **Pending**. In addition, the icons in the **Trigger Events** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are displayed again.

- **Trigger Event** - On clicking the **Trigger Event** icon corresponding to a delinquency event, the system checks whether the approval is required for the **Trigger Event** action in the respective delinquency process type. Note that the **Trigger Event** icon appears only when the following conditions are met:
 - The delinquency process is in the **Initiated** or **Delinquency In Progress** status
 - The delinquency event trigger mode is set to **Manual** or **Manual or Automatic** in the respective delinquency process type
 - The delinquency event is in the **Pending** status

If the approval is not required while manually triggering the delinquency events, the algorithms attached to the **Event Activation** system event of the respective delinquency event type are executed immediately in the specified order. The status of the delinquency event is changed to **Completed** when all algorithms attached to the **Event Activation** system event are successfully executed. In addition, the icons in the **Skip Event** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are also removed. However, if the approval is required

while manually triggering the delinquency events, an approval record is created for the delinquency event in the **Approval In Progress** status. A To Do is created using the approval To Do type to approve the changes and assigned to the users with the approval To Do role. Note that the icons in the **Skip Event** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are removed immediately, so that users should not be able to perform any other actions on the delinquency event.

The status of the delinquency process remains as **Initiated** or **Delinquency In Progress**. Note that the system continues to trigger the delinquency events on the trigger date even when the approval is in progress. If a delinquency event is triggered before the approval is received for the delinquency event, the status of the approval record is changed to **Expired**. If the approver approves the manual trigger action, the algorithms attached to the **Event Activation** system event of the respective delinquency event type are executed immediately in the specified order.

The status of the delinquency event is changed to **Completed** when all algorithms attached to the **Event Activation** system event are successfully executed. In addition, the status of the approval record is changed to **Approved**. Note that the icons in the **Skip Event** and **Edit Trigger Date** columns corresponding to the delinquency event are not displayed again. However, if the approver rejects the manual trigger action, the status of the approval record is changed to **Rejected**. The status of the delinquency event remains as **Pending**. In addition, the icons in the **Skip Event** and **Edit Trigger Date** columns (if any) corresponding to the delinquency event are displayed again.

Note that the algorithms attached to the **Monitor Completed Event** system event of the respective delinquency event type are not executed in the online mode when the status of the delinquency event is changed to **Completed**. These algorithms are executed when you invoke the **C1-DPMON** batch.

Whenever you manually execute the subsequent events (non-first event) in the delinquency process, the system first checks whether the algorithms attached to the **Monitor Completed Event** system event of the previous delinquency event is successfully executed or not. If an algorithm attached to the **Monitor Completed Event** system event of the previous delinquency event is not executed successfully, the system displays a warning message that indicates the previous event's monitoring algorithms are not executed successfully and confirms whether you want to continue in such scenario. If you click **Yes**, the system ignores the previous event's monitoring algorithm and executes the algorithms attached to the **Event Activation** system event of the current delinquency event (which is triggered). However, if you click **No**, the system does not execute the algorithms attached to the **Event Activation** system event of the current delinquency event. Note that if there are no algorithms attached to the **Monitor Completed Event** system event of the previous delinquency event, the system will directly execute the algorithms attached to the **Event Activation** system event of the current delinquency event.

Note: The system considers the approval To Do type and approval To Do role specified in the respective delinquency process type. If the approval To Do role is not specified in the respective delinquency process type, the system considers the default To Do role associated with the approval To Do type.

Delinquency Process (Used for Searching)

The **Delinquency Process** screen allows you to search for a delinquency process using various search criteria. It contains the following zone:

- [Search Delinquency Process](#) on page 4057

Through this screen, you can navigate to the following screen:

- [Delinquency Process \(Used for Viewing\)](#) on page 4062

Search Delinquency Process

The **Search Delinquency Process** zone allows you to search for a delinquency process using various search criteria. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Search By	Used to indicate whether you want to search for a delinquency process using the process details, or person, or account, or membership details. The valid values are: <ul style="list-style-type: none"> Process Details Person/Account/Membership Details 	Yes
	Note: By default, the Process Details option is selected.	
Delinquency Process ID	Used to search a delinquency process using the delinquency process ID.	No
	Note: This field appears when the Process Details option is selected from the Search By list.	
Delinquency Process Type	Used to search delinquency processes with a particular delinquency process type.	No
Delinquency Event Type	Used to search delinquency processes with a particular delinquency event type.	No
	Note: This field appears when the Process Details option is selected from the Search By list.	
Status	Used to search delinquency processes with a particular status. The valid values are: <ul style="list-style-type: none"> Canceled Completed On Hold Initiated Delinquency In Progress Pending Reinstatement Pending Termination Customer Reinstated Reinstatement Payment/Adjustment Canceled Automatic Reinstatement Stopped Request Reinstatement Customer Terminated 	No
Event Preview Status	Used to search delinquency processes with a particular event preview status. The valid values are: <ul style="list-style-type: none"> Completed In Progress Not Required Pending Pending Evaluation 	No
	Note: This field appears when the Process Details option is selected from the Search By list.	

Field Name	Field Description	Mandatory (Yes or No)
Created From	Used to search delinquency processes which are created from a particular date onwards.	No
Created To	Used to search delinquency processes which are created till a particular date.	No
Collection Class	Used to search delinquency processes with a particular collection class.	No
	Note: This field appears when the Process Details option is selected from the Search By list.	
Person ID	Used to search delinquency processes which are created for a specific person.	No
	Note: The Search (🔍) icon appears corresponding to the Person ID field. On clicking the Search (🔍) icon, the Person Search window appears. On specifying the person, the description of the person appears corresponding to the Person ID field. This field appears when the Person/Account/Membership Details option is selected from the Search By list. It has a link. On clicking the link, the Person screen appears, where you can view the details of the respective person.	
Account ID	Used to search delinquency processes which are created for a specific account.	No
	Note: The Search (🔍) icon appears corresponding to the Account ID field. On clicking the Search (🔍) icon, the Account Search window appears. On specifying the person, the description of the account appears corresponding to the Account ID field. This field appears when the Person/Account/Membership Details option is selected from the Search By list. It has a link. On clicking the link, the Account screen appears, where you can view the details of the respective account.	
Membership ID	Used to search delinquency processes which are created for a specific membership.	No
	Note: The Search (🔍) icon appears corresponding to the Membership ID field. On clicking the Search (🔍) icon, the Search Membership window appears. This field appears when the Person/Account/Membership Details option is selected from the Search By list.	

Note: You must specify at least one search criterion while searching for a delinquency process.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Delinquency Process Information	Displays information about the delinquency process.
	Note: It has a link. On clicking the link, the Delinquency Process screen appears where you can view the details of the respective delinquency process.
Person Identifier	Indicates the person identifier associated with the delinquency process.
Person Name	Indicates the person associated with the delinquency process.
Delinquency Entity	Indicates the entity for which the delinquency process is created.
Create Date/Time	Displays the date and time when the delinquency process is created.
Status	Indicates the status of the delinquency process. The valid values are: <ul style="list-style-type: none"> • Canceled • Completed • On Hold • Initiated • Delinquency In Progress • Pending Reinstatement • Pending Termination • Customer Reinstated • Reinstatement Payment/Adjustment Canceled • Automatic Reinstatement Stopped • Request Reinstatement • Customer Terminated
Cancel	On clicking the Cancel (⏏) icon, the Initiate Cancellation of Delinquency Process screen appears where you can specify the details why you want to initiate cancellation of the selected delinquency process.
Request Reinstatement	On clicking the Request Reinstatement (↺) icon, the Initiate Reinstatement for Delinquency Process screen appears where you can specify the reason why you want to initiate reinstatement of the group membership.
	Note: This icon appears only when the delinquency process is created for a group membership.
Hold	On clicking the Hold (⏸) icon, the Initiate Hold for Delinquency Process screen appears where you can specify the details why you want to initiate hold for the selected delinquency process.
Release	On clicking the Release (⏪) icon, the Initiate Release for Delinquency Process screen appears where you can specify the details why you want to initiate release for the selected delinquency process.
Delinquency Process ID	Displays the delinquency process ID.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

You can filter the list using various search criteria (such as, **Delinquency Process ID**, **Delinquency Process Type**, **Delinquency Event Type**, **Status**, **Event Preview Status**, **Created From**, **Created Until**, and **Collection Class**) available in the **Filter** area. You can view the **Filter** area by clicking the **Filters** (∇) icon in the upper right corner of this zone.

Searching for a Delinquency Process

Prerequisites

To search for a delinquency process, you should have:

- Delinquency process business object defined in the application.
- Delinquency process types defined in the application.
- Delinquency event types defined in the application.

Procedure

To search for a delinquency process:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Delinquency Management** and then click **Delinquency Process**.
The **Delinquency Process** screen appears.
3. Enter the search criteria in the **Search Delinquency Process** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

4. Click **Search**.
A list of delinquency processes that meet the search criteria appears in the **Search Results** section.

Viewing the Delinquency Process Details

Procedure

To view the details of a delinquency process:

1. Search for the delinquency process in the **Delinquency Process** screen.
2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the delinquency process whose details you want to view.

The **Delinquency Process** screen appears.

3. View the details of the delinquency process in the **Delinquency Process Details** zone.

Delinquency Process (Used for Viewing)

The **Delinquency Process** screen allows you to:

- Edit the details of a delinquency process
- View the additional attributes of a delinquency process
- View the bills of a delinquency process
- View the events of a delinquency process
- View the approval details of a delinquency process
- View the hold details of a delinquency process
- Approve or reject the manual actions performed on a delinquency process
- Withdraw the manual actions performed on a delinquency process
- Cancel a delinquency process
- Hold a delinquency process
- Release a delinquency process
- Request reinstatement of a delinquency process for a group membership

Note: Reinstatement is not applicable for **Individual Delinquency** purposes.

- View the log of a delinquency process
- Add a log entry for a delinquency process

It consists of the following zones:

- [Delinquency Process Details](#) on page 4062
- [Additional Attributes](#) on page 4064
- [Bills](#) on page 4064
- [Events](#) on page 4065
- [Event Notifications](#) on page 4066
- [Approval Details](#) on page 4067
- [Hold Details](#) on page 4068
- [Log](#) on page 4068

Delinquency Process Details

The **Delinquency Process Details** zone displays the details of the delinquency process. It contains the following fields:

Field Name	Field Description
Delinquency Process ID	Displays the delinquency process ID.

Field Name	Field Description
Delinquency Process Type	Indicates the delinquency process type using which the delinquency process is created.
Delinquency Entity	Indicates the entity for which the delinquency process is created.
Collection Class	Indicates the collection class of a person or an account for the delinquency process.
Grace Period (In Days)	<p>Displays the number of days which are used to define the grace period end date for the delinquency process.</p> <p>Note:</p> <p>For example, if a delinquency process contains bills with the latest bill due date as 01-Jan-2023, the system considers the latest bill due date as the grace period start date which is 01-Jan-2023. Now, if you have configured the grace period as 30 days, the system determines the grace period end date as 31-Jan-2023 by using the following formula:</p> $\text{Grace Period End Date} = \text{Grace Period Start Date} + \text{Grace Period}$
Grace Start Date	Indicates the date from when the grace period is effective for the delinquency process.
Grace End Date	Indicates the date till when the grace period is effective for the delinquency process.
Delinquency Due Date	Indicates the earliest bill due date from when the delinquency process is created.
Termination Date Rule	Indicates the termination date rule used for calculating the termination effective date.
Termination Trigger Date	Indicates the date on which the termination of an individual membership is triggered.
Termination Date	<p>Indicates the date from when the termination is effective.</p> <p>Note: Termination can take place in retro as well as in advance.</p>
Termination Reason	Indicates the reason for initiating the termination process.
Status	<p>Indicates the status of the delinquency process. The valid values are:</p> <ul style="list-style-type: none"> • Canceled • Completed • On Hold • Initiated • Delinquency In Progress • Pending Reinstatement • Pending Termination • Customer Reinstated • Reinstatement Payment/Adjustment Canceled • Automatic Reinstatement Stopped • Request Reinstatement • Customer Terminated

Field Name	Field Description
Comments	Displays the comments added for the delinquency process.
Reinstatement Trigger Date	Indicates the date on which reinstatement is triggered.
Automatic Reinstatement Count	Displays the maximum number of times reinstatement happens systematically.

Additional Attributes

The **Additional Attributes** zone displays additional details of the delinquency process. It contains the following columns:

Column Name	Column Description
Effective Date	Displays the date from when the characteristic is effective for the delinquency process.
Characteristic Type	Indicates the characteristic type for the delinquency process.
Characteristic Value	Displays the value of the characteristic type.
Description	Displays the description of the characteristic type.

You can filter the list using search criteria (such as, **Effective Date**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (🔍) icon in the upper right corner of this zone.

Bills

The **Bills** zone displays the bills that are added in the delinquency process. It contains the following columns:

Column Name	Column Description
Bill ID	Displays the bill ID.
	Note: It has a link. On clicking the link, the Bill screen appears where you can view the details of the respective bill.
Bill Date	Displays the date when the bill was generated.
Due Date	Displays the date when the bill is due for payment.
Status	Indicates the status of the bill. The valid values are: <ul style="list-style-type: none">• Pending• Complete
Original Amount	Displays the bill amount.
Outstanding Amount	Displays the unpaid amount of the bill.
Account Information	Indicates the account for which the bill is generated. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the Account screen appears where you can view the details of the respective account.

Note: Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Events

The **Events** zone displays the events that are created in the delinquency process. It contains the following columns:

Column Name	Column Description
Trigger Date	Displays the trigger date of the event.
Delinquency Event Type	Displays the delinquency event type.
	Note: It has a link. On clicking the link, the Delinquency Event Type screen appears where you can view the details of the delinquency event type.
Event Status	Indicates the event status. The valid values are: <ul style="list-style-type: none">CompletedPendingPending EvaluationPending Contact CreationSkipped
Preview Date	Displays the date from when the preview status of the event is set to In Progress .
	Note: The event's preview status remains as In Progress till the event is triggered. Once the event is triggered, the event's preview status is updated to Completed . The system calculates the preview date based on preview days. The preview date is calculated using the following formula: <code>Preview Date = Trigger Date -- Preview Days</code>
Event Preview Status	Indicates the preview status of the event. The valid values are: <ul style="list-style-type: none">CompletedIn ProgressNot RequiredPending EvaluationPending
Status Update	Displays the date when the status of the event was last updated.
Trigger Events	On clicking the Trigger Event (🔊) icon, the following process takes place: The system invokes the Monitor Completed Event algorithm of the last completed event, if there is any. If the Monitor Completed Event algorithm returns with a false value, the system displays a warning message with a confirmation dialog box. If you click Yes , the system simply triggers the current event. If there are no pending events or if the last completed event does not contain the Monitor Completed Event algorithm, the system triggers the current event. Now, while triggering the event, the system performs the following actions:

Column Name	Column Description
	<ul style="list-style-type: none">The Event Activation algorithm is invoked.The event status is updated from Pending to Completed.The Status Update column is updated with the processing date and user ID.
Skip Event	On clicking the Skip Event (✖) icon, the system performs the following actions: <ul style="list-style-type: none">The event status is updated from Pending to Skipped.The Status Update column is updated with the processing date and user ID.
Edit Trigger Date	On clicking the Edit Trigger Date (📅) icon, the Delinquency Process Update Event Trigger Date screen appears where you can set the new trigger date.
Approval In Progress	Indicates whether the event is assigned to an approver for an approval. The valid values are: <ul style="list-style-type: none">YesNo

Event Notifications

The **Event Notifications** zone displays the notifications that are created for an event. It contains the following columns:

Column Name	Column Description						
Notification Type	Indicates the type of notification sent when the event is triggered. The valid values are: <ul style="list-style-type: none">To DoCustomer Contact						
Notification Information	Displays information about the notification. The system behaves in the following way: <table><tr><th>If...</th><th>Then...</th></tr><tr><td>Notification Type is To Do</td><td>On clicking the link, the To Do Entry screen appears where you can view the details of the respective To Do.</td></tr><tr><td>Notification Type is Customer Contact</td><td>On clicking the link, the Customer Contact screen appears where you can view the details of the respective customer.</td></tr></table>	If...	Then...	Notification Type is To Do	On clicking the link, the To Do Entry screen appears where you can view the details of the respective To Do.	Notification Type is Customer Contact	On clicking the link, the Customer Contact screen appears where you can view the details of the respective customer.
If...	Then...						
Notification Type is To Do	On clicking the link, the To Do Entry screen appears where you can view the details of the respective To Do.						
Notification Type is Customer Contact	On clicking the link, the Customer Contact screen appears where you can view the details of the respective customer.						

Note:

If a delinquency event type is created for terminating an individual membership, the system creates an outbound message whenever the respective event is triggered. Simultaneously, the system also creates an entry related to the outbound message in the **Log** zone.

The **Events Notifications** zone does not appear by default. It appears when you click the **Broadcast** (📢) icon corresponding to an event in the **Events** zone.

Approval Details

The **Approval Details** zone displays the approval information for the delinquency process. It contains the following columns:

Column Name	Column Description
Created By Info	Displays the user who has created an approval entry.
Approval Action	Indicates the action taken by an approver on the approval entry. The valid value is: <ul style="list-style-type: none"> Cancel Edit Hold Edit Trigger Date Hold Request Reinstatement Release Hold Skip Event Trigger Event
Delinquency Event Type	Displays the delinquency event type of the event for which an approval is requested.
Status	Indicates the current status of an approval request. The valid values are: <ul style="list-style-type: none"> Approval In Progress Approved Rejected Withdrawn Expired
Status Update	Displays the date and time when the approval request is updated.
Comments	On clicking the Comments (🗨️) icon, the Delinquency Process Approval Information screen appears where you can specify additional comments for the delinquency process.
View	On clicking the View (🔍) icon, the Delinquency Process Approval Information window appears displaying the approval details.
	Note: You can also approve or reject the approval entry through this screen.
Approve	On clicking the Approve (✅) icon, the Confirmation window appears where you approve the approval entry.
	Note: The Approve icon appears only for those users who have a specified To Do Role.
Reject	On clicking the Reject (❌) icon, the Confirmation window appears where you reject the approval entry.
	Note: The Reject icon appears only for those users who have a specified To Do Role.
Withdraw	On clicking the Withdraw (🚫) icon, the Confirmation window appears where you can withdraw the approval entry.
	Note: The Withdraw icon appears only for those users who have a specified To Do Role.
To Do	Displays the To Do that is generated when the approver when an approval request is created.

Column Name	Column Description
	Note: It contains a link. On clicking the link, the To Do Entry screen appears where you can view the details of the respective To Do.

You can filter the list using **Delinquency Process Approval Status** and **Approval Action** available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (∇) icon in the upper right corner of this zone.

Note: The information in this zone appears only when **Approval Required** option is selected while creating a delinquency process type.

Hold Details

The **Hold Details** zone lists the active delinquency process hold records that are kept on hold. It contains the following columns:

Column Name	Column Description
Hold Start Date	Displays the date from when the hold is effective for the delinquency process.
Hold End Date	Displays the date till when the hold is effective for the delinquency process.
Hold Reason	Indicates the reason for releasing the hold from the delinquency process.
Delinquency Process Hold Status	Indicates the status of the record on hold. The valid value is: <ul style="list-style-type: none"> Active Completed
Creation Mode	Indicates the mode in which the delinquency process hold record is created. The valid values are: <ul style="list-style-type: none"> Automatic Manual
Edit	On clicking the Edit (✎) icon, the Delinquency Process Hold Information screen appears where you can edit the hold details.

Note: This zone displays only those records that have the **Delinquency Process Hold Status** set to **Active**.

Log

The **Log** zone lists the complete trail of actions performed on the delinquency process. It contains the following columns:

Column Name	Column Description
Creation Date Time	Displays the date and time when the action was performed on the delinquency process.
Details	Displays the details about the action performed on the delinquency process.
User	Indicates the user who has performed the action on the delinquency process.
Log Type	Indicates the type of log.

Column Name	Column Description
Related Object	Indicates the object or entity which is created when the action is performed on the delinquency process.
Status Reason	Indicates the reason why the offset request is rejected or unapplied (i.e. canceled).

Note: You can manually add a log entry for the offset request by clicking the **Add Log Entry** link in the upper right corner of the **Log** zone.

Editing a Delinquency Process

Prerequisites

To edit a delinquency process, you should have:

- Delinquency control defined in the application
- Delinquency event type defined in the application
- Delinquency process type and delinquency process business objects defined in the application

Procedure

To edit a delinquency event type:

1. Search for the delinquency process in the **Delinquency Process Search** screen.
2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the delinquency process whose details you want to edit.
The **Delinquency Process** screen appears.
3. Click the **Edit** button in the upper right corner of the **Delinquency Process Information** section.

The **Delinquency Process** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the delinquency process. This section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Delinquency Process	Displays information about the delinquency process.	Not applicable
Delinquency Process Type	Indicates the delinquency process type using which the delinquency process is created.	Not applicable
Delinquency Entity	Indicates the entity for which the delinquency process is created.	Not applicable
Termination Trigger Date	Used to specify the trigger date for terminating the individual membership.	No
	Note: The Termination Trigger Date is calculated by the event activation algorithm configured on the event which terminates the individual membership. This field appears only when the termination trigger date is configured on the respective event.	
Comments	Used to specify additional information about the delinquency process.	No

- **Characteristics** - Used to define the characteristics for the delinquency process. This section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Effective Date	Used to indicate the date from when the delinquency process is effective.	No
Characteristic Type	Used to indicate the characteristic type for the delinquency process.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to Delinquency Process .	Note: This field is required when you are editing the delinquency process details.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the Characteristic Value field.	Note: This field is required when you are editing the delinquency process details.

Note: The **Edit** button appears when the status of the delinquency process is either **Initiated**, **Delinquency In Progress**, or **On Hold**.

4. Enter the required details in the **Main** section.
5. Define characteristics for the delinquency process, if required.
6. If you want to define more than one characteristic for the delinquency process, click the **Add (+)** icon and then repeat step 5.

Note: However, if you want to remove a characteristic from the delinquency process, click the **Delete (🗑)** icon corresponding to the characteristic.

7. Click **Save**.
The changes made to the delinquency process are saved.

Holding a Delinquency Process

Prerequisites

To hold a delinquency process, you should have:

- Status reasons defined in the application.

Procedure

To hold a delinquency process:

1. Search for the delinquency process in the **Delinquency Process Search** screen.
2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the delinquency process that you want to hold.
The **Delinquency Process** screen appears.
3. Click the **Hold** button in the upper right corner of the **Delinquency Process Information** section.

The **Initiate Hold for Delinquency Process** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Delinquency Process Information	Displays information about the delinquency process.	Not applicable
Hold Start Date	Used to indicate the date from when the hold is effective for the delinquency process.	Not applicable
	Note: The hold start date cannot be greater than the hold end date. By default, the system date appears in this field.	
Hold End Date	Used to indicate the date till when the hold is effective for the delinquency process.	Yes
	Note: The hold end date cannot be earlier than the hold start date	
Status Reason	Used to indicate the reason why you want to hold the delinquency process.	Yes
Comments	Used to specify additional information about the hold.	No

Tip: Alternatively, you can hold a delinquency process by clicking the **Hold** (E) icon in the **Hold** column corresponding to the delinquency process.

Note: The **Hold** button appears when the status of the delinquency process is either **Initiated**, **Delinquency In Progress**, or **Pending Termination**.

4. Select the reason for hold from the **Status Reason** list.
5. Enter the comments in the **Comments** field, if required.
6. Click **Save**.
The status of the delinquency process is changed to **On Hold**.

Canceling a Delinquency Process

Prerequisites

To cancel a delinquency process, you should have:

- Cancellation reasons defined in the application.

Procedure

To cancel a delinquency process:

1. Search for the delinquency process in the **Delinquency Process Search** screen.

- 2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the *delinquency process* that you want to cancel.
The **Delinquency Process** screen appears.
- 3. Click the **Cancel** button in the upper right corner of the **Delinquency Process Information** section.

The **Initiate Cancel for Delinquency Process** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Delinquency Process Information	Displays information about the delinquency process.	Not applicable
Status Reason	Used to indicate the reason why you want to cancel the delinquency process.	Yes
Comments	Used to specify additional information while canceling the delinquency process.	No

Tip: Alternatively, you can cancel a delinquency process by clicking the **Cancel** (⌫) icon in the **Cancel** column corresponding to the delinquency process.

Note: The **Cancel** button appears when the status of the delinquency process is either **Initiated**, **Delinquency In Progress**, or **On Hold**.

- 4. Select the cancellation reason from the **Status Reason** list.
- 5. Enter the comments in the **Comments** field, if required.
- 6. Click **Save**.
The status of the delinquency process is changed to **Canceled**.

Related Topics

For more information on...	See...

Adding a Log Entry for a Delinquency Process

Procedure

To add a log entry for a delinquency process:

- 1. Search for the delinquency process in the **Delinquency Process Search** screen.
- 2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the *delinquency process* for which you want to add a log entry.
The **Delinquency Process** screen appears.
- 3. Click the **Add Log Entry** link in the upper right corner of the **Log** zone.

The **Add Delinquency Process Log** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Delinquency Process Information	Displays information about the delinquency process.	Not applicable

Field Name	Field Description	Mandatory (Yes or No)
Log Details	Used to specify additional comments for the delinquency process.	Yes

4. Enter the comments in the **Log Details** field.

5. Click **Save**.

The log entry is added in the **Log** zone.

Triggering an Event in a Delinquency Process

Prerequisites

To trigger an event in a delinquency process, you should have:

- Delinquency event types defined in the application.

Procedure

To trigger an event in a delinquency process:

1. Search for the delinquency process in the **Delinquency Process Search** screen.
2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the delinquency process whose event you want to trigger.
The **Delinquency Process** screen appears.
3. Expand the **Events** zone.
4. Click the **Trigger Events**  icon in the **Trigger Events** column corresponding to the event which you want to trigger.

The system performs the following set of actions:

- The respective **Event Activation** algorithm is invoked.
- The event status is updated from **Pending** to **Completed**.
- The **Status Update** column is updated with the processing date and the user ID.

Skiping an Event in a Delinquency Process

Prerequisites

To skip an event in a delinquency process, you should have:

- Delinquency event types defined in the application.

Procedure

To skip an event in a delinquency process:

1. Search for the delinquency process in the **Delinquency Process Search** screen.
2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the delinquency process whose event you want to skip.
The **Delinquency Process** screen appears.
3. Expand the **Events** zone.
4. Click the **Trigger Events** (▶) icon in the **Trigger Events** column corresponding to the event which you want to skip.

The system performs the following set of actions:

- The event status is updated from **Pending** to **Skipped**.
- The **Status Update** column is updated with the processing date and the user ID.

Editing the Trigger Date of an Event in a Delinquency Process

Procedure

To edit the trigger date of an event in a delinquency process:

1. Search for the delinquency process in the **Delinquency Process Search** screen.
2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the delinquency process whose event trigger date you want to edit.
The **Delinquency Process** screen appears.
3. Expand the **Events** zone.
4. Click the **Trigger Events** (📅) icon in the **Edit Trigger Date** column corresponding to the event whose event trigger date you want to edit.

The **Delinquency Process Update Event Trigger Date** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Trigger Date	Displays the date when the event is scheduled to trigger.	Not applicable
New Trigger Date	Used to indicate the latest date on which the event is scheduled to trigger.	Yes

Field Name	Field Description	Mandatory (Yes or No)
	Note: The new trigger date cannot be earlier than the system date.	

5. Click **Save**.

The changes made to the event trigger date in a delinquency process are saved.

Approving an Event of a Delinquency Process

Prerequisites

To approve an event of a delinquency process, you should have:

- Delinquency event defined in the application.
- To Do Type and To Do Role defined in the application.

Procedure

To approve an event of a delinquency process:

1. Search for the delinquency process in the **Delinquency Process Search** screen.
2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the delinquency process whose event you want to approve.
The **Delinquency Process** screen appears.
3. Ensure that the **Approval Details** zone is expanded.
4. Click the **Approve**  icon in the **Approve** column corresponding to the approval entry which you want to approve.
The confirmation dialog appears confirming whether you want to approve the approval entry.
5. Click **OK**.
The status of the approval entry is changed from **Approval In Progress** to **Approved**.

Rejecting an Event of a Delinquency Process

Prerequisites

To reject an event of a delinquency process, you should have:

- Delinquency event defined in the application.
- To Do Type and To Do Role defined in the application.

Procedure

To reject an event of a delinquency process:

1. Search for the delinquency process in the **Delinquency Process Search** screen.
2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the delinquency process whose event you want to reject.
The **Delinquency Process** screen appears.
3. Ensure that the **Approval Details** zone is expanded.
4. Click the **Reject** (🚫) icon in the **Reject** column corresponding to the approval entry which you want to reject.
The confirmation dialog appears confirming whether you want to reject the approval entry.
5. Click **OK**.
The status of the approval entry is changed from **Approval In Progress** to **Rejected**.

Withdrawing an Event of a Delinquency Process

Prerequisites

To withdraw an event of a delinquency process, you should have:

- Delinquency event defined in the application.
- To Do Type and To Do Role defined in the application.

Procedure

To withdraw an event of a delinquency process:

1. Search for the delinquency process in the **Delinquency Process Search** screen.
2. In the **Search Results** section, click the link in the **Delinquency Process Information** column corresponding to the delinquency process whose event you want to withdraw.
The **Delinquency Process** screen appears.
3. Ensure that the **Approval Details** zone is expanded.
4. Click the **Withdraw** (🔒) icon in the **Withdraw** column corresponding to the approval entry which you want to withdraw.
The confirmation dialog appears confirming whether you want to withdraw the approval entry.
5. Click **OK**.
The status of the approval entry is changed from **Approval In Progress** to **Withdrawn**.

Delinquency Process Type Preference

A delinquency process type preference enables you to set the attributes which are used while creating a delinquency process for a person or an account. You need to create two distinct delinquency process type preferences – one for the fully insured group business and another for the fully insured individual business. A delinquency process type preference for the fully insured group business enables the system to create a delinquency process for a person or an account to which the policies are billed. However, a delinquency process type preference for the fully insured individual business enables the system to create a delinquency process for an account to which the individual memberships are billed. Once you create a delinquency process type preference for the fully insured group business, you need to specify the preference code in the **Delinquency Process Type Field Mapping – Group** parameter of the **C1-DLNQMNRL** algorithm. Similarly, Once you create a delinquency process type preference for the fully insured individual business, you need to specify the preference code in the **Delinquency Process Type Field Mapping – Individual** parameter of the **C1-DLNQMNRL** algorithm.

You can define, edit, delete, and copy a delinquency process type preference using the **C1-FieldMapping** business object through the **Field Mapping** screen. You can create a delinquency process type preference using the **Delinquency Process Type** preference category. While creating a delinquency process type preference for the fully insured individual business, you can specify the following attributes:

- **Active Individual Delinquency** – Used to indicate the delinquency process type using which you want to create a delinquency process for an account when its main customer is an active customer. An individual is deemed to be an active customer when at least one membership of the individual customer is in the **Active** status.
- **Effectuated Individual Delinquency for Ancillary** – Used to indicate the delinquency process type using which you want to create a delinquency process for an account when the following conditions are met:
 - The **Active Individual Delinquency** attribute is not defined in the delinquency process type preference
 - Paid through date is present on the account
 - Earliest unpaid coverage period does not include benefit charges
 - Individual is enrolled to a health plan which belongs to a non-medical health product
- **Effectuated Individual without Benefit** – Used to indicate the delinquency process type using which you want to create a delinquency process for an account when the following conditions are met:
 - The **Active Individual Delinquency** attribute is not defined in the delinquency process type preference
 - Paid through date is present on the account
 - Earliest unpaid coverage period does not include benefit charges
 - Individual is enrolled to a health plan which belongs to a medical health product
- **Effectuated Individual with Benefit** – Used to indicate the delinquency process type using which you want to create a delinquency process for an account when the following conditions are met:
 - The **Active Individual Delinquency** attribute is not defined in the delinquency process type preference
 - Paid through date is present on the account
 - Earliest unpaid coverage period includes benefit charges
- **Benefit Sub Type** – Used to indicate the benefit sub type. The system considers the benefit charges of the specified benefit sub type to derive the appropriate delinquency process type for an account. The system considers this attribute when the following conditions are met:
 - The **Active Individual Delinquency** attribute is not defined in the delinquency process type preference

- Paid through date is present on the account
- The value is defined for the **Effectuated Individual with Benefit** attribute in the delinquency process type preference
- **Non-Effectuated Individual Delinquency** – Used to indicate the delinquency process type using which you want to create a delinquency process for an account when the following conditions are met:
 - The **Active Individual Delinquency** attribute is not defined in the delinquency process type preference
 - Paid through date is not present on the account
- **Termed Individual Delinquency** – Used to indicate the delinquency process type using which you want to create a delinquency process for an account when its main customer is an inactive customer. An individual is deemed to be an inactive customer when all memberships of the individual customer are in the **Terminated** status.

Note:

All the above-mentioned attributes are not applicable for the fully insured group business.

The **Active Individual Delinquency** and **Termed Individual Delinquency** attributes are required. If you do not specify the **Active Individual Delinquency** attribute, you need to specify the following attributes – **Effectuated Individual Delinquency for Ancillary**, **Effectuated Individual without Benefit**, **Effectuated Individual with Benefit**, **Benefit Sub Type**, and **Non-Effectuated Individual Delinquency**.

However, if you specify all these attributes including the **Active Individual Delinquency** attribute, the system will ignore the other attributes and only give priority to the **Active Individual Delinquency** attribute.

However, while creating a delinquency process type preference for the fully insured group business, you can specify the following attributes:

- **Active Group Customers – Account Level** – Used to indicate the delinquency process type using which you want to create the delinquency process for an account when its main customer is an active customer. A person is deemed to be an active customer when at least one policy associated with the person (i.e. policy holder) is in the **Active** status.
- **Active Group Customers – Person Level** – Used to indicate the delinquency process type using which you want to create the delinquency process for an active person. A person is deemed to be an active customer when at least one policy associated with the person (i.e. policy holder) is in the **Active** status.
- **Inactive Group Customers – Account Level** – Used to indicate the delinquency process type using which you want to create the delinquency process for an account when its main customer is an inactive customer. A person is deemed to be an inactive customer when all policies associated with the person (i.e. policy holder) are in the **Terminated** status.
- **Inactive Group Customers – Person Level** – Used to indicate the delinquency process type using which you want to create the delinquency process for an inactive person. A person is deemed to be an inactive customer when all policies associated with the person (i.e. policy holder) are in the **Terminated** status.

Note:

All the above-mentioned attributes are not applicable for the fully insured individual business.

All the above attributes are mandatory while creating a delinquency process type preference for the fully insured group business.

You can define, edit, delete, and copy a delinquency process type preference through the **Field Mapping** screen.

Searching for a Delinquency Process Type Preference

Procedure

To search for a delinquency process type preference:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.

- 2. From the **Admin** menu, select **F** and then click **Field Mapping**.
A sub-menu appears.
- 3. Click the **Search** option from the **Field Mapping** sub-menu.
The **Field Mapping** screen appears.
- 4. Select the **Delinquency Process Type** option from the **Preference Category** list.
- 5. Enter the additional search criteria in the **Search Field Mapping** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 6. Click **Search**.
A list of delinquency process type preferences that meet the search criteria appears in the **Search Results** section.

Defining a Delinquency Process Type Preference

Prerequisites

To define a delinquency process type preference, you should have:

- Field mapping business objects defined in the application
- Delinquency process type defined in the application

Procedure

To define a delinquency process type preference:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **F** and then click **Field Mapping**.
A sub-menu appears.
- 3. Click the **Add** option from the **Field Mapping** sub-menu.

The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Field Mapping Business Object	Used to indicate the business object using which you want to create the delinquency process type preference. The valid values are: <ul style="list-style-type: none">• Bill Route Method - Contact Method Mapping (i.e., C1_BillRouteCntMethMap) - Enables you to maintain a routing method - contact method mapping preference.• Field Mapping (i.e., C1-FieldMapping) - Enables you to maintain the following:<ul style="list-style-type: none">• Automatic Refund/Write-Off Preference• Billing Preference• Binder Payment Preference• Configuration for Match Type - Handling Overpayment Preference• Delinquency Process Preference• Delinquency Process Type Preference	Yes

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> Geographic Rating Area Preference Individual Membership Preference Medicare Preference Member Reconciliation Preference Member Relationship and Subscription Tier Preference Membership Repricing Reasons Preference Statement Construct Preference Medicare Plan Benefit Package (i.e., C1-BenefitPackage) - Enables you to maintain a Medicare plan benefit package. Membership Status Reason Mapping (i.e., C1-MemStatusReasonMapping) - Enables you to maintain an individual membership status reason preference. 	
	<p>Note: The above business objects are shipped with the product. The list includes those business objects which are created using the Field Mapping (i.e., C1-FIELDMAP) maintenance object.</p>	

Note: Alternatively, you can access the **Select Business Object** screen by clicking the **Add** button in the **Page Title** area of the **Field Mapping** screen.

