|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Hot List Categories</b>            | <p>Select this check box to set up categories for the Hot List.</p> <p>When this option is selected, the system displays the User Hot List Categories grid.</p> <p>Set up hot list categories using the Hot List Categories page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>User Applicant Hot List Categories</b> | <p>Enter a value in the Maximum Number of Applicants to determine how many applicants the system should display on the pagelet.</p> <p>Select the Show check box to determine if the category is to be displayed on the pagelet.</p> <p>The All category represents system data and displays all the hot elements in pagelets regardless of categorization.</p> <p>Use the add a new row icon to define a new hot list category. If a user defines their own hot category on this page, they must enter the category code, description, maximum number of applicants, and whether to show the category on the pagelet. The user can delete the category as well.</p> <p>Hot list categories can also be defined using the Hot List Categories page.</p> |

## Staffing Searches

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                               |
|--------------------------------|-----------------------------------------------------------------------------------------|
| <b>Search Type</b>             | Select a search type.                                                                   |
| <b>Saved Search Name</b>       | Select a search name.                                                                   |
| <b>Show</b>                    | Select to indicate that you want this search type to appear on the My Searches pagelet. |

## User Hot List Categories

Specify user specific categories to be displayed on the Applicant Hot List pagelet.

This grid only appears if you select the **Set Up for Applicant Hot List Category** check box.

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                 |
|--------------------------------|-------------------------------------------------------------------------------------------|
| <b>Category</b>                | Enter a title for the category.                                                           |
| <b>Description</b>             | Enter a description for the category.                                                     |
| <b>Max Num of Applicants</b>   | Enter the maximum number of applicants to display in the Applicant Hot List pagelet.      |
| <b>Show</b>                    | Select to show the category in the grid displayed when adding applicants to the hot list. |

---

**Note:** You cannot delete any categories that have applicants attached to them.

---

## Defining Staffing Job Data Preferences

Use the User Preferences - Staffing - Job Data page (OPR\_DEF\_TABLE\_FO2) to define Staffing Front Office and Pay/Bill Management values to be supplied by default to the Job Data section of the Applicant setup pages.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > User Preferences > Define User Preferences**

Click the **Staffing - Job Data** link.

This example illustrates the fields and controls on the User Preferences - Staffing - Job Data page. You can find definitions for the fields and controls later on this page.

| User Preferences                                                  |            | Staffing - Job Data                |                    |
|-------------------------------------------------------------------|------------|------------------------------------|--------------------|
| User ID                                                           |            | VP1                                | Kenneth Schumacher |
| <b>Email and Phone</b>                                            |            |                                    |                    |

## Email and Phone

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                         |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Email Type</b>       | Select <i>Business</i> , <i>Campus</i> , <i>Dorm</i> , <i>Home</i> , or <i>Other</i> to indicate which email address type to default when adding applicants to the system. |
| <b>Phone Type</b>       | Select a type, such as <i>Business</i> , <i>FAX</i> , or <i>Main</i> , to indicate the preferred phone number type to default when adding applicants to the system.        |

## Job Information

The values entered in the following fields will be used as defaults when you are adding applicants, orders, and new reports to the system. Users can override or keep these default values. After the applicant is hired, if Pay/Bill Management is installed, the applicant field values will be used to create the employee job record in HRMS, driving the process by which the employee should be paid.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                   |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Company</b>          | Enter a default value for the company to be associated with the applicants that you add to the system. The company is the employer or legal entity who hires the employee.                                                                                                                           |
| <b>Pay Group</b>        | Enter a default value for the Payroll for North America pay group to be associated with the applicants that you add to the system. Payroll for North America may have several pay groups, for weekly, bimonthly, and monthly pay, for example. Each organization has its own set of valid paygroups. |
| <b>Global Pay Group</b> | <p>Enter a default value for the Global Payroll pay group to be associated with the applicants that you add to the system.</p> <hr/> <p><b>Note:</b> This field is applicable only if Pay/Bill Management and Global Payroll are installed.</p> <hr/>                                                |
| <b>Job Code</b>         | Enter a default value for the job code to be associated with the applicants that you add to the system.                                                                                                                                                                                              |
| <b>Benefit Program</b>  | Enter a default value for the benefit program to be associated with the applicants that you add to the system. In HRMS, you may define several benefit programs based on the different types of benefits that your company extends to its employees.                                                 |

| <b>Field or Control</b>                                 | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Tax Location Code</b>                                | Enter a default taxing location to be associated with the applicants that you add to the system. This information is used by Payroll for North America to determine how taxes should be withheld.                                                                                                                                                                                                                                  |
| <b>HR Business Unit</b> (human resources business unit) | Enter a default business unit to associate with the applicants that you add to the system. This information applies only when Pay/Bill Management is installed.                                                                                                                                                                                                                                                                    |
| <b>Workgroup</b>                                        | Enter a default workgroup to associate with the applicants that you add to the system. Workgroups are used by the Time and Labor application, among other things, to determine which Time and Labor rule programs to apply to reported time, which time reporting codes are available to employees in the group, and whether time entry approval is required. This information applies only when Pay/Bill Management is installed. |
| <b>Taskgroup</b>                                        | Enter a default taskgroup to associate with the applicants that you add to the system. Taskgroups are used by the Time and Labor application, among other things, to determine which task-related information should be captured when you are entering time into the system. This information applies only when Pay/Bill Management is installed.                                                                                  |
| <b>Department</b>                                       | Enter a default department ID to associate with the applicants that you add to the system.                                                                                                                                                                                                                                                                                                                                         |
| <b>Location Code</b>                                    | Enter a default location code to associate with the applicants that you add to the system.                                                                                                                                                                                                                                                                                                                                         |
| <b>Regulatory Region</b>                                | Enter a default regulatory region to associate with the applicants that you add to the system. This information applies only when PeopleSoft Pay/Bill Management is installed.                                                                                                                                                                                                                                                     |
| <b>User Order Type</b>                                  | Enter a user order type to associate with new orders.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Customer ID</b>                                      | Enter a customer ID to associate with new orders and history items.                                                                                                                                                                                                                                                                                                                                                                |
| <b>Priority</b>                                         | Enter a priority to associate with new orders.                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Field or Control</b>      | <b>Description</b>                                               |
|------------------------------|------------------------------------------------------------------|
| <b>Order Event Group</b>     | Enter an order event group to associate with new orders.         |
| <b>Service Order Source</b>  | Enter a service order source to associate with new orders.       |
| <b>Order Reason</b>          | Enter an order reason to associate with new orders.              |
| <b>Line of Business</b>      | Enter a line of business to associate with new orders.           |
| <b>Non-Compliance Reason</b> | Enter a non-compliance reason to associate with new reports.     |
| <b>Empl ID</b>               | Enter an employee ID to associate with new reports.              |
| <b>Sales Operator</b>        | Enter a sales operator to associate with new orders and reports. |
| <b>Run Control ID</b>        | Enter a run control ID to use for running reports.               |

| <b>Field or Control</b>              | <b>Description</b>                                                                                                                                                                                |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow forcing additional jobs</b> | Select to enable power users to override the system logic that reuses employee job records across different assignments.<br>This option is applicable only when Pay/Bill Management is installed. |

## User Preferences - Supplier Contract Management Page

Use the User Preferences - Supplier Contract Management page (OPR\_DEF\_TABLE\_CS) to define user authorizations for managing contract documents through their life cycles and to grant the types of controls that the user who is defined in the User ID field can perform on documents.

This page is enabled only for users who have administration rights for authored contracts, and those users can approve library sections and set configurator status.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >User Preferences >Define User Preferences.** Click the **Supplier Contract Management** link.

**Supplier Contracts > Supplier Contracts Setup > Define User Preferences.** Click the **Supplier Contract Management** link.

This example illustrates the fields and controls on the User Preferences - Supplier Contract Management page.

[User Preferences](#) | [Supplier Contract Management](#)

Use this page to determine how a user can manage a document through its life cycle and to grant the types of controls that the user can perform on documents. This page is enabled only for users who have administration rights for authored contracts, can approve library sections, and can determine the status of a configurator.

Your application administrator enters this setup information for document administrators and librarians.

## Document and Librarian Authorizations

Use this section to grant security to the document administrators and librarians who manage section approvals, status changes for configurators, and import documents.

| <b>Field or Control</b>                     | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Full Authorization for All Documents</b> | <p>Select to grant a user the authority to perform all tasks that are listed on this page.</p> <p>This user is considered a super user with the ability to perform all actions on contracts that are in the system. When you select this option the Document Administrator fields become display only and cannot be edited.</p> <p>If you do not select this check box, then you can select individual authorizations for document tasks.</p>                                                                                                                                                                            |
| <b>Document Administrator</b>               | <p>Select this option to indicate that the user has administrative authority to author supplier contract documents. As a document administrator, a user can generate, re-create, refresh, check out, edit, and check in documents. You can select one or all tasks in this group box.</p> <p>Document administrators can also control the life cycle of a contract for authors, by submitting contracts for collaboration and approvals. Depending on how you are using document types, document administrators may include only contract specialists or may include a broader list of users who generate documents.</p> |
| <b>Delete Documents</b>                     | <p>Select this option to indicate that the user has the authority to delete supplier contract documents.</p> <p>This option grants or restricts the ability of document owners and super users to delete documents once they are created.</p> <p>This option is available when either the <b>Full Authorization for All Documents</b> or <b>Document Administrator</b> option is selected.</p>                                                                                                                                                                                                                           |

| <b>Field or Control</b>                                                       | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Bypass Approval</b>                                                        | <p>Select this option to indicate that the user can bypass approvals. In other words, the document can be automatically approved by this administrator.</p> <p>If your organization uses supplier contract approvals, there are steps required to approve a document. However, if necessary, a user can expedite the document if this option is selected for their user ID.</p> <p>When users have the authority to push a document through the approval process, a <b>Bypass Approval</b> button appears on the "Document Management Page" (PeopleSoft Supplier Contract Management).</p> <p>This option is available when either the <b>Full Authorization for All Documents</b> or <b>Document Administrator</b> option is selected.</p>                                                                                                                                                                                                                                                                 |
| <b>Reset to Dispatch</b>                                                      | <p>Select to indicate that the user can reset a document to a <i>Dispatched</i> status. After a document has been completed between a supplier and customer, it is in an <i>Executed</i> status. At that status, the <b>Reset to Dispatch</b> button is available on the "Document Management Page" (PeopleSoft Supplier Contract Management). This feature is useful if you want to perform minor changes, such as correct typographical errors, in the current version of the document without processing an amendment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Copy PO Authorized for Users</b> (copy purchase order authorized for user) | <p>Click to copy buyer IDs from the <b>Purchase Order Authorization</b> or <b>Buyers User Authorization</b> grid to the <b>Authorized Document Access for</b> grid. These IDs belong to users who are authorized to perform purchase order tasks for the current user.</p> <p>This button is available when the <b>Full Authorization for All Documents</b> check box is not selected and the <b>Purchase Order</b> check box is selected as a valid transaction source (Enabled Transaction Source section ) on the <u>Installation Options - Supplier Contract Management Page</u>.</p> <p>When you click this button, the system checks for users who are defined in the <b>Buyers User Authorization</b> grid for the user whose preferences you are defining. If user IDs exist in the grid, the system copies those user IDs to the <b>Authorized Document Access for</b> grid box. After the user IDs are copied, you can select the authorization access that you want to provide to the users.</p> |

## Librarian

Use this section to set default values for librarians. The default values apply to the user ID that you select at the top of the page.

| <i><b>Field or Control</b></i>    | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Approve Sections</b>           | Select to indicate that a librarian can approve a section, making the section available to use in documents. The status of a section can be changed or Approved using the "Section Definition Page " (PeopleSoft Supplier Contract Management).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Default Section Status</b>     | <p>Select a status that indicates when the librarian can create a new section. This saves time when submitting the section for approval. Values include <i>Approved</i> and <i>Initial</i>. This field is available when the <b>Approve Sections</b> check box has been selected.</p> <p>When this value is <i>Approved</i>, and the librarian checks out and changes an approved section, the system does not change the status to <i>Initial</i>. Instead, the status remains <i>Approved</i>.</p>                                                                                                                                                                                                                                                               |
| <b>Default Clause Status</b>      | <p>Select a status that indicates when the librarian can create a new clause. This saves time when not using clause approvals because the librarian can change the status of a clause to <i>Approved</i> by default. Values include <i>Approved</i> and <i>Initial</i>.</p> <p>This field is not available when the <b>Clause Approval</b> option is selected on the <u>Installation Options - Supplier Contract Management Page</u>. In this case, the default value is <i>Initial</i> because all clauses must be submitted for approval.</p> <p>When this value is <i>Approved</i>, and the librarian checks out and changes an approved clause, the system does not change the status back to <i>Initial</i>. Instead, the status remains <i>Approved</i>.</p> |
| <b>Change Configurator Status</b> | Select to indicate that the user can update the status of a document configurator. Configurator statuses can be changed on the "Document Configurator Definition Page" (PeopleSoft Supplier Contract Management).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Authorize Document Access for

Use this section to add document administrator user IDs for the current user (listed at the top of the page). This section enables the user to act on behalf of the users in the **Document Administrator** column. If the user in the Document Administrator column is away from the office, then the current user (listed at the top of the page) has the authority to perform tasks for the individual's documents.

**Note:** You can copy user IDs from the Purchase Order Authorizations page to populate this section using the **Copy PO Authorized for Users** button.

| <b>Field or Control</b>                   | <b>Description</b>                                                                                                                                                                                                                                                                                                       |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Document Administrator</b> (column)    | <p>Select additional users for whom the current user (listed at the top of the page) can act on behalf of and perform certain document tasks.</p> <p>Use the corresponding check boxes to define the authorities for the selected user.</p> <hr/> <p><b>Note:</b> Only Document Administrators appear in the lookup.</p> |
| <b>Document Administrator</b> (check box) | Select to indicate that the selected user has document administrator privileges for the documents belonging to the document administrator. This means that the selected user can generate and edit documents that belong to the document administrator as if he or she were the administrator.                           |
| <b>Reset to Dispatch</b>                  | Select to indicate that the selected user can change a processed document to <i>Dispatch</i> for the documents that belong to the document administrator.                                                                                                                                                                |
| <b>Bypass Approval</b>                    | Select to indicate that the selected user can bypass approvals and expedite a document for documents that belong to the document administrator.                                                                                                                                                                          |

## User Preferences - Maintenance Management Page

Use the Maintenance Management page (OPR\_DEF\_TABLE\_WM1) to define default maintenance management preferences.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > User Preferences > Define User Preferences > Maintenance Management**

This example illustrates the fields and controls on the User Preferences – Maintenance Management page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'User Preferences – Maintenance Management' page. At the top, it shows 'User: VP1' and 'Default Operator'. The page is divided into two main sections: 'User Defaults' and 'User Options'.

**User Defaults:** This section contains several input fields with search icons and dropdown menus:

- Service Request Unit: US001 (US001 NEW YORK OPERATIONS)
- Service Request Center: US015 (USA - Pleasanton)
- Work Order Bus. Unit: US001 (US001 NEW YORK OPERATIONS)
- Service Group: MAINT (Maintenance Service)
- Shop: (empty)
- Resource Group: (empty)
- Asset Business Unit: US001 (US001 NEW YORK OPERATIONS)
- Asset Type: (dropdown menu)

**User Options:** This section includes:

- Calendar Item Link Option: Work Order (dropdown)
- \*Time Report Method: Elapsed Time (dropdown)
- Enable Actual Hours: ☐
- Allow Mass Change Hours: ☐
- \*Max rows in mobile: 300 (input)
- \*Max rows in PM Mass Update: 300 (input)

**User Authorizations:** This section has tabs for different categories: Work Order, Asset / EPL, Labor / Crew, Inventory, Procurement, Tools, and Advanced. Each tab contains a list of permissions with checkboxes:

- Work Order:** View WO Requirements, Copy To New Work Order
- Asset / EPL:** View Scheduled Resources, Cancel a WO
- Labor / Crew:** View and Update Accounting, Complete a WO
- Inventory:** (empty)
- Procurement:** Allow Submit Time for Posting, Close a WO
- Tools:** (empty)
- Advanced:** (empty)

## User Defaults

| Field or Control                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Service Request Business Unit</b> | Select the business unit that you want to serve as the default service request business unit value when this user creates a service request. Normally business unit is not exposed to self-service users and they can never override it; however, agents creating new service requests via the Agent Service Request component may override the business unit default.                                                                                                                                                                                                                                   |
| <b>Service Request Center</b>        | Select the Service Request Center that you want to serve as the default value whenever this user creates a service request. Users can override this value in the service request.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Work Order Business Unit</b>      | <p>Select the business unit that you want to serve as the default work order business unit value when this user creates a work order without a service request. Users can override this value at the work order level. This is also the default business unit for the Task Search page used by the Technician Workbench, the Work Order Workbench, the Crew Scheduling Workbench, and the Labor Assignment Workbench.</p> <hr/> <p><b>Note:</b> Work orders that are created from service requests derive the work order business unit from the Problem Tree setup, not from user preferences.</p> <hr/> |

| <b>Field or Control</b>    | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Service Group</b>       | Select the Service Group to serve as the default value for a work order created by this user. Users can override this value at the work order level.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Shop</b>                | Select the shop to serve as the default value for a work order created by this user. Users can override this value at the work order level.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Resource Group</b>      | <p>Select the resource group value to use as the default value in the work order.</p> <hr/> <p><b>Note:</b> The Resource Group is used in the Matching process to match members in the group to demand for resources. This default value is normally set up for users who schedule work orders and use the matching process.</p> <hr/> <p><b>Note:</b> This option only applies to the Time Entry page of the Technician Workbench. It does not apply to time entered on the Work Order Completion component.</p> <hr/> |
| <b>Asset Business Unit</b> | Select the business unit that you want to serve as the default Asset Management business unit value in a work order for this user. Users can override this value in the work order.                                                                                                                                                                                                                                                                                                                                     |
| <b>Asset Type</b>          | <p>Select the asset type to display as the default value in the work order, which is used to search for assets to maintain or repair in the work order.</p> <p>You can override this value in the work order.</p>                                                                                                                                                                                                                                                                                                       |

## User Options

|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Calendar Item Link Option</b> | <p>Select the component that you want to access when you select a work order assignment link on a resource's calendar. When you click on a work order task assignment on a resource's calendar, the link takes this user to either the Work Order or the Technician Workbench, depending on selecting either:</p> <ul style="list-style-type: none"> <li>• <i>Technician Workbench</i> (default)</li> <li>• <i>Work Order</i></li> </ul> |

| <b>Field or Control</b>           | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Time Report Method</b>         | <p>Select the format by which this user records their time worked on work order tasks on the Technician Workbench Time Entry page. Options are:</p> <p><i>Elapsed Time:</i> Select to report time as the total hours worked per day.</p> <p><i>Punch Time:</i> Select to report times by entering start times and end times.</p> <p>See "Creating Work Order Tasks" (PeopleSoft Maintenance Management).</p> |
| <b>Enable Actual Hours</b>        | <p>Select to enter the actual labor hours for work order tasks on the Technician Workbench page. When the Enable Actual Hours check box is selected, the Technician Workbench page displays the Actual Hours tab with fields for specifying the employee ID, Craft, Actual Start Date, Actual Start Time, Actual End Date, Actual End Time, and Actual hours.</p>                                            |
| <b>Allow Mass Change Hours</b>    | <p>Select to enable the Actual Hours option on the Technician Workbench - Mass Change page. This check box is enabled only if the <b>Enable Actual Hours</b> check box is selected.</p>                                                                                                                                                                                                                      |
| <b>Max rows in mobile</b>         | <p>Enter the maximum number of rows of the Fluid Quick Work Order search results grid to be displayed on a mobile.</p>                                                                                                                                                                                                                                                                                       |
| <b>Max rows in PM Mass Update</b> | <p>Enter the number of rows to be displayed in the PM Schedule Mass Update grid. The default value is 300 rows and the maximum value is 999999.</p>                                                                                                                                                                                                                                                          |

## User Authorizations – Work Order

| <i>Field or Control</i>                                    | <i>Description</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View WO Requirements</b> (view work order requirements) | <p>Select this check box to enable this user to view work order requirements by enabling access to the Labor, Inventory, Purchase/On-hand, and Tools links in the Requirements page of the Work Order component. If you do not select this check box, then the Labor, Inventory, Purchase/On-hand, and Tools links are not available on the Requirements page of the Work Order component</p> <hr/> <p><b>Note:</b> This user can only view this information if any of the Schedule Labor, Schedule Inventory, or Schedule Tools options in a work order's business unit are selected.</p> <hr/>                                                                                                                    |
| <b>View Scheduled Resources</b>                            | <p>Select this check box to enable this user to view work order resource schedules in the Schedules page of the Work Order component and to enable drill down to it from the Crew Schedule Inquiry page.</p> <hr/> <p><b>Note:</b> This user can only view this information if any of the Schedule Labor, Schedule Inventory, or Schedule Tools options in a work order's business unit are selected.</p> <hr/>                                                                                                                                                                                                                                                                                                     |
| <b>View and Update Accounting</b>                          | <p>Select this check box to enable this user to view and update the accounting ChartField distributions on the Schedules page for labor, inventory, purchase/on-hand, and tools in the Work Order component. Selecting this check box also enables users to view and update the ChartField distributions on the Tools Cost tab of the Tool Usage page in the Technician Workbench and the Work Order Completion component.</p> <p>Selecting this check box also enables access to the distribution templates for the Inventory, Labor, and Purchase/On-Hand Schedules in the Work Order component. However, these options are not available in the Technician Workbench or the Work Order Completion component.</p> |

| <b>Field or Control</b>                      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow Submit Time for Posting</b>         | <p>Select this check box to enable a user to select the Submit Time for Posting button in the Time Entry page of the Technician Workbench and Work Order Completion page.</p> <p>This check box is selected by default. If you do not select this check box this user will be prevented from submitting work order task time entries to Expenses for posting. The user can still enter time. In addition, selecting this option enables the user's manager or supervisor to edit the time entry, if necessary, and then submit it to posting.</p> <p>If you do not select this check box, the Submit Time for Posting button does not appear on the Time Entry page in the Technician Workbench or on the Work Order Completion component for this user.</p> |
| <b>Copy to New Work Order</b>                | <p>Select this check box to enable this user to copy an existing work order to a new work order.</p> <hr/> <p><b>Note:</b> The Copy button in the work order is not visible unless this check box is selected.</p> <hr/>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Cancel Work Order</b>                     | <p>Select this check box to enable the selected user to manually cancel a work order.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Complete a WO</b> (complete a work order) | <p>Select this check box to enable this user to change the status of a work order to <i>Complete</i> in the Work Order component, the Technician Workbench, and the Work Order Completion component.</p> <hr/> <p><b>Note:</b> This option only applies to a manual close does not enable this user to perform the WO_CLOSE batch close process.</p> <hr/>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Close a WO</b> (close a work order)       | <p>Select this check box to enable this user to close a work order online.</p> <hr/> <p><b>Note:</b> This option only applies to a manual close and does not enable this user to perform the WO_CLOSE batch close process.</p> <hr/>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## User Authorizations – Asset/EPL

| <b>Field or Control</b>               | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authorized to Set Asset Action</b> | Select this check box to enable specific users to select the Asset Action for a task on the Requirements page of the work order. The Asset Action dropdown list enables you to install, retire, and replace assets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Authorize Cost Recovery Claim</b>  | Select this check box to enable this user to create a warranty claim. If you do not select this check box, the Warranty Claim link is not available on the Schedules page of the Work Order component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Override Capital Limit</b>         | <p>Select this check box to enable this user to override the capitalization limit on the Task Accounting component, which is set up on the Maintenance Management, Setup, Capitalization Rules component for the asset used in a work order. The user can increase or decrease the minimum amount that it costs to repair an asset in a work order task before it can be capitalized by Project Costing.</p> <hr/> <p><b>Note:</b> If you do not select this check box, the capitalization limit cannot be accessed by this user.</p> <hr/> <p>See "WO Capitalization Limit Page" (PeopleSoft Maintenance Management).</p>                                                                                                                                                                 |
| <b>Allow Planned Downtime</b>         | <p>Select this check box to enable a user to enter <i>planned</i> downtime for an asset specified for a work order task. Users can enter planned and actual downtime for an asset via the Downtime Entry component, a link at the work order task level in the Work Order Component, and a link at the work order task level on the Technician Workbench . When the work order is closed, the asset downtime updates the Asset Maintenance History. This information can be useful for creating warranty claims based on the downtime of an asset.</p> <p>If you do not select this check box, the downtime Planned tab does not display, and users can only enter the actual downtime.</p> <hr/> <p><b>Note:</b> Downtime entries are not updated to Warranty Claim processing.</p> <hr/> |

| <b>Field or Control</b>                                                                       | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Allow Update Non-specific EPLs</b>(allow update non-specific equipment parts lists)</p> | <p>Select this check box to enable the <b>Add to EPL</b> button for this user, which appears above the Inventory and Purchase/On-Hand grids on the Requirements and Schedules pages in the Work Order and Express Work Order components, and the Requirements grid in the Work Order Task Template component.</p> <p>Equipment Parts List (EPL) templates are set up in PeopleSoft Asset Management (Set Up Financials/Supply Chain, Product Related, Asset Management, Service and Repair) based on categories of assets (asset type, asset subtype, manufacturer's ID, and model). An EPL template lists the parts that are used to maintain and repair assets falling under these asset categories. Non-specific EPL templates refer to any EPL template that is not selected as the default EPL template for the asset that is selected for a work order task.</p> <p>When this user selects an asset for the work order task and clicks the <b>Add To EPL</b> button for one or more selected Inventory or Purchase/On-Hand task rows, the Add to Equipment Parts List page appears. This page lists one or more non-specific EPL templates, which were set up for one or more asset categories that apply to the asset selected for the task.</p> <p>For example, these three EPL templates are set up under the asset type, Facilities, and the asset subtype, HVAC/Heating.</p> <ul style="list-style-type: none"> <li>• B&amp;GWaterPump</li> <li>• LIEBERT AC</li> <li>• PUMP_IMPELLER</li> </ul> <p>The Asset ID MMFACTLT0009 is an Air Conditioner Unit that is categorized under the asset type, Facilities, and asset subtype, HVAC/Heating.</p> <p>When you select the asset ID MMFACTLT0009 for a work order task, define and select one or more inventory item rows that you want to add to one or more EPL templates, and click the <b>Add to EPL</b> button. All three of these EPL templates will appear on the Add to Equipment Parts List page. The user adds the one or more inventory items selected for the task to one or all of the EPL templates by selecting the check box for each EPL template row and clicking the <b>Add to EPL</b> button.</p> |

| <b>Field or Control</b>               | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow Update Asset Default EPL</b> | <p>Select this check box to enable this user to access the <b>Add to EPL</b> button, which appears above the Inventory and Purchase/On-Hand grids in the Work Order and Express Work Order components, and above the Inventory and Purchase/On-Hand Requirements grid in Work Order Task Template component.</p> <p>You can set up asset definitions in PeopleSoft Asset Management and select a default EPL template for each asset. If the Allow Update Asset Default EPL check box is selected, and this user selects one of these assets, defines and selects one or more inventory or purchase on-hand rows, and clicks the <b>Add to EPL</b> button, the default EPL template defined for the selected asset displays as preselected on the Add to Equipment Parts List page.</p> <hr/> <p><b>Important!</b> If you select both the <b>Allow Update Non-specific EPLs</b> and the <b>Allow Update Asset Default EPL</b> buttons, then both the asset default EPL and any non-specific EPLs will appear on the Add to Equipment Parts List page as long as the selected asset has a default EPL selected in its definition.</p> <hr/> <p>See "Setting Up Work Order Templates" (PeopleSoft Maintenance Management).</p> <p>See "Understanding Work Order Task Resource Requirements" (PeopleSoft Maintenance Management).</p> <p>See "Understanding Resource Scheduling" (PeopleSoft Maintenance Management).</p> |

## User Authorizations – Labor/Crew

| <b>Field or Control</b>            | <b>Description</b>                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View and Update Labor Rates</b> | <p>Select this check box to enable this user to view and update the labor rates in the work order. When this option is selected the user can override any default rates from a business unit, shop, or craft.</p> <hr/> <p><b>Note:</b> You cannot update labor cost and bill rates in the Work Order Completion component.</p> <hr/> |
| <b>Schedule Labor</b>              | <p>Select this check box to enable a user, such as a craft supervisor, to schedule labor resources for a work order task. This check box must be selected for anyone responsible for scheduling labor resources in your organization.</p>                                                                                             |

| <b>Field or Control</b>                                                   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Update Crew Schedule Metrics</b>                                       | Select this check box to enable specific users to manually update the crew schedule compliance on the Crew Schedule Compliance Revision page of the Crew Schedule Metrics component and enables selection of the Update Schedule Metrics check box on the Maintenance Schedule Completion Report Request page of the Schedule Completion Report.              |
| <b>Allow Override Metrics</b>                                             | Select this check box to allow the confirmation of metrics on past or current periods for the crew selected on the Crew Scheduling Workbench.                                                                                                                                                                                                                 |
| <b>Report Crew Assgnmt Completion</b> (report crew assignment completion) | Select this option to enable specific users to access the Report Completed Hours and Report Completed Date fields. It enables users to update the Completed Hours and Completed Date fields on the Report Crew Assignment Time component, which is accessible through the Technician Workbench or the Crew Assignments grid of the Crew Scheduling Workbench. |
| <b>Report Crew Carryover Hours</b>                                        | Select this check box to enable specific users to access the Report Carryover Hours Action and update the Carryover Hours field on the Report Crew Assignment Time component, which is accessible through the Technician Workbench.                                                                                                                           |

## User Authorizations – Inventory

| <b>Field or Control</b>              | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authorized to Enter Inventory</b> | <p>Select this check box to enable this user to select and enter inventory items in the work order.</p> <hr/> <p><b>Note:</b> If you leave this check box blank, the Inventory link on the Work Order component's Requirements and Scheduling pages, the Express Work Order page, and the Work Order Workbench are unavailable for selection. This setting overrides the selections in the work order business unit and/or shop.</p> <hr/> |
| <b>Allowed to Reserve Inventory</b>  | Select this check box to enable this user to create online, immediate reservations by selecting a Reserve button in the Work Order component. Selecting the Reserve button enables the user to override the Commit and Reservation Rule default hierarchy and reserve selected items in the work order task immediately. The default hierarchy is based on how the rules are specified in the business unit, shop, and work order type,    |

| <b>Field or Control</b>         | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Run Picking Plan</b>         | <p>Select this check box to enable this user to select the Picking Plan button to generate a picking plan.</p> <hr/> <p><b>Note:</b> The Picking Plan button in the Schedules page of the work order, on the Technician Workbench, and the Work Order Completion component is not available for selection unless this check box is selected.</p> <hr/>                       |
| <b>Picking Plan Run Control</b> | <p>Click this link to access Inventory's Process/Output Options page where you must set up pick plan run control data, which is used to allocate parts selected in Maintenance Management to Inventory and runs an SQR (structured query report) to create the picking plan list.</p> <p>See "Schedules Page - Inventory Schedules" (PeopleSoft Maintenance Management).</p> |

## User Authorizations – Procurement

| <b>Field or Control</b>      | <b>Description</b>                                                                                                                                                                                                                                   |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Authorized to Procure</b> | Select this check box to enable this user to select various procurement options within the Purchase/On Hand schedule page of the Work Order component. If this option is not selected, the user will not be able to procure items from a work order. |

## User Authorizations – Tools

| <b>Field or Control</b>            | <b>Description</b>                                                                                                                                                                                                                                                  |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>View and Update Tools Rates</b> | Select this check box to enable a user to view and update the cost rate and billing rate for tools in the work order, the Technician Workbench, and the Work Order Completion component. If this check box is left blank, these rates become unavailable to access. |
| <b>Schedule Tools</b>              | Select this check box to enable a user, such as a tools supervisor, to schedule tools for a work order task. This check box must be selected for anyone responsible for scheduling tools in your organization.                                                      |

## User Authorizations – Advanced

| <i><b>Field or Control</b></i>       | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow Access to Search Views</b>  | <p>Select this check box to enable a user to select the View button on the Technician Workbench to access the Task Search page and search for and access any task based on the search criteria entered on the Task Search page.</p> <p>If you do not select this check box, the View button does not appear on the Technician Workbench page for this user. In this case, the technician (user) only has access to specific work order tasks based on predefined views.</p>                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Allow Access to Other's Tasks</b> | <p>Select this check box to enable a technician to access another technician's work order task in the Technician's Workbench. Selecting this check box enables a user, other than the assigned user, to remove or change the technician's user ID from the Assigned To field on the Task Search page and search for more than one user's assigned tasks. If this check box is not selected, the Assigned To field on the Task Search page associated with the Technician Workbench defaults to the assigned technician and cannot be modified.</p> <hr/> <p><b>Note:</b> Selecting this check box only applies to the Technician Workbench and not the Work Order Completion component. Any user with access to the Work Order Completion component can enter time for multiple employees assigned to one or more tasks associated with a selected work order.</p> <hr/> |

| <b>Field or Control</b>                                                  | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Allow Access to WO Security</b> (allow access to work order security) | <p>Select this check box to enable a user, who is responsible for managing the access of resources to work orders, to click the Technician Work Order Access link on the Miscellaneous page of the Work Order component in order to display the Work Order Access page. If a work order is created with a business unit that has Shop or Shop and Resource Pool selected as the Technician WO Security option on the Definition page of the business unit, then this user can add or remove shops on the Work Order Access page of any work orders created with this business unit.</p> <p>The shop used to create the work order is automatically added to the list and cannot be removed. Resources assigned to any shops listed on the Work Order Access page of a work order have access to the work orders and work order tasks on the Work Order, Express Work Order, and Technician Workbench components.</p> <p>See "Setting Up a Work Order Business Unit" (PeopleSoft Maintenance Management).</p> <p>See Using the Work Order Miscellaneous Page</p> |
| <b>Apply WO Access Security</b> apply work order access security         | <p>Select this check box to restrict the access of this user to specific work orders, work order tasks, and express work orders associated with business units that have Technician WO Security set up for a resource pool, a shop, or a shop and a resource pool. If this check box is not selected, this user has full access to any work order and work order tasks on the Work Order, Express Work Order, and Technician Workbench components, depending on the user's PeopleSoft Security setup for these components.</p> <hr/> <p><b>Note:</b> To enable a specific technician to have access to the work order tasks on the Technician Workbench that are assigned to other technicians, you must also select the <b>Allow Access to Other's Tasks</b> check box.</p> <hr/> <p>See "Business Unit Setup Options" (PeopleSoft Maintenance Management).</p> <p>See "Work Order Creation Using the Work Order Component" (PeopleSoft Maintenance Management).</p> <p>See "Using the Work Order Miscellaneous Page" (PeopleSoft Maintenance Management).</p> |

## User Preferences - Mobile Inventory Management Page

Use the User Preferences – Mobile Inventory page (MIN\_USER\_TASK\_OPT) to define user preferences for Mobile Inventory Management.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >User Preferences >Define User Preferences >Mobile Inventory and select a task flow.**

This example illustrates the fields and controls on the User Preferences – Mobile Inventory: Guided Count page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'User Preferences - Mobile Inventory' page. At the top, there are tabs for 'User Preferences' and 'Mobile Inventory'. Below the tabs, the user information is shown: 'User ID' is 'DVP1', 'Supplier' is 'Development User', and 'Role Name' is 'ADMINISTRATOR'. The main section is titled 'Task Options' and contains various settings for the 'Guided Count' task flow. The 'Task Flow' is set to 'Guided Count'. Other settings include 'Rows Displayed' (10), 'Initial Display Mode' (Single Item), 'Sort By' (Sort By Order Entered), 'Group by' (No Grouping), 'All Item Filter' (Display All), and 'Alternate Item Display' (Item Only). There are several checkboxes for display options: 'Display Lookups' (checked), 'Display Description' (checked), 'Display Filter Related Fields' (checked), 'Display Prior Entry Caption' (checked), 'Display Show/Hide in tables' (unchecked), 'Pre-Load Serial IDs' (checked), 'Count UOM Enabled' (unchecked), and 'Filter All Alternate Items' (unchecked). A section titled 'Count Status to Include' has four checkboxes: 'New' (checked), 'Counting' (checked), 'Quantity Entered - Hold' (unchecked), and 'Ready to Update Stock Quantity' (unchecked). At the top right of the 'Task Options' section, there are links for 'Find | View All' and 'First 1 of 1 Last'.

Mobile Inventory Management pages enables you to tailor PeopleSoft Mobile Inventory Management pages for an individual user. User preferences pages are optional in Mobile Inventory Management. When a user ID does not have this page defined or when the **Use Installation Values** check box is selected, the system uses the values defined for installation values.

User preferences can be defined for these task flows in Mobile Inventory Management:

- Adjustments
- Bin to Bin Transfer
- Delivery, Delivery Cart
- Express Issue
- Count by Location, Count by Item, Guided Count, and Manual Count
- Item Stock Inquiry
- Par Count

- Perform Putaway
- Receiving Ad Hoc and Receiving PO

For additional information about each task flow and the fields that appear for each task flow:

See "Mobile Inventory Management Overview" (PeopleSoft Mobile Inventory Management).

User Preferences - Mobile Inventory Management Fluid Page

Use the User Preferences – Mobile Inventory Fluid page (OPR\_DEF\_TABLE\_MIN) to define user preferences for Mobile Inventory Management fluid page.

Navigation:

Set Up Financials/Supply Chain >Common Definitions >User Preferences >Define User Preferences >Mobile Inventory-Fluid and select a task flow.

This example illustrates the fields and controls on the User Preferences – Mobile Inventory: page. You can find definitions for the fields and controls later on this page.

# Securing Your System

---

## Understanding PeopleSoft Application Security

PeopleSoft applications use multilevel security to enable you to successfully manage shared data environments. You set up data access at different entry points within your system and define the most efficient path to data across business groups, tables, departments, pages, and so forth. You have full control over security definitions, selecting options to create a matrix that enables or restricts user access to data through a series of authorizations.

---

**Note:** User profiles define individual PeopleSoft users. Each user is unique. The user profile specifies a number of user attributes. You set up user profiles using the User Profiles component (USERMAINT).

---

See *PeopleTools: Security Administration*.

Security access covers three areas: networks, databases, and applications. Network security controls the overall point of entry into your system hardware and software resources. Database security narrows the scope of a user's information access. At the application level, security extends to the field level.

These are the PeopleSoft application security levels:

- Workstation user.
- Network server security.
- Database management (RDBMS) security.
- PeopleSoft application security.

Users can access defined sets of functions, pages, and fields. For example, auditors can review inquiry pages and generate reports, controllers can run PeopleSoft business processes, and management information systems staff can configure and maintain pages and records.

This section discusses:

- Security terms.
- Row-level security in PeopleSoft financials.
- Permission lists.

## Security Terms

This table describes the various types of PeopleSoft application security:

| <b>Security Type</b>                          | <b>Location</b>                         | <b>Function</b>                                                                                           |
|-----------------------------------------------|-----------------------------------------|-----------------------------------------------------------------------------------------------------------|
| Network                                       | Network software                        | Controls entry into the network and authorizes rights to use shared resources.                            |
| Relational Database Management System (RDBMS) | Operating system                        | Controls access to the database.                                                                          |
| User                                          | PeopleTools                             | Controls access to application pages, functions, and business components.                                 |
| Object                                        | PeopleTools                             | Controls access to objects or object groups used in application development.                              |
| Query                                         | PeopleTools                             | Defines table row sets accessible for performing system queries.                                          |
| Row-level                                     | PeopleTools and PeopleSoft applications | Controls access to the subset of data rows within tables that the user is authorized to review or update. |
| Field-level                                   | PeopleCode                              | Controls access to individual fields on pages.                                                            |

## Row-Level Security in PeopleSoft Financials

To establish security, you must first decide the level that you want, which key fields to secure, and whether security will be defined through user IDs or permission lists. With row-level support, you can implement security to restrict individual users or permission lists from specific rows of data that are controlled by the following key fields:

- Business unit
- SetID
- Ledger (and ledger group)
- Book
- Project
- Pay cycle
- Planning Instance

You can also limit access to specific subsets of rows. For example, you can specify user ID security to limit an auditor in Paris to the business unit for your European division. Or, if you have a team of auditors, you can assign them all to one primary permission list and then specify permission list security to enforce appropriate limits on the information that they can access.

The sheer volume of users assigned to a level of security can help you determine whether to use security based on user ID or permission list. If 1,000 users have identical access requirements, explore the use of permission list security. By assigning these users to a single role, you can make subsequent changes in their access requirements just once instead of 1,000 times.

---

**Note:** Applying row-level security *does not* restrict the data selected by batch processes.

---

## Permission Lists

These tables show the sample permission lists and the corresponding menus and components available to users.

---

**Note:** The permission lists that you associate with a user through role assignment are not used for row-level security in PeopleSoft financials. Only the primary permission list for a user is relevant when setting up row-level access by permission list.

