| Field or Control          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>InterUnit Template</b> | <p>If the interunit method specified on the installation Overall page is <i>Direct</i> or <i>Indirect</i>, specify an interunit template.</p> <p>Prompting and validation of your selection uses the <i>GL Business Unit</i> as the set control Value.</p> <p>If the interunit method is indirect, the template entered is used by the other GL Business Units involved in the transaction, using their own SetID. If this is the case, all business units with which this business unit might have transactions must either share the same interunit SetID, or the template must also exist in their interunit SetIDs.</p> |
| <b>IntraUnit Template</b> | <p>The field is required if there is at least one ledger group linked to this business unit that has intraunit balancing entries selected on the Detail Ledger Group – Balancing page.</p> <p>Prompting and validation of your selection uses the GL Business Unit as the set control Value.</p>                                                                                                                                                                                                                                                                                                                            |

| <b>Field or Control</b>     | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Legal Entity Unit</b>    | <p>If you select the <b>Use Legal Entity</b> for interunit option on the Installation Overall page, you must establish the legal entity hierarchy among your GL Business Units. Specify the legal entity unit to which the business unit belongs.</p> <p>interunit transactions between business units within the same legal entity unit are treated as <i>IntraEntity</i>. Transactions between business units in different legal entity units are treated as <i>InterEntity</i>.</p> <p>The valid values for the legal entity unit include the business unit being maintained, plus any other business unit that has itself as a legal entity unit</p>                                                                                              |
| <b>Inheritance Defaults</b> | <p>Used to establish default values for each ChartField to be used in product specific inheritance processing when the inheritance option is <i>Use Unit Default</i> or <i>Inherit Within Unit</i>.</p> <p>It is advisable (but not required) to provide an inheritance default for a ChartField under the following circumstances:</p> <ul style="list-style-type: none"> <li>• The business unit being maintained is linked on the Ledgers for a Unit page with a ledger group for which the ChartField is balanced.</li> <li>• A ChartField inheritance group in the SetID used by the business unit for ChartField inheritance has <i>Use Unit Default</i> or <i>Inherit Within Unit</i> as the inheritance option for the ChartField.</li> </ul> |

## Interunit Billing Options

The following fields are used when supporting documents are created for an interunit bill, that is, when Generate an AP Voucher is selected on the System Transaction Map Options page. The fields provide default values for interunit pairs, but if these fields are changed they do not affect any existing InterUnit Pair definitions.

If both Billing and Payables are installed the following fields are displayed:

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                            |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AP Business Unit</b> | <p>The AP (accounts payable) Business Unit is used when this General Ledger Business Unit is the Bill To Business Unit in an InterUnit Billing Transaction.</p> <p>Only AP Business Units that are linked to this General Ledger Business Unit are valid.</p> |
| <b>Supplier SetID</b>   | Provides the SetID, Supplier ID and Address of the supplier you are paying.                                                                                                                                                                                   |

| <b>Field or Control</b>               | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Supplier and Supplier Location</b> | <p>The Vendor and Location are used when this General Ledger Business Unit is the Bill From Business Unit in an InterUnit Billing Transaction. The entered AP Business Unit is used as the Set Control Value for the Vendor and Location. If the AP Business Unit is changed after the Vendor or Location is entered, values must be re-entered based on the new AP Business Unit.</p> <p>The Vend and Location must be valid for the SetID of any AP Business Unit that is used to voucher invoices generated by the billing General Ledger Business Unit. Otherwise, the user must use the Pairs method to establish values at a more detailed level.</p> <p>The Supplier must be designated an InterUnit Supplier and the Affiliate code on the supplier must be the same as the General Ledger Business Unit being maintained.</p> |

## Interunit Transfer Options

The following fields are used when supporting documents are created for an interunit transfer, that is, when Intercompany Processing is selected on the System Transaction Map Options page. The options provide default values for interunit pairs, but if these fields are changed they do not affect any existing interunit pair definitions.

If both Cost Management and Billing are installed, the following fields are displayed:

| <b>Field or Control</b>                                                       | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Billing Business Unit</b> and <b>Customer ID</b> (customer identification) | <p>Used when this General Ledger Business Unit is the source of an Intercompany Inventory Transfer. Only Billing Business Units that are linked to this General Ledger Business Unit being maintained are valid.</p> <p>Customer ID is used when this General Ledger Business Unit is the destination of an Intercompany Inventory Transfer. The entered Billing Business Unit is used as the Set Control Value for the Customer.</p> <p>The Customer ID entered must be valid for the SetID of any Billing Business Unit that is billing this business unit for an Intercompany transfer. Otherwise, you must use the Pairs method to establish values at a more detailed level.</p> <p>The Customer ID must be both a ship to and bill to customer, and must be designated as an InterUnit Customer.</p> <p>If the Billing Business Unit is changed after the Customer ID has been entered, the value must be re-entered based on the new Billing Business Unit.</p> |

For example:

- An InterUnit Billing transaction is record in which a billing business unit associated with general ledger business unit JPN01 is billing an interunit customer associated with general ledger business unit US001.
- The System Transaction Map for Billing Invoice has Generate an AP (accounts payable) Voucher selected on the InterUnit Billing Options, so a voucher must be created.
- The voucher is created in US001, so the US001 general ledger business unit definition provides the AP (accounts payable) Business Unit for the voucher.
- The Supplier and Location for the voucher come from the JPN01 general ledger business unit definition.

The supporting document options are independent of the interunit method. Whether you use the Direct or Indirect method, the options are derived from same sources, which are the Transaction Code and the GL Business Unit definitions.

---

## Running the Centralized Interunit and Intraunit Processor

Use the System Transaction component (IU\_SYS\_TRAN), System Transaction Map component (IU\_TRAN\_MAP), and Transaction Code component (IU\_TRAN\_CD) to view pages.

## Pages Used to Process a Centralized Interunit and Intraunit Interface

| <i>Page Name</i>                      | <i>Definition Name</i> | <i>Usage</i>                                                                                                                                                                                                                                                                                                                                                                                   |

## Understanding the Running of the Centralized Processor

In conjunction with centralized setup, PeopleSoft also provides centralized processing for inter and intraunit transactions. The centralized processor's primary function is the creation of due to and due from balancing entries for transactions that are not yet balanced from either or both an interunit and intraunit perspective.

Typically, a process in an individual PeopleSoft product generates an initial set of accounting entries that are functionally complete, but not yet balanced by business unit or any other balancing ChartField (this includes all system-generated entries as well as those created by the ChartField Offset Inheritance process). You can also create cross entity online journal entries directly in General ledger.

Running of the Centralized Inter/IntraUnit Process (IU\_PROCESSOR) varies from product to product. For example, in General Ledger the inter and intraunit processor is called as a part of the Journal Edit (GL\_JEDIT) process, but in Payables, voucher post (AP\_PSTVCHR) and payment post (AP\_PSTPYMENT) call the central processor to create inter and intraunit balancing accounting entries.

The central processor evaluates the entries by reading directly from product—specific tables defined by the System Transaction and its interface definition. Additional information, such as the Transaction Code and Anchor ChartField values, are passed to the central processor by these product specific tables.

The central processor determines which ChartFields are to be balanced, whether the transaction is in balance, and if it is not balanced, generates any necessary due to and due from balancing lines. The processor writes balancing lines directly to the accounting entry table for the product or to an interface table as specified by the product interface definition. For feeder applications, the balanced accounting

lines are passed back to the application for later journal generation and edit before finally being posted to the General Ledger.

Refer to the documentation on individual products for application specific information about running the centralized inter and intraunit processor.

## Viewing Delivered System Transactions

Each PeopleSoft application delivers System Transactions for major types of activities that can be expected to generate inter and intraunit entries. The variety of System Transactions that are provided enables you to segregate your inter and intraunit payable and receivable accounts by type of transaction, for example AP (accounts payable) Voucher, AP (accounts payable) Payment, GL (general ledger) Journal and Expense Sheet.

System Transactions provide information to your system that is necessary to support the interface between various application processes and the common PeopleSoft Centralized Inter/Intra Unit Processor.

---

**Note:** System Transactions are delivered and are not to be changed. Any changes to the delivered System Transactions are customizations. You need not access or make changes to the System Transaction pages. They are to be used as delivered. The following is provided for information only or for the use of your MIS personnel or consultants in the event that you intend to implement a customization.

---

## System Transaction Page 1 Page

Use the System Transaction Page 1 page (IU\_SYS\_TRAN) for customizing interunit and intraunit transactions. Do not make changes to this page unless you are customizing this process.

Any change you make to this page is a customization of the system. Access to this page is for information only or in the rare event that you intend to implement a customization to your system. System Transactions are predefined and delivered with the system for transactions that can generate inter and intraunit entries

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Inter/Intra Unit >System Transaction Definition >System Transaction Page 1**

This example illustrates the fields and controls on the System Transaction Page 1. You can find definitions for the fields and controls later on this page.

| Field or Control                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow Multiple Transactions</b>   | As delivered, this check box is selected for and is applicable only to General Ledger. It enables you to define additional Transaction Codes and associate or map them to the delivered System Transaction for the General Ledger product.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Account Balancing Groups Used</b> | As delivered, this check box is selected for and is applicable only to General Ledger. It indicates to the processor that the accounting entries on the input record could include accounts with attributes other than the default values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Transaction Completion Flag</b>   | <p>This option determines how the processor calculates the base currency amounts on the interunit balancing entries for the anchor business unit when the corresponding nonanchor business unit has a different base currency.</p> <p>If the option is set to <i>Offset Manually Entered</i>, then the processor calculates the base currency amount by converting the foreign currency amount using the exchange rate retrieved from the market rates table.</p> <p>If the option is set to <i>Offset System Generated</i>, the processor assumes that the original entries were functionally balanced. It then calculates the base currency amount for the balancing entries for the anchor unit using an allocation of the total base currency amounts on all of the original entries for the anchor unit.</p> |

| <b>Field or Control</b>                   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Anchor Due To/Due From ChartFields</b> | <p>There are three possible values:</p> <ol style="list-style-type: none"> <li>1. <i>Use ChartFields Based on Sign</i> means that the balancing entry with the positive sign is booked to the receivable entry type and the balancing entry with the negative sign is booked to the payable entry type.</li> <li>2. <i>Use Payable ChartFields</i> means that the balancing entry for the anchor entity is booked to the payable entry type and the balancing entry for the nonanchor entity is booked to the receivable entry type, regardless of the sign of the entry.</li> <li>3. <i>Use Receivable ChartField</i> means that the balancing entry for the anchor entity is booked to the receivable entry type and the balancing entry for the non anchor entity is booked to the payable entry type, regardless of the sign of the entry.</li> </ol> |
| <b>Header Record and Line Record</b>      | <p>The names are for prompting only. The actual record and line names are passed to the inter and intraunit processor at run time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## System Transaction Page 2 Page

Use the System Transaction Page 2 page (IU\_SYS\_TRAN2) to make customizations to interunit and intraunit transaction processing. Do not make changes to this page.

Any change you make to this page is a customization of the system. Access to this page is for information only or in the rare event that you intend to implement a customization to your system.

| Field or Control | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sequence Field   | Name of the field on the line record that must be incremented for the new balancing entries created by the processor, if applicable.                                                                                                                                                                                                                                                                                                                                                                           |
| Sequence         | <p>Leave this field blank if the Sequence Field is blank, or if you want the processor to continue numbering based on the last sequence number used on the original input entries for each document group. Specify a value if you want the inter and intraunit balancing entries to always begin sequencing with a fixed value.</p> <p>Sequence numbers assigned by the processor are typically consecutive. However, for multibook ledger group lines, it is normal to have gaps in the sequence numbers.</p> |

| Field or Control                   | Description                                                                                                                                                                    |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>InterUnit Balancing Line ID</b> | The name of the field on the line record that identifies the type of entry, if applicable.                                                                                     |
| <b>InterUnit Payable Value</b>     | The value to be populated in the InterUnit Balancing Line ID field for the intraunit (or InterEntity and IntraEntity) payable balancing entries generated by the processor.    |
| <b>InterUnit Receivable Value</b>  | The value to be populated in the InterUnit Balancing Line ID field for the intraunit (or InterEntity and IntraEntity) Receivable balancing entries generated by the processor. |
| <b>IntraUnit Payable Value</b>     | The value to be populated in the InterUnit Balancing Line ID field for the intraunit payable balancing entries generated by the processor.                                     |
| <b>IntraUnit Receivable Value</b>  | The value to be populated in the InterUnit Balancing Line ID field for the intraunit (or InterEntity and IntraEntity) receivable balancing entries generated by the processor. |
| <b>Document Locking Field</b>      | Name of the field that is used to logically lock the transaction while it is being processed.                                                                                  |

| <b>Field or Control</b>            | <b>Description</b>                                                                                                                                                                                                                                                                      |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Commit After Lock</b>           | Selected to commit the data after updating the Documenting Locking Field.                                                                                                                                                                                                               |
| <b>Where Clause</b>                | Static part of the selection criteria. The Where Clause can refer to fields on both the line record and the optional header record. All references to fields from the line record use the record alias LN_A and all fields from the header record use the record alias HDR.             |
| <b>Document Grouping Fields</b>    | The list of fields that together define a unique document, such as a general ledger Journal or an accounts payable voucher. If the optional Header Record is used, then the Document Grouping Fields must come from the Header Record. Otherwise, the fields come from the Line Record. |
| <b>Transaction Grouping Fields</b> | List of fields that identify unique transaction groups within a document. Transaction grouping fields are optional unless you want to use a transaction level status. You do not repeat the Document Grouping fields in this section.                                                   |

This example illustrates the fields and controls on the System Transaction Page 2 (3 of 4). You can find definitions for the fields and controls later on this page.

|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Header/Line Join Fields</b>   | If the System Transaction utilizes the optional header record, list the fields that are used to link the header record with its corresponding line record.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Header Status Fields</b>      | The field or fields on the header record that carry a status value for the document. You can specify different status values for Valid, Error (for example, setup related errors) or Unbalanced (non-setup related out of balance errors). The Valid value is optional, and the processor performs more efficiently if this value is set in the calling application.                                                                                                                                                                                                                              |
| <b>Document Status Fields</b>    | The field or fields on the line record that carry a status value for the document. You can specify different status values for Valid, Error (for example, setup related errors) or Unbalanced (non-setup related out of balance errors). All of the accounting entry lines for the document, both the original entries and any balancing entries generated by the processor, are updated with the same status value. The Valid value is optional, and the processor performs more efficiently if this value is set in the calling application.                                                    |
| <b>Transaction Status Fields</b> | <p>The field or fields on the line record that carry a status value for the transaction group within a document. You can specify different status values for Valid, Error (such as setup related errors) or Unbalanced (non-setup related out of balance errors).</p> <p>All of the accounting entry lines for the transaction group, both the original entries and any balancing entries generated by the processor, is updated with the same status value.</p> <p>The Valid value is optional, and the processor performs more efficiently if this value is set in the calling application.</p> |
| <b>Other Balancing Fields</b>    | Additional balancing fields can be specified; however the processor performs more efficiently if these values are set in the calling application.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

This example illustrates the fields and controls on the System Transaction Page 2 (4 of 4). You can find definitions for the fields and controls later on this page.

Other Fields To Populate

Personalize | Find | First 1-22 of 22 Last

| *Field Name        | *Field Source          | Field Value |   |   |
|--------------------|------------------------|-------------|---|---|
| ACTIVITY_ID        | Constant Value         | ' '         | + | - |
| ANALYSIS_TYPE      | Constant Value         | ' '         | + | - |
| BUDGET_DT          | Inherit From All Lines |             | + | - |
| BUDGET_LINE_STATUS | Constant Value         | 'N'         | + | - |
| BUSINESS_UNIT_PC   | Inherit From All Lines | ' '         | + | - |
| CLOSING_STATUS     | Constant Value         | ' '         | + | - |
| DOC_SEQ_DATE       | Inherit From Header    |             | + | - |
| DOC_SEQ_NBR        | Inherit From Header    |             | + | - |
| DOC_SEQ_STATUS     | Inherit From Header    |             | + | - |
| DOC_TYPE           | Inherit From Header    |             | + | - |
| EE_PROC_STATUS     | Constant Value         | 'N'         | + | - |
| ENTRY_EVENT        | Inherit From All Lines |             | + | - |
| JOURNAL_LINE_DATE  | Inherit From All Lines |             | + | - |
| JOURNAL_LINE_GFEE  | Constant Value         | 0           | + | - |
| JRNL_LINE_STATUS   | Constant Value         | '0'         | + | - |

| Field or Control         | Description                                                                                                                                                                                           |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Other Fields to Populate | List other fields on the line record that are not defined elsewhere on this page, and specify how they are to be formatted on the new inter and intraunit balancing entries created by the processor. |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Name</b>       | <p>The name of the field to be populated.</p> <p>Fields that are not be listed here include any field that is specified elsewhere on the System Transaction, including:</p> <ul style="list-style-type: none"> <li>• GL (general ledger) Business Unit</li> <li>• Foreign Currency and Amount</li> <li>• Base Currency and Amount</li> <li>• Description</li> <li>• Accounting Date</li> <li>• Rate Type</li> <li>• Rate Multiplier and Divisor</li> <li>• Sequence Field</li> <li>• InterUnit Balancing Line ID</li> <li>• Document Locking Field</li> <li>• Document Grouping Fields</li> <li>• Transaction Grouping Fields</li> <li>• Status Fields (both Document and Transaction)</li> <li>• ChartFields (those on standard subrecord, plus DeptID and Project ID)</li> </ul> <hr/> <p><b>Note:</b> Project ID is included in the PCADJ system transaction which is a valid exception.</p> <hr/> <ul style="list-style-type: none"> <li>• Process Instance</li> <li>• Ledger Group</li> <li>• Ledger</li> <li>• IU Anchor Flag</li> <li>• IU System Transaction</li> <li>• IU Transaction Code</li> </ul> |

---

**Note:** Currency Effective Date can be specified in the Other Fields to Populate definition as long as it is not the same field as the Accounting Date.

---

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Source</b>     | <p>Specify how the field is to be populated. Valid values include:</p> <ul style="list-style-type: none"> <li>• <i>Constant Value</i> - use the value entered in the Field Value field on this page.</li> <li>• <i>Date Stamp</i> - use the current system date.</li> <li>• <i>DateTime Stamp</i> - use the current system date and time.</li> <li>• <i>Inherit from All Lines</i> - when writing the anchor balancing entry use the value from the original anchor entry and when writing the nonanchor balancing entry, use the value from the original nonanchor entry.</li> <li>• <i>Inherit from Header</i> - when writing either the anchor or nonanchor balancing entry use the value from the corresponding header record.</li> <li>• <i>Inherit from Non-anchor</i> - when writing either the anchor or nonanchor balancing entry use the value from the original nonanchor entry.</li> </ul> |
| <b>Field Value</b>      | When the Field Source is <i>Constant Value</i> , specify the value to be populated in the Field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Reviewing Sample Parameters Provided at Run Time

The following section describes the sample parameters that you may select before running the process.

### Technical Requirements for calling the Centralized Inter and Intra Unit processor

If you are implementing a customization in which you want to utilize the Centralized Inter/IntraUnit Processor, consider the following requirements.

#### Calling the Centralized Interunit Processor

The Centralized Inter/IntraUnit processor (IU\_PROCESSOR) is an application engine program. In most cases it is called from within another application engine program, such as AP Voucher Post or GL Journal Edit. In some cases it is called directly from PeopleCode using the CallAppEngine built-in function.

When calling the processor, you must first populate the fields on the state record (IU\_PROCESS\_AET), as described in the following section. If you are calling the processor from another application engine program you must specify the Inter/IntraUnit Processor State Record in the list of state records for your program.

The inter and intraunit processor uses a temporary table (IU\_TRAN\_TAO) for some of its internal processing. If you call the processor from another application engine program you specify this record in the list of temporary tables for the calling application engine program. In this way, the dedicated instance is allocated at the beginning of the process. Please refer to the PeopleTools Application Engine documentation for additional information about allocating temporary tables.

When control is passed back to your application from the processor, check the value in the processor status field (IU\_STATUS) on the state record to determine if the processor encountered any errors during processing.

### **The InterUnit Processor State Record (IU\_PROCESS\_AET)**

The Inter/IntraUnit Processor State record is used to pass parameters between the calling program and the inter and intraunit processor. In Contains the Following Fields, list in the order that they appear on the record.

### **Process Instance (PROCESS\_INSTANCE)**

Process Instance is required on every application engine state record. This field is populated automatically by PeopleSoft tools.

### **Business Unit (BUSINESS\_UNIT)**

Insert a general ledger business unit value in this field if you want the inter and intraunit processor to generate balancing entries for just one business unit.

### **Header (Input) Record (HEADER\_RECORD)**

The Header Record is used to send related data for unprocessed accounting entries to the inter and intraunit processor for balancing. It may be a SQL Table, SQL View, or a Temporary Table.

### **Header Update Record (UPDATE\_HEADER\_REC)**

The Header Update Record is used to update the Header Status fields. It may be a SQL Table or a Temporary Table, and in most cases is the same as the Header (Input) Record, unless the Header (Input) Record is a SQL View.

### **Line (Input) Record (LINE\_RECORD)**

The Line Record is used to send unprocessed accounting entries to the inter and intraunit processor for balancing. It may be a SQL Table, SQL View, or Temporary Table. It must contain the following fields:

- GL (general ledger) Business Unit.
- Foreign Currency.
- Foreign Amount.
- Accounting Date (may be on line or optional header).
- Rate Type (may be on line or optional header).
- Currency Effective Date (may be on line or optional header; may be the same as the accounting date).
- ChartFields (those on standard subrecord, plus DeptID and Project ID).
- Ledger Group (LEDGER\_GROUP).
- Ledger (LEDGER).

- IU Anchor Flag (IU\_ANCHOR\_FLG).
- IU System Transaction (IU\_SYS\_TRAN\_CD).
- IU Transaction Code (IU\_TRAN\_CD).

---

**Note:** Where a field name is not specified, any field name may be used because it is defined on the system transaction definition.

---

### Line Update Record (UPDATE\_LINE\_REC)

The **Line Update Record** is used to update the Document and Transaction Status fields on the original accounting entries. It may be a SQL Table or a Temporary Table, and in most cases is the same as the Line (Input) Record, unless the Line (Input) Record is a SQL View.

### Line Insert Record (INSERT\_LINE\_REC)

The **Line Insert Record** is the record to which the processor inserts the inter and intraunit balancing entries that it creates. It may be a SQL Table or a Temporary Table, and in most cases is the same as either the Line (Input) Record or the Line Update Record.

You may wish to use a different Line Insert Record if it is necessary for the calling application to perform additional manipulation of the inter and intraunit balancing entries prior to inserting them in the accounting entry table. For example, if the calling application has non-standard rules regarding sequence numbering, it might be better to perform this function after the processor creates the balancing entries, rather than having the processor assign sequence number.

### Line Work Record (LINE\_WRK\_REC)

The Line Work Record is used internally within the Inter/IntraUnit Processor. It may be a SQL Table or a Temporary Table. It should contain all of the same fields as the Line Record, plus the following additional fields (if they are not already on the Line Record):

- Process Instance (PROCESS\_INSTANCE).
- InterUnit Line Type (IU\_LINE\_TYPE).
- If the Account Balance Group option on the System Transaction is selected, then the work record must also contain the Account Balance Group (ACT\_BAL\_GRP) field.

---

**Note:** If there are fields on the Line Insert Record that should always be populated with the PeopleTools default value (the default specified on the record definition, or blank for character fields and zero for numeric fields), then these fields do not have to be included on the Line Work Record. If you do choose to leave the fields off the Line Work Record, then you should not specify them in the Other Fields to Populate section of the System Transaction definition.

---

### Line Work Record #2 (LINE\_WRK2\_REC)

The Line Work Record #2 is used internally within the Inte/IntraUnit Processor. It may be a SQL Table or a Temporary Table. It should contain all of the same fields as the Line Work Record, plus the following additional fields (if they are not already on the Line Record):

Maximum Sequence Number (MAX\_SEQ\_NBR)

## Error Message Set and Number (MESSAGE\_SET\_NBR and MESSAGE\_NBR)

If the Status returned by the processor is Complete with Errors (IU\_STATUS = 1), these fields contain the message set and message number for the appropriate error message.

## Inter/IntraUnit Processor Status (IU\_STATUS)

The IU Processor Status has the following valid values:

0 - Complete without errors.

1 - Complete with errors.

2 - Incomplete.

It is best practice to set the Status equal to 2 - Incomplete when you populate the state record prior to calling the Inter/IntraUnit Processor. When the processor returns control to the calling program, the status is set to either 0 - Complete without Errors or 1 - Complete with Errors.

## Dynamic Where Clause, part 1 (SQL\_STMT\_254)

The Dynamic Where Clause is used to specify selection criteria that changes each time the processor is called. Selection criteria that is constant or static is typically defined on the System Transaction definition, but can also be included here if desired.

The where clause can refer to fields on both the line record and the optional header record. All references to fields from the line record use the record alias LN\_A and all fields from the header record use the record alias HDR.

If the where clause exceeds 254 characters, you can use the field IU\_WHERE\_SQL below instead of or in addition to this field.

## System Transaction Code (IU\_SYS\_TRAN\_CD)

If all of the transactions on your Line (Input) Record are for the same InterUnit System Transaction Code, or if you want to process entries for a System Transaction only, then you specify the System Transaction Code in this field in the state record. This makes the processor run more efficiently.

If your Line (Input) Record contains transactions for more than one System Transaction and you want to process them with one call to the processor, you can leave this field blank.

## Dynamic Where Clause, part 2 (IU\_WHERE\_SQL)

Continuation of the Dynamic Where Clause, as described above. If your *where* clause exceeds 254 characters, you can use this long character field instead of or in addition to the SQL\_STMT\_254 field described above.

## Specifying Anchor Values for the Inter/IntraUnit Processor

The Inter/IntraUnit Processor looks for the accounting entry line whose InterUnit Anchor (IU\_ANCHOR\_FLG) is set equal to Y to determine the anchor business unit and anchor values for other balancing ChartFields for each transaction group (or document group if transaction group by fields are not used).

It is important that each transaction group (or document group if transaction group-by fields are not used) has one and only one accounting entry identified as the anchor entry per ledger.

The line marked as the *anchor* line (IU\_ANCHOR\_FLG = Y) affects how the due to and due from lines are formatted. For example, assume that you call the interunit and intraunit processor to process the following lines:

| <b>BUSINESS_UNIT</b> | <b>AMOUNT</b> | <b>IU_ANCHOR_FLG</b> | <b>AFFILIATE</b> |
|----------------------|---------------|----------------------|------------------|
| US001                | -100          | Y                    |                  |
| US002                | 60            | N                    |                  |
| US003                | 40            | N                    |                  |

Based on the processing of the preceding information, the processor creates the following lines:

| <b>BUSINESS_UNIT</b> | <b>AMOUNT</b> | <b>IU_ANCHOR_FLG</b> | <b>AFFILIATE</b> |
|----------------------|---------------|----------------------|------------------|
| US002                | -60           | N                    | US001            |
| US001                | 60            | N                    | US002            |
| US003                | -40           | N                    | US001            |
| US001                | 40            | N                    | US003            |

However, if you change the original assumption so that the second line and not the first line has the value Y and is the anchor, the due to and from lines created by the processor then appear as follows:

| <b>BUSINESS_UNIT</b> | <b>AMOUNT</b> | <b>IU_ANCHOR_FLG</b> | <b>AFFILIATE</b> |
|----------------------|---------------|----------------------|------------------|
| US001                | 100           | N                    | US002            |
| US002                | -100          | N                    | US001            |
| US003                | -40           | N                    | US002            |
| US002                | 40            | N                    | US003            |

The following example illustrates how the IU\_ANCHOR\_FLG determines the transaction (foreign) currency and amount of the due to and from lines for a cross currency transaction. The processor rule

is that the due to and from lines have the transaction currency and amount of the non-anchor line. For example, assume the processor is run for the following transaction lines:

| <b><i>BUSINESS_UNIT</i></b> | <b><i>FOREIGN_AMOUNT</i></b> | <b><i>BASE_AMOUNT</i></b> | <b><i>IU_ANCHOR_FLG</i></b> | <b><i>AFFILIATE</i></b> |
|-----------------------------|------------------------------|---------------------------|-----------------------------|-------------------------|
| US001                       | -100 USD                     | -100 USD                  | Y                           |                         |
| US002                       | 150 CAD                      | 100 USD                   | N                           |                         |

The following lines are generated by the processor given the previous assumptions:

| <b><i>BUSINESS_UNIT</i></b> | <b><i>FOREIGN_AMOUNT</i></b> | <b><i>BASE_AMOUNT</i></b> | <b><i>IU_ANCHOR_FLG</i></b> | <b><i>AFFILIATE</i></b> |
|-----------------------------|------------------------------|---------------------------|-----------------------------|-------------------------|
| US002                       | -150 CAD                     | -100                      | N                           | US001                   |
| US001                       | 150 CAD                      | 100 USD                   | N                           | US002                   |

## MultiBook entries and the Inter/IntraUnit Processor

If the calling application supports PeopleSoft MultiBook processing, then the application typically generate accounting entries for both the primary and secondary ledgers prior to calling the processor. In this case, one entry for the primary ledger and all of its corresponding secondary ledger entries are all flagged as anchor entries for each transaction group (or document group if transaction group-by fields are not used).

The following is an example from General Ledger of the type of parameters provided at run-time when calling the Central Inter/IntraUnit Processor:

| <b><i>Field or Control</i></b>         | <b><i>Description</i></b>                                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>JRNL_HEADER</b>                     | Header record name                                                                                                                                                   |
| <b>JRNL_HEADER</b>                     | Header Update record name                                                                                                                                            |
| <b>JRNL_LN joined with JRNL_HEADER</b> | Line record name                                                                                                                                                     |
| <b>JRNL_LN</b>                         | Line Update record name                                                                                                                                              |
| <b>JRNL_LN or JRNL_LN_TMP</b>          | Line Insert record name<br><br>Uses JRNL_LN_TMP if additional manipulation is needed.<br>For example, re-assigning Journal Line numbers before inserting to JRNL_LN. |

| <b>Field or Control</b>                          | <b>Description</b>                  |
|--------------------------------------------------|-------------------------------------|
| <b>Additional WHERE clause for the journals.</b> | Dynamic selection criteria          |
| <b>Process Business Unit</b>                     | Process one business unit at a time |

The JRNL\_IU\_ANCHOR table with the following fields maintains inter and intraunit anchor values:

| <b>Field or Control</b>                                        | <b>Description</b>                                                                                                                                                                  |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BUSINESS_UNIT, JOURNAL_ID, JOURNAL_DATE, and UNPOST_SEQ</b> | These fields provide the keys that link multiple journals together. Journals within the unique set of keys provide by these fields are pulled together into the Journal Entry page. |
| <b>IU_TRAN_GRP_NBR</b>                                         | The key that links unique inter and intraunit transaction groups under the set of interunit journals.                                                                               |
| <b>BUSINESS_UNIT_IU</b>                                        | The key Anchor business unit.                                                                                                                                                       |
| <b>Configurable ChartFields</b>                                | Excludes ACCOUNT, ALTACCT, CURRENCY_CD, STATISTICS_CODE, for example.                                                                                                               |

The table is also used to identify inter and intraunit journals because non-interunit journals have no entries in this table.

The following fields in the JRNL\_HEADER table support calling of the interunit processor:

| <b>Field or Control</b> | <b>Description</b>                                                           |
|-------------------------|------------------------------------------------------------------------------|
| <b>IU_SYS_TRAN_CD</b>   | InterUnit System Transaction Code, for example <i>GLJ</i> .                  |
| <b>IU_TRAN_CD</b>       | InterUnit Transaction Code, for example <i>JOURNAL</i> and <i>EXPALLOC</i> . |

The following fields on the JRNL\_LN table must be populated properly before calling the Iinter and intraunit processor:

| <b>Field or Control</b> | <b>Description</b>                                                                               |
|-------------------------|--------------------------------------------------------------------------------------------------|
| <b>IU_ANCHOR_FLG</b>    | Indicates which journal line contains the Anchor Business Unit value or anchor ChartField value. |

| <b>Field or Control</b> | <b>Description</b>                                                |
|-------------------------|-------------------------------------------------------------------|
| <b>IU_TRAN_GRP_NBR</b>  | Groups a set of journal lines as a set of intraunit transactions. |

## Using Mass Maintenance for Interunit Pairs

### Pages Used to Perform Interunit Pair Mass Maintenance

| <b>Page Name</b>                                     | <b>Definition Name</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                          |
|------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>Interunit Pair Mass Maintenance - Export Page</u> | IU_PAIRS_EXPORT        | Enter criteria to query the InterUnit Pairs Billing and Transfer Options and, if you choose, the ChartField Values tables to generate a Microsoft Excel worksheet to do interunit pairs mass maintenance.                                                                                                                             |
| URL Maintenance Page                                 | URL_TABLE              | As an option, you might want to change the storage location of the file attachment to another location.<br><br>See <a href="#">Setting Up Your System for Importing the Excel Worksheets</a> .<br><br>See also the product documentation for <i>PeopleTools: System and Server Administration</i> , “Using Administration Utilities.” |
| <u>InterUnit Pair Mass Maintenance – Import Page</u> | IU_PAIRS_IMPORT        | Preview your interunit pairs mass maintenance for actions to be taken. Import the final revision of your interunit pairs mass maintenance files to update the database.                                                                                                                                                               |

### Understanding Mass Maintenance for Interunit Pairs

When the sheer number of GL business unit pairs makes it impractical to update interunit pairs online, PeopleSoft provides mass maintenance capabilities using Microsoft Excel worksheets. You can do the following:

- Export interunit pairs for mass maintenance.
- Make changes using Excel worksheets.
- Set up your system for import the Excel worksheets.
- Preview your changes and update the database.

Using the Export to Excel feature you can export from one or both of the following InterUnit Pairs tables to Excel worksheets in the .xls file format to do your maintenance:

- IU\_INTER\_PR\_TR contains interunit pairs with billing and transfer options.
- IU\_INTER\_PR\_CF contains associated ChartField values.

After making your changes, save the worksheets in the CSV (comma delimited) file format. You can then preview the actions to be taken before updating your database tables using the Preview feature.

When you are ready to update your database, the changes are incorporated directly to the interunit pairs tables using the Application Engine process, IU\_PAIRS\_MAINT.

---

**Warning!** If a business unit pair has been exported for mass maintenance but not yet imported, no updates should be made to the pair using the online Interunit Pair page . Online updates made after the export are subsequently overwritten when data is imported with the same key values.