- Select the **Field Mapping** option from the **Field Mapping Business Object** list.
- Click **OK**.

The **Field Mapping** screen appears. It contains the following sections:

- Main** - Used to specify basic details for the delinquency process type preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the delinquency process type preference.	Yes
Description	Used to specify the description for the delinquency process type preference.	Yes
Detailed Description	Used to specify additional information about the delinquency process type preference.	No
Status	Used to indicate the status of the delinquency process type preference. The valid values are: <ul style="list-style-type: none"> Active Inactive 	Yes

- Preference Category** - Used to specify the preference category. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Preference Category	Used to indicate the category to which the preference belongs. The valid values are: <ul style="list-style-type: none"> Automatic Refund/Write-Off 	Yes

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> Billing Binder Payment Claim Extract Configuration for Match Type - Handling Overpayment Delinquency Process Delinquency Process Type Geographic Rating Area Individual Membership Medicare Medicare Plan Benefit Member Reconciliation Member Relationship and Subscription Tier Membership Repricing Reasons Membership Status Reason Routing Method - Contact Method Mapping Statement Construct 	
	<p>Note:</p> <p>The list includes only those values which are defined in the FIELD_CAT_FLG lookup field.</p> <p>You must select the Delinquency Process Type option from the list while creating a delinquency process type preference.</p>	

- **Preference Settings** - Used to set the attributes in the delinquency process type preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the delinquency process type preference.	Yes
	Note: The attribute list appears only when the preference category is selected from the respective list.	
Value	Used to specify the attribute value.	Yes
	<p>Note:</p> <p>The attribute value list appears only when the attribute is selected from the respective list.</p> <p>The attribute value list varies depending on the attribute that you want to set in the delinquency process type preference.</p>	
Entity Type	<p>Used to indicate the type of entity for which the attribute is applicable. The valid values are:</p> <ul style="list-style-type: none"> Account 	No

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none">AdjustmentBillable ChargeMembershipPaymentPolicy	
	Note: At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types to the MAP_ENTITY_FLG lookup field.	

Note: While defining a delinquency process type preference, you must set at least one attribute in the delinquency process type preference.

- 6. Select the **Delinquency Process Type** option from the **Preference Category** list.
The **Preference Category** section disappears and the **Preference Category** field appears in the **Main** section.
- 7. Enter the required details in the **Main** section.
- 8. Set the required attributes in the delinquency process type preference.
- 9. If you want to set more than one attribute in the delinquency process type preference, click the **Add (+)** icon and then repeat step 8.

Note: However, if you want to remove an attribute from the delinquency process type preference, click the **Delete** (■) icon corresponding to the attribute.

- 10. Click **Save**.
The delinquency process type preference is defined.

Editing a Delinquency Process Type Preference

Prerequisites

To edit a delinquency process type preference, you should have:

- Field mapping business objects defined in the application
- Delinquency process type defined in the application

Procedure

To edit a delinquency process type preference:

- 1. Search for the delinquency process type preference in the **Field Mapping** screen.
- 2. In the **Search Results** section, click the **Edit** (✎) icon in the **Edit** column corresponding to the delinquency process type preference whose details you want to edit.

The **Field Mapping** screen appears. It contains the following sections:

- Main** - Used to specify basic details for the delinquency process type preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Displays the delinquency process type preference.	Not applicable

Field Name	Field Description	Mandatory (Yes or No)
Description	Used to specify the description for the delinquency process type preference.	Yes
Detailed Description	Used to specify additional information about the delinquency process type preference.	No
Status	Used to indicate the status of the delinquency process type preference. The valid values are: <ul style="list-style-type: none"> Active Inactive 	Yes
Preference Category	Indicates the category to which the preference belongs. The valid value is: <ul style="list-style-type: none"> Delinquency Process Type 	Not applicable

- **Preference Settings** - Used to set the attributes in the delinquency process type preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the delinquency process type preference.	Yes
	Note: The attribute list appears only when the preference category is selected from the respective list.	
Value	Used to specify the attribute value.	Yes
	Note: The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the delinquency process type preference.	
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: <ul style="list-style-type: none"> Account Adjustment Billable Charge Membership Payment Policy 	No
	Note: At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types to the MAP_ENTITY_FLG lookup field.	

Tip: Alternatively, you can click the **Edit** button in the **Field Mapping** zone to edit the details of the delinquency process type preference.

- 3. Modify the required details in the **Main** section.
- 4. Define, edit, or remove the attribute from the delinquency process type preference, if required.

Note: You must set at least one attribute in a delinquency process type preference.

- 5. Click **Save**.
The changes made to the delinquency process type preference are saved.

Copying a Delinquency Process Type Preference

Instead of creating a delinquency process type preference from scratch, you can create a new delinquency process type preference using an existing delinquency process type preference. This is possible through copying a delinquency process type preference. On copying a delinquency process type preference, the details including the attributes are copied to the new delinquency process type preference. You can then edit the details, if required.

Prerequisites

To copy a delinquency process type preference, you should have:

- Delinquency process type preference (whose copy you want to create) defined in the application
- Field mapping business objects defined in the application

Procedure

To copy a delinquency process type preference:

1. Search for the delinquency process type preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Duplicate** (📄) icon in the **Duplicate** column corresponding to the delinquency process type preference whose copy you want to create.

The **Field Mapping** screen appears. It contains the following sections:

- **Main** - Used to specify basic details of the delinquency process type preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the delinquency process type preference.	Yes
Description	Used to specify the description for the delinquency process type preference.	Yes
Detailed Description	Used to specify additional information about the delinquency process type preference.	No
Status	Used to indicate the status of the delinquency process type preference. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	Yes
Preference Category	Indicates the category to which the preference belongs. The valid values are: <ul style="list-style-type: none"> • Delinquency Process Type 	Not applicable

- **Preference Settings** - Used to set the attributes in the delinquency process type preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the delinquency process type preference.	Yes
	Note: The attribute list appears only when the preference category is selected from the respective list.	
Value	Used to specify the attribute value.	Yes
	Note: The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the delinquency process type preference.	
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: <ul style="list-style-type: none"> • Account • Adjustment • Billable Charge 	No

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none">MembershipPaymentPolicy	
	Note: At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types to the MAP_ENTITY_FLG lookup field.	

Note: While defining a delinquency process type preference, you must set at least one attribute in the delinquency process type preference.

Tip: Alternatively, you can click the **Duplicate** button in the **Field Mapping** zone to create a copy of the delinquency process type preference.

- 3. Enter the required details in the **Main** section.
- 4. Define, edit, or remove the attribute from the delinquency process preference, if required.
- 5. Click **Save**.
The new delinquency process preference is defined.

Delinquency Process Preference

A delinquency process preference enables you to set the attributes which are used at various stages in the lifecycle of a delinquency process. In case you offer the **Delinquency Management** feature to both the fully insured group and

individual customers, the system will use the same delinquency process preference for both the fully insured group business and the fully insured individual business.

Some attributes in the delinquency process preference are common for both the fully insured group business and the fully insured individual business, while some attributes are specific to the fully insured group business or the fully insured individual business. The system considers the delinquency process preference which is specified in the **Delinquency Process Field Mapping** option type of the **DELINPROC** feature configuration.

You can define, edit, delete, and copy a delinquency process preference using the **C1-FieldMapping** business object through the **Field Mapping** screen. You can create a delinquency process preference using the **Delinquency Process** preference category. While creating a delinquency process preference, you need to specify the following attributes:

- **Advance Deposit Account Relationship Type** – Used to specify the account relationship type. It is used to identify the advance deposit account of a parent customer (i.e. policy holder) when the advance deposit level is set to **PG** or **POLI**, respectively. This attribute is required when the group customer wants to allocate advance deposit to settle its overdue bills. This attribute is only applicable for the fully insured group business.
- **Advance Deposit Contract Type** – Used to specify the advance deposit contract type. It is used to identify the advance deposit contract on the parent customer's advance deposit account or linked to the policy when the advance deposit level is set to **PG** or **POLI**, respectively. This attribute is required when the group customer wants to allocate advance deposit to settle its overdue bills. This attribute is only applicable for the fully insured group business.
- **Awaiting Membership Cancellation Reason** – Used to indicate the reason why you want to cancel an individual membership which is billed to an account. Here, you must specify a status reason which is already defined for the **Active** status of the **C1-IndMembership** business object.
- **Delinquency Process Approval In Progress Status** – Used to specify the status to which a delinquency process should be transitioned when approval process is configured for any manual action in a delinquency process type. This attribute is required only when you opt to configure approval process for any manual action in the delinquency process.
- **Delinquency Process Automatic Reinstatement Stopped** – Used to specify the status to which a delinquency process should be transitioned when automatic reinstatement of the delinquency process is stopped due to some reason.
- **Delinquency Process Canceled Status** – Used to specify the status to which a delinquency process should be transitioned when it is canceled due to any reason. It is also referred while resuming a delinquency process due to cancellation of a payment or an adjustment.
- **Delinquency Process Completed Status** – Used to specify the status to which a delinquency process should be transitioned when all its delinquency events are triggered successfully.
- **Delinquency Process Customer Reinstated Status** – Used to specify the status to which a delinquency process should be transitioned when the policies or individual memberships billed to the person or account are reinstated. It is also referred while resuming a delinquency process due to cancellation of a payment or an adjustment.
- **Delinquency Process Hold Status** – Used to specify the status to which a delinquency process should be transitioned when you manually hold the delinquency process or when the system automatically holds the delinquency process if the certain conditions are met.
- **Delinquency Process Initiate Cancel Status** – Used to specify the status to which a delinquency process should be transitioned when you manually cancel the delinquency process.
- **Delinquency Process Initiate Hold Status** – Used to specify the status to which a delinquency process should be transitioned when you manually hold the delinquency process.
- **Delinquency Process Initiate Reinstated Status** – Used to specify the status to which a delinquency process should be transitioned when you manually reinstate the delinquency process.
- **Delinquency Process Initiate Release Status** – Used to specify the status to which a delinquency process should be transitioned when you manually release the hold on delinquency process.
- **Delinquency Process Initiated Status** – Used to specify the status to which a delinquency process should be transitioned when it is created for a person or an account.
- **Delinquency Process InProgress Status** – Used to specify the status to which a delinquency process should be transitioned when its first event is triggered.
- **Delinquency Process Pending Termination Status** – Used to specify the status to which a delinquency process should be transitioned on the termination request date when the **C1-DPMON** batch is executed.

- **Delinquency Process Reinstate Status** – Used to specify the status to which a delinquency process should be transitioned when you manually reinstate the delinquency process or when the system automatically reinstates the delinquency process if the certain conditions are met.
- **Delinquency Process Released Status** – Used to specify the status to which a delinquency process should be transitioned when you manually release the hold on the delinquency process or when the system automatically releases the hold on the delinquency process if the certain conditions are met.
- **Delinquency Process Terminated Status** – Used to specify the status to which a delinquency process should be transitioned when the policies or individual memberships billed to the respective account are terminated in ORMB. This attribute is referred while executing the **C1-DPMON** batch.
- **Delinquency Reinstatement Payment/Adjustment Canceled Status**– Used to specify the status to which a delinquency process should be transitioned when you want to resume the reinstated delinquency process due to cancellation of a payment or an adjustment.
- **Membership Termination Reason for Delinquency** – Used to indicate the reason why you want to terminate an active individual membership which is billed to an account. Here, you must specify a status reason which is already defined for the **Terminated** status of the **C1-IndMembership** business object.
- **Policy Characteristic Type for Customer Contact** – Used to indicate the characteristic type using which you want to store the policy ID on the customer contact. Here, you must specify a characteristic type where the characteristic entity is set to **Customer Contact**. This attribute is also referred while deriving the policy ID from the customer contact.
- **Policy Termination Reason for Delinquency Process** - Used to indicate the reason why you want to terminate an active policy which is billed to a person or an account. Here, you must specify a status reason which is already defined for the **Terminated** status of the **C1-POLICY** business object.

Searching for a Delinquency Process Preference

Procedure

To search for a delinquency process preference:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Field Mapping**.
A sub-menu appears.
3. Click the **Search** option from the **Field Mapping** sub-menu.
The **Field Mapping** screen appears.
4. Select the **Delinquency Process** option from the **Preference Category** list.
5. Enter the additional search criteria in the **Search Field Mapping** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

6. Click **Search**.
A list of delinquency process preferences that meet the search criteria appears in the **Search Results** section.

Defining a Delinquency Process Preference

Prerequisites

To define a delinquency process preference, you should have:

- Field mapping business objects defined in the application.

- Delinquency process defined in the application

Procedure

To define a delinquency process preference:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Field Mapping**.
A sub-menu appears.
3. Click the **Add** option from the **Field Mapping** sub-menu.

The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Field Mapping Business Object	<p>Used to indicate the business object using which you want to create the delinquency process preference. The valid values are:</p> <ul style="list-style-type: none"> • Bill Route Method - Contact Method Mapping (i.e., C1_BillRouteCntMethMap) - Enables you to maintain a routing method - contact method mapping preference. • Field Mapping (i.e., C1-FieldMapping) - Enables you to maintain the following: <ul style="list-style-type: none"> • Automatic Refund/Write-Off Preference • Billing Preference • Binder Payment Preference • Configuration for Match Type - Handling Overpayment Preference • Delinquency Process Preference • Delinquency Process Type Preference • Geographic Rating Area Preference • Individual Membership Preference • Medicare Preference • Member Reconciliation Preference • Member Relationship and Subscription Tier Preference • Membership Repricing Reasons Preference • Statement Construct Preference • Medicare Plan Benefit Package (i.e., C1-BenefitPackage) - Enables you to maintain a Medicare plan benefit package. • Membership Status Reason Mapping (i.e., C1-MemStatusReasonMapping) - Enables you to maintain an individual membership status reason preference. <p>Note: The above business objects are shipped with the product. The list includes those business objects which are created using the Field Mapping (i.e., C1-FIELDMAP) maintenance object.</p>	Yes

Note: Alternatively, you can access the **Select Business Object** screen by clicking the **Add** button in the **Page Title** area of the **Field Mapping** screen.

4. Select the **Field Mapping** option from the **Field Mapping Business Object** list.
5. Click **OK**.

The **Field Mapping** screen appears. It contains the following sections:

- **Main** - Used to specify basic details for the delinquency process preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the delinquency process preference.	Yes
Description	Used to specify the description for the delinquency process preference.	Yes
Detailed Description	Used to specify additional information about the delinquency process preference.	No
Status	Used to indicate the status of the delinquency process preference. The valid values are: <ul style="list-style-type: none"> • Active • Inactive 	Yes

- **Preference Category** - Used to specify the preference category. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Preference Category	Used to indicate the category to which the preference belongs. The valid values are: <ul style="list-style-type: none"> • Automatic Refund/Write-Off • Billing • Binder Payment • Claim Extract • Configuration for Match Type - Handling Overpayment • Delinquency Process • Delinquency Process Type • Geographic Rating Area • Individual Membership • Medicare • Medicare Plan Benefit • Member Reconciliation • Member Relationship and Subscription Tier • Membership Repricing Reasons • Membership Status Reason • Routing Method - Contact Method Mapping • Statement Construct 	Yes

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The list includes only those values which are defined in the FIELD_CAT_FLG lookup field.</p> <p>You must select the Delinquency Process option from the list while creating a delinquency process preference.</p>	

- **Preference Settings** - Used to set the attributes in the delinquency process preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the delinquency process preference.	Yes
	Note: The attribute list appears only when the preference category is selected from the respective list.	
Value	Used to specify the attribute value.	Yes
	<p>Note:</p> <p>The attribute value list appears only when the attribute is selected from the respective list.</p> <p>The attribute value list varies depending on the attribute that you want to set in the delinquency process preference.</p>	
Entity Type	<p>Used to indicate the type of entity for which the attribute is applicable. The valid values are:</p> <ul style="list-style-type: none"> • Account • Adjustment • Billable Charge • Membership • Payment • Policy 	No
	Note: At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types to the MAP_ENTITY_FLG lookup field.	

Note: While defining a delinquency process preference, you must set at least one attribute in the delinquency process preference.

6. Select the **Delinquency Process** option from the **Preference Category** list.
The **Preference Category** section disappears and the **Preference Category** field appears in the **Main** section.
7. Enter the required details in the **Main** section.
8. Set the required attributes in the delinquency process preference.

9. If you want to set more than one attribute in the delinquency process preference, click the **Add (+)** icon and then repeat step 8.

Note: However, if you want to remove an attribute from the delinquency process preference, click the **Delete (🗑)** icon corresponding to the attribute.

10. Click **Save**.
The delinquency process preference is defined.

Editing a Delinquency Process Preference

Prerequisites

To edit a delinquency process preference, you should have:

- Field mapping business objects defined in the application.
- Delinquency process defined in the application

Procedure

To edit a delinquency process preference:

1. Search for the delinquency process preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Edit (🔗)** icon in the **Edit** column corresponding to the delinquency process preference whose details you want to edit.

The **Field Mapping** screen appears. It contains the following sections:

- **Main** - Used to specify basic details for the delinquency process preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Displays the delinquency process preference.	Yes
Description	Used to specify the description for the delinquency process preference.	Yes
Detailed Description	Used to specify additional information about the delinquency process preference.	No
Status	Used to indicate the status of the delinquency process preference. The valid values are: <ul style="list-style-type: none">• Active• Inactive	Yes
Preference Category	Indicates the category to which the preference belongs. The valid value is: <ul style="list-style-type: none">• Delinquency Process	Not applicable

- **Preference Settings** - Used to set the attributes in the delinquency process preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the delinquency process preference.	Yes

Field Name	Field Description	Mandatory (Yes or No)
	Note: The attribute list appears only when the preference category is selected from the respective list.	
Value	Used to specify the attribute value. Note: The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the delinquency process preference.	Yes
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: <ul style="list-style-type: none">• Account• Adjustment• Billable Charge• Membership• Payment• Policy Note: At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types to the MAP_ENTITY_FLG lookup field.	No

Tip: Alternatively, you can click the **Edit** button in the **Field Mapping** zone to edit the details of the delinquency process preference.

3. Modify the required details in the **Main** section.
4. Define, edit, or remove the attribute from the delinquency process preference, if required.

Note: You must set at least one attribute in a delinquency process preference.

5. Click **Save**.
The changes made to the delinquency process preference are saved.

Deleting a Delinquency Process Preference

Procedure

To delete a delinquency process preference:

1. Search for the delinquency process preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Delete** (🗑) icon in the **Delete** column corresponding to the delinquency process preference that you want to delete.
A message appears confirming whether you want to delete the delinquency process preference.

Tip: Alternatively, you can click the **Delete** button in the **Field Mapping** zone to delete the delinquency process preference.

3. Click **OK**.
The delinquency process preference is deleted.

Copying a Delinquency Process Preference

Instead of creating a delinquency process preference from scratch, you can create a new delinquency process preference using an existing delinquency process preference. This is possible through copying a delinquency process preference. On copying a delinquency process preference, the details including the attributes are copied to the new delinquency process preference. You can then edit the details, if required.

Prerequisites

To define a delinquency process preference, you should have:

- Field mapping business objects defined in the application.
- Delinquency process defined in the application

Procedure

To copy a delinquency process preference:

1. Search for the delinquency process preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Duplicate** (📄) icon in the **Duplicate** column corresponding to the delinquency process preference whose copy you want to create.

The **Field Mapping** screen appears. It contains the following sections:

- **Main** - Used to specify basic details for the delinquency process preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the delinquency process preference.	Yes
Description	Used to specify the description for the delinquency process preference.	Yes
Detailed Description	Used to specify additional information about the delinquency process preference.	No
Status	Used to indicate the status of the delinquency process preference. The valid values are: <ul style="list-style-type: none">• Active• Inactive	Yes
Preference Category	Indicates the category to which the preference belongs. The valid value is: <ul style="list-style-type: none">• Delinquency Process	Not applicable

- **Preference Settings** - Used to set the attributes in the delinquency process preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the delinquency process preference.	Yes
	Note: The attribute list appears only when the preference category is selected from the respective list.	
Value	Used to specify the attribute value.	Yes
	Note: The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the delinquency process preference.	
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: <ul style="list-style-type: none"> • Account • Adjustment • Billable Charge • Membership • Payment • Policy 	No
	Note: At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types to the MAP_ENTITY_FLG lookup field.	

Note: While defining a delinquency process preference, you must set at least one attribute in the delinquency process preference.

Tip: Alternatively, you can click the **Duplicate** button in the **Field Mapping** zone to create a copy of the delinquency process preference.

3. Enter the required details in the **Main** section.
4. Define, edit, or remove the attribute from the delinquency process preference, if required.
5. Click **Save**.
The new delinquency process preference is defined.

Routing Method – Contact Method Mapping Preference

A routing method - contact method mapping preference enables you to map a bill routing method to a preferred contact method. The system will then derive the preferred contact method for the bill routing method from the routing method - contact method mapping preference while creating a customer contact for a person or an account during the delinquency management.

In case you offer the **Delinquency Management** feature to both the fully insured group and individual customers, the system will use the same routing method - contact method mapping preference for both the fully insured group business and the fully insured individual business. The system considers the routing method - contact method mapping preference which is specified in the **Routing Method - Contact Method Mapping** option type of the **DELINPROC** feature configuration.

You can define, edit, delete, and copy a routing method - contact method mapping preference using the **C1_BillRouteCntMethMap** business object through the **Field Mapping** screen. While creating a routing method - contact method mapping preference, you can specify the following attributes:

- **Bill Routing Method** - Used to indicate the bill routing method for which you want to map the preferred contact method. Here, the list includes all the values which are defined in the **BILL_RTG_METH_FLG** lookup field.
- **Preferred Contact Method** - Used to indicate the preferred contact method for the bill routing method. Here, the list includes all the values which are defined in the **CONTACT_METH_FLG** lookup field.

You can define, edit, delete, and copy a bill route method - contact method mapping preference through the **Field Mapping** screen.

Searching for a Bill Route Method - Contact Method Mapping Preference

Procedure

To search for a bill route method - contact method mapping preference:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Field Mapping**.
A sub-menu appears.

- 3. Click the **Search** option from the **Field Mapping** sub-menu.
The **Field Mapping** screen appears.
- 4. Select the **Routing Method - Contact Method Mapping** option from the **Preference Category** list.
- 5. Enter the additional search criteria in the **Search Field Mapping** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 6. Click **Search**.
A list of bill route method - contact method mapping preferences that meet the search criteria appears in the **Search Results** section.

Defining a Routing Method – Contact Method Mapping Preference

Prerequisites

To define a bill route method - contact method mapping preference, you should have:

- Field mapping business objects defined in the application.
- Bill routing methods and preferred contact methods defined in the application.

Procedure

To define a bill route method - contact method mapping preference:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **F** and then click **Field Mapping**.
A sub-menu appears.
- 3. Click the **Add** option from the **Field Mapping** sub-menu.

The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Field Mapping Business Object	Used to indicate the business object using which you want to create the bill route method - contact method mapping preference. The valid values are: <ul style="list-style-type: none">• Bill Route Method - Contact Method Mapping (i.e., C1_BillRouteCntMethMap) - Enables you to maintain a routing method - contact method mapping preference.• Field Mapping (i.e., C1-FieldMapping) - Enables you to maintain the following:<ul style="list-style-type: none">• Automatic Refund/Write-Off Preference• Billing Preference• Binder Payment Preference• Configuration for Match Type - Handling Overpayment Preference• Delinquency Process Preference• Delinquency Process Type Preference• Geographic Rating Area Preference	Yes

Field Name	Field Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> Individual Membership Preference Medicare Preference Member Reconciliation Preference Member Relationship and Subscription Tier Preference Membership Repricing Reasons Preference Statement Construct Preference Medicare Plan Benefit Package (i.e., C1-BenefitPackage) - Enables you to maintain a medicare plan benefit package. Membership Status Reason Mapping (i.e., C1-MemStatusReasonMapping) - Enables you to maintain an individual membership status reason preference. 	
	<p>Note: The above business objects are shipped with the product. The list includes those business objects which are created using the Field Mapping (i.e., C1-FIELDMAP) maintenance object.</p>	

Note: Alternatively, you can access the **Select Business Object** screen by clicking the **Add** button in the **Page Title** area of the **Field Mapping** screen.

4. Select the **Bill Route Method - Contact Method Mapping** option from the **Field Mapping Business Object** list.
5. Click **OK**.

The **Bill Route Method - Contact Method Mapping** screen appears. It contains the following sections:

- **Main** - Used to specify basic details for the bill route method - contact method mapping preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the bill route method - contact method mapping preference.	Yes
Description	Used to specify the description for the bill route method - contact method mapping preference.	Yes

- **Bill Route Method - Contact Method Mapping** - Used to set the bill routing and preferred contact method in the bill route method - contact method mapping preference. This section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Bill Routing Method	Used to indicate the bill routing method for which you want to map the preferred contact method.	No
	Note: Here, the list includes all the values which are defined in the BILL_RTG_METH_FLG lookup field.	
Preferred Contact Method	Used to indicate the preferred contact method for the bill routing method.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	Note: Here, the list includes all the values which are defined in the CONTACT_METH_FLG lookup field.	Note: This field is required when the bill routing method is specified in the respective field.

Note:

If a preference is defined using the **C1_BillRouteCntMethMap** business object, the system will derive the preferred contact method for the bill routing method from the preference while creating a customer contact for the delinquent account.

While defining a bill route method - contact method mapping preference, you must set at least one bill routing and preferred contact method in the bill route method contact method mapping preference.

- Enter the required details in the **Main** section.
- Select the required bill routing and preferred contact method from the respective fields.
- If you want to set more than one bill routing and preferred contact method in the bill route method - contact method mapping preference, click the **Add (+)** icon and then repeat step 7.

Note: However, if you want to remove a bill routing and preferred contact method from the bill route method - contact method mapping preference, click the **Delete** (■) icon corresponding to the bill routing and preferred contact method.

- Click **Save**.
The bill route method - contact method mapping preference is defined.

On Demand Billing

Topics:

- [Prerequisites](#)
- [CSV File Format for Insurance Usage Data](#)
- [Usage Record Status Transition](#)
- [File Type](#)
- [On Demand Billing](#)
- [Usage Data Processing](#)

Oracle no longer supports the Off Cycle Billing feature introduced in Oracle Revenue Management and Billing Version 2.2.4.2. Instead, the On Demand Billing feature has been introduced to facilitate adhoc billing. Earlier, you were only able to carry out billing based on the bill cycle (defined for the account). In other words, you were able to generate a bill for a bill cycle using the billable charges whose start and end dates fall within the bill cycle. However, there might be situations where you have received certain billing information after the bill is generated for the bill cycle. In such scenarios, you would like to generate a separate bill for the newly created billable charges. The system now allows you to generate an adhoc bill. However, note that you cannot generate adhoc bills through the **Bill** screen.

A bill is generated using the billable charges. Now, in order to differentiate between the normal and adhoc billable charges, you need to set the **Adhoc Bill** flag for the billable charges. If the value of the **Adhoc Bill** flag is set to **Y**, the system will consider the billable charge during adhoc billing. And, if the value of the **Adhoc Bill** flag is set to **N**, the system will consider the billable charge during regular billing based on the bill cycle.

A new batch named **Adhoc Billing (C1-FABL)** is created which generates adhoc bills. Both, automatically generated and manually created billable charges (with the **Adhoc Bill** flag set to **Y**) are considered during adhoc billing.

With Oracle Revenue Management and Billing V2.4.0.0.0, the On Demand Billing feature has been enhanced to facilitate billing for multiple usage data files in one go. Till now you were only able to create billable charges and bill for only one usage data file at a time using the using the **On Demand Billing** screen. However, there might be situations where you want to upload multiple usage data files and generate billable charges for the usage records (of a single or multiple accounts) that you may want to group together based on certain criteria. For example, you may want to generate billable charges for all debit transactions of one or more accounts. In such scenarios, you can now upload multiple usage data files using a file group and create billable charges for the records uploaded through the **Usage Data Processing** screen. You can create file groups based on various criteria to upload multiple usage data files. For example, you may want to create a file group for uploading usage data files of accounts that need to be billed for the services to be charged for using the credit card facility. You can create a file group using the **On Demand Billing** screen. You can then upload one or more usage data files using the file group through the **Usage Data Processing** screen. Oracle Revenue Management and Billing provides you with a facility to upload usage data received from various product processors or banking applications for billing. You can upload a usage data file in the CSV format. The **Usage Data Processing** screen allows you to upload usage data files for both banking and insurance modules. You need to ensure that the CSV file is in the required format; otherwise the file will not be uploaded in the system. For more information about the CSV file format,

see CSV File Format for Banking and CSV File Format for Insurance. When you upload a usage data file, mapping algorithm parses the flat file in the CSV format and maps the columns in the CSV file to an XML schema named Interface. The validation process starts immediately after the file is uploaded in the system. During the validation process, the system and custom validations (if any) are executed. The status of each usage record is changed to Valid or Invalid depending on whether the usage record was validated successfully or not. Once a usage record is successfully validated, you can submit the valid records and create billable charges for them. Once the usage data files are uploaded and billable charges are generated through the **Usage Data Processing** screen, you can then create and freeze the bills using the **On Demand Billing** screen.

You can optionally configure the system to use the approval workflow process for a usage data file. On submitting a valid record, the approval workflow process routes the usage record to the approver for approval. The approver receives a notification to approve the valid records. The approver can either approve or reject one or more valid records. Once the approver approves a valid record, a billable charge is created for the usage record. However, if the approver rejects a valid record, a notification is sent to the submitter to resolve the usage record. The submitter can then correct the existing data or add missing data (based on the review comments), and can again submit the valid record for approval. Once the valid record is approved, a billable charge is created for the usage record.

The system generates the bills based on the Bill After Date. The Bill After Date indicates the date after which adhoc or normal bills must be generated. In case of adhoc billing, the Bill After Date is specified for a file group using which you can upload one or more usage data files.

While uploading usage data files for adhoc billing, you may or may not specify the Bill After Date for a file group. The system behaves in the following manner when:

- **Bill After Date - Specified:** Adhoc bill is generated for the usage data file and account combination when the Bill After Date is equal to or earlier than the current date.
- **Bill After Date - Not Specified:** During the upload process, the Bill After Date is set to the current date. And, adhoc bill is generated for the usage data file and account combination when the Bill After Date is equal to or earlier than the current date.

In case of regular billing, you may or may not specify the Bill After Date while uploading a usage data file. The system behaves in the following manner when:

- **Bill After Date - Specified:** Normal bill is generated for the account in the bill cycle in which the bill after date falls.
- **Bill After Date - Not Specified:** Normal bill is generated for the account based on the bill cycle defined for the account.

Once the adhoc or normal bills are generated for a usage data file, you can freeze and complete the bills. Oracle Revenue Management and Billing provides you with the ability to freeze and complete adhoc bills generated for a usage data file from the **On Demand Billing** screen.

During the on demand billing process, each usage record of a file goes through various statuses until it is billed to the person. For more information about the usage record statuses, see [Usage Record Status Transition](#) on page 4111.

Prerequisites

To setup the on demand billing process, you need to do the following:

- Ensure approver's user group has access to the **F1-DFLT**S application service
- Create a To Do Type for submitter named **C1-ODBSU** using the following information:
 - **Navigation Option** - C1_SUBMIT
 - **Priority** - Priority 10 - Highest
 - **Message Category** - 17000
 - **Message Number** - 1470
 - **Sort Keys** - Define the following sort keys for the To Do type:

Sort Key	Use as Default	Sort Order
Usage Data ID	Yes	Descending

- **Drill Keys** - Define the following drill keys for the To Do type:

Table Name	Field Name
CI_BCHG_STG	BCHG_HSTG_ID
CI_BCHG_STG	FILE_NAME
CI_BCHG_STG	BCHG_STG_STAT_FLG

- Create a To Do Type for approver named **C1-ODBAP** using the following information:
 - **Navigation Option** - CI_NDAP
 - **Priority** - Priority 10 - Highest
 - **Message Category** - 17000
 - **Message Number** - 1470
 - **Sort Keys** - Define the following sort keys for the To Do type:

Sort Key	Use as Default	Sort Order
Usage Data ID	Yes	Descending

- **Drill Keys** - Define the following drill keys for the To Do type:

Table Name	Field Name
CI_BCHG_STG	BCHG_HSTG_ID
CI_BCHG_STG	FILE_NAME

- Create a To Do role named **C1-ODBSU** for submitter and **C1-ODBAP** for approver
- Assign the **C1-ODBSU** To Do type to the **C1-ODBSU** To Do role
- Assign the **C1-ODBAP** To Do type to the **C1-ODBAP** To Do role
- Create a To Do role named **C1-ODFU** and assign users to this To Do role. The users who have the **C1-ODFU** To Do role will receive the To Do entries generated while executing the **Upload and Validate Usage Data File (C1-ODFU)** batch.
- Assign the **C1-ODFU** To Do type to the **C1-ODFU** To Do role
- Create a To Do role named **C1-ODBCH** and assign users to this To Do role. The users who have the **C1-ODBCH** To Do role will receive the To Do entries generated while executing the **Billable Charge Creation (C1-ODBCH)** batch.
- Assign the **C1-ODBCH** To Do type to the **C1-ODBCH** To Do role

- Create a To Do role named **C1-FABL** and assign users to this To Do role. The users who have the **C1-FABL** To Do role will receive the To Do entries generated while executing the **Adhoc Billing (C1-FABL)** batch.
- Assign the **C1-FABL** To Do type to the **C1-FABL** To Do role
- Create a To Do role named **C1-FCADH** and assign users to this To Do role. The users who have the **C1-FCADH** To Do role will receive the To Do entries generated while executing the **Freeze and Complete Adhoc Bills (C1-FCADH)** batch.
- Assign the **C1-FCADH** To Do type to the **C1-FCADH** To Do role
- Set e-mail address for the users who are going to use the **On Demand Billing** screen (otherwise To Do entry will not be generated on executing the above batches)
- Create a mapping algorithm using the **C1-CSVPMALGO** algorithm type
- Create a validation algorithm using the **C1-VLDALGO** algorithm type
- Create an extract algorithm using the **C1-EXTALGO** algorithm type
- Create a To Do algorithm using the **C1_ODBDALGO** algorithm type and set the following parameters in the algorithm:
 - **To Do Role for Submitter** - Used to indicate that users with the specified To Do role can only resolve the records which are rejected by the approver.
 - **To Do Type for Submitter** - Used to indicate that a To Do entry of the specified To Do type must be created when the approver rejects the records.
 - **To Do Role for Approver** - Used to indicate that users with the specified To Do role can only approve the records submitted by the submitter.
 - **To Do Type for Approver** - Used to indicate that a To Do entry of the specified To Do type must be created when the submitter submits the valid records for approval.
- Define the required file types in the system
- Define values for the following lookup fields:
 - ODB_CAN_RSN_FLG
 - ODB_REJ_RSN_FLG
 - PAGE_NUMBER
- If you want to create billable charges with future date for a contract, then ensure that the **Use Calendar Billing** option is set to **Allow Advanced Billing** in the respective contract type.
- Create an algorithm using the **C1-ODBFILEIN** algorithm type and attach it to the **Upload File Information** system event in the **Algorithms** tab of the **Installation Options - Framework** screen.

Besides this, you need to setup the following feature configurations:

- On Demand Billing (C1-ODBFC)
- Multi Parameter Based Pricing (C1_PPARM_FLG)

Note: If you want to use the **On Demand Billing** feature in an ORMB Cloud Service Premium Edition environment, you need to set the **ODB Extendable Lookup and Bucket** option type of the **C1-CFS** feature configuration.

CSV File Format for Insurance Usage Data

Before uploading a usage data file for insurance, you need to ensure that the CSV file contains the following columns:

Column Name	Description	Mandatory (Yes or No)
DATA IDENTIFIER	Used to specify the serial number of the usage record.	No
START DATE	Used to specify the date from when the price item was used.	No
	Note: You must specify the date in the YYYY-MM-DD format.	
END DATE	Used to specify the date till when the price item was used.	No
	Note: You must specify the date in the YYYY-MM-DD format.	
CONTRACT ID	Used to specify the contract ID.	Yes
CHARGE TYPE	Used to indicate the charge type.	No
DESCRIPTION	Used to specify the description for the usage record. It is shown on the billable charge.	Yes
BILL DESCRIPTION1, LINE BILL LINE DESCRIPTION2,, BILL LINE DESCRIPTION10	Used to specify the description for the line item (charge).	Yes (Conditional)
		Note: This data is required when the charge amount is specified.
AMOUNT1, AMOUNT2, , AMOUNT10	Used to specify the charge amount.	Yes (Conditional)
		Note: This data is required when the bill line description or currency is specified.
CURRENCY1, CURRENCY2, , CURRENCY10	Used to specify the currency in which the amount is charged.	Yes (Conditional)
	Note: If you specify a currency other than the account's invoice currency, the system will do the currency conversion if the appropriate exchange rate is available in the system.	Note: This data is required when the charge amount is specified.
MEMO ONLY1, MEMO ONLY2, , MEMO ONLY10	Used to indicate whether the charge should be included in the bill amount or not. The valid values are: <ul style="list-style-type: none">• true• false	No
	Note: By default, the value will be set to false if the column does not contain any value.	