---

This table lists the permissions granted to the various general ledger users:

| <b>Permission List ID</b> | <b>Description</b>        | <b>Menus</b>     | <b>Components</b> |
|---------------------------|---------------------------|------------------|-------------------|
| EPGL1000                  | GL Transactions/Processes | Process Journals | Journal Entry     |

This table lists the permissions granted to the Accounting Manager role:

| <b>Permission List ID</b> | <b>Description</b>          | <b>Menus</b>             | <b>Components</b>                                                                                                                                                                                                                                                                       |

## Specifying System Security Options

Use the Security Options component (SECURITY\_OPTIONS) to specify system security options.

### Pages Used to Specify System Security Options

| <i>Page Name</i>              | <i>Definition Name</i> | <i>Usage</i>                                                                                                                                                                                                          |
|-------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>Security Options Page</u>  | SECURITY_OPTIONS       | Select the type of security that you plan to implement—by user or permission list—and the key fields to secure. Unlike most of the pages used to set up the system, this page is not keyed by SetID or business unit. |
| <u>Applying Security Page</u> | RUN_FIN9001            | Run the process to apply your options. No parameters are required.                                                                                                                                                    |

### Security Options Page

Use the Security Options page (SECURITY\_OPTIONS) to select the type of security that you plan to implement—by user or permission list—and the key fields to secure.

Unlike most of the pages used to set up the system, this page is not keyed by SetID or business unit.

Navigation:

**Set Up Financials/Supply Chain > Security > Activate Row-level Security**

This example illustrates the fields and controls on the Security Options page. You can find definitions for the fields and controls later on this page.

### Security Options

**Type of Security**

☐ No Security
 ☒ User ID Level Security
 ☐ Permission List Level Security

**Secured Fields**

☒ Business Unit
 ☐ Setid
 ☐ Ledger
 ☐ Book
 ☐ Pay Cycle
 ☐ Planning Instance
 ☐ Project
 Proj Security Type

## Type of Security

| <i>Field or Control</i>               | <i>Description</i>                                                                                                                                                                                                                                             |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>No Security</b>                    | Select to disable PeopleSoft application security. All users authorized to access a page can select any SetID, business unit, or ledger.                                                                                                                       |
| <b>User ID Level Security</b>         | Select to enable security by user ID. Users are limited to accessing application pages or prompt values associated with the SetIDs, business units, projects, and ledgers specified by their user IDs.                                                         |
| <b>Permission List Level Security</b> | Select to enable security by permission list. Users are limited to key fields specified by the primary permission list to which you assign their user IDs. This means that all users assigned to a particular permission list have the same level of security. |

**Note:** The selection must be either user ID or permission list and the selection is across all products.

## Secured Fields

| <i>Field or Control</i>  | <i>Description</i>                                                                                                                                             |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Business Unit</b>     | Select to implement security on the <b>Business Unit</b> field. This is the primary key for all transaction data.                                              |
| <b>Setid</b>             | Select to implement security on the <b>Setid</b> field. This is the primary key for all accounting structure and rules tables.                                 |
| <b>Ledger</b>            | Select to implement security on the <b>Ledger</b> field. This is the key for all ledger balances.                                                              |
| <b>Book</b>              | Select to implement security on the <b>Book</b> field. This code is specific to a business unit. This field refers to <i>Book</i> as used in Asset Management. |
| <b>Pay Cycle</b>         | Select to implement security on the <b>Pay Cycle</b> field. Pay cycles can be daily, weekly, monthly, or at other intervals.                                   |
| <b>Planning Instance</b> | Select to implement security on the <b>Planning Instance</b> field.                                                                                            |

| <b>Field or Control</b>                         | <b>Description</b>                                                                                                                                                                                                          |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Project</b>                                  | Select to implement security on the <b>Project</b> field. This is the primary key for all PeopleSoft Projects Costing data.                                                                                                 |
| <b>Proj Security Type</b> Project Security Type | Determines how a project will be selected when defining security for a user and permission list. Select <i>Use list</i> to select from a list of projects. Select <i>Use tree</i> to select from a tree detailing projects. |

## Applying Security Page

Use the Apply Security page (RUN\_FIN9001) to run the process to apply your options.

No parameters are required.

Navigation:

**Set Up Financials/Supply Chain > Security > Apply Security Setups > Apply Security**

---

**Important!** Before Applying security, you must setup the security that pertains to your setting above, which are defined by the selected check boxes. If you selected UserID Level Security, you must define that security on one or more of these pages: Unit by User ID, TableSet by User ID, Ledger by User ID, Book by User ID, and Pay Cycle by User ID. If you selected Permission List Level Security, you must define that security on one or more of these pages: Unit by Permission List, TableSet by Permission List, Ledger by Permission List, and Book by Permission List.

Access to these pages can be acquired by selecting Setup Financials/Supply Chain, Security.

---

Specify the default language of your database and run the process. This changes all the key field prompt tables to your specified security views.

See the product documentation for: *PeopleTools: Security Administration* and *PeopleTools: PeopleCode Language Reference*.

---

## Defining Security Views

Use the Security View Names component (SECURITY\_VIEWS) to define security views.

## Page Used to Define Security Views

| <i><b>Page Name</b></i>    | <i><b>Definition Name</b></i> | <i><b>Usage</b></i>                                                                                                                                                                                                                                                 |
|----------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>Security Views Page</u> | SECURITY_VIEWS                | For each type of security, specify the security views for your system. The Apply Security Setups process changes the prompt edit tables based on the security view names that you specify here. Update this page only if you add new security views to your system. |

## Understanding Security Views

---

**Note:** Defining new security views is optional.

---

Views are SQL statements that filter out data rows whose key values are not accessible by certain users. This allows users to access data horizontally across more than one table, seeing only appropriate subsets of values (SetIDs, business units, or ledgers) from the edit tables.

Business units, SetIDs, and ledgers are maintained and accessed on pages as primary keys throughout your system. Prompt edit tables give users a list of values from which to choose, and selection is limited to values for which access has been granted. PeopleSoft row-level application security enables you to specify through the edit tables that only certain values are available in a particular view.

PeopleSoft applications are delivered with no security views on the prompt tables of the key fields in your system. You can enable certain security options or even build your own views. Once you set up views, you can specify which users or permission lists can access certain secured field values.

Security view names have one of the following three file extensions to reflect the type of security views for prompting:

| <i><b>Extension</b></i> | <i><b>Description</b></i>                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------|
| NONVW                   | Indicates that no security is chosen for the field using this view as the prompt table.              |
| OPRVW                   | Indicates that user ID security is chosen for the field using this view as the prompt table.         |
| CLSVW                   | Indicates that permission list security is chosen for the field using this view as the prompt table. |

## Security Views Page

Use the Security Views page (SECURITY\_VIEWS) to for each type of security, specify the security views for your system.

The Apply Security Setups process changes the prompt edit tables based on the security view names that you specify here. Update this page only if you add new security views to your system.

Navigation:

**Set Up Financials/Supply Chain > Security > Update Security View Names**

**Note:** There is no need to access this page unless you have customized security views.

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Search Text</b>             | Displays the view name prefixes supplied by your applications. During the Apply Security Setups process, the system searches for prompt edit tables that begin with these prefixes. If an edit table name begins with a prefix from this list, the edit table from the appropriate column is accessed, which matches the security type that you selected when you specified security options (no security, user ID security or permission list security). |
| <b>Type</b>                    | Select the type of field secured by each view. Values are: <i>Book, Ledger, Pay Cycle, Prob Inst, Project, SetID, and Unit</i> . The system stores the list in the SEC_VIEW_NAMES table, where you can review or update the information.                                                                                                                                                                                                                  |

## Defining Row-Level Security

This topic lists the pages used to define row-level security, including their navigation and usage.

### Pages Used to Define Row-Level Security

| <i><b>Page Name</b></i>                        | <i><b>Definition Name</b></i> | <i><b>Navigation</b></i>                                                                                                        | <i><b>Usage</b></i>                                         |
|------------------------------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| Business Unit Security by Permission List Page | SEC_BU_CLS                    | <b>Set Up Financials/Supply Chain &gt; Security &gt; Unit by Permission List &gt; Business Unit Security by Permission List</b> | Grant access to a business unit by using a permission list. |
| Business Unit Security By User ID Page         | SEC_BU_OPR                    | <b>Set Up Financials/Supply Chain &gt; Security &gt; Unit by User ID &gt; Business Unit Security By User ID</b>                 | Grant access to a business unit by using a user ID.         |
| TableSet Security by Permission List Page      | SEC_SETID_CLS                 | <b>Set Up Financials/Supply Chain &gt; Security &gt; TableSet by Permission List &gt; TableSet Security by Permission List</b>  | Grant access to a tableset by using a permission list.      |

| <b>Page Name</b>                                                  | <b>Definition Name</b> | <b>Navigation</b>                                                                                                          | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TableSet Security by User ID Page                                 | SEC_SETID_OPR          | <b>Set Up Financials/Supply Chain &gt; Security &gt; TableSet by User ID &gt; TableSet Security by User ID</b>             | Grant access to a tableset by using a user ID.                                                                                                                                                                                                                                                                                                                                                       |
| Ledger Security by Permission List Page                           | SEC_LEDGER_CLS         | <b>Set Up Financials/Supply Chain &gt; Security &gt; Ledger by Permission List &gt; Ledger Security by Permission List</b> | Grant access to a ledger or ledger group by using a permission list.                                                                                                                                                                                                                                                                                                                                 |
| Ledger by User ID Page                                            | SEC_LEDGER_OPR         | <b>Set Up Financials/Supply Chain &gt; Security &gt; Ledger by User ID &gt; Ledger Security by User ID</b>                 | Grant access to a ledger or ledger group by using a user ID.                                                                                                                                                                                                                                                                                                                                         |
| nVision Ledger Security Page                                      | LEDGER_SECURITY        | <b>Set Up Financials/Supply Chain &gt; Security &gt; nVision Ledger Security</b>                                           | Specify the business units and ledgers accessible in the creation of PS/nVision reports by securing an nVision ledger field by user rather than role. Because the scope of a PS/nVision report may cross business unit and ledger boundaries, you may need to specify particular security access for users who generate reports with field data that they cannot access when performing other tasks. |
| Project Security Page<br>User, Tree Based Security                | SEC_PROJECT_OPR        | <b>Set Up Financials/Supply Chain &gt; Security &gt; Project Security &gt; Project Security</b>                            | Grant access by user ID to project role. There are two versions of the page, depending on whether <i>Use List</i> or <i>Use Tree</i> is selected as the project security type on the Security Options page.                                                                                                                                                                                          |
| Project Security Page                                             | SEC_PROJLST_CLS        | <b>Set Up Financials/Supply Chain &gt; Security &gt; Project Security &gt; Project Security</b>                            | This is a second version of the page. Grant access by permission list to project role.                                                                                                                                                                                                                                                                                                               |
| BU Book/Perm List Page<br>(business unit book by permission list) | SEC_BUBOOK_CLS         | <b>Set Up Financials/Supply Chain &gt; Security &gt; AM Book by Permission List &gt; BU Book/Perm List</b>                 | Grant access to a business unit book by using a permission list.                                                                                                                                                                                                                                                                                                                                     |

| <b>Page Name</b>                                           | <b>Definition Name</b> | <b>Navigation</b>                                                                                                       | <b>Usage</b>                                             |
|------------------------------------------------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| BU Book by User ID Page<br>(business unit book by user ID) | SEC_BUBOOK_OPR         | <b>Set Up Financials/Supply Chain &gt; Security &gt; AM Book by User ID &gt; BU Book by User ID</b>                     | Grant access to a business unit book by using a user ID. |
| Pay Cycle by Permission List Page                          | SEC_PYCYCL_CLS         | <b>Set Up Financials/Supply Chain &gt; Security &gt; Pay Cycle by Permission List &gt; Pay Cycle by Permission List</b> | Grant access to a pay cycle by using a permission list.  |
| Pay Cycle by User ID Page                                  | SEC_PYCYCL_OPR         | <b>Set Up Financials/Supply Chain &gt; Security &gt; Pay Cycle by User ID &gt; Pay Cycle by User ID</b>                 | Grant access to a pay cycle by using a user ID.          |
| Grants Operator Security Page                              | GM_SEC_DEPT_OPR        | <b>Set Up Financials/Supply Chain &gt; Security &gt; Grants Security &gt; Grants Operator Security</b>                  | Grant access by departments by user ID.                  |

| Planning Instance Page                                     | SEC_PRBINS_OPR         | <b>Set Up Financials/Supply Chain &gt; Security &gt; Problem Instance by User ID &gt; Planning Instance</b>             | Grant access to planning instance by user ID.            |
| Planning Instance Page                                     | SEC_PRBINS_CLS         | <b>Set Up Financials/Supply Chain &gt; Security &gt; Problem Instance by Perm List &gt; Planning Instance</b>           | Grant access to planning instance by permission list.    |

## Understanding Defining Row-Level Security

Use the following components to define row-level security:

- Unit Security by Perm List (unit security by permission list) (SEC\_BU\_CLS)
- Unit Security by User ID (SEC\_BU\_OPR)
- TableSet Security by Perm List (tableset security by permission list) (SEC\_SETID\_CLS)
- TableSet Security by User ID (SEC\_SETID\_OPR)
- Ledger Security by Perm List (ledger security by permission list) (SEC\_LEDGER\_CLS)

- Ledger Security by User ID (SEC\_LEDGER\_OPR)
- nVision Ledger Security (LEDGER\_SECURITY)
- Pay Cycle by user ID (SEC\_PYCYCL\_OPR)
- Pay Cycle by permission list (SEC\_PYCYCL\_CLS)
- Project Security (SEC\_PROJECT)

Use the following component interfaces to load data into the respective component tables:

- Use the SEC\_BU\_CLS component interface to load data into the tables for the Unit Security by Perm List component.
- Use the SEC\_BU\_OPR component interface to load data into the tables for the Unit Security by User ID component.
- Use the SEC\_LEDGER\_CLS component interface to load data into the tables for the Ledger Security by Perm List component.
- Use the SEC\_LEDGER\_OPR component interface to load data into the tables for the Ledger Security by User ID component.
- Use the SECURITY\_NVISION\_LEDGER component interface to load data into the tables for the nVision Ledger Security component.

Once you select security options and, if necessary, update security view names, define the secured field values for each user or permission list. You grant access to business units, tablesets, ledgers, business unit books, and pay cycles by using permission lists or user IDs. When securing key fields in your application, the page that you use depends on which level of system security you select. If you select permission list security, secure fields on the permission list security pages. If you select user-level security, secure fields on the user ID security pages.

---

**Note:** When granting row-level access for business unit, SetID, ledger, book, planning instance, and pay cycle to permission lists, the system uses the user's primary permission list.

---

---

**Warning!** Values entered in secured fields are not checked against row-level security permissions when run controls are reused. After a user initially creates a run control, the user can still run processes on a secured field value even if row-level security access to that field is subsequently taken away. If you make security profile changes, verify the run controls that use secured data and remove run controls for secured field values to which a user should no longer have access.

---

---

## Granting Access to Users

This topic discusses how to:

- Grant business unit access.
- Grant tableset access.
- Grant ledger access.

- Grant nVision reporting access.
- Grant project access.
- Grant business unit book access.
- Grant pay cycle access.
- Grant grants access.
- Grant proposal management access.
- Grant planning instance access.

## Granting Business Unit Access

Access the Business Unit Security by Permission List page (Set Up Financials/Supply Chain, Security, Unit by Permission List, Business Unit Security by Permission List).

For each primary permission list, select the accessible business units.

Access the Business Unit by User ID page (Set Up Financials/Supply Chain, Security, Unit by User ID, Business Unit Security By User ID).

For each user ID, select the accessible business units.

## Granting TableSet Access

Access the TableSet Security by Permission List page (Set Up Financials/Supply Chain, Security, TableSet by Permission List, TableSet Security by Permission List).

For each primary permission list, select each accessible SetID.

Access the TableSet Security by User ID page (Set Up Financials/Supply Chain, Security, TableSet by User ID, TableSet Security by User ID).

For each user ID, select each accessible SetID.

## Granting Ledger Access

Access the Ledger Security by Permission List page (Set Up Financials/Supply Chain, Security, Ledger by Permission List, Ledger Security by Permission List).

For each primary permission list, select each accessible ledger type. Commitment and Summary ledger types require a ledger name. Detail ledger types require a ledger group name.

Access the Ledger by User ID page (Set Up Financials/Supply Chain, Security, Ledger by User ID, Ledger Security by User ID).

For each user ID, select each accessible ledger type. Commitment and Summary ledger types require a ledger name. Detail ledger types require a ledger group name.

## Granting nVision Reporting Access

Access the nVision Ledger Security page (Set Up Financials/Supply Chain, Security, nVision Ledger Security).

For each user ID, select each accessible business unit and corresponding ledger. You can specify multiple ledgers for each business unit.

## Granting Project Access

While the purpose of all these pages is to provide row-level security, the appearance of the pages varies based on the method of project row-level security that you implement.

This table lists the purpose of each project security method and the actions that you take on the Security Options page (Set Up Financials/Supply Chain, Security, Security Options, Security Options) and Project Security page (Set Up Financials/Supply Chain, Security, Project Security, Project Security) to implement each method:

| <b>Security Method</b>    | <b>Purpose</b>                                                                 | <b>Security Options Page Actions</b>                                                                                                                                                                                                                                                                             | <b>Project Security Page Actions</b>                                                                                                                                                                                                                |
|---------------------------|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Team-based security       | Grants access to projects based on an employee's membership in a project team. | <ol style="list-style-type: none"> <li>1. Select <b>User ID Level Security</b> in the <b>Type of Security</b> group box.</li> <li>2. Select <b>Project</b> in the <b>Secured Fields</b> group box.</li> <li>3. Select <i>Use list</i> in the <b>Proj Security Type</b> (project security type) field.</li> </ol> | View a read-only list of all projects for which the user is a team member, and the member's security profile for each project.                                                                                                                      |
| User, tree-based security | Grants access to projects based on selected nodes on a project tree.           | <ol style="list-style-type: none"> <li>1. Select <b>User ID Level Security</b> in the <b>Type of Security</b> group box.</li> <li>2. Select <b>Project</b> in the <b>Secured Fields</b> group box.</li> <li>3. Select <i>Use tree</i> in the <b>Proj Security Type</b> field.</li> </ol>                         | Define security for a user. Specify the project tree that the system uses for controlling project security, select nodes (projects) on the tree to grant each user access to specific projects, and select the user's project role on each project. |

| <b>Security Method</b>               | <b>Purpose</b>                                                                                                                         | <b>Security Options Page Actions</b>                                                                                                                                                                                                                                                               | <b>Project Security Page Actions</b>                                                                                                                             |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Permission list, list-based security | Grants access to permission lists that enable users to access projects that are attached to that permission list.                      | <ol style="list-style-type: none"> <li>1. Select <b>Permission List Level Security</b> from the <b>Type of Security</b> group box.</li> <li>2. Select <b>Project</b> in the <b>Secured Fields</b> group box.</li> <li>3. Select <i>Use list</i> in the <b>Proj Security Type</b> field.</li> </ol> | Define security for a permission list. Within a specific permission list to which users have access, specify the business units, project IDs, and project roles. |
| Permission list, tree-based security | Grants access to permission lists that enable users to access projects that belong to a tree that is attached to that permission list. | <ol style="list-style-type: none"> <li>1. Select <b>Permission List Level Security</b> from the <b>Type of Security</b> group box.</li> <li>2. In the <b>Secured Fields</b> group box, check <b>Project</b>.</li> <li>3. Select <i>Use tree</i> in the <b>Proj Security Type</b> field.</li> </ol> | Define security for a permission list. Specify the project tree, project (tree node), and project role.                                                          |

A user's project security profile further defines the degree and type of access that the user has to project data.

See "Defining Project Security" (PeopleSoft Project Costing).

## Granting Business Unit Book Access

Access the BU Book/Perm List page (Set Up Financials/Supply Chain, Security, AM Book by Permission List, BU Book/Perm List).

For each primary permission list, select each accessible business unit and corresponding book name. You can specify access to multiple books for each business unit.

Access the BU Book by User ID page (Set Up Financials/Supply Chain, Security, AM Book by User ID, BU Book by User ID).

For each user ID, select each accessible business unit and corresponding book name. You can specify access to multiple books for each business unit.

## Granting Pay Cycle Access

Access the PayCycle by Permission List page (Set Up Financials/Supply Chain, Security, Pay Cycle by Permission List, Pay Cycle by Permission List).

For each primary permission list, select the accessible pay cycles.

Access the PayCycle by User ID page (Set Up Financials/Supply Chain, Security, Pay Cycle by User ID, Pay Cycle by User ID).

For each user ID, select the accessible pay cycles.

## Granting Grants Access

Access the Grants Operator Security page (Set Up Financials/Supply Chain, Security, Grants Security, Grants Operator Security).

For each user ID, enter the grants security tree SetID, tree name, and the effective date of the tree. On the lower section of the page, enter the departments and an appropriate access code. You can enter as many departments as needed.

This is one step in a multistep security process that is described in detail in the *PeopleSoft Grants* product documentation

### Related Links

"PeopleSoft Grants Security" (PeopleSoft Grants)

## Granting Proposal Management Access

Access the Proposal Management Security page (Set Up Financials/Supply Chain, Security, Proposal Management Security, Proposal Management Security).

For each user ID, enter the proposal security tree SetID, tree name, and the effective date of the tree. On the lower section of the page, enter the departments and an appropriate access code. You can enter as many departments as needed.

This is one step in a multistep security process that is described in detail in the *PeopleSoft Proposal Management* product documentation.

### Related Links

"Understanding PeopleSoft Proposal Management Security" (PeopleSoft Proposal Management)

## Granting Planning Instance Access

Access the Planning Instance page (Set Up Financials/Supply Chain, Security, Problem Instance by User ID, Planning Instance).

If you access problem instance by user ID, you can grant access to *planning* instances by user ID.

If you access problem instance by permission list, you can grant access to *planning* instances by permission list.

Security for planning instances is further described in Supply Planning documentation.

## Securing Advanced Queries

Advanced Query Security is a framework that allows authorized users to set up secured fields for PeopleSoft queries. Authorized users can associate different types of security records and specify which fields (including non-key fields) are to be used to secure data.

**Note:** Oracle's PeopleSoft recommends that PeopleTools Application Designer - Query Security Record is not used when securing General Ledger ChartFields.

### Pages Used to Secure Advanced Queries

| <i><b>Page Name</b></i>                     | <i><b>Definition Name</b></i> | <i><b>Usage</b></i>                                                                       |
|---------------------------------------------|-------------------------------|-------------------------------------------------------------------------------------------|
| <u>Query Security Field Name Page</u>       | QUERY_SEC_CATEGORY            | Determine secured fields for the query.                                                   |
| <u>Query Security - Security Types Page</u> | QUERY_SEC_METHOD              | Determine the type of security for one or more fields and run the Apply Security process. |
| <u>Query Security - Query Record Page</u>   | QUERY_SEC_FIELDS              | Map secured query records for one or more fields and run the Apply Security process.      |
| <u>Set Filter Page</u>                      | QUERY_SEC_FILTER              | Determine filters for the secured query record.                                           |

### Query Security Field Name Page

Use the Query Security Field Name page (QUERY\_SEC\_CATEGORY) to determine secured fields for the query.

**Note:** ChartFields and other fields are delivered as system data.

Navigation:

**Set Up Financials/Supply Chain > Security > Advanced Query Security > Advanced Query Security Field**

This example illustrates the fields and controls on the Query Security Field Name page.

**Query Security Field Name**

**Advanced Query Security Management**

Secure Field:  Secure Field Description:

| *Field Name        |  |
|--------------------|--|
| ACCOUNT            |  |
| ACCOUNT_2          |  |
| ACCOUNT_3          |  |
| ACCOUNT_AD         |  |
| ACCOUNT_BAL_SUSP   |  |
| ACCOUNT_BDOFF      |  |
| ACCOUNT_D          |  |
| ACCOUNT_E          |  |
| ACCOUNT_EDIT_ERROR |  |
| ACCOUNT_FA         |  |
| ACCOUNT_FROM       |  |

All ChartFields and some other fields such as business unit, SetID, ledger, and so on are delivered as system data. You cannot delete these delivered fields. However, you can add more fields per your requirements.

**Note:** If a specific field is not defined within a Secure Field, then you cannot apply query security to that field.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                    |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Secure Field</b>     | Displays ChartFields and some other fields such as business unit, SetID, ledger and so on. This field is also known as the Category.                  |
| <b>Field Name</b>       | Displays or add specific field names that are secured when the Secure Field is selected on the <a href="#">Query Security - Security Types Page</a> . |

## Query Security - Security Types Page

Use the Query Security - Security Types page (QUERY\_SEC\_METHOD) to determine the type of security for one or more fields and run the Apply Security process.

Navigation:

**Set Up Financials/Supply Chain > Security > Advanced Query Security > Apply Advanced Query Security**

This example illustrates the fields and controls on the Query Security - Security Types page.

| Apply Security                                        | Click this button to begin a batch process that applies the query security.                                                                                                                                                                                                                                                                                                                                                         |
| Sync Chartfield Sec (synchronize ChartField security) | Click this button to synchronize ChartFields from the <a href="#">Security Options - ChartField Security Page</a> .                                                                                                                                                                                                                                                                                                                 |

| Field or Control | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Secure Fieldname | <p>Select the secure fieldname (also known as Category) for the fields that you want to secure. If the secured fieldname you are looking for does not appear, verify that it is created on the <a href="#">Query Security Field Name Page</a>. When you select the Secure Field, all field names included in secure field are secured.</p> <hr/> <p><b>Note:</b> Selecting a Secure Fieldname on this page allows you to select the fields within that category on the <a href="#">Query Security - Query Record Page</a>.</p> <hr/> |

Query Security - Query Record Page

Use the Query Security - Security Types page (QUERY\_SEC\_FIELDS) to map query secured records for one or more fields and run the Apply Security process.

Navigation:

Set Up Financials/Supply Chain > Security > Advanced Query Security >Apply Advanced Query Security >Query Record

This example illustrates the fields and controls on the Query Security - Query Record page.

| Field or Control | Description                                                                                                        |
|------------------|--------------------------------------------------------------------------------------------------------------------|
| Apply Security   | Click this button to begin the batch Query Security process (SEC_QUERY).                                           |
| Status           | Displays Not Applied or Applied. When Applied is displayed, the you cannot run the Query Security process.         |
| Filter           | Click this link to access the Set Filter page.                                                                     |
| Active           | Select to indicate that this query record is processed by the apply Query Security application engine (SEC_QUERY). |

| <b>Field or Control</b>       | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Exceed Limit</b>           | <p>Displays as selected when you have selected more than five secure fields. Therefore, you cannot select more than five fields.</p> <p>To resolve the limit, deselect records so that five or less are selected.</p> <hr/> <p><b>Note:</b> If there is no Exceed Limit error, then the label does not appear on the page.</p> <hr/>                                                                                                                                                                                            |
| <b>Conflict</b>               | <p>Displays as selected when there are security records defined (such as through application designer) and the record doesn't exist in the framework. When this check box is selected, the system does not proceed further.</p> <hr/> <p><b>Note:</b> If there is no Conflict error, then the label does not appear on the page.</p> <hr/>                                                                                                                                                                                      |
| <b>Conflict Overrides</b>     | <p>Select to clear a conflict while running the Advanced Query Security process. Selecting this check box deletes all current entries defined for Advanced Query Security under record properties and applies new entries as defined in the framework.</p> <p>This label only appears when there is a Conflict error to clear.</p> <hr/> <p><b>Important!</b> Oracle's PeopleSoft recommends that you always use the framework to define any security to any query record, and not add it using application designer.</p> <hr/> |
| <b>Select</b>                 | Select a row to turn security on or off for a secured field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Secure Field Name</b>      | Enter or select the name of the field that is to be secured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>User ID Record</b>         | Enter or select the name of the User ID record to be secured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Role Record</b>            | Enter or select the name of the Role record to be secured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Permission List Record</b> | Enter or select the name of the Permission List record to be secured.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Field Name</b>             | Enter or select the name of the field that is mapped to the secured field.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Security Applied</b> | <p>Displays as selected when security has been applied to the Secure Field Name. A check in this check box indicates that the Query Security process ran successfully for this field.</p> <p>After security is applied, you cannot delete that particular row unless you deselect the security from that field and run the process again.</p> <hr/> <p><b>Note:</b> This field is display only.</p> <hr/> |
| <b>More</b>             | Click this link to add more joins. This is useful when securing ChartFields.                                                                                                                                                                                                                                                                                                                              |
| <b>Financial Impact</b> | Click the button to view the Impacted Records window. This window displays all Business Intelligence Publisher (BIP) reports, Pivot Grids, and PeopleSoft Queries that will be impacted if you change the security of the query record.                                                                                                                                                                   |
| <b>Populate Lines</b>   | Click this button to populate all security records for ChartFields and any other fields for which a prompt is defined and corresponding security records exist.                                                                                                                                                                                                                                           |

## When Implementing Advanced Query Security for Non-ChartFields

Follow these steps when implementing Advanced Query Security for non-ChartFields:

1. Enter the Query Record value.
2. Select the Field Name you want to secure in the Secure Field column and enter its corresponding security record.

Oracle's PeopleSoft recommends that you enter all three security records if available: User ID record, Role record, and Permission List record. If a security record is not available (your are not going to use that type of security), then leave it blank.

3. If your scenario requires a composite join, then click the More button.
4. Verify that you have selected the Active check box at the Query Record level, and check its corresponding secure fields that you want to secure.

## When Implementing Advanced Query Security for ChartFields

Follow these steps when implementing Advanced Query Security for ChartFields:

1. Create a view based on the record, that you want to secure( or PSQUERY record).
2. Add PRODSRCID as an additional field to this view.
3. Hard-code your Product Source code in the view text.

- 4. Create a Composite key with PRODSRCID field, for example, join PRODSRCID of base view with that of ChartField security view by clicking on the More link.

Set Filter Page

Use the Set Filter page (QUERY\_SEC\_FILTER) to determine filters for the query record.

Navigation:

**Set Up Financials/Supply Chain > Security > Advanced Query Security >Apply Advanced Query Security >Query Records.** Click the Filter link.

This example illustrates the fields and controls on the Set Filter page.

Query Record

| Field or Control | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Apply            | Click this button to apply the filters to the query record.                                                                                                                                                                                                                                                                                                                                                                                           |
| Errors           | Select an option that shows all rows or one of the following: <ul style="list-style-type: none"><li>Show All Rows: Select to show all rows including errors.</li><li>All Errors: Select to show rows that have errors.</li><li>Exceed Limits: Select to show rows that have exceeded limits, such as a limit of five secure records.</li><li>Conflicts: Select to show query records that have conflicts, such as mapping record conflicts.</li></ul> |
| Product Filter   | Select the PeopleSoft products that to filter the query record.                                                                                                                                                                                                                                                                                                                                                                                       |

# PeopleSoft Search for Financials and Supply Chain Management

---

## Understanding Financials and Supply Chain Search

This topic discusses:

- [PeopleSoft Search Technology](#)
- [Global Search and Search Pages within Components](#)
- [Search Categories in PeopleSoft Financials and Supply Chain Management](#)
- [Search Recommendations](#)
- [Terminology](#)

## PeopleSoft Search Technology

PeopleSoft combined with People Tools provides search capabilities using the PeopleSoft Search Framework search instances. The PeopleSoft Search Framework provides a standard method to use search indexes for all PeopleSoft applications.

PeopleSoft Query and Connected Query are used by search definitions that define the content used by search indexes. Search indexes should be updated incrementally, which keeps the data current within the index.

Within the Financials/Supply Chain product areas, PeopleSoft Search Framework indexes have been implemented in these areas:

1. Key components within the Procure-to-Pay business process.

This enables users to perform keyword searches against these components based on specific field values or keywords provided they have been granted security access.

2. Global search using a keyword search box.

The keyword search box is located in the Oracle portal header. This enables users, who have the appropriate security, to search across business processes using keyword searches.

The purpose of the PeopleSoft Search feature is to provide the ability to:

- Search on key words that enable users to find transactions and work with data without having to navigate using menus.
- Refine results using facets.

- Take direct action from search results.
- Search to deeper levels within nested data.
- Search for specific values and unstructured text across multiple data locations.

Click this link to view a short video about [PeopleSoft Global Search for FSCM](#).

## Global Search and Search Pages within Components

The PeopleSoft Search Framework provides two search features:

- Global Search, which is sometimes referred to as global search.
- Keyword search pages are available for selected components.

### Global Search

Global Search consists of a group of Search Categories that display in the Oracle Portal header. The location of the search makes it available to users at all times. A drop-down list is used to select a search category and a free-form text search field enables users to enter data to be searched.

This example illustrates the Search Results for a Global Search.

For additional information about Global Search, see [Understanding Global Searches](#).

### Search Pages within Components

Search Pages within components are accessed using a Keyword Search tab, which is located between the Find an Existing Value tab and the Add a New Value tab for selected components. The Keyword Search tab enables you to enter free-form text when searching the component.

This example illustrates an example of navigating to the Add/Update POs component, and clicking on the Keyword Search tab

For more information about component searches, see [Understanding Search Pages within Components](#).

Global Search can be secured by user roles. Search Pages within a component are specific to an application component and are secured by component security. Both features are built on the PeopleSoft Search Framework.

## Search Categories in PeopleSoft Financials and Supply Chain Management

Search categories are defined by PeopleSoft and secured by role within PeopleTools security. When Global Search is enabled, you can select a search category and enter free-form text in the keyword edit field. Using search categories reduces the number of places you need to go to perform searches and can improve search performance.

This table lists the functional areas that have been enhanced with PeopleSoft Search Framework technology:

| <b><i>Supplier Relations Management</i></b> | <b><i>Financial Management Services</i></b> | <b><i>Asset Lifecycle Management</i></b> | <b><i>Enterprise Service Automation</i></b> |
|---------------------------------------------|---------------------------------------------|------------------------------------------|---------------------------------------------|
| Purchase Order                              | Voucher                                     | Asset                                    | Expense Sheet                               |
| eProcurement Requisition                    | GL Journal                                  | Work Order                               |                                             |
| Purchasing Requisition                      | Payment                                     |                                          |                                             |
| Purchasing Receipt                          | Supplier                                    |                                          |                                             |
| Procurement Contracts                       | Supplier Conversation                       |                                          |                                             |

## Search Recommendations

Search results displayed from PeopleSoft Search Framework for Global Search are based on the user's security access (permission list) to the underlying component shown in the search results. Therefore, if a user does not have access to a particular component, then the user will not see search results. In addition, row level security is applied to keyword search results for Search Pages based on the row level access for the user. This is especially true for SetID and business unit security. If business unit security is enabled, the only valid search results for the enabled business unit is displayed to the user. If Business Unit/SetID types of security are being used, then they must be set up before building search indexes so that all results contain the required security attributes needed.

There are several way to generally set up security, including setting up security by and individual user ID. It is not recommended that setting up security by user ID be used with PeopleSoft Search due to the maintenance involved with search indexes. Indexes that are secured by user will have to be rebuilt every time a user is added or removed. This can cause significant time delays when indexes are large. Therefore, it is recommended that security by permission list be used when Business Unit/SetID security is enabled.

Depending on your FSCM application, there may also be other row level security applied which would prevent the user having access to specific search results. This security has been provided by the application depending on the need for granular restrictions. An example of such security would be access to a supplier contract or expense report by user. These indexes may be more complex to manage since specific users may need to be maintained within each and every individual search result. In some cases, such as Supplier Contracts Management, search results may be updated via incremental index updates when a user changes on a specific searchable object and the update happens automatically. In other cases, changes to granular search security will require a rebuild of your index(es) for the new security to take effect. Review your application-specific documentation for information on row level security which may be enabled for that application. Depending on the type of security implemented, these indexes may require more frequent index rebuilds if these parameters change often within your organization.

---

**Note:** It is recommended that security by permission list is used when Business Unit/SetID are enabled to avoid frequent index rebuilds every time there are changes within your organization.

---

## Terminology

This table lists terminology related to the PeopleSoft Search feature:

| <b>Term</b>                 | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global Search               | <p>A search from the Oracle Portal header that is secured by user roles.</p> <p>The <i>PeopleTools: Search Technology</i> documentation describes Global Search by saying: <i>When enabled, the Global Search bar displays in the header of the application. Beside the keyword edit box, the Global Search bar provides a drop down list for selecting a specific search category against which to run a search.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Search Pages                | <p>The term Search Pages, is a PeopleTools term. The <i>PeopleTools: PeopleSoft Search Technology</i> documentation describes Search Pages by saying:</p> <p><i>If the Search Pages feature has been enabled for a component, a Keyword Search tab appears amongst the search pages the end user encounters when navigating into a component. The Keyword Search page enables users to execute a deeper, more free-form search to access application data. For example, the Find an Existing Value tab is limited to level 0 data, where the Keyword Search tab lets the users enter custom keywords and the system will search indexed data from level 0-3.</i></p> <p>This type of search is secured by user roles. Additional security may also have been specified on the Search Definition, which will limit access to specific business units or SetIDs. Further security can be added by creating additional security attributes and writing PeopleCode to define the security levels.</p> |
| Facet                       | <p>A field relevant to the search that allows the user to browse or refine search results. For example, the user can further refine purchase order search results by business unit, purchase order date, or supplier by clicking on the desired facet value.</p> <p>Facets are presented with counts, which show the number of documents, such as requisitions, purchase orders, journals, and so on, in which the search criteria found and are represented in the search results.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| PeopleSoft Search Framework | <p>The PeopleSoft Search Framework search engine within PeopleTools provides a standard method to use search indexes for all PeopleSoft applications. The Search Framework is based on one or more search engines. For more information about defining search engines, see <i>PeopleTools: Search Technology</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Term</b>                                                | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Search Category                                            | <p>Search categories are part of the PeopleSoft Search Framework that contain one or more search definitions.</p> <p>Search categories help manage search definitions deployed in the Search Framework search engine and provide a way to combine them into functionally related groups. Selecting a search category in the Oracle portal header enables users to narrow the scope of a Global Search, thereby reducing the number of search results that need to be reviewed.</p> <hr/> <p><b>Note:</b> For a facet to be properly used, the Facet (Attribute) Name must exist in every Search Definition, within the Search Category. Facets that are not common to all Search Definitions, but used on a search category, will limit the result set to those indexes containing the facet. See the production documentation for <i>PeopleTools: PeopleSoft Search Technology</i>.</p> <hr/>                                                                                                           |
| Search Definition                                          | <p>Search definitions are part of the PeopleSoft Search Framework that define the main structure of a search index. A search definition contains everything needed to create a search index, which includes facets, security, attachments, pre and post processing, and component mapping.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Search Group                                               | <p>A flag on a search category that makes the category available in the Global Search box within the Oracle portal header.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Callback Security also known as Search Definition Security | <p>Callback Security is the term given to the <i>process</i> that the PeopleSoft Search Framework search engine performs when you search for information. The Search Framework determines what data is presented by calling back to the database for all attributes designated by the search categories being searched. The Search Framework search engine caches this information for subsequent searches.</p> <p>Search Definition Security is PeopleCode on the Search Definition that determines access to the results. Security is tied to an attribute, or set of attributes, defined on the Search Definition, which specifically allows or doesn't allow access.</p> <p>The defined attributes must exist on the query and are sent to the Search Framework search engine for later matching with the results generated by the defined PeopleCode. Search Definition Security can be based on user ID (not recommended), role, installation settings, or some other user-defined parameters.</p> |

## Understanding Global Searches

This topic provides overviews about:

- Global Search categories.

- Global Search category facets.
- Global Search - advanced search.
- Special advanced search fields.
- Example: Advanced Search

## Global Search Categories

Global Search has been enabled for the multiple product areas within the Procure-to-Pay and Credit-to-Cash business processes.

Specific search categories are designated for use in the portal header search field by being defined as a search group, also known as global search categories. These categories combine related search definitions so that results from all indexes are returned when a user enters keywords into a free-form search field. Global Search categories group indexes to target a specific business or product transaction on which to search.

The use of Global Search categories is controlled by role-level security.

This table lists the Global Search categories, defined by PeopleSoft, that contain specific search indexes:

**Note:** The global search categories in this table must be manually deployed from the Deploy Search Category tab in Search Framework before they are viewable from the Global Search bar. The user who deploys the search categories must log out of the PeopleSoft system and log back in before the categories are visible on the global search bar.

| <b><i>Global Search Category Description and Name</i></b> | <b><i>Transaction / Search Definition</i></b>                                            |
|-----------------------------------------------------------|------------------------------------------------------------------------------------------|
| Accounts Payable<br>EP_PAYABLES                           | Payments<br>Vouchers                                                                     |
| Asset Management<br>EP_ASSETS                             | Assets                                                                                   |

The Procure-to-Pay and Credit-to-Cash Global Search categories are used to search for *transactions* within the Procure-to-Pay and Credit-to-Cash business processes respectively. It does not include searches for setup components such as Suppliers and Catalog Items. If you want to search for setup components, then you should use the *All* search category, or another search category that applies to the specific data, such as Supplier Information or Catalog Items.

Product based Global Search categories contain definitions within the specific product and limit search results to the specific product area.