---

## Prerequisites

Microsoft Excel 97 or a later version must be installed to use interunit pairs mass maintenance. Excel displays an error message when a worksheet exceeds 64k rows.

Because the Export page is subject to business unit row level security, you must have the appropriate level of security to access interunit pairs for mass maintenance.

## Interunit Pair Mass Maintenance - Export Page

Use the Interunit Pair Mass Maintenance - Export page (IU\_PAIRS\_EXPORT) to enter criteria to query the InterUnit Pairs Billing and Transfer Options and, if you choose, the ChartField Values tables to generate a Microsoft Excel worksheet to do interunit pairs mass maintenance.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Inter/Intra Unit >InterUnit Pair Mass Maint >Export**

This example illustrates the fields and controls on the InterUnit Pair Mass Maintenance - Export page. You can find definitions for the fields and controls later on this page.

Using the Business Unit Pairs Selection criteria you can create one or more files that contain the interunit pairs, associated transaction codes, billing options, and transfer options.

For each of the files created by your Business Unit Pairs Selection criteria, you can use the ChartField Selection criteria to optionally create an additional file to maintain the associated ChartField values.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Selection ID</b>     | <p>Enter a user-defined value to uniquely identify the set of selection criteria you specify for interunit pairs and associated ChartFields to be exported. One or two Excel worksheets are produced for each Selection ID depending on whether you elect to Include ChartField Values in the mass maintenance. You can affect the size of the resulting Excel worksheets by limiting the number of business unit pairs specified for a particular Selection ID.</p> <p>Do not define multiple Selection IDs which select the same pairs data or you may inadvertently overwrite previous updates when you import your data.</p> |

| <b>Field or Control</b>                                 | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>From GL Unit , To GL Unit , and Transaction Code</b> | <p>Using the following selection methods, enter a set or subset of your interunit pair criteria to produce a manageable worksheet.</p> <p>In the initial drop down edit box, if you select these fields:</p> <ul style="list-style-type: none"> <li>• <i>equal to or not equal to</i>- Select a specific value in the associated prompt edit box. If you leave this field blank, the system selects all values.</li> <li>• <i>In or Not In</i> – Enter a comma delimited list in the free form edit box. You cannot enter a range of values. Enter each value and separate it from any following value by a comma. If you leave this field blank, the system selects all values.</li> <li>• <i>Like or Not Like</i> – Enter a wildcard value in the free form edit box, for example FRA% to include all business units beginning with FRA. If you leave this field blank, the system selects all values.</li> </ul> |
| <b>Process Instance</b>                                 | After the export to Excel is completed, the process instance for the file produced from the Business Unit Pairs Selection criteria for this Selection ID is displayed here and is also incorporated into the Excel file name for ease of identification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Include ChartField Values</b>                        | If associated ChartField values are to be included in your pairs maintenance, select this check box and provide ChartField Selection criteria to produce a second worksheet for the same Selection ID and sharing the criteria specified in your Business Unit Pairs Selection criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Account Balancing Group</b>                          | Select or enter criteria to identify any associated Account Balancing Group. If you leave this field blank, the system selects all values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Entry Type</b>                                       | Select or enter an associated Entry Type. If you leave this field blank, the system selects all values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Process Instance</b>                                 | After the export to Excel is completed, a process instance for the file produced from the ChartField Selection criteria for this Selection ID is displayed here and is also incorporated into the Excel file name for ease of identification.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Field or Control</b>          | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Export to Excel</b>           | When you select the Export to Excel button, the system returns an error message if the criteria you specify would result in a worksheet that exceeds the 64,000 row limit for Excel. This requires adjustment of the selection criteria to achieve the reduced worksheet size. One or two (if Include ChartField Values is selected) queries are run for each Selection ID specified. Each query generates a spreadsheet (.xls) that is posted to the Report Repository. Each field on the source pairs tables has an equivalent column on the worksheet. An additional column, labeled Delete, is added to each worksheet. Use it to specify that a row is to be deleted by the import process. Use Excel functionality to make other changes and additions to the data. |
| <b>Pairs Maintenance Reports</b> | Click to access the Excel worksheets in the report repository. The process instance is incorporated in the worksheet file name for ready recognition of specific worksheets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Process Monitor</b>           | Access the Process Monitor to see the progress or status of the export process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

If your exported worksheet is empty this indicates no data met your selection criteria.

---

**Note:** Although data values may appear in fields that do not apply to particular transaction codes, these fields should be ignored for those transaction codes. For example, the Print Invoice field should be ignored for the *GENERAL* transaction code since it is not mapped to the Billing Invoice System Transaction.

---

## Making Changes Using Excel Worksheets

Using the Pairs Maintenance Reports link on the Export page to access the report repository to locate and open the Excel (.xls) worksheet in which you want to make changes. You can manipulate the data using Excel worksheet functionality; however, to delete a row you must enter a *Y* in the Delete column, located to the far right of the worksheet after the interunit pairs data columns. Do not delete rows loaded from the interunit pairs source tables using the Excel row delete functionality.

Worksheets containing billing and transfer options (from the IU\_INTER\_PR\_TR table) cannot be combined with worksheets containing ChartField values (from the IU\_INTER\_PR\_CF table). If you select to create a Chartfield value worksheet, each row must have a corresponding row in a billing and transfer options worksheet with the same values for:

- From GL Unit
- To GL Unit
- Transaction Code

The following fields in the billing and transfer options worksheet apply to a Transaction Code only if it is mapped to the Billing Invoice System Transaction:

- Print Invoice

- Generate AR Open Item
- Generate AP Voucher
- AP Unit
- Supplier
- Location

The following fields in the billing and transfer options worksheet apply to a Transaction Code only if it is mapped to the Cost Management InterUnit Transfer System Transaction:

- Ownership Unit
- InterCompany Processing
- BI Unit
- Customer

If values are specified in the fields above for Transaction Codes to which they do not apply, the import process will overwrite these values with either the field default (if one is defined) or blanks.

You can open, work on and save the worksheets in the file repository or copy the file to your local drive to do your changes in the .xls file format.

When you have completed your changes, save the worksheet either in the file repository or on your local drive as a CSV (comma delimited) Excel file.

You can then either preview or immediately update your database using the Import page.

If further changes need to be made as a result of your preview, open the worksheet in the .xls format, make your changes and save the file in the CSV (comma delimited) format. You can again preview your changes and actions to be taken before updating your database.

Note: Do not modify column headings or insert/delete columns in the worksheet. The Import process requires that this column information remain unchanged.

## Setting Up Your System for Importing the Excel Worksheets

Use the File Locations component (FILE\_LOC) to setup file locations in conjunction with URL maintenance.

Use the URL Maintenance page (URL\_TABLE) to maintain URL information; for example, change the storage location of the file attachment to another location.

Navigation:

**PeopleTools >Utilities >Administration >URLs >URL Maintenance.**

This example illustrates the fields and controls on the URL Maintenance page. You can find definitions for the fields and controls later on this page.

## URL Maintenance

**URL Identifier:** IU\_PAIRS\_IMPORT

**Description:**

**URLID:**

**Comments:**

The InterUnit Pairs Mass Maintenance use this to store files submitted for processing.  
 To store files in a database record, set URL = record://<reaname>  
 (The default URL store files in the database record PSFILE\_ATTDET)  
 To store files in the server, set URL = ftp://<user>:<password>@<server>.com

[URL Properties](#)

The interunit pairs text file import process (IU\_PR\_IMPORT) may require the following setup:

- The storage location of the file attachment is defined by the URL definition IU\_PAIRS\_IMPORT. By default, it points to a database record. You may want to change the storage location of the file attachment to another location, such as an FTP server. This is optional.
- You are required to define an environmental variable, PS\_FILEDIR. This variable defines the temporary flat file location on the process scheduler that runs the file import process. If you have a Unix or OS390 process scheduler, you define this in the psconfig.sh file. If you have an NT process scheduler, you define this in the control panel. Refer to the PeopleTools description for GetFile() PeopleCode for additional details, or consult your system administrator.
- If you are using Unicode, the CSV file needs to be in a Unicode format. Excel by default does not save CSV as a Unicode file. You can open in Notepad and save as a Unicode.
- If the file contains duplicate values, it does not process any information for that business unit.
- If there is an error in the import excel file, you need an error message indication.

See “Understanding File Attachments and PeopleCode”, *PeopleTools: PeopleCode Developer's Guide*.

## InterUnit Pair Mass Maintenance – Import Page

Use the Import page (IU\_PAIRS\_IMPORT) to preview your interunit pairs mass maintenance for actions to be taken.

Import the final revision of your interunit pairs mass maintenance files to update the database.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Inter/Intra Unit >InterUnit Pair Mass Maint >Import.**

This example illustrates the fields and controls on the InterUnit Pair Mass Maintenance – Import page. You can find definitions for the fields and controls later on this page.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Preview</b>          | <p>Select to preview the actions to be taken by the system as the result of your changes before actually updating the interunit pairs tables in your database. Preview loads your worksheets, which you attach in CSV format, to a worktable when you click the Import button.</p> <p>The system inserts an Action column to the right of the Delete column and assigns one of the following Action values to each row based on your changes:</p> <ul style="list-style-type: none"> <li>• Insert – The row does not exist in the original interunit source table and will be inserted.</li> <li>• Update – The row exists in the original interunit source table and the values in your worksheet will replace existing values in the source table.</li> <li>• Duplicate – One or more rows in your worksheet have the same key values. Duplicate rows are errors and must be resolved before importing to the database.</li> <li>• DUMMY TEXT for completeness check.</li> </ul> <p>The Action column is for information purposes only. The import process ignores this column. Rows to be deleted are identified by a 'Y' in the Delete column and are not identified in the Action column.</p> <p>When you are ready to update your database, deselect the Preview check box prior to selecting the Import button.</p> |
| <b>Attached Files</b>   | <p>Attach worksheets in the CSV (comma delimited) file format. Enter a value or click Add Attachment to find your files. You can add multiple files to be processed in a single Import.</p> <p>Note: If you have already imported a CSV file in a previous run and are re-importing it, you must delete the previous CSV file row from the Import page and insert a new row for the updated file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Field or Control</b>          | <b>Description</b>                                                                                                                                                                                                                                   |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Import Text Files</b>         | When the Preview check box is not selected and you have attached files in the CSV (comma delimited) format, select this button to update the interunit pairs tables with your changes using the PeopleSoft Application Engine process, IU_PR_IMPORT. |
| <b>Pairs Maintenance Reports</b> | Click to access the system generated Excel worksheets in the report repository. The process instance is incorporated in the worksheet file name for ready recognition of specific worksheets.                                                        |
| <b>Process Monitor</b>           | Access the Process Monitor to see the progress or status of the import process.                                                                                                                                                                      |

The import process (IU\_PR\_IMPORT) will produce an Excel worksheet as output for each worksheet imported. This worksheet will list up to 5 error messages for each row of data imported. These errors must be corrected before the data can be successfully imported. If no errors are listed for a row and the Preview check box was not checked for the import run, that row successfully updated the database.

The error message 'InterUnit Pairs transaction does not exist' occurs when importing a ChartField value worksheet row for a GL BU pair/Transaction Code that does not exist in the billing and transfer options (header) table nor in a billing and transfer options worksheet being imported.

---

## Using ChartField Inheritance

To use and setup ChartField inheritance, use the ChartField Inheritance component (CF\_INHERIT) and the Detail Ledger Group component (DETAIL\_LEDGER\_GROU).

## Understanding ChartField Inheritance

ChartField inheritance, in and of itself, does not generate additional entries to complete a transaction. Instead it drives how the ChartFields are determined for the system-generated entries that are normally created for the transaction. In many cases this is an offset, such as AP (accounts payable) Vouchers, where the user enters the distribution lines and the system generates the customer liability. Inheritance also applies to other system generated entries that are not offsets, like the VAT entries generated for a GL (general ledger) journal.

---

**Note:** Even if you do not want to inherit any ChartField values, you must access the ChartField inheritance page to setup Inheritance Groups for each SetID, setting all Inheritance Options to *Do Not Inherit*.

---

ChartField Inheritance uses the ChartField Offset Balancing Method to complete transactions by *inheriting* ChartField values from partial entries, accounting lines or voucher lines to generate complete accounting entries. It is used extensively in education and governmental accounting, and to a lesser extent in commercial accounting.

It enables you to select automatically the source for certain ChartField values to complete partial entries for a given number of system generated accounting entries that are predefined by Inheritance Groups.

Inheritance functionality does not necessarily relate to centralized inter and intraunit processing. This is because it may or may not involve inter or intraunit transactions, and inheritance processing is performed by the individual general ledger feeder systems, such as Receivables and Payables to arrive at offset accounts before any inter and intraunit processing is required.

For example, when posting accounts payable vouchers, you can choose to have the Fund Code on the Vendor Liability entry derived from the Voucher Distribution Line, the GL Business Unit Definition ChartField Defaults, or the Accounting Entry Template.

When you balance on ChartFields other than business unit, and inherit ChartField values onto the system generated offset entries, the transaction often self-balances, making additional intraunit balancing entries unnecessary. For this reason, applications use inheritance functionality before calling the inter and intraunit processor.

The following terms and concepts are important to an understanding of ChartField Inheritance and the examples provided:

| <b>Term</b> | <b>Definition</b>                                                                                                                                                                                                                                                                            |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fund</b> | A fund is a fiscal and accounting entity with a self-balancing set of accounts recording cash and other financial resources, together with all related liabilities and residual equity or balances. Inheritance is often used with this ChartField, but can also be used for any ChartField. |

| <b>Term</b>                         | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Pooled Bank Account</b>          | <p>Pooled is a term used in education and governmental accounting to describe a single bank account that is used for multiple funds. When defining a pooled bank account, you do not associate it with any specific fund or funds. Instead, the fund from the item and or voucher being paid is carried forward (inherited) to the cash entry.</p> <p>The PeopleSoft equivalent of a Pooled bank account is one in which the Inheritance Option for the Fund ChartField is set to Always Inherit or Inherit Within Unit.</p>                                           |
| <b>Non-pooled Bank Account</b>      | <p>Non-pooled is a term used in education and governmental accounting to describe a bank account that is for a single fund, which is identified on the bank account definition. If a non-pooled bank account is used for payments of items or vouchers belonging to other funds, then InterFund entries must be generated to balance the transaction.</p> <p>The PeopleSoft equivalent of a Non-pooled bank account is one in which the Inheritance Option for the Fund ChartField is set to Do Not Inherit.</p>                                                       |
| <b>Offset Inheritance Balancing</b> | <p>For transactions that include system-generated entries (often as offset entries), the system generated entries can be defined to inherit ChartField values from the other entries in the transaction (such as the distribution lines you entered) to balance the transaction and distribute the offset as needed.</p> <p>For example, you enter a voucher that records expenses to two different funds. Using Offset Inheritance, the offsetting entries are properly distributed by the system to the appropriate accounts payable accounts for the two funds.</p> |

## ChartField Inheritance Page

Use the ChartField Inheritance page (CF\_INHERIT) to maintain the Inheritance Options for an Inheritance Group.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Design ChartFields >ChartField Inheritance >Define CF Inheritance Options**

This example illustrates the fields and controls on the ChartField Inheritance page. You can find definitions for the fields and controls later on this page.

| <b>Inheritance Group</b> | <p>Along with SetID, this it is a key field for the table. PeopleSoft delivers the following predefined Inheritance Groups for its various products:</p> <ul style="list-style-type: none"> <li>• Expense Control Accounts</li> <li>• Expenses Payroll Offset</li> <li>• Expenses Cash Advance Recon</li> <li>• Expenses VAT Non-Recoverable</li> <li>• GL Journal VAT Input Other</li> <li>• GL Journal VAT Non-Recoverable</li> <li>• GL Journal VAT Output</li> <li>• Payables Header-Level Entries</li> <li>• Payables Distrib-Level Entries (payables distribution - level entries)</li> <li>• Payables VAT Non-Recoverable</li> <li>• Promotions Mgmt (management) Accounts</li> <li>• Purchasing Control Accounts</li> <li>• Purchasing Expense Accounts</li> <li>• Purchasing VAT Non-Recoverable</li> <li>• Receivables Revaluation</li> <li>• Receivables and Billing</li> <li>• Treasury VAT Input Other</li> <li>• Treasury VAT Non-Recoverable</li> <li>• Treasury VAT Output</li> </ul> |
| <b>ChartField</b>        | <p>The page is pre-populated with the fully and partially configurable ChartFields other than Account, Alternate Account and the Affiliates.</p> <p>Account and Alternate Account are not available for inheritance and Affiliate values are automatically supplied by the system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Field or Control</b>   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Inheritance Option</b> | <p>The following ChartField Inheritance options apply to all Inheritance Groups:</p> <ul style="list-style-type: none"> <li>• <i>Do Not Inherit</i>– When this option is selected, you can specify a value for the ChartField on the product specific Accounting Entry Template or you can leave the value blank. This option would usually not be selected for a balanced ChartField, unless you select the Intra Unit Balancing Entries check box on the Detail Ledger Group - Balancing page.</li> <li>• <i>Use Unit Default</i>– When this option is selected, the ChartField value is the default value that you enter in the Inheritance Defaults for the business unit on the General Ledger Definition – Inter/IntraUnit page. With this option, you do not enter a value for this ChartField on a product specific Accounting Entry Template.</li> <li>• <i>Inherit within Unit</i>– If this option is selected, the ChartField value is inherited from one of the other entries on the transaction, but only if the other entry is in the same business unit. Otherwise, the business unit Default is used. You may want to select this option if the ChartField values are not shared across all business units. With this option you do not enter a value for this ChartField on the product specific Accounting Entry Template page.</li> <li>• <i>Always Inherit</i>– If you select this option, the ChartField value is always inherited from one of the other entries that make up the transaction, regardless of whether it is in the same business unit. This option should only be selected if all business units share the same ChartField values; otherwise, the inherited value might be invalid. With this option, you do not enter a value for the ChartField on the product specific Accounting Entry Template or setup page.</li> </ul> <p>Some Inheritance Groups have edits that restrict which inheritance options are valid for each ChartField, often based on whether or not the ChartField is balanced. Refer to the next section for details.</p> |

Refer to the documentation for ChartField Inheritance for each product for variations in functionality or information specific to that product.

## Dealing with ChartField Inheritance Groups Requiring Special Validation with Balanced ChartFields

For some Inheritance Groups, the Inheritance Options are restricted based on whether or not ChartFields are balanced ChartFields. For this reason, the Inheritance Options table shares the same Record Group control as the Ledger Group definition. There may be multiple Ledger Groups defined for a given SetID. If any one of these Ledger Groups, having a Ledger Group Type of Standard or Translation, defines a ChartField as balanced, the ChartField is considered balanced for Inheritance Option validation.

This cross-validation occurs when you save the ChartField Inheritance page or the Detail Ledger Group page. If you change a ChartField from balancing to non-balancing or vice versa for a Ledger Group, the system checks whether the change has invalidated any existing ChartField inheritance groups. When you select Inheritance Options for an Inheritance Group, the system checks for balancing ChartFields that make the selected Option invalid.

The specific validation requirements for the individual product Inheritance Groups depends not only on whether balanced or non-balanced ChartFields are involved but in the case of accounts payable on whether the posting method is Summary Control or Detail Offset.

If you receive an error message when saving either the ChartField Inheritance page or the Detail Ledger Group - Inter/IntraUnit page, refer to the following table for correct settings:

| <b><i>Inheritance Group</i></b>                           | <b><i>Valid Options for a Balanced ChartField</i></b> | <b><i>Valid Options for a Non-Balanced ChartField</i></b> |
|-----------------------------------------------------------|-------------------------------------------------------|-----------------------------------------------------------|
| <b>Payables</b> (When the Post Method is Summary Control) |                                                       |                                                           |
| APCA - Control                                            | Use Unit Default                                      | Use Unit Default, Do Not Inherit                          |
| APEA - Expense                                            | Always Inherit                                        | Any of the 4 options                                      |
| APVN - Non-Recoverable VAT                                | Always Inherit, Inherit Within Unit                   | Any of the 4 options                                      |
| <b>Payables</b> (When the Post Method is Detail Offset)   |                                                       |                                                           |
| APCA - Control                                            | Always Inherit, Inherit Within Unit                   | Any of the 4 options                                      |
| APEA - Expense                                            | Always Inherit                                        | Any of the 4 options                                      |
| APVN - Non-Recoverable VAT                                | Always Inherit, Inherit Within Unit                   | Any of the 4 options                                      |
| <b>Purchasing</b>                                         |                                                       |                                                           |
| POCA - Control                                            | Always Inherit                                        | Any of the 4 options                                      |
| POEA - Expense                                            | Always Inherit                                        | Any of the 4 options                                      |
| POVN - Non-Recoverable VAT                                | Always Inherit                                        | Any of the 4 options                                      |
| <b>Receivables</b>                                        |                                                       |                                                           |
| ARRE - Revaluation Gain/Loss                              | Always Inherit                                        | Any of the 4 options                                      |

| <b><i>Inheritance Group</i></b> | <b><i>Valid Options for a Balanced ChartField</i></b> | <b><i>Valid Options for a Non-Balanced ChartField</i></b> |
|---------------------------------|-------------------------------------------------------|-----------------------------------------------------------|
| Translate Gain/Loss             | Always Inherit                                        | Any of the 4 options                                      |
| <b>Promotions Management</b>    |                                                       |                                                           |
| TDAC - Promotions Mgt Accounts  | Always Inherit                                        | Any of the 4 options                                      |

## Verifying Interunit, Intraunit, and ChartField Inheritance Setup

### Page Used to Verify Interunit, Intraunit and ChartField Inheritance Setup

| <b><i>Page Name</i></b>                        | <b><i>Definition Name</i></b> | <b><i>Usage</i></b>                                                                        |
|------------------------------------------------|-------------------------------|--------------------------------------------------------------------------------------------|
| <u>Inter/Intraunit - Setup Validation Page</u> | IU_AUDIT                      | Run the application engine audit program and specify desired queries to review audit data. |

## Understanding Verification of Interunit, Intraunit, and ChartField Inheritance Setup

Verifying inter and intraunit setup is very important when first installing your system for inter and intraunit processing and it is also important when any of the following events occur:

- You add new business units.
- You change or restructure your chart of accounts.
- You migrate a subsidiary to your corporate chart of accounts.
- You add or remove Inter/IntraUnit Transaction Codes.

With these and any like events, you typically perform verification to indicate if and where inter and intraunit setup data might be missing. It is advisable to run inter and intraunit setup verification on a periodic basis to catch inadvertent errors as well as after any major maintenance activity.

Using the PeopleSoft Application Engine process (IU\_AUDIT), you can identify missing setup data and run queries that download this data to Microsoft Excel worksheets to be printed, sorted or filtered as you choose.

The Application Engine program first validates inter and intraunit setup data and identifies missing setup data. It populates the following audit tables with the results:

| <b><i>Audit Table</i></b> | <b><i>Type of Audit</i></b>    | <b><i>Summary of Missing Data Identified in Audit</i></b>                                                                                                                                                       |
|---------------------------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IU_AUDIT_BU               | Business Unit Audit            | Identifies business units that require an InterUnit or IntraUnit Template but do not have them defined. It also lists business unit pairs that are not defined when the interunit balancing method is pairs.    |
| IU_AUDIT_TR               | Inter/IntraUnit Template Audit | Identifies missing InterUnit/ and IntraUnit Templates, Transaction Codes, Account Balance Groups and Entry Types.                                                                                               |
| IU_AUDIT_CF               | ChartField Value Audits        | Identifies missing ChartField values for a combination of Transaction Code, Account Balance Group and Entry Type for the general ledger business unit pair or Inter/IntraUnit Template indicated.               |
| IU_AUDIT_INH              | ChartField Inheritance Audits  | Identifies missing ChartField Inheritance Groups and, if also missing, their corresponding SQL Definitions based on installed products. Also lists missing bank account ChartField inheritance SQL Definitions. |

The application engine program then runs the queries selected by the user to extract the audit data and writes it to Microsoft Excel worksheets. A separate Excel worksheet is generated by each query and is posted to the Report Repository.

The Run Control page for the application engine program indicates the names of the queries that are available to run.

Setup validation queries lend themselves to use on an adhoc basis. For example, you enter a voucher involving business units US001 and FRAE1 and the post process fails due to missing interunit setup. In this instance you can run the application engine program, select the queries desired to see the data that is set up for each business unit and, if there is any missing data, go to the setup pages and make corrections.

---

**Note:** If you are using the InterUnit Pairs Method, you can use the related Inter/IntraUnit Mass Maintenance feature to facilitate correction of audit errors.

---

## Prerequisites

Microsoft Excel 97 or a later version must be installed to verify Inter/IntraUnit and ChartField Inheritance setup. Excel displays an error message when a worksheet exceeds 64,000 rows. If you receive this error message, it is necessary to correct some of the errors listed and rerun the application engine process (IU\_AUDIT).

## Inter/Intraunit - Setup Validation Page

Use the Setup Validation page (IU\_AUDIT) to run the application engine audit program and specify desired queries to review audit data.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Inter/Intra Unit >Validate Inter IntraUnit Setup**

This example illustrates the fields and controls on the Setup Validation page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Setup Validation' page. It has a title 'Setup Validation' in blue. Below the title is a list of six audit options, each with a checked checkbox: 'Business Unit Audit', 'Inter/IntraUnit Template Audit', 'ChartField Value Summary Audit', 'ChartField Value Detail Audit', 'ChartField Inheritance Audit', and 'Bank CF Inheritance Audit'. Below the list is a yellow button labeled 'Validate and Run Queries'. At the bottom of the page, there are two links: 'Validation Query Results' on the left and 'Process Monitor' on the right.

**Note:** To preclude the same errors being reported multiple times in subsequent audits, you might begin by running the audits one at a time, in the following order and correct any errors prior to running the next audit:

1. **Business Unit Audit**—Identify business units that require an InterUnit or IntraUnit Template but do not have them defined. It also lists business unit pairs that are not defined when the interunit balancing method is pairs.
2. **Inter/IntraUnit Template Audit**—Identify missing InterUnit and IntraUnit Templates, Transaction Codes, Account Balance Groups and Entry Types.
3. **ChartField Value Summary Audit**—Identify missing SetID/ChartField values. Each SetID/ChartField value is listed only once.
4. **ChartField Value Detail Audit**—Identify missing SetID/ChartField values for a combination of Transaction Code, Account Balance Group and Entry Type for the GL BU (general ledger business unit) pair or Inter/IntraUnit Template indicated.
5. **ChartField Inheritance Audit**—Identify missing ChartField Inheritance Groups and, if also missing, their corresponding SQL Definitions based on installed products.

6. **Bank ChartField Inheritance Audit**—Identify missing external bank account ChartField inheritance SQL Definitions.

The following provides an understanding the query results.

Query columns that do not apply based on the InterUnit Method selected are blank. For example, the From GL Unit and To GL Unit columns are blank if the InterUnit Method is not Pairs.

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Inter/IntraUnit Template Audit</b> | <p>Select this query to verify the following:</p> <ul style="list-style-type: none"> <li>• InterUnit Setup, Direct Method—Verify the InterUnit Template defined for each business unit is valid in the SetID specified under Record Group FS_59 for that business unit. Also verify all possible Transaction Code, Account Balance Group (if active Account Balance Groups are defined) and Entry Type combinations are defined on the InterUnit Template.</li> <li>• InterUnit Setup, Indirect Method—For each business unit (called the <i>driving</i> business unit), verify the InterUnit Template defined for each other business unit is valid in the SetID specified under Record Group FS_59 for the <i>driving</i> business unit. Also verify all possible Transaction Code, Account Balance Group (if active Account Balance Groups are defined) and Entry Type combinations are defined on each of the InterUnit Templates identified above.</li> <li>• InterUnit Setup, Pairs Method—Verify all possible Transaction Code, Account Balance Group (if active Account Balance Groups are defined) and Entry Type combinations are defined for each BU pair defined on the InterUnit Pairs table.</li> <li>• IntraUnit Setup—Based on Ledgers for a Unit, if a business unit is tied to a Ledger Group with the IntraUnit Balancing Entries option selected and that Ledger Group is valid in the SetID specified under Record Group FS_04 for that business unit, verify the business unit's IntraUnit Template is valid in the SetID specified under Record Group FS_59 for that business unit. Also verify all possible Transaction Code, Account Balance Group (if active Account Balance Groups are defined) and Entry Type combinations are defined on the IntraUnit Template.</li> </ul> <p>The Inter/IntraUnit Template Audit query produces a Microsoft Excel worksheet containing the following columns:</p> <ul style="list-style-type: none"> <li>• From GL Unit</li> <li>• To GL Unit</li> <li>• Business Unit</li> <li>• Set Control Value</li> <li>• Template SetID (from FS_59 Record Group)</li> <li>• InterUnit Template</li> <li>• IntraUnit Template</li> <li>• Transaction Code</li> <li>• Account Balancing Group</li> <li>• Entry Type</li> </ul> |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                         | <p>From GL Unit, To GL Unit and Business Unit are <i>driving</i> values that determine which template is being audited.</p> <p>Set Control Value is used to retrieve the Template SetID. It varies depending on the Interunit Method selected.</p> <p>Only Transaction Codes that are mapped to System Transactions are listed.</p> <p>When multiple active Account Balancing Groups are defined, they are only listed for Transaction Codes mapped to the GLJ System Transaction.</p> <p>Inter/IntraUnit Template, Transaction Code, Account Balance Group and Entry Type are hierarchical. If a higher level value is missing or invalid, there is no reason to validate the lower level values, so asterisks are placed in the lower level columns. For example, if an InterUnit Template is missing from a SetID, asterisks are placed in the Transaction Code, Account Balance Group and Entry Type columns. In the same way, if Transaction Code is missing from an InterUnit Template, asterisks are placed in the Account Balance Group and Entry Type columns. Once the higher level values are corrected, the audit is rerun to validate any lower level values that are required.</p> |

| <b>ChartField Value Summary Audit</b> and <b>ChartField Value Detail Audit</b> | <p>These two audits do similar tasks.</p> <p>ChartField Value Summary Audit summarizes data from the IU_AUDIT_CF audit table. It lists each missing SetID/ChartField Value one time.</p> <p>ChartField Value Detail Audit lists detail data from the IU_AUDIT_CF audit table. It lists each missing SetID/ChartField Value for every Transaction Code, Account Balance Group and Entry Type combination.</p> <p>Select these queries to verify the following:</p> <ul style="list-style-type: none"> <li>• <i>InterUnit Setup, Direct Method</i>— For each General Ledger Business Unit/InterUnit Template combination defined, obtain the SetID specified under Record Group FS_59 for that business unit. Using the SetID obtained and the InterUnit Template being processed, validate each ChartField value on the Template, using the business unit as the SetControlValue to obtain the SetID specified under that ChartField's Record Group.</li> <li>• <i>InterUnit Setup, Indirect Method</i>— For each business unit (called the <i>driving</i> business unit), obtain the SetID specified under Record Group FS_59. Using the SetID obtained, validate the InterUnit Template defined for the other business unit. For each template, validate each ChartField value, using the <i>driving</i> business unit as the SetControlValue to obtain the SetID specified under that ChartField's Record Group.</li> <li>• <i>IntraUnit Templates</i>— For each Business Unit and IntraUnit Template combination defined, obtain the SetID specified under Record Group FS_59 for that business unit. Using the SetID obtained and the IntraUnit Template being processed, validate each ChartField value on the Template, using the business unit as the SetControlValue to obtain the SetID specified under that ChartField's Record Group.</li> <li>• <i>InterUnit Pairs</i>— For each Business Unit pair defined on the InterUnit Pairs table, verify that the ChartField values for each populated ChartField are valid in the SetID specified under the Record Group for that ChartField using the From or To General Ledger Unit value as the Set Control Value as detailed in the topic InterUnit Pairs Audit Table A at the end of this section.</li> </ul> <p>The ChartField Value Summary Audit query produces a Microsoft Excel worksheet containing the following columns:</p> <ul style="list-style-type: none"> <li>• From GL Unit</li> <li>• To GL Unit</li> <li>• Business Unit</li> <li>• Template Setid (from FS_59 Record Group)</li> <li>• InterUnit Template</li> </ul> |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# Processing Allocations

---

## Understanding Oracle's PeopleSoft Allocations Process (FS\_ALLC)

Most businesses have some expenses or assets that are held or accumulated in one entity but must be shared by more than one business unit, department, or other entity. Typically, you allocate these balances and statistical quantities across the entities within the organization so that they recognize an appropriate share of the amounts.

Using the PeopleSoft Allocations process, you can define multiple allocation steps or step-down allocations when amounts must be applied according to a hierarchy and in a precise order, which might include allocations to multinational, national, and regional levels for the organization. Step-down allocations are used to determine not only how much general and administrative expense to charge to each business unit and department, but also what portion of that expense to attribute to individual projects or products.

Allocations offers the following advantages:

- Save allocation specifications for such recurring items as rent, utilities, and administrative expenses each time that they are allocated.
- Use time spans (rolling time frames) to automate the determination of accounting periods for the allocations.
- Generate journal entries, edit, and post them to update ledgers from the allocations process or choose to post them later in a separate process.
- Create calculation logs for a complete audit trail.
- Migrate allocation configuration data from one database to another.

When you are defining an allocation, first determine the desired end result. For example, the cost of renting an office building might be shared among the departments that are housed in that building. If rent is paid as a single amount and is initially charged to one department, you can allocate the expense to each department in proportion to its share of office space, personnel head count, or any other fixed, percentage, or statistical criteria.

After you determine the purposes of the allocations, gain a working knowledge of the records or tables that are involved and identify which ChartFields are affected.

---

**Note:** Carefully consider the types of accounts you propose to use with allocations. Allocation does not support open item accounting. In particular, do not select open item accounts on the Target Tab of the Allocation Step Definition Process.

---

These are important consideration as you establish the following basic elements of the allocation:

- **Allocation type:** This is the calculation method for the pool and basis and describes how the basis is used to distribute the pool amounts to the target.
- **Pool:** The amount or amounts to be allocated.

This amount can originate from a ledger or table, or you can specify a fixed amount. If it comes from a ledger, allocations uses the ledger definition to determine its table name and other characteristics (such as calendar, multibook, and base currency). If the pool record is a table, specify the table name.

- **Basis:** Determines how and in what proportion the pool amounts are distributed to the various targets.
- **Target:** This is the destination where the amounts are allocated.
- **Offset:** Entries that balance the targets.

These entries reflect the clearing of pool amounts as they are transferred to the targets or amounts that offset the target.