Column Name	Description	Mandatory (Yes or No)
SUMMARY1, SUMMARY2, SUMMARY10	Used to indicate whether the charge should be included in the summary line or not. The valid values are: <ul style="list-style-type: none"> true false 	No
	Note: By default, the value will be set to true if the column does not contain any value.	
SHOW ON BILL1, SHOW ON BILL2,, SHOW ON BILL10	Used to indicate whether the charge should appear on the person's printed bill or not. The valid values are: <ul style="list-style-type: none"> true false 	No
	Note: By default, the value will be set to true if the column does not contain any value.	
GL DISTRIBUTION CODE 1, GL DISTRIBUTION CODE 2,, GL DISTRIBUTION CODE 10	Used to specify the distribution code which indicates the GL account associated with the charge.	Yes (Conditional)
		Note: This data is required when false is specified in the Memo Only column corresponding to the bill line description.
PRICE ITEM	Used to specify the price item code.	Yes
VARIANCE	Used to indicate the variance that must be used along with the price item for determining the price item pricing.	No
PARAM TYPE1, PARAM TYPE2,, PARAM TYPE15	Used to indicate the price item parameter that must be used along with the price item for determining the price item pricing.	Yes (Conditional)
	Note: If the data in these columns will be used for price item parameter mapping, you must not use the equal to (=) and tilde (~) symbols in these columns.	Note: This data is required when the parameter value is specified.
PARAM VALUE1, PARAM VALUE2,, PARAM VALUE15	Used to specify the parameter value.	Yes (Conditional)
	Note: If the data in these columns will be used for price item parameter mapping, you must not use the equal to (=) and tilde (~) symbols in these columns.	Note: This data is required when the parameter type is specified.
SQI1, SQI2,, SQI10	Used to indicate the service quantity identifier that must be used for calculating the price item charges.	Yes (Conditional)
		Note: This data is required when the service quantity is specified.
SQIVALUE1, SQIVALUE2, SQIVALUE10	Used to specify the number of units of the service quantity.	Yes (Conditional)

Column Name	Description	Mandatory (Yes or No)
		Note: This data is required when the SQI is specified.
CHARTYPE1, CHARTYPE2, CHARTYPE10	Used to indicate the characteristic that must be defined for the billable charge.	Yes (Conditional)
		Note: This data is required when the characteristic value is specified.
CHARVAL1, CHARVAL2, CHARVAL10	Used to specify the value of the characteristic type.	Yes (Conditional)
		Note: This data is required when the characteristic type is specified.
RECURRING FLAG	Used to indicate whether recurring bill segments must be created at the intervals defined in the bill period or at the set invoice frequency.	No
BILL PERIOD	Used to indicate the bill period that you want to use for specifying the intervals at which the recurring bill segments must be created.	Yes (Conditional)
		Note: This data is required when the recurring flag is equal to Bill Period.
FREQUENCY	Used to indicate the invoice frequency at which the recurring bill segments must be created.	Yes (Conditional)
		Note: This data is required when the recurring flag is equal to Frequency.

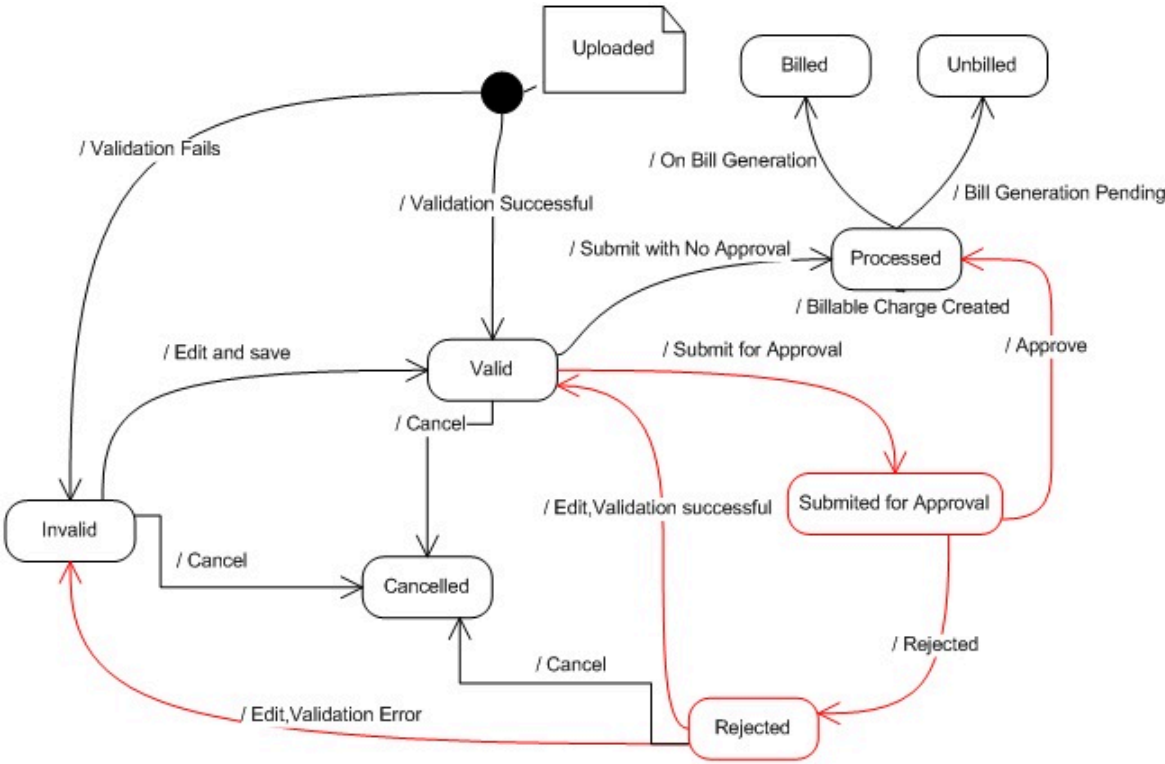

Note:

The column names in the CSV file must be in the Upper case. Otherwise, erroneous results might occur when you upload the usage data file.

While uploading a file using a file type where business labels are defined for usage data fields, the CSV file should contain the business label in the respective column. Otherwise, the usage data file will not be uploaded in the system.

Usage Record Status Transition

The following figure graphically indicates how a usage record moves from one status to another during the on demand billing process:

File Type

Oracle Revenue Management and Billing allows you to define file types using which you can upload a usage or payment data file. It is the file type which helps the system to understand how to process the file. The feed type specified in the file type indicates the type of data that you can upload using the file type. You can upload the following types of data using a file type:

- Banking Usage Data
- Insurance Usage Data

Note: This file type is not applicable for financial services.

- Payment Upload Data

The following table lists the algorithms that you need to specify while defining file types for uploading usage or payment data:

Feed Type	Algorithm	Mandatory (Yes or No)	Algorithm Type Shipped with the Product...	Algorithm Type Purpose
Payment Upload Data	Mapping algorithm	Yes	C1-CSVUPLPAY	Parses the flat file in the CSV format and maps the columns in the CSV file to various tables in the database.
Payment Upload Data	Validation algorithm	Yes	C1-PUPLVALID	Validates a payment data file.
Banking Usage Data	Mapping algorithm	Yes	C1-CSVPMALGO	Parses the flat file in the CSV format and maps the columns in the

Feed Type	Algorithm	Mandatory (Yes or No)	Algorithm Type Shipped with the Product...	Algorithm Type Purpose
				CSV file to an XML schema named Interface .
Banking Usage Data	Validation algorithm	No	C1-VLDALGO	Validates a usage data file.
Banking Usage Data	To Do algorithm	No	C1_ODBTDALGO	Initiates the approval process for usage records before creating the billable charges.
Banking Usage Data	Extract algorithm	No	C1-EXTALGO	Extracts the usage records along with the error messages (if any) in the CSV format.
Insurance Usage Data	Mapping algorithm	Yes	C1-CSVPMALGO	Parses the flat file in the CSV format and maps the columns in the CSV file to an XML schema named Interface .
Insurance Usage Data	Validation algorithm	No	None	-
			Note: You need to design custom algorithm type to validate insurance usage data.	
Insurance Usage Data	To Do algorithm	No	C1_ODBTDALGO	Initiates the approval process for usage records before creating the billable charges.
Insurance Usage Data	Extract algorithm	No	C1-EXTALGO	Extracts the usage records along with the error messages (if any) in the CSV format.

The **File Type** screen allows you to define, edit, and delete a file type. This screen consists of the following zones:

- [File Types](#) on page 4113

File Types

The **File Types** zone lists the file types that are already defined in the system. You can define, edit and delete a file type through this zone.

This zone contains the following columns:

Column Name	Column Description
File Type	Displays the file type.
Description	Displays the description of the file type.
Feed Type	Indicates the type of data that you can upload using the file type. The valid values are: <ul style="list-style-type: none">• Banking Usage Data• Insurance Usage Data

Column Name	Column Description
	<div> Note: This file type is not applicable for financial services. </div> <ul style="list-style-type: none"> Payment Upload Data
Mapping Algorithm	Indicates the mapping algorithm which is triggered when you upload a file.
Validation Algorithm	Indicates the validation algorithm which is triggered once the file is uploaded in the system.
To Do Algorithm	Indicates whether the usage records must be approved before creating the billable charges. If the algorithm is attached, it means the approval is required.
Extract Algorithm	Indicates the extract algorithm which extracts the usage records along with the error messages (if any) in the CSV format.
Edit	<div>On clicking the Edit (✎) icon, the File Type screen appears where you can edit the details of the file type.</div> <div> Note: You can edit the details of a file type when no files are uploaded using the file type. </div>
Delete	<div>On clicking the Delete (🗑) icon, you can delete the file type.</div> <div> Note: You can only delete a file type which is not yet used for uploading a file. </div>

You can define a file type by clicking the **Add** link in the upper right corner of this zone. You can also change the layout of this zone. For more information on how to change the layout, see [Changing the Layout](#) on page 4186.

Defining a File Type

Prerequisites

To define a file type, you should have:

- Mapping algorithm defined using the **C1-CSVUPLPAY** or **C1-CSVPMALGO** algorithm type
- Validation algorithm defined using the **C1-PUPLVALID** or **C1-VLDALGO** algorithm type.
- Extract algorithm defined using the **C1-EXTALGO** algorithm type
- To Do algorithm defined using the **C1_ODBDALGO** algorithm type

Procedure

To define a file type:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **F** and then click **File Type**.
The **File Type** screen appears.

3. Click the **Add** link in the upper right corner of the **File Types** zone.

The **File Type** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Type	Used to specify the file type.	Yes
Description	Used to specify the description for the file type.	Yes
Feed Type	Used to indicate the type of data that you can upload using the file type. The valid values are: <ul style="list-style-type: none">Banking Usage Data <div>Note: This file type is not applicable for health insurance business.</div> <ul style="list-style-type: none">Insurance Usage Data <div>Note: This file type is not applicable for financial services.</div> <ul style="list-style-type: none">Payment Upload Data	Yes
Disable Move to Staging	Used to indicate whether you want to disable the Move to Staging functionality in the Payment Upload screen. <div>Note: This field appears when you select the Payment Upload Data option from the Feed Type list.</div>	No
Mapping Algorithm	Used to attach a mapping algorithm which is triggered when you upload a file.	Yes

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The C1-CSVUPLPAY algorithm type is designed for uploading payment data and the C1-CSVPMALGO algorithm type is designed for uploading usage data. The C1-CSVUPLPAY algorithm type does the following:</p> <ul style="list-style-type: none"> a. Validates whether the file is in the CSV format b. Validates whether at least one payment record is available in the CSV file c. Parses the flat file in the CSV format and maps the columns in the CSV file to various tables in the database d. Uploads the payments records in the pre-staging area <p>However, the C1-CSVPMALGO algorithm type does the following:</p> <ul style="list-style-type: none"> a. Validates whether the file is in the CSV format b. Validates whether the CSV file contains data in the required format c. Validates whether the following data is available for each usage record: <ul style="list-style-type: none"> • Account Identifier Type • Account Identifier • Division • Price Item • Description d. Parses the flat file in the CSV format and maps the columns in the CSV file to an XML schema named Interface <p>The Search (🔍) icon appears corresponding to this field. On clicking the Search icon, the Algorithm Search window appears.</p>	
To Do Algorithm	Used to indicate whether the usage records must be approved before creating the billable charges. If the algorithm is attached, it means the approval is required.	No

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The C1_ODBTDALGO algorithm type contains the following parameters:</p> <ul style="list-style-type: none"> • To Do Role For Submitter - Used to indicate that users with the specified To Do role can only resolve the records which are rejected by the approver. • To Do Type For Submitter - Used to indicate that a To Do using the specified To Do type must be created when the approver rejects the records. • To Do Role For Approver - Used to indicate that users with the specified To Do role can only approve the records submitted by the submitter. • To Do Type For Approver - Used to indicate that a To Do using the specified To Do type must be created when the submitter submits the valid records for approval. <p>This field is disabled when you select the Payment Upload Data option from the Feed Type list.</p> <p>The Search (🔍) icon appears corresponding to this field. On clicking the Search icon, the Algorithm Search window appears.</p>	
Validation Algorithm	Used to attach a validation algorithm which is triggered once the file is uploaded in the system.	Yes (Conditional)
	<p>Note:</p> <p>The C1-PUPLVALID algorithm type is designed for validating a payment data file. It has some pre-defined validations based on which the status of the payment record is set to Valid, Invalid, or Error. For more information about the pre-defined validations, see Upload Payment Records in the Pre-Staging Area on page 1294.</p> <p>However, the C1-VLDALGO algorithm type is designed for validating a banking usage data file. It checks whether account identifier specified for each usage record contains any special characters. You can define any custom validations in this algorithm, if required. You cannot use an algorithm created using the C1-VLDALGO algorithm type to validate an insurance usage data file. If you want to validate an insurance usage data file, you need to create a custom algorithm type.</p> <p>The Search (🔍) icon appears corresponding to this field. On clicking the Search icon, the Algorithm Search window appears.</p>	<p>Note: This field is required when you select the Payment Upload Data option from the Feed Type list.</p>
Extract Algorithm	Used to attach an extract algorithm which extracts the usage records along with the error messages (if any) in the CSV format.	No

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note: This field is disabled when you select the Payment Upload Data option from the Feed Type list.</p> <p>The Search (🔍) icon appears corresponding to this field. On clicking the Search icon, the Algorithm Search window appears.</p>	

In addition, it contains the following two sections:

- **Map Divisions** - Used to indicate the divisions for which you want to use the file type.

Field Name	Field Description	Mandatory (Yes or No)
Division	Used to indicate the division.	No
	<p>Note: You can only view those divisions to which you have access in the Division list.</p>	

Note: This section does not appear when you select the **Payment Upload Data** option from the **Feed Type** list.

- **Custom Labels** - Used to specify business labels for the usage data fields. The usage data fields will change depending on whether you have selected the **Banking Usage Data** or **Insurance Usage Data** option from the **Feed Type** list.

Note:

This section does not appear when you select the **Payment Upload Data** option from the **Feed Type** list.

If you have defined the business label for a usage data field, the CSV file should contain business label in the respective column. Otherwise, the usage data file will not be uploaded in the system.

4. Enter the required details.

Note:

You can search for an algorithm by clicking the **Search** (🔍) icon corresponding to the respective field.

If you want to associate more than one division with the file type, click the **Add** (+) icon and then specify the details in the **Map Divisions** section. However, if you want to remove a division from the file type, click the **Delete** (🗑️) icon corresponding to the division.

5. Click **Save**.
The file type is defined.

Editing a File Type

Prerequisites

To edit a file type, you should have:

- Mapping algorithm defined using the **C1-CSVUPLPAY** or **C1-CSVPMALGO** algorithm type
- Validation algorithm defined using the **C1-PUPLVALID** or **C1-VLDALGO** algorithm type.
- Extract algorithm defined using the **C1-EXTALGO** algorithm type
- To Do algorithm defined using the **C1_ODBDALGO** algorithm type

Note: You can edit the details of a file type when no files are uploaded using the file type.

Procedure

To edit a file type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **File Type**.
The **File Type** screen appears.
3. Click the **Edit** (✎) icon in the **Edit** column corresponding to the file type whose details you want to edit.

The **File Type** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Type	Used to specify the file type.	Yes
Description	Used to specify the description for the file type.	Yes
Feed Type	Used to indicate the type of data that you can upload using the file type. The valid values are: <ul style="list-style-type: none">• Banking Usage Data <div>Note: This file type is not applicable for health insurance business.</div> <ul style="list-style-type: none">• Insurance Usage Data <div>Note: This file type is not applicable for financial services.</div> <ul style="list-style-type: none">• Payment Upload Data	Yes
Disable Move to Staging	Used to indicate whether you want to disable the Move to Staging functionality in the Payment Upload screen. <div>Note: This field appears when you select the Payment Upload Data option from the Feed Type list.</div>	No
Mapping Algorithm	Used to attach a mapping algorithm which is triggered when you upload a file.	Yes

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The C1-CSVUPLPAY algorithm type is designed for uploading payment data and the C1-CSVPMALGO algorithm type is designed for uploading usage data. The C1-CSVUPLPAY algorithm type does the following:</p> <ul style="list-style-type: none"> a. Validates whether the file is in the CSV format b. Validates whether at least one payment record is available in the CSV file c. Parses the flat file in the CSV format and maps the columns in the CSV file to various tables in the database d. Uploads the payments records in the pre-staging area <p>However, the C1-CSVPMALGO algorithm type does the following:</p> <ul style="list-style-type: none"> a. Validates whether the file is in the CSV format b. Validates whether the CSV file contains data in the required format c. Validates whether the following data is available for each usage record: <ul style="list-style-type: none"> • Account Identifier Type • Account Identifier • Division • Price Item • Description d. Parses the flat file in the CSV format and maps the columns in the CSV file to an XML schema named Interface <p>The Search (🔍) icon appears corresponding to this field. On clicking the Search icon, the Algorithm Search window appears.</p>	
To Do Algorithm	Used to indicate whether the usage records must be approved before creating the billable charges. If the algorithm is attached, it means the approval is required.	No

Field Name	Field Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The C1_ODBTDALGO algorithm type contains the following parameters:</p> <ul style="list-style-type: none"> • To Do Role For Submitter - Used to indicate that users with the specified To Do role can only resolve the records which are rejected by the approver. • To Do Type For Submitter - Used to indicate that a To Do using the specified To Do type must be created when the approver rejects the records. • To Do Role For Approver - Used to indicate that users with the specified To Do role can only approve the records submitted by the submitter. • To Do Type For Approver - Used to indicate that a To Do using the specified To Do type must be created when the submitter submits the valid records for approval. <p>This field is disabled when you select the Payment Upload Data option from the Feed Type list.</p> <p>The Search (🔍) icon appears corresponding to this field. On clicking the Search icon, the Algorithm Search window appears.</p>	
Validation Algorithm	Used to attach a validation algorithm which is triggered once the file is uploaded in the system.	Yes (Conditional)
	<p>Note:</p> <p>The C1-PUPLVALID algorithm type is designed for validating a payment data file. It has some pre-defined validations based on which the status of the payment record is set to Valid, Invalid, or Error. For more information about the pre-defined validations, see Upload Payment Records in the Pre-Staging Area on page 1294.</p> <p>However, the C1-VLDALGO algorithm type is designed for validating a banking usage data file. It checks whether account identifier specified for each usage record contains any special characters. You can define any custom validations in this algorithm, if required. You cannot use an algorithm created using the C1-VLDALGO algorithm type to validate an insurance usage data file. If you want to validate an insurance usage data file, you need to create a custom algorithm type.</p> <p>The Search (🔍) icon appears corresponding to this field. On clicking the Search icon, the Algorithm Search window appears.</p>	<p>Note: This field is required when you select the Payment Upload Data option from the Feed Type list.</p>
Extract Algorithm	Used to attach an extract algorithm which extracts the usage records along with the error messages (if any) in the CSV format.	No

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field is disabled when you select the Payment Upload Data option from the Feed Type list. The Search (🔍) icon appears corresponding to this field. On clicking the Search icon, the Algorithm Search window appears.	

In addition, it contains the following two sections:

- **Map Divisions** - Used to indicate the divisions for which you want to use the file type.

Field Name	Field Description	Mandatory (Yes or No)
Division	Used to indicate the division.	No
	Note: You can only view those divisions to which you have access in the Division list.	

Note: This section does not appear when the feed type is set to **Payment Upload Data**.

- **Custom Labels** - Used to specify business labels for the usage data fields. The usage data fields will change depending on whether you have selected the **Banking Usage Data** or **Insurance Usage Data** option from the **Feed Type** list.

Note:
This section does not appear when the feed type is set to **Payment Upload Data**.
If you have defined the business label for a usage data field, the CSV file should contain business label in the respective column. Otherwise, the usage data file will not be uploaded in the system.

4. Modify the required details.

Note:
You can search for an algorithm by clicking the **Search** (🔍) icon corresponding to the respective field.
If you want to associate more than one division with the file type, click the **Add** (+) icon and then specify the details in the **Map Divisions** section. However, if you want to remove a division from the file type, click the **Delete** (🗑) icon corresponding to the division.

5. Click **Save**.
The changes made to the file type are saved.

Deleting a File Type

Procedure

To delete a file type:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **File Type**.
The **File Type** screen appears.
3. Click the **Delete** (🗑️) icon in the **Delete** column corresponding to the file type that you want to delete.
A message appears confirming whether you want to delete the file type.

Note: You can only delete a file type which is not yet used for uploading a file.

4. Click **OK**.
The file type is deleted.

On Demand Billing

The **On Demand Billing** screen allows you to search for a file group based on various search criteria. Through this screen, you can:

- Define a file group
- Edit a file group
- Delete a file group
- Close a file group
- Generate adhoc bills for a file group
- Freeze and complete adhoc bills of a file group
- View all bills generated for a file group
- View usage data files of a file group
- Cancel a usage data file

This screen consists of the following zones:

- [Search](#) on page 4123
- [Group Files](#) on page 4125

Search

The **Search** zone allows you to search for file groups for which bills are processed and/or generated in the system. This zone contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Group	Used to specify the file group.	No
Description	Used to specify the description for the file group.	No

Field Name	Field Description	Mandatory (Yes or No)
User ID	Used to specify the name of the user who has uploaded the usage data files in the file group.	No
Bill After Date	Used to specify the date after which the bills must be generated for the file group.	No
Status	Used to indicate the status of the file group. The valid values are: <ul style="list-style-type: none"> Closed Open 	No

Note: You must specify at least one search criterion while searching for a file group.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
File Group	Displays the name of the file group.
	Note: It has a link. On clicking the link, the File Group screen appears where you can view the details of the file group.
Bill After Date	Displays the date after which the bills must be generated for the file group.
Default Usage Start Date	Displays the date from when the price item was used.
Default Usage End Date	Displays the date till when the price item was used.
Status	Displays the status of the file group. The valid values are: <ul style="list-style-type: none"> Open Close
Close	On clicking the Close (✖) icon, you can close a file group.
	Note: You can only close a file group in which all the records of the usage data files are either in the processed or cancelled status.
Generate Bill	On clicking the Generate Bill (📄) icon, you can generate bills for a file group.
Complete Bill	On clicking the Complete Bill (🔒) icon, you can freeze and complete the bills of a file group.
Total	Displays the total number of records that are uploaded through the file group.
Valid	Displays the number of records which are successfully validated in the system.
Invalid	Displays the number of records which could not pass through the validation process in the system.
Submitted	Displays the number of valid records which are submitted for approval.
Processed	Displays the number of valid records for which billable charges are already created.
Rejected	Displays the number of records which are rejected by the approver.
Cancelled	Displays the number of records which are cancelled in the system.

Column Name	Column Description
Unbilled	Displays the number of records for which billable charges are created, but are not yet billed to the person.
Billed	Displays the number of records for which billable charges are created and billed to the person.
Bills	Displays the number of bills generated for the file group.
	Note: It has a link. On clicking the link, the View Bill Data screen appears where you can view all bills generated for the usage data file.
Last Batch Status	Indicates the batch that was last executed on the file group and its current status.
	Note: It has a link. On clicking the link, the Batch Run Tree screen appears where you can view the execution details of the batch.

Group Files

The **Group Files** zone allows you to view the usage data files uploaded using a file group. This zone contains the following two sections:

- **Search Criteria** - the **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Used to specify the name of the usage data file.	No
File Type	Used to specify the type of usage data file.	No
File Upload From Date	Used to specify the start date of the period during which the usage data file that you want to search was uploaded in the system.	No

Field Name	Field Description	Mandatory (Yes or No)
File Upload To Date	Used to specify the end date of the period during which the usage data file that you want to search was uploaded in the system.	No

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
File Information	Displays the name of the usage data file of the file group and its related details.
Total	Displays the total number of records that are uploaded through the usage data file.
Valid	Displays the number of records which are successfully validated in the system.
Invalid	Displays the number of records which could not pass through the validation process in the system.
Submitted	Displays the number of valid records which are submitted for approval.
Rejected	Displays the number of records which are rejected by the approver.
Processed	Displays the number of valid records for which billable charges are already created.
Cancelled	Displays the number of records of a usage data file which are cancelled.
UnBilled	Displays the number of records for which billable charges are created, but are not yet billed to the person.
Billed	Displays the number of records for which billable charges are created and billed to the person.
Cancel	On clicking the Cancel (⊗) icon, you can cancel a file.

By default, the **Group Files** zone does not appear in the **On Demand Billing** screen. It appears when you click the **Broadcast** (📡) icon corresponding to the file group in the **Search Results** section.

Note: By default, the **Group Files** zone displays a list of usage data files that are uploaded using the file group in the **Search Results** section. However, you can filter the list of usage data files by specifying a search criteria in the **Search Criteria** section.

Searching for a File Group

Procedure

To search for a file group:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Billing Management** and then click **On Demand Billing**.
The **On Demand Billing** screen appears.

3. Enter the search criteria in the **Search** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

4. Click **Search**.

A list of file groups that meet the search criteria appears in the **Search Results** section.

Defining a File Group

Prerequisites

To define a file group, you should have:

- Access to the divisions for which you want to define the file group

Procedure

To define a file group:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Billing Management** and then click **On Demand Billing**.
The **On Demand Billing** screen appears.
3. Click the **Add** link in the upper right corner of the **Search** zone.

The **File Group** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Group	Used to specify the file group.	Yes
Description	Used to specify the description for the file group.	Yes
Bill After Date	Used to specify the date after which the bill must be generated for the file group.	Yes
Default Usage Start Date	Used to specify the date from when the price item was used. The default usage start date is used when the start date is not specified for a record in the usage data file. By default, the current date appears in this field. You can change the default usage start date, if required.	Yes
	Note: The default usage start date cannot be later than the default usage end date.	
Default Usage End Date	Used to specify the date till when the price item was used. The default usage end date is used when the end date is	Yes

Field Name	Field Description	Mandatory (Yes or No)
	not specified for a record in the usage data file. By default, the current date appears in this field. You can change the default usage end date, if required.	
	Note: The default usage end date cannot be earlier than the default usage start date.	

In addition, the **File Group** screen contains the following section:

Map Divisions- The **Map Divisions** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Division	Used to indicate the division for which you want to define the file group.	No
		Note: If you do not associate division(s) with the file group, the file group is not available for uploading a usage data file. This means only those file groups for which you have specified division(s) can be used for uploading a usage data file.

- Enter the required details.
- If you want to define the file group for more than one division, click the **Add (+)** icon and then repeat step 5.

Note: However, if you want to remove a division from the file group, click the **Delete (🗑)** icon corresponding to the division.

- Click **Save**.
The file group is defined.

Editing a File Group

Procedure

To edit a file group:

Note: You can edit the details of a file group when no usage data files of this group have been uploaded in the system or all the records in the usage data files of a file group are cancelled.

- Click the **Menu** link in the **Application** toolbar.
A list appears.

- 2. Select **Billing Management** and then click **On Demand Billing**.
The **On Demand Billing** screen appears.
- 3. Search for the file group in the **On Demand Billing** screen.
- 4. In the **Search Results** section, click the link in the **File Group** column corresponding to the file group whose *details* you want to edit.

The **File Group** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Group	Displays the file group.	Not applicable
Description	Used to specify the description for the file group.	Yes
Bill After Date	Used to specify the date after which the bill must be generated for the file group	Yes
Usage Start Date	Used to specify the date from when the price item was used. The default usage start date is used when the start date is not specified for a record in the usage data file.	Yes
	Note: The default usage start date cannot be later than the default usage end date.	
Usage End Date	Used to specify the date till when the price item was used. The default usage end date is used when the end date is not specified for a record in the usage data file.	Yes
	Note: The default usage end date cannot be earlier than the default usage start date.	

In addition, the **Add/Edit File Group** screen contains the following section:

- **Map Divisions-** The **Map Divisions** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Division	Used to indicate the division for which you want to define the file group.	No
		Note: If you do not associate division(s) with the file group, the file group is not available for uploading a usage data file. This means only those file groups for which you have specified division(s) can be used for uploading a usage data file.

- 5. Modify the required details.

Note: If you want to define the file group for more than one division, click the **Add (+)** icon and then specify the details. However, if you want to remove a division from the file group, click the **Delete (■)** icon corresponding to it.

- 6. Click **Save**.
The changes made to the file group are saved.

Deleting a File Group

Procedure

To delete a file group:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. Select **Billing Management** and then click **On Demand Billing**.
The **On Demand Billing** screen appears.
3. Search for the file group in the **On Demand Billing** screen.
4. In the **Search Results** section, click the link in the **File Group** column corresponding to the file group that you want to delete.
The **File Group** screen appears.
5. Click **Delete**.
The file group is deleted.

Note: The delete button appears only if the file group is not yet used. In other words, you cannot delete a file group that you have used for uploading usage data files.

Closing a File Group

Procedure

To close a file group:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. From the **Main** menu, select **Billing Management** and then click **On Demand Billing**.
The **On Demand Billing** screen appears.
3. Search for the file group in the **On Demand Billing** screen.
4. In the **Search Results** section, click the **Close** (✖) icon in the **Close** column corresponding to the file group that you want to close.
The status of the file group is changed to **Closed**.

Note: You can only close a file group in which all the records of the usage data files are either in the processed, cancelled, or rejected status. However, you may close a file group in which all the records are not in the cancelled and/or processed status, but in that case a to do entry is sent to the approver for approval of the pending records.

Generating Adhoc Bills for a File Group

The **On Demand Billing** screen allows you to generate adhoc bills for a file group. However, you can generate bills only after you close the file group for which you want to generate adhoc bills.

Procedure

To generate adhoc bills for a file group:

1. Search for the file group in the **On Demand Billing** screen.
2. In the **Search Results** section, click the **Generate Bill** (📄) icon corresponding to the file group for which you want to generate the adhoc bills.

The **Generate Bill** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Cutoff Date	Used to specify the cutoff date for the bill.	Yes
Accounting Date	Used to specify the accounting date of the bill.	Yes

3. Enter the required details.
4. Click **OK**.

The adhoc bills are generated for the usage data files of a file group. An adhoc bill is generated for a usage data file and account combination when the bill after date is equal to or earlier than the current date. The status of the usage records is changed to **Billed**. If the total number of billable charges created for a usage data file exceeds the online bill creation limit, a batch job is created using the **Adhoc Billing (C1-FABL)** batch. A message appears indicating the batch job ID. This batch job creates adhoc bills for the usage data file.

Note:

You can change the online bill creation limit, whenever required, using the **On Demand Billing (C1-ODBFC)** feature configuration. For more information on the **Adhoc Billing (C1-FABL)** batch, see *Oracle Revenue Management and Billing Batch Execution Guide*.

If an adhoc bill with the **Pending** status already exists for a usage data file and account combination, then the existing bill is deleted and regenerated. However, you can generate the bill again for a file group only after manually deleting the bill from the **Bill** screen.

On successful completion of the **Adhoc Billing (C1-FABL)** batch, a To Do entry is created using the **C1-FABL** To Do type. You can view this To Do entry when you are assigned a To Do role which is mapped to the **C1-FABL** To Do type. This To Do indicates whether the batch was successfully executed or not. If the batch was successfully executed, it indicates the following:

- Number of billable charges which were processed
- Number of billable charges for which the bill after date is a future date
- Number of adhoc bills generated for the usage data file
- Number of billable charges which could not be processed successfully

Once the batch is executed successfully, the status of the usage records in a usage data file of a file group is changed to **Billed**.

Freezing All Bills of a File Group

Oracle Revenue Management and Billing provides you with the ability to freeze and complete adhoc bills generated for the usage data files of a file group from the **On Demand Billing** screen. You can either freeze and complete all or selected adhoc bills, whenever required. However, you cannot freeze and complete normal or regular bills from the **On Demand Billing** screen.

Procedure

To freeze and complete all adhoc bills generated for a file group:

1. Search for the file group in the **On Demand Billing** screen.
2. In the **Search Results** section, click the **Freeze and Complete** (🔒) icon corresponding to the file group whose adhoc bills you want to freeze and complete.

The **Complete Bill** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Bill Date	Used to specify the date on which the bill was completed.	Yes
Accounting Date	Used to specify the accounting date of the bill.	Yes

3. Enter the required details.
4. Click **OK** in the message box.

A batch job is created using the **Freeze and Complete Adhoc Bills (C1-FCADH)** batch. A message appears indicating the batch job ID. This batch job freezes and completes all adhoc bills of the usage data file which are in the **Pending** status. The system does not freeze and complete pending adhoc bills which have bill segments in the **Error** status. For more information on the **Freeze and Complete Adhoc Bills (C1-FCADH)** batch, see *Oracle Revenue Management and Billing Batch Execution Guide*.

Note:

On successful completion of the **Freeze and Complete Adhoc Bills (C1-FCADH)** batch, a To Do entry is created using the **C1-FCADH** To Do type. You can view this To Do entry when you are assigned a To Do role which is mapped to the **C1-FCADH** To Do type. This To Do indicates whether the batch was successfully executed or not. If the batch was successfully executed, it indicates the following:

- Number of bills which were picked up for completion
- Number of bills which were completed
- Number of bills which could not be completed successfully

Once the batch is executed successfully, the status of the bills is changed to **Complete**.

Freezing Selected Bills of a File Group

Oracle Revenue Management and Billing provides you with the ability to freeze and complete adhoc bills generated for a file group from the **On Demand Billing** screen. You can either freeze and complete all or selected adhoc bills, whenever required. However, you cannot freeze and complete normal or regular bills from the **On Demand Billing** screen.

Procedure

To freeze and complete selected adhoc bills of a file group:

1. Search for the file group in the **On Demand Billing** screen.
2. In the **Search Results** section, click the link in the **Bills** column corresponding to the file group whose adhoc bills you want to freeze and complete.
The **View Bill Data** screen appears.
3. Select the check box corresponding to the pending adhoc bill that you want to freeze and complete.

Note: The check box does not appear corresponding to the completed adhoc bills and pending adhoc bills which have bill segments in the **Error** status.

4. Click **Freeze/Complete**.

The **Complete Bill** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Bill Date	Used to specify the date on which the bill was completed.	Yes
Accounting Date	Used to specify the accounting date of the bill.	Yes

5. Enter the required details.

6. Click **OK** in the message box.
The status of the bills is changed to **Complete**.

Note:

The **Freeze/Complete** button is not available in the **View Bill Data** screen when:

- All bills generated for a file group are in the **Complete** status
- Multiple bills are generated for a usage data file of a file group and one or more bill segments of each bill are in the **Error** status

In other words, the **Freeze/Complete** button is available in the **View Bill Data** screen when there is at least one pending bill for a file group where none of the bill segments are in the **Error** status.

Viewing All Bills Generated for a File Group

Procedure

To view all bills generated for a file group:

1. Search for the file group in the **On Demand Billing** screen.
2. In the **Search Results** section, click the link in the **Bills** column corresponding to the file group whose bills you want to view.

The **View Bill Data** screen appears. It contains the following fields:

Field Name	Field Description
File Group	Displays the name of the file group.
Description	Displays the description of the file group.
Bill Generation Date	Used to specify the date when the bills were generated for the file group.
Billing Method	Indicates the type of billing used for the file group. The valid values are: <ul style="list-style-type: none">• Adhoc Billing
Bill Status	Used to indicate the status of the bill. The valid values are: <ul style="list-style-type: none">• Pending• Complete

In addition, this screen contains the following columns:

Column Name	Column Description
Bill ID	Displays the bill ID.