This table lists permission lists and roles that have been created to help you secure search categories in the PeopleSoft database. These permission lists are setup with a the corresponding Search Group (Category) specified within the Search Group tab of the permission list. Users that have the corresponding role will be able to see the associated category as a drop down option within the Global Keyword Search box:

| <b>Global Search Category Name</b> | <b>Role</b>             | <b>Permission List</b> |
|------------------------------------|-------------------------|------------------------|
| Accounts Payable                   | Search Accounts Payable | EPSR1040               |
| Asset Management                   | Search Assets           | EPSR1030               |
| Catalog Items                      | Search Catalog          | EPSR1080               |

| <b>Global Search Category Name</b> | <b>Role</b>                   | <b>Permission List</b> |
|------------------------------------|-------------------------------|------------------------|
| Credit to Cash                     | Search Credit to Cash         | EPSR1100               |
| Expenses                           | Search Expenses               | EPSR1050               |
| General Ledger                     | Search General Ledger         | EPSR1060               |
| Maintenance Management             | Search Maintenance Management | EPSR1110               |
| Procure to Pay                     | Search Procure to Pay         | EPSR1000               |
| Purchasing/Procurement             | Search Procurement            | EPSR1020               |
| Strategic Sourcing                 | Search Sourcing               | EPSR1010               |
| Supplier Contract Documents        | Search Authored Documents     | EPSR1090               |
| Supplier Information               | Search Supplier Information   | EPSR1080               |

**Note:** If your organization has not purchased licenses for all products within the Procure to Pay or Credit to Cash search categories, you still need to deploy the Search Definitions for the product. However, you do not need to build the indices.

As an alternative, you can remove search definitions that are related to the products that you have not licensed. This is considered to be a minor customization.

## Global Search Category Facets

Facets refine the search results when they are dynamically selected by the user, without the need to apply filters. Global Search categories have a unique set of facets.

If a Global Search category contains only one search definition, such as Asset Management, Expenses, General Ledger, or Strategic Sourcing categories, then the facets should be the same as the search definition.

If a search category contains multiple search definitions, then facets are those that are common to each search definition in the category can be used. Not all common facets can be used in a search category for performance reasons. Instead, a subset can be defined.

**Note:** If a facet is defined for a search category that does not exist on one or more search definitions within that category, then the results are limited to the search definitions that have the facet defined.

Some facets have been specially defined for Global Search categories and may have similar information, even though this information is named differently within each application. These facets were designed to provide a common facet that applies to each search definition.

The facets that are created to be common to each Global Search category are:

- Category
- Business Unit/SetID, which is disabled by default.
- Document Date
- Supplier Name
- Customer Name
- Entered By, which is disabled by default.

---

**Note:** The enabling of facets incurs an additional overhead for index building and search performance. The Business Unit/SetID and Entered by global facets are delivered disabled by default to improve search performance.

---

For more information about Facets, see [Search Result Facets](#).

## Category

Category is a special facet that is automatically created by PeopleTools and identifies each search definition that is referenced in the search category. Only the categories for which results are found are displayed. When performing Global Keyword searches for common values such as a receipt number, the search results are displayed for each category, which provides a way to search across components within the business process.

| <b>Search Category</b> | <b>Description</b> |
|------------------------|--------------------|
| EP_AP_PAYMENTS         | Payments           |
| EP_AP_VOUCHERS         | Vouchers           |
| EP_AR_ITEMS            | AR Items           |
| EP_AR_PMT_ENTRY        | AR Payments        |
| EP_BI_BILLING          | Billing            |
| EP_CA_CONTRACTS        | Contracts          |
| EP_EX_REPORT           | Expense Reports    |
| EP_GL_JOURNAL          | Journals           |
| EP_GM_GRANTS           | Grants             |

| <b>Search Category</b>    | <b>Description</b>             |
|---------------------------|--------------------------------|
| EP_OM_CUSTOMER            | Customers                      |
| EP_PC_PROJ_GENERAL        | Projects                       |
| EP_PO_CONTRACTS           | Procurement Contracts          |
| EP_PO_PURCHASE_ORDERS     | Purchase Orders                |
| EP_PO_RECEIPTS            | Receipts                       |
| EP_PO_REQUISITIONS        | Requisitions                   |
| EP_SS_EVENTS              | Sourcing Events                |
| EP_AM_ASSET               | Assets                         |
| EP_AP_VENDOR              | Vendors/Suppliers              |
| EP_AP_VENDOR_CONVER       | Vendor/Supplier Conversations  |
| EP_PV_EXPRESSITEMS_SD     | Catalog Express Items          |
| EP_PV_MASTERITEMVENDOR_SD | Catalog Items with Supplier    |
| EP_PV_MASTERITEM_SD       | Catalog Items without Supplier |
| EP_CS_AUTHORED_DOCS       | Supplier Contract Documents    |
| EP_WM_SRCH_WO_ASSETS      | Maintenance Assets             |
| EP_WM_SRCH_WORK_ORDERS    | Maintenance Work Orders        |

## Business Unit/SetID

Business Unit/SetID, which is disabled by default, is a facet that is created for the Procure-to-Pay and Credit-to-Cash Global Search categories. Some search definitions contain a Business Unit facet and others contain a SetID within the facet value as required by the underlying search definition. For example, purchase orders are mapped to a business unit and purchase order contracts are mapped to a SetID.

Therefore, the Business Unit/SetID facet is displayed for search categories where the results could contain business unit and SetID.

---

**Note:** This attribute exists on many search definitions but the facet value is disabled to improve build and search performance. As a minor customization, your organization may decide to enable this facet, if needed, and performance is acceptable.

---

## Document Date

The Document Date is a common facet that is created for transaction Global Search categories, such as Procure-to-Pay, Credit-to-Cash, Purchasing, Procurement, and Accounts Payable. The document date facet represents the transaction date for multiple transactions that use different names to describe the transaction date. For example, Purchase Order Date, Received Date, Journal Date, and so on. Assets use the Acquisition Date as the Document Date.

This facet is displayed at the Global Search category level. However, if the user selects a specific category or component, the appropriate transaction date field is displayed for that component. For example, if the user searches Procure To Pay, the Document Date appears as a facet. Then, if the user clicks on the Receipts category facet, the Received Date appears as a facet.

The Document Date facet is hierarchical. The year is displayed first and you can drill into a year to select a specific month or day. Sub-facets define the month and day of the transaction. The month facet is assigned a number so that it can be sorted in numerical order, as it appears on a calendar.

For more information about facets, see [Search Result Facets](#).

## Supplier Name

The Supplier Name is a facet created for transaction Global Search categories, such as Procure-to-Pay, Accounts Payable and Procurement. The Supplier Name facet represents the Supplier Long Name and was selected over the Short Supplier Name and Supplier ID as the standard facet for all search definitions.

---

**Note:** Facet value labels are limited to 30 characters, which makes it possible for long names to be truncated.

---

## Customer Name

The Customer Name is a facet created for transaction Global Search categories, such as Credit-to-Cash, AR Items and Billing.

## Entered By

The Entered By, which is disabled by default, is a facet that represents the user who *created* the transaction. Keep in mind that this facet may not be the same as the *owner* of the transaction. For example, an expense report is filed for User-1 by User-2. The Entered By result is User-2.

---

**Note:** This attribute exists on many search definitions but the facet value is disabled to improve build and search performance. As a minor customization, your organization may decide to enable this facet, if needed, and performance is acceptable.

---

## Global Search - Advanced Search

Click More Options link in the New Search facet.

This example illustrates the fields and controls on the Global Search - Advanced Search. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Search Results' page in PeopleSoft. On the left, there's a 'New Search' sidebar with filters for Category (Procure to Pay), Keywords (1), and various document types. The main area, titled 'View Search Results', shows 2978 results for keyword '1'. The results list includes contract documents, requisitions, and adhoc documents with their respective details.

Advanced Searches are similar to the standard PeopleSoft search dialogs that enable users to specify one or more field values, or partial values, to be used to refine search results. Users can also use operators such as equal to, not equal to, greater than, and so on. The operators that are available depend on the data type of the field that is used. Each search category has its own set of advanced search fields.

**Note:** Most Advanced Search attributes do not contain a prompt option because the context of the field for Global searching is not within a component and higher level keys are not known.

| Term      | Definition                                                                                                                                                           |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Search in | Select one of the search category options: All, Asset Management, Credit to Cash, Expense Reports, Procure to Pay, Purchase Requisitions, or Purchasing/Procurement. |

If a search category contains only one search definition, the search fields are limited to what is defined on the search definition or a smaller subset.

If a search category contains multiple search definitions, then the search fields are those fields that are common among the search definitions in the category, but can also be a smaller subset of these.

## Special Advanced Search Fields

These common fields are defined to enhance Global Searches:

| <b>Term</b>                 | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Procurement Comments</b> | <p>This field is a common field included in all search definitions where the appropriate comment fields are mapped. Some comment fields are not mapped to Procurement Comments. These fields are typically separate search fields.</p> <p>This field enables users to search all relevant, comment-type, fields for specified keywords when the user is not sure which comment field to search. For example, a comment related to a purchase order can be stored at the header, line, or ship-to level. If a user uses the Procurement Comments field to search for keywords, then the system will search all header, line, and ship-to comment fields.</p> <p>Standard search framework rules apply, depending on how you enter your search keywords. For standard searches:</p> <ul style="list-style-type: none"> <li>• Phrases: Use single quotes ( ' ') around words that make up a phrase. For example: 'year-end report'.</li> <li>• All Words: Use an ampersand (&amp;) to specify that all words must appear in the results. For example: documents &amp; reports.</li> <li>• Any Word: Use a pipe ( ) to specify that any word must appear in the results. For example: 'year-end report'   report.</li> <li>• Partial Strings: Use an asterisk (*) to search for partial strings. For example: document* will return words beginning with document, such as documents, documentary, and documentation. An asterisk cannot be the first character of the search string.</li> </ul> <p>The search definitions that include Procurement Comments attribute are:</p> <ul style="list-style-type: none"> <li>• Supplier</li> <li>• Supplier Conversations</li> <li>• Requisitions</li> <li>• Sourcing Events</li> <li>• Procurement Contracts</li> <li>• Vouchers</li> <li>• Payments</li> </ul> |

- Ng, Edward (1)

**Results:**

- Expense - Vincent, Sonya | 0000000054 / 1 | **Air Travel** - United Airlines  
Date: 2000-08-09 | Expense Report Status: Approved for Payment | Amount: 890 USD | Entered By: VP1
- Expense - Schumacher, Kenneth | 0000000071 / 2 | **Air Travel** - American Airlines  
Date: 2003-10-01 | Expense Report Status: On Hold, with Auditor | Amount: 200 USD | Entered By: SAMPLE
- Expense - Roth, Calvin | 0000000132 / 1 | **Air Travel** - American Airlines  
Date: 2016-05-17 | Expense Report Status: Pending | Amount: 350 USD | Entered By: CROTH
- Expense - Roth, Calvin | 0000000115 / 1 | **Air Travel** - American Airlines  
Date: 2016-05-17 | Expense Report Status: Pending | Amount: 350 USD | Entered By: CROTH
- Expense - Channing, Rosanna | 0000000117 / 1 | **Air Travel** - American Airlines  
Date: 2016-05-18 | Expense Report Status: Denied | Amount: 500 USD | Entered By: RCHANNING
- Expense - Emmerson, Nancy | 0000000031 / 1 | **Air Travel** - American Airlines  
Date: 2000-08-02 | Expense Report Status: Submitted for Approval | Amount: 456 USD | Entered By: SAMPLE
- Expense - Channing, Rosanna | 0000000099 / 1 | **Air Travel** - American Airlines  
Date: 2014-11-19 | Expense Report Status: Pending | Amount: 1400 USD | Entered By: RCHANNING
- Expense - Summer, Alice | 0000000088 / 1 | **Air Travel** - United Airlines  
Date: 2014-05-01 | Expense Report Status: Approved for Payment | Amount: 2000 USD | Entered By: VP1
- Expense - Roth, Calvin | 0000000114 / 1 | **Air Travel** - American Airlines  
Date: 2016-05-19 | Expense Report Status: Pending | Amount: 200 USD | Entered By: CROTH
- Expense - Roth, Calvin | 0000000122 / 1 | **Air Travel** - United Airlines  
Date: 2018-05-01 | Expense Report Status: Pending | Amount: 539 USD | Entered By: CROTH
- Expense - Schumacher, Kenneth | 0000000067 / 1 | **Air Travel** - United Airlines  
Date: 2003-10-15 | Expense Report Status: On Hold, with Approver | Amount: 350 USD | Entered By: SAMPLE
- Expense - Elliot, Ken | 0000000079 / 1 | **Air Travel** - American Airlines  
Date: 2007-03-05 | Expense Report Status: Pending | Amount: 150 USD | Entered By: SAMPLE
- Expense - Turner, Cornelia | 0000000086 / 1 | **Air Travel** - American Airlines  
Date: 2014-03-01 | Expense Report Status: Approved for Payment | Amount: 2000 USD | Entered By: VP1

The search results show enabled facets on the left side of the page so that the manager can continue to refine the results based on business unit, creation date, name, and so on.

Search results display on the right side and are typically at the document header level. However, in cases such as expense reports, the search result is provided at the line level to display more pertinent information so that the user doesn't have to drill into the transaction. In this example the expense line contains the amount and description, which may be most important for a manager.

**Note:** An end user would see all expense reports for which they have security. This is based on the same security the user would have when searching within the expense report component.

For more information about search results, see [Understanding Search Results](#).

## Understanding Kibana Analytics Using Elasticsearch

This topic provides an overview about Kibana Analytics and discusses:

- [Search Definitions and Kibana Privileges](#)
- [Deploying Kibana Dashboards](#)
- [Kibana Tiles for Homepages](#)

## Understanding Kibana Analytics

Kibana is a Web application and works with Elasticsearch. It provides visual reports (visualization) in the form of charts, tables, and so on, based on queries that you set up on Elasticsearch indexes.

A visualization is created in Kibana and attached to a dashboard. The dashboard can contain multiple visualizations. Typically, an application developer creates the visualizations and dashboards. The visualizations and dashboards are objects in Kibana, which should be imported into PeopleSoft. Typically, a PeopleSoft user with a Search Administrator role performs the task of importing the dashboards, configuring the dashboards as tiles or related information, specifying user privileges for a dashboard, and then deploying the dashboards. End users can use these dashboards to view analytical data of an application based on the user's privileges.

---

**Note:** Oracle recommends that you do not modify or edit a delivered dashboard or visualization. You may copy a delivered visualization and then modify it as per your business requirements.

---

For more information, see *PeopleTools Search Technology*; "Working with Kibana Dashboards for PeopleSoft Application Data", Understanding Application Data and Kibana Dashboards.

## Search Definitions and Kibana Privileges

This table lists the PeopleSoft search definitions defined for FSCM Application Dashboards, which are delivered with a PeopleSoft image. Use the appropriate search definition to build your indexes. Keep in mind that search definitions must be deployed before you can build the index.

For Kibana dashboards, PeopleSoft roles are created to grant either view or edit access. A permission list is not necessary to access these dashboards. Refer to the table below to see roles associated to each search definition. For more information about assigning Kibana privileges, refer to *PeopleTools Search Technology*; "Working with Kibana Dashboards for PeopleSoft Application Data", Specifying User Privileges.

---

**Note:** Search definitions are used for component keyword search and Kibana analytics.

## Deploying Kibana Dashboards

Use the Deploy Kibana Dashboards page to deploy Kibana dashboards and tiles. For more information about the Deploy Kibana Dashboards page, see *PeopleTools Search Technology*: “Working with Kibana Dashboards for PeopleSoft Application Data”, Managing a Delivered Dashboard.

**Note:** Before you deploy a dashboard, you must ensure that the prerequisites of installing and setting up PeopleTools, Elasticsearch, and Kibana are completed. Also you must ensure that the required search definitions are deployed and indexed successfully because a visualization in Kibana is based on the indexes in Elasticsearch.

For more information on building indexes, see [Understanding the Build Index Process](#)

## Kibana Tiles for Homepages

Kibana dashboards are delivered as tiles. You can add the tile to any homepage. For more information about how to add a tile to a dashboard, see [Adding Homepages and Tiles](#)

## Understanding Search Pages within Components

Component search uses the Keyword Search tab to search more fields compared to the standard tools search. The system automatically changes the Global Search category based on the page displayed.

This example illustrates the Component Keyword Search (Express Purchase Order).

**Express Purchase Order**

Enter any information you have and click Search. Leave fields blank for a list of all values.

**Note:** Keyword Search will return results last updated 11 days ago (02/06/2013 11:18:49AM) [Search Tips](#)

Keywords

[Basic Search](#)
[Advanced Search](#)

| <b>Term</b>            | <b>Definition</b>                                                                                                                                                                                                                                           |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Search Tips</b>     | Explains how to enter free-form text into the Keywords field.                                                                                                                                                                                               |
| <b>Basic Search</b>    | Enables you to select a single field in the Search by field as well as using the Keywords field.                                                                                                                                                            |
| <b>Keyword Only</b>    | Displays only the Keywords field.                                                                                                                                                                                                                           |
| <b>Advanced Search</b> | <p>Enables you to enter a field value in multiple fields as well as using the Keywords field.</p> <p>If the Advanced Search page is visible, then any required fields must also be filled in. This operates the same as the Find an Existing Value tab.</p> |

This example illustrates the Component Keyword Search - Advanced Search (Express Purchase Order).

### Express Purchase Order

Enter any information you have and click Search. Leave fields blank for a list of all values.

In this example, the fields from Business Unit through Hold From Further Processing are the same search fields that appear on the Find an Existing Value tab. The fields from Business Unit Description through Supplier Item ID are defined by the search category, and appear in the order in which they are defined on the Advanced Search Fields tab of the search category definition.

Similar to Global Searches, the component search returns results based on the last index build, or an incremental index, and is not considered to be *real-time*. Using the Find existing Value tab is considered to be *real-time*.

Component searches are created by mapping a component to a search definition within the PeopleTools Search Framework and then updated by running the PTSF\_GENFEED Application Engine.

For more information about this setup and maintenance process, see *PeopleTools: Search Technology*.

---

## Understanding Search Results

This topic provides information about:

- Viewing PeopleSoft search results.
- Search result breadcrumbs.
- Search result facets.
- Search result list format.
- Last search results window.

### Viewing PeopleSoft Search Results

When performing searches against enabled categories, search results will only contain data for which the user is allowed to see. This is based on the drill through URL that is defined in the search definition. For example, if a user does not have access to the purchase order menu, then the user will not see search results containing purchase orders. In addition, a component search result (in most cases) is limited based on row level security, similar to that defined for the component. If a user does not have access to a business unit or SetID, then they will not see search results for that SetID or business unit unless they can access the business unit or SetID when they access to the component directly.

When viewing search results for Global Search and for Component Search, the page appears slightly different.

- Search results for Global Searches always appear in a list format.
- Search results for Component Searches can be viewed in two formats:
  - Grid format, which is the PeopleSoft standard format.
  - List format, which is the same format used for advanced searches.

This example illustrates Global Search: Advanced Search - Search Results.

The search results can be broken into three sections:

- The breadcrumb section, which lists the facets selected in the order in which they were selected.
- The Filter by section, which lists all facets defined for the search category.

- The results section, which displays results in a grid or list format.

## Search Result Breadcrumbs

When a user selects a facet, to reduce their search results, the system displays the options that were selected, also known as breadcrumbs, at the top of the Search Results section. Users can remove any facet by choosing the X next to it. Facets can be removed in any order and the displayed results will no longer reflect the filter.

## Search Result Facets

Facets refine the search results when they are selected by the user. Facets are defined by search categories and must be defined in each search definition included in the search category.

On the left side of the search results are the Filter-By facets that can be used to narrow the search results.

Each facet displays a number in parenthesis, which indicates the number of results for that facet value. This provides a way to refine search results. When you click on a facet value in the Filter by section, the system initiates another search using that particular value.

For example, clicking on a facet value of “Business Unit – US001 (19)” would reduce the search results to 19 results.

After selecting one facet value, you can continue to select other facet values to find the ultimate record for which you are searching. Each facet selected is displayed above the Filter by label and can be removed if you want to select a different filter.

Within Financials and Supply Chain, certain common facets are enabled within components to provide more consistency when searching across various areas, such as creation date. See also, Document Date in the [Global Search Category Facets](#) documentation.

In some cases, facet quantities may not agree across facets. For example, facet results for Business Unit display a total of 25 values across 5 business units. In addition, facet results for Item IDs display a total of 45. The reason for this is that there may be multiple items on an index for which the transaction ID is the same, for example, the item ID is at a lower child level than the business unit.

## Search Result List Format

For search results, the system displays a configured number of results that match your search criteria and the count of display pages that contain your results. The result set is determined by a PeopleSoft Search Framework setting in PeopleTools. You can select the page numbers or use the Next Page and Previous Page icons to view each page.

Global - Advanced and component search results can be displayed in a list format. The actual results are identified by:

- Title link
- Last Updated Date
- Summary information

- Related Actions viewable section

This example illustrates the Global Search: Search Results showing Title, Last Updated, Summary, and Related Actions.

The screenshot shows the Oracle PeopleSoft Search Results page for the query "Voucher bike shop". The page header includes the Oracle logo, a navigation bar with "Home", "Worklist", and "MultiChannel Console", and a search bar with "Procure to Pay" and "Voucher bike shop". Below the search bar, the title "Search Results for 'Voucher bike shop'" is displayed. The results are filtered by "Category" (Vouchers (5), Purchase Orders (1)), "Document Date" (2006 (2), 2005 (3), 2003 (1)), and "Supplier Name" (ERNE'S BIKE SHOP (6)). A list of six results is shown, each with a title link, last updated date, and summary. A right-hand menu lists related actions such as "Match Workbench", "Approval Framework - Vouchers", "Approve Voucher", "Mass Voucher Approval", "Voucher Inquiry", "Close Voucher", "Review Accounting Entries", "UnPost Voucher", "Voucher Build Error Detail", "Voucher Build", "Voucher Posting", and "Review Document Status".

| Filter by                                                | 6 results matched your search criteria                                                                                                                                                                                                                                          |

|                                                          | <a href="#">Voucher - US001   00000107</a><br>Last Updated Date: 2012-04-24 09:59:16<br>Supplier: ERNE'S BIKE SHOP   Date: 2006-04-10   Style: Regular<br>SAMPLE   Invoice ID: 12525   Entry Status: Postable   Source: Online                                                  |
|                                                          | <a href="#">Voucher - US001   00000108</a><br>Last Updated Date: 2012-04-24 09:59:16<br>Supplier: ERNE'S BIKE SHOP   Date: 2006-04-10   Style: Regular Voucher   Amount: 137.5 USD   Entered By: SAMPLE   Invoice ID: 85985   Entry Status: Postable   Source: Online           |
|                                                          | <a href="#">Purchase Order - US001   0000000118</a><br>Last Updated Date: 2005-05-30 06:32:04<br>Supplier: ERNE'S BIKE SHOP   Date: 2005-05-30   Status: Approved   Amount: 5000 USD   Buyer: Kenneth Schumacher   PO Reference: Recurring PO Voucher   Hold From Processing: N |

The first word of the title is designed to identify the result, which in this example is an Accounts Payable Voucher. This is then followed by system-key information. The summary information contains more detailed information for the returned result such as the creation date, status, amount, and who entered the information into the system.

## Title Link

The search result title is a link and identifies unique characters for each search result item. When you click on the Title link, the system takes you to the corresponding page to view, or access, the information. Users can then perform the needed tasks.

**Warning!** The Title link contains returned values for drilling into the underlying component and for related actions. Therefore, any customization to the Title should be created with caution.

The format of the search result title contains all keys of the search result item and is displayed in this format:

<Document Label> - <key1> I <key2> I <key3> I <key 4>

This example illustrates a Title link (partial page).

[Purchase Order - US001 | POAP-EXCP](#)

## Last Updated Date

The last updated date is displayed for the user as a reference. This represents the date and time that the search index was last updated for this document.

## Summary Information

The search result summary enables a user to determine whether each result item is the one to which they were searching. It is in this format:

<Label>: <label data> I <label data>

This example illustrates Summary Information (partial page).

|                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Supplier: Plant Decor   Date: 2005-05-06   Status: Dispatched   Amount: 2000 USD   Buyer: Kenneth Schumacher   PO Reference: Exception   Hold From Processing: N |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|

The data displayed will vary based on the type of document returned in the search results. For application-specific information, see the application documentation.

---

**Note:** Information displayed in the Title link and the Summary Information are defined on the Search Definition. The Title link must contain enough information to make the document unique within the search index. Other information can be modified to show more, or less, information in your search results. See the *PeopleTools: Search Technology* documentation for more information.

---

## Related Actions

Related actions will vary based on the type of document returned in the search results and are role-specific. They are only displayed in the list format Search Results page if configured by the application. The related actions enable users to take specific actions on the selected document without having to navigate through the menu to access the related component.

Related actions are dynamic and depend on user security. For example, if the user does not have access to a component associated with a related action, then the action is not displayed. In addition, in some circumstances related actions may or may not display depending on the item context in the search results, such as a header status.

In most cases, related actions are enabled with modal windows. However, when the related action is more complex, such as one containing links to other locations in the system, a new window may be displayed.

In some cases a related action may display if the user has security, even when no related action details may exist for the returned search result. This is the case when performance considerations, for the related action response, outweighs the need to hide specific related actions in a larger list.

You can place your mouse over the item to view the glyph, which indicates that related actions are available.

---

**Note:** Although related actions are delivered with this feature, they are configurable and defined using PeopleTools Security. See: *PeopleTools: Portal Technology*, Developing and Configuring Related Content

---

## Last Search Results Window

This link enables you to return to your search results if you want to take action on other rows within your search results. You can select a different search result or select the Refine Search link to access another result item.

Click the Last Search Results link, at the top of the page, to view the Last Search Results window. These results include those from search framework searches:

This example illustrates the Last Search Results window.

The system retains your last search results for as long as you are signed on to the system. When you sign off of the system, the system clears your last search results.

## Understanding Search Attachments

Search Attachments are documents that can be included in a search index. Depending on the application and setup, attachments can be stored on the ftp server, the sftp server, or in the database. When attachments are to be included in a search index, they must be defined on the Attachment Properties tab of the Search Definition. The attachment may be dynamic or static, depending on application usage. Any application that uses the Administer File Attachments page must use dynamic attachments. The dynamic setting allows flexibility for changes to the active servers over time. This gives the query flexibility to dynamically access any attachment for the active or previous servers. PeopleSoft Search Framework creates a search index that contains the contents of any attachment so that keyword searches have access to these attachments.

There are performance trade-offs when performing searches on attachments. For more information about performance considerations, see [Understanding Performance Considerations within Financial and Supply Chain Management Search](#)

This table illustrates the Financial and Supply Chain Search Definitions that can search attachments:

| <b>Search Definition</b> | <b>Description</b> | <b>Used In</b>        |
|--------------------------|--------------------|-----------------------|
| EP_AM_ASSET              | Assets             | Global / Search Pages |
| EP_AP_VENDOR             | Suppliers          | Global / Search Pages |

| <b>Search Definition</b> | <b>Description</b>       | <b>Used In</b>                           |
|--------------------------|--------------------------|------------------------------------------|
| EP_AP_VOUCHERS           | Vouchers                 | Global / Search Pages                    |
| EP_CS_DOC_ADHOC          | Adhoc Documents          | Search Content in Supplier Contract Mgmt |
| EP_CS_DOC_CONTRACTS      | Contract Documents       | Search Content in Supplier Contract Mgmt |
| EP_CS_DOC_PURCHORDRS     | Purchase Order Documents | Search Content in Supplier Contract Mgmt |
| EP_CS_DOC_SOURCING       | Sourcing Event Documents | Search Content in Supplier Contract Mgmt |
| EP_PO_CONTRACTS          | Purchase Order Contracts | Global / Search Pages                    |
| EP_PO_PURCHASE_ORDERS    | Purchase Orders          | Global / Search Pages                    |
| EP_PO_REQUISITIONS       | Requisitions             | Global / Search Pages                    |
| EP_SS_EVENTS             | Sourcing Events          | Global / Search Pages                    |

In order for attachments to be properly indexed, you need to define:

- The FSCM File Attachments definition, using the [Administer File Attachments Page](#).
- The PeopleSoft Search Framework Attachment URL ID List (**PeopleTools >Search Framework >Administration >Attachment URLID List**).

The list of all URL identifiers that are related to your systems attachments, which are indexed by various search definitions that are listed in the table, must be listed in the Attachment URLID list page of the search framework. This list is defined and must be present prior to deploying search definitions that may depend on the various attachment servers. The PeopleTools Search Framework publishes this list and associated credentials to the system so that it has the appropriate credentials needed when attempting to crawl and index related documents.

See the product documentation for *PeopleTools: Search Technology*.

---

## Understanding Performance Considerations within Financial and Supply Chain Management Search

This topic discusses performance considerations when enabling application and component search within Financials and Supply Chain Management (FSCM). It provides topics to consider that could improve the end user experience and support when customizing your system. Topics include:

- Enabled facets
- Enabled attachments
- Enabled attributes (including ChartField security)
- Enabled queries

## Enabled Facets

Financials and Supply Chain Management (FSCM) have enabled certain field attributes within the search definitions (and related search categories) as facets within PeopleSoft Search Framework.

---

**Note:** The search framework requires that faceted values be populated, meaning that there cannot be blank values sent for any field defined as a facet.

---

When search attributes are defined as facets in PeopleSoft Search Framework, performance degradation can be incurred when building the index and when performing the search. As a general rule, fields that contain a large number of values should not be enabled as facets. Depending on your FSCM environment, this could include facet values such as Supplier Name or Entered By. If you have thousands of possible faceted values, system performance may be compromised if these types of attributes are enabled as facets. Depending on your environment and volume, you should consider enabling, or disabling, additional facets to balance functional needs against system performance.

---

**Note:** Changing faceted values within a search definition is considered a minor customization. Any changes you make to existing Search Definitions or other PeopleSoft delivered objects should be tracked as with any customization.

---

## Enabled Attachments

Within PeopleSoft Search Framework, attachments are allowed for some search definitions that are used within FSCM. For example attachments are enabled within the purchase order, requisition, and contract search definitions. If large numbers of attachments are enabled, performance degradation can be incurred when building the index and performing the search.

Depending on your FSCM environment and volume, you may consider disabling the ability to search attachments to balance functional needs against system performance.

To remove attachments from being included in an index, delete the attachment from the Search Definition - Attachment Properties page. However, if you decide to include attachments in the Search Definition at a later time, then you should track the current settings of the page so you know how to add the reference back if needed.

---

**Note:** Removing attachments within a search definition is considered a minor customization. Any changes you make to existing search definitions or other PeopleSoft delivered objects should be tracked as with any customization. For more information on Search Definitions, see *PeopleTools: PeopleSoft Search Technology*, link at the bottom of this section

---

## Enabled Attributes (Including Chart Field Security)

FSCM has included a prioritized list of primary and related tables that support search definitions. This is implemented using connected query, which supports more complex data structures such as a purchase order. Within the search definition, only a subset of prioritized attributes has been activated in order to support reasonable search framework build performance. There is some incremental cost for including more attributes within PeopleSoft Search Framework. Reducing the number of attributes can improve system performance.

### ChartFields

PeopleSoft delivers certain attributes, such as ChartFields, disabled within most search definitions. This is for security purposes as opposed to performance reasons. When ChartField attributes are enabled within PeopleSoft Search Framework, *any* user who has the ability to search using the search definition can also search for ChartField values.

For example, searching all purchase orders by project number is possible with the delivered product. The PeopleSoft Search Framework implementation does not support the ChartField row-level security that can be implemented within PeopleSoft system. Therefore, you should carefully consider whether your organization will allow users who have access to the search category, to search using those values, before enabling ChartFields for Global Search or Search Pages.

Depending on your FSCM environment and volume, you may want to consider disabling search attributes to balance functional needs against system performance.

---

**Note:** Enabling or disabling attributes within a search definition is considered a minor customization. Any changes you make to existing search definitions or other PeopleSoft delivered objects should be tracked as with any customization.

---

---

**Note:** : If you have disabled a ChartField for query access, and a search definition is using this field, you must manually deselect the Field to Index check box on the Search Definition page (PTSF\_FIELD\_MAPPING). If this step is not performed when a ChartField is disabled, then the Build Search Index process will not be successful.

---

## Enabled Queries

FSCM has included a prioritized list of primary and related queries and connected queries that support the search definition. This is performed using connected query, which supports more complex data structures such as a purchase order. Not all related tables and information are included in these connected queries.

Depending on your FSCM environment and volume you may consider removing or adding queries to the connected queries and search definitions in order to balance functional needs against system performance.

---

**Note:** Adding or removing queries to a connected query, which affects attributes within a search definition, is considered a significant customization. Any changes you make to existing connected queries and search definitions, or other PeopleSoft delivered objects, should be tracked as with any customization.

---

For more information on PeopleSoft Search and customizations, see *PeopleTools: Search Technology*.

---

## Understanding the Build Index Process

This topic provides overviews about:

- Parts of an Index
- Deploying Indexes
- Building an Index

For more information about the Build Index Process, see the *PeopleTools: Search Technology*.

### Parts of an Index

This topic discusses:

- Queries and Search Definitions.
- Search Categories

#### Queries and Search Definitions

The PeopleTools Search Framework requires queries to build searches. Queries and connected queries are pre-defined for all indexes provided by PeopleSoft. Query security must be granted to the callback user defined on the Search Instance page to build and execute queries. Modifications to queries should always be well documented.

A deletion query is also provided where necessary to synchronize indexes and transaction tables.

Queries are associated with search definitions and define all searchable portions of the data. Fields, also known as attributes, which can be used in a search, are authorized on a search definition. Some fields may be turned on or off without needing to modify the search page. This is the case with component keyword search and Global Search. The number of fields that are indexed can affect performance. A search definition can also be thought of as the physical index that is created.

Facets are also defined on a search definition and may be turned on or off.

---

**Note:** When modifying facets, or attributes, associated with a search definition you must also make similar changes to the search category. The number of facets that are indexed can affect performance.

---

See [Understanding Performance Considerations within Financial and Supply Chain Management Search](#)

#### Search Categories

Search Categories are objects that are used for searching. A search category contains a search definition or a group of search definitions also known as indexes. In order to search across multiple indexes for values, the indexes must first be combined into a single search category. Predefined search categories are provided by PeopleSoft.

---

**Important!** Modifications to existing search categories, facets, or attributes that are associated with a search definition is considered a minor customization and should be well documented.

---

## Deploying Indexes

After indexes are defined, the next step in the build process is to deploy the search definition. You always deploy search definitions and you must deploy search categories that contain more than one index. Search categories with only one index, which is the same name as a search definition, are automatically deployed.

---

**Warning!** The Deploy Search Definitions page also allows you to delete search definitions. Deleted search definitions are not reversible.

---

To deploy a search definition, select the check box on the left column, scroll to the bottom of the Deploy Search Definitions page, and select the Deploy button. After you select the Deploy button, you can select the Search Categories tab, to confirm that the category with the same name as the search definition was automatically deployed.

If a category contains more than one search definition, such as EP\_PROCURE\_TO\_PAY, you can deploy it by following the same steps for a search definition and using the Search Categories tab. Deploying these search categories can occur before or after individual search definitions are indexed.

For more information about the Deploy Search Definitions page and the Deploy Search Category page, see the *PeopleTools: PeopleSoft Search Technology*, Administering PeopleSoft Search Framework, Administering Search Definitions and Search Categories.

## Building an Index

To submit a search definition to be indexed, or built, use the Schedule Search Index page (PeopleTools, Search Framework, Administration, Schedule Search Index). Assign a name that reflects the index you are building. If more than one user is building a particular index, each person must create their own run control.

From the Build Search Index run control page:

- The Search Definition field, lookup option, lists only search definitions that have been deployed.
- The indexing type must also be selected:
  - A full index is a complete rebuild of an index that removes old data and applies completely new data to the index.

For performance reasons, full indexes should not occur where there are large amounts of data.

- An incremental index is used to update an existing index, remove old obsolete records, and add any new records that were modified or added since the last index build.

The indexed document retains a date and time at the header level, which is updated from various pages, transactions, and batch jobs any time the header or any child record changes. If a previous build of the index has occurred, information pertaining to the last build is displayed on the run control page. Incremental indexes are typically more efficient than a full index especially when there is a large amount of data.

- When search results change often, incremental index builds should be run nightly or whenever the system is lightly used.

This keeps the search data current. However, there are some exceptions that will require the index to be rebuilt. This can include:

- Related data changes, such as a buyer's name, which is not updated in locations where the buyer ID is stored.
- Effective dated information where correction mode is used against an existing date and no new effective date is created.

For more information about the Build Search Index page, see the *PeopleTools: PeopleSoft Search Technology*, *Administering PeopleSoft Search Framework*, *Working with Search Indexes*.

---

## Understanding Real Time Indexing in FSCM

Real Time Indexing (RTI) uses DirectTransfer methods to transmit search data directly from PeopleSoft batch servers to Elasticsearch. Indexing is performed in near real-time by sending the data as soon as it is saved.

For additional information about DirectTransfer, see PeopleSoft PeopleTools, *Search Technology*, *Administering PeopleSoft Search Framework* and *Using Direct Transfer*.

For additional information about configuring Real Time Indexing, see PeopleTools, *Development Tools*, *Search Technology*, *Administering PeopleSoft Search Framework*, *Using Real Time Indexing*.

## Understanding RTI Switch

High volume batch updates (for Search definitions enabled for RTI) can cause a sudden spike in the number of entries to process in the RTI staging table added by the database trigger. This can cause the database table fragmentation to go high and potentially slow down overall system performance.

If you have large volumes of batch updates, the RTI process should be temporarily turned off and when the batch is complete, perform catch-up updates to Elasticsearch via incremental indexing before resuming RTI.

RTI switch enables the application to turn OFF RTI before initializing high volume batch programs. It turns ON RTI during the incremental indexing time for a specific search definition.

---

**Note:** Oracle's PeopleSoft recommend that you do not change the Configure Batch switch without a complete understanding of how it works, because batch processes must be specifically coded to reference the RTI Switch.

---

For additional information about RTI Switch, see My Oracle Support (MOS) document 2205540.2. Select the Elasticsearch, Logstash, and Kibana on PeopleTools 8.59 tab. Then open the PeopleTools 8.59 Search Technology, April 2022 document.

## Search Definitions for Real Time Indexing

PeopleSoft certifies existing search definitions that you can implement for RTI. PeopleSoft Applications Development plans to certify more search definitions for RTI in future images.

RTI can be used on these Search Definitions when the minimum tools release is in effect for the respective Update Image.

---

**Warning!** PeopleSoft recommends that you do not implement RTI for any other search definition at this time. PeopleSoft FSCM does not certify RTI for any other search definition other than those listed in this table.

---

| <b><i>FSCM Update Image</i></b> | <b><i>Minimum PeopleTools Release</i></b> | <b><i>Search Definition</i></b> |
|---------------------------------|-------------------------------------------|---------------------------------|
| 41                              | 8.59.03                                   | EP_CS_CLAUSES                   |
| 41                              | 8.59.03                                   | EP_CS_SECTIONS                  |

**Note:** When a search definition is mapped to a component, the Keyword Search page displays a message that indicates when RTI is enabled for that component.

**Note:** \* These search definitions require application update bugs available through the most current update image. You must have these updates and the required PeopleTools release version to configure RTI. If you are on the correct PeopleTools patch and wish to use selective adoption to access only RTI related bugs, search for tracking group "Real Time Indexing for Tools 8.59 or above".

\*\* If you are on MSSQL, Tools 8.59-07 is required for this index.

---

**Note:** Search definitions that are enabled for RTI prior to PeopleTools 8.59.10 are not certified for multiple languages. RTI only indexes changes made in the base language. When your system upgrades to PeopleTools 8.59.10, any index that is certified for use (in the table above), is certified for multiple language situations. Re-indexing may be required to pick up language changes made with RTI before 8.59.10.

---

## Enabling Real Time Indexes

Follow these steps to enable Real Time Indexes.

1. Verify that your index is current by running a full or incremental build.

This allows a baseline index for RTI to add records.

2. Enable RTI on the search definition using the Configure Real Time Indexing page (PeopleTools, Search Framework, Real Time Indexing, Configure Real Time Indexing).
  - a. Enter the search definition (from the list above) in the filter box and select Search.
  - b. Select the correct search definition by selecting the row in the grid.
  - c. Select the Enable check box and Save.

3. If the Configure Batch check box is already selected, a list of selected Batch jobs for RTI enabled transactions are displayed.

Use the Document Count field to set a minimum threshold beyond which RTI is disabled for the selected trigger records. Use the Honor Batch Switch to decide which processes (batch programs) honor the RTI batch switch.

---

**Note:** PeopleSoft Applications delivers a list of batch jobs that disables RTI if the number of records to be processed adversely affects RTI performance. These batch jobs are added to the Configure RTI page. Based on system demands, administrators can set a minimum threshold to determine when the batch job disables RTI.

---

4. Download the trigger SQL for your database environment using the Trigger SQL link.

MSS, DB2, and Oracle are supported.

---

**Note:** When you click the link, trigger SQL is generated for each supported database. Click Cancel if you do not have this database and the next database SQL is generated.

---

5. Provide the trigger to your database administrator to apply to the database and have them bounce all process schedulers.