- **Amount fields:** Determine the mapping of the amount fields between the pool, basis, and target records.

For example, assume that you want to allocate rent expense that is originally debited against the rent account 640000 to administrative department 14000. The pool is the sum of the amounts that are in the ledger rows for that ChartField combination. The pool is divided among the ChartField values that are specified as the target (the other departments in the company) according to the basis, which in this case is the amount of floor space that each department uses as specified by a statistical account. As the target accounts are debited, the system generates an offset to balance them.

The PeopleSoft Allocations process uses background processing. It is also flexible in that you can update the target and offset tables directly, create and post allocation journals, or create journals that are to be posted later.

Ultimately, an allocation results in updated target and offset ledgers, but the output of the allocation can be to journal entries that you choose to post in allocations or later in a separate process to update the ledgers.

In PeopleSoft applications, you can also allocate among business units (interunit) or within business units (intraunit), such as between funds or departments.

## Migrating Allocation Configuration Data

For efficiency when implementing Allocations, you can create and test your allocations in a development or test database and use the Data Migration Workbench to migrate your Allocation Steps, Groups, and Requests from one database to another, and ultimately to the production database.

For more information, see [Using the Data Migration Workbench for PeopleSoft Allocations](#)

## Using the Data Migration Workbench for PeopleSoft Allocations

Allocations are widely used to apportion costs and revenues to lines of business, departments, and so on. There can be quite a bit of setup and testing involved in configuring Allocations. For this reason, it would be advantageous to create the Allocations setup in a development database and use Application Data Set (ADS) definitions to migrate Allocations configuration data between development environments, test environments, and ultimately to a production environment.

The following table lists the delivered ADS definitions (delivered in Data Set Designer) to support the migration of PeopleSoft Allocations configuration data:

| <b><i>Delivered ADS to Support PeopleSoft Allocations</i></b> | <b><i>Application Data Set (ADS) Usage</i></b>                                                                                                                                                         |
|---------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ALLOCATION_STEP                                               | This data set includes the records that store the allocation step definitions. Select this dataset on the Data Migration Workbench page to move allocation steps from one database to another.         |
| ALLOCATION_GROUP                                              | This data set includes the records that store the allocation group definitions. Select this data set on the Data Migration Workbench page to move allocation groups from one database to another.      |
| ALLOCATION_REQUEST                                            | This data set includes the records that store the allocation run control requests. Select this data set on the Data Migration Workbench page to move allocation requests from one database to another. |

When you copy the allocation dataset definitions, make sure that the data referenced within in the copied datasets actually exist within the database to which you are copying the Data Set definitions. For example, the tree definitions and ChartField values that are referenced within the Allocation Steps should be current in your source and target databases.

**Note:** The ADS migration validates record field values during the copy process; however, the validation is limited to report fields that use a prompt table or a translation value. The Allocation Step Definition tables use dynamic or derived prompt edit tables. In other words, the prompt tables are assigned at run-time and are not stored in the record field. As a result, the ADS copy process does not validate these field values.

PeopleSoft delivers an ADS Administrator permission list. For access, the ALLOCATIONS access group should be included on the Data Migration page within the Access Group Permissions and the proper access is granted on the Copy Compare Permissions.

See *PeopleTools: Security Administration, Permission Lists*.

All relevant records are included in the Query Access Tree, QUERY\_TREE\_GL within the ALLOCATIONS access group (PeopleTools, Security, Query Security, Query Access Manager).

See also the product documentation for *PeopleTools: Lifecycle Management Guide*

## Defining Allocation Process Steps

To define steps in the PeopleSoft Allocations process, use the Define Allocation Step component (ALLOCATIONS).

### Pages Used for Allocation Steps

| <i>Page Name</i>                                     | <i>Definition Name</i> | <i>Usage</i>                                                                                                                                                                                                             |
|------------------------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Define Allocation Step - Type Page</a>   | ALLOC_CALC_OPTN        | Define one of five allocation types, as well as any special arithmetic operations that you want to perform by using the pool and basis.<br><br>Select a transaction code for use in interunit and intraunit allocations. |
| <a href="#">Define Allocation Step - Pool Page</a>   | ALLOC_POOL             | Define the allocation pool: pool record, selection criteria, and selection method. You can define the pool from ledger balances, any table, or a fixed amount.                                                           |
| Pool Exceptions Page                                 | ALLOC_POOLX            | Enter pool exceptions for ranges of values.<br><br>See the <a href="#">Define Allocation Step - Pool Page</a> .                                                                                                          |
| <a href="#">Define Allocation Step - Basis Page</a>  | ALLOC_BASIS            | Determine the basis of the allocation or how the pool amount is to be allocated to the target.                                                                                                                           |
| Basis Exceptions Page                                | ALLOC_BASISX           | Enter basis exceptions for ranges of values.<br><br>See the <a href="#">Define Allocation Step - Basis Page</a> .                                                                                                        |
| <a href="#">Define Allocation Step - Target Page</a> | ALLOC_TARGET           | Define the destination for the allocation or the target record (journal or any table) and target field values.                                                                                                           |

| <b>Page Name</b>                                    | <b>Definition Name</b> | <b>Usage</b>                                                                                                                                                                                                                                                |
|-----------------------------------------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>Define Allocation Step - Offset Page</u>         | ALLOC_OFFSET           | Define the offset entry that balances the target. Offset usually reflects the clearing of pool amounts as they are transferred to the targets. However, if the target record is not a balanced ledger, such as a budget ledger, there is usually no offset. |
| <u>Define Allocation Step - Output Options Page</u> | ALLOC_OUT_JRL_OPTN     | Define journal options if the target or offset record is journals, or define the Table Output Option if the target or offset record is table.                                                                                                               |
| <u>Define Allocation Step - Round Options Page</u>  | ALLOC_ROUND_OPTN       | Define the method for rounding the allocation amount and distributing odd cents. This option is valid for only these allocation types: <i>Spread Evenly</i> , <i>Allocate of Fixed Basis</i> , and <i>Prorata with Record Basis</i> .                       |
| <u>Define Allocation Step - Batch Records Page</u>  | ALLOC_RECNAME          | Specify the batch temporary tables that are used in the PeopleSoft Allocations process.                                                                                                                                                                     |
| <u>Define Allocation Step - Amount Fields Page</u>  | ALLOC_AMOUNT           | Define the amount field mapping between the pool, basis, target, and offset records.                                                                                                                                                                        |

## Understanding Allocations Steps and Process Group

Use the Define Allocation Step component (ALLOCATIONS) to do the following:

- Select the allocation type.
- Define the allocation pool.
- Define the allocation basis.
- Define the allocation target.
- Define the allocation offset.
- Select output options.
- Select rounding and distribution of odd cents options.
- Specify batch records.
- Define amount fields.

Depending on its complexity, you can define an allocation by one or more process steps. Multiple steps represent a step-down allocation. These steps together form a process group, with each allocation identified by a unique group ID.

Each allocation step represents a discrete stage in the PeopleSoft Allocations process, which means that the process updates the ledger balances or creates journals at the end of the step. For example, you can perform a rent expense allocation in one step because you update the ledger only once to accomplish this allocation. But for more complex allocations, such as the distribution of administrative expenses across sales departments followed by the allocation of sales expense across products, you need two steps.

This diagram illustrates the use of multiple steps in an allocation processing:

Multiple steps in allocation processing

In this example, the first allocation step distributes administrative expense across the sales departments and then updates the ledger. If the ledger is not updated, the second step draws erroneous data from the ledger because the second step must allocate the newly updated sales expense across products.

## Define Allocation Step - Type Page

Use the Allocation Step - Type page (ALLOC\_CALC\_OPTN) to define one of five allocation types, as well as any special arithmetic operations that you want to perform by using the pool and basis.

Select a transaction code for use in interunit and intraunit allocations.

Navigation:

**Allocations > Define and Perform Allocations > Define Allocation Step > Type**

This example illustrates the fields and controls on the Define Allocation Step - Type page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Define Allocation Step - Type' page. At the top, there are tabs for 'Type', 'Pool', 'Basis', 'Target', 'Offset', 'Output Options', 'Round Options', 'Batch Records', and 'Amount Fields'. The 'Type' tab is selected. Below the tabs, there are fields for 'SetID' (value: SHARE) and 'Step' (value: RENTEXP). A search bar with 'Find | View All' and pagination 'First 1 of 1 Last' is present. The main form contains the following fields: '\*Effective Date' (01/01/1900), 'Status' (Active), '\*Description' (Allocate Rent by Floor Space), '\*Allocation Type' (Prorata with Record Basis), 'Extension opcode' (Add), and 'Transaction Code' (GENERAL). A link 'General Transactions' is also visible.

**Note:** The data that is entered using these pages can also be loaded as an Application Data Set using the Data Migration Workbench. For more information about ADS and the Data Migration Workbench for FSCM applications, see [Using the Data Migration Workbench for PeopleSoft Allocations](#)

| Field or Control                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allocation Type</b>                             | <p>Select a calculation option to determine the pool amounts that are going to the targets from one of the following allocation types:</p> <ul style="list-style-type: none"> <li><i>Copy</i>: Copies pool amounts to the target or offset with possible percentage changes.</li> <li><i>Spread Evenly</i>: Divides pool amounts equally by the specified basis fields to derive the target amounts. For example, this type can be used to divide the pool equally in thirds among department IDs 0100, 0200, and 0300.</li> <li><i>Allocate on Fixed Basis</i>: Allocates on a fixed basis. It is based on the fixed allocation percentage that you specify in the % field in the Value/Node scroll area on the Basis page.</li> <li><i>Prorata with Record Basis</i>: Divides the pool amount among the targets based on amounts that are stored in the basis record.</li> <li><i>Arithmetic Operation</i>: Defines the allocation calculation as a mathematical operation between the pool and basis.</li> </ul> |
| <b>Extension opcode</b> (extension operation code) | <p>When you select <i>Arithmetic Operation</i>, the extension operation code field becomes active and you can select <i>Add</i>, <i>Subtract</i>, <i>Multiply</i>, or <i>Divide</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Transaction Code</b>                            | <p>Select the appropriate code when you use interunit and intraunit allocation.</p> <p>See <a href="#">Setting Up Interunit and Intraunit Allocations</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

These tables illustrate the results of a simple rent allocation using the same pool of 400 GBP but different allocation types.

The following example illustrates the allocation type of spread evenly:

| <b><i>Basis and Target For a Pool of 400 GBP</i></b> | <b><i>Account</i></b> | <b><i>Department</i></b> | <b><i>Amount</i></b> |
|------------------------------------------------------|-----------------------|--------------------------|----------------------|
| Basis                                                |                       | 11001                    | One of 4 departments |
|                                                      |                       | 12000                    | One of 4 departments |
|                                                      |                       | 13000                    | One of 4 departments |
|                                                      |                       | 22001                    | One of 4 departments |
| Target                                               | RENT                  | 11001                    | 100 GBP              |
|                                                      | RENT                  | 12000                    | 100 GBP              |
|                                                      | RENT                  | 13000                    | 100 GBP              |
|                                                      | RENT                  | 22001                    | 100 GBP              |

The following example illustrates the allocation type of fixed basis:

| <b><i>Basis and Target For a Pool of 400 GBP</i></b> | <b><i>Account</i></b> | <b><i>Department</i></b> | <b><i>Amount</i></b> |
|------------------------------------------------------|-----------------------|--------------------------|----------------------|
| Basis                                                |                       | 11001                    | 10 percent           |
|                                                      |                       | 12000                    | 20 percent           |
|                                                      |                       | 13000                    | 20 percent           |
|                                                      |                       | 22001                    | 50 percent           |
| Target                                               | RENT                  | 11001                    | 40 GBP               |
|                                                      | RENT                  | 12000                    | 80 GBP               |
|                                                      | RENT                  | 13000                    | 80 GBP               |
|                                                      | RENT                  | 22001                    | 200 GBP              |

The following example illustrates the allocation type of prorata:

| <b><i>Basis and Target For a Pool of 400 GBP</i></b> | <b><i>Account</i></b> | <b><i>Department</i></b> | <b><i>Amount</i></b> |
|------------------------------------------------------|-----------------------|--------------------------|----------------------|
| Basis                                                | FLOORSPEACE           | 11001                    | 10 SQF               |
|                                                      | FLOORSPEACE           | 12000                    | 20 SQF               |
|                                                      | FLOORSPEACE           | 13000                    | 20 SQF               |
|                                                      | FLOORSPEACE           | 22001                    | 50 SQF               |
| Target                                               | RENT                  | 11001                    | 40 GBP               |

## Define Allocation Step - Pool Page

Use the Define Allocation Step - Pool page (ALLOC\_POOL) to define the allocation pool: pool record, selection criteria, and selection method.

You can define the pool from ledger balances, any table, or a fixed amount.

Navigation:

**Allocations > Define and Perform Allocations > Define Allocation Step > Pool**

This example illustrates the fields and controls on the Define Allocation Step - Pool page. You can find definitions for the fields and controls later on this page.

| Type                                       | Pool | Basis                 | Target              | Offset                                   | Output Options | Round Options   | Batch Records | Amount Fields |

|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Pool Record Type</b> | <p>Specify one of the following:</p> <ul style="list-style-type: none"> <li>• If you are specifying the pool record for General Ledger, select the <i>Ledger Group</i> and enter the ledger group name.</li> <li>• If you are defining the pool record for Project Costing, select <i>Any Table</i> and enter the table name.</li> </ul> <hr/> <p><b>Note:</b> If you specify the value <i>Any Table</i> in the Pool Record Type field, add any additional fields that might be required to the delivered ALC_GL_P_TAO table.</p> <hr/> <ul style="list-style-type: none"> <li>• If you want to pool a specific amount, select <i>Fixed Amount</i>. While the pool amount is typically based on amounts from the ledger, you can choose to base it on any fixed amount, such as equipment cost of 40000.00 GBP allocated across departments. Specify the fixed amount on the Amounts Field page.</li> </ul> <hr/> <p><b>Note:</b> The allocation process does not require the currency control fields (such as FOREIGN_CURRRNCY and CURRENCY_CD) to be specified in the target and offset definitions when using a fixed pool amount.</p> <p>Foreign Currency: The process defaults the target and offset foreign currency from the base currency of the pool primary ledger or from the base currency of the business unit of the request. If you specify a ledger group for the pool, the process selects the base currency of the primary ledger for the pool ledger group. If the pool ledger group is blank, the process gets the base currency from the business unit of the request.</p> <p>Base Currency: The process defaults the base currency to the base currency of the target and offset business unit. This enables you to set up interunit allocation steps by using a fixed amount and targeting the results to different business units with different base currencies.</p> <hr/> |
| <b>Pool factor</b>      | <p>Enter a percentage to apply to the pool amount. This option provides the flexibility to allocate a percentage of the pool amount. You can also allocate more than 100 percent of the pool amount.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Time Span</b>        | <p>Select to specify a period that is relative to the current period: the fiscal year and accounting period that are to be used to retrieve pool records. Enter a single or multiple period time span to determine the accounting periods that are used for the pool. Relative time spans, such as <i>PER</i> (current period activity), retrieve amounts that are relative to the as of date that you specify on the Allocation Request page. You are not required to specify a value in the <b>Time Span</b> field; if you do, the system retrieves only the pool amounts for the specified fiscal year and accounting periods. If you leave this field blank, the system retrieves all the pool amounts for all fiscal years and accounting periods. If you specify <i>Any Table</i> for the pool record, and the pool record does not have both FISCAL_YEAR and ACCOUNTING_PERIOD fields, you cannot specify a time span value here.</p> <p>If you specify <i>Ledger Group</i> for the <b>Pool Record Type</b> field, the system determines the fiscal year and accounting period by using the calendar that is defined for the ledger group on the Ledgers for a Unit - Definition page. If you specify <i>Any Table</i> for the <b>Pool Record Type</b>, the system determines the fiscal year and accounting period by using the calendar that is defined on the Time Spans page.</p> <p>If you specify a multiple period time span, the system adds together the pool amounts for all periods to get one single pool amount, regardless of the values that you enter in the <b>Basis Time Span, Target Time Span, Basis Span Opt, and Target Span Opt</b> fields. You cannot split pool amounts across periods to match basis or target periods.</p> <hr/> <p><b>Note:</b> The PeopleSoft Allocations process excludes period 999.</p> <hr/> |

| <b>Field or Control</b>        | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Zero Pool Amount Option</b> | <p>Select one of the following options to tell the system how to proceed when the amount of the pool record retrieved is zero:</p> <ul style="list-style-type: none"> <li>• <i>Calculate This Pool</i>: Proceed to calculate the amount when the pool is zero.</li> <li>• <i>Select Next Pool</i>: Skip the zero amount pool record and select the next pool record for processing.</li> <li>• <i>Stop Processing</i>: Issue an error message to indicate a zero amount pool record is selected, and stop the allocation step due to this error.</li> <li>• <i>Calc No Rows as Zero</i> (calculate no rows as zero): If no pool rows are selected based on the time span and selection criteria that is specified in the Pool fields, the allocations process processes these rows as zero pool amounts. For rows that exist in the database, the system processes these rows the same as <i>Calculate This Pool</i>. When you use this option, any selection criteria field that you use for the pool must be explicitly defined. For example, if on the Target/Offset pages one of the fields has a source defined as group by pool and basis, then this field must also be defined in the pool.</li> </ul> <p>Before the allocation process selects pool records, it groups them based on how the target and offset fields are specified. The process uses the zero pool amount option logic only if the total amounts of the group of pool records totals zero. If some individual pool amounts are zero but the total amount of the group of the pool records is not zero, the system process this group of pool records.</p> |

| <b>Field or Control</b>       | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Name</b>             | <p>Enter, within the <b>Pool Fields</b> group box, the field name that the PeopleSoft Allocations process uses in selecting only certain pool rows from the pool record. If the pool record type is a ledger group, the pool record name is the ledger record name that is defined in the ledger template for the ledger group. The Field Name prompt table lists all fields that are in the pool record.</p> <p>If no pool rows are selected based on the time span and selection criteria that you specify in the <b>Pool Fields</b> group box, the PeopleSoft Allocations process skips this step unless you specify <i>Calc No Rows as Zero</i> in the <b>Zero Pool Amount Option</b> field. You receive the message, "No record row exists for the pool," and if this is a multiple step group, the system continues processing the next step in the group.</p> <p>In the How Specified group box that follows, specify the appropriate option or select a combination of the three methods that are described to determine how values are to be provided for the field name that you select.</p> <p>If you do not explicitly specify the BUSINESS_UNIT field value, the system uses the business unit that is specified on the Allocation Request page to select pool rows.</p> <hr/> <p><b>Note:</b> Use trees whenever possible to reduce future maintenance when the ChartField values change.</p> <hr/> |
| <b>Selected Detail Values</b> | <p>Select to activate the first <b>Specify Values/Range of Values/Tree Nodes</b> edit box so that you can list individual pool field values, such as specific departments or accounts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Selected Tree Nodes</b>    | <p>Select to activate the tree information fields for you to specify a tree from which to select nodes. The <b>Level Name</b> field is optional and is used to limit the prompting to the selected level.</p> <p>Use the <b>Set Control Value</b> field to select trees that are not keyed by SetID. For example, some Project Costing trees are keyed by business unit. The system uses the value to identify which trees are available in the <b>Tree Name</b> field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Range of Values</b>        | <p>Select to activate the <b>Specify Values/Range of Values/Tree Nodes</b> edit box for you to enter the beginning and ending pool field values. If you leave the from <b>Value</b> field blank, the system selects all pool field values that are less than or equal to the <b>To</b> field value. You cannot leave the <b>To</b> field blank because the blank value is always the smallest value. You can insert multiple ranges of values.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                      |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Include/Exclude</b>  | This option is visible when selecting to enter a Range of Values. Select <i>Exclude Specified Values</i> to specify a range of values that you wish to exclude from the pool. Select <i>Include Specified Values</i> to specify a range of values that you wish to include in the pool. |
| <b>Exceptions</b>       | Click the link in the Exceptions column to access the Pool Exceptions page. Define exceptions to the associated range of included or excluded values on this page. This link displays the number of exceptions that you have defined for a given range of values.                       |

## Pool Exceptions Page

The ability to define exceptions to included or excluded ranges of values provides the ability to refine selection criteria while reducing the need for multiple rows or steps.

Use the Pool Exceptions page (ALLOC\_POOLX) to enter pool exceptions for ranges of values.

Navigation:

Select the Exceptions link on the Define Allocations Step - **Range of Values** option, provide the range values and click the link in the Exceptions column on the Define Allocation Step - Pool page).

This example illustrates the fields and controls on the Pool Exceptions page. You can find definitions for the fields and controls later on this page.

| <b>Field or Control</b>        | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Range From and Range To</b> | Enter the range of values that are exceptions to the associated range of either included values or excluded values. If you selected the <i>Include Specified Values</i> field for the <b>Include/Exclude</b> option on the Pool page, the exceptions that you define on this page are exceptions to the included range that you entered. If you selected the <i>Exclude Specified Values</i> field for the <b>Include/Exclude</b> option on the Pool page, the exceptions that you define on this page are exceptions to the excluded range that you entered. |

## Define Allocation Step - Basis Page

Use the Define Allocation Step - Basis page (ALLOC\_BASIS) to determine the basis of the allocation or how the pool amount is to be allocated to the target.

Navigation:

Allocations, Define and Perform Allocations, Define Allocation Step, Basis

This example illustrates the fields and controls on the Define Allocation Step - Basis page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Define Allocation Step - Basis' page. At the top, there are tabs: Type, Pool, **Basis**, Target, Offset, Output Options, Round Options, Batch Records, and Amount Fields. Below the tabs, the page is divided into sections. The 'Effective Date' section shows '01/01/1900', 'Status' as 'Active', and 'Description' as 'Allocate Rent by Floor Space'. The 'Basis Record' section includes 'Basis Record Type' (Ledger Group), 'Basis Ledger' (RECORDING), 'Time Span' (PER0199), 'Zero Basis' (Stop Processing), and '\*Basis factor' (100.0000). The 'Basis Fields' section has two fields: 'Account' and 'Currency Code'. Each field has a 'How Specified' section with radio buttons for 'Selected Detail Values', 'Selected Tree Nodes', and 'Range of Values'. Below each 'How Specified' section is a table for 'Specify Values/Range of Values/Tree Nodes' with columns for 'Value', 'To', and '%'. The 'Account' field has a value of '999903' in the 'Value' column. The 'Currency Code' field is empty.

The allocation type that you select on the Type page determines much of the Basis page. The following describes what occurs for each allocation type:

- *Copy*: No basis is required and all fields on the Basis page are unavailable.
- *Spread Evenly*: The pool amount is divided evenly across the basis field values that are specified in the basis. No basis rows are required to exist in the basis record that is specified. You must still specify a value in the **Basis Record Type** field so that the system can provide a prompt table listing for the **Field Name** field in the Basis Fields group box.

In the **How Specified** group box, you can use **Selected Detail Values**, **Selected Tree Nodes**, or **Range of Values** fields to specify field values.

You can specify more than one field name; the system divides the pool amount evenly across all basis field value combinations.

Suppose that you spread evenly across department IDs 0100 and 0200 and products A, B, and C. In this case, each department ID and product combination (that is, DeptID 0100 and Product A, DeptID 0100 and Product B, and so on) receives 1/6 of the pool amount.

---

**Note:** This is a simplified example of spread evenly allocation type to illustrate how the amounts are distributed across the target. However, depending on the distribute odd cents option, one of the departments might contain the odd cents that are required to offset the allocated amount against the pool. The distribution of the odd cents is covered in the values in the Selecting Rounding Options section.

---

See [Define Allocation Step - Round Options Page](#).

- *Allocate on Fixed Basis*: This is a variation of prorata allocation, where the percentage of the prorata is fixed. As with *Spread Evenly*, no basis rows are required to exist in the basis record that is specified. You must still specify the basis record type so that the system can provide a prompt table listing on the basis field name.

You can use only the **Selected Detail Values** field to specify basis field values, and you can specify more than one value in the **Field Name** field.

You must also specify the fixed % (percent) for each field value in the **Specify Value/Range of Values/Tree Nodes** edit box. The total of the percentage for one field does not have to add up to 100 percent, but the system uses the percentages to calculate the actual percent-to-total for each value.

For example, if you specify 10 percent for DeptID 0100 and 40 percent for DeptID 0200, the system allocates 20 percent of the pool amount to DeptID 0100 and 80 percent to DeptID 0200.

- *Prorata with Record Basis*: Specify basis fields in the same way that you do the pool. Basis rows are selected from the basis record, and their amounts are used to calculate a percent-to-total to distribute the pool amount to each target.
- *Arithmetic Operation*: Like *Prorata with Record Basis*, basis rows are selected from the basis record, and you specify basis in the same way that you do the pool. Target amounts are calculated by performing the mathematical operation between each pool and basis amount.

For example, suppose that the total November rent expense for US004 is 110,000.00 USD, paid through the administrative division. This expense must be divided among six divisions. The basis for the rent expense allocation is the amount of floor space that is occupied each month by each division. Floor space is maintained in statistical account 999903. Department ID is defined using the MFG\_DEPARTMENTS tree, the DIVISION tree level, and the USA tree node. The following table indicates how much floor space each division uses:

| <b><i>Division</i></b>      | <b><i>Floor Space</i></b> | <b><i>Preallocation Expense</i></b> |
|-----------------------------|---------------------------|-------------------------------------|
| Administration              | 4000                      | 110000 USD                          |
| Sales/Marketing             | 4000                      |                                     |
| Customer Service            | 2000                      |                                     |
| Engineering                 | 4000                      |                                     |
| Manufacturing               | 6000                      |                                     |
| Other (No Department Value) | 2000                      |                                     |
| Total                       | 22,000 square feet        | 110000 USD                          |

When the amounts are allocated, each division is debited for its share of the rent expense:

| <b><i>Division</i></b>      | <b><i>Floor Space</i></b> | <b><i>Allocated Expense</i></b> |
|-----------------------------|---------------------------|---------------------------------|
| Administration              | 4000                      | 20000 USD                       |
| Sales/Marketing             | 4000                      | 20000 USD                       |
| Customer Service            | 2000                      | 10000 USD                       |
| Engineering                 | 4000                      | 20000 USD                       |
| Manufacturing               | 6000                      | 30000 USD                       |
| Other (No Department Value) | 2000                      | 10000 USD                       |
| Total                       | 22000 square feet         | 110000 USD                      |

| <b>Field or Control</b>  | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Basis Record Type</b> | <p>Specify from the following values:</p> <ul style="list-style-type: none"> <li>• <i>Ledger Group</i>: Select if you are specifying the basis record for General Ledger and enter the basis ledger name.</li> <li>• <i>Any Table</i>: Select if you are defining the basis record for Project Costing and enter the table name.</li> </ul> <hr/> <p><b>Note:</b> If you specify the value <i>Any Table</i> in the Basis Record Type field, add any additional fields that might be required to the delivered ALC_GL_B_TAO table.</p> <hr/> |
| <b>Time Span</b>         | <p>Specify the basis time span if the allocation type is prorata with record basis or arithmetic operation. Basis time span works in the same way as the pool time span, except that you have an option (Basis Span Opt) to combine or split basis amounts for a multiple periods' basis time span if you also specify a multiple periods target time span.</p>                                                                                                                                                                             |
| <b>Basis Factor</b>      | <p>Specify a percentage to apply against the basis. The factor is applicable only to arithmetic operations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Zero Basis</b>       | <p>Select an option to indicate how the system should proceed when the amount of the basis record retrieved is zero if the allocation type is prorata with record basis or arithmetic operation:</p> <ul style="list-style-type: none"> <li>• <i>Calculate This Basis</i>: Proceed to calculate the amount when the basis is zero, except for Arithmetic Operation - Divide, where the system issues an error message and stops this allocation step.</li> <li>• <i>Select Next Basis</i>: Skip the zero amount basis record and select the next basis record for processing.</li> <li>• <i>Stop Processing</i>: Issue an error message to indicate that a zero amount basis record is selected, and stop the allocation step due to this error.</li> <li>• <i>Calc No Rows as Zero</i> (calculate no row as zero): If no basis rows are selected based on the time span and selection criteria that is specified in the <b>Basis Fields</b> field, the allocations process processes these rows as zero basis amounts. For rows that exist in the database, the process processes these rows the same way that it processes the <i>Calculate This Basis</i> field value.</li> </ul> <p>When you use this option, any selection criteria field that you use for the basis must be explicitly defined. For example, if on the Target/Offset pages one of the fields has a source defined as group by pool and basis, then this field must also be defined in the basis.</p> <p>Before the PeopleSoft Allocations process selects basis records, it groups them based on how the target and offset fields are specified. It uses the Zero Basis option logic only if the total amounts of the group of basis records add up to zero. If some individual basis amounts are zero, but the total amounts of the group of the basis records are not zero, the system still process this group of basis records. The Zero Basis option works independently of the Zero Pool option. You can select different options for them, and the system proceeds based on those selections.</p> <p>If no basis rows are selected based on the time span and selection criteria that is specified in the <b>Basis Field</b> field, allocations stops this step unless you select the <i>Calc No Rows as Zero</i> option in the <b>Zero Basis Option</b> field. You receive the message, "No record row exist for the basis ...," and whether the system continues processing the next step in a group depends on the option that you specified in the <b>Continue</b> field on the Allocations Group page.</p> |
| <b>Field Name</b>       | <p>Enter the basis field name that the PeopleSoft Allocations process uses in selecting only certain rows from the basis record. If you do not explicitly specify the BUSINESS_UNIT field value, the system uses the business unit that is specified on the Allocation Request page to select basis rows.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Refer to the Pool page for a description of the remaining fields on the Basis page.

**Note:** Allocations does not support using summary ledgers in the basis.

**Basis Exceptions Page**

The ability to define exceptions to included or excluded ranges of values provides the ability to refine selection criteria while reducing the need for multiple rows or steps.

Use the Basis Exceptions page (ALLOC\_BASISX) to enter basis exception ranges.

Navigation:

Select the **Range of Values** option, provide the range values, and click the link in the Exceptions column on the Define Allocation Step - Basis page.

This example illustrates the fields and controls on the Basis Exceptions page. You can find definitions for the fields and controls later on this page.

| Range From and Range To | Enter the range of values that are exceptions to the associated range of either included values or excluded values. If you selected the <i>Include Specified Values</i> field for the <b>Include/Exclude</b> option on the Basis page, the exceptions that you define on this page are exceptions to the included range that you entered. If you selected the <i>Exclude Specified Values</i> field for the <b>Include/Exclude</b> option on the Basis page, the exceptions that you define on this page are exceptions to the excluded range that you entered. |

**Define Allocation Step - Target Page**

Use the Define Allocation Step - Target page (ALLOC\_TARGET) to define the destination for the allocation or the target record (journal or any table) and target field values.

| Field or Control   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Target Record Type | <p>Select one of the following:</p> <ul style="list-style-type: none"><li>For <i>Journals Records</i>, specify a target ledger group name. The system uses this definition to determine the journal line record name and other characteristics (such as calendar, multibook, and base currency).</li><li>If the target is <i>Any Table</i>, specify the table name in the edit box that becomes available.</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                       |
| Time Span          | <p>Use to specify the output for a single or multiple accounting periods for the target. Relative time spans, such as <i>PER</i> (current period activity), create the target relative to the as of date that is specified on the Allocation Request page.</p> <p>If the Target Record Type value is <i>Journals Records</i>, you must specify the time span value.</p> <p>If the target record is a table that has both FISCAL_YEAR and ACCOUNTING_PERIOD fields, you have the option to specify the time span value.</p> <p>If the target record is a table that does not have both FISCAL_YEAR and ACCOUNTING_PERIOD fields, you cannot specify the time span value. If you do not specify the time span value, the system populates both FISCAL_YEAR and ACCOUNTING_PERIOD with a zero value in the target record.</p> |

| <b>Field or Control</b>                   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Basis Span Opt</b> (basis span option) | <p>If you use a multiperiod time span for the basis and target, select one of the following in the <b>Basis Span Opt</b> field:</p> <ul style="list-style-type: none"> <li>• <i>Combine Periods for Basis</i>: Combines the basis amounts for each period that is defined by the time span into one virtual period, producing a single amount.</li> <li>• <i>Split Basis by Period</i>: Maps the basis amount for each period one-to-one with the target periods. For this reason, the number of periods that is in the basis and target time span must match. When you select this option, the <b>Target Span Opt</b> field becomes inactive.</li> </ul> |

| <b>Field or Control</b>                     | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Target Span Opt</b> (target span option) | <p>If you select a multiple period time span for the target, you must specify the <b>Target Span Opt</b> field when the basis time span is either a single period or multiple periods (the Basis Span Opt field is <i>Combine Periods for Basis</i>):</p> <ul style="list-style-type: none"> <li>• <i>Repeat Target Each Period</i>: Repeats the entire target amount for each period that is defined in the time span.</li> <li>• <i>Divide Target Across Periods</i>: Divides the target amount by the number of periods that are defined in the time span and distributes it equally to each period.</li> </ul> |
| <b>Field Name</b>                           | <p>If the target record is journals, the target record name is actually the journal line record name that is defined on the ledger template for the ledger group. The <b>Field Name</b> prompt table lists all fields that are in the target record.</p> <p>The system validates the <b>Field Name</b> field value that is entered against the record when you save this allocation step definition. Typically, you include any fields that are required by the target record including all the keys and any fields that affect functionality and those that you might decide are mandatory.</p>                   |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Source</b>           | <p>Provides a convenient way to populate the target field values, particularly if the values are from the pool or basis records. You need not reenter them here, just prompt for the appropriate option and choose from the following:</p> <ul style="list-style-type: none"> <li>• <i>Pool</i>: Uses the field values from pool records.</li> <li>• <i>Basis</i>: Uses the field values from basis records.</li> <li>• <i>Group By</i>: Uses the matched field values from both the pool and basis records.</li> <li>• <i>Value</i>: Specifies a fixed value for the target field. You can use this only for character- or date-type fields. You should enter a fixed date in one of these formats: mmddyy, mm/dd/yy, or mm/dd/yyyy. If you select this option, you enter the value in the <b>Value/Mask</b> field.</li> <li>• <i>Begin Pd</i> (begin period): Uses the beginning date for the target accounting period. If you use this option, the target time span must be populated. Otherwise, the system cannot populate a date value.</li> <li>• <i>End Period</i>: Uses the end date for the target accounting period. If you use this option, the target time span must be populated. Otherwise, the system cannot populate a date value.</li> <li>• <i>Req Date</i> (request date): Uses the as of date that is specified on the Allocation Request page.</li> <li>• <i>Seq Num</i> (sequence number): Uses the next field sequence number for the target records. The allocations process selects the maximum field sequence number for the specified target criteria and increments the number by one. This option is used if the <b>Target Record Type</b> field value is <i>Any Record</i>.</li> </ul> |
| <b>Field Mapping</b>    | <p>If the source is from <i>Pool</i>, <i>Basis</i>, or <i>Group by</i>, you can specify field mapping for those occasions when the field name for the pool or basis record differs from the field name that is in the target record. For example, this could occur if the <b>Product</b> field value for the target record must come from the <b>Project</b> field value of the pool record.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Value/Mask</b>       | <p>If you specify a fixed value in the <b>Source</b> field, use this <b>Value/Mask</b> field for character or date-type fields. ## Define Allocation Step - Offset Page

Use the Offset page (ALLOC\_OFFSET) to define the offset entry that balances the target.