Column Name	Column Description
	Note: It has a link. On clicking the link, the Bill screen appears with the details of the respective bill.
Alternate Bill ID	Displays the alternate bill ID.
Bill Status	Displays the status of the bill. The valid values are: <ul style="list-style-type: none"> • Pending • Complete
Bill Date	Displays the date when the bill was completed.
Accounting Date	Displays the accounting date for which the financial transaction of the bill is created.
Invoice Amount	Displays the total amount billed to the person.
Invoice Currency	Displays the currency in which the amount is billed to the person.
Invoice Account ID	Indicates the account for which the bill is created. <p>Note: It has a link. On clicking the link, the Account screen appears where you can view the details of the respective account.</p>
Display Bill	On clicking this link, you can view the details of the respective bill. <p>Note: This link appears only for the bills that are in the Complete status. The facility to view the generated bills in PDF format is available only if Oracle Documaker is integrated with Oracle Revenue Management and Billing.</p>

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can change the number of records displayed per page, if required. You can use the navigation buttons, such as **First** (<<), **Previous** (<), **Next** (>), and **Last** (>>) to navigate between pages. You can also select the page to which you want to navigate from the **Go To** list.

3. Click **Search**.
4. View the bills generated for the usage data file in the **View Bill Data** screen.
5. If required, you can change the number of records displayed per page.

Note: By default, the number of records that appear in each page depends on the minimum value defined in the **PAGE_NUMBER** lookup field. For example, if the **PAGE_NUMBER** lookup field has four values - 10, 20, 30, and 40, then the number of records displayed in each page, by default, would be 10.

6. If required, you can click the **First** (<<), **Previous** (<), **Next** (>), and **Last** (>>) buttons to navigate between pages.
7. If required, you can freeze and complete adhoc bills which are generated for the usage data file.

Note:

The **Freeze/Complete** button is not available in the **View Bill Data** screen when:

- All bills generated for a usage data file are in the **Complete** status
- Multiple bills are generated for a usage data file and one or more bill segments of each bill are in the **Error** status

In other words, the **Freeze/Complete** button is available in the **View Bill Data** screen when there is at least one pending bill for a usage data file where none of the bill segments are in the **Error** status.

Usage Data Processing

The **Usage Data Processing** screen allows you to search for a usage data file based on various search criteria. Through this screen, you can:

- Upload a usage data file
- Cancel a usage data file
- View all records uploaded through a usage data file
- View the valid, invalid, and cancelled records of a usage data file
- View the valid records of a usage data file which are submitted for approval
- View the valid records of a usage data file for which billable charges are already created
- View the rejected, billed and unbilled records of a usage data file
- Submit the valid records of a usage data file and create billable charges for them
- Approve or reject one or more valid records of a usage data file
- Revalidate the valid and invalid records of a usage data file
- Edit the valid, invalid and rejected records of a usage data file
- Export the usage data of a usage data file into a CSV file

This screen consists of the following zones:

- [Search](#) on page 4137

Search

The **Search** zone allows you to search for usage data files that are uploaded and/or processed in the system. This zone contains the following two sections:

- **Search Criteria** - the **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Used to specify the name of the usage data file.	No
File Type	Used to indicate the type of usage data file.	No
File Upload From Date	Used when you want to search for usage data files that were uploaded from a particular date onwards.	No
To	Used when you want to search for usage data files that were uploaded till a particular date.	No
User ID	Used to specify the name of the user who has uploaded the usage data file.	No
Billing Method	Used to specify the type of billing used for the usage data file. The valid values are: <ul style="list-style-type: none">• Adhoc Billing• Regular Billing	No
File Group	Used to specify the file group of the usage data file.	No

Note: You must specify at least one search criterion while searching for a usage data file.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
File Information	Displays the name of the usage data file and its related details.
Revalidate	<p>On clicking the Revalidate ( icon, you can execute the validation process once again on the valid, invalid, and rejected records.</p> <p>Note: The Revalidate icon appears when the usage records are in the Valid, Invalid, and/or Rejected status. In other words, you cannot revalidate a usage data file for which billable charges are created or when the bills are generated for a usage data file.</p>
Cancel	<p>On clicking the Cancel ( icon, you can cancel all valid, invalid, and rejected records of the usage data file.</p> <p>Note: The Cancel icon appears when the usage records are in the Valid, Invalid, and/or Rejected status. In other words, you cannot cancel a usage data file for which billable charges are created or when the bills are generated for a usage data file.</p>
Submit	On clicking the Submit ( icon, you can submit the valid records and create billable charges for them. If the valid usage records need to be approved before creating the billable charges, a To Do entry is created for the approver to approve the valid records.

Column Name	Column Description
	<p>Note: The Submit icon appears when all the records of a usage data file are in the Valid status. In other words, if a usage data file contains records in the Invalid status, you cannot create billable charges for a usage data file.</p>
Approve	<p>On clicking the Approve (☺) icon, the approver can approve all valid records of the usage data file.</p> <p>Note: The Approve icon appears when the usage data file (with all usage records in the Valid status) is uploaded using a file type to which the To Do algorithm (for enabling approval workflow) is attached.</p>
Total	<p>Displays the total number of records that are uploaded through the usage data file.</p> <p>Note: It has a link. On clicking the link, the Usage Data screen appears where you can view all records uploaded through the usage data file.</p>
Valid	<p>Displays the number of records which are successfully validated in the system.</p> <p>Note: It has a link. On clicking the link, the Usage Data screen appears where you can view and edit all valid records of the usage data file.</p>
Invalid	<p>Displays the number of records which could not pass through the validation process in the system.</p> <p>Note: It has a link. On clicking the link, the Usage Data screen appears where you can view and edit all invalid records of the usage data file.</p>
Submitted	<p>Displays the number of valid records which are submitted for approval.</p> <p>Note: It has a link. On clicking the link, the Usage Data screen appears where you can view all submitted records of the usage data file.</p>
Rejected	<p>Displays the number of records which are rejected by the approver.</p> <p>Note: It has a link. On clicking the link, the Usage Data screen appears where you can view and edit all rejected records of the usage data file.</p>
Processed	<p>Displays the number of valid records for which billable charges are already created.</p> <p>Note: It has a link. On clicking the link, the Usage Data screen appears where you can view all processed records of the usage data file.</p>
Billed	<p>Displays the number of records for which billable charges are created and billed to the person.</p> <p>Note: It has a link. On clicking the link, the Usage Data screen appears where you can view all billed records of the usage data file.</p>
Unbilled	<p>Displays the number of records for which billable charges are created, but are not yet billed to the person.</p> <p>Note: It has a link. On clicking the link, the Usage Data screen appears where you can view all unbilled records of the usage data file.</p>

Column Name	Column Description
Cancelled	Displays the number of records which are cancelled in the system.
	Note: It has a link. On clicking the link, the Usage Data screen appears where you can view all cancelled records of the usage data file.
Batch Run Status	Indicates the batch that was last executed on the usage data file and its current status.
	Note: It has a link. On clicking the link, the Batch Run Tree screen appears where you can view the execution details of the batch.

You can upload a usage data file by clicking the **Upload** link in the upper right corner of this zone.

Searching for a Usage Data File

Procedure

To search for a usage data file:

- 1. Click the **Menu** link in the **Application** toolbar.
A list appears.
- 2. From the **Main** menu, select **Billing Management** and then click **Usage Data Processing**.
The **Usage Data Processing** screen appears.
- 3. Enter the search criteria in the **Search** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 4. Click **Search**.
A list of usage data files that meet the search criteria appears in the **Search Results** section.

Uploading a Usage Data File

Prerequisites

To upload a usage data file, you should have:

- File types defined in the application
- Usage data in the required CSV file format
- File group using which you want to upload the usage data files is in **Open** status

Procedure

To upload a usage data file:

- 1. Click the **Menu** link in the **Application** toolbar.
A list appears.
- 2. From the **Main** menu, select **Billing Management** and then click **Usage Data Processing**.
The **Usage Data Processing** screen appears.
- 3. Click the **Upload** link in the upper right corner of the **Search** zone.

The **Upload Usage Data File** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Billing Method	Used to specify the type of billing you want to use for the usage data file. The valid values are: <ul style="list-style-type: none">• Adhoc Billing• Regular Billing	Yes
File Group	Used to specify the file group to which you want to add the usage data file.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field appears when you select the Adhoc Billing option from the File Group list. You can only view those file groups that are in the open status and to which you have access in the File Group list.	Note: If you select the billing method as Adhoc Billing , you have to specify the file group to which you want to add the usage data file.
Bill After Date	Used to specify the date after which the bills must be generated for the usage data file. By default, the current date appears in this field.	Yes (Conditional)
	Note: If you have selected the billing method as Adhoc Billing , this field appears in read-only mode and displays the bill after date as defined for the selected file group. If you have selected the billing method as Regular Billing then this field is enabled displaying the current date.	Note: If you select the billing method as Regular Billing , you have to specify the bill after date.
Default Usage Start Date	Used to specify the date from when the price item was used. The default usage start date is used when the start date is not specified for a record in the usage data file. By default, the current date appears in this field. You can change the default usage start date, if required.	Yes (Conditional)
	Note: If you have selected the billing method as Adhoc Billing , this field appears in read-only mode and displays the default usage start date as defined for the selected file group. If you have selected the billing method as Regular Billing then this field is enabled displaying the current date. The default usage start date cannot be later than the default usage end date.	Note: If you select the billing method as Regular Billing , you have to specify the default usage start date.
Default Usage End Date	Used to specify the date till when the price item was used. The default usage end date is used when the end date is not specified for a record in the usage data file. By default, the current date appears in this field. You can change the default usage end date, if required.	Yes (Conditional)
	Note: If you have selected the billing method as Adhoc Billing , this field appears in read-only mode and displays the default usage end date as defined for the selected file group. If you have selected the billing method as Regular Billing then this field is enabled displaying the current date. The default usage end date cannot be earlier than the default usage start date.	Note: If you select the billing method as Regular Billing , you have to specify the default usage end date.
File Type	Used to specify the type of usage data file.	Yes
Replace Existing File	Used to indicate whether you want to replace any existing file in the system. You must select this check box when you want to upload the same file once again.	No
File Name	Used to specify the name and path of the usage data file that you want to upload.	Yes

Field Name	Field Description	Mandatory (Yes or No)
	Note: You can also click the Browse button corresponding to this field to browse to the location where the usage data file is available in the system.	

4. Enter the required details.
5. Click the **Browse** button corresponding to the **File Name** field.
The **Choose File to Upload** dialog box appears.
6. Browse to the location where the usage data file that you want to upload is available.
7. Click **Open**.
The usage data file name and path appears in the **File Name** field.
8. Click **Upload**.

A message appears indicating that the usage data file has been uploaded successfully. If an error occurs while parsing, the usage data file is not uploaded in the system.

Note:

The validation process starts immediately after the file is uploaded in the system. If a usage record is successfully validated, the status of the usage record is changed to **Valid**. And, if a usage record could not pass through the validation process, the status of the usage record is changed to **Invalid**. You can view the details of the uploaded file and its records in the **Usage Data Processing** screen.

If the usage data file size exceeds the file size limit set in the **C1-ODBFC** feature configuration, a batch job is created using the **Upload and Validate Usage Data File (C1-ODFU)** batch. A message appears indicating the batch job ID. This batch job uploads and validates the usage data file. You can change the file size limit using the **On Demand Billing (C1-ODBFC)** feature configuration. For more information on the **Upload and Validate Usage Data File (C1-ODFU)** batch, see *Oracle Revenue Management and Billing Batch Execution Guide*.

The number of usage records that are parsed and mapped in an XML file depends on the value defined for the **Staging XML Size** option type in the **On Demand Billing (C1-ODBFC)** feature configuration. For example, if the **Staging XML Size** option type is set to 100 and a usage data file contains 500 records, then the system creates 5 XML files - each containing 100 records.

If a batch job is created automatically, the number of usage records that are validated in each work unit depends on the value defined for the **Validation Chunk Size** option type in the **On Demand Billing (C1-ODBFC)** feature configuration.

On successful completion of the **Upload and Validate Usage Data File (C1-ODFU)** batch, a To Do entry is created using the **C1-ODFU To Do** type. You can view this To Do entry when you are assigned a To Do role which is mapped to the **C1-ODFU To Do** type. This To Do indicates whether the batch was successfully executed or not. If the batch was successfully executed, it indicates the following:

- Number of records that were uploaded in the system
- Number of records which were successfully validated
- Number of records which could not pass through the validation process
- Number of records which failed to validate due to some technical reasons

9. Click **OK** in the message box.
Once a usage record is successfully validated, the status of the usage record is changed to **Valid**. And, if a usage record could not pass through the validation process, the status of the usage record is changed to **Invalid**.

Replacing an Existing File

Prerequisites

To replace an existing usage data file, you should have:

- File types defined in the application
- Usage data in the required CSV file format
- File group using which you want to upload the usage data files is in **Open** status

Procedure

To replace an existing usage data file:

1. Click the **Menu** link in the **Application** toolbar.
A list appears.
2. Select **Billing Management** and then click **Usage Data Processing**.
The **Usage Data Processing** screen appears.
3. Click the **Upload** link in the upper right corner of the **Search** zone.

The **Upload Usage Data File** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Billing Method	Used to specify the type of billing you want to use for the usage data file. The valid values are: <ul style="list-style-type: none">• Adhoc Billing• Regular Billing	Yes
File Group	Used to specify the file group to which you want to add the usage data file.	Yes (Conditional)
	Note: This field appears when you select the Adhoc Billing option from the File Group list. You can only view those file groups that are in the open status and to which you have access in the File Group list.	Note: If you select the billing method as Adhoc Billing , you have to specify the file group to which you want to add the usage data file.
Bill After Date	Used to specify the date after which the bills must be generated for the usage data file. By default, the current date appears in this field.	Yes (Conditional)
	Note: If you have selected the billing method as Adhoc Billing , this field appears in read-only mode and displays the bill after date as defined for the selected file group. If you have selected the billing method as Regular Billing then this field is enabled displaying the current date.	Note: If you select the billing method as Regular Billing , you have to specify the bill after date.

Field Name	Field Description	Mandatory (Yes or No)
Default Usage Start Date	Used to specify the date from when the price item was used. The default usage start date is used when the start date is not specified for a record in the usage data file. By default, the current date appears in this field. You can change the default usage start date, if required.	Yes (Conditional)
	Note: If you have selected the billing method as Adhoc Billing , this field appears in read-only mode and displays the default usage start date as defined for the selected file group. If you have selected the billing method as Regular Billing then this field is enabled displaying the current date. The default usage start date cannot be later than the default usage end date.	Note: If you select the billing method as Regular Billing , you have to specify the default usage start date.
Default Usage End Date	Used to specify the date till when the price item was used. The default usage end date is used when the end date is not specified for a record in the usage data file. By default, the current date appears in this field. You can change the default usage end date, if required.	Yes (Conditional)
	Note: If you have selected the billing method as Adhoc Billing , this field appears in read-only mode and displays the default usage end date as defined for the selected file group. If you have selected the billing method as Regular Billing then this field is enabled displaying the current date. The default usage end date cannot be earlier than the default usage start date.	Note: If you select the billing method as Regular Billing , you have to specify the default usage end date.
File Type	Used to specify the type of usage data file.	Yes
Replace Existing File	Used to indicate that you want to replace any existing file in the system.	Yes
File Name	Used to specify the name and path of the usage data file that you want to upload.	Yes
	Note: You can also click the Browse button corresponding to this field to browse to the location where the usage data file is available in the system.	

4. Select the **Replace Existing File** check box.

Note: You can replace an existing file when the usage records of a usage data file are in any of the statuses:

- **Valid** and/or **Invalid**
- **Rejected**
- **Cancelled**

In other words, you cannot replace a file when the billable charges are already created for the usage records of a usage data file, or are pending for approval with the approver.

5. Click the **Browse** button corresponding to the **File Name** field.
The **Choose File to Upload** dialog box appears.
6. Browse to the location where the usage data file that you want to replace is available.
7. Click **Open**.
The usage data file name and path appears in the **File Name** field.

8. Click **Upload**.

A message appears indicating that the usage data file has been uploaded successfully. If an error occurs while parsing, the usage data file is not uploaded in the system.

Note:

The validation process starts immediately after the file is uploaded in the system. If a usage record is successfully validated, the status of the usage record is changed to **Valid**. And, if a usage record could not pass through the validation process, the status of the usage record is changed to **Invalid**. You can view the details of the uploaded file and its records in the **Usage Data Processing** screen.

If the usage data file size exceeds the file size limit set in the **C1-ODBFC** feature configuration, a batch job is created using the **Upload and Validate Usage Data File (C1-ODFU)** batch. A message appears indicating the batch job ID. This batch job uploads and validates the usage data file. You can change the file size limit using the **On Demand Billing (C1-ODBFC)** feature configuration. For more information on the **Upload and Validate Usage Data File (C1-ODFU)** batch, see *Oracle Revenue Management and Billing Batch Execution Guide*.

The number of usage records that are parsed and mapped in an XML file depends on the value defined for the **Staging XML Size** option type in the **On Demand Billing (C1-ODBFC)** feature configuration. For example, if the **Staging XML Size** option type is set to 100 and a usage data file contains 500 records, then the system creates 5 XML files - each containing 100 records.

If a batch job is created automatically, the number of usage records that are validated in each work unit depends on the value defined for the **Validation Chunk Size** option type in the **On Demand Billing (C1-ODBFC)** feature configuration.

On successful completion of the **Upload and Validate Usage Data File (C1-ODFU)** batch, a To Do entry is created using the **C1-ODFU To Do** type. You can view this To Do entry when you are assigned a To Do role which is mapped to the **C1-ODFU To Do** type. This To Do indicates whether the batch was successfully executed or not. If the batch was successfully executed, it indicates the following:

- Number of records that were uploaded in the system
- Number of records which were successfully validated
- Number of records which could not pass through the validation process
- Number of records which failed to validate due to some technical reasons

9. Click **OK** in the message box.

Once a usage record is successfully validated, the status of the usage record is changed to **Valid**. And, if a usage record could not pass through the validation process, the status of the usage record is changed to **Invalid**.

Viewing All Records of a Usage Data File

Procedure

To view all records of a usage data file:

1. Search for the usage data file in the **Usage Data Processing** screen.

2. In the **Search Results** section, click the link in the **Total** column corresponding to the usage data file whose records you want to view.

The **Usage Data** screen appears. It contains the following two sections:

- **Search Criteria** - This section allows you to filter the usage records based on the various search criteria. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Displays the name of the usage data file.	Not applicable
File Type	Indicates the type of the usage data file.	Not applicable
Default Usage Start Date	Displays the usage start date entered while uploading the usage data file.	Not applicable
Default Usage End Date	Displays the usage end date entered while uploading the usage data file.	Not applicable
Usage Record Status	Used to specify the status of the usage record. The valid values are: <ul style="list-style-type: none">• Valid• Invalid• Submitted for Approval• Processed• Rejected• Cancelled	No
Division	Used to specify the division to which the usage record belongs.	No
Account Identifier Type	Used to specify the identifier type based on which you want to search for the usage records.	Yes (Conditional) Note: If you enter the account identifier as a search criteria, you have to enter the account identifier type.
Account Identifier	Used to indicate the account whose usage records you want to view.	Yes (Conditional) Note: If you enter the account identifier type as a search criteria, you have to enter the account identifier.

- **Search Results** - By default, all records of the usage data file are listed in the **Search Results** section. You can filter the search results based on the specified criteria. the **Search Results** section contains the following columns:

Column Name	Column Description
BILLABLE CHARGE ID	Indicates the billable charge which is generated for the usage record.
	Note: This column appears only for the valid records for which billable charges have been created.
ACCOUNT ID TYPE	Indicates the account identifier type.

Column Name	Column Description
ACCOUNT IDENTIFIER	Indicates the account to which the usage record belongs.
ACCOUNT INFORMATION	Displays information about the account.
DIVISION	Indicates the division to which the usage record belongs.
CONTRACT ID	Displays the contract ID.
	Note: This column appears only if usage data files are uploaded for the insurance module.
CHARGE TYPE	Indicates the charge type.
	Note: This column appears only if usage data files are uploaded for the insurance module.
START DATE	Displays the date from when the price item was used.
	Note: If the start date is not available, the default usage start date appears in this column.
END DATE	Displays the date till when the price item was used.
	Note: If the end date is not available, the default usage end date appears in this column.
DESCRIPTION	Displays the description of the usage record. It is shown on the billable charge.
PRICE ITEM	Displays the price item code.
VARIANCE	Indicates the variance that must be used along with the price item for determining the price item pricing.
	Note: This column appears when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to False .
PARAM TYPE1, PARAM TYPE2,, PARAM TYPE15	Indicates the price item parameter that must be used along with the price item for determining the price item pricing.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
PARAM VALUE1, PARAM VALUE2,, PARAM VALUE15	Displays the value of the price item parameter.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
SQI1, SQI2,, SQI10	Indicates the service quantity identifier that must be used for calculating the price item charges.

Column Name	Column Description
SQIVALUE1, SQIVALUE2,, SQIVALUE10	Displays the number of units of the service quantity.
BILL LINE DESCRIPTION1, BILL LINE DESCRIPTION2,, BILL LINE DESCRIPTION10	Displays the description of the line item (charge).
AMOUNT1, AMOUNT2,, AMOUNT10	Displays the charge amount.
CURRENCY1, CURRENCY2,, CURRENCY10	Displays the currency in which the amount is charged.
MEMO ONLY1, MEMO ONLY2,, MEMO ONLY10	Indicates whether the charge should be included in the bill amount or not.
SUMMARY1, SUMMARY2,, SUMMARY10	Indicates whether the charge should be included in the summary line or not.
SHOW ON BILL1, SHOW ON BILL2,, SHOW ON BILL10	Indicates whether the charge should appear on the person's printed bill or not.
GL DISTRIBUTION CODE 1, GL DISTRIBUTION CODE 2,, GL DISTRIBUTION CODE 10	Displays the distribution code which indicates the GL account associated with the charge.
CHARTYPE1, CHARTYPE2,, CHARTYPE10	Indicates the characteristic that must be defined for the billable charge.
CHARVAL1, CHARVAL2,, CHARVAL10	Displays the value of the characteristic type.

Note:

If you have defined business labels for usage data fields, the columns will appear with the business labels defined for the respective column.

Only those columns that contain data in the CSV file appear in the **Usage Data** screen. For example, if information about characteristics is provided in the CHARTYPE4 and CHARVAL4 columns of the CSV file, then only the CHARTYPE4 and CHARVAL4 columns appear in the **Usage Data** screen. Similarly, if information about the line item (charge) is provided in the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, and GL DISTRIBUTION CODE 6 columns of the CSV file, then only the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, AND GL DISTRIBUTION CODE 6 columns appear in the **Usage Data** screen.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can change the number of records displayed per page, if required. You can use the navigation buttons, such as **First** (◀), **Previous** (◀), **Next** (▶), and **Last** (▶) to navigate between pages. You can also select the page to which you want to navigate from the **Go To** list.

Note: You can download details of all the records of a usage data file in a CSV file format using the **Export TO Excel** link provided in the **Search** section.

- 3. View the records of the usage data file in the **Usage Data** screen.
- 4. If required, you can change the number of records displayed per page.

Note: By default, the number of records that appear in each page depends on the minimum value defined in the **PAGE_NUMBER** lookup field. For example, if the **PAGE_NUMBER** lookup field has four values - 10, 20, 30, and 40, then the number of records displayed in each page, by default, would be 10.

- 5. If required, you can click the **First** (<<), **Previous** (<), **Next** (>), and **Last** (>>) buttons to *navigate* between pages.
- 6. If required, you can filter the usage records in the **Usage Data** screen.
- 7. If required, you can click the **Export TO Excel** link to download details of all the records of a usage data file *in* a CSV file format.

Viewing Valid Records of a Usage Data File

Procedure

To view valid records of a usage data file:

- 1. Search for the usage data file in the **Usage Data Processing** screen.
- 2. In the **Search Results** section, click the link in the **Valid** column corresponding to the usage data file whose valid records you want to view.

The **Usage Data** screen appears. It contains the following two sections:

- **Search Criteria** - This section allows you to filter the valid records based on the various search criteria. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Displays the name of the usage data file.	Not applicable
File Type	Indicates the type of the usage data file.	Not applicable
Default Usage Start Date	Displays the usage start date entered while uploading the usage data file.	Not applicable
Default Usage End Date	Displays the usage end date entered while uploading the usage data file.	Not applicable
Status	Indicates that all valid records are displayed in the Usage Data screen.	Not applicable
Division	Used to specify the division to which the valid record belongs.	No
Account Identifier Type	Used to specify the identifier type based on which you want to search for the valid records.	Yes (Conditional)

Field Name	Field Description	Mandatory (Yes or No)
		Note: If you enter the account identifier as a search criteria, you have to enter the account identifier type.
Account Identifier	Used to indicate the account whose valid records you want to view.	Yes (Conditional)
		Note: If you enter the account identifier type as a search criteria, you have to enter the account identifier.

- **Search Results** - By default, all valid records of the usage data file are listed in the **Search Results** section. You can filter the search results based on the specified criteria. the **Search Results** section contains the following columns:

Column Name	Column Description
ACCOUNT ID TYPE	Indicates the account identifier type.
ACCOUNT IDENTIFIER	Indicates the account to which the usage record belongs.
ACCOUNT INFORMATION	Displays information about the account.
DIVISION	Indicates the division to which the usage record belongs.
CONTRACT ID	Displays the contract ID.
	Note: This column appears only if usage data files are uploaded for the insurance module.
CHARGE TYPE	Indicates the charge type.
	Note: This column appears only if usage data files are uploaded for the insurance module.
START DATE	Displays the date from when the price item was used.
	Note: If the start date is not available, the default usage start date appears in this column.
END DATE	Displays the date till when the price item was used.
	Note: If the end date is not available, the default usage end date appears in this column.
DESCRIPTION	Displays the description of the usage record. It is shown on the billable charge.
PRICE ITEM	Displays the price item code.
VARIANCE	Indicates the variance that must be used along with the price item for determining the price item pricing.

Column Name	Column Description
	Note: This column appears when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to False .
PARAM TYPE1, PARAM TYPE2,, PARAM TYPE15	Indicates the price item parameter that must be used along with the price item for determining the price item pricing.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
PARAM VALUE1, PARAM VALUE2,, PARAM VALUE15	Displays the value of the price item parameter.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
SQI1, SQI2,, SQI10	Indicates the service quantity identifier that must be used for calculating the price item charges.
SQIVALUE1, SQIVALUE2,, SQIVALUE10	Displays the number of units of the service quantity.
BILL LINE DESCRIPTION1, BILL LINE DESCRIPTION2,, BILL LINE DESCRIPTION10	Displays the description of the line item (charge).
AMOUNT1, AMOUNT2,, AMOUNT10	Displays the charge amount.
CURRENCY1, CURRENCY2,, CURRENCY10	Displays the currency in which the amount is charged.
MEMO ONLY1, MEMO ONLY2,, MEMO ONLY10	Indicates whether the charge should be included in the bill amount or not.
SUMMARY1, SUMMARY2,, SUMMARY10	Indicates whether the charge should be included in the summary line or not.
SHOW ON BILL1, SHOW ON BILL2,, SHOW ON BILL10	Indicates whether the charge should appear on the person's printed bill or not.
GL DISTRIBUTION CODE 1, GL DISTRIBUTION CODE 2,, GL DISTRIBUTION CODE 10	Displays the distribution code which indicates the GL account associated with the charge.
CHARTYPE1, CHARTYPE2,, CHARTYPE10	Indicates the characteristic that must be defined for the billable charge.
CHARVAL1, CHARVAL2,, CHARVAL10	Displays the value of the characteristic type.

Note:

If you have defined business labels for usage data fields, the columns will appear with the business labels defined for the respective column.

Only those columns that contain data in the CSV file appear in the **Usage Data** screen. For example, if information about characteristics is provided in the CHARTYPE4 and CHARVAL4 columns of the CSV file, then only the CHARTYPE4 and CHARVAL4 columns appear in the **Usage Data** screen. Similarly, if information about the line item (charge) is provided in the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, and GL DISTRIBUTION CODE 6 columns of the CSV file, then only the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, AND GL DISTRIBUTION CODE 6 columns appear in the **Usage Data** screen.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can change the number of records displayed per page, if required. You can use the navigation buttons, such as **First** (◀◀), **Previous** (◀), **Next** (▶), and **Last** (▶▶) to navigate between pages. You can also select the page to which you want to navigate from the **Go To** list.

- 3. View the valid records of the usage data file in the **Usage Data** screen.
- 4. If required, you can change the number of records displayed per page.

Note: By default, the number of records that appear in each page depends on the minimum value defined in the **PAGE_NUMBER** lookup field. For example, if the **PAGE_NUMBER** lookup field has four values - 10, 20, 30, and 40, then the number of records displayed in each page, by default, would be 10.

- 5. If required, you can click the **First** (◀◀), **Previous** (◀), **Next** (▶), and **Last** (▶▶) buttons to navigate between pages.
- 6. If required, you can filter the valid records in the **Usage Data** screen.

Viewing Invalid Records of a Usage Data File

Procedure

To view invalid records of a usage data file:

- 1. Search for the usage data file in the **Usage Data Processing** screen.
- 2. In the **Search Results** section, click the link in the **Invalid** column corresponding to the usage data file whose invalid records you want to view.

The **Usage Data** screen appears. It contains the following two sections:

- **Search Criteria** - This section allows you to filter the invalid records based on the various search criteria. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Displays the name of the usage data file.	Not applicable

Field Name	Field Description	Mandatory (Yes or No)
File Type	Indicates the type of the usage data file.	Not applicable
Default Usage Start Date	Displays the usage start date entered while uploading the usage data file.	Not applicable
Default Usage End Date	Displays the usage end date entered while uploading the usage data file.	Not applicable
Status	Indicates that all invalid records are displayed in the Usage Data screen.	Not applicable
Division	Used to specify the division to which the invalid record belongs.	No
Account Identifier Type	Used to specify the identifier type based on which you want to search for the invalid records.	Yes (Conditional)
		Note: If you enter the account identifier as a search criteria, you have to enter the account identifier type.
Account Identifier	Used to indicate the account whose invalid records you want to view.	Yes (Conditional)
		Note: If you enter the account identifier type as a search criteria, you have to enter the account identifier.

- **Search Results** - By default, all invalid records of the usage data file are listed in the **Search Results** section. You can filter the search results based on the specified criteria. the **Search Results** section contains the following columns:

Column Name	Column Description
ACCOUNT ID TYPE	Indicates the account identifier type.
ACCOUNT IDENTIFIER	Indicates the account to which the usage record belongs.
ACCOUNT INFORMATION	Displays information about the account.
DIVISION	Indicates the division to which the usage record belongs.
CONTRACT ID	Displays the contract ID.
	Note: This column appears only if usage data files are uploaded for the insurance module.
CHARGE TYPE	Indicates the charge type.
	Note: This column appears only if usage data files are uploaded for the insurance module.
START DATE	Displays the date from when the price item was used.
	Note: If the start date is not available, the default usage start date appears in this column.

Column Name	Column Description
END DATE	Displays the date till when the price item was used.
	Note: If the end date is not available, the default usage end date appears in this column.
DESCRIPTION	Displays the description of the usage record. It is shown on the billable charge.
PRICE ITEM	Displays the price item code.
VARIANCE	Indicates the variance that must be used along with the price item for determining the price item pricing.
	Note: This column appears when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to False .
PARAM TYPE1, PARAM TYPE2,, PARAM TYPE15	Indicates the price item parameter that must be used along with the price item for determining the price item pricing.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
PARAM VALUE1, PARAM VALUE2,, PARAM VALUE15	Displays the value of the price item parameter.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
SQI1, SQI2,, SQI10	Indicates the service quantity identifier that must be used for calculating the price item charges.
SQIVALUE1, SQIVALUE2,, SQIVALUE10	Displays the number of units of the service quantity.
BILL LINE DESCRIPTION1, BILL LINE DESCRIPTION2,, BILL LINE DESCRIPTION10	Displays the description of the line item (charge).
AMOUNT1, AMOUNT2,, AMOUNT10	Displays the charge amount.
CURRENCY1, CURRENCY2,, CURRENCY10	Displays the currency in which the amount is charged.
MEMO ONLY1, MEMO ONLY2,, MEMO ONLY10	Indicates whether the charge should be included in the bill amount or not.
SUMMARY1, SUMMARY2,, SUMMARY10	Indicates whether the charge should be included in the summary line or not.
SHOW ON BILL1, SHOW ON BILL2,, SHOW ON BILL10	Indicates whether the charge should appear on the person's printed bill or not.

Column Name	Column Description
GL DISTRIBUTION CODE 1, GL DISTRIBUTION CODE 2,, GL DISTRIBUTION CODE 10	Displays the distribution code which indicates the GL account associated with the charge.
CHARTYPE1, CHARTYPE2,, CHARTYPE10	Indicates the characteristic that must be defined for the billable charge.
CHARVAL1, CHARVAL2,, CHARVAL10	Displays the value of the characteristic type.

Note:

If you have defined business labels for usage data fields, the columns will appear with the business labels defined for the respective column.

Only those columns that contain data in the CSV file appear in the **Usage Data** screen. For example, if information about characteristics is provided in the CHARTYPE4 and CHARVAL4 columns of the CSV file, then only the CHARTYPE4 and CHARVAL4 columns appear in the **Usage Data** screen. Similarly, if information about the line item (charge) is provided in the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, and GL DISTRIBUTION CODE 6 columns of the CSV file, then only the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, AND GL DISTRIBUTION CODE 6 columns appear in the **Usage Data** screen.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can change the number of records displayed per page, if required. You can use the navigation buttons, such as **First** (<<), **Previous** (<), **Next** (>), and **Last** (>>) to navigate between pages. You can also select the page to which you want to navigate from the **Go To** list.

- 3. View the invalid records of the usage data file in the **Usage Data** screen.
- 4. If required, you can change the number of records displayed per page.

Note:

By default, the number of records that appear in each page depends on the minimum value defined in the **PAGE_NUMBER** lookup field. For example, if the **PAGE_NUMBER** lookup field has four values - 10, 20, 30, and 40, then the number of records displayed in each page, by default, would be 10.

- 5. If required, you can click the **First** (<<), **Previous** (<), **Next** (>), and **Last** (>>) buttons to navigate between pages.
- 6. If required, you can filter the invalid records in the **Usage Data** screen.

Viewing Submitted Records of a Usage Data File

Procedure

To view submitted records of a usage data file:

- 1. Search for the usage data file in the **Usage Data Processing** screen.
- 2. In the **Search Results** section, click the link in the **Submitted** column corresponding to the usage data file whose submitted records you want to view.

The **Usage Data** screen appears. It contains the following two sections:

- **Search Criteria** - This section allows you to filter the submitted records based on the various search criteria. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Displays the name of the usage data file.	Not applicable
File Type	Indicates the type of the usage data file.	Not applicable
Default Usage Start Date	Displays the usage start date entered while uploading the usage data file.	Not applicable
Default Usage End Date	Displays the usage end date entered while uploading the usage data file.	Not applicable
Usage Record Status	Indicates that all records submitted for approval are displayed in the Usage Data screen.	Not applicable
Division	Used to specify the division to which the submitted record belongs.	No
Account Identifier Type	Used to specify the identifier type based on which you want to search for the submitted records.	Yes (Conditional)
		Note: If you enter the account identifier as a search criteria, you have to enter the account identifier type.
Account Identifier	Used to indicate the account whose submitted records you want to view.	Yes (Conditional)
		Note: If you enter the account identifier type as a search criteria, you have to enter the account identifier.

- **Search Results** - By default, all submitted records of the usage data file are listed in the **Search Results** section. You can filter the search results based on the specified criteria. the **Search Results** section contains the following columns:

Column Name	Column Description
BILLABLE CHARGE ID	Indicates the billable charge which is generated for the usage record.
ACCOUNT ID TYPE	Indicates the account identifier type.
ACCOUNT IDENTIFIER	Indicates the account to which the usage record belongs.
ACCOUNT INFORMATION	Displays information about the account.
DIVISION	Indicates the division to which the usage record belongs.
CONTRACT ID	Displays the contract ID.