---

**Warning!** Any time a change is made to RTI configuration using the Configure Real Time Indexing page, or using PeopleCode in the application class, and whether or not a new trigger is generated and applied, the process scheduler must be restarted. If you do not restart the process scheduler, real time indexing may not pick up the changes and could fail to index you data.

---

## Search Definitions Excluded from Real Time Indexing

The following is a list of Search Definitions excluded from Real Time Indexing by FSCM Applications.

These search definitions have been analyzed and are considered incompatible with RTI for various reasons. Some of those reasons are:

- The search definition is only updated via batch jobs; no online updates are permitted.
- The search definition is based on uploads from external sources; no online updates.
- High volumes or bulk inserts make it impossible for RTI to 'catch up'.

Regular, incremental indexing should always be used.

- For some analytics, aggregation needs to occur that needs other records not involved in the trigger.

This complexity makes it difficult for the RTI to process.

Excluded Search Definitions are:

- AP\_SDN\_ADDRESS
- AP\_SDN\_AKA\_NAME
- EP\_CS\_CWB\_ADHOC
- EP\_CS\_CWB\_SOURCING
- EP\_CS\_CWB\_CONTRACT
- EP\_CS\_CWB\_PO
- EP\_GL\_LEDGER\_KIB
- EP\_PC\_PROJ\_RES\_KIB
- EP\_PV\_EXPRESSITEMS\_SD

---

**Note:** This list may adjust to include other search definitions at a later date. Oracle's PeopleSoft recommends that you implement only the certified search definitions for RTI.

---

# Securing ChartFields

---

## Understanding ChartField Security

ChartField Security allows you to configure data access security specific to a user's role in the organization. ChartField Security is designed to work in conjunction with other security features, such as Business Unit and Ledger Security. The major difference is that, unlike other security features delivered in the PeopleSoft products, ChartField Security allows you to choose the ChartFields by which you want to configure access and configure rules specific to one or more products. You may exclude products or exclude some feature of a product as necessary to support your organizational policy for data security.

Rules may be defined differently by product, and exceptions may be allowed as necessary. A common example of how this feature may be used is to configure access based on job function and activity. For example:

- A Payables user may be allowed access to all departmental transactions in the payables functions but be restricted to her own department when entering self-service requisitions or viewing ledger or budgetary activity.
- A staff accountant may have access to view journal activity for departments but only allowed to view budget balances for his own department.
- A manager may be allowed to monitor expenditure and revenue activity for one or many departments, depending on her business responsibilities.

Security may be enforced by user, role, or permission list so that organizations can implement this feature as efficiently as possible. You should perform an assessment across business areas to determine the best way to implement this security. You should also review other setup (combo edit, distribution code) selections for data conflicts.

By default, most components of each product are secured when the product itself is enabled. You may activate or inactivate certain components for each product with or without exceptions.

The ChartField Security feature is only implemented for pages that display ChartFields with monetary amount fields and other sensitive data. Examples of sensitive data include assets, inventory and expense items. Pages that display ChartFields with non-sensitive data, such as setup definition pages, do not support ChartField Security.

The ChartField Security feature allows you to:

- Enable or disable ChartField Security based on a product.
- Enable or disable ChartField Security based on a component.
- Enable or disable ChartField Security by user ID, role, or permission list.
- Restrict access to transactions containing unauthorized ChartField values.

- Restrict access to distribution code values in relevant components.
- Restrict access to financial data containing unauthorized ChartField values in the Inquiry components.
- Restrict access to unauthorized ChartField values during data entry.
- Specify components as exceptions for a user, role, or permission list.

The previously listed capabilities secure access to accounting information that appears in online pages, including pages that display one or more ChartFields with monetary amount fields. When ChartField Security is not required (that is, components used to reconcile transaction data), you can exclude the components from ChartField Security.

You can secure ChartFields in any of the following ways:

- Secure transactions from component search lists.
- Secure transactions from inquiry page lists.
- Secure inquiry results.
- Secure drills to transaction components.
- Secure prompt edit table values.
- Secure distribution codes.

---

**Note:** The ChartField Security feature only secures the prompt values for a distribution code, not for component access.

---

The following table lists the PeopleSoft products that can be enabled for ChartField Security and provides information about the products. ChartField Security may be enabled for selected fields. For example, when using Payables, you may enable ChartField Security for transactions and inquiries but not for distribution code (because it does not apply to this product).

| <b><i>PeopleSoft Product</i></b> | <b><i>Transaction</i></b> | <b><i>Inquiry</i></b> | <b><i>Distribution Code</i></b> |
|----------------------------------|---------------------------|-----------------------|---------------------------------|
| Payables                         | X                         | X                     | NA                              |
| Receivables                      | X                         | X                     | X                               |
| Asset Management                 | X                         | X                     | NA                              |
| Billing                          | X                         |                       | X                               |
| Commitment Control               | X                         | X                     |                                 |
| Contracts                        | X                         | X                     | X                               |
| Cost Management                  | X                         |                       | NA                              |

| <b><i>PeopleSoft Product</i></b> | <b><i>Transaction</i></b> | <b><i>Inquiry</i></b> | <b><i>Distribution Code</i></b> |

## Common Elements Used in Securing ChartFields

| <b>Field or Control</b>      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Blank ChartField Values      | ChartField Security rules are not enforced for blank values in ChartFields. If a row contains a blank value for a secured ChartField, access will be granted unless a different ChartField contains a value that is unauthorized.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Build Process                | The process that builds the ChartField Security rules into a flattened table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Component                    | A grouping of pages that are functionally related.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Distribution Code            | A code that represents a combination of default ChartField values typically applied to a transaction distribution.<br>Distribution Code security can be enabled or disabled by component. Distribution Code security behaves the same way as ChartField Security by controlling the list of values an end user is authorized to access. Distribution Code security is independent of ChartField Security with the exception of the Validation process when rules are built. The Validation process tests for conflicts between the equivalent ChartFields of the distribution code and any existing ChartField rules assigned to the user.        |
| Inquiry                      | Pages used to support online queries of data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Override Secured Prompt List | The configuration of security rules permits the user to bypass secured prompt lists for ChartFields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Partial Access</b>        | <p>You can set the <b>Partial Access</b> option to <i>Deny Access</i> or <i>Grant Access</i>. For example, for a transaction containing multiple rows of ChartFields (such as in Journal Entry), some rows contain authorized values of ChartFields and some do not. In this case, a user has partial access. Also, if one of the ChartFields in a row contains an authorized value but another ChartField value in the same row is not authorized, then the partial access option applies. That is, the user has access to Department 41000 but not to Program 6700.</p> <p>See <a href="#">Security Options - ChartField Security Page</a>.</p> |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                           |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security Method         | The method you select for controlling security: user, role, or permission list.                                                                              |
| Source Product          | A way to partition the security values by product. For example, an accounts payable clerk can have different security setups in Payables and General Ledger. |

## Describing General ChartField Security Functionality

This section provides an overview of general ChartField Security functionality, lists prerequisites, and discusses the following basic functionality:

- Secure access to transaction pages.
- Secure access to accounting data.
- Secure ChartField prompt edit values.
- Secure defaulted ChartField values.
- Secure distribution code prompt values.

---

**Note:** This section describes ChartField Security basic functionality and general behavior of the component pages that support ChartField Security. This behavior is common across all the products that support ChartField Security. However, this behavior may deviate for some of the products. Any specific behavior that deviates from the general behavior that is described in this section is documented within the individual product sections. For product-specific information, see the associated product sections in this topic.

---

## Securing Access to Transaction Pages

ChartField Security is designed so that transactions with one or more lines containing secured ChartField values are not accessible.

ChartField Security restricts access to component pages that display a single transaction, such as a voucher, journal, or purchase order. You are allowed access to the pages only if the authorization to view the accounting data of the transaction is defined in the security setup.

You can secure access for:

- Component search lists.
- Page drill links.
- Component action option.

## Securing Access for the Component Search List

ChartField Security is enforced when you select the transaction from the component search list. You are only allowed access to the component pages if you are authorized to view the ChartField values of the transaction. When you open a component, the system displays a search page that contains a search list. The search list contains a list of items (transactions) that you can select to open the component pages. ChartField Security does not filter the component search list; therefore, you are able to view the entire component search list based on the search criteria, as shown in the following example:

Secure access from component search page example

| <a href="#">US001</a>         | 0000000002                 | 02/20/2001                   | 0                               | (blank)                                  | US005                              | Edit Req'd                            | Not Chk'd                                     | RECORDING                    | ONL                    |

When you select a transaction from the component search list, ChartField Security determines if you are authorized to open the component pages. If you are not authorized, then the system displays the following message and denies access:

ChartField Security access error message

**Message**

Access denied due to ChartField Security (9050,204)

This transaction cannot be accessed due to ChartField Security. You may not view the transaction because it contains one or more ChartField values which you are unauthorized to view. Please contact your security administrator for more information

## Securing Access for Page Drill Links

Some component pages provide links and buttons that allow you to drill to a page that displays the transaction data. ChartField Security secures access to transaction pages from the drill links. The following provides an example of security from drill links:

Secure access from drill links example

Security is enforced when you select the link to drill to the transaction detail.

Some product pages allow you to directly enter a ChartField value as an alternative to using a prompt list of values. This method bypasses the secured view, which controls the authorized list of values you may access.

## Securing Access for the Component Security Action Option

ChartField Security supports an option to determine access behavior when the user is only authorized to view or modify some of the accounting rows for a single transaction. Possible option values are:

- *Deny Access*: Restrict access to the transaction pages if the user is not authorized to at least one ChartField value in the transaction. Access is only granted if the user has access to all the ChartField values in the transaction.
- *Grant Access*: Restrict access to the transaction pages if the user is not authorized to view or modify all the ChartField values in the transaction. Access is granted if the user has access to at least one ChartField value in the transaction.

An example of security behavior for action options is presented below with the following scenario:

- Secured ChartFields are Department and Operating Unit.
- Authorized Department values are: 11000, 12000, 13000, 14000 and 15000.
- Authorized Operating Unit Value is CALIF.

The following table presents scenarios given the aforementioned security and shows access behavior under each of the two action options:

| <b>Scenario</b>                                                                                                         | <b>Deny Access Option</b> | <b>Grant Access Option</b>                                                                  |
|-------------------------------------------------------------------------------------------------------------------------|---------------------------|---------------------------------------------------------------------------------------------|
| Transaction distribution: <ul style="list-style-type: none"> <li>Department 20000</li> <li>Oper Unit CALIF</li> </ul>   | Access is denied.         | Access is granted because the user is authorized for at least one of the ChartField values. |
| Transaction distribution: <ul style="list-style-type: none"> <li>Department 14000</li> <li>Oper Unit NEWYORK</li> </ul> | Access is denied.         | Access is granted because the user is authorized for at least one of the ChartField values. |

ChartField Security recognizes blank values as authorized values. In the example pictured, the user is authorized to access the transaction pages for both options:

This example illustrates the fields and controls on the Example of blank values as authorized values. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Edit Journal' window in Oracle Financials. The header shows 'Unit: US001', 'Journal ID: SAMPLE03', 'Date: 01/29/2009', and '\*Process: Edit Journal'. Below the header, there are tabs for 'Header', 'Lines', 'Totals', 'Errors', and 'Approval'. The 'Lines' tab is active, showing a table with columns: Select, Line, Unit, Ledger, SpeedType, Account, Oper Unit, Dept, Currency, Amount, and Rate Type. Three lines are listed: Line 1 (Account 610000, Dept 14000, Amount 380,000.00), Line 2 (Account 614000, Amount 20,000.00), and Line 3 (Account 207000, Amount -400,000.00). Below the lines table, there is a 'Lines to add' section with a '1' in a box. At the bottom, the 'Totals' section shows 'Unit: US001', 'Total Lines: 3', 'Total Debits: 400,000.00', 'Total Credits: 400,000.00', and 'Journal Status: N'.

## Securing Access to Accounting Data

ChartField Security uses a different method to secure access to accounting information that is sourced from multiple transactions. Instead of securing access to the page, ChartField Security only displays the data that the user is allowed to access. This data typically includes inquiry components that display posted accounting data, such as GL Ledger Inquiry.

The following examples show the inquiry results. The first shows when ChartField Security is not enabled, and the second shows when it is enabled.

When ChartField Security is not enabled, all the ledger rows appear for the ledger criteria:

This example illustrates the fields and controls on the Not enabled ChartField Security. You can find definitions for the fields and controls later on this page.

**Ledger Inquiry**

**Note:** Because ChartField Security restricts information in these components, you need to determine if security is required for certain users. For example, users who need access to all the information in order to perform their daily tasks will not require security. ChartField Security setup supports disabling security at the component level and overriding security for specific users.

**Note:** The component security action option is not supported for these components.

## Securing ChartField Prompt Edit Values

Chartfield Security restricts users to only select or directly enter authorized Chartfield values. This applies to transaction entry components and components that allow users to update the transaction ChartFields. This does not apply to the inquiry components unless the prompt field value is used to update transaction data.

The following presents an example of a prompt list that includes only the authorized values:

## Journal Entry - Lines page: example of selecting prompt with only authorized values

The screenshot shows the 'Journal Entry - Lines' page. At the top, there are tabs: Header, Lines, Totals, Errors, and Approval. Below the tabs, the 'Unit' is set to 'US001', 'Journal ID' is 'MYJOURNAL', 'Date' is '01/27/2009', and '\*Process' is 'Edit Journal'. There is a 'Process' button and a 'Template List' link. Below this, there is a 'Change Values' link and an 'Inter/IntraUnit' button. The main section is titled 'Lines' and contains a table with columns: Select, Line, \*Unit, \*Ledger, SpeedType, Account, Dept, Currency, Amount, Rate Type, and Exchange Rate. The table has one row with Line 1, Unit US001, Ledger LOCAL, Account 100000, Currency USD, Amount, Rate Type CRRNT, and Exchange Rate 1.00000000. Below the table, there is a 'Lines to add:' section with a '1' in a box and plus/minus buttons. A tooltip 'Look up Dept (Alt+5)' is visible over the 'Dept' field. At the bottom, there is a 'Totals' section with columns: Unit, Total Lines, Total Debits, Total Credits, and Journal Status. The totals for Unit US001 show 1 total line, 0.00 total debits, and 0.00 total credits, with a journal status of 'N'.

When selecting the Dept prompt, the user can access only the authorized values:

Example of authorized prompt list

The screenshot shows a 'Look Up Dept' dialog box. The 'SetID' is 'SHARE'. The 'Department' field has a dropdown menu set to 'begins with'. There are 'Look Up', 'Clear', and 'Cancel' buttons, along with a 'Basic Lookup' link. Below the buttons, there is a 'Search Results' section. It shows 'View 100' and 'First 1-5 of 5 Last'. The results are listed in a table with columns: Department Description and Manager Name. The results are: 11000 Information Services Miller, Samuel; 12000 Public Affairs Miller, Samuel; 13000 Finance Rister, James; 14000 Administration Zak, Jill; and 15000 Business Services Ellis, Hugh.

If a user tries to directly enter an unauthorized value in the secured field, they receive the following error:

## ChartField security prompt error message

## Securing Defaulted ChartField Values

Several products support features that provide default ChartField values from a predefined setup. For example, SpeedTypes and SpeedCharts are used in some financial online transaction pages to provide default ChartField values.

---

**Note:** Generally, default values are secured unless documented in the product-specific sections. However, ChartField values that are provided by default from SpeedTypes and SpeedCharts are not secured since you can set them up by user ID or permission list.

---

## Securing Distribution Code Prompt Values

ChartField Security supports securing the distribution code prompt values for the products that use distribution codes to provide default ChartField values. Similar to the ChartField prompt values, ChartField Security only displays the authorized values in the prompt list. ChartField Security does not look at distribution codes to authorize access to transaction pages. Only the distribution code prompt values are secured.

In the following example, the prompt list includes only the authorized distribution codes:

This example illustrates the fields and controls on the Example of Look Up Code prompt showing authorized codes. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Look Up Code' dialog box in the PeopleSoft Billing system. The background window displays the 'Header - Info 1 | Line - Info 1 | Acctg - Rev Distribution' section. The 'Look Up' dialog box is open, showing the 'SetID' as 'SHARE' and the 'Revenue Dist Code' as 'begins with'. The 'Search Results' table lists the following data:

| Revenue Dist Code | Effective Date | Description               |
|-------------------|----------------|---------------------------|
| REV-MAINT         | 01/01/1900     | Maintenance Revenue       |
| REV-OTHER         | 01/01/1900     | Other Revenue             |
| REV-PROD          | 01/01/1900     | Product Revenue           |
| REV-RETAIL        | 05/23/2000     | Revenue From Retail Sales |

**Note:** Security for distribution code can be enabled and disabled at the component level in the Component Registry page.

### Understanding ChartField Security Setup

To set up ChartField Security, you must:

- Define security options and products using the ChartField Security page group.

- Identify security requirements at the component level. Use the Component Registry page to enable or disable components and to set component level options.
- Define security rules using the ChartField Security Rules page.
- Assign security rules using the Assign Rules, Exceptions, and Security Values pages.
- (Optional) Copy security rules for users, roles, permission lists, or all three.

Set up ChartField Security in this sequence:

1. Select the ChartFields you want to secure.
2. Define the rules.
3. Assign rules to user, role, permission list, or all three.
4. Build rules.
5. Enable the **ChartField Security** option.

See [Component Registry - Secured Components Page](#).

See [ChartField Security Rules Page](#).

See [Assign Security Rule to User ID Page](#).

## Prerequisites

You must complete the following steps before you can enable ChartField Security:

- Define ChartFields to meet your unique requirements.
- Determine which ChartFields require securing.
- Determine the security level best suited for your needs.

See [Understanding PeopleSoft ChartFields](#)

See [Understanding PeopleSoft Application Security](#).

## Security Options - ChartField Security Page

Use the Security Options - ChartField Security page (SEC\_FIELDS) to enable ChartFields for security, set security level (user, role, permission list), and enable individual products.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Secure ChartField Options > Security Options**

This example illustrates the fields and controls on the Security Options - ChartField Security page. You can find definitions for the fields and controls later on this page.

Your selections on this page determine the ChartField Security method, secured fields, and records.

| Field or Control   | Description                                                                                                                                                                                                           |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>No Security</b> | Select to disable ChartField Security if it was previously enabled by user ID, role, or permission list. Also select this field if you want to enable ChartField Security at a later date but complete the setup now. |

| Field or Control | Description                                          |
|------------------|------------------------------------------------------|
| <b>User ID</b>   | Select to define rules to assign directly to a user. |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                 |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Role</b>             | Select to assign security rules by roles created in PeopleSoft PeopleTools security. You can facilitate setup by assigning large groups of users to similar rules. |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                    |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Permission List</b>  | Select to assign security rules using the row security permission list on the Tools Users Profile page. The PeopleTools User Profile page allows you to define a row security permission list that can be different from the primary permission list. |

## Component Security Action

The selection for this field determines the default access behavior when a user is only authorized to view or modify some of the rows for a transaction or some of the ChartField values in a transaction.

| <b>Field or Control</b>             | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>When user has partial access</b> | <p>To allow a user partial access, select <i>Grant Access</i>. If you select <i>Deny Access</i>, the user will not have access to any ChartField values or transactions.</p> <hr/> <p><b>Note:</b> Keep in mind that blank ChartField values are implicitly treated as authorized values. This may be significant when using the partial access option <b>Grant Access</b>. There are some online pages that do not display the full set of ChartFields based on user setup. One example is the Budget Journal Entry, which only displays the ChartFields that are set up as Budget Keys in the Budget Definition. The partial access option <b>Grant Access</b> should not be used for this page if one of the secured ChartFields is not set up as a Budget Key. In this case, the ChartField value will always be blanks.</p> <hr/> |

## Secured Fields

View and select active, delivered ChartFields. You can save the security setting without selecting a ChartField.

---

**Warning!** You may select only one or two ChartFields.

---

| <b>Field or Control</b>            | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Active</b>                      | <p>Select to enable and disable security for a specific field.</p> <p>ChartField Security supports the following ChartField selection:</p> <p>ACCOUNT</p> <p>ALTACCT</p> <p>DEPTID</p> <p>OPERATING_UNIT</p> <p>PRODUCT</p> <p>FUND_CODE</p> <p>BUDGET_REF</p> <p>PROGRAM_CODE</p> <p>CLASS</p> <p>CHARTFIELD1</p> <p>CHARTFIELD2</p> <p>CHARTFIELD3</p> <p>PROJECT_ID</p> <hr/> <p><b>Note:</b> ChartField Security also supports customized non-delivered ChartFields that you add during ChartField Configuration. See Securing Customized ChartFields for additional required setup.</p> <hr/> |
| <b>Secure Affiliate ChartField</b> | <p>Select this check box to secure the related ChartField affiliate prompt values. For example, when Fund Affiliate is enabled, the prompt view for affiliate displays only those values associated with the fund code values you are authorized to access.</p>                                                                                                                                                                                                                                                                                                                                    |

## Security Records

View ChartField associated delivered records. Each ChartField that is enabled for security is associated with a security record for user ID, role, or permission list.

---

**Note:** Table names may not be changed. The ChartField Configuration process creates the security records.

---

## Inquiry Views

The Inquiry Views tab displays the security views for each ChartField that are used by the Security Values Page, which displays the secured ChartField values. You can change the inquiry views that are used on this page.

Review the delivered inquiry security views. Each ChartField that is enabled for security is associated with an inquiry security view for user ID, role, or permission list.

---

**Note:** This is delivered metadata and modifying the existing data is not recommended.

---

## Secure ChartField Options - Products Page

Use the Secure ChartField Options - Products page (SEC\_CF\_PROD) to select products to be enable or disable for ChartField Security.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Secure ChartField Options > Products**

This example illustrates the fields and controls on the Secure ChartField Options - Products page. You can find definitions for the fields and controls later on this page.

| Active                              | Source Product      |
|-------------------------------------|---------------------|
| <input checked="" type="checkbox"/> | Asset Management    |
| <input checked="" type="checkbox"/> | Billing             |
| <input checked="" type="checkbox"/> | Commitment Control  |
| <input checked="" type="checkbox"/> | Contracts           |
| <input checked="" type="checkbox"/> | Cost Management     |
| <input checked="" type="checkbox"/> | Expenses            |
| <input checked="" type="checkbox"/> | General Ledger      |
| <input checked="" type="checkbox"/> | Grants Management   |
| <input checked="" type="checkbox"/> | Inventory           |
| <input checked="" type="checkbox"/> | Order Management    |
| <input checked="" type="checkbox"/> | Payables            |
| <input checked="" type="checkbox"/> | Project Costing     |
| <input checked="" type="checkbox"/> | Purchasing          |
| <input checked="" type="checkbox"/> | Receivables         |
| <input checked="" type="checkbox"/> | Service Procurement |

Your selections on this page determine whether a product is enabled or disabled for ChartField Security. When you disable a product, all registered components for that product are also disabled for ChartField Security. You can enable a product but disable some of its components.

| Field or Control | Description                                                                                                                                                                                                                         |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active           | Select this check box to enable security for source products in the list. When you enable or disable a source product, all components associated with the source product in the component registry are enabled or disabled as well. |

**Note:** When a product and its components are enabled for ChartField Security, you must define rules and assign users, roles, and permission lists. If you do not define rules, then users will not be able to access the product components nor enter or view transactions. When you enable a product and one or all of its components, ChartField Security is strictly enforced.

Component Registry - Secured Components Page

Use the Component Registry - Secured Components page (SEC\_COMP\_REG) to list ChartField Security components.

Disable or enable ChartField Security for components.

Navigation:

Set Up Financials/Supply Chain > Security > ChartField Security > Register Components > Component Registry

This example illustrates the fields and controls on the Component Registry - Secured Components. You can find definitions for the fields and controls later on this page.

| <b>Active</b>                                                                                        | <p>Enable or disable ChartField Security for a component by selecting or deselecting this check box.</p> <hr/> <p><b>Note:</b> Most components are delivered with the <b>Active Flag</b> field enabled. However, some components are delivered as disabled for ChartField Security. These components typically do not require security, but you can enable security for these components.</p> <hr/>                                                                                                                                                            |
|  Drill to Component | Click to navigate directly to the component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Secure Dist Code</b> (secure distribution code)                                                   | <p>Select this check box to enable components that support a distribution code. This check box is grayed out for components that do not use distribution codes. Distribution code security rules work much like ChartField Security rules do. When this check box is selected for a component, you must define rules for the distribution code and assign those rules to end users who have access to the component.</p> <hr/> <p><b>Note:</b> ChartField Security only secures the prompt values for a distribution code, not the component access.</p> <hr/> |

| <b>Field or Control</b>           | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Source Product</b>             | <p>Lists the source PeopleSoft product that the component is associated with and establishes the link between products and their components. You can change the Source Product assignment for a component to group it with a different product to provide additional flexibility for components that may be shared by multiple products.</p> <hr/> <p><b>Note:</b> If this list box is grayed out, the product is not secured with ChartField Security.</p> <hr/> <p>Use this field to reassign a component to another product. For example, you can reassign PeopleSoft General Ledger exception tables to PeopleSoft Commitment Control because the users of these tables are Commitment Control users.</p> <p>Your selection here is related to the function of the product and how you use it.</p> <hr/> <p><b>Note:</b> There may be components that are shared by two different products. One product may be enabled for security and another product may not. For example, the Budget Journal Exceptions component is owned by Commitment Control but shared with General Ledger. If General Ledger is enabled for security and Commitment Control is not, then the Budget Journal Exceptions component will <i>not</i> be active for ChartField Security. In this case, you can change the source product here for the Budget Journal Exceptions component to General Ledger; which would then activate it for security enforcement.</p> <hr/> |
| <b>Single Transaction Display</b> | <p>Select this check box to indicate that the component displays one transaction. If the component displays many rows of transaction information, then do not select this check box. When a new row of transaction information is added, you may edit this check box. Once saved, this information cannot be changed because this setting determines the way in which ChartField Security executes.</p> <p>An example of a single-transaction display page is an expense report or payables voucher. A user entering the component views only one transaction at a time.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Field or Control</b>          | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Component Security Action</b> | <p>This field determines the access behavior when a conflict occurs between ChartField rules, which is called <i>partial access</i>. You can override the security action setting in the Security Options page for partial access conditions. You also can selectively disable components in a product that is enabled for security.</p> <p>Options are:</p> <p><i>Deny Access</i>: Do not allow access.</p> <p><i>Grant Access</i>: Allow access to transaction.</p> <p><i>Default to Higher Level</i>: Use the option selected on the ChartField Security Options page as the default.</p> <hr/> <p><b>Note:</b> This selection applies only to components that have the <b>Single Transaction Display</b> field enabled.</p> <hr/> |

## Register Components - Record Details

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                  |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Header Record</b>    | Provides the header record name used in the component. This value should not be changed. This record includes the key structure that identifies the transaction.                                    |
| <b>Detail</b>           | Select this link to access the Component Details page, where you can view additional component information and associate the prompt edit tables defined in the Edit Table Set to the detail record. |

## Component Details Page

Use the Component Details page (SEC\_COMP\_SEC) to list component detail records and associate ChartField prompt edit tables (defined in the Edit Table Set) to the detail record.

Navigation:

Click the **Detail** link on the Component Registry - Record Details page.

This example illustrates the fields and controls on the Component Details page. You can find definitions for the fields and controls later on this page.

Component Details

Component ASSET\_ENTRY Express Asset Add

Details Personalize Find View All First 1 of 1 Last

| Active                              | *Detail Record | Record Description      | Edit Table Set |
|-------------------------------------|----------------|-------------------------|----------------|
| <input checked="" type="checkbox"/> | COST           | Asset Cost Transactions | Standard       |

This page shows the detail record (or records) that are delivered for each component. You can activate or inactivate specific detail records for each component. At least one record should be active for ChartField Security to be enabled.

The detail record includes the same key fields as the header record. ChartField Security supports multiple detail records. For Transaction Entry or Transaction Data Correction Components only, the Edit Table Set must be identified. For inquiry components, the **Edit Table Set** field should be blank because it does not require inquiry components, even if the component includes prompt edits for the criteria selection.

| Field or Control          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active                    | Select to include the detail records for ChartField Security.<br>For example, it may not be necessary to secure all the detail records in Bill Entry. Each detail record that is active adds overhead cost to open the component.<br><br><b>Note:</b> Most components include only one or two detail records. For these components, the overhead should not be an issue.                                                                                                                                  |
| Detail Record             | This column displays if the <b>Single Transaction Display</b> check box is selected from the Register Components - Options page. The detail record stores the ChartFields and distribution codes.                                                                                                                                                                                                                                                                                                         |
| Detail Record/Search View | This column displays if the <b>Single Transaction Display</b> check box is not selected from the Register Components - Options page. This field contains the associated detail record that stores the ChartFields or the search view that is used to retrieve the data in the inquiry pages. If a product component uses more than one detail record or search view for security in the component, then each record must be identified in a separate row, as shown in the example that is pictured below. |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Security View</b>    | Contains the associated security search view that is used by the inquiry pages to retrieve accounting data. The view retrieved is based on registered metadata configured during the installation process. The list of values is restricted to the authorized values for the user and product.                                                                                                                                                           |
| <b>Edit Table Set</b>   | Defines the set of prompt edit tables used by the product component. The <b>Edit Table Set</b> field controls the prompting for each ChartField enabled for security. Only one Edit Table Set value may be assigned to a detail record, and it should be assigned using the same guidelines used by products for standard ChartField validation in their transaction pages. This field will be blank if the page does not require prompt value security. |

The example pictured shows the component details for the Detail Budget Maintenance component. This component has multiple detail records (DTL\_LEDG\_DVW and LEDGER\_BUDG):

This example illustrates the fields and controls on the Component Details page (Single Transaction Display check box not selected on Register Components - Options page). You can find definitions for the fields and controls later on this page.

## Working With Shared Components

ChartField Security is implemented at the component level. Occasionally, a component is shared by two different products. One product may be enabled for security and the other product may not. For example, the Requisitions component is owned by eProcurement, but it is shared with Purchasing. If Purchasing is enabled for security and eProcurement is not, then the Requisitions component will *not* be active for ChartField Security. In this scenario, you can change the source product using the Source Components - Component Registry page for the Requisitions component to Purchasing. This change would then activate it for security enforcement.

See [Component Registry - Secured Components Page](#).

## Defining ChartField Security Rules, Exceptions, and Values

### Pages Used to Define ChartField Security Rules, Exceptions, and Values

| <i>Page Name</i>                                     | <i>Definition Name</i> | <i>Usage</i>                                                                                                                                                                                                        |
|------------------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ChartField Security Rules Page</a>       | SEC_RULE_DEFN          | Establish and maintain ChartField Security rules.                                                                                                                                                                   |

## ChartField Security Rules Page

Use the Rule Definition - ChartField Security Rules page (SEC\_RULE\_DEFN) to establish and maintain ChartField Security rules.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Define Security Rules > Rule Definition**

This example illustrates the fields and controls on the Rule Definition - ChartField Security Rules page. You can find definitions for the fields and controls later on this page.

For example, if you selected User ID on the Security Options page, then only the User Assignment page will appear.</div> |

**Note:** When PeopleSoft Project Costing is installed, field criteria is controlled by the PC business unit. When PeopleSoft Project Costing is not installed, field criteria is controlled by SetID.

## Users for a Rule Definition Page

Use the Define Security Rules - Users for a Rule Definition page (SEC\_RULE\_ASCUSER) to associate users with a rule definition.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Define Security Rules > Users**

This example illustrates the fields and controls on the Define Security Rules – Users for a Rule Definition page. You can find definitions for the fields and controls later on this page.

Associate specific users for security access to a rule definition. The same associations are made for roles and permission lists using the Roles and Permission Lists tabs.

**Note:** You use the Assign Rules page to associate Rule Definitions to a User, Role or Permission List. The Assign Rules page is used to create and maintain the assignment. This page is used to associate multiple Users, Roles or Permission Lists to a Rule Definition. If the assignment does not already exist, the page will create a new assignment. You can also use this page to remove existing assignment.

### Default values for new rows:

| Field or Control      | Description                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Effective Date</b> | The default effective date is assigned to associated users. When you add a new row for User ID, you can override the defaulted effective date for the row. |
| <b>All Products</b>   | Select to associate users for a given rule for all products. Deselect the check box to associate users to a rule for selected products.                    |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                            |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Products</b>  | Click this link to display the Source Product Selection page (SEC_RULE_PRD_SEC), where you can assign a rule to a selected group of products. |

### Associate Users:

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User ID</b>          | Select user IDs to associate with the ChartField Security rule.                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>      | If rule assignments already exist, then the description becomes a link that allows you to drill down to the Rule Assignment page.                                                                                                                                                                                                                                                                                                            |
| <b>Effective Date</b>   | <p>Users are assigned to security rules by effective date. By default, the effective date of each row added is the value from the default effective date field value. You may elect to use the value for the new user or override it for a specific date during entry.</p> <p>This date represents an As Of date for the rules building process. Only one set of rules may be in effect for a user/role/permission at any point in time.</p> |
| <b>Build</b>            | Click to run the build process that builds the security values for all the rule assignments that are associated with this rule definition. At the same time, the build process builds other rule definitions assigned to the same users who meet the date criteria. Changes to rule assignments will not take effect until the new configuration is built into the security tables.                                                          |

---

**Note:** Rule assignments to users made through this page are automatically assigned to all products unless disabled.

---

## Assign Security Rule to User ID Page

Use the Assign Security Rule to User ID page (SEC\_RULE\_USER) to facilitate the assignment of multiple rules to one user.

Perform ongoing maintenance of security rule assignments as organizational changes, such as employee terminations, transfers, new hires, and so on, occur.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Assign Security Rule to User > Assign Rules**

This example illustrates the fields and controls on the Assign Security Rule to User ID page. You can find definitions for the fields and controls later on this page.

| Field or Control                                                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Effective Date</b>                                                               | Enter an effective data for the security rules that will be assigned. New and changed rule assignments must be built according to the effective date of the assignment. Only one effective date record can be built and be in effect at any point in time. You can set up future-dated changes to security rules before an implementation date, but you must perform the Build process on that date.                                                                             |
| <b>Status</b>                                                                       | The effective date status for the security rule.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Super User</b>                                                                   | Select to cancel ChartField Security and identify the user as one who has access to all values of the secured ChartFields. When this check box is enabled, you do not need to assign security rules or exceptions.                                                                                                                                                                                                                                                               |
| <b>Field Name</b>                                                                   | <p>Select the secured ChartField for which rules will be assigned. Only the ChartFields enabled for security are available.</p> <p><b>Note:</b> You will not be allowed to change or delete the Field Name when security rules values are built in the security tables for that field. You must delete the security values before you change or delete this field. You can schedule a process request to delete the values from a run control or you can click <b>Build</b>.</p> |
| <b>Security Rule</b>                                                                | Select the ChartField Security rule to be assigned to this user.                                                                                                                                                                                                                                                                                                                                                                                                                 |
|  | Select this icon when a group of values must be assigned to the user.                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>                                                                  | Displays the Security Rule description. Click the description link to drill down for more information about the security rule.                                                                                                                                                                                                                                                                                                                                                   |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                          |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>All Products</b>     | Provides a simple way to enable a rule assignment that will apply to all product components. Assignments made through the ChartField Security Rule - Definition page will, by default, assign the rule to users for all product components. |
| <b>Select Products</b>  | If the <b>All Products</b> check box is deselected, then the Select Product text becomes a link that will open a page for selecting individual products.                                                                                    |
| <b>Build</b>            | Click to schedule the Build process that builds the security rule values into the security tables. When you click <b>Build</b> , the Build Security Rules page appears.                                                                     |
| <b>Message Log</b>      | Click this link to navigate to the Message Log page, where you can review the message log post build.                                                                                                                                       |

See [ChartField Security Rules Page](#).

## Component Exceptions Page

Use the Assign Rule to User - Component Exceptions page (SEC\_COMPEX\_USER) to specify components exceptions to ChartField Security for a user.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Assign Rule to User > Exceptions**

This example illustrates the fields and controls on the Component Exceptions page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Component Exceptions' page. At the top, there are tabs for 'Assign Rules', 'Exceptions' (selected), and 'Security Values'. Below the tabs, the page title 'Component Exceptions' is displayed. The user is identified as 'User ID DVP1' (Smith, Jane). The 'Effective Date' is '01/24/2013' and the 'Status' is 'Active'. There are navigation links: 'Find | View All' and 'First 1 of 1 Last'. Below this, there is a section titled 'Specify Component Exceptions' with a sub-header 'Personalize | Find | View All | [icon]'. It shows a table with columns: 'Component', 'Description', and 'Override Prompt List Security'. The table contains two rows: 'JOURNAL\_ENTRY\_IE' with description 'Journal Entry' and 'OPEN\_ITEM\_UPDATE' with description 'Open Item Update'. Both rows have a checked box in the 'Override Prompt List Security' column. There are also '+' and '-' buttons next to each row.

Exceptions override ChartField Security for the component that you select. They also allow access to all ChartField values in the component.

| <b>Field or Control</b>              | <b>Description</b>                                                                                                                                                                |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Component</b>                     | Select the component name for which you want to make an exception.                                                                                                                |
| <b>Override Prompt List Security</b> | This check box allows you to refine the access rule. Select this option to override the secured prompt lists and allow edit access to all ChartField values within the component. |

## Security Rule Values Page

Use the Security Rule Values page (SEC\_RULE\_DV\_U) to view security values populated in the security table from the Security Build process.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Assign Rule to User > Security Values**

| <b>Field or Control</b> | <b>Description</b>                                                                                                                         |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Name</b>       | The system displays only one value at a time.                                                                                              |
| <b>Source Product</b>   | Select to filter the results for a specific source product.                                                                                |
| <b>Fetch</b>            | Click this button to retrieve security values populated by the Build process. If no rule assignment was ever built, no values will appear. |

See the product documentation for the User Profile Table and Rule Assignment page in *PeopleTools: Security Administration*.

## Maintaining Additional Security Rules

Use the Assign Security Rule to Role page (SEC\_RULE\_ROLE) to facilitate the assignment of multiple rules to one role.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Assign Security Rule to Role > Assign Rules**

Use the Assign Rule to Role - Component Exceptions page (SEC\_COMPEX\_ROLE) to specify component exceptions to ChartField Security for a role.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Assign Security Rule to Role > Exceptions**

Use the Assign Rule to Role - Security Rule Values page (SEC\_RULE\_DV\_R) to view security values populated in the security table from the Security Build process.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Assign Security Rule to Role > Security Values**

Use the Assign Security Rule to Permission List page (SEC\_RULE\_PERM) to facilitate the assignment of multiple rules to one permission list.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Assign Rule to Permission List > Assign Rules**

| <i>Field or Control</i> | <i>Description</i>                                                                                                                             |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Select Products</b>  | Click this link to access the Select Source Products page (SEC_RULE_U_PRD), where you can select source products to assign to a security rule. |

Use the Assign Rule to Permission List - Component Exceptions page (SEC\_COMPEX\_PERM) to specify component exceptions to ChartField Security for a permission list.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Assign Rule to Permission List > Exceptions**

Use the Assign Rule to Permission List - Security Rule Values page (SEC\_RULE\_DV\_P) to view security values populated in the security table from the Security Build process.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Assign Rule to Permission List > Security Values**

---

## Building ChartField Security Rules

### Pages Used to Build ChartField Security Rules

| <i>Page Name</i>                 | <i>Definition Name</i> | <i>Usage</i>                                                                                                                            |
|----------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| <u>Build Security Rules Page</u> | SEC_BUILD_PARMS        | Implement incremental changes and enable scheduling of the Build process that builds the security rule values into the security tables. |

| <b>Page Name</b>                   | <b>Definition Name</b> | <b>Usage</b>                        |
|------------------------------------|------------------------|-------------------------------------|
| <u>Security Build Request Page</u> | SEC_BUILD_REQ          | Schedule and run the Build process. |

## Build Security Rules Page

Use the Build Security Rules page (SEC\_BUILD\_PARDS) to implement incremental changes and enable scheduling of the Build process that builds the security rule values into the security tables.

Navigation:

Click the **Build** button from the Assign Rules page of the User, Role, or Permission List components.

This example illustrates the fields and controls on the Build Security Rules page. You can find definitions for the fields and controls later on this page.

Build Security Rules

Request Parameters

\*Process Type

Build

▼

\*As of Date

01/24/2013

31

Field Name

▼

**Note:** You should create a run control process to perform a regularly scheduled build to enhance system performance and to update your information.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                           |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Process Type</b>     | Select <i>Build</i> to build the security rules to the security tables.<br>Select <i>Delete</i> to delete existing values in the security tables.                                                                                                                                            |
| <b>As of Date</b>       | The system provides the current system date by default. This value drives the effective date processing for selecting the rule assignments. The Build process uses the most current effective dated rule assignment for a user/role/permission that is less than or equal to the As of Date. |
| <b>Field Name</b>       | Select a specific field in the Field Name list. If this field is blank, the Build process builds the values for all of the fields in the rule assignments.                                                                                                                                   |

**Note:** The Build process uses the effective date to indicate the rule or rules used in the Build process. Only one set of rules resides in the flattened tables. Therefore, the Build process ignores any other effective dated rows. You must run the Build process on the day of the future dated row to put a future rule into effect.

See [Security Build Request Page](#).