Offset usually reflects the clearing of pool amounts as they are transferred to the targets. However, if the target record is not a balanced ledger, such as a budget ledger, there is usually no offset.

Navigation:

Allocations, Define and Perform Allocations, Define Allocation Step, Offset

This example illustrates the fields and controls on the Define Allocation Step - Offset page. You can find definitions for the fields and controls later on this page.

| Field or Control     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Offset Record Type   | <p>Select <i>Journal Records</i> or <i>Any Table</i>. For journals, specify the<b>Offset Ledger</b> name. The system uses this definition to determine the journal line record name and other characteristics (such as calendar, multibook, and base currency). If the value in the <b>Offset Record Type</b> field is a table, specify the record name in the<b>Table</b> edit box that becomes available.</p> <p><b>Note:</b> If the allocation step does not require an offset, leave this field blank.</p> |
| Specify Field Values | <p>Specify the offset field values. The offset fields can be directed to the pool record or a particular target table, but the purpose of the offset is always to prevent double counting.</p>                                                                                                                                                                                                                                                                                                                 |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Journal ID Mask</b>  | <p>If the target or offset is a journal that is on the Allocations Target or Allocations Offset pages, you must define the journal options.</p> <p>The <b>Journal ID Mask</b> field enables you to specify a prefix for naming allocation journals. A 10-character alphanumeric ID identifies journals. The system automatically appends the prefix that you specify to the journal IDs. For example, if you specify the Journal ID Mask to be <i>ALLOC</i>, the allocation journal IDs might be ALLOC00001, ALLOC00002, and so on. Alternatively, the value <i>NEXT</i> causes the system to assign the next available journal ID number automatically.</p> <p>Reserve a unique mask value for allocations to ensure that no other process creates the same journal ID.</p> <p>When Reversal option is specified, the system appends one of the alpha characters between A to Z to the Journal ID Mask depending on the accounting period (1 to 26) of the Allocation Journal in the same sequence. The system will use A-Z in repeating cycle when the accounting period is greater than 26. For example, when Reversal option is specified, Journal ID Mask is ALC, and the accounting period is 5, the allocation journal IDs will be ALC00E0001, ALC00E0002, etc, and can go up to ALC00E9999. The maximum journal sequence length is 9999. However, it could be less if the length of allocation Journal ID Mask is 6. So when Reversal option is specified and if the Journal ID Mask is XXXXXX, then allocation Journal ID Mask generated by the system after appending the alpha character for accounting period will have length 7. Hence, the maximum journal sequence length would be 999. So it is recommended for the users to restrict the size of the mask up to 5 characters, if they need 4 digits(9999 instead of 999) for Journal ID generation.</p> |

| <b>Field or Control</b>  | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Journal Date Code</b> | <p>You can assign a value based on the following options, all of which are adjusted to the prior working day if the next day is in the next period:</p> <ul style="list-style-type: none"><li>• <i>Request As of Date:</i> Uses the as of date that is specified in the Allocation Request page. As a result, the system dates all journals the same day as the allocation request. If you use the as of date, and the date is a not a working calendar day that you define on the Business Calendars page, the system adjusts the date to the next working calendar day.</li><li>• <i>Beginning of the Period:</i> Uses the beginning day of the periods that are defined in the target time span.</li><li>• <i>End of the Period:</i> Uses the last day of the periods that are defined in the target time span.</li></ul> <hr/> <p><b>Note:</b> You must use either the <i>Beginning of the Period</i> or <i>End of the Period</i> journal date options if you use multiple-period time spans for the target.</p> <hr/> |
| <b>Source</b>            | <p>Enter the journal source. Unless you specify otherwise, the journal source moves by default to <i>ALO</i> (allocations).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reversal</b>         | <p>Click to access the Journal Entry Reversal page.</p> <p>You can set up a reversing entry for the current allocation by selecting the applicable option, which then appears in the link.</p> <p>Options are:</p> <ul style="list-style-type: none"> <li>• <i>Beginning of Next Period:</i> Creates a reversing entry that is dated the first business day of the next accounting period. It uses the business calendar that you assign to the business unit that is on the General Ledger Definition - Definition page to determine the first business day.</li> <li>• <i>Do Not Generate Reversal:</i> The PeopleSoft Allocations process does not create the reversal entry, but it does mark the allocation journals with the reversal code. When the allocation journals are posted later in a separate process, the system creates the reversal entry.</li> <li>• <i>End of Next Period:</i> Creates a reversing entry that is dated the last business day of the next accounting period. It uses the business calendar that you assign to the business unit on the General Ledger Definition - Definition page to determine the last business day.</li> <li>• <i>Next Day:</i> Creates a reversing entry that is dated the next business day. It uses the holiday list ID that you assign to the business unit that is on the General Ledger Definition - Definition page to determine the next business day. If the business unit is not assigned a holiday list ID, the reversing entry is dated the next day.</li> <li>• <i>Adjustment Period:</i> Creates a reversing entry to the adjustment period that you select. Click in the drop-down list to display a list of valid adjustment periods (as defined on the Detail Calendar). When you select this option, you also must enter the <b>Reversal Date</b>. The reversal date value is used to populate the journal date and fiscal year of the reversing entry.</li> <li>• <i>On Date Specified By User:</i> Enables you to select any date that is in the calendar. When you select this option, you also must enter the adjustment period and reversal date. If you enter a date on a nonworking day, and a holiday list ID is assigned to the business unit, you get an error message. The system does not reset the reversal date. You must reenter a date that is a working day.</li> </ul> |

| <b>Field or Control</b>                                          | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Reference Number</b>                                          | Enables you to refer each journal back to a document, person, invoice, date, or any other piece of information that is helpful to you when you track the source of the transaction.                                                                                                                                                                                                                                                                                                                                        |
| <b>Document Type</b>                                             | If you run the PeopleSoft Allocations process for a business unit for which you enable document sequencing, you must select a document type. If you do not select a document type, you receive an error. If some of the business units require document sequencing, you assign a document type to the allocation rules regardless of whether you enable document sequencing for that business unit. If you do not enable document sequencing for any of the business units, the <b>Document Type</b> field is unavailable. |
| <b>Bypass VAT Processing</b> (bypass value added tax processing) | <p>Click if you want the allocations process to skip VAT processing.</p> <p>Even if <b>Bypass VAT Processing</b> is not selected, the journals that are created through allocations and edited do not create VAT rows for VAT applicable accounts. The VAT process processes VAT accounts that are created by the allocation process.</p> <p>However, to prevent double counting, the VAT process does not create VAT lines for VAT applicable accounts that are created from allocations.</p>                             |
| <b>Post Journal (s)</b>                                          | Click to post the journals. If you select this option, the system automatically selects the <b>Edit Journal(s)</b> and <b>Budget Check Journal(s)</b> check boxes. You can deselect the <b>Budget Check Journal(s)</b> check box if you want to run the Budget Processor later to update the commitment control ledgers.                                                                                                                                                                                                   |

| <b>Field or Control</b>             | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Edit Journal (s)</b>             | <p>Select to edit the journals that the PeopleSoft Allocations process creates so that you do not have to edit them later in a separate process. You select this option when you want to edit journals without posting them. Typically, you select this option in a multiple-step allocation process where the pool amount for the next step comes from the target of the previous step.</p> <p>If journals are not posted, the ledger is not updated. The next multiple step then draws erroneous data from the ledger. If you select this option, the PeopleSoft Allocations process calls the Journal Edit process (GL_JEDIT) first to edit the journals.</p> <p>If the journals fail in the Journal Edit process, the system does not post them to the ledger and the PeopleSoft Allocations process issues this error message: "Allocation step ... is complete with journal created but not posted." Journals can fail the Journal Edit process for many reasons, including invalid ChartFields, balancing by ChartField, or ChartField combination edit. After you determine the cause of the problem, you might have to change the allocation step definition to avoid it.</p> |
| <b>Budget Check Journal (s)</b>     | <p>Select this check box to run the Budget Processor to budget check journals for the commitment control ledgers. This option is available only if you enable the commitment control option.</p> <p>If you select this option, the system automatically selects <b>Edit Journal</b>. You must edit journals before you budget check them.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>When No Journals are Created</b> | <p>Specify what you want the PeopleSoft Allocations process to do:</p> <ul style="list-style-type: none"> <li>• Issue the no journal message type Issue Error message.</li> <li>• Issue the no journal message type Issue Warning message.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Commitment Control

Click the **Commitment Control** link to access the Commitment Control page.

In the **Commitment Control Amount Type** field, select from the following options:

| <b>Field or Control</b>       | <b>Description</b>                                                                     |
|-------------------------------|----------------------------------------------------------------------------------------|
| <b>Actuals and Recognized</b> | Select for the actual amount of the expenditure or the recognized revenue transaction. |

| <b>Field or Control</b>               | <b>Description</b>                                                                                                                                                                      |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Encumbrance</b>                    | Select if the journal is not an actuals transaction. Instead, it records the amount that you authorize to be spent. This usually occurs when you create a contract or a purchase order. |
| <b>Pre-Encumbrance</b>                | Select if the journal is not an actual transaction. Instead, it records the amount that you expect to expend. This usually occurs when you create a requisition.                        |
| <b>Collected Revenue</b>              | Select if the journal records the collected amount from a prior revenue transaction.                                                                                                    |
| <b>Actuals, Recognize and Collect</b> | Select if the journal records both recognize and collect amounts on the revenue estimate budget ledger.                                                                                 |
| <b>Planned</b>                        | Select if the journal records the amount that you plan to spend. This amount is only an estimate; it is not yet an actual transaction.                                                  |

## Bypassing or Overriding Budget Checking

Click the **Commitment Control** link to access the Commitment Control page.

| <b>Field or Control</b>       | <b>Description</b>                                                                                                                                                 |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Bypass Budget Checking</b> | You can select this option to temporarily allow the journal to bypass budget checking. This field is active only if you enabled Commitment Control.                |
| <b>Override</b>               | If selected, journal entries are allowed to pass budget checking if they exceed their budgeted amount. This field displays the override user ID and override date. |

## Budget Entry Type

The following options apply to commitment control budget journals:

| <b>Field or Control</b> | <b>Description</b>                                                                               |
|-------------------------|--------------------------------------------------------------------------------------------------|
| <b>Original</b>         | Select to indicate an original budget journal entry. Used to record adopted or approved budgets. |

| <b>Field or Control</b> | <b>Description</b>                                      |
|-------------------------|---------------------------------------------------------|
| <b>Adjustment</b>       | Select to indicate an adjustment to an original budget. |

## Parent Budget Options

Automatic generation of parent budget impacts revolves around the *originating* journal. The originating journal is a child level budget, budget adjustment, or transfer budget journal, entered manually or by journal import or allocations, on which parent or multiple parent budget level impacts are generated.

The automatic generation of parent budgets is discussed in the Commitment Control documentation regarding posting of budgets.

See "Generating Parent Budgets, Budget Adjustments and Budget Transfers Automatically" (PeopleSoft Commitment Control).

## Table Output Option

| <b>Field or Control</b>    | <b>Description</b>                                                                                                                                                                                                                                                  |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Table Output Option</b> | If the target or offset record that you select is <i>Any Table</i> on the Allocation Target or Allocation Offset pages, the <b>Table Output Option</b> field becomes available and you can select <i>Replace Existing Amount</i> or <i>Update Existing Amount</i> . |

## Currency Conversion

The currency conversion fields are used by the PeopleSoft Allocations process to convert the base currency amount of the target and offset. The process converts the base currency if the base currency of the target and offset is different from the base currency of the pool. When allocating to a table, the business unit of the target and offset must be a General Ledger business unit; otherwise, the process does not convert the base currency amount.

| <b>Field or Control</b>             | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Rate Type</b>                    | Specify the currency conversion exchange rate type. The process converts the base currency only if the base currency of the target and offset is different from the base currency of the pool. When allocating to a journal, if the base currency of the target and offset is same as the base currency of the pool, Allocation calculates rates as per the ratio of summarized pool base amount and summarized pool transaction amount. If the user requires to recalculate rates as per rate type entered on Allocation step – Output Options page, then allocation journals should be edited in batch with <i>Recalc Exchange Rates</i> check box selected. When allocating to a journal, if the rate type is blank, the process uses the rate type from the primary ledger of the target and offset ledger group. When allocating to a table, if the rate type is blank, the process does not convert the base currency amount. |
| <b>Currency Effective Date Code</b> | Select one of the following for the allocation: <ul style="list-style-type: none"> <li>• <i>Jrnl Date</i> (journal date)</li> <li>• <i>Req Date</i> (request date)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Define Allocation Step - Round Options Page

Use the Round Options page (ALLOC\_ROUND\_OPTN) to define the method for rounding the allocation amount and distributing odd cents.

This option is valid for only these allocation types: Spread Evenly, Allocate of Fixed Basis, and Prorata with Record Basis.

Navigation:

**Allocations > Define and Perform Allocations > Define Allocation Step > Round OptionsA**

This example illustrates the fields and controls on the Define Allocation Step - Round Options page. You can find definitions for the fields and controls later on this page.

| Round Options    | <p>Specify the method to use to round the allocation amount from the following options:</p> <ul style="list-style-type: none"><li><i>Normal</i>: This is the default. The process rounds the allocated amount based on the decimal precision of the currency control value. For example, 104.495 is rounded to 104.50 GBP.</li><li><i>Round Down</i>: The process rounds the allocated amount down to the nearest decimal based on the decimal precision of the currency control value. For example, 104.495 is rounded down to 104.49 GBP.</li><li><i>Round Up</i>: Rounds the allocated amount up to the nearest decimal based on the decimal precision of the currency control value. For example, 104.495 and 104.494 are both rounded up to 104.50 GBP.</li><li><i>Truncate</i>: Truncates the allocated amount after the decimal precision of the currency control value. For example, 104.495 and 104.4949 are truncated to 104.49 GBP.</li></ul> |

| <b>Field or Control</b>           | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Distribute Odd Cents</b>       | <p>For allocation types of prorata, spread even, and fixed basis, the process balances the target and offset amounts to the pool amount that is allocated. In other words, the process attempts to allocate 100 percent of the pool amount to the target and offset amount, sometimes resulting in odd cents.</p> <p>The <b>Distribute Odd Cents</b> option gives you the flexibility to determine where to distribute odd cents. Because allocation processing is set based rather than row-by-row to improve performance, this option is required for allocation types of prorata, spread even, and fixed basis.</p> <ul style="list-style-type: none"> <li>• <i>First Target Line</i>: This is the default. Odd cents are distributed to the first target line.</li> <li>• <i>Specify ChartFields</i>: Define the ChartFields to which the system distributes the odd cents.</li> <li>• <i>Last Target Line</i>: Select to distribute odd cents to the last target line.</li> <li>• <i>Largest Target</i>: Select to distribute odd cents to the target line with the largest amount.</li> </ul> <p>If you are allocating within ChartFields or grouping by ChartFields in the definition, the process distributes odd cents with each group, ChartField value.</p> <hr/> <p><b>Note:</b> PeopleSoft recommends that you select the first two options for optimum performance.</p> <hr/> |
| <b>Field Name and Field Value</b> | <p>If you select <i>Specify ChartFields</i> as the <b>Distribute Odd Cents</b> option, enter the ChartField combination to which you want to distribute the odd cents. Enter the ChartField in the <b>Field Name</b> field and the ChartField value in the <b>Field Value</b> field. For example, enter <i>ACCOUNT</i> for the field name and <i>100000</i> for the field value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

The following examples show how the process rounds the allocation amounts if you select one of the options on this page:

| <b>Field or Control</b> | <b>Description</b>                                 |
|-------------------------|----------------------------------------------------|
| <b>Allocation Type</b>  | Spread evenly.                                     |
| <b>Pool Amount</b>      | 1000.00 with a currency precision of two for USD.  |
| <b>Pool Factor</b>      | 100.00.                                            |
| <b>Basis</b>            | Dept ID: 11001, 12000, 13000, 14000, 15000, 16000. |

| <b>Field or Control</b> | <b>Description</b>                              |
|-------------------------|-------------------------------------------------|
| <b>Target</b>           | Account: 100000.<br>Dept ID: values from basis. |

### Example 1

The first example shows how the process rounds the allocation amounts if you specify the following options:

| <b>Field or Control</b>     | <b>Description</b>                                         |
|-----------------------------|------------------------------------------------------------|
| <b>Distribute Odd Cents</b> | Specify ChartField.<br>Account: 100004.<br>Dept ID: 41000. |
| <b>Round Options</b>        | Normal.                                                    |

The process uses the following formula to calculate the amounts:

Allocated Amount = (Pool Amount (Pool Factor/100)) (Basis Amount/Total Basis).

(1000 (1/6)) = 166.67 rounded:

| <b>Account</b> | <b>Dept ID</b> | <b>Allocated Amount</b> |
|----------------|----------------|-------------------------|
| 100000         | 11001          | 166.67                  |
| 100000         | 12000          | 166.67                  |
| 100000         | 13000          | 166.67                  |
| 100000         | 14000          | 166.67                  |
| 100000         | 15000          | 166.67                  |
| 100000         | 16000          | 166.67                  |
| 100004         | 41000          | -0.02                   |

## Example 2

The second example shows how the process rounds the allocation amounts if you specify the following options:

| <b>Field or Control</b>     | <b>Description</b> |
|-----------------------------|--------------------|
| <b>Distribute Odd Cents</b> | Last target line.  |
| <b>Round Options</b>        | Round up.          |

The process uses the following formula to calculate the amounts:

Allocated Amount = (Pool Amount (Pool Factor/100)) (Basis Amount/Total Basis) + .005.

(1000 (1/6)) = 166.67 rounded:

| <b>Account</b> | <b>Dept ID</b> | <b>Allocated Amount</b> |
|----------------|----------------|-------------------------|
| 100000         | 11001          | 166.67                  |
| 100000         | 12000          | 166.67                  |
| 100000         | 13000          | 166.67                  |
| 100000         | 14000          | 166.67                  |
| 100000         | 15000          | 166.67                  |
| 100000         | 16000          | 166.65                  |

## Example 3

The third example shows how the process rounds the allocation amounts if you specify the following options:

| <b>Field or Control</b>     | <b>Description</b> |
|-----------------------------|--------------------|
| <b>Distribute Odd Cents</b> | Largest target.    |
| <b>Round Options</b>        | Round down.        |

The process uses the following formula to calculate the amounts:

Allocated Amount = (Pool Amount (Pool Factor/100)) (Basis Amount/Total Basis) - .005.

(1000 (1/6)) = 166.67 rounded:

| <b>Account</b> | <b>Dept ID</b> | <b>Allocated Amount</b> |
|----------------|----------------|-------------------------|
| 100000         | 11001          | 166.70                  |
| 100000         | 12000          | 166.66                  |
| 100000         | 13000          | 166.66                  |
| 100000         | 14000          | 166.66                  |
| 100000         | 15000          | 166.66                  |
| 100000         | 16000          | 166.66                  |

  - Target Detail:** ALC\_GL\_T\_TAO
  - Offset Detail:** ALC\_GL\_O\_TAO
  - Target Balance:** ALC\_GL\_TB\_TAO
  - Calculation Log:** ALC\_CLOG\_TAO
  - Basis Summary:** ALC\_GL\_BS\_TAO
  - Target Summary:** ALC\_GL\_TS\_TAO
  - Offset Summary:** ALC\_GL\_OS\_TAO

| <b>Field or Control</b>       | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Calculation Log Record</b> | Specify to create a calculation log for a complete audit trail for debugging. Select the <b>Create Calculation Log</b> option on the Allocation Request page. You can use the delivered calculation log record, ALLOC_CALC_LOG, for all allocation steps that are processed against the actuals ledger (but not the budgets ledger, which might have ChartFields that are different from the actuals ledger). If the allocation is not processed against the actuals ledger, modify the <b>Calculation Log Record</b> field or create a unique record. |
| <b>Pool</b>                   | Specify the temporary table for the pool data. The PeopleSoft Allocations process uses this table to store the temporary data for the pool.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Basis</b>                  | Specify the temporary table for the basis data. The PeopleSoft Allocations process uses this table to store the temporary data for the basis.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Target Detail</b>          | Specify the temporary table for the target detail data. The PeopleSoft Allocations process uses this table to store the temporary data for the target.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Target Summary</b>         | Specify the temporary table for the target summary data. The PeopleSoft Allocations process uses this table to store the summarized data for the target and offset.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Offset Detail</b>          | Specify the temporary table for the offset detail data. When allocating to a journal, sometimes the process uses a separate temporary table to store the offset data.                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Offset Summary</b>         | Specify the temporary table for the <b>Offset Summary</b> data. Data is summarized from the target record or journals. When allocating to a journal, sometimes the process uses a separate temporary table to store the offset summary data.                                                                                                                                                                                                                                                                                                           |
| <b>Target Balance</b>         | Specify the temporary table for the target balance data. The PeopleSoft Allocations process uses this table to store the target balance lines, which are necessary to balance the target and offset against the pool amount.                                                                                                                                                                                                                                                                                                                           |
| <b>Calculation Log</b>        | Specify the temporary table (ALC_CLOG_TAO) to the calculation log.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Default</b>                | Click the <b>Default</b> button to assign the default temporary tables. The process assigns the temporary tables based on the setup of the pool, basis, target, and offset.                                                                                                                                                                                                                                                                                                                                                                            |

PeopleSoft delivers these standard temporary (TAO) tables:

| <b>Temporary Table</b> | <b>General Ledger</b> | <b>Projects</b> |
|------------------------|-----------------------|-----------------|
| Calculation log        | ALC_CLOG_TAO          | ALC_CLOG_TAO    |
| Pool                   | ALC_GL_P_TAO          | ALC_PC_P_TAO    |
| Basis                  | ALC_GL_B_TAO          | ALC_PC_B_TAO    |
| Basis Summary          | ALC_GL_BS_TAO         | ALC_PC_BS_TAO   |
| Target Detail          | ALC_GL_T_TAO          | ALC_PC_T_TAO    |
| Target Summary         | ALC_GL_TS_TAO         | ALC_PC_TS_TAO   |
| Offset Detail          | ALC_GL_O_TAO          | ALC_PC_T_TAO    |
| Offset Summary         | ALC_GL_OS_TAO         | ALC_PC_TS_TAO   |
| Target Balance         | ALC_GL_TB_TAO         | ALC_PC_TB_TAO   |

Use the standard General Ledger TAO tables to allocate ledger (including all ledger, commitment control, projects, and budgets) and journal data.

Use the standard Project Costing TAO tables to allocate projects resource data.

---

**Note:** When allocating to a journal, the PeopleSoft Allocations process sometimes uses a separate temporary table for the offset detail and offset summary data in order to optimize the processing performance. The process determines if it must use a separate temporary table at runtime. Even if you specify a different table for the offset detail and summary, the process might not use a separate temporary table to process the offset data. There are no delivered offset detail and summary TAO tables for projects because these tables are not used to allocate to a journal.

---

PeopleSoft recommends that you use the standard delivered TAO tables.

---

**Note:** If you specify the value Any Table in the Pool Record Type field, add any additional fields that might be required to the delivered ALC\_GL\_P\_TAO table.

---

If you are using your own customized TAO tables, use the delivered TAO tables as a model. Open the delivered TAO table and do a save as to create a TAO table. The following fields are required:

- PROCESS\_INSTANCE, LOGICAL\_RECORDS, BUSINESS\_UNIT, BUSINESS\_UNIT\_IU.
- ChartField that are applicable to the process, such as Account, DEPTID, and so on.
- Amount Fields and the currency control fields that are applicable to the amounts that are allocated.

This should also include the calculation log pool and basis amount fields, namely, ALLOC\_POOL\_AMT, ALLOC\_POOL\_PBA, ALLOC\_POOL\_PTR, ALLOC\_BASIS\_AMT, ALLOC\_BASIS\_TOT.

- Fields required for interunit processing, IU\_TRAN\_GRP\_NBR, IU\_ANCHOR\_FLG.
- Fields required for intraunit processing, CF\_VALUE1 to CF\_VALUE10.
- Field required for base currency conversion, BASE\_CURRENCY\_POOL, RATE\_MULT, RATE\_DIV.
- Fields required for time span, ACCOUNTING\_PERIOD, FISCAL\_YEAR.
- Other fields that are applicable to the setup.

For example, if you are allocating to a specific ledger, add field LEDGER to the TAO tables.

**Note:** To increase performance, the PeopleSoft Allocations process attempts to use a dedicated temporary table for all TAO tables. If you are using your own TAO tables, use dedicated temporary tables that are created in PeopleSoft Application Designer and define the record type as a temporary table. Define the temporary tables in the definition of the PeopleSoft Allocations process (FS\_ALLC).

## Define Allocation Step - Amount Fields Page

Use the Amount Fields page (ALLOC\_AMOUNT) to define the amount field mapping between the pool, basis, target, and offset records.

Navigation:

**Allocations > Define and Perform Allocations > Define Allocation Step > Amount Fields**

This example illustrates the fields and controls on the Define Allocation Step - Amount Fields page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Define Allocation Step - Amount Fields' page. At the top, there are tabs for 'Type', 'Pool', 'Basis', 'Target', 'Offset', 'Output Options', 'Round Options', 'Batch Records', and 'Amount Fields'. Below the tabs, the page header shows 'SetID: SHARE' and 'Step: RENTEXP'. The 'Effective Date' is 01/01/1900, and the 'Status' is 'Active'. The 'Description' is 'Allocate Rent by Floor Space'. The page contains a table titled 'Allocation Amount Field Mappings' with the following columns: Field Name, Pool, Basis, Target, and Offset. The table has five rows of mappings:

| Field Name             | Pool                        | Basis               | Target                      | Offset          |
|------------------------|-----------------------------|---------------------|-----------------------------|-----------------|
| Amount                 | Posted Total Amount         | Posted Total Amount | Foreign Amount              | Foreign Amount  |
| Base Amount            | Posted Base Currency Amount |                     | Monetary Amount             | Monetary Amount |
| Log Amount             | Allocations Pool Amount     | Alloc Basis Amt     | Alloc Target/Offset Amount  |                 |
| Log Base Amount        | Allocations Pool PBA Amount |                     | Alloc Target/Offset PBA Amt |                 |
| Log Basis Total Amount |                             | Alloc Basis Total   |                             |                 |

Use this page to define the fields in the chosen pool record that store the pool amounts, the fields in the chosen basis record that store the basis amounts, and where the system is to put the calculated amounts in the chosen target and offset records.

You can specify many sets of amount fields to perform allocations. For example, Project Costing can allocate on both resource amount and resource quantity fields in the same allocations. You can allocate pool resource amounts by using the basis resource amount percentage-to-total ratio and the pool resource quantity by using the basis resource quantity percentage-to-total ratio. You can also allocate both the pool resource amount and resource quantity using the basis resource amount percentage-to-total ratio. This page gives you the flexibility to define how the amounts are distributed from the fields in the pool record to the fields in the target and offset record.

General Ledger provides information about the total balances in the base currency and in individual transaction currency balances. Use the posted total amount field to get the total balance in the base currency. You can use the **Posted Transaction Amount** field to get the individual transaction currency balances. The Posted Transaction Amount (POSTED\_TRAN\_AMT) and Posted Total Amount (POSTED\_TOTAL\_AMT) fields exist in the ledger table to store different currency information.

The following simplified example illustrates the totals as recorded in the ledger for three transactions in three currencies: 1000 EUR, 100 USD, and 1000 GBP. Assume that the base currency is USD. Also, assume that 1 EUR is equal to 1.10 USD and that 1 GBP is equal to 1.58 USD. After the three transactions are recorded, the balances in the ledger are as follows:

| <b>Currency</b> | <b>Posted Total Amount</b> | <b>Posted Base Currency Amount</b> | <b>Posted Transaction Amount</b> |
|-----------------|----------------------------|------------------------------------|----------------------------------|
| EUR             | 1000                       | 1100                               | 1000                             |
| USD             | 2780                       | 100                                | 100                              |
| GBP             | 1000                       | 1580                               | 1000                             |

**Note:** The Foreign Amount (FOREIGN\_AMOUNT) field on the journal line is the transaction currency amount and is ultimately recorded in the posted transaction amount. The Monetary Amount (MONETARY\_AMOUNT) field on the journal line is the equivalent of the base currency amount and is recorded in the posted base amount. It is important to keep this relationship between ledger and journal line fields in mind when the target and offset are journal lines.

| <b>Field or Control</b>  | <b>Description</b>                                                                                                                                                                           |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fixed Pool Amount</b> | Enter an amount if the pool is not a record but a fixed amount. This field is not available if you do not specify <i>Fixed Amount</i> in the <b>Pool Record Type</b> field on the Pool page. |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Amount</b>           | <p>Select amount fields for the <b>Pool, Basis, Target, and Offset</b>. Depending on the records and fields that you specify on the Pool, Basis, Target and Offset pages, the system displays possible fields for the amount in the drop-down menus. Following are values for a RENTEXP allocation example that uses the ledger group record and the <b>Account</b> field for pool and basis and is allocating the pool amount to the journal record for target and offset.</p> <p>The values that are available in the drop-down menus differ depending on the records and fields that are specified for the basis, pool, target and offset, and thus for the product for which the allocation is intended. For example, the values are different for Project Costing and General Ledger allocations because the records and fields are different. You must thoroughly understand the relationship between records and fields in the product and between pool, basis, target, and offset before you can successfully complete the allocations.</p> <ul style="list-style-type: none"> <li>Pool amount: Select the field in the pool record that provides the amounts that are to be allocated to the target and offset.</li> </ul> <p>For example, select the Posted Transaction Amount (POSTED_TRAN_AMT) in the ledger record when you are allocating transaction amounts to the target and offset.</p> <ul style="list-style-type: none"> <li>Basis amount: Select a field in the basis record that you can use to determine in what proportion the pool amounts are distributed to the target and offset.</li> <li>Target amount: Select the field in the target record where the pool amounts are to be distributed. For example, the transaction (FOREIGN_AMOUNT) field in the journal line record.</li> <li>Offset amount: Select a field in the offset record where the pool amounts that are distributed to the target are offset, or cleared.</li> </ul> <p>Offset is only necessary when you must prevent double counting. For example, FOREIGN_AMOUNT in the journal line record offsets (balances out) the amount that is distributed to the target in the FOREIGN_AMOUNT field when posted to the ledger.</p> |

| <b>Field or Control</b>   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Base Amount</b>        | <p>Select from the values for the <b>Pool</b>, <b>Target</b>, and <b>Offset</b> fields.</p> <ul style="list-style-type: none"> <li>Pool base amount: Select the field in the pool record that contains the amount that is the base currency that is equivalent to the pool <b>Amount</b> field.</li> </ul> <p>For example, POSTED_BASE_AMT is the base currency equivalent of POSTED_TOTAL_AMT in the ledger record and MONETARY_AMOUNT is the base currency equivalent of FOREIGN_AMOUNT in the journal line record. When you specify the base amount for the pool, the PeopleSoft Allocations process assumes that the amounts are monetary and uses the currency control fields that are defined for the Pool, Target and Offset records to determine the currency codes.</p> <ul style="list-style-type: none"> <li>Target base amount: Select the <b>Amount</b> field in the target record that contains amounts that are the base currency equivalent of the <b>Target Amount</b> field.</li> </ul> <p>For example, MONETARY_AMOUNT is the base currency equivalent of FOREIGN_AMOUNT in the journal line record.</p> <ul style="list-style-type: none"> <li>Offset base amount: Select the field in the offset record for which is the base currency equivalent of FOREIGN_AMOUNT on the journal line record.</li> </ul> <p>This field is optional. Its purpose is to support multicurrency functionality for monetary amount fields in allocations. If the target amount is a statistical amount or only one currency is involved, leave this field blank.</p> |
| <b>Transaction Amount</b> | <p>Specify the <i>Posted Transaction Amount</i> to allocate the individual transaction currencies when the target record is specified as <i>Any Table</i> on the Target page. The allocation must be allocating to a record for this field to be available. It does not appear on the Amount page otherwise.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Log Amount</b>         | <p>Select the appropriate fields from the Calculation Log record used to store the pool, basis, and target amounts to provide an audit trail.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Log Base Amount</b>    | <p>Select the appropriate fields from the Calculation Log record:</p> <ul style="list-style-type: none"> <li>Pool log base amount: Select the field that is used to store the pool base currency amount for an audit trail.</li> <li>Target log base amount: Select the amount field that is used to store the calculated target base currency amount for an audit trail.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Field or Control</b>       | <b>Description</b>                                                                                                                                                                                                                                                                                  |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Log Basis Total Amount</b> | The amount field in the Calculation Log record that is used to store the total basis amount for the audit trail. Dividing the value stored in the <b>Log Basis</b> field by the value stored in the <b>Log Basis Total</b> field gives you the percentage of pool amount distributed to the target. |

The following are examples of the setup for the amount fields for various allocation scenarios.

For example, if you are allocating on monetary amounts for General Ledger, the pool record might be Ledger Group ACTUALS and the Target record journals ACTUALS. The allocation fields are:

| <b>Allocation Amount Fields</b> | <b>Field Value</b> |
|---------------------------------|--------------------|
| Pool Amount                     | POSTED_TRAN_AMT    |
| Pool Base Amount                | POSTED_BASE_AMT    |
| Target Amount                   | FOREIGN_AMOUNT     |
| Target Base Amount              | MONETARY_AMOUNT    |

The actual pool and target records are LEDGER and JRNL\_LN, respectively. The currency control fields that are defined in PeopleSoft Application Designer for the POSTED\_TOTAL\_AMT, POSTED\_TRAN\_AMT, and POSTED\_BASE\_AMT fields are the CURRENCY\_CD and BASE\_CURRENCY fields for the LEDGER record. The currency control fields that are defined in PeopleSoft Application Designer for the FOREIGN\_AMOUNT and MONETARY\_AMOUNT fields are the FOREIGN\_CURRENCY and CURRENCY\_CD fields for the JRNL\_LN record.