Column Name	Column Description
	Note: This column appears only if usage data files are uploaded for the insurance module.
CHARGE TYPE	Indicates the charge type. Note: This column appears only if usage data files are uploaded for the insurance module.
START DATE	Displays the date from when the price item was used. Note: If the start date is not available, the default usage start date appears in this column.
END DATE	Displays the date till when the price item was used. Note: If the end date is not available, the default usage end date appears in this column.
DESCRIPTION	Displays the description of the usage record. It is shown on the billable charge.
PRICE ITEM	Displays the price item code.
VARIANCE	Indicates the variance that must be used along with the price item for determining the price item pricing. Note: This column appears when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to False .
PARAM TYPE1, PARAM TYPE2,, PARAM TYPE15	Indicates the price item parameter that must be used along with the price item for determining the price item pricing. Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
PARAM VALUE1, PARAM VALUE2,, PARAM VALUE15	Displays the value of the price item parameter. Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
SQI1, SQI2,, SQI10	Indicates the service quantity identifier that must be used for calculating the price item charges.
SQIVALUE1, SQIVALUE2,, SQIVALUE10	Displays the number of units of the service quantity.
BILL LINE DESCRIPTION1, BILL LINE DESCRIPTION2,, BILL LINE DESCRIPTION10	Displays the description of the line item (charge).

Column Name	Column Description
AMOUNT1, AMOUNT2,, AMOUNT10	Displays the charge amount.
CURRENCY1, CURRENCY2,, CURRENCY10	Displays the currency in which the amount is charged.
MEMO ONLY1, MEMO ONLY2,, MEMO ONLY10	Indicates whether the charge should be included in the bill amount or not.
SUMMARY1, SUMMARY2,, SUMMARY10	Indicates whether the charge should be included in the summary line or not.
SHOW ON BILL1, SHOW ON BILL2,, SHOW ON BILL10	Indicates whether the charge should appear on the person's printed bill or not.
GL DISTRIBUTION CODE 1, GL DISTRIBUTION CODE 2,, GL DISTRIBUTION CODE 10	Displays the distribution code which indicates the GL account associated with the charge.
CHARTYPE1, CHARTYPE2,, CHARTYPE10	Indicates the characteristic that must be defined for the billable charge.
CHARVAL1, CHARVAL2,, CHARVAL10	Displays the value of the characteristic type.

Note:

If you have defined business labels for usage data fields, the columns will appear with the business labels defined for the respective column.

Only those columns that contain data in the CSV file appear in the **Usage Data** screen. For example, if information about characteristics is provided in the CHARTYPE4 and CHARVAL4 columns of the CSV file, then only the CHARTYPE4 and CHARVAL4 columns appear in the **Usage Data** screen. Similarly, if information about the line item (charge) is provided in the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, and GL DISTRIBUTION CODE 6 columns of the CSV file, then only the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, AND GL DISTRIBUTION CODE 6 columns appear in the **Usage Data** screen.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can change the number of records displayed per page, if required. You can use the navigation buttons, such as **First** (<<), **Previous** (<), **Next** (>), and **Last** (>>) to navigate between pages. You can also select the page to which you want to navigate from the **Go To** list.

3. View the submitted records of the usage data file in the **Usage Data** screen.
4. If required, you can change the number of records displayed per page.

Note: By default, the number of records that appear in each page depends on the minimum value defined in the **PAGE_NUMBER** lookup field. For example, if the **PAGE_NUMBER** lookup field has four values - 10, 20, 30, and 40, then the number of records displayed in each page, by default, would be 10.

5. If required, you can click the **First** (<<), **Previous** (<), **Next** (>), and **Last** (>>) buttons to navigate between pages.
6. If required, you can filter the submitted records in the **Usage Data** screen.

Viewing Processed Records of a Usage Data File

Procedure

To view processed records of a usage data file:

1. Search for the usage data file in the **Usage Data Processing** screen.
2. In the **Search Results** section, click the link in the **Processed** column corresponding to the usage data file whose processed records you want to view.

The **Usage Data** screen appears. It contains the following two sections:

- **Search Criteria** - This section allows you to filter the processed records based on the various search criteria. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Displays the name of the usage data file.	Not applicable
File Type	Indicates the type of the usage data file.	Not applicable
Default Usage Start Date	Displays the usage start date entered while uploading the usage data file.	Not applicable
Default Usage End Date	Displays the usage end date entered while uploading the usage data file.	Not applicable
Usage Record Status	Indicates that all processed records are displayed in the Usage Data screen.	Not applicable
Division	Used to specify the division to which the processed record belongs.	No
Account Identifier Type	Used to specify the identifier type based on which you want to search for the processed records.	Yes (Conditional)
		Note: If you enter the account identifier as a search criteria, you have to enter the account identifier type.
Account Identifier	Used to indicate the account whose processed records you want to view.	Yes (Conditional)
		Note: If you enter the account identifier type as a search criteria, you have to enter the account identifier.

- **Search Results** - By default, all processed records of the usage data file are listed in the **Search Results** section. You can filter the search results based on the specified criteria. the **Search Results** section contains the following columns:

Column Name	Column Description
BILLABLE CHARGE ID	Indicates the billable charge which is generated for the usage record.
ACCOUNT ID TYPE	Indicates the account identifier type.
ACCOUNT IDENTIFIER	Indicates the account to which the usage record belongs.
ACCOUNT INFORMATION	Displays information about the account.
DIVISION	Indicates the division to which the usage record belongs.
CONTRACT ID	Displays the contract ID.
	Note: This column appears only if usage data files are uploaded for the insurance module.
CHARGE TYPE	Indicates the charge type.
	Note: This column appears only if usage data files are uploaded for the insurance module.
START DATE	Displays the date from when the price item was used.
	Note: If the start date is not available, the default usage start date appears in this column.
END DATE	Displays the date till when the price item was used.
	Note: If the end date is not available, the default usage end date appears in this column.
DESCRIPTION	Displays the description of the usage record. It is shown on the billable charge.
PRICE ITEM	Displays the price item code.
VARIANCE	Indicates the variance that must be used along with the price item for determining the price item pricing.
	Note: This column appears when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to False .
PARAM TYPE1, PARAM TYPE2,, PARAM TYPE15	Indicates the price item parameter that must be used along with the price item for determining the price item pricing.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
PARAM VALUE1, PARAM VALUE2,, PARAM VALUE15	Displays the value of the price item parameter.

Column Name	Column Description
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
SQI1, SQI2,, SQI10	Indicates the service quantity identifier that must be used for calculating the price item charges.
SQIVALUE1, SQIVALUE2,, SQIVALUE10	Displays the number of units of the service quantity.
BILL LINE DESCRIPTION1, BILL LINE DESCRIPTION2,, BILL LINE DESCRIPTION10	Displays the description of the line item (charge).
AMOUNT1, AMOUNT2,, AMOUNT10	Displays the charge amount.
CURRENCY1, CURRENCY2,, CURRENCY10	Displays the currency in which the amount is charged.
MEMO ONLY1, MEMO ONLY2,, MEMO ONLY10	Indicates whether the charge should be included in the bill amount or not.
SUMMARY1, SUMMARY2,, SUMMARY10	Indicates whether the charge should be included in the summary line or not.
SHOW ON BILL1, SHOW ON BILL2,, SHOW ON BILL10	Indicates whether the charge should appear on the person's printed bill or not.
GL DISTRIBUTION CODE 1, GL DISTRIBUTION CODE 2,, GL DISTRIBUTION CODE 10	Displays the distribution code which indicates the GL account associated with the charge.
CHARTYPE1, CHARTYPE2,, CHARTYPE10	Indicates the characteristic that must be defined for the billable charge.
CHARVAL1, CHARVAL2,, CHARVAL10	Displays the value of the characteristic type.

Note:

Viewing Cancelled Records of a Usage Data File

Procedure

To view cancelled records of a usage data file:

- 1. Search for the usage data file in the **Usage Data Processing** screen.
- 2. In the **Search Results** section, click the link in the **Cancelled** column corresponding to the usage data file whose cancelled records you want to view.

The **Usage Data** screen appears. It contains the following two sections:

- **Search Criteria** - This section allows you to filter the cancelled records based on the various search criteria. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Displays the name of the usage data file.	Not applicable
File Type	Indicates the type of the usage data file.	Not applicable
Default Usage Start Date	Displays the usage start date entered while uploading the usage data file.	Not applicable
Default Usage End Date	Displays the usage end date entered while uploading the usage data file.	Not applicable
Usage Record Status	Indicates that all cancelled records are displayed in the Usage Data screen.	Not applicable
Division	Used to specify the division to which the cancelled record belongs.	No

Field Name	Field Description	Mandatory (Yes or No)
Account Identifier Type	Used to specify the identifier type based on which you want to search for the cancelled records.	Yes (Conditional)
		Note: If you enter the account identifier as a search criteria, you have to enter the account identifier type.
Account Identifier	Used to indicate the account whose cancelled records you want to view.	Yes (Conditional)
		Note: If you enter the account identifier type as a search criteria, you have to enter the account identifier.

- **Search Results** - By default, all cancelled records of the usage data file are listed in the **Search Results** section. You can filter the search results based on the specified criteria. the **Search Results** section contains the following columns:

Column Name	Column Description
BILLABLE CHARGE ID	Indicates the billable charge which is generated for the usage record.
	Note: This column appears only if you have cancelled a valid record for which billable charges have been created.
ACCOUNT ID TYPE	Indicates the account identifier type.
ACCOUNT IDENTIFIER	Indicates the account to which the usage record belongs.
ACCOUNT INFORMATION	Displays information about the account.
DIVISION	Indicates the division to which the usage record belongs.
CONTRACT ID	Displays the contract ID.
	Note: This column appears only if usage data files are uploaded for the insurance module.
CHARGE TYPE	Indicates the charge type.
	Note: This column appears only if usage data files are uploaded for the insurance module.
START DATE	Displays the date from when the price item was used.
	Note: If the start date is not available, the default usage start date appears in this column.
END DATE	Displays the date till when the price item was used.
	Note: If the end date is not available, the default usage end date appears in this column.
DESCRIPTION	Displays the description of the usage record. It is shown on the billable charge.

Column Name	Column Description
PRICE ITEM	Displays the price item code.
VARIANCE	Indicates the variance that must be used along with the price item for determining the price item pricing.
	Note: This column appears when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to False .
PARAM TYPE1, PARAM TYPE2,, PARAM TYPE15	Indicates the price item parameter that must be used along with the price item for determining the price item pricing.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
PARAM VALUE1, PARAM VALUE2,, PARAM VALUE15	Displays the value of the price item parameter.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
SQI1, SQI2,, SQI10	Indicates the service quantity identifier that must be used for calculating the price item charges.
SQIVALUE1, SQIVALUE2,, SQIVALUE10	Displays the number of units of the service quantity.
BILL LINE DESCRIPTION1, BILL LINE DESCRIPTION2,, BILL LINE DESCRIPTION10	Displays the description of the line item (charge).
AMOUNT1, AMOUNT2,, AMOUNT10	Displays the charge amount.
CURRENCY1, CURRENCY2,, CURRENCY10	Displays the currency in which the amount is charged.
MEMO ONLY1, MEMO ONLY2,, MEMO ONLY10	Indicates whether the charge should be included in the bill amount or not.
SUMMARY1, SUMMARY2,, SUMMARY10	Indicates whether the charge should be included in the summary line or not.
SHOW ON BILL1, SHOW ON BILL2,, SHOW ON BILL10	Indicates whether the charge should appear on the person's printed bill or not.
GL DISTRIBUTION CODE 1, GL DISTRIBUTION CODE 2,, GL DISTRIBUTION CODE 10	Displays the distribution code which indicates the GL account associated with the charge.

Column Name	Column Description
CHARTYPE1, CHARTYPE2,, CHARTYPE10	Indicates the characteristic that must be defined for the billable charge.
CHARVAL1, CHARVAL2,, CHARVAL10	Displays the value of the characteristic type.
REASON	Indicates the reason why the usage record was cancelled.
COMMENTS	Displays additional information entered while cancelling a usage record.

Note:

If you have defined business labels for usage data fields, the columns will appear with the business labels defined for the respective column.

Only those columns that contain data in the CSV file appear in the **Usage Data** screen. For example, if information about characteristics is provided in the CHARTYPE4 and CHARVAL4 columns of the CSV file, then only the CHARTYPE4 and CHARVAL4 columns appear in the **Usage Data** screen. Similarly, if information about the line item (charge) is provided in the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, and GL DISTRIBUTION CODE 6 columns of the CSV file, then only the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, AND GL DISTRIBUTION CODE 6 columns appear in the **Usage Data** screen.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can change the number of records displayed per page, if required. You can use the navigation buttons, such as **First** (◀), **Previous** (◀), **Next** (▶), and **Last** (▶) to navigate between pages. You can also select the page to which you want to navigate from the **Go To** list.

- 3. View the cancelled records of the usage data file in the **Usage Data** screen.
- 4. If required, you can change the number of records displayed per page.

Note: By default, the number of records that appear in each page depends on the minimum value defined in the **PAGE_NUMBER** lookup field. For example, if the **PAGE_NUMBER** lookup field has four values - 10, 20, 30, and 40, then the number of records displayed in each page, by default, would be 10.

- 5. If required, you can click the **First** (◀), **Previous** (◀), **Next** (▶), and **Last** (▶) buttons to navigate between pages.
- 6. If required, you can filter the cancelled records in the **Usage Data** screen.

Viewing Rejected Records of a Usage Data File

Procedure

To view rejected records of a usage data file:

1. Search for the usage data file in the **Usage Data Processing** screen.
2. In the **Search Results** section, click the link in the **Rejected** column corresponding to the usage data file whose rejected records you want to view.

The **Usage Data** screen appears. It contains the following two sections:

- **Search Criteria** - This section allows you to filter the rejected records based on the various search criteria. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Displays the name of the usage data file.	Not applicable
File Type	Indicates the type of the usage data file.	Not applicable
Default Usage Start Date	Displays the usage start date entered while uploading the usage data file.	Not applicable
Default Usage End Date	Displays the usage end date entered while uploading the usage data file.	Not applicable
Status	Indicates that all rejected records are displayed in the Usage Data screen.	Not applicable
Division	Used to specify the division to which the rejected record belongs.	No
Account Identifier Type	Used to specify the identifier type based on which you want to search for the rejected records.	Yes (Conditional)
		Note: If you enter the account identifier as a search criteria, you have to enter the account identifier type.
Account Identifier	Used to indicate the account whose rejected records you want to view.	Yes (Conditional)
		Note: If you enter the account identifier type as a search criteria, you have to enter the account identifier.

- **Search Results** - By default, all rejected records of the usage data file are listed in the **Search Results** section. You can filter the search results based on the specified criteria. the **Search Results** section contains the following columns:

Column Name	Column Description
ACCOUNT ID TYPE	Indicates the account identifier type.
ACCOUNT IDENTIFIER	Indicates the account to which the usage record belongs.
ACCOUNT INFORMATION	Displays information about the account.
DIVISION	Indicates the division to which the usage record belongs.
CONTRACT ID	Displays the contract ID.
	Note: This column appears only if usage data files are uploaded for the insurance module.
CHARGE TYPE	Indicates the charge type.

Column Name	Column Description
	Note: This column appears only if usage data files are uploaded for the insurance module.
START DATE	Displays the date from when the price item was used. Note: If the start date is not available, the default usage start date appears in this column.
END DATE	Displays the date till when the price item was used. Note: If the end date is not available, the default usage end date appears in this column.
DESCRIPTION	Displays the description of the usage record. It is shown on the billable charge.
PRICE ITEM	Displays the price item code.
VARIANCE	Indicates the variance that must be used along with the price item for determining the price item pricing. Note: This column appears when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to False .
PARAM TYPE 1, PARAM TYPE 2,, PARAM TYPE 15	Indicates the price item parameter that must be used along with the price item for determining the price item pricing. Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
PARAM VALUE 1, PARAM VALUE 2,, PARAM VALUE 15	Displays the value of the price item parameter. Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
SQI1, SQI2,, SQI10	Indicates the service quantity identifier that must be used for calculating the price item charges.
SQVALUE1, SQVALUE2,, SQVALUE10	Displays the number of units of the service quantity.
BILL LINE DESCRIPTION1, BILL LINE DESCRIPTION2,, BILL LINE DESCRIPTION10	Displays the description of the line item (charge).
AMOUNT1, AMOUNT2,, AMOUNT10	Displays the charge amount.
CURRENCY 1, CURRENCY 2,, CURRENCY 10	Displays the currency in which the amount is charged.

Column Name	Column Description
MEMO ONLY 1, MEMO ONLY 2,, MEMO ONLY 10	Indicates whether the charge should be included in the bill amount or not.
SUMMARY 1, SUMMARY 2,, SUMMARY 10	Indicates whether the charge should be included in the summary line or not.
SHOW ON BILL 1, SHOW ON BILL 2,, SHOW ON BILL 10	Indicates whether the charge should appear on the person's printed bill or not.
GL DISTRIBUTION CODE 1, GL DISTRIBUTION CODE 2,, GL DISTRIBUTION CODE 10	Displays the distribution code which indicates the GL account associated with the charge.
CHARTYPE 1, CHARTYPE 2,, CHARTYPE 10	Indicates the characteristic that must be defined for the billable charge.
CHARVAL 1, CHARVAL 2,, CHARVAL 10	Displays the value of the characteristic type.
REASON	Indicates the reason why the usage record was rejected by the approver.
COMMENTS	Displays additional information entered while rejecting a usage record.

Note:

If you have defined business labels for usage data fields, the columns will appear with the business labels defined for the respective column.

Only those columns that contain data in the CSV file appear in the **Usage Data** screen. For example, if information about characteristics is provided in the CHARTYPE4 and CHARVAL4 columns of the CSV file, then only the CHARTYPE4 and CHARVAL4 columns appear in the **Usage Data** screen. Similarly, if information about the line item (charge) is provided in the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, and GL DISTRIBUTION CODE 6 columns of the CSV file, then only the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, AND GL DISTRIBUTION CODE 6 columns appear in the **Usage Data** screen.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can change the number of records displayed per page, if required. You can use the navigation buttons, such as **First** (<<), **Previous** (<), **Next** (>), and **Last** (>>) to navigate between pages. You can also select the page to which you want to navigate from the **Go To** list.

3. View the rejected records of the usage data file in the **Usage Data** screen.
4. If required, you can change the number of records displayed per page.

Note: By default, the number of records that appear in each page depends on the minimum value defined in the **PAGE_NUMBER** lookup field. For example, if the **PAGE_NUMBER** lookup field has four values - 10, 20, 30, and 40, then the number of records displayed in each page, by default, would be 10.

5. If required, you can click the **First** (<<), **Previous** (<), **Next** (>), and **Last** (>>) buttons to navigate between pages.
6. If required, you can filter the rejected records in the **Usage Data** screen.

Viewing Billed Records of a Usage Data File

Procedure

To view billed records of a usage data file:

1. Search for the usage data file in the **Usage Data Processing** screen.
2. In the **Search Results** section, click the link in the **Billed** column corresponding to the usage data file whose billed records you want to view.

The **Usage Data** screen appears. It contains the following two sections:

- **Search Criteria** - This section allows you to filter the billed records based on the various search criteria. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Displays the name of the usage data file.	Not applicable
File Type	Indicates the type of the usage data file.	Not applicable
Default Usage Start Date	Displays the usage start date entered while uploading the usage data file.	Not applicable
Default Usage End Date	Displays the usage end date entered while uploading the usage data file.	Not applicable
Usage Record Status	Indicates that all billed records are displayed in the Usage Data screen.	Not applicable
Division	Used to specify the division to which the billed record belongs.	No
Account Identifier Type	Used to specify the identifier type based on which you want to search for the billed records.	Yes (Conditional) Note: If you enter the account identifier as a search criteria, you have to enter the account identifier type.
Account Identifier	Used to indicate the account whose billed records you want to view.	Yes (Conditional) Note: If you enter the account identifier type as a search criteria, you have to enter the account identifier.

- **Search Results** - By default, all billed records of the usage data file are listed in the **Search Results** section. You can filter the search results based on the specified criteria. the **Search Results** section contains the following columns:

Column Name	Column Description
BILLABLE CHARGE ID	Indicates the billable charge which is generated for the usage record.
ACCOUNT ID TYPE	Indicates the account identifier type.
ACCOUNT IDENTIFIER	Indicates the account to which the usage record belongs.
ACCOUNT INFORMATION	Displays information about the account.
DIVISION	Indicates the division to which the usage record belongs.
CONTRACT ID	Displays the contract ID.
	Note: This column appears only if usage data files are uploaded for the insurance module.
CHARGE TYPE	Indicates the charge type.
	Note: This column appears only if usage data files are uploaded for the insurance module.
START DATE	Displays the date from when the price item was used.
	Note: If the start date is not available, the default usage start date appears in this column.
END DATE	Displays the date till when the price item was used.
	Note: If the end date is not available, the default usage end date appears in this column.
DESCRIPTION	Displays the description of the usage record. It is shown on the billable charge.
PRICE ITEM	Displays the price item code.
VARIANCE	Indicates the variance that must be used along with the price item for determining the price item pricing.
	Note: This column appears when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to False .
PARAM TYPE1, PARAM TYPE2,, PARAM TYPE15	Indicates the price item parameter that must be used along with the price item for determining the price item pricing.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
PARAM VALUE1, PARAM VALUE2,, PARAM VALUE15	Displays the value of the price item parameter.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .

Column Name	Column Description
SQI1, SQI2,, SQI10	Indicates the service quantity identifier that must be used for calculating the price item charges.
SQVALUE1, SQVALUE2,, SQVALUE10	Displays the number of units of the service quantity.
BILL LINE DESCRIPTION1, BILL LINE DESCRIPTION2,, BILL LINE DESCRIPTION10	Displays the description of the line item (charge).
AMOUNT1, AMOUNT2,, AMOUNT10	Displays the charge amount.
CURRENCY1, CURRENCY2,, CURRENCY10	Displays the currency in which the amount is charged.
MEMO ONLY1, MEMO ONLY2,, MEMO ONLY10	Indicates whether the charge should be included in the bill amount or not.
SUMMARY1, SUMMARY2,, SUMMARY10	Indicates whether the charge should be included in the summary line or not.
SHOW ON BILL1, SHOW ON BILL2,, SHOW ON BILL10	Indicates whether the charge should appear on the person's printed bill or not.
GL DISTRIBUTION CODE 1, GL DISTRIBUTION CODE 2,, GL DISTRIBUTION CODE 10	Displays the distribution code which indicates the GL account associated with the charge.
CHARTYPE1, CHARTYPE2,, CHARTYPE10	Indicates the characteristic that must be defined for the billable charge.
CHARVAL1, CHARVAL2,, CHARVAL10	Displays the value of the characteristic type.

Note:

If you have defined business labels for usage data fields, the columns will appear with the business labels defined for the respective column.

Only those columns that contain data in the CSV file appear in the **Usage Data** screen. For example, if information about characteristics is provided in the CHARTYPE4 and CHARVAL4 columns of the CSV file, then only the CHARTYPE4 and CHARVAL4 columns appear in the **Usage Data** screen. Similarly, if information about the line item (charge) is provided in the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, and GL DISTRIBUTION CODE 6 columns of the CSV file, then only the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, AND GL DISTRIBUTION CODE 6 columns appear in the **Usage Data** screen.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can change the number of records displayed per page, if required. You can use the navigation buttons, such as **First** (◀◀), **Previous** (◀), **Next** (▶), and **Last** (▶▶) to navigate between pages. You can also select the page to which you want to navigate from the **Go To** list.

- 3. View the billed records of the usage data file in the **Usage Data** screen.
- 4. If required, you can change the number of records displayed per page.

Note:

By default, the number of records that appear in each page depends on the minimum value defined in the **PAGE_NUMBER** lookup field. For example, if the **PAGE_NUMBER** lookup field has four values - 10, 20, 30, and 40, then the number of records displayed in each page, by default, would be 10.

- 5. If required, you can click the **First** (◀◀), **Previous** (◀), **Next** (▶), and **Last** (▶▶) buttons to navigate between pages.
- 6. If required, you can filter the billed records in the **Usage Data** screen.

Viewing Unbilled Records of a Usage Data File

Procedure

To view unbilled records of a usage data file:

- 1. Search for the usage data file in the **Usage Data Processing** screen.
- 2. In the **Search Results** section, click the link in the **Unbilled** column corresponding to the usage data file whose unbilled records you want to view.

The **Usage Data** screen appears. It contains the following two sections:

- **Search Criteria** - This section allows you to filter the unbilled records based on the various search criteria. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
File Name	Displays the name of the usage data file.	Not applicable
File Type	Indicates the type of the usage data file.	Not applicable
Default Usage Start Date	Displays the usage start date entered while uploading the usage data file.	Not applicable
Default Usage End Date	Displays the usage end date entered while uploading the usage data file.	Not applicable
Usage Record Status	Indicates that all unbilled records are displayed in the Usage Data screen.	Not applicable
Division	Used to specify the division to which the unbilled record belongs.	No

Field Name	Field Description	Mandatory (Yes or No)
Account Identifier Type	Used to specify the identifier type based on which you want to search for the unbilled records.	Yes (Conditional)
		Note: If you enter the account identifier as a search criteria, you have to enter the account identifier type.
Account Identifier	Used to indicate the account whose unbilled records you want to view.	Yes (Conditional)
		Note: If you enter the account identifier type as a search criteria, you have to enter the account identifier.

- **Search Results** - By default, all unbilled records of the usage data file are listed in the **Search Results** section. You can filter the search results based on the specified criteria. the **Search Results** section contains the following columns:

Column Name	Column Description
BILLABLE CHARGE ID	Indicates the billable charge which is generated for the usage record.
ACCOUNT ID TYPE	Indicates the account identifier type.
ACCOUNT IDENTIFIER	Indicates the account to which the usage record belongs.
ACCOUNT INFORMATION	Displays information about the account.
DIVISION	Indicates the division to which the usage record belongs.
CONTRACT ID	Displays the contract ID.
	Note: This column appears only if usage data files are uploaded for the insurance module.
CHARGE TYPE	Indicates the charge type.
	Note: This column appears only if usage data files are uploaded for the insurance module.
START DATE	Displays the date from when the price item was used.
	Note: If the start date is not available, the default usage start date appears in this column.
END DATE	Displays the date till when the price item was used.
	Note: If the end date is not available, the default usage end date appears in this column.
DESCRIPTION	Displays the description of the usage record. It is shown on the billable charge.
PRICE ITEM	Displays the price item code.
VARIANCE	Indicates the variance that must be used along with the price item for determining the price item pricing.

Column Name	Column Description
	Note: This column appears when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to False .
PARAM TYPE1, PARAM TYPE2,, PARAM TYPE15	Indicates the price item parameter that must be used along with the price item for determining the price item pricing.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
PARAM VALUE1, PARAM VALUE2,, PARAM VALUE15	Displays the value of the price item parameter.
	Note: These columns appear when the Multi Price Parameter option type of the Multi Parameter Based Pricing (C1_PPARM_FLG) feature configuration is set to True .
SQI1, SQI2,, SQI10	Indicates the service quantity identifier that must be used for calculating the price item charges.
SQIVALUE1, SQIVALUE2,, SQIVALUE10	Displays the number of units of the service quantity.
BILL LINE DESCRIPTION1, BILL LINE DESCRIPTION2,, BILL LINE DESCRIPTION10	Displays the description of the line item (charge).
AMOUNT1, AMOUNT2,, AMOUNT10	Displays the charge amount.
CURRENCY1, CURRENCY2,, CURRENCY10	Displays the currency in which the amount is charged.
MEMO ONLY1, MEMO ONLY2,, MEMO ONLY10	Indicates whether the charge should be included in the bill amount or not.
SUMMARY1, SUMMARY2,, SUMMARY10	Indicates whether the charge should be included in the summary line or not.
SHOW ON BILL1, SHOW ON BILL2,, SHOW ON BILL10	Indicates whether the charge should appear on the person's printed bill or not.
GL DISTRIBUTION CODE 1, GL DISTRIBUTION CODE 2,, GL DISTRIBUTION CODE 10	Displays the distribution code which indicates the GL account associated with the charge.
CHARTYPE1, CHARTYPE2,, CHARTYPE10	Indicates the characteristic that must be defined for the billable charge.
CHARVAL1, CHARVAL2,, CHARVAL10	Displays the value of the characteristic type.

Note:

If you have defined business labels for usage data fields, the columns will appear with the business labels defined for the respective column.

Only those columns that contain data in the CSV file appear in the **Usage Data** screen. For example, if information about characteristics is provided in the CHARTYPE4 and CHARVAL4 columns of the CSV file, then only the CHARTYPE4 and CHARVAL4 columns appear in the **Usage Data** screen. Similarly, if information about the line item (charge) is provided in the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, and GL DISTRIBUTION CODE 6 columns of the CSV file, then only the BILL LINE DESCRIPTION6, AMOUNT6, CURRENCY6, MEMO ONLY6, SUMMARY6, SHOW ON BILL6, AND GL DISTRIBUTION CODE 6 columns appear in the **Usage Data** screen.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can change the number of records displayed per page, if required. You can use the navigation buttons, such as **First** (◀◀), **Previous** (◀), **Next** (▶), and **Last** (▶▶) to navigate between pages. You can also select the page to which you want to navigate from the **Go To** list.

- 3. View the unbilled records of the usage data file in the **Usage Data** screen.
- 4. If required, you can change the number of records displayed per page.

Note: By default, the number of records that appear in each page depends on the minimum value defined in the **PAGE_NUMBER** lookup field. For example, if the **PAGE_NUMBER** lookup field has four values - 10, 20, 30, and 40, then the number of records displayed in each page, by default, would be 10.

- 5. If required, you can click the **First** (◀◀), **Previous** (◀), **Next** (▶), and **Last** (▶▶) buttons to *navigate* between pages.
- 6. If required, you can filter the unbilled records in the **Usage Data** screen.

Submitting a Valid Record

Procedure

To submit a valid record:

- 1. Search for the usage data file in the **Usage Data Processing** screen.
- 2. In the **Search Results** section, click the **Submit** (📤) icon corresponding to the usage data file whose valid records you want to submit.

The system behaves in the following manner when:

- **Billing Method - Adhoc Billing, Approval Workflow - Off, and Bill After Date - Current or Future Date:** A billable charge is created for each valid usage record. The **Adhoc Bill** flag is set to **Y** and the **Bill After Date** is stamped on the billable charge. If the total number of valid records in a usage data file exceeds the transaction limit, a batch job is created using the **Billable Charge Creation (C1-ODBCH)** batch. A message

appears indicating the batch job ID. This batch job creates a billable charge for each valid usage record. The status of the usage record is changed to **Processed**.

- **Billing Method - Adhoc Billing, Approval Workflow - On, and Bill After Date - Current or Future Date:** A To Do entry is created for the approver to approve the valid records. The status of the usage record is changed to **Submitted**.
- **Billing Method - Regular Billing, Approval Workflow - Off, and Bill After Date - Specified:** A billable charge is created for each valid usage record. The **Adhoc Bill** flag is set to **N** and the **Bill After Date** is stamped on the billable charge. If the total number of valid records in a usage data file exceeds the transaction limit, a batch job is created using the **Billable Charge Creation (C1-ODBCH)** batch. A message appears indicating the batch job ID. This batch job creates a billable charge for each valid usage record. The status of the usage record is changed to **Processed**. The bills will be generated for the account in the bill cycle in which the bill after date falls.
- **Billing Method - Regular Billing, Approval Workflow - Off, and Bill After Date - Not Specified:** A billable charge is created for each valid usage record. The **Adhoc Bill** flag is set to **N** in the billable charge. If the total number of valid records in a usage data file exceeds the transaction limit, a batch job is created using the **Billable Charge Creation (C1-ODBCH)** batch. A message appears indicating the batch job ID. This batch job creates a billable charge for each valid usage record. The status of the usage record is changed to **Processed**. The bills will be generated for the account based on the bill cycle defined for the account.
- **Billing Method - Regular Billing and Approval Workflow - On:** A To Do entry is created for the approver to approve the valid records. The status of the usage record is changed to **Submitted**.

Note:

You can change the transaction limit, whenever required, using the **On Demand Billing (C1-ODBFC)** feature configuration. For more information on the **Billable Charge Creation (C1-ODBCH)** batch, see *Oracle Revenue Management and Billing Batch Execution Guide*.

If you want to create billable charges for valid usage records where start date is a future date, then ensure that the **Use Calendar Billing** option is set to **Allow Advanced Billing** in the respective contract type.

If a batch job is created automatically, the number of valid records for which billable charges are created in each work unit depends on the value defined for the **Billable Charge Chunk Size** option type in the **On Demand Billing (C1-ODBFC)** feature configuration.

In case an account belongs to an invoicing group, the billable charge is created for the member account and the bill is generated for the master account.

On successful completion of the **Billable Charge Creation (C1-ODBCH)** batch, a To Do entry is created using the **C1-ODBCH To Do** type. You can view this To Do entry when you are assigned a To Do role which is mapped to the **C1-ODBCH To Do** type. This To Do indicates whether the batch was successfully executed or not. If the batch was successfully executed, it indicates the following:

- Number of records for which billable charges were created
- Number of records for which billable charges could not be created successfully

3. If a batch job is created automatically, click **OK** in the message box.

Approving a Valid Record

You can view the number of records which are pending for approval in the **Submitted** column corresponding to the usage data file in the **Usage Data Processing** screen. The approver can review, and accordingly approve or reject the usage record based on the observations.

Note: The system will not allow you to approve or reject a usage record submitted by you.

Procedure

To approve a valid record:

1. Do either of the following:

If you want to...	Then...
Approve the usage record from the Usage Data Processing screen	<ol style="list-style-type: none"> a. Search for the usage data file in the Usage Data Processing screen. b. In the Search Results section, click the Approve (☺) icon corresponding to the usage data file whose records you want to review.
Approve the usage record from the To Do List screen	<ol style="list-style-type: none"> a. From the Main Menu, select To Do and then click To Do List. The To Do Type for User Search window appears. b. Select the type of To Do entries you want to view. The To Do List screen appears. c. Select Open from the Filter by list to view all unassigned To Dos. d. Click the Submitted Message link corresponding to the To Do entry whose records you want to review.

The **Usage Data** screen appears.

2. Review the usage records which you want approve or reject.
3. Do either of the following:

If you want to...	Then...
Approve one or more usage records	<ol style="list-style-type: none"> a. If the usage record is accurate, then select the check box corresponding to the usage record. b. Click Approve. The system behaves in the following manner when: <ul style="list-style-type: none"> • Billing Method - Adhoc Billing and Bill After Date - Current or Future Date: A billable charge is created for each valid record which is approved. The Adhoc Bill flag is set to Y and the Bill After Date is stamped on the billable charge. The status of the usage record is changed to Processed. • Billing Method - Regular Billing and Bill After Date - Specified: A billable charge is created for each valid record which is approved. The Adhoc Bill flag is set to N and the Bill After Date is stamped on the billable charge. The status of the usage record is changed to Processed. The bills will be generated for the account in the bill cycle in which the bill after date falls.

If you want to...	Then...
	<ul style="list-style-type: none"> • Billing Method - Regular Billing and Bill After Date - Not Specified: A billable charge is created for each valid record which is approved. The Adhoc Bill flag is set to N in the billable charge. The status of the usage record is changed to Processed. The bills will be generated for the account based on the bill cycle defined for the account.
Approve all usage records	<p>a. Click Approve All.</p> <p>The system behaves in the following manner when:</p> <ul style="list-style-type: none"> • Billing Method - Adhoc Billing and Bill After Date - Current or Future Date: A billable charge is created for each valid record which is approved. The Adhoc Bill flag is set to Y and the Bill After Date is stamped on the billable charge. If the total number of records that you want to approve exceeds the transaction limit, a batch job is created using the Billable Charge Creation (C1-ODBCH) batch. A message appears indicating the batch job ID. This batch job creates a billable charge for each valid usage record. The status of the usage record is changed to Processed. • Billing Method - Regular Billing and Bill After Date - Specified: A billable charge is created for each valid record which is approved. The Adhoc Bill flag is set to N and the Bill After Date is stamped on the billable charge. Rejecting a Valid Record

You can view the number of records which are pending for approval in the **Submitted** column corresponding to the usage data file in the **Usage Data Processing** screen. The approver can review, and accordingly approve or reject the usage record based on the observations.

Note: The system will not allow you to approve or reject a usage record submitted by you.

Procedure

To reject a valid record:

1. Do either of the following:

If you want to...	Then...
Reject the usage record from the Usage Data Processing screen	<p>a. Search for the usage data file in the Usage Data Processing screen.</p> <p>b. In the Search Results section, click the Approve (☺) icon corresponding to the usage data file whose records you want to review.</p>
Reject the usage record from the To Do List screen	<p>a. From the Main Menu, select To Do and then click To Do List. The To Do Type for User Search window appears.</p>

If you want to...	Then...
	b. Select the type of To Do entries you want to view. The To Do List screen appears. c. Select Open from the Filter by list to view all unassigned To Dos. d. Click the Submitted Message link corresponding to the To Do entry whose records you want to review.

The **Usage Data** screen appears.

- Review the usage records which you want approve or reject.
- Do either of the following:

If you want to...	Then...
Reject one or more usage records	a. If the usage record is not appropriate, then select the check box corresponding to the usage record. b. Click Reject .
Reject all usage records	a. Click Reject All .