## Security Build Request Page

Use the Security Build Request page (SEC\_BUILD\_REQ) to schedule and run the Build process.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Request CF Security Build**

This example illustrates the fields and controls on the Security Build Request page. You can find definitions for the fields and controls later on this page.

| <b>Field or Control</b>             | <b>Description</b>                                                                                                                                                                                             |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Process Type</b>                 | Select <i>Build</i> to build the security rules to the security tables. Select <i>Delete</i> to delete existing values in the security tables.                                                                 |
| <b>Request Date Option</b>          | Select the date that drives the effective date processing for selecting the rule assignments and tree data. Select <i>As Of Date</i> or <i>System Date</i> to use the current system date.                     |
| <b>Security Method</b>              | The system provides the default security method value selected on the Security Options page. Select to run the build and populate the ChartField Security tables for User ID, Role, or Permission List values. |
| <b>Field Name</b>                   | Select a specific field to build the security rules or to delete security values. If you leave the field blank, the Build process creates values for all fields in the rule assignments.                       |
| <b>User ID/Role/Permission List</b> | Specify a specific User, Role, or Permission List to build or delete values in the <b>User ID</b> field. If you leave this field blank, the Build process selects all the rule assignments for processing.     |

**Note:** You should schedule the Build process periodically to process effective dated rule assignment changes.

See [Security Options - ChartField Security Page](#).

## Copying ChartField Security Rule Assignments

### Pages Used to Copy ChartField Security Rule Assignments

| <i>Page Name</i>                                 | <i>Definition Name</i> | <i>Usage</i>                                                                           |
|--------------------------------------------------|------------------------|----------------------------------------------------------------------------------------|
| <u>Copy User Rule Assignment Page</u>            | SEC_USER_COPY          | Copy a set of security rules assigned to a user permission list to another user.       |
| <u>Copy Role Rule Assignment Page</u>            | SEC_ROLE_COPY          | Copy a set of security rules assigned to a role permission list to another role.       |
| <u>Copy Permission List Rule Assignment Page</u> | SEC_PERM_COPY          | Copy a set of security rules assigned to a permission list to another permission list. |

### Copy User Rule Assignment Page

Use the Copy User Rule Assignment page (SEC\_USER\_COPY) to copy a set of security rules assigned to a user permission list to another user.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Copy CF Security for a User**

This example illustrates the fields and controls on the Copy User Rule Assignment page. You can find definitions for the fields and controls later on this page.

Select a User ID from which to copy user rule assignments and select the User ID or IDs to which you want to copy the user rule assignment. Click the Copy button to copy the rule assignment.

The process is the same for roles and permission lists using the Copy Role Rule Assignment page and the Copy Permission List Rule Assignment page, respectively.

## Copy Role Rule Assignment Page

Use the Copy Role Rule Assignment page (SEC\_ROLE\_COPY) to copy a set of security rules assigned to a role permission list to another role.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Copy CF Security for a Rule**

## Copy Permission List Rule Assignment Page

Use the Copy Permission List Rule Assignment page (SEC\_PERM\_COPY) to copy a set of security rules assigned to a permission list to another permission list.

Navigation:

**Set Up Financials/Supply Chain > Security > ChartField Security > Maintain Security Rules > Copy CF Security for Perm Lst**

---

## Securing Customized ChartFields

This topic discusses how to secure non-delivered ChartFields.

### Steps to Secure Customized ChartFields

If you add new ChartFields to your system using the ChartField Configuration Utility, and if you want to enable ChartField Security for any of the customized ChartFields, you must complete additional setup steps.

---

**Note:** These steps are not needed for any of the delivered ChartFields since they are already configured in preparation for potential ChartField Security implementation.

---

Complete the following setup steps for a new ChartField for which you want to implement ChartField Security:

1. Create a new work field to be used in the prompt edit tables for ChartField Security.
2. Add the new work field to the work record that is used by FSCM online pages.
3. Add the new work field to ChartField Security pages.
4. Configure prompt table field properties to use derived work field.
5. Add the new ChartField to the ChartField Security Options page.
6. Add the new ChartField prompt edit views to the ChartField Security Edit Tables page.

## Creating a New Work Field

You can add new ChartFields (customized) by using the ChartField Configuration Utility.

See *PeopleSoft Application Fundamentals, Configuring ChartFields*.

Create a work field for each new ChartField for which you want to secure using ChartField Security. These work fields are used as placeholders for the prompt edit tables that are dynamically assigned at runtime by the online processes.

To create a new work field for the new ChartField, clone an existing work field using Application Designer - Open Definition:

This example illustrates the fields and controls on the Application Designer - Open Definition (Field). You can find definitions for the fields and controls later on this page.

| Field or Control | Description                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| Definition       | Select <i>Field</i> to open a field that you can clone for your new work field.                                                                  |
| Name             | As your selection criteria for the field, enter a prefix of <i>EDIT_</i> to retrieve a list of work fields from which to select.                 |
| Open             | Click this button to retrieve a list of fields from which to select. Open an existing field, such as <i>EDIT_OPER_UNIT</i> , by double-clicking. |

Click the Save icon and save as *EDIT\_<new ChartField name>*. For example, if the new ChartField name is *CFQ*, then save the new work field as *EDIT\_CFQ*. The work field must start with "EDIT\_". It is not imperative, however, to include the new ChartField name in the work field name. Choose a concise and meaningful suffix. Do not change any of the field attributes, such as Field Type, Field Length, or Field Labels.

Adding the New Work Field to the Work Record

Add the new work field that you created for a customized ChartField to the work record, DERIVED, using PeopleTools Application Designer. This is a common work record that is used by the Financials and Supply Chain Management online pages.

To add the new work field to the DERIVED work record, access the record using PeopleTools Application Designer - Open Definition:

This example illustrates the fields and controls on the Application Designer - Open Definition (Record). You can find definitions for the fields and controls later on this page.

| Field or Control | Description                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Definition       | Select <i>Record</i> to retrieve the work record, DERIVED.                                                                        |
| Name             | As your selection criteria for the field, enter the record name, <i>DERIVED</i> and click the Open button to retrieve the record. |

Double-click the DERIVED record from the search result grid to open the record. Add the new work field or fields that you created in the first step. The field position within the record definition is not important. Save the record.

Adding the New Work Field to ChartField Security Pages

Add the new work field that you created for a customized ChartField to the ChartField Security SEC\_CF\_SBP sub page and the INV\_SEC\_CF\_SBR secondary page using PeopleTools Application Designer. These pages are used by the online pages that support ChartField Security.

To add the new work field to the sub page and secondary page, access each within PeopleTools Application Designer - Open Definition:

This example illustrates the fields and controls on the Application Designer - Open Definition (Page). You can find definitions for the fields and controls later on this page.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                          |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Definition</b>       | Select <i>Page</i> to retrieve the sub page or secondary page.                                                                              |
| <b>Name</b>             | As your selection criteria, enter the page name, <i>SEC_CF_SBP</i> or <i>INV_SEC_CF_SBR</i> and click the Open button to retrieve the page. |

Double-click the page from the search result grid to open it. Expand the page to fill the window so that you can add the work field. Perform the following steps on each page to add the new work field:

1. From the Application Designer menu at top, select Insert, Edit Box.
2. Add the edit box to each page (*SEC\_CF\_SBP*) and (*INV\_SEC\_CF\_SBR*).
3. Double-click the edit box to open the Edit Box Properties window and select the following values:
  - **Record Name** - *DERIVED*
  - **Field Name** - *<new work field>*
4. From the Label tab, select *None* for the Type.
5. From the Use tab, select the *Display Only* and *Invisible* check boxes.

6. Save the pages.

## Configuring Prompt Table Field Properties

Within PeopleTools Application Designer, change the record field prompt table properties to use the derived work field instead of the edit table on the ChartField Security sub records. Configure all of the delivered Chartfield Security sub records:

- CFS14\_AN\_SBR
- CFS15\_AN\_SBR
- CFS16\_AN\_SBR
- CFS18A\_AK\_SBR
- CFS21\_AN\_SBR
- CFS29\_AN\_SBR
- CFS9A\_AK\_SBR
- CFS9B\_AK\_SBR

---

***Warning!*** Be very careful to select the ChartField Security sub records to modify and *NOT* the regular ChartField sub records. The ChartField Security sub record prefix is **CFS**, whereas the regular ChartField sub record prefix is **CF**.

---

To configure the record field properties for the ChartField Security sub records, access each record within PeopleTools Application Designer - Open Definition:

This example illustrates the fields and controls on the Application Designer - Open Definition (Record). You can find definitions for the fields and controls later on this page.

| Field or Control | Description                                                                                                                                                                                                                                                                                                                                               |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Definition       | Select <i>Record</i> to retrieve the sub record to configure.                                                                                                                                                                                                                                                                                             |
| Name             | <div>As your selection criteria, enter the ChartField Security sub record name; for example, <i>CFS14_AN_SBR</i> or <i>CFS15_AN_SBR</i> and click the Open button to retrieve the record.</div> <div><b>Warning!</b> Be careful not to select CF14_AN_SBR by mistake. This is the corresponding ChartField sub record, which should not be altered.</div> |

Double-click the record from the search result grid to open it. Complete the following steps to configure properties:

1. Double-click on the new ChartField (that was created by the ChartField Configuration Utility) within the sub record. This launches the Record Field Properties.
2. Select the Edits tab and replace the Prompt Table field value with the work field value that you created. Be sure to preface the work field value with a %. For example, if the new ChartField value is CFQ, the work field that you created (in step 1) might be EDIT\_CFQ. In this case, you would replace the original Prompt Table field value of *CFQ\_TBL* with the new work field value *%EDIT\_CFQ*. Do not change any other field values within Record Field Properties.
3. Click OK and save.

- Repeat these steps for all of the other ChartField Security sub records as listed at the beginning of this section.

## ChartField Security Options Page

Use the ChartField Security Options page to add the new ChartField (that was created by the ChartField Configuration Utility).

Navigation:

**Set Up Financials/Supply Chain >Security >Chartfield Security >Secure Chartfield Options.**

This example illustrates the fields and controls on the Security Options - ChartField Security. You can find definitions for the fields and controls later on this page.

See [Security Options - ChartField Security Page](#).

Complete the following steps:

1. Secured Fields tab - Add a new row and select the new ChartField from the prompt list. Select the **Active** check box to enable ChartField Security for that ChartField.
2. Security Records tab - Select the Chartfield Security tables for the user, role and permission list for the new ChartField. The ChartField Security tables store the secured ChartField values. These tables are created by the ChartField Configuration process when the new ChartField is created.
3. Inquiry Views tab - Select the ChartField Security inquiry views for the user, role and permission list for the new ChartField. These views are used by the Security Values page to display the secured values. These tables are cloned by the ChartField Configuration process.

## Adding the New ChartField Prompt Edit Views

Use the ChartField Security Edit Tables page to add the new ChartField prompt edit views to the Chartfield Security Edit Tables component.

Navigation:

**Set Up Financials/Supply Chain >Security >ChartField Security >Security Edit Tables >Define Default Edit Table Sets.**

These views are used by the prompt edit list in the transaction online pages that support ChartField Security.

This example illustrates the fields and controls on the ChartField Security Edit Tables - Edit Tables. You can find definitions for the fields and controls later on this page.

## Securing ChartFields for PeopleSoft Receivables

This topic provides an overview of securing ChartFields for PeopleSoft Receivables and describes the components in PeopleSoft Receivables that support ChartField Security.

### Understanding Securing ChartFields for PeopleSoft Receivables

Some components include a prompt for distribution code. Although distribution code is not a ChartField, it represents a combination of ChartFields that may need to be secured. Therefore, whenever a prompt for a distribution code appears, the values are secured.

Five components included in the following table do not have a security code. If users attempt to drill down from any of these components to an item with ChartFields that have ChartField Security applied,

they will receive an error. Therefore, these components are considered to be secure and are included in the table. These components are:

- CUST\_PENDING\_ITEM
- DD\_ALL
- DRAFT\_ALL
- ITEM\_RVW\_CST\_SS
- REF\_REASON\_CHNG

The following table lists the components in PeopleSoft Receivables that support ChartField Security:

| <b>Component</b>                                   | <b>Component Description</b> |
|----------------------------------------------------|------------------------------|
| AR_CC_TRAN                                         | Revenue Estimate Review      |
| AR_CC_TRAN_ACT                                     | Revenue Estimate Review      |
| AR_CC_TRAN_ERROR                                   | Revenue Estimate Correction  |
| AR_ITEM_DRILL                                      | Transfer GL and AR           |
| AR_PAYMISC_DRILL                                   | Transfer GL and Paymisc      |
| AR_RVL_DRILL                                       | Transfer GL and Revaluation  |
| AUTO_ENTRY_TABLE2                                  | Automatic Entry Type         |
| CUST_PENDING_ITEM<br>See Introduction paragraph 2. | Outstanding Customer Items   |
| DD_ACCT_ENTRIES                                    | DD Accounting Entries        |
| DD_ALL<br>See Introduction paragraph 2.            | All Direct Debits            |
| DD_WORKSHEET                                       | Direct Debit Worksheet       |
| DRAFT_ALL<br>See Introduction paragraph 2.         | All Drafts                   |
| DRAFT_REVIEW                                       | Draft Review                 |

| <b>Component</b>                                 | <b>Component Description</b>           |
|--------------------------------------------------|----------------------------------------|
| ENT_EXTASID_UPDT                                 | External Pending Item Entry            |
| ENT_EXTNID_ADD1                                  | External Large Group Entry             |
| ENT_EXTSID_ERRORS                                | External Error Correction              |

| WS_WORKSHEET_IC  | Maintenance Worksheet                |

## Securing ChartFields for PeopleSoft Billing

This topic provides an overview of securing ChartFields for PeopleSoft Billing and describes the components in PeopleSoft Billing that support ChartField Security.

### Understanding Securing ChartFields for PeopleSoft Billing

PeopleSoft Billing provides ChartField and Distribution Code security in the components described in this section.

The Billing transaction entry pages allow you to directly enter a Distribution Code, bypassing the prompt list. These pages need to be secured to validate user-entered values against the security prompt list.

In PeopleSoft Billing, many ChartFields and distribution codes are supplied as default values. Default values are not validated against the ChartField Security rules. Therefore, a ChartField can be provided by default to a bill being created even if the user does not have access to the ChartField. In this case, the user can save the bill that contains the default information; however, the ChartField Security feature may restrict access to the transaction pages after the user exits the component.

The following table lists the components in PeopleSoft Billing that support ChartField Security:

| <b>Component</b>   | <b>Component Description</b>       |
|--------------------|------------------------------------|
| BI_ACCT_ENTRY_INV  | BI Accounting Entry by Invoice     |
| BI_ACCT_ENTRY_JRNL | BI Accounting Entries by Journal   |
| *BI_ACCT_STG_COR   | Staged Accounting Entry Correction |
| BI_BILL_SEARCH-I   | Bill Search                        |

| <b>Component</b>  | <b>Component Description</b>  |
|-------------------|-------------------------------|
| BI_BILL_SEARCH-U  | Bill Search - Not Invoiced    |
| *BI_ENTRY         | Bill Entry                    |
| *BI_ENTRY_X       | Express Bill Entry            |
| *BI_INQUIRY       | Bill Inquiry                  |
| BI_IVC_MAINT      | Invoice Maintenance           |
| BI_KK_COR         | Commitment Control Correction |
| BI_TMP_SEARCH     | Search for Temporary Bills    |
| INTFC_BI_C_VW     | Interface Completed View      |
| INTFC_BI_E_VW     | Interface Errors View         |
| INTFC_BI_N_VW     | Interface Pending Items View  |
| INTFC_BI_N_VW_INQ | Interface Pending Items View  |
| KK_XCP_BI1        | Invoice Exceptions            |

**Note:** An asterisk (\*) before the component name indicates that registry entries for these components are delivered with only a subset of detail records enabled for ChartField Security. You can enable or disable the detail records from ChartField Security, depending on the business requirements. Each detail record that is enabled adds overhead to open the component.

See [Component Registry - Secured Components Page](#).

## Securing ChartFields for PeopleSoft Commitment Control

The following table lists the components in PeopleSoft Commitment Control that support ChartField Security:

| <b>Component</b> | <b>Component Description</b> |
|------------------|------------------------------|
| KK_ACT_LOG       | Activity Log Inquiry         |

| <b>Component</b>   | <b>Component Description</b> |
|--------------------|------------------------------|
| KK_BD_XFER2        | Control Budget Transfer      |
| KK_BUDGET_ENTRY    | Enter Budget Journals        |
| KK_GEN_TRANS_ENTRY | Generic Transaction Entry    |
| KK_INQ_BD_DETAIL   | Budget Detail                |
| KK_INQ_LEDGER      | Budget Overview Inquiry      |
| KK_XCP_BD          | Budget Exceptions            |

**Note:** You cannot secure transaction drilldowns in the PeopleSoft Commitment Control budget inquiry and the budget overview inquiry components through ChartField Security. Therefore, the transaction level drilldowns are not secured. If a user has access to the budget level data, then the transaction level data is not secured, which allows access even if the user is not authorized. For the activity log inquiry, only the budget level data is secured when a search is performed.

## Securing ChartFields for PeopleSoft Contracts

The following table lists the components in PeopleSoft Contracts that support ChartField Security:

| <b>Component</b>   | <b>Component Description</b>           |
|--------------------|----------------------------------------|
| CA_ACCT_CRM_JRNL   | CRM Journal Accounting Lines           |
| CA_ACCT_LINE_JRNL  | Contract Accounting Lines Journal      |
| CA_ACCT_RATE_JRNL  | Accounting Rate Journal                |
| CA_AP_DTL_ASIN     | Review as incurred revenue             |
| CA_AP_PC_SUMM_PNLG | Redistribute as incurred revenue lines |
| CA_AP_REDST_CRM    | Redistribute CRM revenue lines         |
| CA_AP_SUMM_PNLG    | Redistribute fixed fee revenue lines   |
| CA_DETAIL_DST      | Accounting Distribution                |

| <b>Component</b>   | <b>Component Description</b>                       |
|--------------------|----------------------------------------------------|
| CA_DETAIL_DST_RED  | Accounting Distribution - Discounts and Surcharges |
| CA_PGP_TERMS       | Progress Payment Terms                             |
| CA_PPD_BY_CONTRACT | Prepaid balances by contract                       |
| CA_PREVIEW_REVENUE | Preview revenue                                    |
| CA_REV_MGMT_DTL    | Fixed Fee Revenue History                          |
| INQ_RMC18_CRITERIA | Review reimbursable contract agreements            |

In PeopleSoft Contracts, the Revenue Reconciliation component (CA\_RECON\_COMP) does not support ChartField Security.

---

## Securing ChartFields for PeopleSoft Cost Management

This table lists the PeopleSoft Cost Management components that support ChartField Security.

| <b>Component</b>   | <b>Component Description</b>                  |
|--------------------|-----------------------------------------------|
| CM_COST_ADJ        | Adjust Average Cost                           |
| CM_COST_ADJ_RETRO  | Adjust Retroactive Cost                       |
| CM_ACCTG_LINE      | Accounting Entries                            |
| CM_DRILL_UNPST_DET | Unposted Accounting Lines                     |
| CM_DRILL_JRNL_DET  | Posted Accounting Lines                       |
| CM_APRECN_INQ      | CM/AP Reconciliation Summary                  |
| CM_APRECN_DETAIL   | CM/AP Reconciliation Detail                   |
| CM_DRILL_ACCT_INV  | Inventory Transactions - Transaction Entries  |
| CM_DRILL_ACCT_ERN  | Earned Conversion Costs - Transaction Entries |

| <b>Component</b>   | <b>Component Description</b>                                               |
|--------------------|----------------------------------------------------------------------------|
| CM_DRILL_ACCT_VAR  | Production Variances - Transaction Entries                                 |
| CM_DRILL_ACCT_SCP  | Production Scrap Costs - Transaction Entries                               |
| CM_DRILL_ACCT_MFG  | Production Actual Costs - Transaction Entries                              |
| CM_DRILL_ACCT_REV  | Standard Cost Revaluations - Transaction Entries                           |
| CM_DRILL_ACCT_ADJ  | Avg Cost Adjustment Entries- Transaction Entries                           |
| CM_DRILL_ACCT_UAD  | Actual Cost Adjustment Entries- Transaction Entries                        |
| CM_DRILL_ACCT_NSS  | Non Stock Shipment - Transaction Entries                                   |
| CM_DRILL_INV_DET   | Inventory Transactions - Transaction Details                               |
| CM_DRILL_ERN_DET   | Earned Conversion Costs - Transaction Details                              |
| CM_DRILL_VAR_DET   | Production Variances - Transaction Details                                 |
| CM_DRILL_SCP_DET   | Production Scrap Costs - Transaction Details                               |
| CM_DRILL_ACCT_MFG  | Production Actual Costs - Transaction Details                              |
| CM_DRILL_REV_DET   | Standard Cost Revaluations - Transaction Details                           |
| CM_DRILL_ADJ_DET   | Avg Cost Adjustment Details- Transaction Details                           |
| CM_DRILL_UADJ_DET  | Actual Cost Adjustment Details- Transaction Details                        |
| CM_DRILL_NSS_DET   | Non Stock Shipment - Transaction Details                                   |
| EXD_DRILL_JRNL_DET | Excise Journal Drill Down<br>(Excise and Sales Tax/VAT IND, Journal Lines) |

---

## Securing ChartFields for PeopleSoft eProcurement

This topic discusses the PeopleSoft eProcurement components that support ChartField Security.

The following table lists the PeopleSoft eProcurement components that support ChartField Security, and lists the ChartField Security type that is used by each component:

| <b>Component</b>  | <b>Component Description</b> |
|-------------------|------------------------------|
| PV_REQUISITIONS   | Create Requisition           |
| PV_REQ_APPROVAL   | Approval Status              |
| PV_PO_REQ_SELECT  | Requisition Expeditor        |
| PV_REQ_PO_DETAILS | Requisition/PO Details Page  |

## Securing ChartFields for PeopleSoft Expenses

This topic provides an overview of securing ChartFields for PeopleSoft Expenses and describes the components in PeopleSoft Expenses that support ChartField Security.

### Understanding Securing ChartFields for PeopleSoft Expenses

PeopleSoft Expenses does not secure access to transaction pages and accounting data.

PeopleSoft Expenses has its own security; therefore, it does not use ChartField Security to restrict access to transaction pages and accounting data. Employees should always be able to view their past transactions, even if they no longer have authority to view a specific ChartField. For example, employee A had access to department ID 42000 but has moved to department 50000. He or she can view all expense reports for all departments of which he or she was, or is, a member.

See *PeopleSoft FSCM: Application Fundamentals* product documentation.

### Secure ChartField Prompt Values

The Expenses components secure the ChartField prompt values with the exception of the **Project ID** field.

Securing the Project ID prompt values in the Expense components depends on whether PeopleSoft Project Costing is installed:

- If PeopleSoft Project Costing is installed, Expenses excludes the **Project ID** field from ChartField Security.

Expenses observes project team security to secure the **Project ID** field.

- If PeopleSoft Project Costing is not installed, Expenses does not exclude the **Project ID** field from ChartField Security.

**Note:** The exception is for Time Entry and Employee Profile components, for which the **Project ID** field is always excluded from ChartField Security and is not dependant on whether or not Project Costing is installed.

The following table lists the components in PeopleSoft Expenses that support ChartField Security:

| <b>Component</b>   | <b>Component Description</b>    |
|--------------------|---------------------------------|
| EX_ACCTG_DRILLDWN  | Journal Entry Detail            |
| EX_BGTCHK_TAUTH    | Cancel Travel Authorizations    |
| EX_EE_PROFILE      | Employee Profile                |
| EX_EE_PROFILE2     | Employee Profile                |
| EX_SHEET_APPR      | Approve Expense Report          |
| EX_TAUTH_APPR      | Approve Travel Authorization    |
| KK_XCP_EX1         | Travel Authorization Exceptions |
| KK_XCP_EX2         | Expense Sheet Exceptions        |
| KK_XCP_EX3         | Period End Accrual Exceptions   |
| KK_XCP_EX4         | Period End Accrual Exceptions   |
| TE_EXPENSE_SHEET   | Expense Report Entry            |
| TE_EXPENSE_SHEET2  | Expense Report Entry            |
| TE_EXPENSE_SHEET_J | Journal Expense Sheet           |
| TE_TIME_ENTRY      | Time Report Entry               |
| TE_TIME_ENTRY2     | Time Report Entry               |
| TE_TRAVEL_AUTH     | Travel Authorization Entry      |
| TE_TRAVEL_AUTH2    | Travel Authorization Entry      |

| <b>Component</b>  | <b>Component Description</b> |
|-------------------|------------------------------|
| TE_UNPOSTED_SHEET | Unposted Expense Report      |

## Securing ChartFields for PeopleSoft General Ledger

The following table lists the components in PeopleSoft General Ledger that support ChartField Security:

| <b>Component</b> | <b>Component Description</b>   |
|------------------|--------------------------------|
| AV_DRILL_PNL     | Contributor Relation Component |
| DEPT_ENTRY       | Detail Budget Maintenance      |
| EE_GLADJ_DRILL   | GL Adjustment Drill Down       |
| EE_GLBUD_DRILL   | Budget Jnl Entry Event Drill   |
| ELM_JRNL_DRILL   | ELM Acctg Entry Drill Down     |
| F2_STAGE_REV     | Review FACTS II Data           |
| FSAH_ACCT_DRILL  | FSAH Accounting Drill          |
| GL_OPEN_ITEM_INQ | Open Item Inquiry              |
| INQUIRY_CRITERIA | GL Ledger Inquiry              |
| INQ_COMPARE      | Compare Across Ledgers         |
| INQ_LED_CMP_PNL  | GL Ledger Compare Inquiry      |
| JGEN_ACCTG_DRILL | Generic Accounting Drill       |
| JOURNAL_ENTRY_IE | Journal Entry                  |
| JOURNAL_FS       | Journal Status                 |
| JOURNAL_INQUIRY  | Journal Inquiry                |

| <b>Component</b>    | <b>Component Description</b>     |
|---------------------|----------------------------------|
| JOURNAL_OPEN_ITEMS  | Open Item Maintenance            |
| JOURNAL_POST_MARK   | Mark Journals for Post           |
| JOURNAL_UNPOST_MRK  | Mark Journals for Unpost         |
| JRNL_SUSPENSE_COR   | Journal Suspense Correction      |
| KK_XCP_GEN          | Generic Transaction Exceptions   |
| KK_XCP_GL1          | GL Journal Exceptions            |
| KK_XCP_GL2          | Budget Journal Exceptions        |
| KK_XCP_HR1          | HR Payroll Exceptions            |
| MARK_JRNLS_OVERRIDE | Override Budget Excpns           |
| MULTIBOOK_JOURNALS  | Multibook Journal Inquiry        |
| ORT_ACCT_DRILL      | Oracle Retail Accounting Drill   |
| ORT_ACCT_ENT        | Oracle Retail Accounting Entries |
| PY_DRILL_PNL        | Payroll Accounting Drill         |
| SF_DRILL_PNL        | Student Financial Drill          |
| PROJ_ENTRY          | Detail Project Maintenance       |

---

## Securing ChartFields for PeopleSoft Grants Management

This table lists the components in PeopleSoft Grants Management that support ChartField Security:

| <b>Component</b> | <b>Component Description</b>                       |
|------------------|----------------------------------------------------|
| GM_BUD_DETAIL    | Project Budget Detail                              |
| GM_FA_INQ        | Grants F&A (Facilities and Administration) Summary |

| <b>Component</b> | <b>Component Description</b> |
|------------------|------------------------------|
| KK_XCP_GM1       | GM F&A Exceptions            |

In PeopleSoft Grants Management, all proposal components and components that use Grants department security do not support ChartField Security.

## Securing ChartFields for PeopleSoft Inventory

This table lists the PeopleSoft Inventory components that support ChartField Security, and lists the ChartField Security type that is used by each component:

| <b>Component</b>   | <b>Component Description</b> |
|--------------------|------------------------------|
| ADJUSTMENT_INV     | Adjustments                  |
| CART_TEMPLATE_INV  | Define Par Location          |
| EXPRESS_ISSUE_INV  | Express Issue                |
| INV_CHG            | Maintain Stock Request       |
| IN_DEMAND_ERRORS   | Correct Demand Errors        |
| IN_WO_ISSUES       | Work Order - Issue Parts     |
| KK_XCP_CM1         | Cost Management Exceptions   |
| MATERIAL_ISSUES    | Create/Update Stock Request  |
| PUTAWAY_ENTRY1_INV | Express Putaway              |
| PUTAWAY_EXP_ISSUE  | Express Issue Return         |
| PUTAWAY_FEEDBK_INV | Stockroom Feedback           |

## Securing ChartFields for PeopleSoft Order Management

The following table lists the components in PeopleSoft Order Management that support ChartField Security:

| <b>Component</b> | <b>Component Description</b> |
|------------------|------------------------------|
| CB_ACCRUALS_INQ  | Claimbacks Accruals Inquiry  |
| CB_GL_ACCRUAL    | GL Accrual Inquiry           |
| *RMA_FORM_INV    | RMA Header (Inventory)       |

An asterisk (\*) indicates that securing access to the transaction page for this component is not enforced, as described in the Securing Access to Transaction Pages section. The ChartField values that the user enters in this component are exceptions that override the ChartField values that are provided by default from the rules and setup. This component secures the ChartField prompt values.

---

## Securing ChartFields for PeopleSoft Project Costing

This topic discusses the components in PeopleSoft Project Costing that support ChartField Security.

---

**Note:** Project Costing excludes the **Project ID** field from ChartField Security because it considers the Project ID to be a Project Costing identifier field and not a project ChartField. Therefore, if the **Project ID** field is included in ChartField Security, then Project Costing behaves as though the **Project ID** field is *not* part of ChartField Security.

---

---

**Important!** If you are using ChartField Security for the Budget Plan and Budget Detail components, the budget amount may not reflect the full amount. This is because ChartField Security filters out the unauthorized values, which are not reflected in the budget amount.

---

The following table lists the components in PeopleSoft Project Costing that support ChartField Security:

| <b>Component</b>   | <b>Component Description</b>             |
|--------------------|------------------------------------------|
| EE_PCBUD_DRILL     | Entry Event Budget Drill Down            |
| INTERFACE_RESOURCE | Review Transaction Details               |
| INTFC_PROJ_EXPRESS | Add Resources                            |
| KK_XCP_PC1         | Project Journal Exceptions               |
| KK_XCP_PC5         | Project Costing Budget                   |
| PC_ACCTG_JNL_COMP  | Accounting History Component             |
| PC_ACCTG_LN_COMP   | Project Accounting Line                  |
| PC_ADJ_ACCT_ASSGN  | Trans Adjust Account Assignment          |
| PC_AM_APPROVE      | Approve review assets                    |
| PC_AM_DEFN         | Project Costing Asset Definition         |
| PC_AM_DEFN_INQ     | Project Costing Asset Definition Inquiry |
| PC_AM_EXPRESS      | Project Costing Asset Management Express |
| PC_AM_RESOURCES    | Assign Resources to an Asset             |
| PC_BUD_DETAIL      | Project Budget Detail                    |
| PC_FND_DIST        | Funds Distribution Source                |
| PC_FND_DIST_LN     | Funds Distribution Target                |
| PC_FND_INTFC_EXCPT | Funds Budget Exceptions                  |
| PC_FND_UNAPPL_BAJ  | Project Billing Adjustments              |
| PC_KK_INTFC_EXCEPT | Review Commitment Control                |
| PROJECT_EXPRESS    | Project Resource                         |

| <b>Component</b> | <b>Component Description</b> |
|------------------|------------------------------|
| PROJ_RES_ARCH    | Resource Archive Detail      |
| PROJ_SUM_ARCH    | Resource Archive Summary     |
| RESOURCE_ADJUST  | Resource Adjustment          |
| TIMELABOR_INTFC  | Time Labor Interface         |

---

## Securing ChartFields for PeopleSoft Purchasing

The following table lists the PeopleSoft Purchasing components that support ChartField Security:

| <b>Component</b> | <b>Component Description</b>   |
|------------------|--------------------------------|
| CNTRCT_ENTRY     | Contract Entry                 |
| CNTRCT_RELEASES  | Contract Releases              |
| EE_PO_DRILL      | EE PO Purchase Order Drillback |
| EE_RCV_DRILL     | EE Receipt Accrual Drillback   |
| EE_REC_DRILL     | EE PO Requisition Drillback    |
| KK_XCP_PO1       | Purchase Order Exceptions      |
| KK_XCP_PO1N      | Purchase Order (NP) Exceptions |
| KK_XCP_PO2       | Requisition Exceptions         |
| KK_XCP_PO2N      | Requisition (NP) Exceptions    |
| KK_XCP_PO3       | Procurement Card Exceptions    |
| KK_XCP_PO4       | Receipt Expense Exceptions     |
| KK_XCP_PO5       | Receipt Encumbrance Exceptions |
| CC_RECON_WB      | ProCard Recon Workbench *      |

| <b>Component</b>   | <b>Component Description</b>  |
|--------------------|-------------------------------|
| MAINTAIN_PO_CF     | Maintain Distributions        |
| PO_ACCTG_LN_INQ    | PO Accting Line Entry Inquiry |
| PO_APPROVAL_CHRT   | PO ChartField Approval        |
| PO_GL_DRILL        | PO - GL Drill Down            |
| PO_INQUIRY         | PO Inquiry                    |
| PO_RC_WB           | PO WorkBench *                |
| PO_REQ_SELECT      | Requisitions Selection        |
| PURCHASE_ORDER     | Purchase Order                |
| PURCHASE_ORDER_EXP | Express Purchase Order        |
| RECV_CHARTFIELDS   | Receipt ChartFields           |
| RECV_INQ           | Receive Inquiry               |
| RECV_LN_ACCTG_INQ  | Receipt Accrual Entry Inquiry |
| RECV_PO            | Purchasing Receiving          |
| REQUISITIONS       | Requisitions                  |
| REQUISITION_LOADER | Requisition Loader            |
| REQ_ACCTG_LN_INQ   | Requisition Accounting Entry  |
| REQ_APPROVAL_CHRT  | Req Approval ChartField       |
| REQ_INQUIRY        | REQ Inquiry                   |
| REQ_RC_WB          | Requester's WorkBench *       |
| RFQ_AWARDS         | Award Quote                   |

| <b>Component</b>   | <b>Component Description</b> |
|--------------------|------------------------------|
| RTV_HEADER         | Return To Supplier           |
| RTV_HEADER_INQ     | Return To Supplier Inquiry   |
| VRBT_AGREEMENT     | Add/Update Rebate Agreement  |
| VRBT_AGREEMENT_INQ | Rebate Agreement Inquiry     |
| VRBT_CLAIM_MGM     | Claim Detail Management      |

Components marked with an asterisk (\*) are delivered as deselected. You can choose to select them to make them available for ChartField security.

---

## Securing ChartFields for PeopleSoft Services Procurement

The following table lists the PeopleSoft Services Procurement components that support ChartField Security:

| <b>Component</b>   | <b>Component Description</b> |
|--------------------|------------------------------|
| SPF_REQ_LINE       | Maintain SP Requisition Line |
| SPF_REQ_SUMMARY    | SP Requisition Summary       |
| SPF_WORDERCOMP     | Work Order Component         |
| SPF_WORK_ORDER_CMP | Work Order Component         |

---

## Securing ChartFields for PeopleSoft Treasury

The following table lists and describes the components in PeopleSoft Treasury that support ChartField Security:

| <b>Component</b>  | <b>Component Description</b>      |
|-------------------|-----------------------------------|
| ACCOUNTING_BUILD  | Build Accounting Entries          |
| ACCOUNTING_REVIEW | Review/Approve Accounting Entries |

| <b><i>Component</i></b> | <b><i>Component Description</i></b> |
|-------------------------|-------------------------------------|
| ACCTG_ENT_SUMMARY       | Accounting Summary                  |
| TR_DRILL_GRP            | Treasury Journal Drill              |

# Defining and Using ChartFields

---

## Understanding PeopleSoft ChartFields

In Oracle's PeopleSoft applications, the fields that store your charts of accounts and provide your system with the basic structure to segregate and categorize transactional and budget data are called ChartFields. Each ChartField has its own attributes for maximum efficiency and flexibility in recording, reporting and analyzing its intended category of data. While a particular ChartField always represents only one category of data, it stores many values that you use to further categorize that same data.

In addition to this basic categorization of a transaction amount using the account ChartField, you can simultaneously record the same transaction by product, project, investment portfolio, policy, endowment, fund, service, or any number of categories by using other ChartFields with appropriate values. This creates additional subsets of that same transactional data.

PeopleSoft delivers a set of ChartFields and associated functionality that fully covers most accounting and reporting requirements. ChartFields are designed to be configured by you to meet your specific requirements.

This topic discusses:

- Delivered ChartFields.
- Balancing ChartFields.
- Alternate accounts and statutory accounting.
- ChartField values.
- ChartField combination editing.

PeopleSoft Project Costing ChartFields are further described in the product documentation for *PeopleSoft FSCM: Project Costing*.

Business unit is not considered a ChartField.

---

**Warning!** If you have not licensed PeopleSoft Project Costing, Expenses, Resource Management, or Services Procurement and you see the following ChartFields: PC Business Unit, Activity, Source Type, Category, or Subcategory on pages, deselect the check boxes for these products on the Installation Options - Products page and run ChartField configuration to inactivate the ChartFields because they are specific to these products.

If you have not licensed Project Costing but have licensed Expenses, Resource Management, or Services Procurement and you still see Source Type, Category, or Subcategory on pages, deselect the check boxes for the unlicensed products on the Installation Options - Products page and run ChartField configuration to inactivate these ChartFields because they are specific to Project Costing. ChartFields that are not necessary can cause performance and other processing problems when they are allowed to remain active.

---

See [Using Standard ChartField Configuration](#).

See "Understanding Project-Related Control Data" (PeopleSoft Project Costing).

## Project ChartFields

The project ChartFields consist of:

- PC Business Unit
- Project
- Activity
- Source Type
- Category
- Subcategory

Add the Project ChartField on one of two different pages, depending on whether Project Costing is installed or is not installed. Use the Project page (PROJECT\_GL) to enter project ChartField values when PeopleSoft Project Costing is not installed. Otherwise, add the Project Chartfield when adding projects within Project Costing (PROJECT\_GEN\_01A).

The values and control data for the other five Project Costing ChartFields are *not* entered using a separate page within common definitions. They are entered using the pages and components mentioned in the preceding list of ChartFields and are fully described in the PeopleSoft Project Costing documentation.

The Project Costing ChartFields are available on various page displays and entry grids for use within Project Costing, Expenses, Resource Management or General Ledger. Some examples include the Journal Entry - Lines page and SpeedTypes.

---

**Note:** Resource Analysis Type is not considered a ChartField and, for that reason, is not included in the list of Project Costing ChartFields; nor is it included on either the Standard or Advanced Configuration pages. However, it is available for entry on the General Ledger Journal Entry - Lines page, located between the Activity and Source Type ChartFields. If the Project Costing ChartField display order is reordered during ChartField configuration, the Resource Analysis Type retains its relative position and is reordered accordingly.

---

See "Understanding Project-Related Control Data" (PeopleSoft Project Costing).

See [Using Standard ChartField Configuration](#).

## Balancing ChartFields

Business unit or a ChartField is said to be *balancing* when you require debit amounts to equal credit amounts to maintain a balanced set of accounts for the particular business unit or ChartField.

Defining balancing ChartFields is done on the Ledger Group definition using the Ledger Groups - Balancing page. A balanced detail ledger requires that the debit amounts equal the credit amounts for business unit, base currency code, book code and adjustment type.

When you select additional ChartFields for balancing, all unique occurrences of the combination of values must be in balance. You can choose to have the system automatically generate intraunit balancing entries for transactions that involve multiple values of a balanced ChartField. If you do not have this option active, or if the journal is not in balance for other reasons, journal edit uses the rules set up for balancing journals (such as, suspend or recycle) on the Journal Edit Options page.

For example, if you define department as an additional balancing ChartField, any journal created requires that business unit FR001 and department A have debits that equal credits. If they do not, the journal entry is out of balance. This also means that business unit USA01 and department B must balance.

You then see why account and alternate account cannot be balancing ChartFields. If for example, account could be made a balancing ChartField, business unit A and account 101200 would have to have debits equal credits that would always result in a zero balance for account 101200.

## Alternate Accounts and Statutory Accounting

The PeopleSoft alternate account feature enables you to enter a statutory chart of accounts as well as analytic or primary accounts at the detail transaction level. The alternate account produces journal line or transaction level balances for statutory reporting requirements. The primary account ChartField contains the corporate accounts, and alternate account ChartField contains the statutory accounts. This is useful for organizations that have two different reporting requirements—one for internal management or a corporate parent, and another for a local jurisdiction or national government.

In PeopleSoft applications, the analytic or primary account ChartField is ACCOUNT.

Local regulatory authorities often require *statutory* accounts. In PeopleSoft applications, this is termed the alternate account ChartField (ALTACCT).

You link alternate account ChartField values with account ChartField values. When you enter values for the account ChartField, the system enters the associated alternate account value. When you enter values for the alternate account ChartField, the system enters the associated account value. You can override the default values by selecting another value from the prompt list. The system displays only account values that you have mapped to the account or alternate account ChartField.