Using these currency control field definitions, allocations automatically determine that the target record's FOREIGN\_CURRENCY field value source is from the pool record's CURRENCY\_CD field value, and the target record's CURRENCY\_CD field value source is from the pool record's BASE\_CURRENCY field value. You need not define the currency field values explicitly for the **Target** and **Offset** fields.

These currency control field values also determine the currency precision and rounding feature in the PeopleSoft Allocations process. For example, if the target record FOREIGN\_CURRENCY field value is USD, the system rounds the FOREIGN\_AMOUNT to the second decimal. If the target record FOREIGN\_CURRENCY field value is JPY (Japanese yen), the system rounds the FOREIGN\_AMOUNT to the integer.

The PeopleSoft Allocations process uses the target record's currency control field values to determine the currencies that are for the target and offset records. If you are allocating on fixed pool amounts, there is no pool record; you must specify the target and offset records' currency field values in the **Target** and **Offset** fields. For example, if you are allocating 100.00 USD, you enter 100 in the **Fixed Pool Amount** field on the Amount page. On the Target and Offset pages, specify the FOREIGN\_CURRENCY and CURRENCY\_CD fields in the **Specify Field Values** group box. Set the **Source** field value on the Target and Offset page to *Value*.

The following table is an example of the fields that are used when allocating on monetary amounts in PeopleSoft applications:

| <b><i>Allocation Amount Field</i></b> | <b><i>Field Value</i></b> |
|---------------------------------------|---------------------------|
| Pool Amount                           | POSTED_TRAN_AMT           |
| Pool Base Amount                      | POSTED_BASE_AMT           |
| Basis Amount                          | POSTED_TOTAL_AMT          |
| Target Amount                         | FOREIGN_AMOUNT            |
| Target Base Amount                    | MONETARY_AMOUNT           |
| Offset Amount                         | FOREIGN_AMOUNT            |
| Offset Base Amount                    | MONETARY_AMOUNT           |
| Pool Log Amt                          | ALLOC_POOL_AMT            |
| Pool Log Base Amt                     | ALLOC_POOL_PBA            |
| Basis Log Amt                         | ALLOC_BASIS_AMT           |
| Basis Log Total                       | ALLOC_BASIS_TOT           |
| Target Log Amt                        | ALLOC_TARG_OFF_AMT        |
| Target Log Base Amt                   | ALLOC_TARG_OFF_PBA        |

The following example shows fields used when allocating to statistics amounts in PeopleSoft applications:

| <b><i>Allocation Amount Field</i></b> | <b><i>Field Value</i></b> |
|---------------------------------------|---------------------------|
| Pool Amount                           | POSTED_TOTAL_AMT          |
| Pool Base Amount                      | optional                  |
| Basis Amount                          | POSTED_TOTAL_AMT          |
| Target Amount                         | STATISTIC_AMOUNT          |

| <b>Allocation Amount Field</b> | <b>Field Value</b> |
|--------------------------------|--------------------|
| Target Base Amount             | optional           |
| Offset Amount                  | STATISTIC_AMOUNT   |
| Offset Base Amount             | optional           |
| Pool Log Amt                   | ALLOC_POOL_AMT     |
| Pool Log Base Amt              | optional           |
| Basis Log Amt                  | ALLOC_BASIS_AMT    |
| Basis Log Total                | ALLOC_BASIS_TOT    |
| Target Log Amt                 | ALLOC_TARG_OFF_AMT |
| Target Log Base Amt            | optional           |

If you are multiplying a statistics pool amount (such as, hours) by a basis amount (such as , hourly rate) in PeopleSoft applications to create a monetary amount target, explicitly specify the FOREIGN\_CURRENCY and CURRENCY\_CD field values for the target and offset record. The amount fields are defined as follows:

| <b>Allocation Amount Field</b> | <b>Field Value</b> |
|--------------------------------|--------------------|
| Pool Amount                    | POSTED_TOTAL_AMT   |
| Pool Base Amount               | optional           |
| Basis Amount                   | POSTED_TOTAL_AMT   |
| Target Amount                  | FOREIGN_AMOUNT     |
| Target Base Amount             | MONETARY_AMOUNT    |
| Offset Amount                  | FOREIGN_AMOUNT     |
| Offset Base Amount             | MONETARY_AMOUNT    |
| Pool Log Amt                   | ALLOC_POOL_AMT     |

| <b><i>Allocation Amount Field</i></b> | <b><i>Field Value</i></b> |
|---------------------------------------|---------------------------|
| Pool Log Base Amt                     | optional                  |
| Basis Log Amt                         | ALLOC_BASIS_AMT           |
| Basis Log Total                       | ALLOC_BASIS_TOT           |
| Target Log Amt                        | ALLOC_TARG_OFF_AMT        |
| Target Log Base Amt                   | ALLOC_TARG_OFF_PBA        |

If you are creating budgets for next year in PeopleSoft applications and you do not want to carry all foreign currencies in the budget ledger but instead you want to use the consolidated total amounts for all currencies, you can specify the currency code equal to the base currency for your pool. Define the amount fields as follows:

| <b><i>Allocation Amount Field</i></b> | <b><i>Field Value</i></b> |
|---------------------------------------|---------------------------|
| Pool Amount                           | POSTED_TRAN_AMT           |
| Pool Base Amount                      | POSTED_BASE_AMT           |
| Basis Amount                          | POSTED_TOTAL_AMT          |
| Target Amount                         | FOREIGN_AMOUNT            |
| Target Base Amount                    | MONETARY_AMOUNT           |
| Offset Amount                         | FOREIGN_AMOUNT            |
| Offset Base Amount                    | MONETARY_AMOUNT           |
| Pool Log Amt                          | ALLOC_POOL_AMT            |
| Pool Log Base Amt                     | ALLOC_POOL_PBA            |
| Basis Log Amt                         | ALLOC_BASIS_AMT           |
| Basis Log Total                       | ALLOC_BASIS_TOT           |
| Target Log Amt                        | ALLOC_TARG_OFF_AMT        |

| <i>Allocation Amount Field</i> | <i>Field Value</i> |
|--------------------------------|--------------------|
| Target Log Base Amt            | ALLOC_TARG_OFF_PBA |

## Defining the Allocation Group

To define the allocation group, use the Define Allocation Group component (ALLOC\_GROUP).

### Page Used to Define Allocation Group

| <i>Page Name</i>             | <i>Definition Name</i> | <i>Usage</i>                                    |
|------------------------------|------------------------|-------------------------------------------------|
| <u>Allocation Group Page</u> | ALLOC_GROUP            | Define multiple allocations across ChartFields. |

## Understanding the Allocation Group

You can define multiple allocation steps for step-down allocations across ChartFields. The target for each step can become the next step's pool or basis. You define an allocation group for these steps and then process the allocation on the group. If a step in the sequence fails, the **Continue** option determines if processing continues for the next step.

The allocation group is effective-dated, allowing you to track the historical basis of the financial data that results from allocation processing.

---

**Note:** Even if there is only one step in an allocation, you must define an allocation group.

---

## Allocation Group Page

Use the Allocation Group page (ALLOC\_GROUP) to define multiple allocations across ChartFields.

Navigation:

**Allocations > Define and Perform Allocations > Define Allocation Group > Allocation Group.**

This example illustrates the fields and controls on the Allocation Group page. You can find definitions for the fields and controls later on this page.

**Note:** The data that is entered using this page can also be loaded as an Application Data Set using the Data Migration Workbench. For more information about ADS and the Data Migration Workbench for FSCM applications, see [Using the Data Migration Workbench for PeopleSoft Allocations](#)

Use the icons in the upper right corner of the page to copy, rename, or delete the allocation group.

| Field or Control                                                                    | Description                                                                                                                                                                           |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Click the <b>Copy Allocation Group</b> button to make a copy of the group.                                                                                                            |
|  | Click the <b>Rename Allocation Group</b> button to rename the copy group.                                                                                                             |
|  | Click the <b>Delete Allocation Group</b> button to delete the copy group.                                                                                                             |
| <b>Effective Date</b>                                                               | Enter the date that the Allocation Group is to be effective. This provides the ability to change the Allocation Group as time progresses and retain the audit trail of those changes. |
| <b>Status</b>                                                                       | Select a status of <i>Active</i> or <i>Inactive</i> for the Allocation Group.                                                                                                         |
| <b>Description</b>                                                                  | Enter a short description to appear in prompt lists and reports.                                                                                                                      |
| <b>Comments</b>                                                                     | Add a detailed explanation for the Allocation Group and document the purpose of each step within a complex allocation.                                                                |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Step</b>             | <p>Select the process step that determines the various allocations processing options in addition to the pool, basis, target, and offset ChartFields. You can define allocation steps in the Allocation Step component, or you can define them from the Allocation Group page using the Update/Create link. After you have defined an allocation step, you can use it in any number of allocations.</p> <p>The sequence determines the order in which the PeopleSoft Allocations process performs the steps. It is important to enter them in the correct sequence because the target of each step becomes the pool for the next step (or basis if the journals are posted).</p> |
| <b>Update/Create</b>    | Click to access the Allocation Step component where you can define allocation steps. See also <a href="#">Defining Allocation Process Steps</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Continue</b>         | Select for a specific step to indicate that you want the system to continue processing even if that allocation step fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Understanding Copying, Renaming, or Deleting Allocation Steps

The PeopleSoft Allocations process requires several steps. Chances are that some of the steps in a single allocation—or even steps for a different allocation altogether—can be quite similar. It's possible to use identical steps in several allocations simply by specifying the step name; there is no limit to the number of times or places that you can use a given step.

Copy / Rename / Delete Allocation Step Page

Use the Copy / Rename / Delete Allocation Step page (GL\_ALC\_COPY) to create new steps that are identical or similar to the ones that you already defined.

Also rename or delete an allocation step.

Navigation:

Allocations >Define and Perform Allocations >Modify Allocation Step

This example illustrates the fields and controls on the Copy / Rename / Delete Allocation Step page. You can find definitions for the fields and controls later on this page.

Creating Adjusting Entry Journals

To create adjusting entry journals, use the TimeSpans component (TIME\_SPAN).

## Page Used to Create Adjusting Entry Journals

| <b>Page Name</b>      | <b>Definition Name</b> | <b>Usage</b>                                        |
|-----------------------|------------------------|-----------------------------------------------------|
| <u>TimeSpans Page</u> | TIME_SPAN              | Specify the adjusting period's type for the output. |

## Understanding Allocations and Adjusting Entry Journals

The PeopleSoft Allocations process supports creating adjusting entry journals, where the accounting period is an adjustment period. Adjustment periods can be defined as absolute period or relative to current period.

Use the TimeSpans component (TIME\_SPAN) to:

- Set up time span definitions specifying absolute period.
- Set up time span definitions specifying relative period.
- Allocate to multiple adjustment periods.
- Specify the Adjusting Entry option.

## TimeSpans Page

Use the TimeSpans page (TIME\_SPAN) to specify the adjusting period's type for the output.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Calendars/Schedules >Define TimeSpans**

This example illustrates the fields and controls on the TimeSpans page. You can find definitions for the fields and controls later on this page.

In this example, the adjustment period is set up for the absolute period of 905.

Setting Up TimeSpan Definitions Specifying Relative Period

In the following example, the adjustment periods are defined relative to the current regular period:

This example illustrates the fields and controls on the TimeSpans page (adjustment period determined relative to current period). You can find definitions for the fields and controls later on this page.

Calendar ID01

Monthly

☐ Include Balance Forward

Include Adjustment Periods

☐ No Adjustment Period

☐ Adjustment Period 998

☒ Specify Adjustment Period

Start Adjustment Period900

\*Start Adjustment Period TypeRelative to Current Period

End Adjustment Period900

\*End Adjustment Period TypeRelative to Current Period

The adjustment period is the Start Adjustment Period/End Adjustment Period value that is specified, plus the current regular period. For example, suppose that you are processing allocations in March, then the current period is 03 (monthly calendar) and the adjustment period is 903.

The advantage of defining the adjustment period as relative to the current period is that you need not maintain the adjustment period value in the time span.

Allocating to Multiple Adjustment Periods - Example

Use relative adjustment periods to allocate to multiple adjustment periods. In this example, the TimeSpans page is defined for allocations to create adjusting journal entries for adjustment periods 901 through 912:

This example illustrates the fields and controls on the TimeSpan for multiple adjustment periods. You can find definitions for the fields and controls later on this page.

## Specifying the Adjusting Entry Option

Select a time span that uses adjustment period on the Define Allocation Step - Target page.

Navigation:

**Allocations > Define and Perform Allocations > Define Allocation Step.** Select the **Target** tab.

This example illustrates the fields and controls on the Define Allocation Step - Target Page. You can find definitions for the fields and controls later on this page.

Notice in the following example that if the TimeSpan that you select on the Target page is set up to use adjustment periods, the Adjusting Entry options on the allocation Output Option page are visible.

Navigation:

**Allocations > Define and Perform Allocations > Define Allocation Step.** Select the **Output Options** tab.

This example illustrates the fields and controls on the Define Allocation Step - Output Options Page. You can find definitions for the fields and controls later on this page.

The PeopleSoft Allocations process uses this option to determine which accounting periods are used with the journals. If the **Adjusting Entry** option is selected, the PeopleSoft Allocations process creates the journal or journals with the adjustment period or periods that are defined in the target time span. If the option is not selected, allocations creates the journal or journals with the regular accounting period or periods.

## Setting Up Interunit and Intraunit Allocations

The PeopleSoft Allocations process creates what are initially unbalanced allocation journal entries between legal entities (interentity), between business units (interunit), and among balancing ChartFields within a particular business unit (intraunit).

The PeopleSoft Allocations process does not create the interunit and intraunit balancing journal lines as a part of the process. The interunit and intraunit balancing transaction lines are created by the Inter/IntraUnit Processor, which is run from journal edit.

In the following example, business unit JP001 is allocating rent expense that is accumulated in its account 640000 in the amount of 1000000 JPY to JP001, JP002, and JP003 on a fixed basis of 50 percent, 20 percent, and 30 percent, respectively.

The following illustrates a simple allocation of this expense across multiple business units:

| <i><b>BU<br/>Pool</b></i> | <i><b>Fixed<br/>Basis</b></i> | <i><b>Target by Basis</b></i> | <i><b>Offset to<br/>BU Pool</b></i> |
|---------------------------|-------------------------------|-------------------------------|-------------------------------------|
| JP001                     | 50 percent to JP001           | JP001                         | JP001                               |
|                           | 20 percent to JP002           | JP002                         |                                     |
|                           | 30 percent to JP003           | JP003                         |                                     |

You create an interunit and intraunit allocation much as you would any other, except that you must select an appropriate transaction code on the Allocation Type page. The PeopleSoft Allocations process populates this value on each journal entry line.

The transaction code is a means to categorize interunit and intraunit transactions. This example illustrates the delivered System Transaction for General Ledger journals (GLJ) and the Transaction Code JOURNALS.

If you want to distinguish the allocated interunit and intraunit rent receivables and payables from all others, you can create a transaction code (such as AllocJrnl) and map it to the GLJ System Transaction. You must also create interunit templates and intraunit templates that associate the new transaction code with accounting entry types for which you provide ChartField values that are used by the system to complete the partial interunit and intraunit entries.

The PeopleSoft Allocations process supplies the following information for the journal header:

| <b><i>Business Unit</i></b> | <b><i>Business Unit IU</i></b> | <b><i>System Transaction</i></b> | <b><i>Transaction Code</i></b> |
|-----------------------------|--------------------------------|----------------------------------|--------------------------------|
| JP001                       | JP001                          | GLJ                              | JOURNALS                       |
| JP002                       | JP001                          | GLJ                              | JOURNALS                       |
| JP003                       | JP001                          | GLJ                              | JOURNALS                       |

The PeopleSoft Allocations process creates the following journal line information:

| <b><i>IU Group</i></b> | <b><i>Anchor</i></b> | <b><i>Line #</i></b> | <b><i>BU</i></b> | <b><i>Acct</i></b> | <b><i>Amount</i></b> |
|------------------------|----------------------|----------------------|------------------|--------------------|----------------------|
| 1                      | JP001                | 1                    | JP001            | 640000             | -1000000             |
| 1                      |                      | 2                    | JP001            | 640001             | 500000               |
| 1                      |                      | 3                    | JP002            | 640001             | 200000               |
| 1                      |                      | 4                    | JP003            | 640001             | 300000               |

The anchor is the business unit or ChartField value around which the system completes the entry and determines such things as the balancing method and organizes the related journal lines in the same IU group (interunit group).

For intraunit allocation steps, the process always defines a unique IU group for each balancing ChartField value that is defined in the pool. For interunit, the process always uses an IU group number of 1.

The PeopleSoft Allocations process derives the anchor business unit based on the definition setup.

The process first checks to determine if the business unit is defined in the offset as a fixed value. If this condition is the case, the process uses the offset fixed value as the anchor.

If not, the business unit is not in the offset as a fixed value, the process checks if the business unit is defined in the target as a fixed value. If this condition is true, the process uses the target fixed value as the anchor.

If the business unit is not defined in the target or offset as a fixed value, then the process uses the business unit from the pool as the anchor.

---

**Note:** If there are multiple pool values, each is processed against the basis in turn. The result is a separate IU group for each pool value and its journal entry lines. Use any of the interunit business units that are defined in the pool when requesting interunit allocations.

---

At this point, the rent expense is allocated but the journal is not in balance because you have not yet created the due to and due from interunit or intraunit payables and receivables lines. When you run the Inter/IntraUnit Central Processor, it provides the following information or additional lines to balance the journal entry (lines 5 through 8):

| <i><b>IU Group</b></i> | <i><b>Anchor</b></i> | <i><b>Line#</b></i> | <i><b>BU</b></i> | <i><b>Acct</b></i> | <i><b>Affiliate</b></i> | <i><b>Amount</b></i> |
|------------------------|----------------------|---------------------|------------------|--------------------|-------------------------|----------------------|
| 1                      |                      | 5                   | JP001            | 100000             | JP002                   | 200000               |
| 1                      |                      | 6                   | JP001            | 100000             | JP003                   | 300000               |
| 1                      |                      | 7                   | JP002            | 100000             | JP001                   | -200000              |
| 1                      |                      | 8                   | JP003            | 100000             | JP001                   | -300000              |

## Using Allocations with PeopleSoft Project Costing

There are two basic types of allocations that you can perform in PeopleSoft Project Costing by using the PeopleSoft Allocations process:

- Project-to-project allocations.
- General Ledger to Project Costing allocations.

The *PeopleSoft Project Costing* product documentation discusses using the PeopleSoft Allocations process in Project Costing and provides an example of a project-to-project allocation step.

|--------------------|-------|-------------------|----------------------|----------------------------|--------------------------------|
| Always             | US001 | RENT              | Process Date         | Create Calc Log and Output | Rent & Building exp Allocation |

**Note:** The data that is entered using this page can also be loaded as an Application Data Set using the Data Migration Workbench. For more information about ADS and the Data Migration Workbench for FSCM applications, see [Using the Data Migration Workbench for PeopleSoft Allocations](#)

Run the request after you define the allocation steps and allocation group.

| Field or Control | Description                                                                                                                                                                                                                                                                                                                     |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Unit             | Specify the business unit for the PeopleSoft Allocations process. For non-interunit steps, this business unit also determines the business unit value for the pool and basis rows that are selected. For interunit steps, use any one of the business units that are defined in the pool when requesting interunit allocations. |
| Allocation Group | Identify the allocation group to be processed in this request.                                                                                                                                                                                                                                                                  |

| <b>Field or Control</b>                                                           | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Request Date Option</b>                                                        | <p>Select the <i>As of Date</i> value in the <b>Request Date Option</b> field, and two additional <b>As of Date</b> fields become available. The as of date moves by default to the current system date; however, you can change the date for individual lines by using the <b>As of Date</b> field on each line or for all lines using the <b>As of Date</b> field for the request.</p> <p>You can define individual steps in an allocation group using relative time spans, such as PER (Current Period Activity). A relative time span retrieves ledger amounts relative to the <b>Request Date Option</b> that you specify. The request date options are:</p> <ul style="list-style-type: none"> <li>• <i>Process Date</i>: Uses journals dated before the run date.</li> <li>• <i>SYSDATE</i>: Uses journals dated before the system date for your computer.</li> <li>• <i>As of Date</i>: Uses journals dated before the date that you specify in the <b>As of Date</b> field that appears for the line when you select this option.</li> </ul> |
|  | Click the <b>Update As of Date</b> button to change the as of date for all lines in the run requests to the current date or the date that you specify.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Output Options</b>                                                             | <p>Select one of the following options:</p> <ul style="list-style-type: none"> <li>• <i>Create Calc Log - No Output</i> (create calculation log - no output): Serves as a <i>dry run</i> by creating a calculation log but no journals and ledger entries.</li> <li>• <i>Create Calc Log and Output</i> (create calculation log and output): Creates a calculation log and generates journals and ledger entries.</li> <li>• <i>No Calc Log - Create Output</i> (no calculation log - create output): Creates journals and ledger entries, but no calculation log. This is the system default value.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Note:** Calculation logs are cleared using SQL scripts.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                            |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Start Step</b>       | When errors occur and processing aborts, you can restart processing at the step that failed by selecting <b>Start Step</b> . This option appears only if an error occurred during processing. |

## Viewing Process Messages

The run status in the process monitor appears as a warning if allocations generates any error messages for the request. Use the Message Log to view any system-generated messages when you process allocations. The Message Log can also help you to troubleshoot allocations and to audit allocation information.

---

## Restarting and Recovering the Allocations Process

If the system encounters an error while it is processing a request, it sets the request status to error. The program then continues with the next request. To rerun the canceled request, you must return to the online request page and initiate the request.

You can use the Message Log page to identify any request marked in error. When you correct the condition that caused the error, mark the request for processing and run the job again.

For allocations, the request specifies the allocation group to be processed and a commit is performed after each allocation step in that group. If the system encounters an error while it is processing a step, two factors determine whether the system continues with subsequent steps:

- The type of error.
- The **Continue** option on the Allocation Group page.

If the error is a system error, the allocation process aborts. If the error is a data error, the system checks the **Step Continue** option on the Allocation group definition.

If you select **Continue** for the step that failed, the system continues processing despite the failure. If you do not select **Continue** for that step, allocations proceeds with the next group on the request. After you correct the problem that caused the error, you can rerun the process for the same group.

The **Start Step** check box on the Allocation Request page enables you to specify whether the PeopleSoft Allocations process should restart processing at the step that failed. If you do not select this check box, allocations starts with the first step in the group. The **Start Step** option is available only if an error occurred during processing.

# Setting Up On-Demand Processing

---

## Understanding Setting Up On-Demand Processing

Oracle's PeopleSoft Financial Management and Supply Chain Management provides on-demand process groups that certain users can run directly from transaction entry pages. These process groups generally consist of logically related and sequentially ordered processes that a transaction might require.

The process groups available depend on your user ID and whether or not a given transaction requires the processing. For example, if budget checking is not applicable to a particular voucher, the Budget Checking (BUDGET\_CHK) process group is not available.

---

**Warning!** Some of the on-demand processing depends on products installed. For example, if PeopleSoft General Ledger is licensed and installed, the Journal Generator (FS\_JGEN) process will also execute the Journal Edit and Journal Post process. If you do not choose to license and install PeopleSoft General Ledger, deselect the check box for the PeopleSoft General Ledger product on the Installation Options - Products page. This eliminates the wasted time your system will incur by executing the Journal Edit and Journal Post process when these processes are not needed. In general, deselect all check boxes on the Installation Options - Products page for all products that you have not licensed.

---

### Payables

When you finish entering a voucher in PeopleSoft Payables, you can either save the voucher and process it in batch, or you can process it on demand on the following pages:

- Cancel Payment (PYMNT\_CANCEL).
- Close Voucher (VCHR\_CLOSE1).
- Complete Register Voucher (VCHR\_HDR\_CMP).
- Mass Payment Cancellation (AP\_PMT\_MASS\_CNL).
- Match Exception Workbench Details (AP\_MTCH\_WB\_EXCPTN).
- Match Overridden Workbench Details (AP\_MTCH\_WB\_OVRD).
- Match Workbench (AP\_MTCH\_WB).
- Payment Escheatment (PYMNT\_ESCHEAT).
- Quick Invoice (VCHR\_HEADER\_QV1 and VCHR\_HEADER\_QV2).
- Voucher component (VCHR\_EXPRESS).
- Voucher Maintenance component (VCHR\_CORRECTION).
- Voucher Mass Maintenance – Close (VCHR\_MMT\_CLSE\_SEC1).

- Voucher Mass Maintenance – Delete (VCHR\_MMT\_DLTE\_SEC1).
- Voucher Mass Maintenance – Field Replace (VCHR\_MMT\_RPLC\_SEC1).
- Voucher Mass Maintenance – UnPost (VCHR\_MMT\_UNPS\_SEC1).
- Withholding Invoice Line Update (WTHD\_LINE\_UPDT).
- Withholding Vendor Update (VNDR\_UPDT).

On-demand processing is also available from the Voucher On-Demand Process component for batch processing by process group.

Processes are numbered to indicate the order of how the processes run. For example, on the Quick Invoice page if you select 4. Journal Generate, the system automatically initiates the number 1 process (Voucher Build), the number 2 process (Matching), the number 3 process (Voucher Posting), and then the number 4 process (Journal Generate). The process group used in this example is All Processes through Journal Generate (QVJGEN).

---

**Note:** The system automatically displays the on-demand processing functionality only to assigned users. Definitions configured on the User Preferences - Process Group page determine whether the system enables this functionality for a specific user, and further, a specific process.

---

See "Invoice Information Page" (PeopleSoft Payables).

## Receivables

In PeopleSoft Receivables, a process group is not associated with a process; it is associated with a posting action. The posting action that is associated with a process group determines which processes to run, and when to run those processes.

Each process group (posting action) is associated with six different source transactions, for example payment worksheets and maintenance worksheets.

See "Understanding the Receivables Update Application Engine Process" (PeopleSoft Receivables).

## Process Groups

This table shows the process groups, their associated processes and posting actions, and the products that use them:

| <b>Process Group</b>          | <b>Processes and Posting Actions</b>                            | <b>PeopleSoft Products</b> |
|-------------------------------|-----------------------------------------------------------------|----------------------------|
| Voucher Build (AP_VCHRBLD)    | Runs the Voucher Build Application Engine process (AP_VCHRBLD). | Payables                   |
| Mass Cancellation (APPMTCNL1) | Runs the Mass Cancellation Application Engine (AP_MASSPMTCN).   | Payables                   |

| <b>Process Group</b>                               | <b>Processes and Posting Actions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>PeopleSoft Products</b> |
|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Cancel, Payment Post (APPMTCNL2)                   | Runs the Mass Cancellation process followed by the Payment Posting Application Engine process (AP_PSTPYMNT).                                                                                                                                                                                                                                                                                                                                                                       | Payables                   |
| Cancel, Payment Post, Voucher Post (APPMTCNL2A)    | Runs three processes: first, the Mass Cancellation process, followed by the Payment Posting process, and then the Voucher Posting Application Engine process (AP_PSTVCHR).                                                                                                                                                                                                                                                                                                         | Payables                   |
| All Processes Through Journal Generate (BLDTPPOST) | <p>Runs the following Application Engine processes, in the order listed:</p> <ul style="list-style-type: none"> <li>• Voucher Build.</li> <li>• Matching.</li> </ul> <hr/> <p><b>Note:</b> Matching runs only if vouchers have associated copied purchase orders or receivers.</p> <hr/> <ul style="list-style-type: none"> <li>• Document Tolerance Checking.</li> <li>• Commitment Control Budget Checking.</li> <li>• Voucher Posting.</li> <li>• Journal Generator.</li> </ul> | Payables                   |
| Budget Checking (BUDGET_CHK)                       | Runs the Commitment Control Budget Chk on-demand process (FS_BCHK), which in turn calls the Budget Processor Application Engine process (FS_BP).                                                                                                                                                                                                                                                                                                                                   | Payables                   |
| Document Tolerance (DOC_TOL)                       | Runs the Document Tolerance Checking Application Engine process (FS_DOCTOL).                                                                                                                                                                                                                                                                                                                                                                                                       | Payables                   |
| Voucher Mass Maintenance (MASSMAINT)               | Runs the Voucher Mass Maintenance Application Engine process (APVCHMASSMNT).                                                                                                                                                                                                                                                                                                                                                                                                       | Payables                   |
| Mass Maintenance and Voucher Build (MASSMNTVB)     | Runs the same process as the Voucher Mass Maintenance process group, along with the Voucher Build Application Engine Process (AP_VCHRBLD).                                                                                                                                                                                                                                                                                                                                         | Payables                   |

| <b>Process Group</b>                                                                      | <b>Processes and Posting Actions</b>                                                                                                                                                      | <b>PeopleSoft Products</b> |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Voucher Maintenance and Voucher Posting (MASSPOST)                                        | Runs the same process as the Voucher Mass Maintenance process group, along with the Voucher Posting Application Engine process (AP_PSTVCHR).                                              | Payables                   |
| Voucher Maintenance, Post and Journal Generator (MASSPOSTGL)                              | Runs the same process as the Voucher Maintenance and Voucher Posting process group, along with and the Journal Generator Application Engine process (FS_JGEN).                            | Payables                   |
| Matching (MATCHING)<br><hr/> <b>Note:</b> eSettlements delivers Matching (ESMATCH). <hr/> | Runs the Matching Application Engine process (AP_MATCH).                                                                                                                                  | Payables                   |
| Matching, Doc Tolerance, Budget Check (MTCH_DT_BC)                                        | Runs the Matching process, the Document Tolerance Checking process, and the Commitment Control Budget Chk on-demand process.<br><br>Only the processes that apply to the voucher are run. | Payables                   |
| Payment Post (PAYPAYPOST)                                                                 | Runs the Payment Posting Application Engine process (AP_PSTPYMNT).                                                                                                                        | Payables                   |
| Payment Post and Journal Generator (PAYPOSTGL)                                            | Runs the same process as the Payment Post process group, along with the Journal Generator Application Engine process (FS_JGEN).                                                           | Payables                   |
| Payment, Voucher Post and Journal Generator (PAYVCHRJG)                                   | Runs the same processes as the Payment Post and Voucher Post process group, along with the Journal Generator Application Engine process (FS_JGEN).                                        | Payables                   |
| Payment Post and Voucher Post (PAYVCHRPST)                                                | Runs the same process as the Payment Post process group, along with the Voucher Posting Application Engine process (AP_PSTVCHR).                                                          | Payables                   |
| Payment Post (PYMNTPOST)                                                                  | Runs the Payment Posting Application Engine process (AP_PSTPYMNT).                                                                                                                        | Payables                   |

| <b>Process Group</b>              | <b>Processes and Posting Actions</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>PeopleSoft Products</b> |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Voucher Post (PST_VCHR)           | Runs the same processes as the Matching, Doc Tolerance, Budget Check process group, and also runs the Voucher Posting Application Engine process (AP_PSTVCHR).                                                                                                                                                                                                                                                                                                                                                                                                                                  | Payables                   |
| Journal Generate (PST_VCHRG)      | Runs the same processes as the Voucher Post process group and also runs the Journal Generator process (FS_JGEN).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Payables                   |
| Voucher Post Load AM (POSTAPAM)   | <p>Runs the following Application Engine processes, in the order listed:</p> <ul style="list-style-type: none"> <li>• Matching.</li> <li>• Document Tolerance Checking.</li> <li>• Commitment Control Budget Checking.</li> <li>• Voucher Posting</li> </ul> <p>Only the processes that apply to the voucher are run.</p> <p>Runs the AP/AM Interface Application Engine process (INTFAPAM), and the Pre-Interface Loader process (AMPS1000), which in turn calls the Transaction Loader process (AMIF1000).</p> <p>This posts the voucher and sends asset information to Asset Management.</p> | Payables                   |
| Journal Gen, Load AM (POSTAPGLAM) | <p>Runs the same processes as the Voucher Post Load AM process group, with the addition of the Journal Generator process (FS_JGEN).</p> <p>This performs all possible voucher processes on the voucher, therefore there is no need to run any other process. This process sends the information to Asset Management, Payables, and General Ledger.</p>                                                                                                                                                                                                                                          | Payables                   |
| Payment Post (PYCNCLPOST)         | Runs the Payment Posting Application Engine process (AP_PSTPYMNT).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Payables                   |

| Voucher Build (QVVBLDCC)                         | Runs the Voucher Build Application Engine process (AP_VCHRBLD).                                                                                                                                                                                                                                                                                                                                                                            | Payables                   |
| Voucher Build Doc Tol On CC Off (QVVBLDDT)       | Runs the Voucher Build Application Engine process (AP_VCHRBLD).                                                                                                                                                                                                                                                                                                                                                                            | Payables                   |
| Voucher Build (AVVBLDDTCC)                       | Runs the Voucher Build Application Engine process (AP_VCHRBLD).                                                                                                                                                                                                                                                                                                                                                                            | Payables                   |
| Mass Maintenance & Journal Generator (UNPSTJGEN) | Runs the same processes as the Voucher Mass Maintenance and Journal Generate process groups, and also calls the Voucher UnPost Application Engine process (APVCHRUNPOST).                                                                                                                                                                                                                                                                  | Payables                   |

| <b>Process Group</b>                         | <b>Processes and Posting Actions</b>                                                                                                                                                                                                                                                                                                                                                                                                   | <b>PeopleSoft Products</b> |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Voucher Post (VCHRPOST)                      | Runs the Voucher Posting Application Engine Process (AP_PSTVCHR).                                                                                                                                                                                                                                                                                                                                                                      | Payables                   |
| Voucher Post and General Ledger (VCHRPOSTGL) | Runs the same process as the Voucher Post process group, with the addition of the and the Journal Generator Application Engine process (FS_JGEN).                                                                                                                                                                                                                                                                                      | Payables                   |
| Withhold Post and Update (WHUPDPST)          | Runs the same process as the Withhold Update process group, along with the Withholding Posting Application Engine process (AP_WTHD).                                                                                                                                                                                                                                                                                                   | Payables                   |
| Withhold Update (WTHDUPD)                    | Runs the Withholding Update Application Engine process (AP_WTHD_UPDT).                                                                                                                                                                                                                                                                                                                                                                 | Payables                   |
| Do Not Post (ARACTIONA)                      | Posting Action: Do Not Post<br><br>Changes the posting status for the group so that the group is not processed by a scheduled run of the Receivable Update multiprocess job (ARUPDATE).                                                                                                                                                                                                                                                | Receivables                |
| Batch Standard (ARACTIONL)                   | Posting Action: Batch Standard<br><br>Changes the posting status for the group so that the group is processed by the Receivable Update multiprocess job, which calls the Revenue Estimate and Budget Processor processes the next time it is scheduled to run. The Budget Processor process runs only if you have enabled the commitment control feature for Receivables and the business unit.                                        | Receivables                |
| Batch Priority (ARACTIONN)                   | Posting Action: Batch Priority<br><br>Changes the posting status for the group so that the group is processed by the Receivable Update multiprocess job, which calls the Revenue Estimate and Budget Processor processes the next time it is scheduled to run with the RP_RUN_OPTIONS "PRIORITY" flag set.<br><br>The Budget Processor process runs only if you have enabled commitment control for Receivables and the business unit. | Receivables                |

| <b>Process Group</b>      | <b>Processes and Posting Actions</b>                                                                                                                                                                                                                                                                                                                                         | <b>PeopleSoft Products</b> |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| Post Now (ARPOST)         | Posting Action: Post Now<br><br>Runs the Receivable Update job immediately, which calls the Revenue Estimate and Budget Processor processes if you have enabled the commitment control feature for Receivables and the business unit.                                                                                                                                        | Receivables                |
| Post Now to GL (ARPOSTGL) | Posting Action: Post Now to GL<br><br>Runs the Receivable Update job immediately, which calls the Revenue Estimate and Budget Processor processes if you have enabled the commitment control feature for Receivables and the business unit. Also runs the Journal Generator process (FS_JGEN), the Journal Edit process (GL_JEDIT), and the Journal Post process (GLPPPOST). | Receivables                |

**Note:** If a given voucher is not asset related, then neither the *Voucher Post Load AM* nor *Journal Gen, Load AM* process groups will be available. These process groups are only available for selection if the voucher is asset related.