The **Rejection Reason** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Reason	Used to indicate the reason why you want to reject the usage record.	Yes
Comments	Used to specify additional information while rejecting the usage record.	Yes

- Select the reason for rejecting the usage record and enter the comments in the respective field.

Note: The **ODB_REJ_RSN_FLG** lookup field values appear in the **Reason** list.

- Click **OK**.
The status of the usage record is changed to **Rejected**. A To Do entry is created for the submitter to include correct or missing data.

Cancelling a Usage Data File

There might be situations when incorrect usage data file is uploaded in the system. In such case, the system provides you with an ability to cancel the file. Once the usage data file is cancelled, the status of the file and all usage records in the file is changed to **Cancelled**. However, note that you can cancel a usage data file when there are no records (in other words, zero records) in the **Processed** and **Submitted** statuses.

Procedure

To cancel a usage data file:

1. Do either of the following:

If you want to...	Then...
Cancel the usage data file from the Usage Data Processing screen	<p>a. Search for the usage data file in the Usage Data Processing screen.</p> <p>b. In the Search Results section, click the Cancel (🚫) icon corresponding to the usage data file that you want to cancel.</p>
Cancel the usage data file from the On Demand Billing screen	<p>a. From the Main Menu, select Billing Management and then click On Demand Billing.</p> <p>The On Demand Billing screen appears.</p> <p>b. Search for the file group whose usage data file you want to cancel.</p> <p>The search results appears.</p> <p>c. Click the Broadcast (📡) icon corresponding to the required file group.</p> <p>The Group Files zone appears. The Group Files zone lists the usage data files that are uploaded using the file group.</p> <p>d. Click the Cancel (🚫) icon corresponding to the usage data file that you want to cancel.</p>

A message appears confirming whether you want to cancel the usage data file.

2. Click **OK**.

The **Cancel Reason** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Reason	Used to indicate the reason why you want to cancel the usage data file.	Yes
Comments	Used to specify additional information while cancelling the usage data file.	Yes

3. Select the reason for cancelling the usage data file and enter the comments in the respective field.

Note: The **ODB_CAN_RSN_FLG** lookup field values appear in the **Reason** list.

4. Click **OK**.

The status of the usage data file is changed to **Cancelled**.

Revalidating a Usage Data File

There might be situations when you want to execute the validation process once again on the usage data file. For example, initially when the usage data file was uploaded, accounts didn't have an active contract and therefore the status of the usage records was set to **Invalid**. Later, a contract was created and activated for each account (whose usage records are available in the usage data file). In such case, you need to execute the validation process once again on the usage data file. However, note that when you revalidate a usage data file, only the records in the **Valid** and **Invalid** status are revalidated.

Procedure

To revalidate a usage data file:

1. Search for the usage data file in the **Usage Data Processing** screen.
2. Click the **Revalidate** (🔄) icon corresponding to the usage data file on which you want to execute the validation process once again.

The valid and invalid records are revalidated, and accordingly the status of records is changed. A message appears indicating that the validation process has completed successfully.

Note:

If the usage data file size exceeds the file size limit set in the **On Demand Billing (C1-ODBFC)** feature configuration, a batch job is created using the **Upload and Validate Usage Data File (C1-ODFU)** batch. A message appears indicating the batch job ID. This batch job revalidates the usage data file. For more information on the **Upload and Validate Usage Data File (C1-ODFU)** batch, see *Oracle Revenue Management and Billing Batch Execution Guide*.

If a batch job is created automatically, the number of usage records that are revalidated in each work unit depends on the value defined for the **Validation Chunk Size** option type in the **On Demand Billing (C1-ODBFC)** feature configuration.

On successful completion of the **Upload and Validate Usage Data File (C1-ODFU)** batch, a To Do entry is created using the **C1-ODFU To Do** type. You can view this To Do entry when you are assigned a To Do role which is mapped to the **C1-ODFU To Do** type. This To Do indicates whether the batch was successfully executed or not. If the batch was successfully executed, it indicates the following:

- Number of records which were successfully validated
- Number of records which could not pass through the validation process
- Number of records which failed to validate due to some technical reasons

3. Click **OK** in the message box.
Once a usage record is successfully validated, the status of the usage record is changed to **Valid**. And, if a usage record could not pass through the validation process, the status of the usage record is changed to **Invalid**.

Editing a Valid, Invalid, or Rejected Usage Record

If the usage record validation fails or the approver rejects the usage record due to some reason, the status of the record is changed to **Invalid** or **Rejected**, respectively. You need to then correct the existing data or add the missing data. The system allows you to edit the valid, invalid, and rejected usage records.

Procedure

To edit a valid, invalid or rejected usage record:

1. Search for the usage data file in the **Usage Data Processing** screen.
2. Depending on whether you want to edit a valid, invalid, or rejected record, click the link in the **Valid, Invalid, or Rejected** column corresponding to the usage data file whose records you want to edit.
The **Usage Data** screen appears. The columns in the **Search Results** section are editable.

Note:

In case of rejected records, all columns except the **Reason** and **Comments** columns are editable.

In case of invalid record, the field with incorrect or missing data is highlighted with the red color. This helps to easily identify the reason why the validation process failed.

3. Enter the correct or missing data in the respective field.
4. Click **Save**.
All valid, invalid, or rejected usage records are validated once again. Once the validation process has completed successfully, the status of the records is changed accordingly.

Exporting Usage Data into CSV file

Oracle Revenue Management and Billing provides you the facility to export the usage data into a CSV file. However, you can download the usage data in a CSV file only if the billable charges are not yet created. In other words, you can download the usage data only when all the records of a usage data file are in the valid and/or invalid status. Once the usage data is downloaded, you can edit the usage records and reupload the usage data file.

Note: When you download the usage data file using the **Export To Excel** option, the downloaded file is saved on your system with a unique ID. Once you make the required changes in the downloaded usage data file, you need to save the modified file with the same name as it exists in Oracle Revenue Management and Billing, and then upload the file into the system to replace the existing file.

Procedure

To export usage data into CSV file:

1. Search for the usage data file in the **Usage Data Processing** screen.
2. In the **Search Results** section, click the link in the **Total** column corresponding to the usage data file whose usage records you want to export.
The **Usage Data** screen appears.
3. Click the **Export TO Excel** link in the **Search** section to download details of all the valid and/or invalid records of a usage data file in a CSV file format.

A message appears indicating that all valid and invalid records will be exported.

4. Click **OK**.

The system prompts you to save the file.

Filtering Usage Records

Procedure

To filter records of a usage data file:

1. Search for the usage data file in the **Usage Data Processing** screen.
2. Depending on whether you want to filter total, valid, invalid, submitted, processed, rejected, cancelled, billed, or unbilled usage records, click the link in the respective column corresponding to the usage data file.
The **Usage Data** screen appears.
3. Enter the search criteria based on which you want to filter the records.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

4. Click **Search**.

The search results are filtered based on the specified criteria.

Most Commonly Used Tasks

Topics:

- [Changing the Layout](#)

This section lists some of the common tasks that are performed while using various functionality in the application.

Changing the Layout

You can change the layout of the zone by:

- [Removing a Column from the Zone](#) on page 4186
- [Adding a Column to the Zone](#) on page 4186
- [Rearranging Columns in the Zone](#) on page 4186

Adding a Column to the Zone

Once you have removed the columns from the zone, you can add them back to the zone. To add a column to the zone:

1. Click the **Column Configuration** (⚙️) icon in the upper right corner of the zone.
A panel appears at the bottom of the zone with a list of column names.

Note: The column names with the white background in the panel are currently not displayed in the zone.

2. Drag and drop the column name from the panel to the location where you want to add the column in the zone.
The white background of the column name in the panel changes to the grey background indicating that the column is currently displayed in the zone.
3. If you want to add another column name from the panel to the zone, repeat the second step. Click the **Refresh** button, data will be displayed to the columns added in the zone.

Related Topics

For more information on...	See...
How to change the layout of the zone	Changing the Layout on page 4186

Rearranging Columns in the Zone

You can change the order in which the columns are displayed in the zone. To change the position of a column in the zone:

1. Click the column name whose position you want to change in the zone.
2. Drag and drop the column name between the columns where you want to place the selected column.
The position of the column changes in the zone.

Related Topics

For more information on...	See...
How to change the layout of the zone	Changing the Layout on page 4186

Removing a Column from the Zone

To remove a column from the zone:

Click the **Delete** (🗑️) icon corresponding to the column name that you want to remove from the zone.
The column is removed from the zone and is currently displayed with white background in the panel.

Note: Alternatively you can remove the column from the zone by clicking the Delete (🗑️) icon corresponding to the column name in the panel.

How to change the layout of the zone	Changing the Layout on page 4186

Appendix

B

Administration

Topics:

- [UI Maps](#)
- [Feature Configurations](#)

This section lists some of the administrative tasks.

UI Maps

This section explains how to create the UI maps for viewing and modifying data of the business objects within the approval workflow group.

Creating Display UI Map for an Approval Workflow Group

The system provides you with the ability to automatically generate a Display UI map, and associate it with the approval workflow group. Alternatively, you can create a Display UI map manually, and attach it to the approval workflow group.

Procedure

To create a Display UI map manually:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **U** and then click **UI Map**.
A sub-menu appears.
3. Click the **Search** option from the **UI Map** sub-menu.
The **UI Map** screen appears.
4. In the **Main** tab, enter the name and description of the Display UI map.

Note: The system uses the CM_<Approval Workflow Group Code>_AppTxn_Display naming convention while automatically generating a Display UI map. Therefore, do not use this naming convention while creating a Display UI map manually.

5. Select **Complete HTML Document** from the **UI Map Type** list.
6. Click the **Schema** tab.
The **Schema** tab appears.
7. Add the following schema in the **Scheme Editor** zone:

```
<schema>
  <<Business Object Name> type="group">
    <includeBO name="<Business Object Name>" />
  </<Business Object Name>>
</schema>
```

In the above schema, you must replace <Business Object Name> with the name of the business object. For example, if you want to create a Display UI map for account, you must use the following schema:

```
<schema>
  <account type="group">
    <includeBO name="Account" />
  </account>
</schema>
```

8. Click the **Save** link in the **Actions/Navigation** area.
The **Display Only** and **Input Map** buttons are enabled on the dashboard.
9. Click the **Display Only** button.
The HTML code is generated in the **HTML Editor** zone.
10. Click the **Save** link in the **Actions/Navigation** area.
The changes are saved.

Related Topics

For more information on...	See...
How to define an approval workflow group	Defining an Approval Workflow Group on page 997
How to edit an approval workflow group	Editing an Approval Workflow Group on page 1006

Creating Input UI Map for an Approval Workflow Group

The system provides you with the ability to automatically generate an Input UI map, and associate it with the approval workflow group. Alternatively, you can create an Input UI map manually, and attach it to the approval workflow group.

Procedure

To create an Input UI map manually:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **U** and then click **UI Map**.
A sub-menu appears.
3. Click the **Search** option from the **UI Map** sub-menu.
The **UI Map** screen appears.
4. In the **Main** tab, enter the name and description of the Input UI map.

Note: The system uses the CM_<Approval Workflow Group Code>_AppTxn_Input naming convention while automatically generating an Input UI map. Therefore, do not use this naming convention while creating an Input UI map manually.

5. Select **Complete HTML Document** from the **UI Map Type** list.
6. Click the **Schema** tab.
The **Schema** tab appears.
7. Add the following schema in the **Scheme Editor** zone:

```
<schema>
  <approvalTransactionId/>
  <action/>
  <<Business Object Name> type="group">
    <includeBO name="<Business Object Name>"/>
  </<Business Object Name>>
</schema>
```

In the above schema, you must replace <Business Object Name> with the name of the business object. For example, if you want to create an Input UI map for account, you must use the following schema:

```
<schema>
  <approvalTransactionId/>
  <action/>
  <account type="group">
    <includeBO name="Account"/>
  </account>
</schema>
```

The <approvalTransactionId/> tag is used in the schema to retrieve the approval transaction ID of the respective business object. The <action/> tag is used in the schema to retrieve the action performed by the submitter.

8. Click the **Save** link in the **Actions/Navigation** area.
The **Display Only** and **Input Map** buttons are enabled on the dashboard.
9. Click the **Input Map** button.

The HTML code is generated in the **HTML Editor** zone.

10. Add the following tag in the head tag:

```
<script language="javascript" type="text/javascript" src="code/
approvalWorkflow.js"></script>
```

11. Add the text highlighted in bold within the tag as shown below:

```
<td>
<input onClick=performAction('<Approval Workflow Group Code>');" -
oraMdLabel="SAVE_BTN_LBL" class="oraButton" type="button">
<input onClick="oraSubmitMap('CANCEL', false);" oraMdLabel="CANCEL_LBL" -
class="oraButton" type="button">
</td>
```

In the above HTML code, you must replace `<Approval Workflow Group Code>` with the code of the approval workflow group for which you are creating a UI map.

12. Click the **Save** link in the **Actions/Navigation** area.

The changes are saved.

Feature Configurations

This section explains how to set various feature configurations which are required for implementing various features in Oracle Revenue Management and Billing.

Setting the C1_ACCTINFO Feature Configuration

Prerequisites

To set the **C1_ACCTINFO** feature configuration, you should have:

- Account Type characteristic type defined in the application (where the characteristic entity is set to Account)
- Invoice Group Account characteristic type defined in the application (where the characteristic entity is set to Account)

Procedure

To set the **C1_ACCTINFO** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1_ACCTINFO** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.

A list of feature configurations that meet the search criteria appears in the search results.

6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Account Type	Used to specify the characteristic type. This characteristic type is used to define the type of account in the Account screen.	Yes
	Note: By default, the C1_F_ATY characteristic type is specified. If you want to use account types other than the ones defined in the C1_F_ATY characteristic type, you need to create a new predefined characteristic type and add the required account types as its characteristic values. Then, specify the newly created characteristic type as the value for this option type.	
Invoice Group Account	Used to specify the characteristic type. This characteristic type is used to indicate whether the account is a master or member account in the Account screen.	Yes
	Note: By default, the C1_F_IGA characteristic type is specified. If you want to use any other characteristic type other than C1_F_IGA , you need to create a new predefined characteristic type and add two characteristic values - Y and N. Then, specify the newly created characteristic type as the value for this option type.	

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1-ASOBLLNG Feature Configuration

The **C1-ASOBLLNG** feature configuration enables the system to determine the following:

- Whether the approval transaction should be created while defining, editing, or deleting a self-funded pricing rule.
- Various parameters, characteristic types, and extendable lookup business objects which should be used for the fully-insured group, fully-insured individual, and self-funded business.
- Person relationship type using which the bill group should be related to the parent customer.
- Policy person roles using which the parent customer and bill groups should be associated with the fully-insured group and self-funded policies.
- Status to which a policy should be transitioned on terminating, reinstating, or renewing the fully-insured group policy.
- Status to which a group membership should be transitioned on inactivating the main subscriber of the group membership.

- Status to which a member person of a group membership should be transitioned on inactivating the group membership.
- Status to which an individual membership should be transitioned on canceling the main subscriber of the individual membership.
- Status to which a member person of an individual membership should be transitioned on canceling the individual membership.
- Whether the plan-specific contracts should be created on the accounts for the fully-insured group policies.

Prerequisites

To set the **C1-ASOBLLNG** feature configuration, you should have:

- Required policy person roles, account relationship types, and person relationship types defined in the application
- Approval workflow settings configured for the **C1PRCANC**, **C1PRCASL**, **C1PRCRLCLM**, **C1PRCDA**, **C1PRFLTTEE**, **C1PRCLVLFN**, **C1PRETCLM**, **C1PRRETENR**, and **C1PRCSSL** approval workflow groups
- Required approval workflow group defined for the Minimum Premium Program (MPP) pricing rule and approval workflow settings configured for the MPP approval workflow group
- Required characteristic types defined in the application
- Values defined for the **C1-ExtLookClaimTemplate**, **C1-ExtLookPricingRuleLineItem**, and **C1-ExtLookRetTypeRateOpt** extendable lookups
- Predefined values defined for the **C1INVTYP** characteristic type
- Required SQIs defined in the application
- Pricing arrangement parameter defined in the application (where the value type is set to **Adhoc**, source entity is set to **Transaction**, and the parameter usage is set to **Price Item**)
- Billable charge line type parameter defined in the application (where the value type is set to **Adhoc**, source entity is set to **Transaction**, and the parameter usage is set to **Price Item**)
- Pricing group rule parameter defined in the application (where the value type is set to **Adhoc**, source entity is set to **Transaction**, and the parameter usage is set to **Price Item**)
- A predefined characteristic type named **Active Employee Coverage Billing Arrangement** defined with the following characteristic values:

Characteristic Value	Description
DRT	Direct Billing
GRP	Group Billing

You must set the characteristic entity of the **Active Employee Coverage Billing Arrangement** characteristic type to **Person**.

- A predefined characteristic type named **Benefit Billing Arrangement** defined with the following characteristic values:

Characteristic Value	Description
DRT	Direct Billing
GRP	Group Billing

You must set the characteristic entity of the **Benefit Billing Arrangement** characteristic type to **Person**, **Policy**, and **Policy Plan**.

- A predefined characteristic type named **COBRA Billing Arrangement** defined with the following characteristic values:

Characteristic Value	Description
DRT	Direct Billing
GRP	Group Billing

Characteristic Value	Description
TPA	TPA Billing

You must set the characteristic entity of the **COBRA Billing Arrangement** characteristic type to **Person, Policy, and Policy Plan**.

- Required billing preference, binder payment preference, geographic rating area preference for fully-insured group and individual, medicare preference, member relationship and subscription tier preference, and membership status reason preference defined in the application.

Procedure

To set the **C1-ASOBLLNG** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1-ASOBLLNG** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Account Identifier Type Char Type	Used to specify the characteristic type which stores the account identifier type. It is used to determine the account to which you want to bill the group or individual membership.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Membership .	Note: This data is required while billing a group or individual membership.
Account Identifier Value Char Type	Used to specify the characteristic type which stores the account identifier. It is used to determine the account to which you want to bill the group or individual membership.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Membership .	Note: This data is required while billing a group or individual membership.
Age Based Parameter	Used to specify the parameter using which you want to define the lower age limit and upper age	Yes (Conditional)

Option Type	Description	Mandatory (Yes or No)
	limit pricing eligibility criteria in an age based pricing.	Note: This data is required while defining an age based pricing rule.
	Note: The AGEBASED parameter is shipped with the product. By default, the value is set to AGEBASED . You can change the value, if required. However, note that you must specify an adhoc parameter where source entity is set to Algorithm , source type code is set to Calculate membership person's age , and the parameter usage is set to Pricing Eligibility Criteria .	
Approval Workflow Group for ASL	Used to specify the approval workflow group for an aggregate stop-loss pricing rule. It helps the system to determine whether the approval transaction should be created while defining, editing, or deleting an aggregate stop-loss pricing rule.	Yes (Conditional)
	Note: The C1PRCASL approval workflow group for an aggregate stop-loss pricing rule is shipped with the product. By default, the value is set to C1PRCASL . You can change the value, if required.	Note: This data is required while enabling the approval workflow process for an aggregate stop-loss pricing rule.
Approval Workflow Group for Ancillary	Used to specify the approval workflow group for an ancillary pricing rule. It helps the system to determine whether the approval transaction should be created while defining, editing, or deleting an ancillary pricing rule.	Yes (Conditional)
	Note: The C1PRCANC approval workflow group for an ancillary pricing rule is shipped with the product. By default, the value is set to C1PRCANC . You can change the value, if required.	Note: This data is required while enabling the approval workflow process for an ancillary pricing rule.
Approval Workflow Group for Claim	Used to specify the approval workflow group for a claim pricing rule. It helps the system to determine whether the approval transaction should be created while defining, editing, or deleting a claim pricing rule.	Yes (Conditional)
		Note: This data is required while enabling the approval workflow process for a claim pricing rule.

Option Type	Description	Mandatory (Yes or No)
	Note: The C1PRCRLCLM approval workflow group for a claim pricing rule is shipped with the product. By default, the value is set to C1PRCRLCLM . You can change the value, if required.	
Approval Workflow Group for Flat Fees	Used to specify the approval workflow group for the one-time and recurring flat fees pricing rules. It helps the system to determine whether the approval transaction should be created while defining, editing, or deleting the one-time and recurring flat fees pricing rules.	Yes (Conditional)
	Note: The C1PRFLTTEE approval workflow group for the one-time and recurring flat fees pricing rules is shipped with the product. By default, the value is set to C1PRFLTTEE . You can change the value, if required.	Note: This data is required while enabling the approval workflow process for the one-time and recurring flat fees pricing rules.
Approval Workflow Group for Level Funded	Used to specify the approval workflow group for the enrollment based premium and flat rate based premium level funded pricing rules. It helps the system to determine whether the approval transaction should be created while defining, editing, or deleting the enrollment based premium and flat rate based premium level funded pricing rules.	Yes (Conditional)
	Note: The C1PRCLVLFN approval workflow group for the enrollment based premium and flat rate based premium level funded pricing rules is shipped with the product. By default, the value is set to C1PRCLVLFN . You can change the value, if required.	Note: This data is required while enabling the approval workflow process for the enrollment based premium and flat rate based premium level funded pricing rules.
Approval Workflow Group for MPP	Used to specify the approval workflow group for a minimum premium program pricing rule. It helps the system to determine whether the approval transaction should be created while defining, editing, or deleting a minimum premium program pricing rule.	Yes (Conditional)
		Note: This data is required while enabling the approval workflow process for the minimum premium program pricing rules.
Approval Workflow Group for Retention Type Claim Based	Used to specify the approval workflow group for a retention type claim based pricing rule. It helps the system to determine whether the approval	Yes (Conditional)

Option Type	Description	Mandatory (Yes or No)
	transaction should be created while defining, editing, or deleting a retention type claim based pricing rule.	Note: This data is required while enabling the approval workflow process for a retention type claim based pricing rule.
	Note: The C1PRETCLM approval workflow group for a retention type claim based pricing rule is shipped with the product. By default, the value is set to C1PRETCLM . You can change the value, if required.	
Approval Workflow Group for Retention Type Enrollment Based	Used to specify the approval workflow group for a retention type enrollment based pricing rule. It helps the system to determine whether the approval transaction should be created while defining, editing, or deleting a retention type enrollment based pricing rule.	Yes (Conditional)
	Note: The C1PRRETENR approval workflow group for a retention type enrollment based pricing rule is shipped with the product. By default, the value is set to C1PRRETENR . You can change the value, if required.	Note: This data is required while enabling the approval workflow process for a retention type enrollment based pricing rule.
Approval Workflow Group for SSL	Used to specify the approval workflow group for a specific stop-loss pricing rule. It helps the system to determine whether the approval transaction should be created while defining, editing, or deleting a specific stop-loss pricing rule.	Yes (Conditional)
	Note: The C1PRCSSL approval workflow group for a specific stop-loss pricing rule is shipped with the product. By default, the value is set to C1PRCSSL . You can change the value, if required.	Note: This data is required while enabling the approval workflow process for a specific stop-loss pricing rule.
Approval Workflow Group-Discount Arrangement	Used to specify the approval workflow group for the discount share and discount guarantee pricing rules. It helps the system to determine whether the approval transaction should be created while defining, editing, or deleting the discount share and discount guarantee pricing rules.	Yes (Conditional)
		Note: This data is required while enabling the approval workflow process for the discount share and discount guarantee pricing rules.

Option Type	Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The C1PRCDA approval workflow group for the discount share and discount guarantee pricing rules is shipped with the product.</p> <p>By default, the value is set to C1PRCDA. You can change the value, if required.</p>	
Base Fee PC Sequence Characteristic	Used to specify the characteristic type where you want to store the sequence number of the eligible base fee's price component. This characteristic is then passed to the rating engine for further processing.	Yes (Conditional)
	<p>Note:</p> <p>This data is required while billing fully-insured group and individual health plans.</p>	
	<p>Note:</p> <p>The C1BSFESE characteristic type is shipped with the product.</p> <p>By default, the value is set to C1BSFESE. You can change the value, if required. However, note that you must specify an adhoc characteristic type where the characteristic entity is set to Rate Component.</p>	
Benefit Billing Arrangement	Used to specify the characteristic type which indicates whom to bill the premium for a Medicare group membership. This characteristic type is defined for a policy plan, policy, and/or parent customer. The system then uses this characteristic type to determine whom to bill the Medicare group membership premium.	Yes (Conditional)
	<p>Note:</p> <p>This data is required while billing the premium for a Medicare group membership.</p>	
Bill Cycle Rule Code	Used to specify the characteristic type which stores the billing preference of the account. This characteristic type is defined for an account. The system then uses this characteristic type to derive the bill cycle and bill period for the account.	Yes (Conditional)
	<p>Note:</p> <p>You must specify a characteristic type where the characteristic entity is set to Account.</p>	<p>Note:</p> <p>This data is required when you want the bill cycle and bill period to be tightly coupled with each other.</p>
Bill Group Policy Person Role	Used to specify the policy person role using which a bill group should be associated with a fully-insured group or self-funded policy when the policy information is given for the bill group in an inbound message.	Yes
	<p>Note:</p> <p>You must specify a policy person role which is already defined in the system.</p>	
Bill Seg Req Reference Id Char Type	Used to indicate the characteristic type where you want to store the request reference ID. During the fully-insured group and individual bill segment	Yes (Conditional)

Option Type	Description	Mandatory (Yes or No)
	generation, this characteristic is stamped on a bill segment calculation line which indicates the repricing request for which the bill segment calculation line is created.	Note: This data is required while billing fully-insured group and individual health plans.
	Note: You must specify a characteristic type where the characteristic entity is set to Bill Segment Calc Line .	
Billable Charge Line Type Parameter	Used to specify the parameter in which you want to store the billable charge line type. This parameter can then be used while defining an ancillary pricing rule type.	Yes (Conditional)
	Note: This data is required while defining an ancillary pricing rule type.	
	Note: You must specify an adhoc parameter where the source entity is set to Transaction and the parameter usage is set to Price Item .	
Billing Arrangement	Used to specify the characteristic type which indicates whom to bill the premium for an active employee coverage group membership. This characteristic type is defined for a parent customer and/or bill group. The system then uses this characteristic type to determine whom to bill the active employee coverage group membership premium.	Yes (Conditional)
		Note: This data is required while billing the premium for an active employee coverage group membership.
Binder Payment Field Mapping	Used to specify a binder payment preference. The system considers the various attributes of the binder payment preference while creating and monitoring binder payments for an individual membership.	Yes (Conditional)
	Note: This data is required while creating and monitoring binder payments for an individual membership.	
	Note: You must specify a binder payment preference which is already defined in the system.	
Claim Template Extendable Business Object Lookup	Used to specify the claim template extendable lookup business object. The system displays the values of the specified extendable lookup in the Claim Template list while defining or editing a claim pricing rule type.	Yes
	Note: The C1-ExtLookClaimTemplate extendable lookup for claim template is shipped with the product. By default, the value is set to C1-ExtLookClaimTemplate . You can change the value, if required.	
Cobra Arrangement Billing	Used to specify the characteristic type which indicates whom to bill the premium for a COBRA group membership. This characteristic type is	Yes (Conditional)

Option Type	Description	Mandatory (Yes or No)
	defined for a policy plan, policy, and/or parent customer. The system then uses this characteristic type to determine whom to bill the COBRA group membership premium.	Note: This data is required while billing the premium for a COBRA group membership.
Customer Registration ID Characteristic for Inbound Log	Used to specify the characteristic type where you want to store the customer registration ID. This characteristic type is used while creating a log entry for a health care inbound message. The log entry then indicates the customer registration object which is created through the health care inbound message.	Yes (Conditional)
	Note: The C1CRLOG characteristic type is shipped with the product. By default, the value is set to C1CRLOG . You can change the value, if required. However, note that you must specify a foreign key characteristic type where the characteristic entity is set to Inbound Message Log .	Note: This data is required while creating a person, account, policy, and/or policy plan through a health care inbound message.
Default Flat Rate Option	Used to specify the rate option which must be used by default when the rate option is not given and the modifier method is set to either FLAT or NULL in the pricing rule data of a health care inbound message.	Yes (Conditional)
	Note: You must specify a rate option where the rate schedule is set to HC_FRTSC .	Note: This data is required while creating an age based and tier based pricing.
Default Percentage Rate Option	Used to specify the rate option which must be used by default when the rate option is not given and the modifier method is set to either EXPT or INPT in the pricing rule data of a health care inbound message.	Yes (Conditional)
	Note: You must specify a rate option where the rate schedule is set to HC_PRTSC .	Note: This data is required while creating an age based and tier based pricing.
Invoice Characteristic Type	Used to specify the characteristic type which indicates the type of account. This characteristic type is defined for the account. The system then uses this characteristic type to determine the account on which the claim, specific stop-loss credits, aggregate stop-loss credits, claim based fee, enrollment based fee, one-time flat fees, recurring flat fees, ancillary, discount, or level funded billable charges should be created in the system. For more information, refer to Bill Group's Account on page 9.	Yes

Option Type	Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The C1INVTYP characteristic type is shipped with the product.</p> <p>By default, the value is set to C1INVTYP. You can change the value, if required. However, note that you must specify a predefined characteristic type where the characteristic entity is set to Account.</p>	
Line Item Extendable Lookup Business Object	<p>Used to specify the line item extendable lookup business object. The system displays the values of the specified extendable lookup in the Line Item list while defining, editing, or copying a claim template.</p> <p>Note:</p> <p>The C1-ExtLookPricingRuleLineItem extendable lookup for line item is shipped with the product.</p> <p>By default, the value is set to C1-ExtLookPricingRuleLineItem. You can change the value, if required.</p>	Yes
Medicare	<p>Used to specify a Medicare preference. The system considers the various attributes of the Medicare preference while creating charges for Medicare Part D Low Income Subsidy (LIS) and Late Enrollment Penalty (LEP).</p> <p>Note: You must specify a Medicare preference which is already defined in the system.</p>	<p>Yes (Conditional)</p> <p>Note: This data is required while creating charges for Medicare Part D LIS and LEP.</p>
Membership Cancel Status	<p>Used to specify the status to which an individual membership should be transitioned when the status of its main subscriber is set to Canceled.</p> <p>Note: You must specify a status which is defined in the lifecycle of the C1-IndMembership business object.</p>	<p>Yes (Conditional)</p> <p>Note: This data is required while canceling an individual membership.</p>
Membership Characteristic for Inbound Log	<p>Used to specify the characteristic type where you want to store the membership ID. This characteristic type is used while creating a log entry for a health care inbound message. The log entry then indicates the group or individual membership which is created through the health care inbound message.</p>	<p>Yes (Conditional)</p> <p>Note: This data is required while creating a group or individual membership through a health care inbound message.</p>

Option Type	Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The C1MBRLOG characteristic type is shipped with the product.</p> <p>By default, the value is set to C1MBRLOG. You can change the value, if required. However, note that you must specify a foreign key characteristic type where the characteristic entity is set to Inbound Message Log.</p>	
Membership ID Characteristic for Billable Charge	Used to specify the characteristic type where you want to store the membership ID. During the fully-insured group and individual billable charge creation process, this characteristic is stamped on a billable charge which indicates the group or individual membership for which the billable charge is created.	Yes (Conditional)
	Note: You must specify a foreign key characteristic type where the characteristic entity is set to Billable Charge .	Note: This data is required while billing a group or individual membership.
Membership Inactive Status	Used to specify the status to which a group membership should be transitioned when its main subscriber is inactivated.	Yes (Conditional)
	Note: You must specify a status which is defined in the lifecycle of the C1-Membership business object.	Note: This data is required while inactivating a group membership.
Membership Person Cancel Status	Used to specify the status to which the member persons of an individual membership should be transitioned when the individual membership is canceled.	Note: This data is required while canceling an individual membership.
	Note: You must specify a status which is defined in the MEMBER_PER_STATUS_FLG lookup field.	
Membership Person Inactive Status	Used to specify the status to which the member persons of a group membership should be transitioned when the group membership is inactivated.	Yes (Conditional)
	Note: You must specify a status which is defined in the MEMBER_PER_STATUS_FLG lookup field.	Note: This data is required while inactivating a group membership.
Off-process Request Detail Maximum Count	Used to indicate the maximum number of amendment details you can specify in an off-process request.	Yes (Conditional)
		Note: This data is required while creating an off-process request.

Option Type	Description	Mandatory (Yes or No)
Override Proration Applicability Characteristic Type	Used to specify the characteristic type which indicates whether the proration rule should be overridden for a member person. At present, the override proration feature is used for a new born when the gift days are offered to a new born. This characteristic type can be defined for the group membership, policy plan, policy, and state.	Yes (Conditional)
	Note: This data is required when you want to override the proration rule.	
	Note: You must specify a characteristic type where the characteristic entity is set to Membership, Policy Plan, Policy, and State . Here, the predefined values for the characteristic type can be Y and N .	
Override Proration Effective Date Characteristic Type	Used to specify the characteristic type where you want to store the date from when the premium should be calculated for the new born. This characteristic is used during the bill segment generation to determine the bill period in which the date falls. The system then accordingly prorates the premium amount for the new born.	Yes (Conditional)
	Note: This data is required when you want to override the proration rule.	
	Note: You must specify a characteristic type where the characteristic entity is set to Membership Person .	
Override Proration Rule Characteristic Type	Used to specify the characteristic type where you want to store the override SQ rule for a new born. This characteristic type can be defined for the group membership, policy plan, policy, and state. If this characteristic is not defined at any level, the system uses the SQ rule of the rate schedule attached to the active contract to prorate the premium amount of a new born child.	Yes (Conditional)
	Note: This data is required when you want to override the proration rule.	
	Note: You must specify a characteristic type where the characteristic entity is set to Membership, Policy Plan, Policy, and State .	
Parent Customer Policy Person Role	Used to specify the policy person role using which the parent customer should be associated with a fully-insured group or self-funded policy when the policy information is given for the bill group or parent customer in an inbound message.	Yes
	Note: You must specify a policy person role which is already defined in the system.	
Person ID Characteristic for Inbound Log	Used to specify the characteristic type where you want to store the person ID. This characteristic type is used while creating a log entry for a health care inbound message. The log entry then indicates the person whose record is created through the health care inbound message.	Yes (Conditional)
	Note: This data is required while creating a person through a health care inbound message.	

Option Type	Description	Mandatory (Yes or No)
	<p>Note:</p> <p>The C1PERLOG characteristic type is shipped with the product.</p> <p>By default, the value is set to C1PERLOG. You can change the value, if required. However, note that you must specify a foreign key characteristic type where the characteristic entity is set to Inbound Message Log.</p>	
Person Identifier Type Char Type	Used to specify the characteristic type which stores the person identifier type. It is used to determine the person to whom you want to bill the group or individual membership.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Membership .	Note: This data is required while billing a group or individual membership.
Person Identifier Value Char Type	Used to specify the characteristic type which stores the person identifier. It is used to determine the person to whom you want to bill the group or individual membership.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Membership .	Note: This data is required while billing a group or individual membership.
Person Relationship Type	Used to indicate how a bill group should be related to a parent customer. The system uses the person relationship type while:	Yes
	<ul style="list-style-type: none"> Creating a bill group for a parent customer through an inbound message Viewing the 360° information of a parent customer 	
	Note: You must specify a person relationship type which is already defined in the system.	
Plan Based Contract Characteristic Type	Used to specify the characteristic type which helps to determine whether the system should create plan-specific contracts for a price item. This characteristic must be defined on the person for whom you want to create plan-specific contracts on the accounts.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Person .	Note: This data is required when you want to enable the plan-specific contract creation feature for specific persons in the fully-insured group health plan business.
Plan Based Contract Characteristic Value	Used to specify the characteristic value which indicates that the system should create plan-specific contracts for a price item on the accounts.	Yes (Conditional)

Option Type	Description	Mandatory (Yes or No)
		Note: This data is required when you want to enable the plan-specific contract creation feature for specific persons in the fully-insured group health plan business.
Plan Based Contract Creation Eligibility	Used to indicate whether the system should create plan-specific contract for a price item on the account. The valid value is Yes .	Yes (Conditional) Note: This data is required when you want to enable the plan-specific contract creation feature for the fully-insured group health plan business.
Plan Id Characteristic Type	Used to specify the characteristic type where you want to store the plan for which the contract is created. During the fully-insured group policy plan contract creation, this characteristic is defined on the contract. Note: You must specify a characteristic type where the characteristic entity is set to Contract .	Yes (Conditional) Note: This data is required when you want to enable the plan-specific contract creation feature for the fully-insured group health plan business.
Policy Reinstatement Status	Used to specify the status to which the policy must be transitioned when it is reinstated. Note: You must specify a status which is defined in the lifecycle of the C1-POLICY business object.	Yes (Conditional) Note: This data is required while reinstating a fully-insured group policy.
Policy Renewal Status	Used to specify the status to which the policy must be transitioned when it is renewed. Note: You must specify a status which is defined in the lifecycle of the C1-POLICY business object.	Yes (Conditional) Note: This data is required while renewing a fully-insured group policy.
Policy Termination Status	Used to specify the status to which the policy must be transitioned when it is terminated. Note: You must specify a status which is defined in the lifecycle of the C1-POLICY business object.	Yes (Conditional) Note: This data is required while terminating a fully-insured group policy.
Pricing Arrangement Parameter	Used to specify the parameter in which you want to store the pricing arrangement. This parameter can then be used while defining an ancillary pricing rule type. Note: You must specify an adhoc parameter where the source entity is set to Transaction and the parameter usage is set to Price Item .	Yes (Conditional) Note: This data is required while defining an ancillary pricing rule type.