To create different alternate accounts for different statutory reporting, use the PeopleSoft SetID functionality when you set up your ChartFields.

## ChartField Values

If you use the ChartFields as delivered by PeopleSoft, sample ChartField values are already set up and in many cases are populated with sample amounts. All PeopleSoft sample or model values are entered with the 01/01/1900 effective date. To distinguish your data avoid using this date and instead use another early date, such as 01/01/1901.

You can enter an unlimited number of values for each ChartField. You can enter values using the online ChartField Values page, but because of the volume of entries needed to populate some ChartFields, you might use a batch import process or the Microsoft Excel spreadsheet for the PeopleSoft Component Interface process to initially load values to ChartField tables.

The project ChartFields component interfaces mentioned in the previous ChartField listing are more fully described in the Project Costing documentation.

See [Loading ChartField Values Using the Excel Spreadsheet to Component Interface Process](#).

---

**Note:** PeopleSoft recommends that you not use special characters and embedded blanks in ChartField values. Use the generally accepted alphanumeric characters and the underscore. In general avoid special characters such as apostrophes and do not include embedded blanks when defining ChartField values. Special characters and embedded blanks can be problematic and in particular can cause problems in some batch processes, such as those in allocations, combination editing and open item accounting. (This caveat also applies to such things as business units, ledgers and journal IDs.)

---

Because changes to the definition of most ChartField value are effective-dated, you can establish when you want to *activate* a department, *introduce* a product line, or *close* an account. Use effective dating with activation and inactivation functionality to maintain a full history of all changes or additions, to provide a complete audit trail and to make possible historical comparisons with past, present, or future conditions. When you no longer use a certain ChartField value, add a row to create an effective-dated *inactive* entry, instead of inactivating the original row. If you simply make the existing row *inactive*, you will have no history of its time as an active ChartField value.

Project ChartField values can be made active or inactive, but the values cannot be effective-dated for status.

However, the project status of a project can be effective dated for these statuses: budgeted, closed, hold, open, and proposed if Project Costing is not installed. These statuses are memo data only and do not provide control functionality.

## ChartField Combination Editing

Optionally, combinations of ChartField values can be edited to determine such things as which accounts are valid with which departments, funds or operating units. Use ChartField combination editing to maintain discipline over accounting entries and eliminate as much as possible additional account analysis and reconciliation. ChartField combination editing is in addition to ChartField validation editing.

ChartField combination editing is also available for commitment control budget entries.

## Prerequisites

The following steps are required before you can define ChartFields:

- Complete the Installation Options for the PeopleSoft products that you are installing.
- Configure ChartFields to meet your unique requirements.
- Complete the miscellaneous shared resource tables dealing with currencies, market rates, units of measure, holidays, calendars and TimeSpans.
- Define VAT options and settings, if applicable to your activities.

---

## Common Elements Used in Defining and Using ChartFields

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Effective Date</b>   | When you add a new ChartField value, the system uses the current date as the default date. However, you can enter a date when you want the new value to be active. By using a future date, you can set up a ChartField value without inadvertently using it for processing before your scheduled effective date.<br>Enter the status intended for the ChartField value: <i>active</i> or <i>inactive</i> as of the effective date. (The Project ID ChartField does not have effective-dating but it does include an effective status as of the effective date.) |
| <b>Description</b>      | Identifies the ChartField value on reports, pages, prompt lists, or online inquiries. Enter a short description to appear on pages and drop-down list boxes where display space is limited.                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                        |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Long Description</b> | Enter long descriptions and provide more extensive information about ChartField values. This is particularly helpful for the public sector when there is a need to input fund names as specified by donors and other sources where particular names and descriptions are required that can be quite detailed and lengthy. |

## Defining and Using Account Types and Attributes

To define and use account types and attributes, use the following components:

- Account Types (ACCT\_TYPE)
- ChartField Attributes (CF\_ATTRIBUTES)
- Installation Options (INSTALLATION)
- Account Balancing Group (ACT\_BAL\_GRP)
- Journal Source (SOURCE)

## Pages Used to Define Account Types and Attributes

| <b>Page Name</b>                        | <b>Definition Name</b> | <b>Usage</b>                                                                                                                                             |
|-----------------------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>Account Types Page</u>               | ACCT_TYPE              | Define account types to which each general ledger account is assigned. Typically used to designate balance sheet or income statement accounts.           |
| <u>ChartField Attributes Page</u>       | CF_ATTRIBUTES          | Create ChartField attributes for use in such things as intraunit consolidation eliminations, government reporting and payment processing.                |
| <u>ChartField Attribute Values Page</u> | CF_ATTRIB_VALUES       | Select user-defined values to support intraunit consolidations and Federal requirements for reporting and payment processing.                            |
| Installation Options - Overall Page     | INSTALLATION_FS1       | Activate or inactivate the Book Code and Balance Sheet Indicator attributes.<br><br>See <u>Setting Installation Options for Account Balancing Groups</u> |

| <b>Page Name</b>                         | <b>Definition Name</b> | <b>Usage</b>                                                                                                                 |
|------------------------------------------|------------------------|------------------------------------------------------------------------------------------------------------------------------|
| <u>Account Balancing Group Page</u>      | ACT_BAL_GRP            | Define the combination of active account attribute values using book code values and the balance sheet indicator attributes. |
| <u>Balance Suspense ChartFields Page</u> | SRC_JE_BS_CFS_SEC      | Used to select balancing suspense ChartFields for journal processing.                                                        |

## Account Types Page

Use the Account Types page (ACCT\_TYPE) to define account types to which each general ledger account is assigned.

Typically used to designate balance sheet or income statement accounts.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > Define Account Types**

| <b>Field or Control</b>                      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Account Type or Monetary Account Type</b> | <p>The Account Type is a classification that is assigned to accounts that determines its treatment for such processes as year end closing and reporting. The Account Types follow the normal balance sheet and income statement classifications of asset, liability, equity, revenue and expense.</p> <p>Use the delivered Account Types when you add accounts using the Account page.</p> |

PeopleSoft delivers the following account types:

- *A* (asset)
- *E* (expense)
- *L* (liability)
- *Q* (equity)
- *R* (revenue)

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Balance Forward</b>  | <p>Select one of these values:</p> <ul style="list-style-type: none"> <li>• Carry Forward — Rolls the account type's balance forward to the new period.</li> <li>• Not Carry Forward – Does not roll forward the account type's balance to the next period.</li> <li>• Other – Ignores this account type during year-end closing.</li> </ul> <p>The Balance Forward check box is normally checked for asset, liability, and equity accounts, but not for revenue or expense accounts.</p> <p>The year-end close process sums the balances of your non-balance forward accounts to calculate the amount that it posts to retained earnings.</p> |

After you set up accounts, you can generate the Account Types report (FIN0004), which includes a description and a listing of the accounts that you have defined for your balance sheet and income statement.

You can add account types for special circumstances but these require additional changes in your system and are not recommended unless you are prepared to make extensive modifications.

For example, if you add account types, you might also need to modify the Closing Trial Balance Report, GLS1003.SQR.

## ChartField Attributes Page

Use the ChartField Attribute page (CF\_ATTRIBUTES) to create ChartField attributes for use in intraunit consolidation eliminations, government reporting, and payment processing.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Configure > Define CF Attributes**

This example illustrates the fields and controls on the ChartField Attribute page. You can find definitions for the fields and controls later on this page.

| *ChartField Attribute Value | Description           |                                                                                     |                                                                                     |
|-----------------------------|-----------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| B                           | Borrowing Authority   |  |  |
| C                           | Contract Authority    |  |  |
| D                           | Advance Appropriation |  |  |

Generic ChartField attributes are optional features that support such things as intraunit consolidation eliminations and United States federal government requirements for reporting and payment processing.

After you attach an attribute value to a ChartField value, it *cannot* be deleted using the ChartField Attribute page. However, using the ChartField value attribute secondary page, you can delete any attribute and attribute value.

Attributes share the effective dating of the ChartField values to which they are attached. The Project ChartField does not have effective dating. Project ChartField attributes are automatically assigned a default effective date of 01/01/1900.

**Note:** Create or delete attributes as required for the applicable ChartFields. However, once you attach an attribute to a ChartField value, it *cannot* be deleted.

| <b>Field or Control</b>                                                     | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Attribute</b>                                                            | <p>A user-defined field in which you name the attribute.</p> <hr/> <p><b>Note:</b> When using this field for Asset Management and federal fund transfers, ensure that the attribute name matches the value entered for the Federal Fund Attribute field on the Installation Options - Asset Management page.</p> <hr/>                                                                                                                                                                                                                                                                                     |
| <b>Allow Multiple Values per Attr</b> (Allow Multiple Values per Attribute) | <p>Select this check box to allow multiple values of the same attribute to be attached to a ChartField value. If you do not select this check box, only one attribute value can be attached to a ChartField value.</p> <hr/> <p><b>Note:</b> Multiple combinations are usually associated with accounts but this option is available to all applicable ChartFields.</p> <hr/>                                                                                                                                                                                                                              |

| <b>Field or Control</b>           | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ChartField Attribute Value</b> | <p>This is user defined. For example, you can distinguish between single and multiple-year reporting for a fund by creating these two values for an attribute—either of which you can then attach to a fund value to make this distinction.</p> <hr/> <p><b>Note:</b> When using this field for Asset Management - federal fund transfers (FEDERAL FUND attribute), you will use a 'Y' (YES) value and a 'N' (NO) value to distinguish between Federal and Non-Federal funds, which you can then attach to a fund value to make this distinction.</p> <hr/> |

## ChartField Attribute Values Page

Use the ChartField Attribute Values page (CF\_ATTRIB\_VALUES) to select user-defined values to support intraunit consolidations and Federal requirements for reporting and payment processing.

Navigation:

Click the **Attributes** link from the applicable ChartField Values page.

This example illustrates the fields and controls on the Chartfield Attributes Page. You can find definitions for the fields and controls later on this page.

| Chartfield Attributes       |                  |                |                                                       |                       |                            |                                    |
|-----------------------------|------------------|----------------|-------------------------------------------------------|-----------------------|----------------------------|------------------------------------|
| ChartField Attribute Values |                  |                |                                                       |                       |                            |                                    |
|                             |                  |                | Personalize   Find   View All       First 1 of 1 Last |                       |                            |                                    |
| SetID                       | ChartField Value | Effective Date | Field Name                                            | *ChartField Attribute | ChartField Attribute Value | Attribute Value Description        |
| SHARE                       | ELIMEAST         | 01/01/1900     | OPERATING_UNIT                                        | ELIM_UNIT             | Y                          | Elimination Unit for Consolidation |

Use this page to select one or more of the ChartField attribute and attribute value combinations you have created for a particular applicable ChartField to be applied to the selected ChartField value.

**Note:** When using this page for Asset Management - federal fund transfers, attach the Federal fund chartfield attribute you created on the ChartField Attribute page, and indicate 'Y' for a Federal fund or 'N' for a non-Federal fund using the ChartField Attribute Value field.

## Using the Balance Sheet Indicator and Book Code

Segregating accounts as balance sheet or off balance sheet is a common accounting practice used by the financial services industry. Use this segregation of accounts to simultaneously record and generate balanced off balance sheet and balance sheet journal entries. It is not important in processes that automatically generate additional balancing lines for journal entries.

## Selecting the Balance Sheet Indicator Attribute

PeopleSoft delivers standard balancing attributes for account ChartField values to segregate and maintain separate transactions within a Business Unit and ledger:

- *BS* (balance sheet).
- *OB* (off balance sheet).

The process is flexible and supports balancing on additional account attributes without modification to your system.

If you define an account value as balance sheet or off balance sheet, you must also assign various General Ledger processes, such as journal edit, revaluation, closing, position accounting, and so on, with the appropriate balance sheet or off balance sheet account to perform the necessary balancing.

If you use the book code feature to further segregate transactions into balancing subsets within the same ledger, it is particularly important that the book code ChartField values and the balance sheet indicator values be properly grouped and matched with your account ChartField to ensure proper balancing. You define a combination of a book code and a balance sheet indicator value as an account balancing group. Associate the two with an account as an attribute.

## Setting Installation Options for Account Balancing Groups

Use the Installation Options - Overall page (INSTALLATION\_FS1) to activate or inactivate the Book Code and Balance Sheet Indicator attributes.

Navigation:

**Set Up Financials/Supply Chain > Install > Installation Options > Installation Options.**

Click the **Overall** link on the Installation Options page.

This example illustrates the fields and controls on the Installation Options - Overall page. You can find definitions for the fields and controls later on this page.

| Field or Control | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Group            | <p>Select one or more account balancing groups and balance suspense ChartFields and ChartField values to be used in the journal balance suspense process.</p> <p>If you do not have an account balancing attribute active, you will have one account balancing group only. This is the default group that is delivered with the system. You only need to define one balance suspense ChartField for the default group.</p> <p>However, if you have one or more account balancing attributes active, you inactivate the default group and add your own account balancing groups on the Account Balancing Groups page, which contain various combinations of active account balancing attribute values. Then, you must define one balance suspense ChartField for each group. The account value of the balance suspense ChartFields must have the same account balancing attribute values as the account balancing group.</p> <p>For example, assume you activate the balance sheet indicator. You then inactivate the default group and add two new account balancing groups. One for balance sheet group and the other for off balance sheet group. You must then define two balance suspense ChartFields, one for each group. The account value for balance sheet group must have a balance sheet indicator value equal to balance sheet. Similarly, the account value for the off balance sheet group must have a balance sheet indicator value equal to off balance sheet.</p> |

Account balancing groups identify balancing subsets within the same ledger that involve simultaneous use of the book code and balance sheet indicator. You must define for each group, or subset, its own balancing or suspense accounts to be used by various processes to maintain the balance within the group.

For example, each of the following requires a suspense or balancing ChartField for each applicable account balancing group:

- Balance suspense ChartFields.
- Edit suspense ChartFields.
- Amount suspense ChartFields.
- Rounding adjustment ChartFields.
- Position accounting.

---

## Entering and Maintaining ChartField Values

To enter and maintain ChartField values, use the following components:

- ChartField Values (FS\_CF\_VALUE\_HOME)
- Adjustment Type (ADJUST\_TYPE)
- Book Code (BOOK\_CODE)
- Scenario (BD\_SCENARIO)
- Account (GL\_ACCOUNT)
- Operating Unit (OPERATING\_UNIT)
- Fund (FUND\_DEFINITION)
- Department (DEPARTMENT)
- Product (PRODUCT)
- Alternate Account (ALTACCT)
- PC Bus Unit (PC\_BU\_DEFN, PC\_BUS\_UNIT\_OPT)
- Project ID (PROJECT)
- Activity (FS\_ACTIVITY\_TBL)
- Source Type (RESOURCE\_TYPE)
- Category (PROJ\_CATG\_DEFN)
- Subcategory (PROJ\_SUBCAT\_DEFN)
- Statistics Code (STATISTICS\_TBL)
- Budget Reference (BUDREF\_PNL)
- Class Field (CLASS\_PNL)
- Program Code (PROGRAM\_DEFINITION)

- ChartField1 (CHARTFIELD1)
- ChartField2 (CHARTFIELD2)
- ChartField3 (CHARTFIELD3)

To load data into the respective component tables, use the following component interfaces:

- Use the BUDGET\_SCENARIO component interface to load data into the tables for the Scenario component.
- Use the ACCOUNT\_CF component interface to load data into the tables for the Account component.
- Use the OPER\_UNIT\_CF component interface to load data into the tables for the Operating Unit component.
- Use the FUND\_CF component interface to load data into the tables for the Fund component.
- Use the DEPT\_CF component interface to load data into the tables for the Department component.
- Use the PRODUCT\_CF component interface to load data into the tables for the Product component.
- Use the ALTACCT\_CF component interface to load data into the tables for the Alternate Account component.
- Use the PROJECT\_BU\_OPTIONS component Interface to load data into the tables for the PC Business Unit component.
- Use the PROJECT\_CF component interface to load data into the tables for the Project ID component.
- Use the PC\_STD\_ACT\_INTFC component interface to load data into the tables for the Activity component.
- Use the PC\_RES\_TYPE\_INTFC component interface to load data into the tables for the Source Type component.
- Use the PC\_CATG\_DEFN\_INTFC component interface to load data into the tables for the Category component.
- Use the PC\_SUBCAT\_DEFN\_INTFC component interface to load data into the tables for the Subcategory component.
- Use the STATISTICS\_CODE component interface to load data into the tables for the Statistics Code component.
- Use the BUDGET\_REF component interface to load data into the tables for the Budget Reference component.
- Use the CLASS\_CF component interface to load data into the tables for the Class Field component.
- Use the PROGRAM\_CF component interface to load data into the tables for the Program Definition component.
- Use the CHARTFIELD1 component interface to load data into the tables for the ChartField1 component.

- Use the CHARTFIELD2 component interface to load data into the tables for the ChartField2 component.
- Use the CHARTFIELD3 component interface to load data into the tables for the ChartField3 component.

## Pages Used to Define ChartFields

| <b>Page Name</b>                     | <b>Definition Name</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                |
|--------------------------------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>Long Description Page</u>         | CF_LONG_DESCR          | Enter long descriptions and more extensive information about ChartField values. This is particularly helpful for the public sector when there is a need to input fund names as specified by donors and other sources where particular names and descriptions are required that can be detailed and lengthy. |
| <u>Book Code Page</u>                | BOOK_CODE              | Identify subsets of ledger rows to segregate and maintain in the same ledger various accounting, recording and reporting requirements for transactions in different accounting environments.                                                                                                                |
| <u>Adjustment Type Page</u>          | ADJUST_TYPE            | Define adjustment types associated with varying accounting treatments of prior period adjustments.                                                                                                                                                                                                          |
| <u>Account Page</u>                  | GL_ACCOUNT             | Set up new account ChartField values.                                                                                                                                                                                                                                                                       |
| <u>Map to Alternate Account Page</u> | ACC_XREF               | Map a corporate chart of accounts to one or many statutory charts of accounts. For example, you could have one chart of accounts for each country or local office that requires statutory accounting and reporting.                                                                                         |
| <u>Alternate Account Page</u>        | ALTACCT                | Add alternate account values.                                                                                                                                                                                                                                                                               |
| <u>Map to Account Page</u>           | ALT_XREF               | Maps an alternate account to one or more accounts.                                                                                                                                                                                                                                                          |
| <u>Operating Unit Page</u>           | OPERATING_UNIT         | Create values that identify a plant, office, physical location, branch, building, store, hospital, outpatient surgery center, clinic, or geographic location. It is usually related to responsibility reporting                                                                                             |
| <u>Fund Code Page</u>                | FUND_DEFINITION        | Define values for all types of funds.                                                                                                                                                                                                                                                                       |

| <b><i>Page Name</i></b>      | <b><i>Definition Name</i></b> | <b><i>Usage</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>Department Page</u>       | DEPARTMENT                    | Add a department representing an operational unit. It is often associated with responsibility accounting.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <u>Product Page</u>          | PRODUCT                       | Add product codes and track product performance and financial information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <u>Project Page</u>          | PROJECT_GL                    | <p>Add project values and set ChartField status to active or inactive. If you have not installed Project Costing you can also add memo project start and end date, project manager information, and project status.</p> <p>If you have installed Project Costing and any of the other applications requiring the full complement of project ChartFields, use the components mentioned in the preceding ChartField list to create the ChartField values and their control data. These components and pages are fully described in the Project Costing documentation.</p> |
| <u>Statistics Code Page</u>  | STATISTICS_TBL                | Add or modify statistics codes to track nonmonetary information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <u>Scenario Page</u>         | BD_SCENARIO                   | Define different budget iterations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <a href="#">Standard ChartField Configuration Page</a> | STANDARD_CF_TMPLT      | You must have been granted user security to use this page. Unless a ChartField is active it will not be displayed in the navigational menus. Related ChartFields determine the values for affiliate ChartFields. Business unit is required for the interunit affiliate ChartField. Assign a unique intraunit related ChartField of the same ChartField length that is specified for each intraunit affiliate ChartField that is active. |

## Understanding Entering and Maintaining ChartField Values

Use effective date in conjunction with status to add new ChartField values for current or future access and to inactivate or modify ChartField values while maintaining a complete audit trail.

---

**Note:** Some ChartFields are delivered inactive. A ChartField must be activated to be available in your menu. Activation can be performed on the Standard Configuration page.

---

ChartFields are search keys for all financial transactional data. To maintain the integrity of data relationships, PeopleSoft does *not* allow you to delete all values in a ChartField and then save the page. However, you can delete all but the last row for each ChartField value in the ChartField table.

---

**Note:** Oracle recommends that you not use special characters and embedded blanks in ChartField values. Use the generally accepted alphanumeric characters and the underscore. In general avoid special characters such as apostrophes and do not include embedded blanks when defining ChartField values. Special characters and embedded blanks can be problematic and in particular can cause problems in some batch processes, such as those in allocations, combination editing and open item accounting. (This caveat also applies to such thing as business units, ledgers and journal IDs.)

---

## Long Description Page

Use the Long Description page (CF\_LONG\_DESCR) to enter long descriptions and more extensive information about ChartField values.

This is particularly helpful for the public sector when there is a need to input fund names as specified by donors and other sources where particular names and descriptions are required that can be detailed and lengthy.

Navigation:

**Set Up Financials/SCM > Common Definitions > Design Chartfield > Define Values > Chartfield values and click the Long Description link.**

This example illustrates the fields and controls on the Long Description page. You can find definitions for the fields and controls later on this page.

The screenshot shows a web-based form titled "Long Description". At the top, it displays "SetID SHARE" and "Effective Date 01/01/1900". Below this, it shows "Account 100208". The main part of the form is a large text area labeled "Description" with the following placeholder text: "You can enter an extensive description or additional information here about the ChartField value. Enter multiple effective-dated long descriptions for the same ChartField value." At the bottom of the form, there are two buttons: "OK" and "Cancel".

Click the Long Description link on a ChartField page when entering a new ChartField value to access the Long Description page and you can enter an extensive description or additional information about that particular ChartField value. You can enter multiple effective dated long descriptions for the same ChartField value. Long Descriptions are informational only.

The Long Description link is available on each of the ChartField entry pages. However, if PeopleSoft Project Costing is an installed product, the Long Description link does not display on the Project page within the Design ChartFields menu. Rather, the long descriptions for the project-related ChartFields are entered on the General Information pages of the related ChartFields within PeopleSoft Project Costing.

If you are using the Project ChartField without PeopleSoft Project Costing, you can add a long description using the link on the Project page.

## Book Code Page

Use the Book Code page (BOOK\_CODE) to identify subsets of ledger rows to segregate and maintain in the same ledger various accounting, recording and reporting requirements for transactions in different accounting environments.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Book Code**

This example illustrates the fields and controls on the Book Code page. You can find definitions for the fields and controls later on this page.

| *Effective Date | *Status | *Description             | *Short Description | Long Description |
|-----------------|---------|--------------------------|--------------------|------------------|
| 01/01/1900      | Active  | Corporate reporting book | Corporate          | Long Description |

Book Code is an account attribute and a balancing ChartField. You can activate book code on the Installation Options - Overall page. If you activate the book code, you must specify a book code for each account value. The **Allow Book Code Override** option that is set on the Account page determines whether this book code can be overridden on the transaction line.

Generally accepted accounting principles often vary from country to country and by jurisdiction. Organizations must record and report their operations according to local accounting requirements as well as by corporate rules, which are often dictated by another national jurisdiction and might require that other accounting principles be applied. For example, local rules might require that you keep your local books open for a longer period than do the corporate rules and perhaps prior period adjustments are handled differently.

In conjunction with ledger code and the adjustment type ChartField, book codes address transactions in common book codes between GAAPs requiring different open close periods. Book code is also used with the balance sheet indicator attribute to ensure that proper balancing is maintained for *on* and *off* balance sheet entries.

PeopleSoft also provides the ability to maintain separate ledgers for separate accounting rules, to record transactions under varying statutory rules using alternate account and to use MultiBook with its automatic synchronization capabilities. However, by using book codes you can *simultaneously* generate sets of entries to record related transactions according to multiple generally accepted accounting principals (GAAPs) for the *same* business unit in the *same* ledger. For example, where local and corporate accounting principles are not compatible you define a local (L) and a corporate (C) book code. For those situations where requirements are alike, you define a code for both (B). Using these book codes as attributes, attach them to accounts. This results in groups of accounts in which you can simultaneously record related transactions under local, corporate, or both rules.

You can choose to associate a single book code with one account value. Using this method a unique account value must be created for the number of unique book code instances. For example, book code C would be associated with account 500001, book code L with account 500002, and book code B with account 500003 to record related amounts in the same ledger but effectively in different books. When you

choose this method, book code appears as a read-only field on the journal entry page when you enter the account and the book code cannot be modified at time of journal entry.

PeopleSoft provides the **Allow Book Code Override** option that enables you to choose different book code and account combinations at the time of journal entry. You can then associate any of your book codes with the account value to record related amounts in the same ledger. For example, book codes C, L or B can be associated with account 500001. The chief advantage of this method is that fewer account values are required. The book codes you can associate with an account are available from a drop down list at the time of journal entry

| Field or Control | Description                                                                                                                                                                                         |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Book Code        | Add or select a value. The <b>Effective Date</b> and <b>Status</b> fields must match the settings for the account values to which the book code is attached as an attribute using the Account page. |

Adjustment Type Page

Use the Adjustment Type page (ADJUST\_TYPE) to define adjustment types associated with varying accounting treatments of prior period adjustments.

Navigation:

Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Adjustment Type

This example illustrates the fields and controls on the Adjustment Type page. You can find definitions for the fields and controls later on this page.

Adjustment type is delivered as a balancing ChartField. It is used in conjunction with ledger code and book code to facilitate recording of transactions for organizations having multiple accounting rule environments. If you choose to update open periods by ledger code, you must specify an adjustment type value for the ledger code having its period closed earlier than other ledger codes. By doing this, when the system encounter transactions in a book code common to multiple GAAPs, yet belonging to a ledger code that is already closed; it can generate adjustments specifically to the adjustment type associated with the ledger code and effectively move the transaction to the open period.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                           |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Adjustment Type</b>  | Create a type for each combination of ledger code and book code that share accounts in other ledger code and book code combinations involving different accounting rules (multiple GAAPs) that specify different rules regarding closing dates and prior period adjustments. |

## Account Page

Use the Account page (GL\_ACCOUNT) to set up new account ChartField values.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Account**

This example illustrates the fields and controls on the Account page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Account' page in PeopleSoft. At the top, there are tabs for 'Account' and 'Map to Alternate Account'. Below the tabs, the 'SetID' is 'SHARE' and the 'Account' is '100000'. The page is divided into several sections. The 'Effective Date' section shows '01/01/1900'. The 'Description' section shows 'Petty Cash'. The 'Short Description' section shows 'Petty Cash'. The 'Monetary Account Type' section shows 'Asset'. The 'Balance Sheet Indicator' section shows 'Balance Sheet'. The 'VAT Account Flag' section shows 'Non-VAT Related'. The 'Status' section shows 'Active'. The 'Control Account' section has a checkbox. The 'Budgetary Only' section has a checkbox. The 'UOM' section shows a blank field. The 'Book Code' section shows 'B'. The 'Allow Book Code Override' section has a checkbox. The 'Physical Nature' section shows a blank field. The 'Reconcile on Base Amount' section has a checkbox. The 'Edit Record' section shows a blank field. The 'Prompt Table' section shows a blank field. The 'Reconcile Tolerance' section shows a blank field. The 'Edit Field' section shows a blank field. The 'Description of OpenItem' section shows a blank field. The 'Reconcile Currency' section shows a blank field. The 'Performance Measurement' section has three checkboxes: 'General Ledger Account' (checked), 'Performance Measurement Acct', and 'ABM Account'.

Account values are used in combination with other ChartFields values to create journal entries.

| <b>Statistical Account</b>   | <p>Select to track statistical data such as square footage or head count. Statistical accounts are used to capture statistical amounts only, not monetary amounts. If you select the check box, you must specify a UOM (unit of measure).</p> <p>The system automatically makes available (and selects by default) the <b>Balance Forward</b> check box. You can override this default by deselecting the check box for accounts that you do not want to carry forward, such as statistical accounts associated with revenue and expenses.</p>                                                                                                                  |
| <b>Monetary Account Type</b> | Select from the values defined on the Account Types page                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>VAT Account Flag</b>      | <p>Select one of the following values to indicate the relationship to value added tax (VAT) processing for this account value:</p> <p><i>Non-VAT Related:</i> Not used for VAT processing.</p> <p><i>VAT Account:</i> The account to which calculated VAT is applied. VAT account journal entries are calculated and automatically generated based on the VAT applicable account entries in the journal entry and on the values that you set up for your VAT environment and options. You can also enter VAT account lines directly into a journal entry.</p> <p><i>VAT Applicable Account:</i> The monetary account against which you add journal entries.</p> |
| <b>Physical Nature</b>       | <p>For VAT-related accounts, indicates whether an object is a <i>Good</i> or a <i>Service</i>. For many countries there is a requirement to report the sale and/or purchase of goods separately from services.</p> <p>The physical nature setting defaults not only from your setting here for the account value but also from the journal source or the business unit settings according to the VAT default hierarchy. The default can be overridden on the journal line.</p>                                                                                                                                                                                  |
| <b>VAT Default</b>           | <p>For VAT related accounts, click this link to access VAT Defaults Setup component on which you can define or override VAT settings for this account. VAT processing is available for non-receivable and non-payable items directly entered into the general ledger. The VAT Defaults Setup component</p> <p>See "Establishing VAT Defaults" (PeopleSoft Global Options and Reports).</p>                                                                                                                                                                                                                                                                      |

| <b>Field or Control</b>                                                 | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>OpenItem Account</b>                                                 | <p>Select to activate OpenItem processing for tracking and matching debits and credits that post to this account. When you select this option, there are six related fields to complete. If you do not select this check box, any information you enter in these related fields is not retained and is deselected from the fields when you save the page.</p> <hr/> <p><b>Note:</b> An OpenItem account cannot be a VAT-related account.</p> <hr/> |
| <b>Reconcile on Base Amount</b>                                         | Select this check box to ensure that the Open Item reconciliation process closes Open Items that have both a zero Base Amount balance and a zero Transaction (Foreign) Amount balance. When this check box is not selected, the process only looks at the Transaction (Foreign) Amount balance and closes the Open Items whose Transaction (Foreign) Amount balance is zero.                                                                       |
| <b>Edit Record</b>                                                      | Select the name of the table against which you want to validate the OpenItem search key. For example, if the OpenItem key is an employee ID, enter a table that contains a list of valid employee IDs, such as the EMPLOYEE_TBL.                                                                                                                                                                                                                   |
| <b>Edit Field</b>                                                       | Enter the name of the field from the edit record to match against your OpenItem key.                                                                                                                                                                                                                                                                                                                                                               |
| <b>Prompt Table</b>                                                     | Enter the name of the prompt table that is to return the current actual OpenItem rows for the account.                                                                                                                                                                                                                                                                                                                                             |
| <b>Description of OpenItem</b>                                          | Enter a description to appear in prompt lists, reports, and online inquiries. It typically is used to identify the OpenItem key that must be specified in the Ref (reference) field on the Journal Entry pages.                                                                                                                                                                                                                                    |
| <b>Reconcile Tolerance and Reconcile Currency</b>                       | Enter a tolerance, and select the reconcile currency to use. You can close OpenItem rows if the balance is equal to or less than the tolerance. For background reconciliation, there is no tolerance. The balance must be zero.                                                                                                                                                                                                                    |
| <b>General Ledger Account, Performance Measurement, and ABM Account</b> | <p>Select the <b>General Ledger Account</b>, <b>Performance Measurement Acct</b> (account), and <b>ABM Account</b> (Activity-Based Management account) check boxes only if you use PeopleSoft Enterprise Performance Management (EPM).</p> <p>See "Understanding Cost Structure" (PeopleSoft Cost Management).</p>                                                                                                                                 |
| <b>Attributes</b>                                                       | Click the link to access the ChartField Attributes page described earlier in this topic                                                                                                                                                                                                                                                                                                                                                            |

| <b>Field or Control</b>            | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Long Description</b>            | Click this link to access the Long Description page described earlier in this topic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Control Account</b>             | <p>Select to indicate that this is a control account and that it can be updated only by using the Journal Generator or <i>a load process from a third party system</i>. The purpose of this designation is to prevent manual or online entries in general ledger to the account.</p> <p>You can map account ChartFields only to alternate account ChartFields having the same control account designation.</p> <p>A control account represents a summarization of detail from a feeder application such as Payables that is posted by the system to the general ledger. For example, a control account for Accounts Payable provides a summary of accounts payable detail activity in the general ledger equal to the sum of the individual amounts by supplier in the Accounts Payable system. <i>Only Journal Generator can update a control account.</i></p> |
| <b>Budgetary Only</b>              | Select if the account value is to be used for budgetary purposes only. The account will not be available for recording actual transactional entries. Budgetary only functionality is available for all fully configurable ChartFields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Commitment Control Override</b> | Select if you are using Commitment Control and you want to designate this account with an automatic override. This is only applicable for overrideable errors, such as <i>Exceeds Budget</i> . It does not override errors that cannot be overridden, such as <i>No Budget Exists</i> . This override is similar to the transaction override and requires at least a zero amount budget row to pass edit.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Book Code</b>                   | If book code is enabled on the Installation Options - Overall page, you must enter a default book code that is appropriate for this account value for most instances of its use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Allow Book Code Override</b>    | This check box is selected by default to enable override of the default book code for this account on the transaction line. Deselect the check box if you choose to always associate the default book code with the account value and not allow changes at the transaction line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Balance Sheet Indicator</b>     | If enabled on the Installation Options - Overall page, the account can be designated as either off balance sheet or on balance sheet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Map to Alternate Account Page

Use the Map to Alternate Account page (ACC\_XREF) to map a corporate chart of accounts to one or many statutory charts of accounts.

For example, you could have one chart of accounts for each country or local office that requires statutory accounting and reporting.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Account > Map to Alternate Account**

This example illustrates the fields and controls on the Map to Alternate Account page. You can find definitions for the fields and controls later on this page.

| Field or Control                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>AltAcct SetID</b> (alternate account SetID) | Enter the SetID for the alternate account to which you want to link the account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Add AltAcct</b> (add alternate account)     | Click to access the Alternate Account page on which you can add a new alternate account. This page is described below.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Mapping Mode</b>                            | <p>This is a system default and you cannot change the value:</p> <p><b>One Acct to One or Many AltAccts</b> (one account to one or many alternate accounts) indicates that the mapping is one account value to one or more alternate account values. You can map the one account value to one or more alternate accounts.</p> <p><b>One AltAcct to One or Many Accts</b> (one alternate account to one or many accounts) indicates that the mapping is one Alternate Account value to one or more account values. You can map the account value to only one alternate account.</p> |

**Note:** The system does not update the mapping mode setting until you have linked the account with one or more alternate accounts. If you have previously linked the account to an alternate account on the Map to Account page, the mapping mode might already be selected. When you add one or more alternate accounts and select default for one of the alternate accounts, the system selects One Acct to One/Many AltAccts. Also, you must specify a default account or alternate account for each SetID that you map to either account or alternate account.

| <b>Field or Control</b>                            | <b>Description</b>                                                                                                                                                                                                               |
|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mapped Alternate Accounts</b>                   | Use the scroll arrows to select the alternate accounts that you want to link to the account. When you enter an account value on a transaction page, you can use only the alternate account values that you select in the scroll. |
| <b>Default AltAcct</b> (default alternate account) | Select the check box if you want the system to use the alternate account as the default on a transaction entry page.                                                                                                             |
| <b>Alternate Account</b>                           | Select the alternate account that you want to link with the account. The system automatically enters the description of the alternate account.                                                                                   |

## Alternate Account Page

Use the Alternate Account page (ALTACCT) to add alternate account values.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Alternate Account**

This example illustrates the fields and controls on the Alternate Account page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Alternate Account' page. At the top, there are two tabs: 'Alternate Account' (selected) and 'Map to Account'. Below the tabs, the page header shows 'SetID SHARE' and 'Alternate Account 211003'. The main content area includes the following fields and controls:

- Effective Date:** A date field with the value '01/01/1900'.
- Status:** A dropdown menu with 'Active' selected.
- \*Description:** A text field with the value 'Alt Acct for Imp Contra'.
- \*Short Description:** A text field with the value 'Imp Contra'.
- Notes:** A large text area with the value 'Alt Acct for Impairment Contra'.
- Monetary Account Type:** A dropdown menu with 'Revenue' selected.
- Control Flag:** A checkbox that is currently unchecked.
- Statistical Account:** A checkbox that is currently unchecked.

On the right side of the page, there are links for 'Find | View All', 'First 1 of 1 Last', 'Attributes', and 'Long Description'.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                 |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Long Description</b> | Optionally, you can enter the purpose or use of the alternate account, and an explanation of the type of transactions that are to be posted to it. |

**Note:** You can map alternate account ChartFields only to account ChartFields with the same attributes unless they have a different SetID.

| <b>Field or Control</b>      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                             |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Monetary Account Type</b> | Select from the types previously defined on the Account Types page.                                                                                                                                                                                                                                                                                                            |
| <b>Statistical Account</b>   | Used for statistical amounts, not monetary amounts. If you select the check box, you must specify a unit of measure.                                                                                                                                                                                                                                                           |
| <b>Attributes</b>            | Select the link to access the ChartField Attributes page.                                                                                                                                                                                                                                                                                                                      |
| <b>Control Flag</b>          | Select to indicate that you can update this alternate account only by using the Journal Generator. A control account represents a summarization of detail from an application. For example, a control account for Accounts Payable would provide a summary of accounts payable activity equal to the sum of the individual amounts by supplier in the Accounts Payable system. |

| Field or Control     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Account SetID</b> | Enter the SetID for the account to which you want to link the alternate account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Add Account</b>   | Click the link to access the Account page on which you can add a new account ChartField value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Mapping Mode</b>  | <p>This is a system default. You cannot change the value:</p> <ul style="list-style-type: none"> <li> <b>One Acct to One or Many AltAccts</b> (one account to one or many alternate accounts) indicates that the mapping is one account value to one or more alternate account values. You can map the one alternate account value to only one account. </li> <li> <b>One AltAcct to One or Many Accts</b> (one alternate account to one or many accounts) indicates that the mapping is one alternate account value to one or more account values. You can map the alternate account value to one or more accounts. </li> </ul> |

**Note:** The system does not update the mapping mode until you link the alternate account with one or more accounts. If you previously linked the alternate account to an account on the Map to Alternate Account page, the mapping mode might already be selected. When you add one or more accounts and select default account for one of the accounts, the system selects One AltAcct to One or Many Accts.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                               |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mapped Accounts</b>  | Use the scroll arrows to select the accounts that you want to link to the alternate account. When you enter an alternate account value on a transaction page, you can use only the account values that you select in the scroll. |
| <b>Default Account</b>  | Select if you want the system to use the account as the default account on transaction entry pages.                                                                                                                              |
| <b>Account</b>          | Enter each account that you want to link with the alternate account. The system automatically enters the description of the account.                                                                                             |

## Operating Unit Page

Use the Operating Unit page (OPERATING\_UNIT) to create values that identify a plant, office, physical location, branch, building, store, hospital, outpatient surgery center, clinic, or geographic location. It is usually related to responsibility reporting

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Operating Unit**

This example illustrates the fields and controls on the Operating Unit page. You can find definitions for the fields and controls later on this page.

Use this ChartField to identify such things as a plant, office, physical location, branch, building, store, hospital, outpatient surgery center, clinic, or geographic location. This ChartField is usually related to responsibility reporting. It can also be used to assist in reporting for tax purposes or it can be used at the city, county, and state levels for both profit and loss (P&L) and balance sheet purposes.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Budgetary Only</b>   | Select if the value is to be used for budgetary purposes only. The operating unit will not be available for recording actual transactional entries for most products. However, General Ledger allows either budgetary only or non budgetary values to be selected for journal entry but validates against the ledger type at journal edit. Budgetary only functionality is available for all fully configurable ChartFields. |

| <b>Field or Control</b> | <b>Description</b>                                         |
|-------------------------|------------------------------------------------------------|
| <b>Attributes</b>       | Select this link to access the ChartField Attributes page. |

## Fund Code Page

Use the Fund Code page (FUND\_DEFINITION) to define values for all types of funds.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Fund Code**

This example illustrates the fields and controls on the Fund Code page. You can find definitions for the fields and controls later on this page.

Funds are primary structural units for education and governmental accounting. Funds are maintained as a balanced set of accounts and are used to present financial statements.

Fund code is a balancing ChartField, and you establish all types of funds by using the Fund Code page.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                               |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b>      | Use to indicate the name of the fund and any pertinent details.                                                                                                                                                                  |
| <b>Budgetary Only</b>   | Select if the fund value is to be used for budgetary purposes only. The fund will not be available for recording actual transactional entries. Budgetary only functionality is available for all fully configurable ChartFields. |
| <b>Attributes</b>       | Select this link to access the ChartField Attributes page.                                                                                                                                                                       |

## Department Page

Use the Department page (DEPARTMENT) to add a department representing an operational unit.