## Setting Up On-Demand Processing Options

To set up on-demand processing options, use the On-Demand Processing Options component (RTM\_OPTIONS).

### Page Used to Set Up On-Demand Processing Options

| <b>Page Name</b>                         | <b>Definition Name</b> | <b>Usage</b>                                                                                                      |
|------------------------------------------|------------------------|-------------------------------------------------------------------------------------------------------------------|
| <u>On-Demand Processing Options Page</u> | RTM_OPTIONS            | Specify Journal Generator accounting entry definitions and other processing options for on-demand process groups. |

### Understanding Setting Up On-Demand Processing Options

Before you can use on-demand processing, you must specify the accounting entry definitions that are used by each source transaction-process group combination, along with other options. Accounting entry definitions define the record and fields that the Journal Generator process uses to extract accounting entries from the system source.

## On-Demand Processing Options Page

Use the On-Demand Processing Options page (RTM\_OPTIONS) to specify Journal Generator accounting entry definitions and other processing options for on-demand process groups.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > On-Demand Processing > On-Demand Process Options > On-Demand Processing Options**

This example illustrates the fields and controls on the On-Demand Processing Options page. You can find definitions for the fields and controls later on this page.

## Defining Process Group User Preferences

To define process group user preferences, use the User Preferences - Process Group component (OPR\_DEFAULT).

## Page Used to Define Process Group Preferences

| <i>Page Name</i>                                      | <i>Definition Name</i> | <i>Usage</i>                                                                                |
|-------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------|
| <a href="#">User Preferences - Process Group Page</a> | OPR_DEF_TBL_RTM        | Specify, by source transaction, the process groups a user can use for on-demand processing. |

## Understanding Process Group User Preferences

Each user must be assigned access to a process group to use it for a particular type of transaction.

For Payables, you assign the process groups for each of these source transactions for defined users to enable on-demand processing functionality:

- Complete Register Voucher (REGISTER).
- Mass Payment Cancellation v1 (APMASSCNL).
- Mass Payment Cancellation v2 (APMASSCNL2).
- Matching Exception (MTCHEXPTN).
- Matching Override (MTCHOVRD).
- Payment Cancellation (PYMNCNCL).
- Payment Escheatment (PYMNESCH).
- Quick Invoice (QUICKVCHR).
- Voucher Close (VCHRCLOSE).
- Voucher Entry (VOUCHER).
- Voucher Maintenance (VCHR\_MAINT).
- Voucher Mass Maintenance Close (VCHMASSCLS).
- Voucher Mass Maintenance Delete (VCHMASSDEL).
- Voucher Mass Maintenance Field Update (VCHMASSFLD).
- Voucher Mass Maintenance Unpost (VCHMASSUNP).
- Voucher On-Demand Processes (VCHR\_STM).
- Withholding Invoice Line Update (LINEWTHD).
- Withholding Vendor Update (VNDRWTHD).

For Receivables you assign the appropriate process groups to each of these source transactions for all users based on the posting actions that you want to enable each user to perform:

- Item Split (ARITSPLT).
- Maintain Receivables (ARMNTWS).
- Online Pending Item Entry (AROPIE).
- Payment Worksheet (ARPAYWS).
- Transfer Worksheet (ARTRNWS).
- Unpost (ARUNPOST).

---

**Note:** All Receivables source transactions except Item Split (ARITSPLT) support all five process groups. Item Split (ARITSPLT) supports only Do Not Post (ARACTIONA), Batch Standard (ARACTIONL) and Post Now (ARPOST).

---

## User Preferences - Process Group Page

Use the User Preferences - Process Group page (OPR\_DEF\_TBL\_RTM) to specify, by source transaction, the process groups a user can use for on-demand processing.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > User Preferences > Define User Preferences > Process Group**

---

**Note:** Ensure that the process groups that you assign match the responsibilities of the user you are setting up.

---

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                                                                                                                                                             |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Copy From User ID</b>       | Enter an already-defined user ID from which the system is to copy the source transaction specifications. This enables you to set up template user ID's that can then be used to copy source transaction process groups to other users with the same responsibilities. |
| <b>Allow Processing</b>        | Select this check box to enable on-demand processing for this user ID.                                                                                                                                                                                                |
| <b>Use Event Notification</b>  | Select this check box to have the system run the processes in asynchronous mode, such that the processes run independently in the background and no response is required from the server.                                                                             |

| <b>Field or Control</b>   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

# Using Common Usability Features

---

## Understanding Mouse Over Popup Pages

This topic provides an overview of:

- How to identify mouse over popup pages.
- Customer popup pages.
- Customer contact popup pages.
- Supplier popup pages.
- Supplier extension popup pages.
- Supplier contact popup pages.

## Understanding How To Identify Mouse Over Popup Pages

Mouse over popup pages enable users to see additional information for fields such as customers, suppliers, contacts, and sponsors. The popup page provides information such as name, phone number, location, and email address.

This feature provides the ability to display additional information on the page without having to use space on the primary page and without having to open a secondary page.

The mouse over popup page is a PeopleTools feature that is configured using Application Designer. PeopleSoft FSCM provides the mouse over popup feature on selected pages. However, not all customer and supplier pages are activated for the mouse over popup feature. You can activate the mouse over popup feature on additional pages using PeopleTools Application Designer.

See [Activating the Mouse Over Popup Feature](#).

You can:

- Set up additional popup pages.
- Turn on or turn off the mouse over popup page feature at two levels:
  - On the Define Personalizations page at the installation level.
  - On the My Personalizations page at the user level.

The popup page is activated when you pause your mouse over a field that has a dotted line. For example, this page shows that the popup page is activated for the Supplier Name field, CAMPER'S WAREHOUSE, on the Maintain Purchase Order – Purchase Order page.

This example illustrates the fields and controls on the Example of mouse over popup page. You can find definitions for the fields and controls later on this page.

PeopleSoft Financials and Supply Chain Management deliver these types of popup pages:

- Customer popup pages.
- Customer contact popup pages.
- Customer popup pages.
- Customer extension popup pages.
- Customer contact popup pages.

## Understanding Customer Popup Pages

There are three types of customer popup pages:

- Bill To Customer Popup Page (type 1)
- Ship To Customer Popup Page (type 2)
- Sold To Customer Popup Page (type 3)

The address and phone numbers that are shown in the popup page depends on the information that is shown on the main page. If the main page displays information for a document, such as an invoice or an order, and if that document references a location, then the address and phone numbers of the location on the document is displayed. Otherwise the page shows the primary address and phone for the customer. The primary address that is shown depends on the type of page, such as bill to, sold to, or ship to. For

example, for bill to customer, the page shows the primary bill to address and phone numbers. For ship to customer, the page shows the primary ship to address and phone numbers. For sold to customer, the page shows the primary sold to address and phone numbers. The current date is used as the effective date.

If any of the fields on the popup page show as blank, it means that the data is not defined for the customer. For example, phone number and web site are optional fields, so if they are blank on the customer master, they display as blank on the popup page.

The customer phone number is stored in three separate fields, namely country code, phone, and extension. These three fields are concatenated together when displayed on the page. The country code is prefixed with a + and the extension field is prefixed with an x. The customer fax number does not consist of three separate fields, but is only one field, so it is displayed as it is displayed on the customer master record.

## Bill To Customer Popup Page (Type 1)

The Bill To Customer popup page (SAC\_CUSTBIL\_POP):

This example illustrates the fields and controls on the Example of Bill To Customer popup page. You can find definitions for the fields and controls later on this page.

Examples of where this popup page is used are:

- Review Billing - As Incurred page in PeopleSoft Contracts.
- Review Pre - Award Budget component in PeopleSoft Grants.
- Review Statements page in PeopleSoft Receivables.
- Standard Bill Entry page in PeopleSoft Billing.

## Ship To Customer Popup Page (Type 2)

The Ship To Customer popup page (SAC\_CUSTSHP\_POP):

This page is currently not delivered on a specific page. To activate this popup page:

See [Activating the Mouse Over Popup Feature](#).

## Sold To Customer Popup Page (Type 3)

The Sold To Customer popup page (SAC\_CUSTSLD\_POP):

This example illustrates the fields and controls on the Example of Sold To Customer popup page. You can find definitions for the fields and controls later on this page.

Examples of where this popup page is used are:

- Contract - General Information page in PeopleSoft Contracts.
- Buying Agreement Form page in PeopleSoft Order Management.

## Understanding Customer Contact Popup Pages

There are three types of contact popup pages:

- Bill To Customer Contact Popup Page (type 4)
- Ship To Customer Contact Popup Page (type 5)
- Sold To Customer Contact Popup Page (type 6)

If the address of the contact is the correct type of address for the page, then the address of the contact is shown. If it is not the correct type of address, then the customer's primary address is shown. For example, on the Bill To Contact popup page, if the contact's address is not marked as a bill to address, then the customer's primary bill to address is shown. The contact's address is stored on the Contact Customer page. The current date is used as the effective date.

If any of the fields on the popup page show as blank, it means that the data is not defined for the contact. For example, the phone numbers and title are optional fields. Therefore, if they are blank on the contact master, they are displayed as blank on the popup page.

The contact phone numbers are stored in three separate fields: country code, phone, and extension. These three fields are concatenated together when displayed on the page. The country code is prefixed with a + and the extension field is prefixed with an x.

If the email link on the popup page is pressed, a new window with the defined mail program for the user opens for the user to create a new email. The email address is automatically populated on the email.

Bill To Customer Contact Popup Page (Type 4)

The Bill To Customer Contact popup page (SAC\_CUSTCNTBIL\_POP):

This example illustrates the fields and controls on the Example of Bill To Customer Contact popup page. You can find definitions for the fields and controls later on this page.

An example of where this popup page is used is the RMA Form page in PeopleSoft Order Management.

Ship To Customer Contact Popup Page (Type 5)

The Ship To Customer Contact popup page (SAC\_CUSTCNTSHP\_POP):

This example illustrates the fields and controls on the Example of Ship To Customer Contact popup page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'RMA Form' page. At the top, fields include Unit (US001), RMA Number (REC0106), RMA Date (11/05/2002), RMA Status (Open), Reason Code (DAMAGE), and Return Type Code (RETURN). Below these are sections for 'Sold To' and 'Return From' information, including location, contact, and address. A popup window is open for the 'Sold To' contact, Paula Smith, showing her title (Owner/President), phone numbers, fax, email, and address. To the right of the popup, there are links for 'Transfer To', 'Customer Shipment History', 'Customer Conversations', 'Change Currency Display', 'Header Notes/Attachments', 'Refund Payment Groups', and 'RMA Header Project'. Below the contact information, there are fields for 'Estimated Return Date', 'Estimated Return Time', 'Payment Terms ID', 'Pay Method', 'RMA Pricing Date', and 'RMA Arbitration Plan'. At the bottom, there is a table for 'RMA Lines' with columns for Line, Status, Product Source, Product ID, Actions, Quantity Returned, Quantity Base, UOM, Return To, Net Unit Price, Ext Net Amount, Currency, and RMA Line. Below the table is an 'RMA Summary' section with a 'Calculate Price' button and a table showing Return Goods Amount, RTV (Supplier) Amount, No Return Amount, and RMA Total.

An example of where this popup page is used is the RMA Form page in PeopleSoft Order Management.

## Sold To Customer Contact Popup Page (Type 6)

The Sold To Customer Contact popup page (SAC\_CUSTCNTSLD\_POP):

This example illustrates the fields and controls on the Example of Sold To Customer Contact popup page. You can find definitions for the fields and controls later on this page.

This screenshot shows the 'Sold To Customer Contact' popup page. It features a similar layout to the RMA Form page, with fields for Unit, RMA Number, RMA Date, RMA Status, Reason Code, and Return Type Code. The 'Sold To' section is highlighted, showing contact information for Paula Smith. A popup window is open for the 'Sold To' contact, displaying her details. To the right, there are links for 'Transfer To', 'Customer Shipment History', 'Customer Conversations', 'Change Currency Display', 'Header Notes/Attachments', 'Refund Payment Groups', and 'RMA Header Project'. Below the contact information, there are fields for 'Estimated Return Date', 'Estimated Return Time', 'Payment Terms ID', 'Pay Method', 'RMA Pricing Date', and 'RMA Arbitration Plan'. At the bottom, there is a table for 'RMA Lines' and an 'RMA Summary' section with a 'Calculate Price' button and a table showing Return Goods Amount, RTV (Supplier) Amount, No Return Amount, and RMA Total.

An example of where this popup page is used is the RMA Form page in PeopleSoft Order Management.

## Understanding Supplier Popup Pages

There are three types of supplier popup pages:

- Supplier popup page (type 1).
- Supplier popup page (type 2).
- Supplier popup page (type 3).

**Note:** All of these popup pages are visually identical. They differ only in the fields that are required on the main page to populate the data and in how the data is retrieved for each.

### Supplier Popup Page (Type 1)

The supplier popup page (type 1) (SAC\_VENDOR\_POP):

This example illustrates the fields and controls on the Example of supplier popup page (type 1). You can find definitions for the fields and controls later on this page.

The field ADDRESS\_SEQ\_NUM references the address that is shown on the page. Email and business phone for this location are shown on the page using the current date as the effective date to retrieve the correct row. VNDR\_LOC is used to display the location name.

An example of where this popup page is used is the Return to Supplier page in PeopleSoft Purchasing.

## Supplier Popup Page (Type 3)

The supplier popup page (type 3) (SAC\_VENDOR\_POP3):

This example illustrates the fields and controls on the Example of supplier popup page (type 3). You can find definitions for the fields and controls later on this page.

The supplier location identified by the VNDR\_LOC field is used to obtain the ordering address key field, which is used to retrieve the correct address to display on the page using the current date as the effective date.

Examples of where this popup page is used are:

- Maintain Receipts - Header Details page in PeopleSoft Purchasing.
- Match Exception Workbench Details page in PeopleSoft Payables.

## Understanding Supplier Extension Popup Pages

There are two types of supplier extension popup pages:

- Supplier extension popup page (type 1).
- Supplier extension popup page (type 2).

The supplier extension popup pages include supplier and contact information on the pop up page.

### Supplier Extension Popup Page (Type 1)

The supplier extension popup page (type 1) (SAC\_VENDOREXT\_POP):

This example illustrates the fields and controls on the Example of supplier extension popup page (type 1). You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Express Purchase Order' interface. At the top, it shows 'Purchase Order' details including Business Unit (US001), PO ID (SUMMARYPO), and PO Status (Dispatched). A 'Supplier Search' popup is active, showing details for 'East Bay Travel' (Short Name: EB.TRAVEL-001, Location 1: 2598 Clayton Rd, Concord, CA 94528, United States). The background page includes fields for PO Date (02/17/2012), Supplier (EB.TRAVEL-001), Supplier ID (USA0000002), and Buyer (POS4). It also features a 'Supplier Details' link, a 'Create BackOrder' button, and a 'Calculate' button. The bottom section shows a table with columns for Line, Item, and Description, and a 'Find' button.

VENDOR is keyed by SETID, VENDOR\_ID. VNDR\_HLOC\_VW is keyed by the additional field VNDR\_LOC, and VNDR\_HADDR\_VW is keyed by ADDRESS\_SEQ\_NUM. VENDOR\_CNT\_VW is keyed by SETID, VENDOR\_ID, and CNTCT\_SEQ\_NUM. All of these fields are required at level 0 so that they can retrieve the appropriate rows to display.

An example of where this popup page is used is Maintain Purchase Order – Purchase Order page in PeopleSoft Purchasing.

## Supplier Extension Popup Page (Type 2)

The supplier extension popup page (type 2) (SAC\_VENDOREXT\_POP2):

This example illustrates the fields and controls on the Example of supplier extension popup page (type 2). You can find definitions for the fields and controls later on this page.

The supplier address is retrieved based on the ADDRESS\_SEQ\_NUM found in record PO\_HDR. The current date is used as the effective date to retrieve the appropriate address row. Email and business phone are also retrieved in this manner.

For the contact, the address used is the one linked to the supplier contact keyed by CNTCT\_SEQ\_NUM. The business phone and email are also retrieved from this row using the current date as the effective date.

An example of where this popup page is used is Manage PO Acknowledgements page in PeopleSoft Purchasing.

## Understanding Supplier Contact Popup Pages

The supplier contact popup page (SAC\_VENDRCNTCT\_POP):

This example illustrates the fields and controls on the Example of supplier contact popup page. You can find definitions for the fields and controls later on this page.

| DCSP         | Mixedcase    | 1             |                     |                 | .                          | Set Option Default Value |  |
| DFRMT        |              |               | PSXLATITEM          | PT_DATE_FORMAT  | MMDDYY                     | Set Option Default Value |  |
| DICTIONARY   | Uppercase    | 1             |                     |                 | N                          | Set Option Default Value |  |
| DTSP         | Mixedcase    | 1             |                     |                 | /                          | Set Option Default Value |  |
| EXPERT       |              |               | PSXLATITEM          | PSYESNO         | Yes                        | Set Option Default Value |  |
| GRDRWS       | Numbers 0    | 6             |                     |                 | 100                        | Set Option Default Value |  |

To activate or deactivate the mouse over popup feature at the installation level:

1. Select PeopleTools (PPTL) category.
2. Select the Format tab.
3. For user option BMOPOPUP, select the **Set Option Default Value** link.
4. Select *Yes* or *No* in the **Option Default Value** field.

The option is delivered as *Yes*.

5. Click the Save button.

## My Personalizations Page

Use the My Personalizations page (PSUSERSELFPRSNL) to activate or deactivate the mouse over popup feature for a user.

Navigation:

## My Personalizations

This example illustrates the fields and controls on the My Personalizations page: Navigation Personalizations. You can find definitions for the fields and controls later on this page.

| Option Category: Navigation Personalizations |               |                      |                         |
|----------------------------------------------|---------------|----------------------|-------------------------|
| Personalizations                             |               | Find                 | First 1-22 of 22 Last   |
| Personalization Option                       | Default Value | Override Value       |                         |
| Tab over Add/Del Buttons (+/-)               | No            | <input type="text"/> | <a href="#">Explain</a> |
| Drop down Menu Sort Order                    | None          | <input type="text"/> | <a href="#">Explain</a> |
| Automatic Menu Collapse                      | No            | <input type="text"/> | <a href="#">Explain</a> |
| Show browser address location                | Yes           | <input type="text"/> | <a href="#">Explain</a> |
| Show browser navigation bar                  | Yes           | <input type="text"/> | <a href="#">Explain</a> |
| Tab over Glyph icon                          | Yes           | <input type="text"/> | <a href="#">Explain</a> |
| Show browser links                           | Yes           | <input type="text"/> | <a href="#">Explain</a> |
| Show browser menu                            | Yes           | <input type="text"/> | <a href="#">Explain</a> |
| Mouse over popup event                       | Yes           | <input type="text"/> | <a href="#">Explain</a> |

To activate or deactivate the mouse over popup feature at the user level:

1. From the Navigation Personalizations category, select the **Personalize User Options** button.
2. From the **Mouse over pop up event** option, select *Yes* or *No* in the Override Value column.

The option is delivered as *Yes*.

3. Click the OK button.
4. Click the Save button.

## Adding Popup Pages to Additional Pages

Access the Edit Box Properties - Use page in Application Designer.

This example illustrates the fields and controls on the Edit Box Properties - Use page. You can find definitions for the fields and controls later on this page.

PeopleSoft FSCM does not activate the mouse over popup feature on all customer and supplier pages. Therefore, you may decide to add this feature to additional pages. To do this, determine which pages that you want to activate the mouse over popup feature. Then link a field on the page to the appropriate popup page using the Application Designer Edit Box Properties - Use page.

To link a field to a popup page:

- A mouse over can be added to a page by selecting a display-only field on the page.  
In other words, the Display Only option must be selected in the Field Use Options topic.
- Select a popup page in the Mouse Over Popup section

See “Using Page Controls, Using Popup Pages, Associating Popup Pages with Fields”, and “Creating Page Definitions, Setting Use Properties”, in *PeopleTools: Application Designer Developer's Guide*

To activate a popup page, specific fields, also known as keys, must be available in the component buffer.

### **Bill To Customer Popup Page**

Required fields in the component buffer for the bill to customer pop up page are:

- SETID
- BILL\_TO\_CUST\_ID
- ADDRESS\_SEQ\_NUM (optional – if found on main page, this address will be displayed)

### **Ship To Customer Popup Page**

Required fields in the component buffer for the ship to customer pop up page are:

- SETID
- SHIP\_TO\_CUST\_ID
- ADDRESS\_SEQ\_SHIP (optional – if found on main page, this address will be displayed)

### **Sold To Customer Popup Page**

Required fields in the component buffer for the sold to customer pop up page are:

- SETID
- SOLD\_TO\_CUST\_ID
- ADDRESS\_SEQ\_SOLD (optional – if found on main page, this address will be displayed)

### **Bill To Customer Contact Popup Page**

Required fields in the component buffer for the bill to customer contact pop up page are:

- SETID
- BILL\_TO\_CUST\_ID
- CNTCT\_SEQ\_BILL

### **Ship To Customer Contact Popup Page**

Required fields in the component buffer for the ship to customer contact pop up page are:

- SETID
- SHIP\_TO\_CUST\_ID
- CNTCT\_SEQ\_SHIP

## **Sold To Customer Contact Popup Page**

Required fields in the component buffer for the sold to customer contact pop up page are:

- SETID
- SOLD\_TO\_CUST\_ID
- CNTCT\_SEQ\_NUM

## **Supplier Popup Page (Type 1)**

Required fields in the component buffer for the supplier pop up (type 1) page are:

- SETID
- VENDOR\_ID at level 0

## **Supplier Popup Page (Type 2)**

Required fields in the component buffer for the supplier pop up (type 2) page are:

- SETID
- VENDOR\_ID
- VNDR\_LOC
- ADDRESS\_SEQ\_NUM at level 0

## **Supplier Popup Page (Type 3)**

Required fields in the component buffer for the supplier pop up (type 3) page are:

- SETID
- VENDOR\_ID
- VNDR\_LOC at level 0

## **Supplier Extension Popup Page (Type 1)**

Required fields in the component buffer for the supplier extension pop up (type 1) page are:

- SETID
- VENDOR\_ID
- VNDR\_LOC
- ADDRESS\_SEQ\_NUM
- CNTCT\_SEQ\_NUM at level 0

## **Supplier Extension Popup Page (Type 2)**

Required fields in the component buffer for the supplier extension pop up (type 2) page are:

- SETID
- VENDOR\_ID
- CNTCT\_SEQ\_NUM at level 0

## **Supplier Contact Popup Page**

Required fields in the component buffer for the supplier contact pop up page are:

- SETID
- VENDOR\_ID
- CNTCT\_SEQ\_NUM
- EFFDT at level 0.

# Working with and Personalizing PeopleSoft Classic WorkCenters

---

## Understanding PeopleSoft Classic WorkCenters and Dashboards

This topic discusses:

- PeopleSoft Classic WorkCenters.
- Common terms used with the PeopleSoft WorkCenter.
- Pagelets and pagelet setup, maintenance, and personalization.
- Dashboards and pivot grids.

### PeopleSoft Classic WorkCenters

WorkCenters are designed for specific roles and provide a central area for users to access key components within Financial and Supply Chain applications. They enable users to access various pages and perform daily tasks without leaving the WorkCenter, thus reducing the time used when navigating through menus.

WorkCenters are delivered as empty components. The system administrator from your organization is responsible for designing and creating links so that users can view and access specific links and pages.

Click to watch a short video about [PeopleSoft WorkCenters](#).

For more information about setting up WorkCenters as a system administrator, see the documentation for "Understanding WorkCenters and Dashboards" (Enterprise Components), "Configuring Filter Definitions and Values" (Enterprise Components), "Configuring Pagelets" (Enterprise Components).

For information about setting up PeopleTools options for the WorkCenter, see *PeopleTools: Portal Technology*.

## Example: WorkCenter page (Classic)

This example illustrates the fields and controls on the WorkCenter page (Classic).

**Note:** Other application-specific WorkCenters may appear slightly differently. This example is provided as a general example of a WorkCenter.

The WorkCenter navigation is located on the left side of the page and includes two main tabs: Main and Reports/Queries. Some WorkCenter pagelets are common to multiple applications, and some pagelets are unique to individual applications.

Oracle's PeopleSoft development has predefined My Work links that are available for import.

## PeopleSoft Classic WorkCenter Tabs and Pagelets

There are common pagelets within a WorkCenter:

- Main tab:
  - My Work
  - Links
- Reports/Queries:
  - Queries
  - Reports and Processes

WorkCenters also provide a Welcome pane, which appears to the right of the left pane. A Welcome page explains some of the basic icons that are used throughout the WorkCenter. If a system administrator or an end user (if given access rights) selects the **Starting Page** check box on the Configure Pagelets component for My Work, Links, Queries, or Reports/Processes, then the option selected replaces the Welcome page in this pane.

## Common Terms Used with the PeopleSoft Classic WorkCenter

These terms are commonly used when referring to the PeopleSoft WorkCenter:

| <b>Term</b>                   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alert                         | An alert is a condition that requires your attention from the events and notifications framework.                                                                                                                                                                                                                                                                                                                  |
| Dashboard                     | A dashboard is a collection of information summaries (high-level data views) that enable users to monitor different objects and data. A dashboard is within a subdomain or functional area of interest to a specific user, based on his or her roles. It is meant to support lightweight actions directly, and in-place, and it offers users quick navigation to a work area or transaction page when appropriate. |
| Edit Filters                  | Select to access the "Edit Filters Page" (Application Fundamentals). If a system administrator had granted filter editing rights to the end user, then this link is displayed.                                                                                                                                                                                                                                     |
| Links Pagelet                 | A pagelet that contains links to PeopleSoft components and links to external URLs. This typically contains links that a user needs to do their daily work. An administrator can add links as needed to suit the needs of your business.                                                                                                                                                                            |
| My Work Pagelet               | A common pagelet that contains links to application-designed results pages. The content is filtered by administrator or end user defined criteria.                                                                                                                                                                                                                                                                 |
| Pagelet Area                  | A collection of application-defined pagelets that contains links, task lists, and other content. This area is part of the PeopleTools framework, but the pagelet content is defined by individual product needs.                                                                                                                                                                                                   |
| Pivot Grids                   | Pivot Grids display data in a dashboard. Business analysts can display data in different views by performing operations such as pivoting and filtering, which enables them to interpret data in a variety of ways.                                                                                                                                                                                                 |
| Queries Pagelet               | A common pagelet that contains links to queries (public or private) that are added by the administrator (public queries) or the end user (public or private queries).                                                                                                                                                                                                                                              |
| Refine Filter Criteria        | Select to access predefined filter criteria for an exception. Users can change filter values to change search results.                                                                                                                                                                                                                                                                                             |
| Reports and Processes Pagelet | A pagelet that contains links to PeopleSoft components; primarily reports and processes. This type of pagelet is controlled by the administrator.                                                                                                                                                                                                                                                                  |

| <b>Term</b>                      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Scope                            | <p>Scope is a collection of filter values for the links defined in a My Work configuration. When scope is enabled, you are allowed to create multiple sets of filter value collections. Each set is considered a scope.</p> <p>When you change between scopes, you are changing the set of filter values applied to all the configured My Work links at once. This gives you the ability to quickly change between work for different operations with one drop down list selection. For example, you may have multiple scopes created to represent your operations by geographic region.</p> |
| WorkCenter                       | A WorkCenter is used to increase the productivity of a specific role by streamlining and simplifying their work in a central place. The left pane of a WorkCenter should help drive the transaction or work area for a user to complete their tasks based on the functional area.                                                                                                                                                                                                                                                                                                            |
| WorkCenter Configuration ID      | Individual PeopleSoft products, such as Payables, Billing, and Supply and Demand, has defined a template that is assigned to users who have a specific role in an organization. For example, a Billing Specialist or an Accounts Payable Clerk.                                                                                                                                                                                                                                                                                                                                              |
| Worklist                         | A list of tasks in PeopleTools.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Working Zone or Transaction Area | The pagelet area where the search results or components are displayed. This area is the area that is not occupied by the pagelet area or is the entire WorkCenter if the pagelet area is hidden.                                                                                                                                                                                                                                                                                                                                                                                             |

## Pagelets and Pagelet Setup, Maintenance, and Personalization

This topic provides a general, high-level description of the four types of pagelets that are available in PeopleSoft Classic WorkCenters:

- My Work Pagelet
- Links Pagelet
- Queries Pagelet
- Reports and Processes Pagelet
- Pagelet setup, maintenance, and personalization

### My Work Pagelet

The My Work section of the Main tab includes links to pages that an end user would need to access on a daily basis. The My Work section can also include exceptions and alerts, where the user would need to take some type of action.

Some links that are set up for the My Work pagelet can be subject to filter criteria that limit the amount of data that is available to a user.

The My Work section can be personalized by end users by clicking the **Pagelet Settings** icon and then selecting Personalize.

## Links Pagelet

The Links section of the Main tab includes additional links to pages or other areas of interest to the user role. A system administrator can determine a list of links that are available to end users, and the end user can personalize which links they want to appear on their WorkCenter.

Links to external pages can be placed in this section as well.

## Queries Pagelet

The Query section of the Reports/Queries tab includes links to Query Manager, public queries, private queries, and pivot grids. The system administrator can determine if an end user can add public or private queries. The end user can personalize their private queries.

When a link is selected, the query or pivot grid results appear in the right pane of the WorkCenter or in a new window. Query results can be saved to Microsoft Excel.

## Reports and Processes Pagelet

The Reports and Processes section of the Reports/Queries tab includes links to reports and processes. The links take you to the run control page for reports, processes, and the Reporting Console.

The system administrator can determine whether end users can configure their pagelet.

## Pagelet Setup, Maintenance, and Personalization

When setting up and maintaining a Classic WorkCenter, setup options are defined at the system administrator level, and personalization options are defined at the user level.

System administrators must perform their setup options first, using the Enterprise Components, WorkCenter/Dashboards component. End users perform their personalization options second, using the Personalize and Configure options in the Classic WorkCenter.

## Dashboards and Pivot Grids

Setting up PeopleSoft Dashboards is similar to setting up Classic WorkCenters because you use the same pages in Enterprise Components. However, Dashboards can display pivot grids that can also appear on a user's Home page.

Pivots grids are based on PSQueries and can display the results in a grid format, a chart format, or both. You use the Pivot Grid Wizard (**Reporting Tools >Pivot Grid >Pivot Grid Wizard**) to design how the page will appear to the user.

Pivot Grids can be added as pagelets (on a user's Home page or in a Dashboard), to the Queries tab in a Classic WorkCenter, and more.

For more information about WorkCenters, see the documentation for "Understanding WorkCenters and Dashboards" (Enterprise Components).

For more information about setting up pivot grids, see *PeopleTools: Pivot Grid*

---

## Understanding How to Set Up PeopleSoft Classic and Fluid WorkCenters As a System Administrator

Use the Enterprise Components menu to set up PeopleSoft Classic and Fluid WorkCenters and Dashboards as a system administrator.

For complete information about setting up WorkCenters and Dashboards as a system administrator, see these topics in the *PeopleSoft Enterprise Components* documentation:

- "Understanding WorkCenters and Dashboards" (Enterprise Components).
- "Configuring Filter Definitions and Values" (Enterprise Components).
- "Configuring Pagelets" (Enterprise Components).

## Using the Data Migration Workbench for PeopleSoft WorkCenters

PeopleSoft WorkCenters provide critical My Work Link filters that are based in SQL application classes. You can use the ADS definitions to migrate the WorkCenter My Work Links, Filters, and Pagelet Configurations between databases, and ultimately to your production environments.

The following table lists the delivered ADS definitions (delivered in Data Set Designer) to support the migration of PeopleSoft Classic and Fluid WorkCenter configuration data:

| <b><i>Delivered ADS to Support PeopleSoft WorkCenters</i></b> | <b><i>Application Data Set (ADS) Usage</i></b>                                                                                                                                                                                                                                      |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WORKCENTER_FILTER_VALUES                                      | This data set includes the records that store the WorkCenter System Delivered My Work Links. Select this data set on the Data Migration Workbench page to move the My Work Links from one database to another.                                                                      |
| WORKCENTER_FILTERS                                            | This data set includes the records that store the WorkCenter Filters definitions. Select this data set on the Data Migration Workbench page to move WorkCenter Filter Definitions from one database to another.                                                                     |
| WORKCENTER_CONFIGURATION                                      | This data set includes the records that store the WorkCenter Pagelet Configurations. Select this data set on the Data Migration Workbench page to move the Pagelet Configurations from one database to another. (Enterprise Components, WorkCenter/Dashboards, Configure Pagelets). |

All relevant records are delivered in the Query Access Tree, QUERY\_TREE\_EO, within the EO\_WORKCENTER access group (PeopleTools, Security, Query Security, Query Access Manager).