Option Type	Description	Mandatory (Yes or No)
Pricing Group Rule Parameter	Used to specify the parameter in which you want to store the pricing group rule. The system stamps this parameter on the price assignment which is created through a pricing rule using a pricing group. It indicates that the price assignment is created using the respective rule in the pricing group.	Yes (Conditional)
	Note: You must specify an adhoc parameter where the source entity is set to Transaction and the parameter usage is set to Price Item .	Note: This data is required while defining a claim, specific stop-loss, aggregate stop-loss, retention type claim based, or retention type enrollment based pricing rule for a bill group using a pricing group.
Pricing Rule ID Characteristic for Inbound Log	Used to specify the characteristic type where you want to store the pricing rule ID. This characteristic type is used while creating a log entry for a health care inbound message. The log entry then indicates the pricing rule which is created through the health care inbound message.	Yes (Conditional)
	Note: The C1PRLOG characteristic type is shipped with the product. By default, the value is set to C1PRLOG . You can change the value, if required. However, note that you must specify a foreign key characteristic type where the characteristic entity is set to Inbound Message Log .	Note: This data is required while creating a pricing rule through a health care inbound message.
Pricing Rule Type Category Characteristic	Used to specify the characteristic type which indicates the pricing rule type category. This characteristic type is defined for a billable charge line type. The system uses this characteristic to lists the billable charge line types which are valid while defining a pricing rule type or pricing rule of a particular category.	Yes
	Note: The C1PRTCAT characteristic type is shipped with the product. By default, the value is set to C1PRTCAT . You can change the value, if required. However, note that you must specify a foreign key characteristic type where the characteristic entity is set to Billable Charge Line Type .	
Proration Distributed SQI	Used to specify the SQI where you want to store the distributed premium amount for the non-skip billing period. The system uses this SQI while creating the SQI based billable charge for the group membership premium.	es (Conditional)
		Note: This data is required when the 9/10 Billing (Skip Months) feature is enabled for an account.

Option Type	Description	Mandatory (Yes or No)
	Note: You must specify an SQI which is already defined in the system.	
Proration SQI	Used to specify the SQI where you want to store the pre-calculated or calculated premium amount. The system uses this SQI while creating the SQI based billable charge for the group or individual membership premium.	Yes (Conditional)
	Note: This data is required while billing fully-insured group and individual health plans.	
	Note: You must specify an SQI which is already defined in the system.	
Rate Component Base Fee Characteristic	Used to specify the characteristic type which indicates whether the rate component is a base fee rate component. This characteristic type is defined for the rate component.	Yes
	Note: The C1RCBFMA characteristic type is shipped with the product. By default, the value is set to C1RCBFMA .	
Rate Option Extendable Lookup Business Object	Used to specify the rate option extendable lookup business object. The system displays the values of the specified extendable lookup in the Rate Option list while defining, editing, or copying a pricing rule type.	Yes
	Note: The C1-ExtLookRetTypeRateOpt extendable lookup for rate option is shipped with the product. By default, the value is set to C1-ExtLookRetTypeRateOpt . You can change the value, if required.	
Rating Area Field Mapping for Group	Used to specify a geographic rating area preference. The system considers the various attributes of the geographic rating area preference while deriving the geographic rating area for a group membership.	Yes (Conditional)
	Note: This data is required while deriving the geographic rating area for a group membership.	
	Note: You must specify a geographic rating area preference which is already defined in the system.	
Rating Area Field Mapping for Individual	Used to specify a geographic rating area preference. The system considers the various attributes of the geographic rating area preference while deriving the geographic rating area for an individual membership.	Yes (Conditional)
	Note: This data is required while deriving the geographic rating area for an individual membership.	

Option Type	Description	Mandatory (Yes or No)
	Note: You must specify a geographic rating area preference which is already defined in the system.	
Reinsurer Person Relationship Type	Used to indicate the relationship type using which the reinsurer person should be associated with the parent customer.	Yes (Conditional)
	Note: You must specify a reinsurer person relationship type which is already defined in the system.	Note: This data is required while associating the reinsurer person with the parent customer.
Relation Structure Code Field Mapping	Used to specify a member relationship and subscription tier preference. The system considers the various attributes of the member relationship and subscription tier preference while deriving the member relationship for a member person and the subscription tier for a group or individual membership.	Yes (Conditional)
	Note: You must specify a member relationship and subscription tier preference which is already defined in the system.	Note: This data is required while deriving the member relationship for a member person and the subscription tier for a group or individual membership.
Sponsored Switch Characteristic for Billable Charge	Used to specify the characteristic type which indicates whether the billable charge is a reverse charge for a membership benefit. This characteristic type is defined while creating the reverse charge for a membership benefit.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Billable Charge .	Note: This data is required while creating the reverse charge for a benefit.
State of Issue Characteristic Type	Used to specify the characteristic type where you store the state for which the group or individual membership, policy plan, or policy is issued. This characteristic type can be defined for the group or individual membership, policy plan, or policy. This characteristic is used while identifying a list of eligible children in a group or individual membership for premium calculation.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Membership, Policy Plan, and Policy .	Note: This data is required while identifying a list of eligible children for premium calculation.
Statement Construct Char for Inbound Log	Used to specify the characteristic type where you want to store the statement construct ID. This characteristic type is used while creating a log entry for a health care inbound message. The log entry then indicates the statement construct which is created through the health care inbound message.	Yes (Conditional)
		Note: This data is required while creating a log entry for a health care inbound message.

Option Type	Description	Mandatory (Yes or No)
	Note: You must specify a characteristic type where the characteristic entity is set to Statement Construct for Inbound Log .	
Status Reason Mapping	Used to specify a membership status reason preference. The system considers the various attributes of the membership status reason preference while deriving the individual membership or member person status reason.	Yes (Conditional)
	Note: This data is required while maintaining an individual membership.	
	Note: You must specify a membership status reason preference which is already defined in the system.	
To Do Role Characteristic Type	Used to specify the characteristic type where you want to store the To Do role. This characteristic type is defined for the parent customer. The system uses this characteristic to determine the users to whom the To Dos created using the C1-REPC1 , C1-REPC2 , and C1-FIBCR To Do types should be assigned.	Yes (Conditional)
	Note: A To Do is created using the C1-REPC1 To Do type when an error occurs while creating a repricing request. A To Do is created using the C1-REPC2 To Do type when an error occurs while calculating group or individual membership premium. A To Do is created using the C1-FIBCR To Do type when an error occurs while creating a billable charge for a group and individual membership. You must specify an adhoc characteristic type where the characteristic entity is set to Person .	Note: This data is required while billing fully-insured group and individual health plans.
TPA Account Relationship Type	Used to indicate how a third party administrator (TPA) person should be related to its account. The system uses this account relationship type while creating a TPA account for a TPA person through a health care inbound message.	Yes (Conditional)
	Note: This data is required while creating a TPA account through a health care inbound message.	
	Note: You must specify an account relationship type which is already defined in the system.	
TPA Person Relationship Type	Used to indicate how a third party administrator (TPA) person should be related to its parent customer. The system uses this person relationship type while creating a TPA person for a parent customer through a health care inbound message.	Yes (Conditional)
		Note: This data is required while creating a TPA person through a health care inbound message.

Option Type	Description	Mandatory (Yes or No)
	Note: You must specify a person relationship type which is already defined in the system.	
TPA Policy Person Role	Used to specify the policy person role using which a third party administrator (TPA) person should be associated with a fully-insured group policy when the policy information is given for the TPA person in a health care inbound message.	Yes (Conditional)
	Note: You must specify a policy person role which is already defined in the system.	Note: This data is required while associating a TPA person with a fully-insured group policy through a health care inbound message.
Bill Cycle Rule Code	Used to specify the characteristic type. The system considers this characteristic type to determine the billing preference for an account. If the billing preference characteristic is defined for the account, the system derives the bill cycle, bill period, and skip months for the account from the billing preference.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Account . This option type is only applicable for the fully insured group and individual lines of business. This option type is referred while deriving the bill cycle, bill period, and skip months for an account. For more information, see Tightly Coupled Bill Cycle and Bill Period through Billing Preference on page 3342 and 9/10 Billing (Skip Months) on page 3345.	Note: This data is required when: <ul style="list-style-type: none">You want the bill cycle and bill period to be tightly coupled with each other.You want to skip billing for an account for one or more months of the coverage period.

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1_AXENTITY Feature Configuration

The **C1_AXENTITY** feature configuration enables you to configure various settings related to the **Approval Workflow** feature.

Prerequisites

To set the **C1_AXENTITY** feature configuration, you should have:

- An algorithm defined using the **C1-APPTXN** algorithm type in the application
- To Do types defined in the application
- Fields defined in the application
- XSL files that you want to use for the Input and Display UI maps

Procedure

To set the **C1_AXENTITY** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1_AXENTITY** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Approval Transaction Compare New or Missing Entry Color	Used to indicate the color in which you want to highlight the new record or new additions made to the existing record. This helps in comparing the existing and new data while reviewing an approval transaction.	Yes
	Note: You must specify a hexadecimal value for this option type.	
Approval Transaction Compare Value Changed Color	Used to indicate the color in which you want to highlight the modifications made to the existing data. This helps in comparing the existing and new data while reviewing an approval transaction.	Yes
	Note: You must specify a hexadecimal value for this option type.	
Approval Transaction Entity Access Algorithms	Used to specify the algorithm which controls access to the maintenance objects based on the access group and division.	Yes

Option Type	Description	Mandatory (Yes or No)
	<p>Note: By default, the value is set to C1-APPTXN. If you create new maintenance objects and want to control the access of these new maintenance objects based on the access group and division, you have to create a custom algorithm and then attach it to this option type. In such case, you will have to define this option type twice - one with the default algorithm (that is, C1-APPTXN) and another with the custom algorithm.</p>	
Approval Transaction Field Masking	<p>Used to specify the business object for masking the approval transaction field in the approval workflow group schema.</p> <p>Note: If you do not specify the business object, masking is disabled for the respective field.</p>	Yes
Approval Transaction Resolve To Do Type	<p>Used to indicate that To Do entry of the specified To Do type must be created when an approver at any level in the hierarchy rejects an approval transaction.</p> <p>Note: You must specify a To Do type which is already defined in the system.</p>	Yes
Approval Transaction screen timeout	Used to indicate the time (in minutes) in which the screen timeout message should appear in the Comparison: New versus Existing screen when the system takes longer time to display an approval transaction.	Yes
Disable Approval Transaction Fields in Input UI Maps	<p>Used to indicate the fields that you want to disable whenever the input UI maps are regenerated.</p> <p>Note: You must specify a field which is already defined in the application.</p>	Yes
Display Existing Panel on Left Side (Y/N)	<p>Used to indicate whether you want to view the existing or new data in the left panel while reviewing an approval transaction. The valid values are:</p> <ul style="list-style-type: none"> • Y - Used when you want the existing data to appear in the left panel of the Comparison: New versus Existing screen. • N - Used when you want the new data to appear in the left panel of the Comparison: New versus Existing screen. <p>Note: If you do not specify the value for this option type, by default, it is set to N.</p>	No
Display Information String	<p>Used to indicate whether the approval transaction information string should appear in the Comparison: New versus Existing screen when you are reviewing an approval transaction of a construct. The valid values are:</p> <ul style="list-style-type: none"> • true • false 	Yes
Display UI XSL	Used to indicate the XSL file that you want to use while regenerating the Display UI maps.	Yes

Option Type	Description	Mandatory (Yes or No)
Display only Differences of fields on UI	Used to indicate whether you want to view only those fields of a record where the data is added or updated or all fields of a record while reviewing an approval transaction. The valid values are: <ul style="list-style-type: none"> Yes - Used when you want to view only those fields of a record where the data is added or updated in the Comparison: New versus Existing screen. No - Used when you want to view all fields of a record in the Comparison: New versus Existing screen. 	Yes
Input UI XSL	Used to indicate the XSL file that you want to use while regenerating the Input UI maps.	Yes

- Enter the values for the required option types in the **Feature Configuration** screen.
- Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1-BILLADJSQ Feature Configuration

Prerequisites

To set the **C1-BILLADJSQ** feature configuration, you should have:

- Service quantity identifiers (SQIs) defined in the application

Procedure

To set the **C1-BILLADJSQ** feature configuration:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- In the **Feature Configuration Search** zone, enter **C1-BILLADJSQ** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Billable Charge SQI	Used to specify the service quantity identifier (SQI) which you want to use while creating a billable charge for the state assessment fee.	Yes (Conditional)

Option Type	Description	Mandatory (Yes or No)
	Note: You must specify an SQI which is already defined in the system.	Note: This data is required when you want to create billable charges for the state assessment fee.
Coverage End Date SQI	Used to specify the service quantity identifier (SQI) which you want use to derive the coverage end date from the account's last billed charge. The system uses the derived coverage end date in calculating the future retro adds (debits) for the respective account.	Yes
	Note: You must specify an SQI which is already defined in the system.	
Premium Amount SQI	Used to specify the service quantity identifier (SQI) based on which you want to calculate the catch up premium for each eligible billable charge. The value derived is finally used to calculate the future retro adds (debits) for the respective account.	Yes
	Note: You must specify an SQI which is already defined in the system. The future retro adds (debits) appears in the Billing and Adjustment Summary zone of the Account tab on the Customer 360° Information screen.	

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1_CMO Feature Configuration

The **C1_CMO** feature configuration enables the system to determine the following:

- Administrative contracts and excess credit transactions which should be listed in the **Customer 360° Information** screen
- Payments against the suspense, on account, and excess credit contracts which are eligible for partial payment transfer from the payment list

Prerequisites

To set the **C1_CMO** feature configuration, you should have:

- Required contract types defined in the application

Procedure

To set the **C1_CMO** feature configuration:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- 3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- 4. In the **Feature Configuration Search** zone, enter **C1_CMO** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- 6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Administrative Contract Type	Used to specify the contract type. The contracts of the specified contract type are then listed in the Administrative Contracts zone of the Account tab on the Customer 360° Information screen.	No
	Note: If you want to specify multiple contract types, you need to set the Administrative Contract Type option type multiple times with a unique sequence number. If you do not specify the value for this option type, the data does not appear in the Administrative Contracts zone.	
On Account Contract Type	Used to specify the contract type. The excess credit transactions on the contracts of the specified contract type are then listed in the Billed Vs Paid zone of the Account tab on the Customer 360° Information screen. It also helps the system to determine the payments against the on account contracts (created using the specified contract type) which are eligible for partial payment transfer from the payment list.	No
	Note: If you want to specify multiple contract types, you need to set the On Account Contract Type option type multiple times with a unique sequence number. If you do not specify the value for this option type, the data does not appear in the Billed Vs Paid zone.	

Option Type	Description	Mandatory (Yes or No)
Excess Credit Contract Type	Used to specify the contract type. It helps the system to determine the payments against the excess credit contracts (created using the specified contract type) which are eligible for partial payment transfer from the payment list. Ideally, these excess credit contracts of the accounts should be used to park overpayments on the bills.	No
	Note: If you want to specify multiple contract types, you need to set the Excess Credit Contract Type option type multiple times with a unique sequence number.	
Suspense Contract Type	Used to specify the contract type. It helps the system to determine the payments against the suspense contracts (created using the specified contract type) which are eligible for partial payment transfer from the payment list.	No
	Note: If you want to specify multiple contract types, you need to set the Suspense Contract Type option type multiple times with a unique sequence number.	
Excluded Contract types for netting	Used when you want to exclude unmatched financial transactions of a particular contract type while creating transfer adjustments for a refund/write off request at the account level.	Yes (Conditional)
	Note: You can exclude multiple contract types by defining the Excluded Contract types for netting option type multiple times (with unique sequence number) in the feature configuration.	Note: This data is required when the adjustment level in the refund/write off request is set to Account or Bill .

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1_DIVFUNCT Feature Configuration

Procedure

To set the **C1_DIVFUNCT** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.

The **Feature Configuration Query** screen appears.

4. In the **Feature Configuration Search** zone, enter **C1_DIVFUNCT** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Enforce division-specific validations	Used to indicate whether the division-specific validations must be triggered on the Person, Account and Contract screens. The valid values are: <ul style="list-style-type: none">YN	Yes

7. Enter the values for the required option types in the **Feature Configuration** screen.
8. Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the **DELINPROC** Feature Configuration

Procedure

To set the **DELINPROC** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **DELINPROC** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Delinquency Process Field Mapping	Used to specify a delinquency process preference which is created using the Delinquency Process preference category through the Field Mapping screen. The system then avails the attributes from the preference at various stages in the lifecycle of a delinquency process.	Yes (Conditional)
	Note: This data is required while defining a delinquency process preference.	
	Note: This option type is applicable for both the fully insured group and the fully insured individual businesses. For more information about the preference, refer to the Delinquency Process Type Preference on page 4077 section.	
Policy Characteristic Type for Customer Contact	Used to indicate the characteristic type using which you want to store the policy ID on the customer contact. Here, you must specify a characteristic type where the characteristic entity is set to Customer Contact .	Yes (Conditional)
	Note: This data is required while defining a delinquency process preference.	
	Note: This option type is referred in the C1-NOTADREC and C1-NOTADCAN algorithms attached to a customer class. It is required when the group customer wants to allocate advance deposit to settle its overdue bills through a delinquency process. It is only applicable for the fully insured group business.	
Routing Method - Contact Method Mapping	Used to specify a routing method - contact method mapping preference which is created using the C1_BillRouteCntMethMap business object through the Field Mapping screen. The system then derives the preferred contact method for the bill routing method from the routing method - contact method mapping preference while creating a customer contact for a person or an account during the delinquency management.	Yes (Conditional)
	Note: This data is required while defining a delinquency process preference.	
	Note: This option type is applicable for both the fully insured group and the fully insured individual businesses. For more information about the preference, refer to the Routing Method – Contact Method Mapping Preference on page 4096 section.	

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1-EHRCONFIG Feature Configuration

The **C1-EHRCONFIG** feature configuration enables the system to determine the maximum number of levels that can be included in an entity hierarchy relationship. Accordingly, the system enables you to create hierarchy entities for upto one level less than the level specified in the **Maximum Hierarchy Level** option type of the **C1-EHRCONFIG** feature configuration. For example, if you set the **Maximum Hierarchy Level** option type to 5, the system allows you to create hierarchy entities for upto four levels (i.e. Level 1, Level 2, Level 3, and Level 4). The last level (i.e. Level 5) is reserved for a price item that you want to include in an entity hierarchy relationship. Therefore, you need to accordingly set the value as per the business requirements.

Procedure

To set the **C1-EHRCONFIG** feature configuration:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- 3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- 4. In the **Feature Configuration Search** zone, enter **C1-EHRCONFIG** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- 6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option type:

Option Type	Description	Mandatory (Yes or No)
Maximum Hierarchy Level	Used to indicate the maximum number of levels that you want to include in an entity hierarchy relationship.	Yes
	Note: At present, the system supports maximum 10 levels in an entity hierarchy relationship. Therefore, you can define hierarchy entities for upto 9 levels. The last level (i.e. Level 10) is reserved for a price item that you want to include in an entity hierarchy relationship. By default, the value is set to 10. If you do not require 10 levels in an entity hierarchy relationship, you can set a lower maximum limit in this option type.	

- 7. Enter the value for the required option type in the **Feature Configuration** screen.
- 8. Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1_EXCHRATE Feature Configuration

Procedure

To set the **C1_EXCHRATE** feature configuration:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- 3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- 4. In the **Feature Configuration Search** zone, enter **C1_EXCHRATE** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- 6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
End Date Required for Division Override	Used to indicate whether the end date is mandatory for a division-specific exchange rate. The valid values are: <ul style="list-style-type: none">• Y• N By default, the value of this option type is set to N .	Yes

- 7. Enter the values for the required option types in the **Feature Configuration** screen.
- 8. Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1_EXP_OVRD Feature Configuration

Procedure

To set the **C1_EXP_OVRD** feature configuration:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- 3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- 4. In the **Feature Configuration Search** zone, enter **C1_EXP_OVRD** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.

- In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Expire Override Switch	Used to indicate whether you want to automatically expire an agreed pricing when the agreed pricing of a person or an account without end date is overridden. The valid values are: <ul style="list-style-type: none"> Y N 	Yes

- Enter the values for the required option types in the **Feature Configuration** screen.
- Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1_FINTRANOP Feature Configuration

The **C1_FINTRANOP** feature configuration enables the system to determine various options which should be considered while creating billable charges, determining a price item pricing, generating bill segments, and while creating an actual bill using a trial bill.

Prerequisites

To set the **C1_FINTRANOP** feature configuration, you should have:

- Values defined for the **BIRC_OPT_TYP_FLG** lookup field

Procedure

To set the **C1_FINTRANOP** feature configuration:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- In the **Feature Configuration Search** zone, enter **C1_FINTRANOP** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Account Financial History Details Switch	<p>Used to indicate whether detailed or summarized information should be displayed for an account in the Account Financial History screen. The valid values are:</p> <ul style="list-style-type: none"> • Y - Used when you want to list all financial transactions of a bill, payment, or adjustment for an account in the Account Financial History screen. • N - Used when you want to summarize all financial transactions of a particular type on an entity (i.e. bill, payment, or adjustment) and display the total amount in the Account Financial History screen. <p>Note: If you do not specify the value for this option type, by default, it is set to Y.</p>	No
Allow Advance Billing of Future Dated Charges	<p>Used to indicate whether you want to use advance billing for future dated billable charges. The valid values are:</p> <ul style="list-style-type: none"> • Y • N <p>Note:</p> <p>If the Allow Advance Billing of Future Dated Charges option type is set to Y, the system considers those billable charges where the bill after date is on or before the cut-off date, irrespective whether the date of those billable charges is past or future dated.</p> <p>The Allow Advance Billing of Future Dated Charges option type should be defined only in case of non-recurring billable charges.</p> <p>By default, the value for this option type is set to N.</p>	No
Allow Caching Of Rule Based Autopay List	<p>Used to indicate whether you want to cache the rule based auto pay instructions of an account when the C1-APRULEEVL algorithm is invoked. The valid values are:</p> <ul style="list-style-type: none"> • Y • N <p>Note: If you do not specify the value for this option type, by default, it is set to N.</p>	No
Allow non-significant zero amount FT GL entry	<p>Used to indicate whether you want to allow non-significant zero amount FT GL entries in the system. The valid values are:</p> <ul style="list-style-type: none"> • Y • N <p>Note: The FT GL amount is considered significant only when the statistical and total amount are non-zero.</p>	<p>Yes (Conditional)</p> <p>Note: This data is required when you want to allow non-significant zero amount FT GL entries in the system.</p>

Option Type	Description	Mandatory (Yes or No)
Avoid internal match event creation for zero dollar Bill	Used to indicate whether you want to consider a zero balance bill for offsetting against another bills in an offset request. The valid values are: <ul style="list-style-type: none"> • Y • N 	Yes (Conditional)
	Note: If you set this option type to Y , the system does not match the credit and debit line items internally of a zero balance bill on the bill completion. If you set this option type to N , the system matches the credit and debit line items internally of a zero balance bill on the bill completion.	Note: This data is required when you want to consider a zero balance bill for offsetting against another bills in an offset request.
Avoid Pricing Crawling if Rate Schedule present at Contract	Used to indicate that the system should not determine the price item pricing using the price assignment search algorithm (which is attached on the account's division) when the effective rate schedule is present on the contract. The valid values are: <ul style="list-style-type: none"> • Y • N 	No
	Note: If you do not specify the value for this option type, by default, it is set to N .	
Bill Segment Regeneration on Freeze	Used to indicate whether you want to regenerate the bill segments before freezing them. The valid values are: <ul style="list-style-type: none"> • Y • N 	No
	Note: If you do not specify the value for this option type, by default, it is set to N . If the Freeze and Complete option is selected for the respective window period in the bill cycle and the Bill Segment Regeneration on Freeze option type is set to Y , then the bill segments are regenerated and the status of the bill segments is set to Frozen . However, if the Freeze and Complete option is not selected for the respective window period in the bill cycle, then the bill segments are always regenerated irrespective of whether the Bill Segment Regeneration on Freeze option type is set to Y or N .	
Billable Charges Date - Non Recurring	Used to indicate whether you want to consider the non-recurring billable charges whose start or end date is earlier than or equal to the cut-off date. The valid values are: <ul style="list-style-type: none"> • S - Used when you want to consider the non-recurring billable charges whose start date is earlier than or equal to the cut-off date. 	No

Option Type	Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> E - Used when you want to consider the non-recurring billable charges whose end date is earlier than or equal to the cut-off date. 	
	<p>Note:</p> <p>If you do not specify the value for this option type, by default, it is set to S.</p> <p>The system always considers the recurring billable charges whose start date is earlier than the cut-off date and end date is later than the cut-off date irrespective of whether the Billable Charges Date option type is set to S or E.</p>	
Billable Charges Date - Recurring	<p>Used to indicate whether you want to consider the recurring billable charges whose start or end date is earlier than or equal to the cut-off date. The valid values are:</p> <ul style="list-style-type: none"> S - Used when you want to consider the recurring billable charges whose start date is earlier than or equal to the cut-off date. E - Used when you want to consider the recurring billable charges whose end date is earlier than or equal to the cut-off date. 	No
	<p>Note: If you do not specify the value for this option type, by default, it is set to S.</p>	
Catch Up Flag For Recurring Charges	<p>Used to indicate whether you want to consider the recurring billable charges for catch up. The valid values are:</p> <ul style="list-style-type: none"> Y - Used when you want to consider the recurring billable charges for catch up during the bill generation process, where the billable charge end date is earlier than the billable charge cut-off date. N - Used when you do not want to consider the recurring billable charges for catch up during the bill generation process, where the billable charge end date is earlier than the billable charge cut-off date. 	Yes (Conditional)
		<p>Note: This data is required when you want to catch up with the recurring billable charges before the bill generation process.</p>
Defer Bill Segment Freeze	<p>Used to indicate whether you want to defer the freezing process of bill segments until the bill routing and due date calculation is completed. The valid values are:</p> <ul style="list-style-type: none"> Y - Used when you want the system to freeze the bill segment after the bill routing and bill due date calculation is completed. N - Used when you do not want the system to freeze the bill segment after the bill routing and bill due date calculation is completed. 	Yes (Conditional)
	<p>Note: This flag is only considered for freezing the bill once the bill's status is set to Complete.</p>	<p>Note: This data is required when you want to defer the freezing process of bill segments until the bill routing and due date calculation is completed.</p>

Option Type	Description	Mandatory (Yes or No)
Hide Debt Class Details On Account Main Page	Used to indicate whether you want to hide the debt class details in the Main tab of the Account screen. The valid values are:	Yes (Conditional)
	<ul style="list-style-type: none"> Y - Used when you want the system to hide the debt class details in the Main tab of the Account screen. N - Used when you want the system to populate the debt class details in the Main tab of the Account screen. 	Note: This data is required when you want to hide the debt class details in the Main tab of the Account screen.
Rate Component Step Optimization	Used to indicate whether you want to determine the rate for all tiering ranges of a step tiered rate component or for only those tiering ranges of a step tiered rate component till when the quantity is exhausted. The valid values are:	No
	<ul style="list-style-type: none"> Y - Used when you want to determine the rate for only those tiering ranges of a step tiered rate component till when the quantity is exhausted. It helps to improve the performance of the billing batches. If you set this option type to Y, always ensure that you define the price components with the tiering ranges in the ascending order. N - Used when you want to determine the rate for all tiering ranges of a step tiered rate component. 	
	Note: If you do not specify the value for this option type, by default, it is set to N.	
Refund/Write-Off Flush Counter	Used to specify the value for flush counter when the refund or write-off details are defined.	Yes (Conditional)
	Note: You must specify a numeric value greater than zero. If the total number of refund or write-off records are equal to the flush counter, the system then performs a flush and clear at session level.	Note: This data is required when you are defining the refund or write-off details in the system.
Skip Priceitem Contract Type Validation	Used to indicate whether you want to skip the price item's and billable charge's contract's contract type validation. The valid values are:	No
	<ul style="list-style-type: none"> Y - Used when you want to create a billable charge for a price item on the contract which is created using a contract type to which the price item is not associated. N - Used when you want to create a billable charge for a price item on the contract which is created using a contract type to which the price item is associated. 	
	Note: If you do not specify the value for this option type, by default, it is set to N.	
Trial Bill Characteristics Conversion	Used to indicate whether you want to copy the trial bill's characteristics when an actual bill is created using a trial bill. The valid values are:	No

Option Type	Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> Y N 	
	Note: If you do not specify the value for this option type, by default, it is set to N.	

- Enter the values for the required option types in the **Feature Configuration** screen.
- Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1_FM Feature Configuration

Procedure

To set the **C1_FM** feature configuration:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- In the **Feature Configuration Search** zone, enter **C1_FM** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
First Batch in Transaction Aggregation Cycle	Used to specify the first mandatory batch that you want to be executed in the transaction aggregation cycle.	Yes
	Note: At present, the system does not support any value other than C1-TXNIP for this option type.	
Last Batch in Transaction Aggregation Cycle	Used to specify the last mandatory batch that you want to be executed in the transaction aggregation cycle.	Yes
	Note: At present, the system does not support any value other than C1-TXNCU for this option type.	
Disaggregation - Price Assignment	Used to indicate whether the disaggregation request should be automatically created for a person or account when a price item	No

Option Type	Description	Mandatory (Yes or No)
	<p>is assigned to the person or account or the existing price item pricing assigned to the person or account is modified. The valid values are:</p> <ul style="list-style-type: none"> • true • false <p>Note: You can use this feature when an algorithm which is created using the TXNDISAGGPRA algorithm type is attached to the Post-Processing system event of the C1_PRASGN_BO business object.</p>	
Allow Duplicate Summary ID	<p>Used to indicate whether the transaction legs can have duplicate summary ID while creating an aggregated billable charge using the Service Quantity Calculation (C1-TXNSQ) batch. The valid values are:</p> <ul style="list-style-type: none"> • true • false <p>Note:</p> <p>If you set this option type to false, the system does not create the aggregated billable charge when one or more transaction legs have the same summary ID.</p> <p>If you do not specify the value for this option type, by default, the value is set to false.</p>	No
Parallel Query Degree	<p>Used to specify the degree of parallelism that you want to use while creating chunks (i.e. work units) in various Transaction Feed Management (TFM) batches. The valid values are:</p> <ul style="list-style-type: none"> • 1 • 2 • 3 • 4 • 5 • 6 • 7 	No

Option Type	Description	Mandatory (Yes or No)
	<p>Note:</p> <p>With the parallel query feature, multiple threads on the database can work together simultaneously to process a single SQL statement which is used to create chunks. This helps to improve the batch performance.</p> <p>The system calculates the number of threads on the database that can be used to execute the SQL statement by setting 2 to the power of the specified parallel query degree. For example, if you set the parallel query degree to 4, the system uses 16 (i.e. 2^4) threads on the database to create work units.</p> <p>You must set the parallel query degree depending on the infrastructure available on the site. If you do not specify the value for this option type, by default, the parallel query degree is set to 2.</p>	
Price Item Determination Batch Description	Used to specify the description for the batch which is used for validating the transaction and deriving the price item in the transaction aggregation cycle. For example, Validate Transaction and Derive Price Item . This description appears in the error message when the transaction aggregation batches are not executed in the specified sequence.	Yes
Remove Duplicates from Accumulated Rule Output	<p>Used to indicate whether duplicate transaction legs must be created during the transaction aggregation cycle through the rule output accumulation process. The valid values are:</p> <ul style="list-style-type: none"> true false <p>Note: If you do not specify the value for this option type, by default, the value is set to false.</p>	No
Rule Output Accumulation	<p>Used to indicate whether the system should accumulate the output parameters of all rules where the criteria returns Rule Is True irrespective of whether the rule true action is set to Next Dependent, Next Rule by Priority, or Success and then create transaction legs using the accumulated output parameters. The valid values are:</p> <ul style="list-style-type: none"> true false <p>Note: If you do not specify the value for this option type, by default, the value is set to false.</p>	No
Show Default Values in Price Item Pricing	<p>Used to indicate whether the default values must appear in the Ignore Transaction, Aggregate Transaction, and Aggregation Schedule fields while defining the price item pricing. The valid values are:</p> <ul style="list-style-type: none"> Y N 	Yes

Option Type	Description	Mandatory (Yes or No)
Use Materialized Views	Used to indicate whether the price item pricing information must be cached in the CI_PRC_AGRD , CI_PRC_PL , and CI_PRC_INH_PL tables. The valid values are: <ul style="list-style-type: none"> true false 	Yes
Maximum Price Item Parameters Cache Size	Used to indicate the maximum number of price items whose parameter information can be cached in the memory.	Yes
Maximum Price Item Parameter Groups Cache Size	Used to indicate the maximum number of price item parameter groups whose information can be cached in the memory.	Yes
SQ Recalculation Required	Used to indicate whether the SQIs in an aggregated billable charge must be recalculated while executing the C1-TXNCU batch. The valid values are: <ul style="list-style-type: none"> Y N <p>Note: If you do not specify the value for this option type or if you set the value to N, the system will not recalculate the SQIs in an aggregated billable charge.</p>	No
Transaction Detail Account Validation	Used to indicate whether the account must be validated during the transaction validation process. The valid values are: <ul style="list-style-type: none"> Y N <p>Note:</p> <p>If you set this option type to N, the system overrides the transaction's account identifier type, account identifier, and division with the first derived account's account identifier type, account identifier, and division, respectively.</p> <p>If you do not specify the value for this option type, the system will validate the account during the transaction validation process.</p>	No
Populate Summary Table Batch Description	Used to specify the description for the batch which is used for adding a summary record in the CI_TXN_DTL_PRITM_SUMMARY table. For example, Populate CI_TXN_DTL_PRITM_SUMMARY Table . This description appears in the error message when the transaction aggregation batches are not executed in the specified sequence.	Yes (Conditional) <p>Note: This data is required when the Use C1-TXNPS During Transaction Aggregation option type is set to true.</p>
Find Price Item Pricing Batch Description	Used to specify the description for the batch which is used for finding the price item pricing for transactions in the transaction aggregation cycle. For example, Price Item Pricing Verification . This description appears in the error message	Yes

Option Type	Description	Mandatory (Yes or No)
	when the transaction aggregation batches are not executed in the specified sequence.	
Update Transaction Status Batch Description	Used to specify the description for the batch which is used for updating the status of the transactions (for which the error has occurred) in the transaction aggregation cycle. For example, Update Status . This description appears in the error message when the transaction aggregation batches are not executed in the specified sequence.	Yes
Service Quantity Calculation Batch Description	Used to specify the description for the batch which is used for creating the billable charges for transactions in the transaction aggregation cycle. For example, Service Quantity Calculation . This description appears in the error message when the transaction aggregation batches are not executed in the specified sequence.	Yes
Transaction Completion Batch Description	Used to specify the description for the batch which is used for updating the status of the transactions in the transaction aggregation cycle. For example, Mark Completion . This description appears in the error message when the transaction aggregation batches are not executed in the specified sequence.	Yes
Cleanup Unwanted Data Batch Description	Used to specify the description for the batch which is used for updating or deleting billable charges created for transactions in the transaction aggregation cycle. For example, Clean Up . This description appears in the error message when the transaction aggregation batches are not executed in the specified sequence.	Yes
Use C1-TXNPS During Transaction Aggregation	Used to indicate whether you want to use an alternative transaction aggregation process when the aggregation ratio is low. The valid values are: <ul style="list-style-type: none"> true false 	No
	<p>Note: If you set this option type to true, you need to execute the following batches in the specified order in the transaction aggregation cycle:</p> <ol style="list-style-type: none"> Flush All Caches (F1-FLUSH) Refresh Pricing (C1-TXNRP) Header Validation (C1-TXNHV) Validate Transaction and Derive Price Item (C1-TXNIP) Populate CI_TXN_DTL_PRITM_SUMMARY Table (C1-TXNPS) Price Item Pricing Verification (C1-TXNVP) Update Status (C1-TXNEX) Service Quantity Calculation (C1-TXNSQ) Mark Completion (C1-TXNCM) Clean Up (C1-TXNCU) with the Request Type parameter set to EROR 	

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1-INVREQ Feature Configuration

Procedure

To set the C1-INVREQ feature configuration:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- 3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- 4. In the **Feature Configuration Search** zone, enter **C1-INVREQ** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- 6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Account Limit	Used to specify the maximum number of accounts that you can derive in the online mode when an invoice request is created for a person. If the number of accounts of the person or the person and its child persons does not exceed the account limit, the system derives the account of the person or the person and its child persons in the online mode (i.e., in the real time). Once the accounts are successfully derived, the status of the invoice request is changed to Defer Processing Batch .	Yes (Conditional)
	However, if the number of accounts of the person or the person and its child persons exceeds the account limit, the status of the invoice request is changed to Account Derivation Pending . The system then derives the account of the person or the person and its child persons in the deferred mode (i.e., when the C1-INVREQ batch is executed).	Note: This data is required when you want to use the Invoice Request feature.
	Note: You must specify an integer value for this option type. This option type is referred while manually creating an invoice request for a person.	
Account Search	Used to specify the zone using which you want to search for an account in the Invoice Request screen. The system then	Yes (Conditional)

Option Type	Description	Mandatory (Yes or No)
	accordingly displays the Account Search window on clicking the Search (🔍) icon corresponding to the Account ID field.	Note: This data is required when you want to use the Invoice Request feature.
	Note: You must specify a zone which is already defined in the system.	
Invoice Request-Account Eligible Char Type	Used to specify the characteristic type. The system considers this characteristic type to determine whether the group memberships, individual memberships, and direct billed group memberships are eligible for the invoice request creation.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to Membership . This option type is only applicable for the fully insured group, fully insured individual, and direct billed group membership lines of business. This option type is referred while manually or automatically creating an invoice request for an account to which the membership is billed. For more information about the feature, see Invoice Request .	Note: This data is required when you want to use the Invoice Request feature.
Membership Search	Used to specify the zone using which you want to search for a group membership, individual membership, or direct billed group membership in the Invoice Request screen. The system then accordingly displays the Membership Search window when the external reference type is set to Membership and the Search (🔍) icon is clicked corresponding to the External Reference ID field.	Yes (Conditional)
	Note: You must specify a zone which is already defined in the system.	Note: This data is required when you want to use the Invoice Request feature.
Person Search	Used to specify the zone using which you want to search for a person in the Invoice Request screen. The system then accordingly displays the Person Search window on clicking the Search (🔍) icon corresponding to the Person ID field.	Yes (Conditional)
	Note: You must specify a zone which is already defined in the system.	Note: This data is required when you want to use the Invoice Request feature.
Policy Search	Used to specify the zone using which you want to search for a policy in the Invoice Request screen. The system then accordingly displays the Policy Search window when the external reference type is set to Policy and the Search (🔍) icon is clicked corresponding to the External Reference ID field.	Yes (Conditional)
	Note: You must specify a zone which is already defined in the system.	Note: This data is required when you want to use the Invoice Request feature.