It is often associated with responsibility accounting.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Department**

This example illustrates the fields and controls on the Department page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Department' page in a software application. The page has a header with 'SetID SHARE' and 'Department 10000'. Below the header is a form with several fields and controls. The 'Effective Date' field is set to '01/01/1900'. The 'Status' field is a dropdown menu set to 'Active'. The 'Description' field contains 'Human Resources'. The 'Short Description' field contains 'HR'. The 'Manager ID' field contains 'KU0079'. The 'Company' field is empty. There are also links for 'Attributes' and 'Long Description', and a checkbox for 'Budgetary Only'.

Departments typically represent a divisional classification of a larger entity in your organization (such as a profit center, an operating unit, a school within a university or a bureau of a government). Its emphasis is usually on budget and responsibility accounting.

| <b>Field or Control</b>                         | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b>                                   | Select the current status of the department: <i>Active</i> or <i>Inactive</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b> and <b>Short Description</b> | Enter a description and short description. These fields appear on pages and in reports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Attributes</b>                               | Select this link to access the ChartField Attributes page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Budgetary Only</b>                           | Select this check box if the department value is to be used for budgetary purposes only. The department will not be available for recording actual transactional entries. Budgetary only functionality is available for all fully configurable ChartFields.                                                                                                                                                                                                                                                                                                 |
| <b>Manager ID</b>                               | Select from a list of IDs that you entered on the Personal Data page. The system automatically populates the name in the <b>Manager Name</b> field and you cannot change it. Alternatively, enter a manager name only. The system does not edit a name that you manually enter against any table.                                                                                                                                                                                                                                                           |
| <b>Company</b>                                  | <p>Indicate the payroll company to which this department belongs and into which the department reports. The system uses the payroll company to calculate worker compensation. The system also uses the department on the order in conjunction with the state to look up the appropriate worker compensation rate.</p> <hr/> <p><b>Note:</b> If yours is a multi-company environment and you want more than one company to share the department, leave this field blank. The field displays only if you have PeopleSoft Staffing Front Office installed.</p> |

## Product Page

Use the Product page (PRODUCT) to add product codes and track product performance and financial information.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Product**

This example illustrates the fields and controls on the Product page. You can find definitions for the fields and controls later on this page.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Budgetary Only</b>   | Select if the value is to be used for budgetary purposes only. The product will not be available for recording actual transactional entries for most products. However, General Ledger allows either budgetary only or non budgetary values to be selected for journal entry but validates against the ledger type at journal edit. Budgetary only functionality is available for all fully configurable ChartFields. |
| <b>Attributes</b>       | Select this link to access the ChartField Attributes page.                                                                                                                                                                                                                                                                                                                                                            |

## Project Page

Use the Project page (PROJECT\_GL) to add project values and set ChartField status to active or inactive.

If you have not installed Project Costing you can also add memo project start and end date, project manager information, and project status. If you have installed Project Costing and any of the other applications requiring the full complement of project ChartFields, use the components mentioned in the preceding ChartField list to create the ChartField values and their control data. These components and pages are fully described in the Project Costing documentation.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Project > Project**

This example illustrates the fields and controls on the Project page - when the PeopleSoft Project Costing application is not installed. You can find definitions for the fields and controls later on this page.

☐ Summary Project

The preceding page is available when Project Costing is installed on your system and is selected on the Installation Options - Products page.

Of the six project ChartFields, Project values is available for selection for setup using the ChartField Values page. The other five ChartFields are defined and their controls established using the Project Costing application. To define the other five project ChartFields, use the pages discussed in the Project Costing documentation.

See "PeopleSoft Project Costing Implementation" (PeopleSoft Project Costing).

You can use the project ID ChartField with or without the Project Costing application. The setup for the page varies depending on this option.

**Note:** If you are using Project Costing, the Description tab and the fields associated with project manager and project status are not available through the Project page because applicable controls are entered or maintained through the Project Costing application pages. Also, when you use project IDs in General Ledger or other applications in your integrated database, the system validates them for standard Chartfield edits without regard to where the values were created. These and other important considerations are more fully explained in the Project Costing documentation dealing with setting up and integrating Project Costing, General Ledger and the feeder systems.

| <b>Field or Control</b>        | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Integration</b>             | Use to select an integration template for the project and project level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Status</b>                  | ChartField edit uses this value to determine if the project ID value is active or inactive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Start Date and End Date</b> | <p>If you have <i>not</i> installed PeopleSoft Project Costing, these fields are used for memo entries only and there is no general ledger process that uses them.</p> <hr/> <p><b>Note:</b> No edits are subject to these dates nor does the Commitment Control Budget Processor use these dates during budget checking.</p> <hr/>                                                                                                                                                                                                                                                                                                                                                              |
| <b>Project Manager</b>         | If you have <i>not</i> installed Project Costing, these fields enable you to specify the project manager ID, display the manager name, and effective date of the entry. The fields are not available on this page if you are using Project Costing.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Project Status</b>          | <p>If you have <i>not</i> installed Project Costing, you can enter the effective date and select a project status to indicate the various stages of the life cycle for the project, such as <i>Proposed</i>, <i>Budgeted</i>, <i>Hold</i>, <i>Open</i>, or <i>Closed</i>. The fields are not available on this page if you are using Project Costing.</p> <hr/> <p><b>Note:</b> These fields are memo entries only and are not used by any general ledger process. Do not confuse them with ChartField editing that uses the ChartField status (active or inactive) that is also set on this page nor with budget checking in Commitment Control that uses budget start and end dates.</p> <hr/> |
| <b>Attributes</b>              | <p>Select to access the ChartField Attributes page.</p> <hr/> <p><b>Note:</b> Attributes normally share the effective dating of the ChartField values to which they are attached, however, the Project ChartField does not have effective dating. Project ChartField attributes are automatically assigned a default effective date of 01/01/1900.</p> <hr/>                                                                                                                                                                                                                                                                                                                                     |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Summary Project</b>  | If you select this option, the project ID value is used at a budget summary level for budgets but not at a detail transaction level within Commitment Control. If the Project Costing product is installed, it serves a similar function to indicate the project ID value is a rollup or summary level project and is not used for detail activity. |

## Grants

You can also set up and maintain Project values to track grants.

See the *PeopleSoft Grants* product documentation.

## Statistics Code Page

Use the Statistics Code page (STATISTICS\_TBL) to add or modify statistics codes to track nonmonetary information.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Statistics Code**

This example illustrates the fields and controls on the Statistics Code page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Statistics Code' page. At the top, there are tabs for 'SetID SHARE' and 'Statistics Code FLS'. Below the tabs is a table with the following columns: 'Effective Date', '\*Status', '\*Description', '\*Short Description', '\*Unit of Measure', 'Short Description', and 'Long Description'. The first row of data shows: '1' in the first column, '01/01/1900' in the second, 'Active' in the third, 'Floor Space' in the fourth, 'FI Space' in the fifth, 'SQF' in the sixth, and 'Square Ft' in the seventh. There are also buttons for 'Personalize', 'Find', and 'First', '1 of 1', 'Last'.

You can track a variety of nonmonetary amounts with statistics. Statistics codes are used to maintain statistical amounts to facilitate financial analysis and reporting. If you plan to use statistics codes, you must also establish units of measure.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                             |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Unit of Measure</b>  | Select a default unit of measure in which the system is to store statistical amounts that you enter. If you enter an amount on a journal line in a unit of measure that differs from this default, the system automatically converts it to the one that you specify here if you have defined a conversion factor on the Units of Measure page. |

## Related Links

[Units of Measure Page](#)

"Understanding Statistical Journals" (PeopleSoft General Ledger)

## Scenario Page

Use the Scenarios page (BD\_SCENARIO) to define different budget iterations.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Scenario**

This example illustrates the fields and controls on the Scenario page. You can find definitions for the fields and controls later on this page.

You can easily keep track of different budget versions using *scenarios*. A scenario is a ChartField value that you can use to identify various budget iterations that use different assumptions.

## Related Links

"Understanding General Ledger Standard Budgets" (PeopleSoft General Ledger)

"PeopleSoft Commitment Control Implementation" (PeopleSoft Commitment Control)

## Program Code Page

Use the Program Code page (PROGRAM\_DEFINITION) to track amounts to which you want to apply budgetary controls.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Program Code.**

This example illustrates the fields and controls on the Program Code page. You can find definitions for the fields and controls later on this page.

These values lend themselves to identifying and tracking revenues and costs to which you want to apply budgetary controls, for example, a toxic waste removal program or research being conducted by a university.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Manager Name</b>     | Programs typically involve responsibility accounting.                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Budgetary Only</b>   | Select if the value is to be used for budgetary purposes only. This program code will not be available for recording actual transactional entries for most products. However, General Ledger allows either budgetary only or non budgetary values to be selected for journal entry but validates against the ledger type at journal edit. Budgetary only functionality is available for all fully configurable ChartFields. |
| <b>Attributes</b>       | Select to access the ChartField Attributes page. Attributes share the effective dating of the ChartField values to which they are attached.                                                                                                                                                                                                                                                                                 |

## Class Field Page

Use the Class Field page (CLASS\_PNL) to classify activities concurrently recorded in funds, departments and programs into detail categories in which you normally track class amounts such as salaries or materials

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Design ChartFields >Define Values >ChartField Values >Class Field.**

This example illustrates the fields and controls on the Class Field page. You can find definitions for the fields and controls later on this page.

**Class Field**

Class values enable you to further classify activities concurrently recorded in funds, departments and programs into detail categories in which you normally track class amounts such as salaries or materials.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Budgetary Only</b>   | Select if the value is to be used for budgetary purposes only. This class field will not be available for recording actual transactional entries for most products. However, General Ledger allows either budgetary only or non budgetary values to be selected for journal entry but validates against the ledger type at journal edit. Budgetary only functionality is available for all fully configurable ChartFields. |
| <b>Attributes</b>       | Select to access the ChartField Attributes page. Attributes share the effective dating of the ChartField values to which they are attached.                                                                                                                                                                                                                                                                                |

## Budget Reference Page

Use the Budget Reference page (BUDGET\_REF) to identify unique budgets where individual budgets share budget keys and overlapping periods.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > Budget Reference**

This example illustrates the fields and controls on the Budget Reference page. You can find definitions for the fields and controls later on this page.

**Budget Reference**

SetID FEDRL      Budget Reference B2013

Effective Date      Personalize | Find | View All | 1-2 of 2 | First | Last

## ChartField 1 Page

Use the ChartField 1 page (CHARTFIELD1) to add a ChartField value and enter a long and short description for the ChartField value.

ChartField 1 must be activated using standard ChartField configuration to be available in the menu.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > ChartField 1**

Use the ChartField 2 page (CHARTFIELD2) to add a ChartField value and enter a long and short description for the ChartField value.

ChartField 2 must be activated using standard ChartField configuration to be available in the menu.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > ChartField 2**

Use the ChartField 3 page (CHARTFIELD3) to add a ChartField value and to enter a long and short description for the ChartField value.

ChartField 3 must be activated using standard ChartField configuration to be available in the menu.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > ChartField Values > ChartField 3**

PeopleSoft delivers three ready-to-configure expansion ChartFields. When additional ChartFields are required, these expansion ChartFields can be activated rather than adding new ChartFields. ChartField 1, 2, and 3 must be activated on the Standard ChartField Configuration page.

---

**Note:** Additional ChartFields can be added using advanced ChartField configuration if the three expansion ChartFields do not meet your needs.

---

## Standard ChartField Configuration Page

Use the Standard ChartField Configuration page (STANDARD\_CF\_TMPLT) to you must have been granted user security to use this page.

Unless a ChartField is active it will not be displayed in the navigational menus. Related ChartFields determine the values for affiliate ChartFields. Business unit is required for the interunit affiliate ChartField. Assign a unique intraunit related ChartField of the same ChartField length that is specified for each intraunit affiliate ChartField that is active.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Configure > Define CF Standard Config**

Use affiliate ChartField values when interunit or intraunit transactions are maintained using the same account ChartField value among several related entities (such as business units, funds, or operating units). For example, each entity might use account 140000 as both an interunit receivables and payables account. Each entity could also have a different account value. However, in each instance an affiliate ChartField value must be assigned to the accounting line or journal line to identify the entity with which the receivable or payable is shared.

PeopleSoft delivers the following affiliate ChartFields:

- Affiliate ChartField.

This ChartField is not configurable and is used only for *interunit* accounting in association with business unit.

- Fund affiliate ChartField.

This ChartField is fully configurable and can be renamed, deleted, resized or relabeled. It is used for *intraunit* accounting between entities. This ChartField is delivered with an association to the fund ChartField but it can be associated with any fully configurable ChartField.

- Operating unit affiliate ChartField.

This ChartField is fully configurable and can be renamed, deleted, resized or relabeled. It is used for *intraunit* accounting between entities. This ChartField is delivered with an association to the operating unit ChartField but it can be associated with any fully configurable ChartField.

Affiliate ChartFields *cannot* be used as standard standalone ChartFields. They must be used in association with another related ChartField. This is because the affiliate ChartField values are the values of the related ChartField. In other words, there is no separate affiliate ChartField page where you enter affiliate values as with the stand alone ChartFields, such as account or department.

Business unit is required as the interunit-related ChartField for affiliate. It provides the values available in the drop down list box for the **Affiliate** field on the Journal Entry page.

A unique intraunit-related ChartField must be specified for each intraunit affiliate ChartField that is active. Intraunit-related ChartFields must be used with intraunit affiliate ChartFields; they cannot be used for interunit purposes. The intraunit-related ChartField length must not be greater than the intraunit affiliate ChartField length to which it is mapped.

Related ChartFields provide the prompt values for affiliate ChartFields.

**Adding PeopleSoft Project Accounting Product ChartField Values**

ChartFields specific to the Project Costing application are described in the PeopleSoft Project Costing documentation.

**Loading ChartField Values Using the Excel Spreadsheet to Component Interface Process**

PeopleSoft delivers a Microsoft Excel Spreadsheet to PeopleSoft Components Interface to enter ChartField data into PeopleSoft databases. Component Interfaces are listed with the topics on the applicable ChartFields and associated functionality.

For more information on Component Interfaces, refer to your PeopleTools documentation.

See the product documentation for *PeopleTools: Component Interfaces*.

---

**Using Trees to Summarize ChartFields**

Using the PeopleTools Tree Manager, you can set up ChartField summarization rules, reporting hierarchies, and rollup structures. The Tree Manager adds a convenient graphic layer that displays the relationships between ChartField values. You see where individual ChartField values fit in the overall scheme; and you can maintain the ChartFields directly from the Tree Manager.

The Tree Manager simplifies chart of account design. It enables you to position individual ChartField values on an intuitive tree diagram, so that your summary levels or hierarchies are established exactly as they are displayed on the screen. You maintain ChartField values and include them in the appropriate rollup structures at the same time.

**Defining and Using SpeedTypes**

To define and use speed types, use the SpeedTypes component (SPEEDTYPE).

## Pages Used to Define and Manage SpeedTypes

| <i>Page Name</i>                      | <i>Definition Name</i> | <i>Usage</i>                                                                                                                                 |
|---------------------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">SpeedType Page</a>        | SPEEDTYPE              | Define the ChartField value combination that you want the system to enter into the journal automatically when you select the Speed Type key. |
| <a href="#">SpeedType Delete Page</a> | SPEEDTYPE_DELETE       | Select to delete one or more existing SpeedTypes at once.                                                                                    |

## Understanding Defining and Using SpeedTypes

You often have common transactions in which you must enter the same combination of ChartField values repeatedly. By creating shortcut keys called SpeedTypes for these frequently used combinations of ChartFields, you can greatly increase journal entry efficiency and reduce errors.

Assume that you regularly post sales of a certain product to a specific revenue account. Each time that you create a journal entry that describes this transaction, you enter the same product code, department ID, and account number. Using a SpeedType that you define, you can type in the SpeedType code or one or more leading characters of the SpeedType code, click the drop down menu and quickly select the code from a list that appears to automatically enter all three ChartField values. For example, if SREV is the Speed Type you created for the entry described above, you can type in SREV or just enter S or SR to narrow the number of SpeedTypes that are available on the SpeedType List page that appears when you click the drop down menu for the **Speed Type** field.

## SpeedType Page

Use the SpeedType page (SPEEDTYPE) to define the ChartField value combination that you want the system to enter into the journal automatically when you select the Speed Type key.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Define Values > Define Speed Type**

This example illustrates the fields and controls on the SpeedType page. You can find definitions for the fields and controls later on this page.

|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Type of SpeedType</b> | <p>Select to restrict the key to a particular user or permission list. Values are:</p> <ul style="list-style-type: none"> <li>• <i>Universal (All Users)</i>: All users are authorized to use this combination. To create a Universal SpeedType when adding a new value, do not enter a <i>User ID</i> or a <i>Primary Permission List</i> value.</li> <li>• <i>One User</i>: The user that you specify in the <b>User ID</b> field is authorized to use this combination.</li> <li>• <i>One Permission</i>: Permission that you specify in the <b>Primary Permission List</b> field is authorized to use this combination.</li> </ul> |
| <b>Currency Code</b>     | <p>It is not necessary to select a value because the value defaults to the currency of the ledger. If you do specify a currency and you use the SpeedType in a journal for a ledger that has a different currency, the system does not use the Speed Type currency for the foreign currency in the journal line.</p>                                                                                                                                                                                                                                                                                                                   |

**Note:** The **Publish Data** check box is used if you want to send the ChartField values of the new or updated SpeedType to PeopleSoft HCM, which uses the values to update the Account Code (ACCT\_CD\_TBL) table. The check box is only available if the SpeedType is a *One User* Speed Type; and the HCM installation option is selected.

If the Publish Data check box is visible but unavailable on the SpeedType page, it indicates that the message object, HR\_CHARTFIELD\_COMBO\_SYNC, is not activated. When the Publish Data check box is available, its default is not selected. The option is not part of the SpeedType data and is not saved with your SpeedType definition.

**Note:** The published data content includes detail project ChartField values, as the data source is the SpeedType record (SPEEDTYP\_TBL).

| <input type="checkbox"/> | QCASH      |      | 100002  |          |           |      |       |         |       |         |         |
| <input type="checkbox"/> | SCASH      |      | 100001  |          |           |      |       |         |       |         |         |
| <input type="checkbox"/> | SREV       |      | 401000  |          |           |      |       |         |       |         |         |

Select and delete one or more existing SpeedTypes in one action using the SpeedType Delete page. Situations that may warrant multiple SpeedTypes be deleted at once are account inactivation, user inactivation, or ChartField relationships that are no longer valid within the organization.

Search for the SpeedTypes that you want to delete. You must enter a SetID. If you want a complete listing of the SpeedTypes within a SetID, leave the Type of SpeedType, Field Name, Selection Criteria and Value fields blank. Otherwise, enter values in these fields to narrow your search and click the Search button to retrieve the SpeedTypes. From the result set, select those SpeedTypes that you want to delete, or click the Mark All button if you want to delete them all and click the Delete link.

## Defining and Using ChartField Value Sets

To define and use ChartField value sets, use the ChartField Value Sets component (CF\_VALUE\_SET).

### Page Used to Define ChartField Value Sets

| Page Name                                 | Definition Name | Usage                                                                                                                                                |
|-------------------------------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">ChartField Value Set Page</a> | CF_VALUE_SET    | Define sets of ChartField values to be used for such things as closing, commitment control budget close, equitization, and consolidation processing. |

## Understanding Defining and Using ChartField Value Sets

ChartField value sets enable you to define combinations of ChartField values to be used for source data during the general ledger closing process and the Commitment Control ledger closing process. They can also be used to define the source data for consolidations, equitization, and various other process.

For example, you can create one ChartField value set for the income statement accounts used in interim closing and a different set to be used in year-end closing. When you define closing rules for the interim close or the year-end close, you select which ChartField value sets to use.

### ChartField Value Set Page

Use the ChartField Value Set page (CF\_VALUE\_SET) to define sets of ChartField values to be used for such things as closing, commitment control budget close, equitization, and consolidation processing.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >ChartField Value Sets >Set Up ChartField Value Sets >ChartField Value Set.**

This example illustrates the fields and controls on the ChartField Value Set page. You can find definitions for the fields and controls later on this page.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Summary Ledger</b>   | If the Ledger Template that you selected is for a summary ledger, enter the summary ledger ID. This identifies which ChartField values are available for selection in the <b>Select Values/Nodes</b> group box.                                                                                                                                          |
| <b>Description</b>      | <p>Enter a short description of the ChartField value set to display on pages and in drop-down list boxes where display space is limited.</p> <p>In the following field, enter a longer description to identify the ChartField value set on reports, pages, prompt lists, or online inquiries. Include any comments or information regarding its use.</p> |

In the **Values by ChartFields** group box, identify the values to be included in this value set.

| <b>Field or Control</b>                                                             | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Select Values/Nodes</b>                                                          | The system prompts you to enter accounts or tree nodes depending on the <b>How Specified</b> option that you selected. Click the <b>Add</b> button to add each account or node value.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|  | Click the <b>Tree View</b> button to access the tree referenced when using Selected Parents in How Specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|  | To the right of the <b>How Specified</b> field, click the <b>Add</b> button to add additional ChartFields to the value set; then complete the fields to select values to include for the ChartField as described.                                                                                                                                                                                                                                                                                                                                                                                                               |

## Producing ChartField Reports

Use the ChartField Reports (FS\_CF\_REPORT\_HOME) component to access reports pages.

Below are listed standard ChartField reports to monitor your progress in implementing ChartFields and related functionality.

To run a report, select it from its menu and enter the necessary parameters. After you entered the report parameters, you use Process Scheduler to run the report. The Process Scheduler manages the processes, tracks the status, and generates the report.

To modify standard reports, create your own reports, or change the report output format, a variety of reporting options are available in PeopleTools. Refer to your PeopleTools documentation for more information.

### Pages Used to Produce ChartField Reports

| <b>Page Name</b>         | <b>Definition Name</b> | <b>Navigation</b>                                                                                                                                                                                                                                                                                                                                                                                                              | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Account Types            | RUN_FIN0004            | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Design ChartFields &gt; Reports &gt; Account Types &gt; Account Types</b>                                                                                                                                                                                                                                                                                       | Specify parameters for running the Account Types report. The Account Types report (FSX0004) displays the account type, the long and short descriptive name and indicates whether the system carries forward the balance for that account type.<br>It is a BI Publisher report and as such, if you have configured ChartFields, you avoid manual changes to the report.                                                                                                                                        |
| List of Valid SpeedTypes | RUN_FIN0007            | <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Design ChartFields &gt; Reports &gt; SpeedTypes &gt; Run &gt; Process Scheduler Request &gt; and select List of Valid Speed Types</b><br><br><b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Design ChartFields &gt; Reports &gt; SpeedTypes &gt; Run &gt; Process Scheduler Request &gt; and select BI Publisher: List of Valid Speed Types</b> | Specify parameters for running the SpeedTypes report. The SpeedTypes report (FSX0007) produces a list of valid SpeedTypes.<br>A SpeedType enables you to enter <i>shorthand</i> keys to trigger the population of ChartField pre-specified values for one or more fields for a journal entry. It also shows if the SpeedType is to be used by a single user ID or an entire permission list.<br><br>FSX0007 is a BI Publisher report and does not require manual changes to support ChartField configuration. |

| <u>ChartField Display Template Page</u> | CF_DSP_TEMPLATE        | Set up ChartField display options.                                                                                                       |
| <u>Assign CF Display Templates Page</u> | CF_DSP_COMPONENTS      | Determine the ChartField display template that the system should use for the designated component based on a permission list or user ID. |

## Understanding ChartField Display Templates

ChartField Display Templates are used to extend ChartField configuration to control the display of individual ChartFields on PeopleSoft Fluid components. It displays ChartFields in a consistent manner on PeopleSoft Fluid transaction pages across PeopleSoft products.

Users define a template for each unique type of ChartField display that is needed. When adding a new template, the active ChartFields are displayed according to the ChartField configuration. If the ChartField configuration is modified, for example the ChartField is inactivated, all existing templates are updated as part of the ChartField configuration.

---

**Note:** As of PeopleSoft Image 22, the Book Code ChartField is supported in the ChartField Display Template for system maintained and user defined templates.

---

## ChartField Display Template Page

Use the ChartField Display Template page (CF\_DSP\_TEMPLATE) to set up ChartField display options.

Navigation:

**Setup Financials/Supply Chain >Common Definitions > Design ChartFields >ChartField Display Templates >Define CF Display Templates**

This example illustrates the fields and controls on the ChartField Display Template page.

|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ChartField Display Template</b> | Enter the name of the ChartField display template.                                                                                                                                                                                    |
| <b>Default</b>                     | <p>Select this check box to indicate that this ChartField display template is the default template. Only one default is allowed and one must be set as the default.</p> <p>This page cannot be saved until a default is selected.</p> |
| <b>System Maintained</b>           | Displays as selected for templates that are delivered by PeopleSoft. These templates cannot be edited.                                                                                                                                |

| <b>Field or Control</b>          | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ChartField Option</b>         | <p>Select an option that indicates which field to display on PeopleSoft Fluid transaction pages. Options include:</p> <ul style="list-style-type: none"> <li>• <i>Both Value and Description</i>: Select to indicate that the system displays the ChartField values and the corresponding ChartField descriptions on PeopleSoft Fluid transaction pages.</li> <li>• <i>ChartField Values</i>: Select to indicate that the system displays only ChartField values on PeopleSoft Fluid transaction pages.</li> <li>• <i>ChartField Descriptions</i>: Select to indicate that the system displays only ChartField descriptions on PeopleSoft Fluid transaction pages.</li> </ul>                                                                                                              |
| <b>Copy from Template</b>        | Select a ChartField Display template from which to copy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Order</b>                     | Displays the order from ChartField configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>ChartField Display Option</b> | <p>Select an option to control the display the ChartFields on PeopleSoft Fluid pages. Options include:</p> <ul style="list-style-type: none"> <li>• <i>Component Default</i>: Select to indicate that the system should use the transaction logic to determine how to display the ChartFields, which could present the field as editable, non-editable, or hidden.</li> <li>• <i>Display ChartField</i>: Select to indicate that the system should show the ChartField as a non-editable field.</li> <li>• <b>Hide ChartField</b>: Select to indicated that the system should hide the ChartField.</li> </ul>                                                                                                                                                                              |
| <b>Required Option</b>           | <p>Select an option that indicates whether the ChartField is required. Options are:</p> <ul style="list-style-type: none"> <li>• <i>Not Required</i>: Select to indicate that the transaction logic determines whether the ChartField is required.</li> <li>• <i>Required</i>: Select to indicate that the ChartField is required and that the user must enter a value, if the field is editable on the transaction page.</li> </ul> <p>This option is only available when <i>Component Default</i> is selected in the <b>ChartField Display Option</b> field.</p> <p>This option is not available for Project Costing business unit, Project, Activity, Source Type, Category, or SubCategory because these fields are controlled at the Project Costing business unit options level.</p> |

| <b>Field or Control</b>       | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Summary Display Option</b> | <p>Select an option for the ChartField to display on the Account Summary grid. This option is used because some PeopleSoft Fluid pages display accounting information in summarized form.</p> <p>Options include:</p> <ul style="list-style-type: none"> <li>• <i>Exclude</i>: Select to indicate that the ChartField should not be displayed on the Account Summary grid.</li> <li>• <i>Group 1</i>: Select to indicate that ChartFields are displayed in the first group on the Accounting Summary grid, such as General Ledger ChartFields.</li> <li>• <i>Group 2</i>: Select to indicate that ChartFields are displayed in the second group on the Accounting Summary grid, such as Project Costing ChartFields.</li> </ul> |

## Assign CF Display Templates Page

Use the Assign CF Display Templates page (CF\_DSP\_COMPONENTS) to determine the ChartField display template that the system should use for the designated component for all users, a permission list, or user ID.

Navigation:

**Setup Financials/Supply Chain >Common Definitions > Design ChartFields >ChartField Display Templates >Assign CF Display Templates**

This example illustrates the fields and controls on the Assign CF Display Templates page.

## Setting Up Accounting Tags

Accounting Tags increase data entry efficiency by reducing the number of keystrokes required to enter frequently used ChartField combinations. Accounting Tags are used when a transaction is created using a PeopleSoft Fluid or PeopleSoft Classic(+) transaction page, Accounting Tags can also be used to populate ChartFields on transaction distribution lines, instead of using existing ChartField distribution option such as Speedcharts and Speedtypes.

When creating a transaction within a product, a secondary [Accounting tags Page](#) is used to select the Accounting Tag. In addition, users can determine a list of favorite Accounting Tags that they use most frequently using the [Accounting Tag Favorites Page](#).

Accounting Tags can be defined with single or multiple accounting distributions. The system automatically prorates the amount of an accounting line according to the proration percentages defined on the Accounting Tag.

The purpose of accounting tags is to standardize how PeopleSoft FSCM applications distribute accounting transactions when creating transactions using the PeopleSoft Fluid and Classic(+) User Interface.

The list of accounting tags made available are determined by various factors and include, displaying accounting tags:

- Associated with a specific product.
- Associated with specific tag groups mapped to the current component.

- With no tag groups.
- Associated with permission lists assigned to you on the accounting tag component.
- Related to you on the accounting tag component.
- Having security settings for all users.

## Pages Used to Set Up Accounting Tags

| <i><b>Page Name</b></i>                   | <i><b>Definition Name</b></i> | <i><b>Usage</b></i>                                                                                                        |
|-------------------------------------------|-------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <u>Accounting Tag Registration Page</u>   | TAG_PROD_RG                   | Determine whether you want to use Accounting Tags for Classic(+) or continue to use other ChartField distribution options. |
| <u>Accounting Tags - ChartFields Page</u> | ACCTG_TAG_MAIN                | Define effective dated ChartField distributions.                                                                           |
| <u>Accounting Tag Products Page</u>       | ACCTG_TAG_SEC                 | Associate an accounting tag with one or more products (PeopleSoft applications).                                           |
| <u>Accounting Tags - Permissions Page</u> | ACCTG_TAG_PERM                | Associate an accounting tag to users.                                                                                      |
| <u>Tag Group Page</u>                     | ACCTG_TAG_GROUP               | Define functional groups for Accounting Tags.                                                                              |
| <u>Assign Tag Groups Page</u>             | ACCTG_TAG_COMP                | Associate tag groups with PeopleSoft Product components.                                                                   |

## Accounting Tag Registration Page

Use the Accounting Tag Registration page (TAG\_PROD\_RG) to determine whether you want to use Accounting Tags for Classic(+) or continue to use other ChartField distribution options.

Navigation:

**Setup Financials/Supply Chain >Common Definitions > Design ChartFields > Accounting Tags >Tag Registration by Products**

This example illustrates the fields and controls on the Accounting Tag Registration Page.

Accounting Tag Registration

Accounting Tag

1-6 of 6

| Object Owner ID | Use Accounting Tag                  |
|-----------------|-------------------------------------|
| Purchasing      | <input type="checkbox"/>            |
| eProcurement    | <input type="checkbox"/>            |
| Payables        | <input type="checkbox"/>            |
| Expenses        | <input checked="" type="checkbox"/> |
| General Ledger  | <input type="checkbox"/>            |
| eSettlements    | <input type="checkbox"/>            |

Select the Use Account Tag check box to indicate that you want to use Accounting Tags in PeopleSoft. If the Use Accounting Tag check box is not selected, then you can continue to use another ChartField distribution option like SpeedType.

## Accounting Tags - ChartFields Page

Use the Accounting Tags – ChartFields (ACCTG\_TAG\_MAIN) page to define effective dated ChartField distributions.

Accounting Tags may be single or multi line and support respective chartfield distribution lines. For example, General Ledger is enabled for single line accounting tags.

Navigation:

**Setup Financials/Supply Chain >Common Definitions > Design ChartFields > Accounting Tags >Accounting Tags.**

This example illustrates the fields and controls on the Single Line Accounting Tags - ChartFields page.

Effective Date Section

Use this section to define effective dated information for the Accounting Tag.

| Field or Control | Description                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Tag Group        | Select a tag group, which is defined using the Tag Group page. This is an optional field.                                                                                                                                                                                                                                                                                                            |
| Products         | <p>Click to access the <a href="#">Accounting Tag Products Page</a>.</p> <p>When creating a new Accounting Tag, the system automatically selects all products within the balancing group on the Accounting Tag Products page by default. You can select this link to review and deselect a product.</p> <hr/> <p><b>Note:</b> At least one product must be selected for an Accounting Tag.</p> <hr/> |

## Definition Section

Select how you want the system to calculate a split between one or more ChartField combinations.

Options include:

- *Enter Percentages*: When selected, there are three display-only fields that act as visual cues for the user when distributing ChartField lines by percentage; Positive, Negative, and Total Percentage. The Total Percentage field must add to 100.

---

**Note:** Oracle's PeopleSoft recommends that this option is used for PeopleSoft Expenses.

---

- *Enter Weights*: When selected, you can also determine a unit of measure. At least one line must have a value for the weight.

Your selection determines the appearance of the Distributions section of the page.

## Distributions Section

Use this section to determine ChartField combinations for the Accounting Tag.

---

**Note:** The system verifies that Budgetary Only ChartFields are not allowed in this section. In addition, at least one row of ChartField values must be entered.

---

Tag Group
GL TAG GROUP

\*Description
Tag Group for GL Product

Comments

After creating a Tag Group, you associate the Tag Group with Accounting Tags and transaction components. The system uses these configurations to restrict access to Accounting Tag values on transaction pages.

Creating a Tag Group is optional.

## Assign Tag Groups Page

Use the Assign Tag Groups page (ACCTG\_TAG\_COMP) to associate tag groups with PeopleSoft Product components.

Navigation:

**Setup Financials/Supply Chain > Common Definitions > Design ChartFields > Accounting Tags > Assign Tag Groups**

This example illustrates the fields and controls on the Assign Tag Groups page.

| <b>Description</b>             | Select or enter a component object description. This field can be used instead of the Component Name field. The options for this field are determined by PeopleSoft Development. |
| <b>SetID</b>                   | Select the Accounting Tag Group SetID. The options for this field are determined by you.                                                                                         |
| <b>Accounting Tag Group</b>    | Select or enter the accounting tag group. The options for this field are determined by you.                                                                                      |
| <b>Description</b>             | Select or enter the accounting tag group description. This field can be used instead of the Accounting Tag Group field.                                                          |

## Using Accounting Tags in PeopleSoft Classic

This topic discusses common pages that are used by PeopleSoft products when using Accounting Tags in PeopleSoft Classic pages. The explanation below is intended to be general and not application-specific. For application-specific information, please see the documentation for that application.

### Pages Used for Accounting Tags in PeopleSoft Classic

| <b><i>Page Name</i></b>              | <b><i>Definition Name</i></b> | <b><i>Usage</i></b>                                                    |
|--------------------------------------|-------------------------------|------------------------------------------------------------------------|
| <u>Accounting tags Page</u>          | ACCTG_TAG_SEL_SEC             | Select accounting tags to populate the transaction distribution lines. |
| <u>Accounting Tag Favorites Page</u> | ACCTG_TAG_FAV_SEC             | Create accounting tag favorites.                                       |
| <u>Accounting Tag Filter Page</u>    | ACCTG_TAG_FIL_SEC             | Filter the list of tags that appear on the Accounting tags page.       |
| <u>Favorites Tag Filter Page</u>     | TAG_FAV_FIL_SEC               | Filter the favorites on your Accounting Tag Favorites page.            |

### Accounting tags Page

Use the Accounting tags page (ACCTG\_TAG\_SEL\_SEC) to select accounting tags to populate the transaction distribution lines.

Navigation:

This is a secondary page that is invoked from an application-specific link or push button.

This example illustrates the fields and controls on the Accounting tags Page.

## Accounting Tag List Section

This section lists the accounting tags that are available to the end user. The list is determined by these factors.

1. Accounting tags associated with the specific product.
2. Accounting tags associated with the specific tag group mapped to the current component
3. Accounting tags with no tag groups.
4. Accounting tags associated with the permission list assigned to user on the accounting tag component.
5. Accounting tags associated with the user on the accounting tag component.
6. Accounting tags associated with the All Users security setting.

For additional information, see [Setting Up Accounting Tags](#).

## Accounting Tag Favorites Page

Use the Accounting Tag Favorites page (ACCTG\_TAG\_FAV\_SEC) to create accounting tag favorites.

Navigation:

Select the Manage Favorites link from the Accounting tags page.

This example illustrates the fields and controls on the Accounting Tag Favorites Page.

| Accounting Tag Favorites                                              |                          |                |                  |

| Show tags with No Groups | Select this check box to display tags that are not associated with a tag group, in addition to those tags that match your filter criteria. |

Favorites Tag Filter Page

Use the Favorites Tag Filter page (TAG\_FAV\_FIL\_SEC) to filter the favorites on your Accounting Tag Favorites page.

Navigation:

From the Accounting Tag Favorites page, click the Favorites button.

This example illustrates the fields and controls on the Favorites Tag Filter Page.

The screenshot shows a dialog box titled "Favorites Tag Filter" with a close button (X) in the top right corner. Inside the dialog, there are three input fields, each with a label to its left:

- The first field is labeled "Accounting Tag" and has a magnifying glass icon to its right.
- The second field is labeled "Description" and has no icon to its right.
- The third field is labeled "Accounting Tag Group" and has a magnifying glass icon to its right.

## Chapter 12

# Editing ChartField Combinations

---

## Understanding ChartField Combination Editing

Use this optional feature to set and enforce criteria for filtering out unwanted journal entry lines to ledgers based on combinations of ChartFields and their values.

If you are using Commitment Control, you can also edit commitment control budget journals online separately from posting or during the batch posting processing as a part of the Budget Processor (FS\_BP) Application Engine process, which edits and posts budget journal entries.

See "Combination Editing for Budget and Budget Adjustment Journals" (PeopleSoft Commitment Control).

See "Using Combination Editing with Budget, Transfer, and Adjustment Journals" (PeopleSoft Commitment Control).

You can implement ChartField combination editing by:

- Setting up combination editing in the general ledger feeder applications as described in the application-specific product documentation.
- Setting up general ledger journal editing to execute combination editing.

---

**Note:** Combination editing does not apply to summary ledgers.

---

---

**Note:** Combination editing does not support the publishing of detail project ChartFields to HCM since the source record is the COMBO\_DATA\_TBL, which does not include the detail project ChartFields. The only project ChartField that is published is PROJECT\_ID.

---

If you activate combination editing for the detail ledger group in which transactions are processed and recorded, when you run the Journal Edit process, it also calls the ChartField combination editing process.

ChartField combination editing compares the ChartField combination to the definitions and rules governing ChartField combinations that you define. For example, when you assign what PeopleSoft calls the anchor ChartField a value, and then associate it with nonanchor ChartFields and their values, ChartField Combination Editing uses something like an if-then test to ensure that entries conform to the ChartField combination rules and definitions. ChartField combinations can be set up for valid or invalid conditions depending on which is more efficient at precluding unwanted entries.

The decisions as to how to implement ChartField combination editing and what types of underlying tables to use greatly affect the efficiency, speed, and the ease of maintenance.

This section discusses:

- ChartFields, rules, and trees in combination editing.

- Advantages of using various table types in combination editing.
- Online and batch combination editing availability in PeopleSoft applications.
- Combination editing by transaction source.
- ChartField combination editing online.
- ChartField combination editing in batch or background processing.
- Retain detail values generated for master selector tables.
- Online combination editing for applications outside the financials database using a Web service.
- Combination editing in PeopleSoft Commitment Control.
- Master selector tables.
- ChartField combination editing templates.
- Combination editing groups.
- Various examples.

## **ChartFields, Rules, and Trees in Combination Editing**

The following are general recommendations concerning efficiencies and ChartFields, rules, and trees.

### **How Many ChartFields to Use**

For example, it might be required that only certain departments post to asset, liability, and equity accounts and that other departments post only to revenue and expense accounts. In the first instance, this involves defining editing rules for a combination that includes two ChartFields: Account and Department for department values that are limited to the balance sheet accounts.

You can also limit the departments that can post to income statement accounts to those recording particular product costs by introducing a third ChartField, Product, to the combination definition.

While any number of combinations is possible, limiting the combinations to three or fewer ChartFields optimizes performance.

### **How Many Combination Rules to Use**

Analyze the proposed combination rules and decide which are critical and which are not. The more rules that you implement, the more time that it takes to edit the transactions and maintain the rules.

### **Ranges of ChartField Values in Trees for Combination Editing Rules**

You can use PeopleSoft trees to set up combination edit rules having ranges of ChartField values rather than static values. Ranges of values can make it easier to keep ChartField combination edit rules current with changes in the ChartField values of your organization.

You can use spring, summer and winter trees with combination editing and you can further restrict values available from these trees through the use of tree levels and nodes.