PeopleSoft delivers an ADS Administrator permission list. For access, the EO\_WORKCENTER access group should be included on the Data Migration page within the Access Group Permissions and the proper access is granted on the Copy Compare Permissions. See *PeopleTools: Security Administration, Permission Lists*.

| <a href="#">Configure Scope Values Page (Classic)</a>                            | EOWC_FILTER_VALUES         | Determine filter values for your scope options.                                                                                                               |

### My Work Pagelet

Use the My Work page (<Application Code>\_WC\_INIT) to access links to pages that are needed on a daily basis.

Navigation:

**<Application> ><Application> WorkCenter**

Select the Main tab.

This example illustrates the fields and controls on the Example: My Work pagelet (Classic).

This example illustrates the fields and controls on the My Work pagelet when the Scope field is enabled (Classic).

Depending on how your system administrator set up the "Configure Pagelets - My Work Page" (Enterprise Components), an end user sees the group headers, links, and transaction counts in parenthesis.

## My Work

| Field or Control                                                                    | Description                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Click the <b>Pagelet Settings</b> icon and select an option to: <ul style="list-style-type: none"> <li><i>Minimize</i>: Minimizes the My Work links. The system displays the My Work heading as well as this icon.</li> <li><i>Personalize</i>: Access the <a href="#">Define User My Work Links – My Work Pagelet Personalization Page</a>.</li> </ul> |
|  | Select to reload the options.                                                                                                                                                                                                                                                                                                                           |

| <b>Field or Control</b>  | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Scope</b>             | <p>Select this drop-down option to change the scope filter set.</p> <p>Creating scope options allows you to have a collection of filter values for the links defined in your My Work configuration. When you change between scopes, you're changing the set of filter values applied to all the configured My Work links. For example, you may have multiple scopes that represent your operations by geographic region.</p> <p>Scope options are defined on the <a href="#">Configure Scope Page (Fluid)</a>.</p> <p>When you select a different scope, the count next to each link changes.</p> <hr/> <p><b>Note:</b> This option is only available when the user has been granted access to the Scope field.</p> <hr/> <p><b>Note:</b> If a user has existing filter values and the Scope field is available to that user, then existing filter values are copied into their default scope.</p> <hr/> |
| (icon) (Configure Scope) | <p>Select the Configure Scope icon to access the Configure Scope page.</p> <hr/> <p><b>Note:</b> This option is only available when the user has been granted access to the Scope field.</p> <hr/>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Define User My Work Links – My Work Pagelet Personalization Page

Use the Define User My Work Links – My Work Pagelet Personalization page (FSPC\_USER\_MYWORK) to personalize the My Work pagelet as an end user.

Navigation:

<Application> ><Application> WorkCenter

Click the **Pagelet Settings** icon and then select Personalize.

This example illustrates the fields and controls on the Define User My Work Links – My Work Pagelet Personalization page.

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                            |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>Delete Personalization</b>  | Click this button to delete user-specific personalizations. This button does not appear until you've saved the Personalization page. |

## My Work Groups

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                                                                                                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Display Order</b>           | Enter the order in which you want this group label to appear on the pagelet.                                                                                                                                                                                           |
| <b>Start Group Collapsed</b>   | <p>Select to indicate that you want this group label to appear collapsed when entering the WorkCenter page.</p> <p>Deselect to indicate that you want this group label to appear expanded and to see all links within the group when entering the WorkCenter page.</p> |

## Edit Filters Page

Use the Edit Filters page (FSPC\_MYWORK\_FILTER) to modify filters for the My Work pagelet as an end user.

Navigation:

<<Application> >>Application> WorkCenter

Click the **Edit Filters** link.

This example illustrates the fields and controls on the Edit Filters page. You can find definitions for the fields and controls later on this page.

| Invoices Not Integrated to AP       | BI_FILTER | Billing Generic Filter |  |  |  |
| Invoices Not Integrated to AR       | BI_FILTER | Billing Generic Filter |  |  |  |

If a system administrator selected the **Public** check box on the Configure Filter Definition page, then this page is available to end users.

| <i><b>Field or Control</b></i>                                                      | <i><b>Description</b></i>                                                                               |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
|  | Click the <b>Edit Filter</b> icon to access the "Configure Filter Values Page" (Enterprise Components). |

## Configure Scope Page (Classic)

Use the [Configure Scope](#) page (EOWC EDIT VIEWBY) to personalize your Scope options.

Navigation:

**<Application> ><Application> WorkCenter**

Select the **Configure Scope** icon.

This example illustrates the fields and controls on the Configure Scope Page (Classic).

**Configure Scope**

Billing WorkCenter

**Scope** Personalize | Find | First 1-2 of 2 Last

| *Scope Label | Default                             | Configure Links |  |  |
|--------------|-------------------------------------|-----------------|--|--|
| Default      | <input checked="" type="checkbox"/> |                 |  |  |
| Test         | <input type="checkbox"/>            |                 |  |  |

| Field or Control   | Description                                                                                                                                                                 |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Scope Label</b> | Enter a Scope Label that you want as an option in your Scope drop-down list box. The scope label represents a user-defined set of filter values.                            |
| <b>Default</b>     | Select this check box if you want this scope label to appear as a default each time you access the <Application> WorkCenter – My Work pagelet. Only one default is allowed. |
| (Configure Links)  | Click the Configure Links icon to access the <a href="#">Configure Scope Links Page (Classic)</a> .                                                                         |

## Configure Scope Links Page (Classic)

Use the Configure Scope Links page (EOWC\_CFG\_LNK\_FLTRS) to view link labels and access the Configure Scope Values page.

Navigation:

<Application> ><Application> WorkCenter

Select the **Configure Scope** icon. Select the Configure Scope Links icon.

This example illustrates the fields and controls on the Configure Scope Links Page (Classic).

|  (Edit Filter) | Click the Edit Filters icon to access the <a href="#">Configure Scope Values Page (Classic)</a> |

## Configure Scope Values Page (Classic)

Use the Configure Scope Values page (EOWC\_FILTER\_VALUES) to determine filter values for your Scope option.

Navigation:

<Application> ><Application> **WorkCenter**

Select the Configure Scope icon. Select the Configure Scope Links icon. Select the Edit Filters icon.

This example illustrates the fields and controls on the Configure Scope Values Page (Classic).

This page allows individual users (who have been given access to the Scope field) to define their own filter values for each user-defined scope.

Access to the Scope field is granted by a system administrator using the "Set Up Scope Security Page" (Enterprise Components) in Enterprise Components.

## Working With and Personalizing the Classic Links Pagelet As an End User

### Pages Used to Use and Personalize the Classic Links Pagelet As an End User

| <i><b>Page Name</b></i>                                               | <i><b>Definition Name</b></i> | <i><b>Usage</b></i>                           |
|-----------------------------------------------------------------------|-------------------------------|-----------------------------------------------|
| <u>Links Pagelet</u>                                                  | <Application Code>_WC_INIT    | Use the Links pagelet as an end user.         |
| <u>Define User "Links" Links – Links Pagelet Personalization Page</u> | FSPC_USER_LINK                | Personalize the Links pagelet as an end user. |
| <u>Define Link Page</u>                                               | FSPC_USR_LNK_SEC              | Define a <b>Links</b> link as an end user.    |

## Links Pagelet

Use the Links pagelet (<Application Code>\_WC\_INIT) to access additional links to pages or other areas of interest for the user's role.

Navigation:

## <Application> > <Application> WorkCenter

Open the Links section.

This example illustrates the fields and controls on the Links pagelet.

## Links

| <i>Field or Control</i>                                                             | <i>Description</i>                                                                                                                                                                                                                                                                                                                                   |

| Display Order    | Enter the order in which you want this group label to appear on the pagelet.                                                                                                                                                                                                                                                          |

| <b>Field or Control</b>      | <b>Description</b>                                                                                                                                                                                                                                                    |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Start Group Collapsed</b> | <p>Select to indicate that you want this group label to appear collapsed when entering the WorkCenter page.</p> <p>Deselect to indicate that you want this group label to appear expanded, and see all links within the group, when entering the WorkCenter page.</p> |

## Link List

| <b>Field or Control</b> | <b>Description</b>                                                                                            |
|-------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Define</b>           | Click to access the <a href="#">Define Link Page</a> , where you can define the link as a menu item or a URL. |

## Define Link Page

Use the Define Link page (FSPC\_USR\_LNK\_SEC) to define a link as an end user.

Navigation:

<Application> ><Application> **WorkCenter**

In the Links pagelet, click the **Pagelet Setting** icon. Select the Personalize option. Click the **Define Link** link.

| <b>Field or Control</b> | <b>Description</b>                                                                                                |
|-------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Link Type</b>        | Select <i>Menu Item</i> or <i>URL</i> .                                                                           |
| <b>Select Menu Item</b> | Click to access the Select a Content Reference page, where you can select a menu item from a tree structure view. |
| <b>Override Label</b>   | Select to indicate that you want to override the menu label that is populated when selecting a menu item.         |
| <b>Label</b>            | Enter the label that you want the system to use if you selected the <b>Override Label</b> check box.              |

## Working With and Personalizing the Classic Queries Pagelet As an End User

### Pages Used to Use and Personalize the Classic Queries Pagelet As an End User

| <i>Page Name</i>                                                      | <i>Definition Name</i>     | <i>Usage</i>                                                                     |
|-----------------------------------------------------------------------|----------------------------|----------------------------------------------------------------------------------|
| <u>Queries Pagelet</u>                                                | <Application Code>_WC_INIT | Access links to Query Manager, public queries, private queries, and pivot grids. |
| <u>Define User Query Links – Queries Pagelet Personalization Page</u> | FSPC_USER_QUERY            | Personalize the Queries pagelet as an end user.                                  |

### Queries Pagelet

Use the Queries pagelet (<Application Code>\_WC\_INIT) to access links to Query Manager, public queries, private queries, and pivot grids.

Navigation:

<Application> ><Application> **WorkCenter**

Select the Reports/Queries tab.

This example illustrates the fields and controls on the Queries pagelet.

## Queries

| <i>Field or Control</i>                                                           | <i>Description</i>                                                                                                                                                                                                                                                                                                                                   |

| <b>Owner</b>                      | Select <i>Private Owner</i> or <i>Public Owner</i> .                                                                            |
| <b>Type</b>                       | Select <i>Pivot Grid</i> or <i>Query</i> .                                                                                      |
| <b>Override Description/Title</b> | Select to override the query description, the pivot grid title, and the query label for the user added queries and pivot grids. |

| <b>Field or Control</b>                     | <b>Description</b>                                                                                                                       |
|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Query Name</b> or <b>Pivot Grid Name</b> | Select the name of a query or pivot grid.<br><br>For more information about setting up Pivot Grids, see <i>PeopleTools: Pivot Grid</i> . |

## Working With and Personalizing the Classic Reports and Processes Pagelet As an End User

### Pages Used to Use and Personalize the Classic Reports and Processes Pagelet As an End User

| <b>Page Name</b>                                                                    | <b>Definition Name</b>     | <b>Usage</b>                                |
|-------------------------------------------------------------------------------------|----------------------------|---------------------------------------------|
| <u>Reports and Processes Pagelet</u>                                                | <Application Code>_WC_INIT | Access links to reports and processes.      |
| <u>Define User “Reports” Links – Reports/Processes Pagelet Personalization Page</u> | FSPC_USER_REPORT           | Personalize links to reports and processes. |

### Reports and Processes Pagelet

Use the Reports and Processes pagelet (<Application Code>\_WC\_INIT) to access links to reports and processes.

Navigation:

<Application> > <Application> WorkCenter.

Select the Reports/Queries tab.

This example illustrates the fields and controls on the Reports/Processes pagelet.

## Reports/Processes

| <i>Field or Control</i>                                                             | <i>Description</i>                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p>Click the <b>Pagelet Settings</b> icon and select an option to:</p> <ul style="list-style-type: none"> <li><i>Minimize</i>: Minimize the My Work links. The system displays the My Work heading as well as this icon.</li> <li><i>Personalize</i>: Access the <a href="#">Define User “Reports” Links – Reports/Processes Pagelet Personalization Page</a>.</li> </ul> |
|  | Select to reload the options.                                                                                                                                                                                                                                                                                                                                             |
|  | Click the <b>New Window</b> icon to launch the link in a new window.                                                                                                                                                                                                                                                                                                      |

## Define User “Reports” Links – Reports/Processes Pagelet Personalization Page

Use the Define User “Reports” Links – Reports/Processes Pagelet Personalization page (FSPC\_USER\_REPORT) to personalize links to reports and processes.

Navigation:

<Application> ><Application> WorkCenter

Select the Reports/Queries tab. Click the **Pagelet Settings** icon. Select the *Personalize* option.

This example illustrates the fields and controls on the Define User “Reports” Links – Reports/Processes Pagelet Personalization page.

Define User "Reports" Links

**Reports/Processes Pagelet Personalization**

|------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Delete Personalization | Click this button to delete user-specific personalizations. This button does not appear until you've saved the Personalization page. |

### Link Groups

| Field or Control | Description                                                                                                            |
|------------------|------------------------------------------------------------------------------------------------------------------------|
| Group Label      | Enter a description that describes the group of reports or process links that appear on the Reports/Processes pagelet. |

| <b>Field or Control</b>                                                           | <b>Description</b>                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p>Click to add additional links.</p> <p>If the system administrator has selected the <b>Allow User to Add Additional Links</b> check box on the "Configure Pagelets – Reports/Processes Page" (Enterprise Components), then the end user can click the <b>Add</b> icon within the Link Groups section of the page.</p> |
| <b>Display Order</b>                                                              | Enter the order in which you want this group label to appear on the pagelet.                                                                                                                                                                                                                                            |
| <b>Start Group Collapsed</b>                                                      | <p>Select to indicate that you want this group label to appear collapsed when entering the WorkCenter page.</p> <p>Deselect to indicate that you want this group label to appear expanded, and see all links within the group, when entering the WorkCenter page.</p>                                                   |

## Link List

| <b>Field or Control</b> | <b>Description</b>                                                                                         |
|-------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Define</b>           | Click to access the <u>Define Link Page</u> , where you can define the link as a menu item or a URL.       |
| <b>Run Control ID</b>   | Enter a value that appears when you select this link. This field is associated with reports and processes. |

# Working with and Personalizing PeopleSoft Fluid WorkCenters

---

## Understanding PeopleSoft Fluid WorkCenters

### PeopleSoft Fluid WorkCenter Framework

The PeopleSoft Fluid WorkCenter Framework is an Enterprise Components feature that requires PeopleTools 8.55 and allows system administrators to create WorkCenters that can be accessed using devices, such as:

- Smart Phones (SFF: small form factor).
- Tablets (MFF: medium form factor).
- Laptops, Desktops and some tablets. (LFF: large form factor )

PeopleSoft Fluid WorkCenters are designed for specific roles and provide a central area for users to access key components within PeopleSoft applications. They enable users to access various pages and perform daily tasks without leaving the WorkCenter.

Similar to PeopleSoft Classic WorkCenters, PeopleSoft Fluid WorkCenters are delivered as empty components. However, PeopleSoft delivers examples of application-specific WorkCenters. It's the responsibility of your system administrator to design and create PeopleSoft Fluid WorkCenters for your organization.

Use the "Configure Pagelets – WorkCenter/Dashboard Page" (Enterprise Components) documentation to set up PeopleSoft Fluid WorkCenters as a system administrator.

### Example: PeopleSoft Fluid Billing WorkCenter Page

This example illustrates the fields and controls on the Billing WorkCenter page in PeopleSoft Fluid:

---

**Note:** Other PeopleSoft Fluid application-specific WorkCenters may appear slightly different. This is provided as a general example of a WorkCenter as it appears in PeopleSoft Fluid.

---

This example illustrates the fields and controls on the Example: PeopleSoft Fluid Billing WorkCenter page.

The order in which the group boxes appear, such as Links and My Work in the above page shot, is determined by the display order entered on the "Configure Pagelets – WorkCenter/Dashboard Page" (Enterprise Components). The order in which the links appear within each group box is determined by the display order entered on the "Configure Pagelets - My Work Page" (Enterprise Components).

## Setup, Maintenance, and Personalization

When setting up and maintaining a Fluid WorkCenter, setup options are defined at the system administrator level, and personalization options are defined at the user level.

System administrators must perform their setup first, using the Enterprise Components, WorkCenter/Dashboards component. End users perform their personalization options second, using the Display Options, Edit Filters, and Scope options in the Fluid WorkCenter.

## Understanding How to Set Up PeopleSoft Classic and Fluid WorkCenters As a System Administrator

Use the Enterprise Components menu to set up PeopleSoft Classic and Fluid WorkCenters and Dashboards as a system administrator.

For complete information about setting up WorkCenters and Dashboards as a system administrator, see these topics in the *PeopleSoft Enterprise Components* documentation:

- "Understanding WorkCenters and Dashboards" (Enterprise Components).
- "Configuring Filter Definitions and Values" (Enterprise Components).
- "Configuring Pagelets" (Enterprise Components).

## Understanding Delivered WorkCenters and Dashboards

### Delivered WorkCenters

This table lists PeopleSoft-delivered WorkCenters:

| <b>WorkCenter</b>                 | <b><i>Link to Product Documentation for Classic WorkCenter</i></b>                                             | <b><i>Link to Product Documentation for Fluid WorkCenter</i></b>                       |

## Setting Up and Personalizing PeopleSoft Fluid WorkCenters

### Pages Used to Set Up and Personalize PeopleSoft Fluid WorkCenters

| <b><i>Page Name</i></b>                                                         | <b><i>Definition Name</i></b> | <b><i>Usage</i></b>                                                                           |
|---------------------------------------------------------------------------------|-------------------------------|-----------------------------------------------------------------------------------------------|
| "Configure Pagelets – WorkCenter/<br>Dashboard Page" (Enterprise<br>Components) | FSPC_ADMIN_MAIN               | Define configuration IDs for Classic<br>WorkCenters and Dashboards, and Fluid<br>WorkCenters. |
| "Configure Pagelets - My Work<br>Page" (Enterprise Components)                  | FSPC_ADMIN_MYWORK             | Set up My Work links for end users.                                                           |
| <u>Personalize Page (Fluid)</u>                                                 | EOWC_WORKLINKS_FL             | Personalize your display options for the<br>My Work and Links pagelets.                       |
| <u>Edit Filters Personalize Page (Fluid)</u>                                    | EOWC_WORKFILTER_FL            | Modify filters for the My Work pagelet<br>as an end user.                                     |
| <u>Maintain Scope Detail Page (Fluid)</u>                                       | EOWC_EDITVIEWLK_FL            | Change scope detail options for sections<br>in the My Work pagelet.                           |
| <u>Configure Scope Page (Fluid)</u>                                             | EOWC_EDITVIEWBY_FL            | Determine the order of your scope labels<br>and access additional maintenance pages.          |
| <u>Create Scope Page (Fluid)</u>                                                | EOWC_EDITVIEWN_SCF            | Create a new scope.                                                                           |
| <u>Configure Filter Values Page (Fluid)</u>                                     | EOWC_EDITVIEWVA_FL            | Modify filter values for your scope<br>option.                                                |
| <u>Ad hoc Email Configuration Page</u>                                          | FL_WRKCENTER_EMAIL            | Register the WorkCenter fluid page for<br>which an email notification is required.            |

| <b>Page Name</b>               | <b>Definition Name</b> | <b>Usage</b>                                                               |
|--------------------------------|------------------------|----------------------------------------------------------------------------|
| <u>Email Notification Page</u> | FL_EMAILNTFY_SCF       | Notify one or more users of an action they need to take for a transaction. |

## Personalize Page (Fluid)

Use the Personalize page (EOWC\_PERSONAL\_FL) to personalize your display options for the My Work and Links group boxes.

Navigation:

Select the <Application> WorkCenter (Fluid). Click the Personalize icon and then select Personalize option.

This example illustrates the fields and controls on the Personalize page.

| Link Label                          | Show Count                          | Starting Page            |
|-------------------------------------|-------------------------------------|--------------------------|
| Invoices Not Finalized              | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Consolidated Invoices Not Finalized | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Invoices Pending My Approval        | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Invoices Not Submitted for Approval | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| Invoices Pending Approval           | <input checked="" type="checkbox"/> | <input type="checkbox"/> |

End users use this page to modify display options for their links in the My Work and Links group boxes.

## Edit Filters Personalize Page (Fluid)

Use the Edit Filters Personalize page (EOWC\_WORKFILTER\_FL) (Fluid) to modify filter values as an end user.

Navigation:

Select the <Application> WorkCenter (Fluid). Click the Personalize icon and then select Edit Filters.

Navigation:

This example illustrates the fields and controls on the Edit Filters Personalize Page (Fluid).

| Edit Filters Personalize            |             |                        |
|-------------------------------------|-------------|------------------------|
| ▼ Current Work                      |             |                        |
| Link Label ◊                        | Filter ID ◊ | Description ◊          |
| Invoices Not Finalized              | BI_FILTER   | Billing Generic Filter |
| Consolidated Invoices Not Finalized | BI_FILTER   | Billing Generic Filter |
| Invoices Pending My Approval        |             |                        |
| Invoices Not Submitted for Approval | BI_FILTER   | Billing Generic Filter |
| Invoices Pending Approval           | BI_FILTER   | Billing Generic Filter |
| Installment Invoices Not Generated  | BI_FILTER   | Billing Generic Filter |
| Recurring Invoices Not Generated    | BI_FILTER   | Billing Generic Filter |
| Recurring Schedules Expiring        | BI_FILTER   | Billing Generic Filter |
| Invoices Entered Today              | BI_FILTER   | Billing Generic Filter |
| Recent Invoices                     | BI_FILTER   | Billing Generic Filter |
| Recent Credit and Rebill Invoices   | BI_FILTER   | Billing Generic Filter |

| Field or Control             | Description                                                                                                                        |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| (right arrow) (My Work Links | Click the My Work Links icon (right arrow) to access the "Configure Filter Values Page" (Enterprise Components) for the filter ID. |

## Maintain Scope Detail Page (Fluid)

Use the Maintain Scope Detail page (EOWC\_EDITVIEWLK\_FL) to change scope detail options for collapsible sections in the My Work group box.

Navigation:

Select the <Application> WorkCenter (Fluid). Click the Personalize icon, then select Maintain Scope Detail.

This example illustrates the fields and controls on the Maintain Scope Detail Page (Fluid).

| Link Label                          | Description            | Edit Filters |
|-------------------------------------|------------------------|--------------|
| Invoices Not Finalized              | Billing Generic Filter |              |
| Consolidated Invoices Not Finalized | Billing Generic Filter |              |
| Invoices Pending My Approval        |                        |              |
| Invoices Not Submitted for Approval | Billing Generic Filter |              |
| Invoices Pending Approval           | Billing Generic Filter |              |
| Installment Invoices Not Generated  | Billing Generic Filter |              |
| Recurring Invoices Not Generated    | Billing Generic Filter |              |
| Recurring Schedules Expiring        | Billing Generic Filter |              |
| Invoices Entered Today              | Billing Generic Filter |              |

**Note:** This page is only available when the user has access to the Scope field.

| Field or Control | Description                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------|
| Edits Filters    | Click to access the <a href="#">Setting Up and Personalizing PeopleSoft Fluid WorkCenters</a> . |

## Configure Scope Page (Fluid)

Use the Configure Scope page (EOWC\_EDITVIEWBY\_FL) to determine the order of your scope labels and access additional pages.

Navigation:

<Application> WorkCenter (Fluid) >Personalize icon >Configure Scope.

This example illustrates the fields and controls on the Configure Scope Page (Fluid).

| Scope   | Details   |
|---------|-----------|
| Default | Default > |
| Test    | >         |

**Note:** This page is only available when the user has access to the Scope field.

| <b>Field or Control</b>                                                                   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Done</b>                                                                               | Click to refresh the page. When clicking this button, the system refreshes to the last order used.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Create Scope</b>                                                                       | Click this button to access the <a href="#">Setting Up and Personalizing PeopleSoft Fluid WorkCenters</a> , where you can copy from an existing scope label.                                                                                                                                                                                                                                                                                                                              |
|  (Scope) | <p>Use the Scope icon to reorder the list of Scopes created. The order you determine on this page determines the order in which the Scopes appear when you use the Scope drop-down field in the My Work group box.</p> <p>To change the order, click, drag, and drop the Scope icon in the desired order. (This option is not available for Classic WorkCenters.)</p> <p>The first row is always the default scope option, so make sure that your desired default view is at the top.</p> |
| <b>Details</b>                                                                            | Click the Details button to access the <a href="#">Setting Up and Personalizing PeopleSoft Fluid WorkCenters</a> .                                                                                                                                                                                                                                                                                                                                                                        |

## Create Scope Page (Fluid)

Use the Create Scope page (EOWC\_EDITVIEWN\_SCF) to create a new scope.

Navigation:

<Application> **WorkCenter (Fluid)** >**Personalize icon** >**Configure Scope**. Click the Create Scope button.

This example illustrates the fields and controls on the Create Scope Page (Fluid).

| <b>Field or Control</b> | <b>Description</b>                                    |
|-------------------------|-------------------------------------------------------|
| <b>Copy From</b>        | Enter or select an existing scope from which to copy. |
| <b>Done</b>             | Click this button to create or copy a scope.          |

## Configure Filter Values Page (Fluid)

Use the Configure Filter Values page (EOWC\_EDITVIEWVA\_FL) to modify filter values for your link.

Navigation:

<Application> **WorkCenter (Fluid)** >**Personalize icon** >**Edit Filters** Select a row.

This example illustrates the fields and controls on the Configure Filter Values Page (Fluid).

**Configure Filter Values**

| <i>Field or Control</i> | <i>Description</i>                                                                                                                                                                                                                                                                                        |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Owner</b>            | Displays the product owner ID.                                                                                                                                                                                                                                                                            |
| <b>Link ID</b>          | Displays the WorkCenter link ID. Each My Work link in a fluid WorkCenter page has a unique link ID.                                                                                                                                                                                                       |
| <b>Page Name</b>        | Select the WorkCenter fluid page on which an email notification option is required.                                                                                                                                                                                                                       |
| <b>Data Record</b>      | Select the data record from which data is populated on the WorkCenter fluid page.                                                                                                                                                                                                                         |
| <b>Select Fields</b>    | Select the fields to be displayed in the email notification. If you do not select any fields, then the process picks the first three key fields of the data record. If the data record does not have any key fields defined, then the first three non-key fields are displayed in the email notification. |

## Email Notification Page

Use the Email Notification page (FL\_EMAILNTFY\_SCF) to notify one or more users of an action they need to take for a transaction.

You need to follow the given steps to set up the email notification framework:

1. Register the fluid pages on which the email notification option has to be provided. See [Ad hoc Email Configuration Page](#) for more information.
2. Use DMS/DAT files to migrate the email notification setup.

3. In Application designer, open the fluid page on which the email notification option has to be provided and add a secondary page. Enter page name as FL\_EMAILNTFY\_SCF.
4. Add the following PeopleCode in the fluid page activate event.

```
Component string &strLinkID; /* Added for Email Notification */
&strLinkID = %Request.GetParameter("SystemLinkID"); /* Added for Email Notific⇒
ation */
```
5. Access Manage Related Content for Content References page and add a Related Action for the fluid page on which email notification option has to be provided. For more information, see *PeopleTools: Portal Technology*. Use FL\_WORKCENTER\_ADHOC\_EMAIL as the Service ID for the Email Notification related action.

**Note:** Email Notification is not available in small form factor (SFF).

Navigation:

Select the Actions icon from the Fluid WorkCenter and select Email Notification.

This example illustrates the fields and controls on the Email Notification page. You can find definitions for the fields and controls later on this page.

| Field or Control       | Description                                                                                                                                                                                        |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Notify To              | Add the users to notify.                                                                                                                                                                           |
| Subject and Email Text | The system adds this information based on the transactions selected from the previous page. You can edit the email text. See <a href="#">Ad hoc Email Configuration Page</a> for more information. |

**Note:** For Fluid pages that do not have a related content reference, add a work record field (button) on the fluid page. Use FL\_WC\_EMAIL\_WRK as the record name and SENDMAILFIELD as the field name for the button. Invoke the ad hoc email framework.

# Understanding Pivot Grids

## Understanding Delivered Pivot Grids

PeopleSoft Pivot Grid supports operational dashboard reporting within the PeopleTools framework to provide a pivot table and chart representation of data using PSQuery data source. The framework also enables users to see different views of the data.

### Delivered Pivot Grids

This table lists delivered Pivot Grids for PeopleSoft FSCM.

| <i><b>Application/Product</b></i> | <i><b>Pivot Grid Title</b></i> | <i><b>Link to Topic</b></i>                                                            |

# Understanding Drop Zones

---

## Understanding Drop Zones

This topic provides an overview of Drop Zones, and the PeopleSoft Fluid, Classic, and Classic Plus components that are Drop Zone-enabled. Components are listed by:

- [Financial Management Components Where Drop Zones are Enabled](#)
- [Asset Lifecycle Management Components Where Drop Zones are Enabled](#)
- [Enterprise Service Automation Components Where Drop Zones are Enabled](#)
- [Supply Chain Management Components Where Drop Zones are Enabled](#)

## Understanding Drop Zones

Drop Zones allow editable or display only transaction fields to be added to an existing PeopleSoft Fluid page using configurations without customizing the delivered objects. You can add your own fields to Fluid pages to display or update your data. PeopleSoft has added Drop Zones to the top and bottom of some Fluid pages. You can create records, sub-pages and other new objects as necessary to fill in the Drop Zones.

For more information about Drop Zones, see the product documentation for *PeopleTools: Fluid User Interface Developer's Guide*, "Creating Pages for Fluid Applications", Creating and Configuring Drop Zones.

---

**Note:** For future uptake of drop zones, use the *PeopleTools Features* tracking group. Enter the tracking group value *Drop Zone Support for PT8.57*, or above.

---

Click to view a Video Feature Overview of [PeopleSoft Drop Zones](#).

## Find Drop Zone-Enabled Pages

To find which fluid pages have been enabled for drop zones:

1. Navigate to: **PeopleTools** > **Portal** > **Configure Drop Zones**
2. Enter the Component (in column 2 below) into the **Component** field.
3. Click Search.

Lists drop zone-enabled pages by component.

| Configure Drop Zones                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |           |                               |                      |           |           |           |              |                 |   |                     |                      |                 |    |                        |                      |                |   |                   |                      |                |    |                      |                      |                |    |                              |                      |                |    |                               |                      |                |    |                             |                      |                   |   |                         |                      |                   |   |                            |                      |

# Setting Up and Using PeopleSoft Fluid for Financials and Supply Chain Management

---

## Understanding PeopleSoft Fluid User Interface

Click to watch a short video about [PeopleSoft Fluid User Experience in Financials and Supply Chain Management](#)

Click to watch a short video about [PeopleSoft Fluid User Interface - Getting Started](#).

Oracle's PeopleSoft has two user interfaces:

- PeopleSoft Classic User Interface, which was designed to be used on a laptop and desktop.

This interface was previously known as PIA (PeopleSoft Internet Architecture).

- PeopleSoft Fluid User Interface, which was designed to be used on mobile devices, but can also be used on a laptop and desktop.

The PeopleSoft application reads the type of device you are using and renders the page accordingly. However, some pages are not designed for smart phones at this time.

PeopleTools documentation regarding the PeopleSoft Fluid User Interface includes:

- *PeopleTools: Fluid User Interface Developer's Guide*.
- *PeopleTools: Applications User's Guide*, Working With PeopleSoft Fluid User Interface.

## Understanding PeopleSoft Page Navigation in Online Help Documentation

With the introduction of PeopleSoft PeopleTools 8.55, Fluid navigation will be the default navigation approach for PeopleSoft applications. Users will be able to navigate to application pages from Fluid homepages. Additionally, application pages can be accessed through classic PeopleSoft navigation paths by selecting Navigator from the Fluid NavBar.

Companies using PeopleSoft applications might configure the delivered homepages and Fluid transactions differently since both are customizable, but the classic navigation remains a consistent way to navigate to all pages.

Since the Classic navigation paths remain relatively static, the PeopleSoft Online Help documentation provides only the classic navigation paths. This ensures that readers of PeopleSoft documentation can always navigate to a page even if their own Fluid homepages have been customized.

## Common Terms Used with the PeopleSoft Fluid WorkCenter

See [Common Terms Used with the PeopleSoft Classic WorkCenter](#) for a list of terms used in PeopleSoft Fluid WorkCenters. Not all apply to Fluid.

## Understanding Delivered Fluid Pages

This topic provides the PeopleSoft Fluid pages listed by:

- [Common to FSCM Applications](#)
- [Financial Management](#)
- [Asset Lifecycle Management](#)
- [Enterprise Service Automation](#)
- [Supply Chain Management](#)

In addition to the PeopleSoft Fluid pages listed in these tables, you can find:

- PeopleSoft Approval pages listed in this topic: [PeopleSoft Applications - Mobile Approval Transactions](#)
- PeopleSoft WorkCenter pages listed in this topic: [Understanding Delivered WorkCenters and Dashboards](#)

## Common to FSCM Applications

This table lists PeopleSoft delivered Fluid pages that are common to FSCM Applications:

| <b><i>Fluid Page</i></b>                              | <b><i>Classic Page (Replaced or Counterpart)</i></b> | <b><i>Image Fluid Page Delivered</i></b> | <b><i>Comments</i></b> |
|-------------------------------------------------------|------------------------------------------------------|------------------------------------------|------------------------|
| <a href="#">Personalize Page (Fluid)</a>              |                                                      |                                          |                        |
| <a href="#">Edit Filters Personalize Page (Fluid)</a> |                                                      |                                          |                        |

## Adding Homepages and Tiles

### Pages Used to Add Homepages and Tiles

| <i>Page Name</i>                 | <i>Definition Name</i> | <i>Usage</i>                                         |
|----------------------------------|------------------------|------------------------------------------------------|
| <u>Personalize Homepage Page</u> | PT_LANDINGPAGE         | Add a Homepage or add a tile to an existing Homepage |
| <u>Add Homepage Page</u>         | PTNUI_ADDLP_SEC        | Select My Homepage or create a new Homepage.         |
| <u>Add Tile Page</u>             | PT_LANDINGPAGE         | Add a tile to a Homepage                             |

### Personalize Homepage Page

Use the Personalize Homepage page (PT\_LANDINGPAGE) to add a Homepage or add a tile to an existing Homepage

Navigation:

**Fluid Home >Action List >Personalize Home Page**

This example illustrates the fields and controls on the Personalize Homepage Page.