Option Type	Description	Mandatory (Yes or No)
Regular Bill FK Ref	Used to specify the foreign key reference using which you want to generate the regular bill information string in the Invoice Request screen.	Yes (Conditional)
	Note: You must specify a foreign key reference for regular bill which is already defined in the system. The C1-BLACT foreign key reference for regular bill is shipped with the product. You can also create a custom foreign key reference, if required.	Note: This data is required when you want to use the Invoice Request feature.
Trial Bill FK Ref	Used to specify the foreign key reference using which you want to generate the trial bill information string in the Invoice Request screen.	Yes (Conditional)
	Note: You must specify a foreign key reference for trial bill which is already defined in the system. The C1TRIBIL foreign key reference for trial bill is shipped with the product. You can also create a custom foreign key reference, if required.	Note: This data is required when you want to use the Invoice Request feature.

- Enter the values for the required option types in the **Feature Configuration** screen.
- Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1-OFFSETREQ Feature Configuration

The **C1-OFFSETREQ** feature configuration enables the system to determine whether the completed debit or credit bills of the effective child persons of the main customer (whose bill is added as the primary bill in the offset request) should be listed when you search for a bill in the offset request.

Procedure

To set the **C1-OFFSETREQ** feature configuration:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- In the **Feature Configuration Search** zone, enter **C1-OFFSETREQ** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- Click **Search**.

A list of feature configurations that meet the search criteria appears in the search results.

6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option type:

Option Type	Description	Mandatory (Yes or No)
Allow Offsetting Across Persons	Used to indicate whether you want to offset bills across main customer's hierarchy. The valid values are: <ul style="list-style-type: none">• Y - Used when you want to offset one or more bills of the main customer against one or more bills of the same or other accounts of the main customer or against one or more bills of the accounts of its effective child persons.• N - Used when you want to offset one or more bills of the main customer against one or more bills of the same or other accounts of the main customer.	Yes
Show Warning When Offsetting Across Person Hierarchy	Used to indicate whether the system should display a warning message when a bill added for offsetting is in different person hierarchy than the base bill person hierarchy. The valid values are: <ul style="list-style-type: none">• Y - Used when you want the system to display a warning message when a bill is added for offset• N	Yes (Conditional)
	Note: If you do not specify the value for this option type, by default, it is set to N.	Note: This data is required when the Allow Offsetting Across Person option type is set to Y .

7. Enter the value for the required option type in the **Feature Configuration** screen.
8. Click the **Save** button in the **Page Title** area.
- The changes made to the feature configuration are saved.

Setting the C1-PAYPORTAL Feature Configuration

Procedure

To set the **C1-PAYPORTAL** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1-PAYPORTAL** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.

A list of feature configurations that meet the search criteria appears in the search results.

6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Allow Overpayment	Used to indicate whether you want to allow overpayment against an entity while editing the payment amount. The valid values are: <ul style="list-style-type: none"> true false 	Yes
FK Reference for Bill	Used to indicate the foreign key reference which generates the information string for a bill in the Edit Payment Amount screen. <p>Note: The C1-BLACT foreign key reference for bill is shipped with the product. You can also create a custom foreign key reference, if required.</p>	Yes
FK Reference for Bill Segment	Used to indicate the foreign key reference which generates the information string for a bill segment in the Edit Payment Amount screen. <p>Note: The C1-BSEG foreign key reference for bill segment is shipped with the product. You can also create a custom foreign key reference, if required.</p>	Yes
FK Reference for Contract	Used to indicate the foreign key reference which generates the information string for a contract in the Edit Payment Amount screen. <p>Note: The C1_F_SA foreign key reference for contract is shipped with the product. You can also create a custom foreign key reference, if required.</p>	Yes
FK Reference for Settlement	Used to indicate the foreign key reference which generates the information string for a settlement ID in the Edit Payment Amount screen. <p>Note: At present, no foreign key reference for settlement ID is shipped with the product. Only the settlement ID appears in the information string. You can create a foreign key reference for settlement ID and specify it in this field.</p>	No

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1_PER_REL Feature Configuration

You can define person to person relationship type sequence in the **C1_PER_REL** feature configuration. This sequence is used while searching for effective price item pricing at the parent customer level.

Procedure

To set the **C1_PER_REL** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1_PER_REL** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Person to Person Relationship Type	Used to indicate the person to person relationship type.	Yes
	Note: If you want to define more than one relationship type in the feature configuration, you need to specify the sequence in which the relationship type should be considered while searching effective price item pricing at the parent customer level.	

7. Enter the values for the required option types in the **Feature Configuration** screen.
8. Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1_PERSTYPE Feature Configuration

The **C1_PERSTYPE** feature configuration enables the system to determine whether the entities should be created directly or through a customer registration object whenever a health care inbound message is processed. If the person type specified in the health care inbound message matches the person type specified in the **Bill Group Person Type** , **Parent Person Type**, or **TPA Person Type** option type of the **C1_PERSTYPE** feature configuration, the system creates or updates the person, account, policy, policy plan, and address through a customer registration object. Note that the memberships, pass-through billable charges, and pricing rules are created directly and not via customer registration object. However, if the person type specified in the health care inbound message does not match the person type specified in the **Bill Group Person Type**, **Parent Person Type**, or **TPA Person Type** option type, the system creates or updates the person and its other entities directly and not through a customer registration object.

Prerequisites

To set the **C1_PERSTYPE** feature configuration, you should have:

- Values defined for the **PER_OR_BUS_FLG** lookup field

Procedure

To set the **C1_PERSTYPE** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1_PERSTYPE** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Bill Group Person Type	Used to specify the person type which indicates that the person is a bill group.	Yes (Conditional)
	Note: You must specify a value which is already defined in the PER_OR_BUS_FLG lookup field. It must be in the Active status.	Note: This data is required while creating a bill group through a health care inbound message.
Parent Person Type	Used to specify the person type which indicates that the person is a parent customer.	Yes (Conditional)

Option Type	Description	Mandatory (Yes or No)
	Note: You must specify a value which is already defined in the PER_OR_BUS_FLG lookup field. It must be in the Active status.	Note: This data is required while creating a parent customer through a health care inbound message.
TPA Person Type	Used to specify the person type which indicates that the person is a third party administrator.	Yes (Conditional)
	Note: You must specify a value which is already defined in the PER_OR_BUS_FLG lookup field. It must be in the Active status.	Note: This data is required while creating a TPA person through a health care inbound message.

7. Enter the values for the required option types in the **Feature Configuration** screen.
8. Click the **Save** button in the **Page Title** area.
- The changes made to the feature configuration are saved.

Setting the C1_PPARM_FLG Feature Configuration

The **C1_PPARM_FLG** feature configuration enables the system to determine whether the multi parameter based pricing or variance parameter based pricing feature is enabled. For more information on how to define pricing for a price item or price item bundle based on multiple parameters, see [Multi Parameter Based Pricing](#). For more information on how to define pricing for a price item or price item bundle based on variance parameter, see [Variance Parameter Based Pricing](#).

Procedure

To set the **C1_PPARM_FLG** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1_PPARM_FLG** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option type:

Option Type	Description	Mandatory (Yes or No)
Multi Price Parameter	Used to indicate whether you want to enable the multi parameter or variance parameter based pricing feature. The valid values are: <ul style="list-style-type: none"> True - Used when you want to enable the multi parameter based pricing feature. False - Used when you want to enable the variance parameter based pricing feature. 	Yes

7. Enter the value for the required option type in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1_PR_REC Feature Configuration

Procedure

To set the **C1_PR_REC** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1_PR_REC** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.

A list of feature configurations that meet the search criteria appears in the search results.

6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option type:

Option Type	Description	Mandatory (Yes or No)
Effective Pricing Record Set Limit	Used to specify the number of records that can be displayed in the Search Results section of the Effective Price Assignment zone. The value must be an integer and not in decimals. The maximum number of records that can be displayed are 5000. Note: If you enter the value as 0 or if you do not specify the value for the Effective Pricing RecordSet Limit option type, no records will be displayed in the Search Results section.	Yes

- 7. Enter the values for the required option types in the **Feature Configuration** screen.
- 8. Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1_PRASNORDR Feature Configuration

The **C1_PRASNORDR** feature configuration enables the system to determine the manner in which price assignments should be searched for a global customer. For more information on how effective price item pricing is derived, see [Price Assignment Search Mechanism](#).

Prerequisites

To set the **C1_PRASNORDR** feature configuration, you should have:

- An algorithm defined using the **C1_PRASN_PP** algorithm type in the application

Procedure

To set the **C1_PRASNORDR** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1_PRASNORDR** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option type:

Option Type	Description	Mandatory (Yes or No)
Price Assignment Algorithm	Used to specify the algorithm using which the price assignment should be searched for a global customer.	Yes
	Note: You must specify an algorithm which is already defined in the system.	

7. Enter the value for the required option type in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1_PRICING Feature Configuration

The **C1_PRICING** feature configuration enables the system to determine the following:

- The contract type that should be associated with a price item or price item bundle which is available for pricing.
- The priority that should be defaulted while assigning a price list to a person or an account from the user interface or through a business service.
- Whether the logs should be maintained when the **C1-GetAllAssignedPriceLists**, **C1-AssignPriceList**, **C1-GetEffectivePricing**, **C1-GetAccountRate**, **C1_PRICEASSIGN_SERVICE**, **C1-PriceAccount**, and **C1-GetPricing** business services are invoked.

Prerequisites

To set the **C1_PRICING** feature configuration, you should have:

- Contract types defined in the application

Procedure

To set the **C1_PRICING** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1_PRICING** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Default Contract Type	Used to indicate the contract type that you want to associate with a price item or price item bundle which is available for pricing.	Yes
	Note: You must specify a contract type which is already defined in the system. You must ensure that the specified contract type is defined for all divisions in the system.	

Option Type	Description	Mandatory (Yes or No)
Default Price List Priority	Used to indicate the default priority that should appear in the Price List Assignment screen when you assign a price list to a person or an account. You can then edit the priority, if required. It is also used when both the priority and priority indicator are not passed to the C1-AssignPriceList business service.	No
	Note: The value for this option type must be a positive integer.	
Enable Service Logging	Used to indicate whether you want to maintain logs when the C1-GetAllAssignedPriceLists , C1-AssignPriceList , C1-GetEffectivePricing , C1-GetAccountRate , C1_PRICEASSIGN_SERVICE , C1-PriceAccount , and C1-GetPricing business services are invoked. The valid values are: <ul style="list-style-type: none"> • True • False 	No

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1-PYREQSRT Feature Configuration

Procedure

To set the **C1-PYREQSRT** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.

A list appears.

- 2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- 3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- 4. In the **Feature Configuration Search** zone, enter **C1-PYREQSRT** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- 6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Bill	Used to sort columns by the selected option type. The table fields in CI_BILL table are used to set the values for the option type Bill . It also enables sorting by order. Its valid values are: <ul style="list-style-type: none">AscendingDescending	No
Bill Segment	Used to sort columns by the selected option type. The table fields in CI_BSEG table are used to set the values for the option type Bill Segment . It also enables sorting by order. Its valid values are: <ul style="list-style-type: none">AscendingDescending	No
Contract	Used to sort columns by the selected option type. The table fields in CI_SA table are used to set the values for the option type Contract . It also enables sorting by order. Its valid values are: <ul style="list-style-type: none">AscendingDescending	No

Note: Above options types are configured for the **Sort By** field for sorting columns on the **Edit Payment Amount** screen.

- 7. Enter the values for the required option types in the **Feature Configuration** screen.
- 8. Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1_RLENG Feature Configuration

Procedure

To set the **C1_RLENG** feature configuration:

- 1. Click the **Admin** link in the **Application** toolbar.

A list appears.

2. From the **Admin** menu, select **F** and then click **Feature Configuration**.

A sub-menu appears.

3. Click the **Search** option from the **Feature Configuration** sub-menu.

The **Feature Configuration Query** screen appears.

4. In the **Feature Configuration Search** zone, enter **C1_RLENG** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.

A list of feature configurations that meet the search criteria appears in the search results.

6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Logging Rules for Transaction Feed	Used to indicate whether a log should be generated when you execute the Transaction Validation and Initial Product Determination (C1-TXNIP) batch. The valid values are: <ul style="list-style-type: none">• True• False	Yes
	Note: This log indicates the rules that were executed for each transaction and whether each rule passed or failed during the execution.	
Maximum Number of Rules in Cache	Used to indicate the maximum number of rules whose entry should be created in the log file.	Yes

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1-TXNDMYID Feature Configuration

For manually added transactions, the system can generate header details including the header ID automatically if you set the option types in the **C1-TXNDMYID** feature configuration.

Procedure

To set the **C1-TXNDMYID** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.

A list appears.

- 2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- 3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- 4. In the **Feature Configuration Search** zone, enter **C1-TXNDMYID** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 5. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- 6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Dummy File Name	Used to specify the dummy file name.	Yes
Dummy Header ID	Used to specify the dummy header ID.	Yes
Dummy Transaction Source	Used to specify the dummy transaction source.	Yes
Dummy Header Date	Used to specify the dummy header date.	Yes

- 7. Enter the values for the required option types in the **Feature Configuration** screen.
- 8. Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1-HOLDSRCH Feature Configuration

The **C1-HOLDSRCH** feature configuration enables you to set certain feature-specific options which are used while creating or viewing a hold request in the system.

Prerequisites

To set the **C1-HOLDSRCH** feature configuration, you should have:

- Foreign key references defined for different entities, such as person, account, and bill
- Required hold request types defined in the application

Procedure

To set the **C1-HOLDSRCH** feature configuration:

- 1. Click the **Admin** link in the **Application** toolbar.
A list appears.
- 2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- 3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.

4. In the **Feature Configuration Search** zone, enter **C1-HOLDSRCH** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.

A list of feature configurations that meet the search criteria appears in the search results.

6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Account FK Ref	Used to indicate the foreign key reference for account. The system then generates information string for the account using the specified foreign key reference and accordingly displays it in the Hold Request screen.	Yes
	<p>Note:</p> <p>You must specify a foreign key reference which is already defined in the system.</p> <p>The ACCT foreign key reference for account is shipped with the product. You can also use a custom foreign key reference, if required.</p>	
Bill FK Ref	Used to indicate the foreign key reference for bill. The system then generates information string for the bill using the specified foreign key reference and accordingly displays it in the Hold Request screen.	Yes
	<p>Note:</p> <p>You must specify a foreign key reference which is already defined in the system.</p> <p>The C1-BILL foreign key reference for bill is shipped with the product. You can also use a custom foreign key reference, if required.</p>	
Default Hold Request Type for IWS	Used to indicate the hold request type using which you want to create a hold request through an inbound web service. The system uses the specified hold request type when it is not received in the inbound request.	Yes
	<p>Note:</p> <p>You must specify a hold request type which is already defined in the system.</p> <p>Here, you must specify an active hold request type where the approval process is not configured for activation and release.</p>	

Option Type	Description	Mandatory (Yes or No)
Funding Exclusion Reason	Used to indicate the reason why the bill record was excluded from the funding request. The system stamps this reason corresponding to the bill record when you create a hold request for a bill via the Funding Request screen.	Yes
Person FK Ref	Used to indicate the foreign key reference for person. The system then generates information string for the person using the specified foreign key reference and accordingly displays it in the Hold Request screen.	Yes
	Note: You must specify a foreign key reference which is already defined in the system. The PERS foreign key reference for person is shipped with the product. You can also use a custom foreign key reference, if required.	

- Enter the values for the required option types in the **Feature Configuration** screen.
- Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.

Setting the C1_REFWO Feature Configuration

Procedure

To set the **C1_REFWO** feature configuration:

- Click the **Admin** link in the **Application** toolbar.
A list appears.
- From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- In the **Feature Configuration Search** zone, enter **C1_REFWO** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Default Adjustment Level	Used to indicate the default adjustment level required to create the refund/write off adjustments. The valid values are:	Yes

Option Type	Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> • ACCT • BILL • SEGT 	
Field Mapping Preference for Individual Membership	Used to indicate an automatic refund/write-off preference. The system considers the various attributes of the automatic refund/write-off preference while deriving the automatic refund/write-off details for an individual membership.	Yes (Conditional)
	Note: You must specify an automatic refund/write-off preference which is already defined in the system.	Note: This data is required while deriving the automatic refund/write-off details for an individual membership.
Field Mapping Preference for Policy (Small Group)	Used to indicate an automatic refund/write-off preference. The system considers the various attributes of the automatic refund/write-off preference while deriving the automatic refund/write-off details for a policy.	Yes (Conditional)
	Note: You must specify an automatic refund/write-off preference which is already defined in the system.	Note: This data is required while deriving the automatic refund/write-off details for a group.

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1-PAYFLUPLD Feature Configuration

Procedure

To set the **C1-PAYFLUPLD** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **C1-PAYFLUPLD** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.

A list of feature configurations that meet the search criteria appears in the search results.

6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Field Mapping for Match Type	Used to specify a field mapping which is created using the Configuration for Match Type - Handling Overpayment preference category.	Yes
	<p>Note:</p> <p>The system then considers this field mapping during the step-three PUPL batch execution whenever there are multiple payment records of the payee account in the CSV file.</p> <p>By default, the value is set to MT_CNF. You can change the value, if required.</p> <p>This option type is only applicable for the health insurance domain.</p>	
Payment Portal Thread Count	Used to specify the number of threads you want to spawn in parallel. This value is used when a batch job is automatically created for the Create Payments from Payment Staging Records (PUPL) batch.	No
	<p>Note: By default, the value is set to 1. You can change the value, if required.</p>	
Thread Pool Name	Used to specify the thread pool on which you want to execute the batch. This value is used when a batch job is automatically created for the following batches:	No
	<ul style="list-style-type: none"> • Upload Payment Records in Pre-Staging Area (C1-PYUP1) • Move Payment Records to Staging Area (C1-PYUP2) • Create Payments from Payment Staging Records (PUPL) <p>Note: By default, the value is set to DEFAULT. You can change the value, if required.</p>	

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1-CFS Feature Configuration

The **C1-CFS** feature configuration enables you to indicate whether the application environment should use the file object storage service of Oracle Cloud Infrastructure (OCI). If the file object storage service of OCI is used, you need to specify the buckets or containers within the Object Storage namespace from where you need to read files for the On Demand Billing and Payment Upload features. Before specifying the buckets to read files from the external location for the On Demand Billing and Payment Upload features, you need to define a file storage extendable lookup value using the **File Storage Configuration (F1-FileStorage)** extendable lookup where the file adapter is set to **Oracle Cloud**

Object Storage. For more information on how to define a file storage extendable lookup value, refer to the **Oracle Utilities Application Framework Administrative Processes → Configuration Tools → Miscellaneous Topics → Referencing URIs → External File Storage** in *Oracle Revenue Management and Billing Online Help*.

Procedure

To set the **C1-CFS** feature configuration:

1. Login to Oracle Revenue Management and Billing Version 5.1.0.0.0.
2. Click the **Admin** link in the **Application** toolbar.
A list appears.
3. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
4. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
5. In the **Feature Configuration Search** zone, enter **C1-CFS** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

6. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
7. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
File Object Storage Usage	Used to indicate whether the application environment should use the file object storage service of Oracle Cloud Infrastructure (OCI). The valid values are: <ul style="list-style-type: none">• Y• N	Yes
	Note: By default, the value is set to N. You must ensure that the value of this option type is set to N in the On Premise and Cloud Service environments. If the value of this option type is set to Y, you need to accordingly specify the directory paths while executing the DWLDBILC , C1-PUPSG , C1-APACK , and C1-RECUP batches. For more information, refer to the <i>Oracle Revenue Management and Billing Batch Guide</i> .	
ODB Extendable Lookup and Bucket	Used to specify the following information in the <File Storage Extendable Lookup Value>/<Object Storage Bucket> format:	Yes (Conditional)

Option Type	Description	Mandatory (Yes or No)
	<ul style="list-style-type: none"> The file storage extendable lookup value from where the cloud storage compartment and connection details are retrieved while uploading the files through the On Demand Billing feature. The bucket or container from where you want to upload the file using the On Demand Billing feature. <p>Note: This option type is required only when the File Object Storage Usage option type is set to Y and you want to use the On Demand Billing feature.</p>	
Payment Upld Extendable Lookup and Bucket	<p>Used to specify the following information in the <File Storage Extendable Lookup Value>/<Object Storage Bucket> format:</p> <ul style="list-style-type: none"> The file storage extendable lookup value from where the cloud storage compartment and connection details are retrieved while uploading the files through the Payment Upload feature. The bucket or container from where you want to upload the file using the Payment Upload feature. <p>Note: This option type is required only when the File Object Storage Usage option type is set to Y and you want to use the Payment Upload feature.</p>	Yes (Conditional)

8. Set the **File Object Storage Usage** option type to **N**.

9. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1-FLUPLD Feature Configuration

You need to set the **C1-FLUPLD** feature configuration only when you want to decrypt the encrypted files on the SFTP server while uploading and transforming the files through the **C1-FTRAN** batch. The **C1-FRDALG** algorithm is used to decrypt the file using the keystore. Earlier, the following properties were derived from the `FW_spl.properties.keystore.truststore.include` file to encrypt or decrypt the files using the keystore:

- `com.oracle.ouaf.system.keystore.file`
- `com.oracle.ouaf.system.keystore.passwordFileName`
- `com.oracle.ouaf.system.keystore.type`
- `com.oracle.ouaf.system.keystore.padding`
- `com.oracle.ouaf.system.keystore.mode`
- `com.oracle.ouaf.system.keystore.alias`
- `ouaf.system.fileupload.pgp.pvt.key.filepath`

Now, the **C1-FLUPLD** feature configuration enables you to specify the required details to encrypt or decrypt the files using the keystore.

Procedure

To set the **C1-FLUPLD** feature configuration:

1. Login to Oracle Revenue Management and Billing Version 5.1.0.0.0.
2. Click the **Admin** link in the **Application** toolbar.
A list appears.
3. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
4. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
5. In the **Feature Configuration Search** zone, enter **C1-FLUPLD** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

6. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
7. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
File Decryption Key Alias	Used to specify the alias (i.e. key defined in the keystore) using which you want to encrypt or decrypt the files.	Yes
	Note: By default, the value is set to ouaf.system . You can change the value as per the requirement.	
Key Store File Path	<p>Used to specify the directory or bucket from where you want to fetch the keystore file. If the application environment is an On Premise or Cloud Service environment, you can specify the directory name along with the following relative path:</p> <ul style="list-style-type: none">• @SHARED_DIR - Used when you want to fetch the keystore file from the shared directory on the server. <p>For example, you can set the value to @SHARED_DIR/.ouaf_keystore.</p> <p>However, if the application environment is a Cloud Service Premium Edition environment, you must specify the following information in the file-storage://<File Storage Extendable Lookup Value>/<Object Storage Bucket> format:</p> <ul style="list-style-type: none">• The file storage extendable lookup value from where the cloud storage compartment and connection details are retrieved while fetching the keystore file on OCI.• The bucket or container from where you want the system to fetch the keystore file.	Yes

Option Type	Description	Mandatory (Yes or No)
	<p>Note:</p> <p>By default, the value is set to @SHARED_DIR/ks.ouaf_keystore. You must change the value as per the requirement.</p> <p>The shared directory variable (i.e. SHARED_DIR) is case-sensitive.</p>	
Key Store Mode	<p>Used to specify the mode using which you want to encrypt or decrypt the files.</p> <p>Note: By default, the value is set to CBC (i.e. Cipher-block Chaining).</p>	Yes
Key Store Padding	<p>Used to specify the padding using which you want to encrypt or decrypt the files.</p> <p>Note: By default, the value is set to PKCS5Padding.</p>	Yes
Key Store Password File Path	<p>Used to specify the directory or bucket from where you want to fetch the keystore password file. If the application environment is an On Premise or Cloud Service environment, you can specify the directory name along with the following relative path:</p> <ul style="list-style-type: none"> • @SHARED_DIR - Used when you want to fetch the keystore password file from the shared directory on the server. <p>For example, you can set the value to @SHARED_DIR/.ouaf_storepass.</p> <p>However, if the application environment is a Cloud Service Premium Edition environment, you must specify the following information in the file-storage://<File Storage Extendable Lookup Value>/<Object Storage Bucket> format:</p> <ul style="list-style-type: none"> • The file storage extendable lookup value from where the cloud storage compartment and connection details are retrieved while fetching the keystore password file on OCI. • The bucket or container from where you want the system to fetch the keystore password file. <p>Note:</p> <p>By default, the value is set to @SHARED_DIR/ks.ouaf_storepass. You must change the value as per the requirement.</p> <p>The shared directory variable (i.e. SHARED_DIR) is case-sensitive.</p>	Yes

Option Type	Description	Mandatory (Yes or No)
Key Store Type	Used to indicate the type of keystore file.	Yes
	Note: By default, the value is set to JCEKS .	
Private Key File Path	Used to specify the directory or bucket from where you want to fetch the private key file. If the application environment is an On Premise or Cloud Service environment, you can specify the directory name along with the following relative path: <ul style="list-style-type: none"> • @SHARED_DIR - Used when you want to fetch the private key file from the shared directory on the server. For example, you can set the value to @SHARED_DIR/.ouaf_storepass . However, if the application environment is a Cloud Service Premium Edition environment, you must specify the following information in the file-storage://<File Storage Extendable Lookup Value>/<Object Storage Bucket> format: <ul style="list-style-type: none"> • The file storage extendable lookup value from where the cloud storage compartment and connection details are retrieved while fetching the private key file on OCI. • The bucket or container from where you want the system to fetch the private key file. 	Yes
	Note: By default, the value is set to @SHARED_DIR/ks.ouaf_storepass . You must change the value as per the requirement. The shared directory variable (i.e. SHARED_DIR) is case-sensitive.	

8. Enter the values for the required option types in the **Feature Configuration** screen.

9. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1-REPORTVW Feature Configuration

You need to set the **C1-REPORTVW** feature configuration only when you are using the Apache FOP Reporting framework in ORMB. It enables you to define the following properties which were earlier derived from the **spl.properties** file:

- `ouaf.runtime.billView.directoryPath`
- `ouaf.runtime.reportView.directoryPath`
- `ouaf.application.reportingDir`

Procedure

To set the **C1-REPORTVW** feature configuration:

1. Login to Oracle Revenue Management and Billing Version 5.1.0.0.0.
2. Click the **Admin** link in the **Application** toolbar.

A list appears.

- 3. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
- 4. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
- 5. In the **Feature Configuration Search** zone, enter **C1-REPORTVW** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

- 6. Click **Search**.
A list of feature configurations that meet the search criteria appears in the search results.
- 7. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Report Download HTTP URL	Used to specify the HTTP servlet using which you want to download and view the FOP reports that are generated in the online mode. You must specify the URL in the following format: https://ipaddress:port/ouaf/reportView	Yes
	Note: You must override the default value as per the requirement.	
Report Generation (FOP) File Path	Used to specify the directory or bucket where you want to store the FOP reports which are generated either from the user interface or through a batch process. If the application environment is an On Premise or Cloud Service environment, you can specify the directory name along with the following relative path: <ul style="list-style-type: none">• @SHARED_DIR - Used when you want to store the FOP reports in the shared directory on the server. For example, you can set the value to @SHARED_DIR/output. However, if the application environment is a Cloud Service Premium Edition environment, you must specify the following information in the file-storage://<File Storage Extendable Lookup Value>/<Object Storage Bucket> format: <ul style="list-style-type: none">• The file storage extendable lookup value from where the cloud storage compartment and connection details are retrieved while storing the FOP reports on OCI.• The bucket or container where you want the system to store the FOP reports which are generated in the different formats.	Yes

Option Type	Description	Mandatory (Yes or No)
	<p>Note:</p> <p>By default, the value is set to @SHARED_DIR/splapp/reporting/output. You must change the value as per the requirement.</p> <p>The shared directory variable (i.e. SHARED_DIR) is case-sensitive.</p>	
Report Generation XSL Template File Path	<p>Used to specify the directory or bucket from where the respective XSL file should be fetched while generating the FOP report.</p> <p>If the application environment is an On Premise or Cloud Service environment, you can specify the directory name along with the following relative path:</p> <ul style="list-style-type: none"> @SHARED_DIR - Used when you want to fetch the XSL file from the shared directory on the server. <p>For example, you can set the value to @SHARED_DIR/xsl.</p> <p>However, if the application environment is a Cloud Service Premium Edition environment, you must specify the following information in the file-storage://<File Storage Extendable Lookup Value>/<Object Storage Bucket> format:</p> <ul style="list-style-type: none"> The file storage extendable lookup value from where the cloud storage compartment and connection details are retrieved while fetching the XSL file for an FOP report. The bucket or container from where you want the system to fetch the XSL file while generating the FOP report. <p>Note:</p> <p>By default, the value is set to @SHARED_DIR/splapp/reporting/xsl. You must change the value as per the requirement.</p> <p>The shared directory variable (i.e. SHARED_DIR) is case-sensitive.</p> <p>Before generating an FOP report, you need to ensure that the XSL files are copied from the @INSTALL_DIR/splapp/reporting/xsl directory to the specified shared directory.</p>	Yes
Report Generation XML Data File Path	Used to specify the directory or bucket where you want to extract the data from the system in the XML format for an FOP report.	Yes

Option Type	Description	Mandatory (Yes or No)
	<p>If the application environment is an On Premise or Cloud Service environment, you can specify the directory name along with the following relative path:</p> <ul style="list-style-type: none"> • @SHARED_DIR - Used when you want to store the XML file in the shared directory on the server. <p>For example, you can set the value to @SHARED_DIR/extractxml.</p> <p>However, if the application environment is a Cloud Service Premium Edition environment, you must specify the following information in the file-storage://<File Storage Extendable Lookup Value>/<Object Storage Bucket> format:</p> <ul style="list-style-type: none"> • The file storage extendable lookup value from where the cloud storage compartment and connection details are retrieved while storing the XML file on OCI. • The bucket or container where you want the system to store the XML file for an FOP report. <p>Note:</p> <p>By default, the value is set to @SHARED_DIR/splapp/reporting/extractxml. You must change the value as per the requirement.</p> <p>The shared directory variable (i.e. SHARED_DIR) is case-sensitive.</p>	

8. Enter the values for the required option types in the **Feature Configuration** screen.

9. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the SYSDT Feature Configuration

The **SYSDT** feature configuration enables you to set certain environment options which will be used across features in the application.

Procedure

To set the **SYSDT** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Query** screen appears.
4. In the **Feature Configuration Search** zone, enter **SYSDT** in the **Feature Name** field.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.

A list of feature configurations that meet the search criteria appears in the search results.

6. In the **Search Results** section, click the link in the **Description** column corresponding to the feature configuration whose details you want to edit.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Environment Type	Used to indicate whether the environment will be used for the financial services or health insurance domain. The valid values are: <ul style="list-style-type: none"> B - Used when you want to use the environment for the financial services domain. H - Used when you want to use the environment for the health insurance domain. 	Yes
Maximum Attachment Size	Used to specify the maximum size limit for a file that can be uploaded in the system. The size is interpreted in megabytes (MB). For example, if you want to set the maximum size limit of a file to 5 MB, then specify the value as 5 in this option type. <p>Note:</p> <p>You must specify a value greater than zero.</p> <p>If you do not specify any value for this option type, the system would not enforce any limit while uploading a file in the system.</p>	No
System Override Date	Used when you want to override the system date. The system will then use the specified date as the system date instead of retrieving the system date from the database. <p>Note:</p> <p>You must specify the date in the YYYY-MM-DD format.</p> <p>This option type is valid only when an appropriate system property is set. It provides a way to override the system date for online operations of all the users in the region. See the online help (search for 'System Override Date') for more information about the system property and how to override the system date at the user level rather than at the system level.</p>	No

7. Enter the values for the required option types in the **Feature Configuration** screen.

8. Click the **Save** button in the **Page Title** area.

The changes made to the feature configuration are saved.

Setting the C1-ODBFC Feature Configuration

Procedure

To set the **C1-ODBFC** feature configuration:

1. Click the **Admin** link in the **Application** toolbar.
A list appears.
2. From the **Admin** menu, select **F** and then click **Feature Configuration**.
A sub-menu appears.
3. Click the **Search** option from the **Feature Configuration** sub-menu.
The **Feature Configuration Search** window appears.
4. Enter **C1-ODBFC** in the **Feature Name** field.
5. Click the **Search** button corresponding to the **Feature Name** field.

The **Feature Configuration** screen appears. It contains the following option types:

Option Type	Description	Mandatory (Yes or No)
Average Record Size	Used to specify the average size of a usage record in bytes. By default, the value is set to 500. You can change the value, if required.	Yes
Billable Charge Chunk Size	Used to specify the number of billable charges you want to create in each work unit. By default, the value is set to 500. You can change the value, if required.	Yes
File Size Limit	Used to specify the size of a usage data file in bytes. By default, the value is set to 100000. You can change the value, if required.	Yes
Online Bill Creation Limit	Used to determine whether adhoc bills must be generated for a usage data file online or through the background process. If the total number of billable charges created for a usage data file exceeds the online bill creation limit, adhoc bills are generated for the usage data file through a batch process. By default, the value is set to 500. You can change the value, if required.	Yes
Staging XML Size	Used to specify the number of usage records you want to parse and map in each XML file. By default, the value is set to 500. You can change the value, if required.	Yes
Thread Count	Used to specify the number of threads you want to spawn in parallel.	No
Thread Pool Name	Used to specify the thread pool on which you want to execute the batch.	No
Transaction Limit	Used to determine whether billable charges for a usage data file must be created online or through the background process. If the total number of valid or approved records in a usage data file exceeds the transaction limit, billable charges are created for the valid or approved records through a batch process.	No
Validation Chunk Size	Used to specify the number of usage records you want to validate or revalidate in each work unit. By default,	Yes

Option Type	Description	Mandatory (Yes or No)
	the value is set to 500. You can change the value, if required.	

- 6. Enter the value for the option types in the **Feature Configuration** screen.
- 7. Click the **Save** button in the **Page Title** area.
The changes made to the feature configuration are saved.