The screenshot displays the 'Personalize Homepage' interface. On the left, a sidebar lists various functional areas under 'Employee Self Service', each with a red 'X' icon. The main area shows a grid of ten tiles, each representing a different service or report. Each tile has a title, a red 'X' icon, and a small 'Add' icon in the bottom right corner. The tiles are: Approvals, eProcurement, Expenses, Time Entry, Travel Authorizations, My Service Requests, Status Reports, Payment Request Center, Design Forms, and My Forms. The page includes a 'Cancel' button at the top left, a 'Save' button at the top right, and an 'Add Tile' button at the bottom right.

## Add Homepage Page

Use the Add Homepage page (PTNUI\_ADDLP\_SEC) to select My Homepage or create a new Homepage.

Navigation:

**Fluid Home >Action List >Personalize Home Page >Add Homepage**

This example illustrates the fields and controls on the Add Homepage Page.

The screenshot shows a dialog box titled "Add Homepage" with a close button (X) in the top right corner. The dialog is divided into two main sections. The first section, titled "Choose from available homepages", contains a single selectable option labeled "My Homepage". The second section, titled "Or create a new Homepage", contains a text input field with the placeholder text "Add New Homepage" and an "Add" button to its right.

## Add Tile Page

Use the Add Tile (PT\_LANDINGPAGE) page to add a tile to a Homepage.

Navigation:

**Fluid Home >Action List >Personalize Home Page >Add Tile**

This example illustrates the fields and controls on the Add Tile page.

PeopleSoft delivers many tiles for its applications. Select the application to access a list of delivered tiles. Select the tile and the system adds it to the intended Homepage.

For information about how to add a tile to a PeopleSoft Fluid Home page, see *PeopleTools: Application User's Guide*, “Working With PeopleSoft Fluid User Interface”, Working With Fluid Homepages and Dashboards, Managing Tiles on Fluid Homepages and Dashboards.

---

## Understanding Configuration Specialist Tiles

Tile definitions are available for you to add to any Homepage for Configuration Specialists within your organization. PeopleSoft delivers Tiles that access PeopleTools configuration pages and Enterprise Component configuration pages.

### PeopleTools

When adding these tiles to any homepage, use the Configuration Specialist folder on the Add Tile page.

---

**Note:** To access these tiles, you must have PeopleTools 8.58 or higher. You may need to updated the security settings of the tiles so they can be added with appropriate permissions.

## Enterprise Components Tiles

Enterprise Components Tiles can be added by users who have access to the underlying functionality associated and granted by the corresponding permission list.

When adding these tiles to a homepage, use the Configuration Specialist - EC folder on the Add Tile page.

## Sending Notifications Using PeopleSoft Fluid Pages

### Page Used to Send Notifications Using PeopleSoft Fluid Pages

| <b>Page Name</b>   | <b>Definition Name</b> | <b>Usage</b>                                                                      |
|--------------------|------------------------|-----------------------------------------------------------------------------------|
| <u>Notify Page</u> | PC_EMAILER_FL          | Send an e-mail notification to an employee, an employee's manager, or a resource. |

### Understanding the Notify Page

The Notify page is a common page that can be accessed from multiple PeopleSoft Fluid pages. It is used to send an e-mail notification to an employee, a manager, a resource, a contract administrator, and more.

Typically, the notify option is available when you select the Related Action icon and then select *Notify* <option>. The Notify page is available from these pages, using this navigation:

- "My Project Teams (pivot) Page" (PeopleSoft Project Costing), Related Actions, Notify Manager.
- "Project Team Resources Page" (PeopleSoft Project Costing), Related Actions, Notify Resource.
- "Project Financials (detail) Page" (PeopleSoft Project Costing), Related Actions, Notify Manager.
- "Project Performance Page" (PeopleSoft Project Costing), Related Actions, Notify Manager.

- "Project Timesheets Due (pivot) Page" (PeopleSoft Project Costing), Related Actions, Notify Resource.
- "Project Timesheets Due (detail) Page" (PeopleSoft Project Costing), Related Actions, Notify Resource.
- "Project Profit Margin (pivot) Page" (PeopleSoft Project Costing), Related Actions, Notify Manager.
- "Contract Profit Margin (pivot) Page" (PeopleSoft Project Costing), Related Actions, Notify Contract Administrator.
- "Project Unbilled Cost WIP (pivot) Page" (PeopleSoft Project Costing), Related Actions, Notify Manager.
- "Project Status Reports Page (pivot)" (PeopleSoft Project Costing), Related Actions, Notify Resource.

## Notify Page

Use the Notify page (PC\_EMAILER\_FL) to send an e-mail notification to an employee, an employee's manager, or a resource.

Navigation:

Select the *Notify* action from the Actions drop down list box on a PeopleSoft Fluid page.

This example illustrates the fields and controls on the Notify page.

The screenshot shows a 'Notify Manager' dialog box. It includes the following fields and controls:

- \*To:** A text field containing 'change\_me@oracle.com'.
- CC:** An empty text field.
- BCC:** An empty text field.
- \*Subject:** A text field containing 'Project: ALLPROJECTS - All Projects'.
- Message:** A large, empty text area for the message body.
- Send Email:** A green button at the bottom left.

Use the Notify page to send a message to various individuals. Depending on the page from which you select the notify option, the system automatically completes some fields.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                 |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>To</b>               | Review, add, or change the e-mail address for whom you want to send the notification. If you have set up e-mail addresses in your system, this field may be automatically completed by the system. |
| <b>Subject</b>          | Review, add, or change the text in the subject field. Depending on the page from where you selected the notify option, the system automatically enters a subject.                                  |

## Viewing the Business Card

### Page Used to View the Business Card

| <i>Page Name</i>               | <i>Definition Name</i> | <i>Usage</i>                              |
|--------------------------------|------------------------|-------------------------------------------|
| <u>View Business Card Page</u> | RS_BUS_CRD_FL          | View personal details as a business card. |

### Understanding the Business Card Page

To view the Business Card page, you must be using PeopleTools 8.54 and you must integrate with PeopleSoft HRMS 9.2.00 or later.

The information is loaded using these asynchronous messages, which are published by HCM.

- USER\_PHOTO\_FULLSYNC
- USER\_PHOTO\_SYNC

### View Business Card Page

Use the View Business Card page (RS\_BUS\_CRD\_FL) to view personal details as a business card.

Navigation:

Click the Related Action icon. Select View Business Card.

This example illustrates the fields and controls on the View Business Card page.

# PeopleSoft Mobile Approvals

---

## Understanding Mobile Approvals

The PeopleSoft Mobile Approvals feature provides an option to approve transactions using a mobile device using the Fluid User Interface as opposed to using the Classic User Interface. Approvers continue to take Application Workflow Engine (AWE) actions on PeopleSoft transactions pending their approval, but can do so using any form factor. See [Access Approval Pages](#).

---

**Important!** PeopleSoft Financials and Supply Chain Management is converting from PeopleTools - Mobile Approval Platform (MAP) technology to Enterprise Components - Fluid Approval technology. This chapter discusses Enterprise Components - Fluid Approval only. For information about PeopleTools MAP technology, see previous image documentation.

---

**Note:** When taking PeopleSoft Image 20, if you select 'All Updates Not Installed' you receive Fluid approval technology for applications that previously used MAP technology. In addition, if you pull any MAP main Unit of Work (UOW) from a previous image, it switches all MAP applications to a Fluid Approval application.

---

Click to view a Video Feature Overview of [PeopleSoft FSCM Fluid Approvals](#).

Enterprise Components - Fluid Approval Framework technology consists of; Enterprise Objects Approval Workflow (EOAW), Application Workflow Engine (AWE), and Enterprise Objects Page Composer (EOPC). A minimum tools release of 8.54 is required for Fluid Approvals.

In order to use the Mobile Approval feature, applications must utilize the Approval Framework, also known as Approval Workflow Engine (AWE). All transactions must be created in the database, and adhere to the Approval Framework logic and configuration within each application.

Mobile Approvals provides a convenient option to review and approve pending transactions, including these tasks from a mobile device, depending on the application:

- Approve, deny, push back, or hold pending transactions at the header level and the line level.  
You can perform approval actions for one or more transactions, depending on setup.
- Add comments for approval actions.
- View approvals that other approvers have approved.
- View requestor comments and attachments associated with the pending transaction.

"Using the PeopleSoft Fluid User Interface to Work with Approvals" (Enterprise Components)

## Prerequisites

For Enterprise Components - Fluid Approval Technology, the prerequisites are:

1. PeopleTools 8.54 is the minimum requirement.
2. Follow the instructions in the Mobile Approval Installation document, which can be accessed on Oracle's My Oracle Support (support.oracle.com), document number 2166359.1.
3. Enable and configure the PeopleSoft applications for Approval Framework.

See "Understanding the Approval Framework Feature" (Approval Framework).

## PeopleSoft Applications - Mobile Approval Transactions

This table lists the PeopleSoft applications and transactions that allow fluid mobile approvals.

| <b><i>PeopleSoft Application</i></b> | <b><i>PeopleSoft Mobile Approval Transactions</i></b>                                                                                                                                                                                                                                                                                                                                                                          | <b><i>Additional Information</i></b>                                                           |

## Access Approval Pages

The PeopleSoft Fluid User Interface is designed for users to access PeopleSoft pages using multiple form factors:

- SFF: Small Form Factor, such as smart phones.
- MFF: Medium Form Factor, such as tablets.
- LFF: Large Form Factor, such as large tablets.
- XLFF: Extra Large Form Factor, such as desktops.

When using a mobile device, you can access the approval pages by selecting the Approvals tile from Employee Self Service or Manager Self Service home page. When you access the approval pages by selecting the Approvals tile, the first page you see is the Pending Approvals page. The Pending Approvals page displays differently depending on your form factor. Approval transactions listed for each user depends on the permission level established for the user logged in.

## Configuring Mobile Approvals

### Pages Used to Configure PeopleSoft Mobile Approvals

| <i><b>Page Name</b></i>                                                   | <i><b>Definition Name</b></i> | <i><b>Usage</b></i>                                           |
|---------------------------------------------------------------------------|-------------------------------|---------------------------------------------------------------|
| Web Profile Configuration – Look and Feel                                 | WEB_PROF_LOOKFEEL             | (Optional) Configure appearance and character of web profile. |
| "Mobile Approval Options - General Settings Page" (Enterprise Components) | HMAP_MBL_TYPE_SET             | Configure the general settings for Mobile Approvals.          |

## Approvals Tile

Use the Approval tile to access the Pending Approvals page.

Navigation:

This tile can be placed on any PeopleSoft Fluid Home page.

This example illustrates the Approvals Tile.

For information about how to add a tile to a PeopleSoft Fluid Home page, see [Adding Homepages and Tiles](#)

The tile can show the total number of pending approvals. If no pending approvals are available, the tile does not display a number count.

## Pending Approvals Page

Use the Pending Approvals page (EOAWMA\_MAIN\_FL) to view a list of all transactions that apply to the selected transaction category and access the respective transactions that are pending your approval.

Navigation:

Select the Approval tile.

This example illustrates the fields and controls on the Pending Approvals page. You can find definitions for the fields and controls later on this page.

## Notifications

You can select the Notification flag icon at the top of either the PeopleSoft Fluid or Classic pages to view alerts in a notification window.

## Action Menu

You can access one of these approval views (by selecting the Action Menu drop-down option) to access either of these pages:

- Pending Approvals

An approver can view transactions pending their approval under one interface, thus eliminating the need to go to several different components to look for pending approvals.

- Approvals History

An approver can view approval transactions that they already worked on. This functionality enables the user to view the status of the approval request in the approval chain and view comments by individuals within the chain. Your administrator defines how far, in the past, historical approvals can be viewed.

- Review Approval

An approver can review approval transactions This functionality enables the user to review the status of the approval request in the approval chain and view comments by individuals within the chain.

- Administer Approval

An administer approval gives administrators a view into all approvals to which they have access, as well as the ability to take necessary actions on pending approvals. Administrators are provided access to Approval Transactions based on the Role defined as System Administrator on the Approval Process Definition page.

## Pending Approvals

The Pending Approvals page can display a mixture of HCM and FSCM approvals, based on the permissions of the current user. The initial list is displayed by transaction type and the corresponding number of pending approvals.

On the left side of the page, vertical tabs group approval transaction types into categories that are defined by the **View By** type value selected. The *All* category type appears at the top of the list for all view types when there are pending transactions. Transaction categories within a **View By** type display a badge identifying the number of pending approvals for that transaction category. If you do not have pending approvals for a transaction category, the tab does not appear in the list.

---

**Note:** If you are using the approvals pages in portrait mode on your mobile device, the page displays an arrow on the left side of the page. Select this arrow to reveal or hide the category tabs.

---

Select a transaction category tab to display the pending approvals that apply to that category. When you select a transaction category, the page displays pending approvals sorted by the date on which the approval request was received, with the oldest pending approval displaying first.

The system displays View By options on the left side of the page. The system displays a summarized list of the selected View by option on the right side of the page. In the example above, a summary of all pending approvals displayed. The right side displays header information for the selected View By option (left side).

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View By</b>          | <p>Select a type to view a list of transactions to be approved. Options are: <i>Date Routed</i>, <i>Last Operator</i>, <i>Priority</i>, <i>Type</i>, <i>Requester</i>, and <i>Type</i>. Depending on the option selected, the options below this field change. For example, if you select <i>Priority</i>, the selection options below this field are <i>High Priority</i>, <i>Medium Priority</i>, <i>Low Priority</i>, or a combination of each depending on applicable transactions.</p> <p>A bubble count displays the number of transactions within each view by category.</p> |
| <b>Load More</b>        | <p>Select to display remaining transactions in chunks. The number of transactions displayed is based on the value entered on the Mobile Approval Options - General Settings page in Enterprise Components.</p> <p>This button displays the next list of transactions out of total transactions to be displayed.</p>                                                                                                                                                                                                                                                                 |

| <b>Field or Control</b>                                                                              | <b>Description</b>                                                                                                                                            |
|------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  <b>Filter icon</b> | <p>Select the Filter icon to access the <a href="#">Filters Page</a>.</p> <p>The Filter icon appears green when filters have been applied to your search.</p> |

The right side of the page displays transactions that belong to the selected option on the left. Select a transaction row to access the [Approval Header Detail Page](#).

If a transaction type category is not set up to allow mass approvals, then the page lists the approval request transactions but the action buttons do not appear. For these types of transactions, you must select the desired row to access the [Approval Header Detail Page](#), and approve the transaction from there. Mass approvals is determined on the "Mobile Approval Options - Transactions Page" (Enterprise Components).

## Filters Page

Use the Filters page (EOAWMA\_FLTR\_SCF) to refine the results displayed in the Pending Approvals page.

Navigation:

From the Pending Approvals page, select the Filter icon.

This example illustrates the fields and controls on the Filters page.

Each filter field provides the same options that display below the View By field on the Pending Approvals page. For example, the Type field in the page shot above provides these options: Purchase Order, Requisition Approvals, Treasury Deals, and Treasury Settlements. If there are other types of approvals for you to approve, such as Expense Reports or Journal Entries, then they are displayed as well. The list is made up of the transactions you need to approve and the View By option selected.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                          |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Cancel</b>           | Select to return to the Pending Approvals or Approvals History page.                                                                                                                                                                                        |
| <b>Filter</b>           | Select to apply the filters and refine the approval request results on the Pending Approvals or Approvals History page.<br>The Filter icon on the Pending Approvals or Approvals History page changes to green, indicating that there are filters in place. |

## Approval Header Detail Page

Use the Approval Header Detail page (EOAWMA\_TXNHDTL\_FL) to view transaction information and perform approval tasks.

Navigation:

From the Pending Approval page, select a transaction on the right.

This example illustrates the fields and controls on the Approval Header Detail Page. You can find definitions for the fields and controls later on this page.

**Request for Bike-A-Thon**  
1,750.00 USD

☐ Header is pending your approval

Approver Comments

Approval Chain >

**Approve** **Deny** **More**

**Note:** The title in the banner of this page changes based on the approval request selected. Fields and elements on this page also vary depending on the type of approval transaction you are reviewing.

When viewing transaction details on a phone, you must scroll down to view each section; Summary, Lines, Requester Comments, Approver Comments, and approval chain.

The buttons that are available on the page are determined by the "Pending Approvals Page" (Enterprise Components). Buttons can include:

- **Approve**

- **Deny**
- **Pushback**
- **Hold**
- **More** (the page displays this button when the other buttons do not all fit on the page)

| <b><i>Field or Control</i></b>       | <b><i>Description</i></b>                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| <b>Approve, Deny, Pushback, Hold</b> | Select an option for the transaction. When you select one of these buttons, the system allows you to confirm or cancel your action. |

## Summary Section

The Summary section displays high-level information about the transaction. Most of this information is also displayed on the Pending Approvals page.

## Lines Section

The Lines section displays a summarized list of all lines on the transaction. Select the right arrow to access line summary and detail information.

## Approval Chain

Select Approval Chain to view approvers and add approvers to the approval chain.

## Approval Chain Page

Use the Approval Chain page (EOAWMA\_APPC\_SCF) to view and add to the approval chain.

This example illustrates the fields and controls on the Approval Chain page.

The screenshot shows the 'Approval Chain' page with a close button in the top right corner. The page is divided into two main sections: 'HR Supervisor' and 'Project Approval'.

**HR Supervisor Section:**

- A header bar displays 'TIME\_SHEET\_ID=0000000159, VERSION\_NUM=1' and 'Pending'.
- A button labeled 'Start New Path' is located below the header.
- A sub-section titled 'Time Report HR Supervisor' contains:
  - A row with a clock icon, the text 'Pending', and a '+' button.
  - A row with the text 'Davis, Al' and 'Time Report Approver List', followed by a right-pointing arrow.

**Project Approval Section:**

- A row displays 'TIME\_SHEET\_ID=0000000159, VERSION\_NUM=1, LINE\_NBR=2' and 'Initiated'.
- A second row displays 'TIME\_SHEET\_ID=0000000159, VERSION\_NUM=1, LINE\_NBR=3' and 'Initiated'.

The Approval Chain section displays the status of the approval chain for the transaction. You can expand and collapse subsections displayed. See application-specific documentation for how this section or page operates.

## Approve Page

Use the Approve page (EOAWMA\_HDRACT\_SCF) to submit or cancel your action selected for the transaction.

Navigation:

From the Pending Approvals (by Transaction) Page or the Transaction Approval page, select one or more transactions and select an action (Approve, Deny, Pushback, Hold).

This example illustrates the fields and controls on the Approve page.

Enter a comment and then select the Submit button to send your approval of the transaction to the system. The system removes the transaction from your Pending Approvals queue and adds it to your Approvals History page.

## Approval Line Detail Page

Use the Approval Line Detail page (EOAWMA\_TXNDTL\_FL) to view line details.

This example illustrates the fields and controls on the Approval Line Detail page.

|                                |                            |
|--------------------------------|----------------------------|
| <b>Automobile Rental</b>       |                            |
| 1,000.00 USD                   |                            |
| <b>Line Detail</b>             |                            |
| Transaction Date 07/01/14      | Payment Method Cash        |
| Expense Type Automobile Rental | Merchant Hertz Rent-a-Car  |
| Description                    | Location FORT WORTH, Texas |
| Billing Action Internal        | Personal Expense N         |
|                                | Receipt Verified N         |

Some applications allow you to approve a transaction at the line level. This is performed on the [Approval Header Detail Page](#).

## Approvals History Page

Use the Approvals History page (EOAWMA\_MAIN\_FL) to view transactions that you have previously approved.

Navigation:

Select the Approvals tile on the Employee Self Service home page, and then select the Approvals History option from the Action List (located in the banner) from the Pending Approvals page.

This example illustrates the fields and controls on the Approvals History Page. You can find definitions for the fields and controls later on this page.

< Employee Self Service
Approvals History

| View By | Type        |     |
|---------|-------------|-----|
|         | All         | (1) |
|         | Requisition | (1) |

**All**
1 rows

---

|                    |                                |              |
|--------------------|--------------------------------|--------------|
| <b>Requisition</b> | US003 / 0000000005 Calvin Roth | Updated      |
| 675.00 USD         | Medium Priority                | 09/05/2016 > |
|                    | In Process                     |              |

The Approvals History page shows approval transactions you have addressed in the past. How far back you can view historical approval transactions is defined by the administrator on the "Mobile Approval Options - General Settings Page" (Enterprise Components) setup page. This page displays a message below the category tabs indicating the time period for which history is displayed.

When you select a category, the page displays historical approvals sorted by the date on which the last person updated or took action on the request, with the most recently updated approvals displaying first.

Select a transaction row to view details of the transaction.

# Third Party Images Provided with Sample Data

## Using Third Party Images Provided with Sample Data

The PeopleSoft FSCM demo database includes sample data images that are provided under a restricted use license for demonstration purposes only, such as a product demonstration and conference room pilots. The specific images are listed below. If you want to use these sample images in a production environment, you must contact the image owners directly to purchase the images. You can find contact information for the owners in the [Licensing Notes for Oracle’s PeopleSoft Financial and Supply Chain Management \(FSCM\) 9.2](#) document on [My Oracle Support](#).

| <i>Image</i>                                                                        | <i>Owner</i> | <i>Owner’s Media ID for Image</i> |

## Chapter 34

# FSCM Abbreviations

---

## FSCM Abbreviations

Throughout PeopleSoft Financial and Supply Management (FSCM) applications fields may be labeled with an abbreviation rather than with the full spelling of the field name. Those abbreviations are used in FSCM applications, along with the corresponding full name.

| <b><i>Term</i></b>    | <b><i>Definition</i></b>               |
|-----------------------|----------------------------------------|
| #                     | Number                                 |
| # Interviewed         | Number Of Interviewed                  |
| # of Bids Received    | Number Of Bids Received                |
| # of Past Due Tasks   | Number of Past Due Tasks               |
| # of Rejects          | Number of Rejects                      |
| # of Reporting Months | Number of Reporting Months             |
| # Submitted           | Number of Submitted                    |
| %                     | Percentage                             |
| % Complete            | Percentage Complete                    |
| % Complete TD         | Percent Complete To Date               |
| % of WO               | Percentage of Work Order               |
| % of WO Labor Amount  | Percentage of Work Order Labour Amount |
| 3rd Party Markup %    | 3rd Party Markup Percentage            |
| Acct                  | Account                                |

| <b><i>Term</i></b>           | <b><i>Definition</i></b>                 |
|------------------------------|------------------------------------------|
| Acct                         | Account                                  |
| Accr                         | Accrual                                  |
| Acctg                        | Accounting                               |
| ACH                          | Automated Clearing House                 |
| Ack                          | Acknowledgement                          |
| Acpt w/err                   | Accepted with Error                      |
| ADB Date                     | Average Daily Balance Date               |
| Adj                          | Adjust or adjustment                     |
| Adj Meth                     | Adjustment Method                        |
| Adjusted Sales/Use Tax %     | Adjusted Sales or Use Tax Percentage     |
| Admin                        | Administration                           |
| Advance ID                   | Advance identifier                       |
| AE                           | Application Engine                       |
| AERP                         | Advanced Enterprise Resource Planning    |
| Affil                        | Affiliate                                |
| AG Number                    | Accept Giro Number                       |
| Alert Seq Num                | Alert Sequence Number                    |
| Alloc                        | Allocation                               |
| Allow Time/Expense Overage % | Allow Time or Expense Overage Percentage |
| Alt                          | Alternate                                |

| <b>Term</b>                 | <b>Definition</b>                      |
|-----------------------------|----------------------------------------|
| Alt Acct                    | Alternate Account                      |
| Alt SetID                   | Alternate Stead                        |
| Altacct                     | Alternate Account                      |
| AM                          | Asset Management                       |
| AM Unit                     | Asset Management Business Unit         |
| Amt                         | Amount                                 |
| An Type                     | Analysis Type                          |
| Appr                        | Approval                               |
| Approval Amount Tolerance % | Approval Amount Tolerance Percentage   |
| Approval User Id            | Approval User Identifier               |

# Application Fundamentals Reports

## Application Fundamentals Reports: General Description

Use this table to find general information about PeopleSoft Application Fundamentals reports.

**Note:** You may see both of the terms XML Publisher (XMLP) and BI Publisher, depending on the version of your PeopleTools installation and the bundle version of your application. As of PeopleTools 8.52, references to XML Publisher (XMLP) have changed to BI Publisher. This does not denote a change to the reports; only the naming convention has changed.

See [Managing ChartFields for Reports](#).

| <b>Report ID and Report Name</b>     | <b>Description</b>                                                                                                                                                                | <b>Navigation</b>                                                                                                       | <b>Run Control Page</b> |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|-------------------------|
| APY0003<br>AP Operator Profile       | Displays Payables User defaults by SetID. For each user, the default values for Business Unit, SetID and Origin as well as Supplier and Voucher Processing Authority display.     | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; User Preferences &gt; AP User Preferences Report</b>     | RUN_APY0003             |
| APY0006<br>Tax Authorities Report    | Displays tax authorities by SetID. For each tax authority, the authority code, name, effective date, percentage and ChartField values appear.                                     | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Sales and Use Tax &gt; Authorities Report</b>            | RUN_APY0006             |
| APY0007<br>Tax Codes Report          | Displays tax codes by SetID. For each tax code, a description, tax type, VAT reference, tax calculation information, taxing authority, effective date, and tax percentage appear. | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Sales and Use Tax &gt; Sales and Use tax Code Report</b> | RUN_APY0007             |
| APY0012<br>Accounting Entry Template | Displays available accounting entry templates and shows template name, effective date, type, description, account, department, product, and project.                              | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Accounting Entry Templates &gt; Template Report</b>      | RUN_APY0012             |

| <b>Report ID and Report Name</b>                      | <b>Description</b>                                                                                                                                                                                                                                                | <b>Navigation</b>                                                                                                                 | <b>Run Control Page</b> |
|-------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| CFX001<br>ChartField Project                          | Displays steps to configure a ChartField to individual needs. (BI Publisher)                                                                                                                                                                                      | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Design ChartFields &gt; Reports &gt;Run CF Config Steps Report</b> | RUN_CFC001              |
| EO9030<br>Cross/Reciprocal Rate Calc                  | Displays the cross rates calculated for selected currency exchange rates. (SQR)                                                                                                                                                                                   | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Market Rates &gt;Calculate Market Rates</b>                        | RUN_EO9030              |
| FSX0001<br>Installation Options (BI Publisher)        | Displays the contents of the PeopleSoft Installation Table, which contains system-wide parameters used by the applications. (BI Publisher)                                                                                                                        | <b>Set Up Financials/Supply Chain &gt; Install &gt; Installation Options Report</b>                                               | RUN_FIN0001             |
| FSX0002<br>Detail Calendars (BI Publisher)            | Displays information about detail calendars, including a description as well as a listing of the periods you have defined for the calendar. (BI Publisher)                                                                                                        | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Calendars/Schedules &gt; Detail Calendar Report</b>                | RUN_FIN0002             |
| FSX0003<br>TimeSpans (BI Publisher)                   | Displays the TimeSpan definitions for a SetID, including a description and information about the start year, start period, end year, and end period. The report also shows whether the TimeSpan includes forward balances and closing adjustments. (BI Publisher) | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Calendars/Schedules &gt;Print TimeSpans Report</b>                 | RUN_FIN0003             |
| FSX0004<br>Account Types (BI Publisher)               | Displays all the account types, including the long and short descriptive name, and indicates whether the system carries forward the balance for that account type. (BI Publisher)                                                                                 | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Design ChartFields &gt; Reports &gt;Define Acct Type</b>           | RUN_FIN0004             |
| FSX0005<br>Statistics Units of Measure (BI Publisher) | Displays a standard, portrait-style report of the contents of the Statistics Units of Measure table. The report also contains the unit of measure and description. (BI Publisher)                                                                                 | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Units of Measure &gt; Units of Measure Report</b>                  | RUN_FIN0005             |

## Managing ChartFields for Reports

The following discusses how to:

- Use Oracle BI Publisher reports to support configured ChartFields.
- Select ChartFields for SQR reports.

## Using Oracle Business Intelligence (BI) Publisher Reports to Support Configured ChartFields

Oracle BI Publisher (formerly XMLP) technology streamlines report and form generation and is accessible from PeopleTools 8.52 PS Query and all PeopleTools 8.52-based applications and beyond. This technology enables PeopleSoft to deliver BI Publisher reports. The BI Publisher reports do not require manual changes to support ChartField configuration.

The following is a list of the reports that can be generated in the BI Publisher formats:

- Installation Options: FSX0001 BI Publisher report.
- Detail Calendars: FSX0002 BI Publisher report.
- TimeSpans: FSX0003 BI Publisher report.
- Account Types: FSX0004 BI Publisher report.
- Statistics Units of Measure: FSX0005 BI Publisher report.
- Valid SpeedTypes: FSX0007 BI Publisher report.
- Valid Accounts: FSX0010 BI Publisher report.
- Valid Departments: FSX0011 BI Publisher report.
- Valid Products: FSX0012 BI Publisher report.
- Valid Project IDs: FSX0013 BI Publisher report.
- Valid Statistics Codes: FSX0015 BI Publisher report.
- Tables by Record Group: FSX0016 BI Publisher report.
- Valid SetIDs: FSX0017 BI Publisher report.

- Detail Ledger Definition: FSX0022 BI Publisher report.
- Ledger Template: FSX0023 BI Publisher report.
- Budget Reference: FSX0024 BI Publisher report.
- Scenario: FSX0025 BI Publisher report.
- List of PS/nVision Reports: FSX0030 BI Publisher report.
- List of PS/nVision Scopes: FSX0031 BI Publisher report.
- Valid Operating Units: FSX0032 BI Publisher report.
- Alternate Accounts: FSX0033 BI Publisher report.
- Currency Codes: FSX0035 BI Publisher report.
- ChartField1: FSX0037 BI Publisher report.
- ChartField2: FSX0038 BI Publisher report.
- ChartField3: FSX0039 BI Publisher report.
- Valid Funds: FSX0050 BI Publisher report.
- Valid Programs: FSX0052 BI Publisher report.
- Valid Sub Class: FSX0053 BI Publisher report.
- Journal Types: FSX0057 BI Publisher report.
- Journal Codes: FSX0058 BI Publisher report.
- Document Types: FSX0059 BI Publisher report.
- Document Sequence Ranges: FSX0060 BI Publisher report.
- Regulatory Ledger Translation Error: FSX5101 BI Publisher report.
- Ledger Code: GLX1001 BI Publisher report.
- Combination Edit Group: GLX4003 BI Publisher report.
- Adjustment Type ChartField: GLX4004 BI Publisher report.
- Book Code: GLX4005 BI Publisher report.
- Account Balancing Group: GLX4006 BI Publisher report.
- Journal Entry Template: GLX4007 BI Publisher report.
- Inconsistent ChartField on Combination Editing: GLX4009 BI Publisher report.
- ADB Processes: GLX5501 BI Publisher report.
- Allocation Group Definition: GLX6001 BI Publisher report.

- Budget Attributes: GLX8100 BI Publisher report.
- Associated Budgets: GLX8110 BI Publisher report.
- Budget Checking Batch Process Statuses: GLX 8530 BI Publisher report.
- Activity Log Detail: GLX8570 BI Publisher report.
- Activity Log Summary: GLX8571 BI Publisher report.

---

**Note:** The navigation to the reports listed above is included in this report lists for PeopleSoft Application Reports and in the report lists for each of the applications.

---

See "PeopleSoft Global Options and Reports: A-Z" (PeopleSoft Global Options and Reports).

See "Managing ChartFields for Reports" (PeopleSoft Commitment Control).

The BI Publisher report templates are designed in Microsoft Word's rich text format and contain the report layout and BI Publisher tags (placeholders) that are associated with the BI Publisher input file elements.

The following are general formatting features:

- All elements are placed in tables to optimize exact placement and alignment when the template is transformed to the actual report format.
- BI publisher can split columns to multiple pages if the columns exceed one page.

However, the GL report templates are designed to display all of the columns for a row on one page in most instances. There will be exceptions if some of the columns will be split on multiple pages. For example, if you have additional ChartFields. Multiple ChartFields will be grouped in a single column to optimize horizontal space.

- Some of the reports use intelligent formatting to display ChartFields only where a value exists in a row.
- Intelligent formatting is also used on other data such as statistical amount and statistical code to optimize horizontal spacing.

## Selecting ChartFields for SQR Reports

The *ChartField Selection* grid is used by many report request pages and enables you to select the ChartFields you want to view for SQR based reports that print ChartField values.

To enter report selection criteria in the ChartField Selection Grid:

1. Enter the header selection criteria and click **Refresh** to populate the grid with rows for each ChartField.
2. Click **Include CF** for the ChartFields that you want to include values for in the report.

PeopleSoft delivers reports with a fixed number of lines on the report heading. This number is determined based on the most common business practice. There is just enough space for a few ChartFields on the heading and still retain enough space for detail lines on each page. If you elect to include more ChartFields, the report will not have enough space to print all ChartField headings. This results in report heading and detail lines that overlay each other. If your circumstances require

you to print more than the optimum number of ChartField values, change the report to increase the report heading lines. Increasing the number of ChartFields is a customization and is not supported by PeopleSoft.

3. (Optional) Use the *Value* field to enter ChartField values for the budgets on which you want to report.

Leave blank to select all values for the ChartField. Some Commitment Control report request pages include *Value From* and *Value To* fields to enable you to select ranges of ChartField values.

4. (Optional) Change the *Sequence* in which the ChartFields appears on the report.

For example, if you are reporting by Account and Department and you select Account to be first in the sequence, the report displays budget rows as follows:

| <b>Account</b> | <b>Department</b> |
|----------------|-------------------|
| 60000          | 100               |
|                | 110               |
|                | 120               |
| 62000          | 100               |
|                | 110               |
|                | 130               |

The default sequence is alphabetical.

5. (Optional) Select *Descr* to include a description of the ChartField value.
6. (Optional) Select *Subtotal* to include a subtotal of all amounts for the ChartField.

For example, if you are reporting by Account and Department as in the above example, and you select Subtotal for Account, the report displays a subtotal amount for each Account:

| <b>Account</b> | <b>Department</b> | <b>Amount</b> |
|----------------|-------------------|---------------|
| 60000          | 100               | 1000          |
|                | 110               | 2000          |
|                | 120               | 1000          |
| Subtotal       |                   | 4000          |

| <b><i>Account</i></b> | <b><i>Department</i></b> | <b><i>Amount</i></b> |
|-----------------------|--------------------------|----------------------|
| 62000                 | 100                      | 2000                 |
|                       | 110                      | 1000                 |
|                       | 130                      | 3000                 |
| Subtotal              |                          | <i>6000</i>          |