## Advantages of Using Various Table Types in Combination Editing

PeopleSoft uses several types of tables to support combination editing. The following compares their advantages and disadvantages:

| <b>Table Type</b>              | <b>Advantage</b>                                                                                    | <b>Disadvantage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------|-----------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMBO_DATA_TBL table           | It is simple and provides relatively fast edits.                                                    | <p>Use this table type when the combinations do not change much and the table size, due to the number of combinations required, is moderate.</p> <p>It is a static table built during the combo build process. Once built there is no further processing that considers subsequent changes to your rules. Depending on the number of combinations, the table size can be very large and entail a slow build process.</p> <p>Supports online and background Combination Editing.</p> |
| User-defined table             | It is simple and provides relatively fast edits.                                                    | It is a static table and can require high maintenance.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Static master selector tables  | Entails a simple, fast build of relatively small tables.                                            | <p>Compared to the COMBO_DATA_TBL, this table type more easily incorporates changes in ChartField values and has a faster build due to smaller tables.</p> <p>Results are less intuitive. They are still static tables, but not as restrictive as the COMBO_DATA_TBL. Static master selector tables support online and background processing in General Ledger and in subsystems.</p>                                                                                               |
| Dynamic master selector tables | Nothing is static, so edits are consistent with the latest combination rules and ChartField values. | <p>This table type deals more effectively with frequent changes in ChartFields. These tables are both created and deleted during the edit process for General Ledger background edits.</p> <p>This table applies only to background, or batch, processing in General Ledger.</p>                                                                                                                                                                                                    |

| <b>Table Type</b>      | <b>Advantage</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>Disadvantage</b>                                                                                                                                                                                                                |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PS_COMB_EXPLODED table | This option using Retain Detail Values is a variation on the use of Static Master Selector Tables and is of particular value if tree nodes encompass large numbers of ChartField values. The build process might take longer but batch and online combination editing performance can be greatly improved. This is because detail values generated from the Master Selector Tables are retained in a permanent table (PS_COMB_EXPLODED) and the repeated exploding of detail values to temporary tables with each separate edit request is eliminated. | Changes within an exiting range of values that are included in a tree node are not reflected in a previously built PS_COMB_EXPLODED table. The table must be rebuilt after changes in trees and combination definitions and rules. |
| Mixed tables           | You can tune the process by using different tables to get optimal performance and minimal maintenance. For example, use fewer unchanging combinations in a COMBO_DATA_TBL and use dynamic master selector tables for combination rules that change often.                                                                                                                                                                                                                                                                                              | Requires expertise to implement and maintain.                                                                                                                                                                                      |

The following provides additional details about the tables and their advantages.

In general, master selector tables when compared with the other tables:

- Require less time to build and maintain.
- Take up less space in the database.
- Can be built for date ranges or periods that encompass any number of effective dated PeopleSoft trees.

---

**Note:** When you use ranges of values in trees, you only need to rebuild when you change nodes or ranges in the trees or change tree nodes that are used in the rules.

---

If you use detail values in the trees, you must rebuild the selector tables each time that you make changes to the detail values that are in the trees. However, the build for the master selector tables is much faster than that for the COMBO\_DATA\_TBL.

In PeopleSoft General Ledger feeder systems you can build a permanent set of static master selector tables that support both batch and subsystem online editing.

You have the option to use static master selector tables or dynamic selector tables in batch edits for General Ledger. If you do not run Combo Build by using the master selector table build option, the combination editing program then builds the dynamic selector tables during the batch edit process.

The system must explode the ranges of ChartField values defined in the tree nodes when you use static selector tables and store the values in additional temporary tables. The explosion process to populate the temporary tables is repeated each time a new transaction is edited. In addition, these temporary tables are not maintained by the system beyond the current edit; however, you can elect to retain the generated combinations for the detail values in a permanent table named PS\_COMB\_EXPLODED for

use in subsequent combination edits. When using the PS\_COMB\_EXPLODED table, the build process might take longer but batch combination editing performance can be greatly improved because repeated exploding of values and creation of temporary tables is avoided.

You can also configure and maintain a user defined combination data table. Because this method gives you complete control over the population of the data table, you might be able to reduce the size of the table over other table types and increase efficiency.

However, over time user-defined tables usually require more attention to analysis and maintenance in a changing ChartField environment than either the COMBO\_DATA\_TBL or the master selector tables. PeopleSoft provides you with functionality to maintain the COMBO\_DATA\_TBL and master selector tables, however, you have complete responsibility for detecting or noting changes to the applicable ChartFields or values and cleaning out the old and adding new combinations for the user-defined tables.

You can combine these table approaches with different combination edit groups to increase efficiency. When ChartField combination definitions and rules do not change often, they are candidates for a user-defined data table, because you can afford to trade flexibility for the prospect of additional speed in processing. For situations when you expect periodic changes in combination definitions and rules, using master selector tables may improve both speed and flexibility. Exploding the COMBO\_DATA\_TBL is desirable when the volume of the table does not burden the system or unduly increase processing time and you only occasionally need to update the table for ChartField combination changes.

Both batch combination editing and online PeopleCode editing support your choice of combo editing option. Although you run a process to populate both types of tables, the advantage of using the master selector tables is that the process to rebuild them is much faster than the COMBO\_DATA\_TBL explosion. Also, if you use tree ranges, you do not need to build the dynamic selector tables when you add ChartField values or delete them from the chart of accounts as you do with the COMBO\_DATA\_TBL.

Both batch and online PeopleCode editing support multiple combination groups that are attached to a business unit, each using a different choice for the combo editing option.

## Online and Batch Combination Editing Availability in PeopleSoft Applications

PeopleSoft applications can use ChartField combination editing online or in background (batch) processing, as shown for various applications in the following table.

| <b><i>Application</i></b> | <b><i>Online Editing</i></b> | <b><i>Background Editing</i></b> |
|---------------------------|------------------------------|----------------------------------|
| Asset Management          | Yes                          | Yes                              |
| Billing                   | Yes                          | Yes                              |
| Contracts                 | Yes                          | Yes                              |
| Cost Management           | Yes                          | No                               |
| eProcurement              | Yes                          | No                               |

| <b><i>Application</i></b>      | <b><i>Online Editing</i></b> | <b><i>Background Editing</i></b> |
|--------------------------------|------------------------------|----------------------------------|
| Expenses                       | Yes                          | No                               |
| General Ledger                 | No *                         | Yes                              |
| Inventory                      | Yes                          | No                               |
| Manufacturing                  | Yes                          | No                               |
| Payables                       | Yes                          | Yes                              |
| Pay/Bill Management            | Yes                          | No                               |
| Production Management          | Yes                          | No                               |
| Project Costing                | Yes                          | Yes                              |
| Purchasing                     | Yes                          | Yes                              |
| Receivables                    | Yes                          | Yes                              |
| sPro                           | Yes                          | No                               |
| Supplier Contract Management   | Yes                          | No                               |
| Treasury                       | Yes                          | Yes                              |
| Work Order Management          | Yes                          | No                               |
| Enterprise Learning Management | Yes **                       | No                               |
| Human Capital Management (HCM) | Yes **                       | No                               |
| Commitment Control ***         | Yes                          | Yes                              |

\* Combination edits for online journal entries that are in General Ledger are performed when the journal is edited. Journal edit can be performed immediately after saving an online journal entry. The difference between General Ledger and the other applications is that General Ledger uses the background editing program while the other applications use the online routines to perform online editing.

\*\* Because PeopleSoft Enterprise Learning Management (PeopleSoft ELM) and PeopleSoft Human Capital Management (HCM) run in a different database from that of Financials, you use the delivered web service to perform combination editing. You can use the combo edit request service that calls combo edit

online validation logic and returns the results to ELM before ELM sends entries to General Ledger for posting.

\*\*\* While Commitment Control is not an application, it is a major optional functionality that is used by several of the PeopleSoft applications. You can use combination editing in commitment control for budget journal editing. Combination editing of budget journals is discussed in the commitment control documentation.

For specific information on how ChartField combination editing is used and how errors are researched and corrected within those applications previously listed, as well as other PeopleSoft applications, see the application-specific product documentations.

## Combination Editing by Transaction Source

In order to increase process efficiency, PeopleSoft Financials provides the ability to perform combination editing for a process group by transaction source. Transaction sources include Asset Management transactions, Payables accounting lines, Receivables items, General Ledger journals, and so on. You can associate a Transaction Source with a process group so that during combination edit processing, only the data for the designated transaction source is processed for that group of rules rather than processing all data for all sources.

See [Defining Combination Editing by Transaction Source](#).

## ChartField Combination Editing Online

Typically, you click either an edit or a save button to initiate PeopleCode that starts an online edit for transactions that you enter in a particular application. For example, when you save Accounts Payable vouchers, many edits and processes occur automatically, including online combination editing if you implement this option.

Various underlying tables that are available to the Combination Editing process do support online editing. These underlying table options are described in a separate topic in this topic

After you decide on the table type and build the underlying table, the system can use the table to validate accounting and voucher lines against combinations in the table while online if the application supports online combination editing. This enables PeopleSoft General Ledger feeder systems, such as PeopleSoft Accounts Payable, to capture and correct errors as a standalone application before running the journal generator and performing journal edits. By performing the combination edit in the feeder system, you can correct errors promptly at the source before you post journals to the general ledger.

The online edit process edits one transaction line at a time. Each line is edited against all the process groups that are attached to the business units. The online edit process cannot dynamically build the tables, so you must build the COMBO\_DATA\_TBL, the master selector tables, the PS\_COMB\_EXPLODED table, or the user-defined table prior to using online edits in the feeder system applications.

The online combination editing process in the feeder systems does the following:

- If the combination exists in the table, it marks the line as valid or invalid depending on the **Combination Group Defines** option that you select.
- It analyzes transaction lines that are not found on the table to determine if the anchor ChartField has a value for which you have defined a combination rule.

- If the anchor ChartField value has a combination rule that is defined for it and if the entire combination is not found, the combination fails.
- On the ChartField Combination Group page, you can select a value for the **Anchor Values Not in Rules** field. This option determines if the system marks valid or invalid those journal lines having an anchor ChartField value that has no combination rule that is defined for it.

Feeder systems have three ways to initiate online logic:

- Use the edit\_combo function in FUNCLIB\_FS.EDIT\_COMBINATION FieldFormula record PeopleCode.
- Use the ComboEdit application class in the FS\_COMBO\_EDIT application package.
- Use the combination edit service operation to perform edits on data originating from other than the financial database. The Web service calls ComboEdit to perform combination editing and returns the results to the requesting application whether PeopleSoft or third party application.

Every page component that uses the edit\_combo function must include the COMBO\_EDIT\_WRK page. When you select the **Save** button, the system first populates the work page with information from combination editing groups and rules. Combination editing online uses the information that is on the work page to process the transaction lines. The system refreshes the work page when the business unit changes.

Components that use the ComboEdit application class do not need the COMBO\_EDIT\_WRK page. The ComboEdit application class should be instantiated at the component level so that the combination editing groups and rules that are stored in the class object can be reused for all transactions that are going to the same business unit. PeopleSoft recommends that feeder systems use the ComboEdit application package instead of the edit\_combo function.

## ChartField Combination Editing in Batch or Background Processing

To make combination editing background processing generic to all PeopleSoft applications, combination editing uses a ChartField Combination Editing template, which is discussed in a separate topic in this topic. The template defines the table structure of the various application transaction records. The combination editing process uses this structural information to perform its edit.

Record templates have a unique name that is applicable to a particular PeopleSoft application. You supply that name for your application to enable background combination editing.

Select the name of the combination edit template on the ChartField Combination Template page, in the **Template** field. The template is used only for background, or batch, editing.

Various underlying tables are available to combination editing that support batch editing. These underlying table options are also described in a separate topic in this topic.

The system performs batch, or background, combination editing at the time of journal editing or during accounting line and voucher line edits in the various PeopleSoft General Ledger feeder systems. In any case, editing occurs before posting journals to the general ledger.

---

**Note:** During journal editing, the Transaction Set Editor (TSE) determines whether a journal line is valid by finding a ChartField on a line, and then checking the ChartField against its ChartField table to make sure that the ChartField itself is valid. If the ChartField is invalid, the TSE marks it invalid and immediately excludes the journal line from the combination editing process.

---

Combination editing also validates whether a combination group is associated with a business unit and ledger group during a batch combination edit process.

## Batch Validation of Project Costing ChartFields

The following PeopleSoft applications have the ability to perform Project Costing ChartField validation through the batch Combination Edit process:

- Asset Management
- General Ledger
- Grants
- Payables
- Receivables
- Purchasing
- Project Costing

Similar to the online validation of detail Project ChartFields, PeopleSoft enables validation of Project ChartFields through batch combination edit by calling PC\_EDIT. The online Combination Edit does not call project validation; however, the existing online project edits handle the validation.

The following Project Costing edits are included in the batch combination edit:

- Validation of the Project Costing Business Unit, Project ID, and Activity ID combination
- Enforcement of Project and Activity Status Control check (Set Up Financials/Supply Chain, Install, Installation Options, Project Costing Integration)
- Enforcement of the Input Control option (Set Up Financials/Supply Chain, Business Unit Related, Project Costing, Project Costing Options)
- Enforcement of the Dynamic Edit Tables option (Set Up Financials/Supply Chain, Business Unit Related, Project Costing, Project Costing Definition)
- Validation of Project Costing and General Ledger Business Unit mapping via the Project Costing Integration Template (Set Up Financials/Supply Chain, Product Related, Project Costing, Project Options, Integration Templates, General Ledger Integration)
- Enforcement of the Analysis Type is required (for General Ledger journals only)

To implement the validation of Project Costing ChartFields through batch combination edit,

- Project Costing must be an installed product.

- Use the Project Costing Options page to Establish project-related transaction fields that are required for importing transactions from other PeopleSoft applications (Set Up Financials/Supply Chain, Business Unit Related, Project Costing, Project Costing Options).

In General Ledger, you can perform validation of Project Costing ChartFields of Spreadsheet journals or from Flat File Journal Import using batch edit, for example. In Payables, the batch edit occurs during the Voucher Build process, for example.

See PeopleSoft General Ledger Documentation Update: Project Costing Edit, Note number 1063525.1, on My Oracle Support, at: <https://support.oracle.com/CSP/ui/flash.html>.

## Batch Combination Editing Using the Combo Data Table or a User-Defined Data Table

The combination editing process repeats the following steps for each combination group that you associate with a business unit and ledger group for which you select either the Combo Data table or a user-defined combination data table:

- Combination editing compares all transaction lines against the table.

If the combination exists in the data table, it marks the line as valid or invalid depending on the Combination Group Defines option that you select.

If the anchor ChartField value has a combination rule defined for it and if the entire combination is not found, the combination fails the edit.

If the anchor ChartField value does not have a combination rule defined for it, then the line is marked with the state that you select—either *Mark Invalid* or *Mark Valid* on the ChartField Combination Editing Group page for the **Anchor Values Not in Rules** field.

- When the program encounters an invalid combination, it logs the invalid transaction with an error status message in the error log records that are defined in the Combination template.

## Batch Combination Editing Using the Master Selector Tables Option

If you select the master selector tables option for the combination group, the batch combination editing process does the following:

- It retrieves the combination groups that are attached to the business unit and ledger group that you specify.
- It loops through the combination groups and determines if the master selector tables are built for a group. If you have not built them, it builds them dynamically according to the rules, using Application Engine temporary tables.
- It expands the master selector tables to create an Application Engine temporary COMB\_EXP\_TAO table that contains the permutations of values for the combinations.
- It compares each journal line against the COMB\_EXP\_TAO table and if the combination exists in the table, it marks the line as valid or invalid depending on the option that you select in the **Combination Group Defines** field.
- It analyzes transaction lines that are not found on the table to determine if an anchor ChartField has a value for which you have defined a combination rule.

- If the anchor ChartField value has a combination rule defined for it and if the entire combination is not found, the combination fails.
- If the anchor ChartField value does not have a combination rule defined for it, then the line is marked with the state you select, - either *Mark Invalid* or *Mark Valid* on the ChartField Combination Editing Group page in the **Anchor Values Not in Rules** field.

---

**Note:** In other words, if the combination fails, it is marked valid or invalid depending on the attribute that is selected for this field.

---

- If the process encounters an invalid combination, it logs the invalid transaction with an error status message in the error log records defined in the ChartField Combination Editing Template.
- When the edits are complete, the process deletes the COMB\_EXP\_TAO tables.

## Retain Detail Values Generated for Master Selector Tables

When using master selector tables and trees to specify ChartField combination values, the build process for static master selector tables stores only the range of values described by the tree nodes. The build process does not store the detail values encompassed by the nodes. It is when transactions are edited during combination editing batch processing that the range of values for each ChartField is exploded and stored in temporary tables for each editing request. Because the process deletes the temporary tables when the edits are complete, the temporary tables must be rebuilt for each separate edit request.

However, if you select the Retain Detail Values option for master selector tables on the ChartField Combination Editing Group page, combinations for the detail values are retained in a permanent table, PS\_COMB\_EXPLODED, after the values are generated during the build process. This precluding the repeated generation of combination detail values that were previously generated.

The Retain Detail Values option is of particularly value if the tree nodes encompass large numbers of ChartField values. When you use this option, the build process might take longer but batch combination editing performance is greatly improved because repeated exploding of values is eliminated.

However, if a new value is added within a ChartField range that is setup for a tree node, it does not cause the new value to be automatically included in the permanent ChartField value combination table even if the Increment option is selected on the ChartField Combination Editing Group setup page. Addition of a new value to a range does not in itself cause a rebuild of the detail values for the master selector table because the tree version is not changed.

If you add a new ChartField value within a range of values in a tree node and if you have selected the Retain Detail Values option and have already built the combination data, you must run the combination build process again to include the newly added values in the PS\_COMB\_EXPLODED table.

---

**Note:** The Review Combination Selector table inquiry displays the result from the selector tables and not the detail values even if a Combination Group has the Retain Detail Values check box selected.

---

## Online Combination Editing for Applications Outside the Financials Database Using a Web Service

Using a PeopleSoft synchronous web service, COMBO\_CF\_EDIT\_REQUEST, systems and products that run outside of the financials core database can validate ChartField combinations. The service exposes ChartField combination editing as a black box service to the other systems. This is provided to third party and PeopleSoft products running outside of the financials database, such as PeopleSoft Enterprise Learning Management (PeopleSoft ELM).

The following is the processing logic using PeopleSoft Enterprise Learning Management (ELM) as an example:

- ELM initiates ChartField Combination Editing from its transactions by sending a synchronous request COMBO\_CF\_EDIT\_REQUEST service to the financials database for General Ledger and waits for the reply.
- General Ledger listens to the service and calls the Combo Edit application class to validate the transactions that it receives.
- General Ledger returns the results in a synchronous reply to the ELM process that is waiting for the reply.
- ELM then proceeds with its transaction according to the Combination Editing result.

---

**Note:** While you can use the Web service with third-party products, PeopleSoft does not officially support third-party products.

---

See *PeopleSoft Enterprise Learning Management: Managing Person and Organization Data, Setting Up Financial ChartField Data*

See "General Ledger Integrations" (PeopleSoft General Ledger).

## Combination Editing in PeopleSoft Commitment Control

Commitment Control is an optional functionality providing commitment accounting and budget control and is available to many PeopleSoft applications. If you are using commitment control you can also use combination editing for budget and budget adjustment journal entries.

---

**Note:** You can specify winter and spring trees, which facilitates combination editing of control budgets by eliminating the need for multiple trees to accommodate commitment control combination editing.

---

Combination editing for commitment control is fully discussed in the commitment control documentation.

See "Combination Editing for Budget and Budget Adjustment Journals" (PeopleSoft Commitment Control).

See "Using Combination Editing with Budget, Transfer, and Adjustment Journals" (PeopleSoft Commitment Control).

## Master Selector Tables

As an alternative to the COMBO\_DATA\_TBL, you can build static or dynamic master selector tables. Make the decision about the combination build option based on the nature of the combination rules. Consider both the number of rules and expected changes in the relationships of the underlying values.

You build a static set of master selector tables to support online and batch PeopleCode editing that is done in general ledger feeder systems when it is not practical to build the COMBO\_DATA\_TBL. This is usually due to the number of combinations that are generated or due to the time it takes to clear and rebuild the COMBO\_DATA\_TBL when you make changes in the combination values.

Static master selector tables are not maintained dynamically by the online PeopleCode or the batch editing process and must be rebuilt each time that you change a tree or a combination rule. However, they still have an advantage over the COMBO\_DATA\_TBL, which must be built every time you add a ChartField value to the system. You do not need to rebuild the master selector tables when you add a ChartField value if it falls within a range of values that are defined in a tree that is used by the combination rules.

When you use trees to define the combination rule, the system stores the ranges of values in the tree that you specify for the master selector tables when you build the tables. You only need to rebuild the tables when certain data on which they are based changes. For example, rebuild the tables when you change the combination rule to reference a different node of a tree, or if you change a tree originally having a range of accounts from 100001-100099 to a new range of 100004-100099 in a particular node.

You can build master selector tables for a range of time spanning a period as long as you want. The transactions during the specified date range are correctly edited. The tables contain data from the PeopleSoft trees you referenced in your combination rules. If you do not have many effective dated versions of trees, you can build the Master Selector Tables for a very large date range, for example January 1, 1900 to January 1, 2999.

However, if you change the trees often and create new effective dated versions of trees when you make changes to the trees, you can build the master selector tables more often, and have the tables span shorter periods of time. The amount of data that is in the master selector tables grows according to the number of effective dated trees in the time period that you specify. It is best practice to build master selector tables only for the time period for which journals or transactions are most actively being edited. For example, build them for one or two accounting periods or for one fiscal year at a time.

Batch editing, such as for journal edits, use the master selector tables if they are built for a time period that includes the date of the journals or vouchers being edited. If they are not built, batch edit builds the tables dynamically. You may want to build the master selector tables even if you are only using batch editing to improve the performance of the edits.

### Run Build Combination Data Request Page for Master Selector Tables

Use the Build Combination Data Request page to run the process to build master selector tables.

Before you can run the Build Combination Data process, you must first define the detail ledger group for the business unit, and then tie the combination editing group to that ledger group.

Select *Build Selector Tables* in the **Build Option** field, and the **From Date** and **To Date** fields become available for you to specify a time period. All trees that are in the rules that have effective dates that are within the range of this time period are included in building the Master Selector tables.

## ChartField Combination Editing Templates

The ChartField Combination Editing Template page defines the structure for each transaction record for each PeopleSoft application that uses the background, or batch, ChartField Combination Editing process. The ChartField Combination Editing Template is not used in online processing.

PeopleSoft delivers specific templates that are needed to run background combination editing. For example, the JOURNALS ChartField Combination Editing Template is used in the PeopleSoft Journal Edit process in general ledger, and the VCHREDIT template is used in the voucher edit process that is in PeopleSoft Accounts Payable.

The following is a list of delivered templates:

| <b>Template</b> | <b>Description</b>                                    |
|-----------------|-------------------------------------------------------|
| AMEDIT          | Template for PeopleSoft asset management accounting.  |
| AREEDIT         | Template for receivables accounting.                  |
| BD_COMMIT       | Commitment Control Edit template for budget journals. |
| BI_ACCT         | Combination template for billing transactions.        |
| CA_TXN          | Combination template for contract transactions.       |
| JOURNALS        | Combination template for journals.                    |
| POBATCH         | Template for batch purchase order creation.           |
| POCCLOADLD      | Template for procurement card load statement process. |
| POREQBATCH      | Template for batch requisition creation.              |
| PROJECTS        | Template for projects accounting.                     |
| PROJECTS_A      | Services accounting model template                    |
| PROJECTS_I      | Projects interface template.                          |
| PROJECTS_P      | Projects pricing template.                            |
| TREASURY        | Template for treasury accounting.                     |

| <i>Template</i> | <i>Description</i>     |
|-----------------|------------------------|
| VCHREDIT        | Voucher Edit template. |

---

**Note:** PeopleSoft provides the ChartField Combination Editing templates for the PeopleSoft applications that use combination editing background processing, and you do not need to change them unless you modify a related table or field name.

---

## Combination Editing Groups

Combination editing groups define a set of combination rules. You can use the Combination Group page to associate multiple combination rules with a combination group definition. The system then applies the rules as a group during the journal edit process.

For example, if you create a combination definition in which you specify ACCOUNT as the anchor ChartField and DEPTID and PRODUCT as the nonanchor ChartFields for the rules, all the rules that are in a common group must use this combination definition. If you create a combination definition for PROJECT\_ID and AFFILIATE, you must create another group for the rules with this combination definition.

---

**Note:** You can define several groups by using the same ChartField combination definition and attach all of these groups to a ledger group for a given business unit. However, PeopleSoft recommends that you keep all the rules that have the same combination definition within the same group if possible. This increases performance of the combination editing process, because it reduces the number of groups that are being processed. Within the Ledgers For A Unit component, you can select to process a combination edit group (Process Group) by transaction source, which also increases processing efficiency by eliminating unnecessary validation against process groups that are not applicable.

---

See [Defining Combination Editing by Transaction Source](#).

## Various Examples

Before examining the various representative examples that are presented, keep in mind the following:

- Combination *definitions* define the *ChartFields* that are involved in the combination editing.
- Combination *rules* define the valid ChartField *values* for the combination definitions.
- Combination groups require that all combination rules that are within a group have the same combination definition.

Also, when the same anchor ChartFields are specified in different combination rules that are within a combination group, careful consideration is required to avoid problems.

- Combinations that are found to match the rules and definitions can be marked valid or invalid at your option.
- Combinations that do not match the rules and definitions are invalid and they cannot be marked as valid.

The following examples illustrate some logic and functional considerations when you define the combination groups and apply the various parameters.

### Grouping When There is the Same Anchor ChartField in Different Rules

If the same anchor ChartField exists in multiple rules that you include in the same group, and if the values that you define for the anchor and nonanchor ChartFields are sets or subsets of one another, it can easily cause confusion.

In the following example, rule 1 and rule 2 share the same anchor ChartField, account. The anchor account value of 614000 in rule 2 also exists in the range of account values that are described by the INCSTMT tree node, and the DeptID value 10000 also exists in the set of values that are described by any value that is valid:

| <b>Rule</b> | <b>Anchor ChartField</b> | <b>Anchor ChartField Value</b> | <b>Non-Anchor ChartField</b> | <b>Non-Anchor ChartField Value</b> | <b>Combo Defines Valid or Invalid Combinations</b> |
|-------------|--------------------------|--------------------------------|------------------------------|------------------------------------|----------------------------------------------------|
| Rule 1      | Account                  | INCSTMT                        | DeptID                       | Any Value                          | Valid                                              |
| Rule 2      | Account                  | 614000                         | DeptID                       | 10000                              | Valid                                              |

When the rules are included in the same combination group, the system marks a row valid when either of the if-then conditions that are specified by the anchor and nonanchor values in either rule 1 or rule 2 is met. The result is that any row is valid if it meets the conditions of rule 1 or rule 2. These rules are redundant when they are included in the same combination group.

If the rules are included in different combination groups, the system marks a row valid only if it satisfies the requirements of all rules. In this scenario 614000 is valid only with DeptID 10000. So, when rules 1 and 2 are in different combination groups, boolean and logic applies whether both combination groups use the same combination definition, or whether the combination groups define valid combinations, invalid combinations or a mix of both.

### Dealing With Anchor Values Not Included When There are Multiple Rules Having the Same Anchor ChartField

Whenever a combination group specifies that anchor values that are not included in rules are to be marked invalid, this criteria overrides other rules that may specify valid combinations for values that are not included in the original rule:

| <b>Rule</b> | <b>Anchor ChartField</b> | <b>Anchor ChartField Value</b> | <b>Non-Anchor ChartField</b> | <b>Non-Anchor ChartField Value</b> | <b>Defines Valid or Invalid Combinations</b> | <b>Anchor Values Not Included in Rules</b> |
|-------------|--------------------------|--------------------------------|------------------------------|------------------------------------|----------------------------------------------|--------------------------------------------|
| Rule 3      | Account                  | BALSHEET                       | DeptID                       | Blank                              | Valid                                        | Mark Invalid                               |
| Rule 2      | Account                  | 614000                         | DeptID                       | 10000                              | Valid                                        | Mark Valid                                 |

In this scenario, anchor account 614000 in rule 2 is an income statement account and as such is not part of the BALSHEET tree node that is specified in rule 3. Rows using account 614000 are always marked invalid, regardless of the fact that another rule specifically identifies it as a valid account when used with department 10000. You can see that marking anchor values that are not included as invalid should be thoroughly analyzed if more than one rule that is in a group has the same anchor ChartField.

## Comparing Valid and Invalid Rules

When combination definitions are comprised of two ChartFields, there may be times when defining an invalid combination is more efficient than defining a valid combination. However, if the combination definition uses three ChartFields, there are distinct differences when defining a combination group as valid or invalid:

| <b>Rule</b> | <b>Anchor ChartField</b> | <b>Anchor ChartField Value</b> | <b>Non-Anchor ChartField</b> | <b>Non-Anchor ChartField Value</b> | <b>Combo Defines Valid or Invalid Combinations</b> |
|-------------|--------------------------|--------------------------------|------------------------------|------------------------------------|----------------------------------------------------|
| Rule 4      | Account                  | BALSHEET                       | DeptID                       | Any Value                          | Valid                                              |
|             |                          |                                | Product                      | Any Value                          | Valid                                              |
| Rule 5      | Account                  | BALSHEET                       | DeptID                       | Blank                              | Invalid                                            |
|             |                          |                                | Product                      | Blank                              | Invalid                                            |

In this example, both rule 4 and rule 5 might seem as though they generate about the same results. However, rule 4 specifies that BALSHEET accounts need both a valid DeptID and product.

Rule 5 specifies that BALSHEET accounts must not have a blank department ID and blank product. If the combination that is edited in rule 5 meets the condition, then it is marked invalid.

The difference in the rules is that rule 5 marks as valid a BALSHEET account with either a blank department ID or a blank product. The rule states that only a blank department ID and a blank product are invalid with BALSHEET accounts. Specifying invalid combinations when the combination definition includes more than two ChartFields should be done with careful analysis of the intended result.

## ChartField Combination Group, Anchor Values Not In Rules:

When you run the following journal line ChartField values through the Journal Edit process:

| <b>Journal Line</b> | <b>Account</b> | <b>Department ID</b> | <b>Product</b> | <b>Amount</b> |
|---------------------|----------------|----------------------|----------------|---------------|
| 1                   | 110100         | 0100                 | GLDB2          | 500.00        |
| 2                   | 200002         | 0500                 | GLORACLE       | <250.00>      |

| <b>Journal Line</b> | <b>Account</b> | <b>Department ID</b> | <b>Product</b> | <b>Amount</b> |
|---------------------|----------------|----------------------|----------------|---------------|
| 3                   | 200003         | 0400                 | GLORACLE       | <250.00>      |

In this example, Account is the anchor ChartField, with department ID and product as the nonanchor combinations for a group of rules. You specify the following exact value combinations as valid:

| <b>Example Reference</b> | <b>Account</b> | <b>Department ID</b> | <b>Product</b> |
|--------------------------|----------------|----------------------|----------------|
| Combination 1            | 110100         | 0100                 | GLDB2          |
| Combination 2            | 110100         | 0400                 | GLDB2          |
| Combination 3            | 200002         | 0100                 | GLORACLE       |
| Combination 4            | 200002         | 0400                 | GLORACLE       |

These combinations are contained in one combination group. When you run the Journal Edit process, different combination editing results occur depending on which **Anchor Values Not in Rules** option you select.

| <b>Term</b>         | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Mark Valid</i>   | If you select this option, the program marks as valid journal line 1 because it contains the exact values that you specify in combination 1. It marks as invalid journal line 2 because the line contains one of the anchor values that you specify in the combination rules, but does not have the matching department ID and product values that you specify in the combinations. It marks valid journal line 3, marking it valid since no rule exists for account 200003. |
| <i>Mark Invalid</i> | If you select this option, the program marks as valid journal line 1 because the combination values that are on the journal line match the exact values for account, department ID, and product in combination 1. It marks as invalid all lines that have an anchor value that does not have an exact combination that you define in the rules, such as journal line 2. No rule exists for account 200003, so it marks journal line 3 as invalid.                            |

You can define the combination direction by using the Combination Group Defines options to specify whether the combinations that you define should be marked as valid combinations or invalid combinations. In some cases it is possible to greatly reduce the number of combinations that you must define by taking either an inclusive or exclusive approach. Rather than editing across a large number of valid combinations, you might edit against a relatively small number of invalid combinations.

Whether the system marks the combination valid or invalid depends on the combination direction option that you select for the combination group. The choice is applicable to all rules that are within the group.

- If you take the inclusive approach, the system marks as valid all the lines that have the same values as those that are in the combination rule and marks as invalid all the lines that have the same anchor value but different nonanchor values.
- If you choose the exclusive approach, the system marks as invalid all the lines that have the same values as those that are in the combination rule and marks as valid all the lines that have the same anchor value but different nonanchor values.

Since you can define a combination with a blank nonanchor ChartField value as an invalid combination, you can use this option in place of the **Value Required** flag. You can only define a combination with a blank value by using trees.

---

**Note:** To use the PeopleSoft rules for Combination Editing, you must select at least one valid combination rule. You can add any number of rules by inserting additional rows.

---

## Common Elements Used in Editing ChartField Combinations

| <i>Field or Control</i>  | <i>Description</i>                                                                                                                                                                                                                                                  |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Anchor ChartField</b> | The first ChartField that you enter on the Combination Definition page becomes the anchor ChartField. When you run the Combination Editing process, the system first searches for the anchor ChartField and then matches the other ChartFields in your combination. |

## Prerequisites

Although it is best to initiate ChartField combination editing when you first begin to use the new system, you can put it in place at any time after implementation. Implementation prerequisites are:

- General ledger and subsystem applications exist.
- Summarization rules and reporting structure for ChartFields using PeopleSoft trees are in place.

You must understand how to create and use PeopleSoft trees. Trees enable you to create combination edit rules that reference a range of ChartField values rather than static values.

See also *PeopleTools: Tree Manager*.

## Defining Combination Editing by Transaction Source

PeopleSoft allows you to define different combination edit rules and groups for different transaction sources and gives you the option to limit the combination edit process to one transaction source by

process group. This effectively reduces processing overhead and time as it targets only those transactions of a given transaction source, avoiding unnecessary processing of data.

When you associate the combination edit groups (process groups) to a specific Business Unit and Ledger Group on the Ledgers For A Unit – Journal Edit Options page, you can specify a transaction source to apply to certain process groups. If you do not select a specific transaction source for a process group, the combination edit process will apply the combination rules of that process group to all transactions.

If the transaction source value is General Ledger (GLJ), all Journals (including Journal generated from sub system accounting lines) are subject to combo edits.

See [Journal Edit Options Page](#).

The following transaction sources are delivered:

| <b><i>Transaction Source Value</i></b> | <b><i>Transaction Source Description</i></b>                                 |
|----------------------------------------|------------------------------------------------------------------------------|
| AMT                                    | Asset Management Transaction                                                 |
| APA                                    | Payables Accounting Line                                                     |
| ARI                                    | Accounts Receivable Item                                                     |
| BDJ                                    | Commitment Control Bud Journal                                               |
| BIA                                    | Billing Accounting Line                                                      |
| CAA                                    | Contracts Accounting Line                                                    |
| CMA                                    | Cost Management                                                              |
| CSF                                    | Campus Solutions SF Accounting Line                                          |
| CSC                                    | Campus Solutions CR Accounting Line                                          |
| GLJ                                    | General Ledger Journal (includes Oracle Retail integration accounting lines) |
| GMA                                    | Grants Accounting Line                                                       |
| HCM                                    | Human Capital Management                                                     |

| POR                             | Purchasing Requisition                |
| TRA                             | Treasury Accounting Line              |

**Note:** The delivered values are defined based on the existing ChartField Editing templates. You can add more values as needed. The first two letters represent the product or common feature, and the last letter is for a specific transaction source within that product.

## Setting Up Combination Editing

To set up combination editing, use the following components:

- ChartField Editing Template (COMBO\_EDIT\_TMPL1).
- Templates (LEDGER\_TEMPLATE).
- Combination Definition (COMBO\_CF\_DEFN).
- Combination Rule (COMBO\_RULE).
- Combination Group (COMBO\_GROUP).
- Ledgers For A Unit (BUSINESS\_UNIT\_LED).

Use the EM\_BUS\_UNIT\_LED component interface to load data into the tables for the BUSINESS\_UNIT\_LED component.

## Pages Used to Set Up Combination Editing

| <i>Page Name</i>                                             | <i>Definition Name</i> | <i>Usage</i>                                                                                                          |
|--------------------------------------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <a href="#">ChartField Combination Editing Template Page</a> | COMBO_EDIT_TMPL1       | Define a template to tell the combination editing process which tables and fields to process and how to process them. |

| <b>Page Name</b>                                               | <b>Definition Name</b> | <b>Usage</b>                                                                                                                                                                                                                                                                   |
|----------------------------------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Ledger Template - Field Definitions Page</a>       | LEDGER_TEMPLATE2       | Link a ChartField combination editing template for the applicable application to a ledger template for combination ChartField editing during journal edit; it is also required for ChartField validation during journal edit whether you are using combination editing or not. |
| <a href="#">ChartField Combination Editing Definition Page</a> | COMBO_CF_DEFN          | Define the combination of ChartFields to edit.                                                                                                                                                                                                                                 |
| <a href="#">Rule Definition Page</a>                           | COMBO_RULE1            | Define the combination rule by specifying the SetID, naming the combination rule, and specifying the combination definition and effective dates that are for the rule.                                                                                                         |
| <a href="#">ChartField Combinations Page</a>                   | COMBO_RULE2            | Define the anchor ChartField and nonanchor ChartField values to include in the rule.                                                                                                                                                                                           |
| <a href="#">ChartField Combination Editing Group Page</a>      | COMBO_GROUP            | Link combination rules together in a combination group.                                                                                                                                                                                                                        |
| <a href="#">Journal Edit Options Page</a>                      | BUSINESS_UNIT_LED2     | Link a process group to ledger groups. Assign a transaction source by process group if you want to limit combination edit processing for efficiency.                                                                                                                           |
| <a href="#">Combo Edit Transaction Source Page</a>             | COMBO_TRAN_SOURCE      | Define the name of the transaction source that is associated with a given process group.                                                                                                                                                                                       |
| Combo Edit Transaction Source Page (display only)              | COMBO_TRAN_SRC_COB     | (Display only) Displays all Combo Transaction Sources attached to a particular Process Group. This page is accessed from the Build Combination Data Request page.<br><br>See the <a href="#">Build Combination Data Request Page</a> for more information.                     |

## Understanding Combination Editing Setup

To set up the combination editing process, complete the following setup steps:

1. Enable combination editing in the applications, for example Accounts Payable and Billing.
2. Select or define the ChartField combination editing template that is specific to the application for performing background combination editing.

3. Link the combination edit template to the applicable ledger template for People Soft General Ledger.
4. Set up combination definitions that specify two or more ChartFields that you want to edit in combination for a business unit and ledger group.
5. Define combination rules 1 and 2 that link ChartField combination values for journal entries.

These rules determine the combinations of ChartField values that pass the Journal Editing process. Consider the following:

- Whether to edit for valid or invalid combinations, after analyzing which is more efficient in the circumstances.
- Whether to define ChartField values as specific values or as a range of values using PeopleSoft tree-based criteria.
- Which rules, and how many, to define for each ledger group.

An unlimited number of rules is possible, but the more rules there are, the slower the process. This is especially true when you have required ChartFields in the combination rules.

- You must update the rules whenever the accounting control requirements change.
6. Define combination editing groups.  
  
Associate multiple combination rules with a combination group definition. Include combination editing rules that belong to each group. The system uses these related combinations for validating journal entries during the journal edit process.
  7. Tie a combination group to a ledger group on the Ledgers for a Unit — Journal Edit page. Decide whether to assign a transaction source to the combination group or not. Assigning a specific transaction source to the process group can avoid unnecessary processing of data.
  8. Run the process to build the COMBO\_DATA\_TBL or master selector tables from the Build Combination Data page.
  9. Build a user-defined data table if it fills your needs.
  10. Run the Journal Edit process to generate selector tables dynamically and validate ChartField combinations.
  11. Use the Retain Detail Values options to create a permanent table of combination ChartField Values from the master selector table.
  12. Maintain the system by changing combination rules and regenerating the tables as necessary.

## Understanding the Data Migration Workbench for Combination Editing

Combination editing is an optional feature that is used to filter unwanted journal entry lines. The combination editing process compares the combination of ChartFields and their values to combination definition and rules that you define.

PeopleSoft delivers Application Data Sets (ADS) to move data between development, test, and production environments for setting up Combination data.

This table lists the delivered ADS definitions (delivered in Data Set Designer) that supports the migration of PeopleSoft General Ledger Combination Editing setup data.

| <b><i>Delivered ADS to Support PeopleSoft General Ledger</i></b> | <b><i>Application Data Set (ADS) Usage</i></b>                                                       |
|------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| Combination Group - GL_COMBO_GROUP                               | This data set includes the records that store combination groups for PeopleSoft General Ledger.      |
| Combination Rule - GL_COMBO_RULE                                 | This data set includes the records that store combination rules for PeopleSoft General Ledger.       |
| Combination Definition - GL_COMBO_DEFN                           | This data set includes the records that store combination definitions for PeopleSoft General Ledger. |

Select these data sets on the Data Migration Workbench page to move combination data from one database to another.

For more information about Application Data Sets and the Data Migration Workbench, see [Understanding the PeopleSoft Data Migration Workbench](#) and [Using Application Data Sets](#)

For more information about the details of this data set, see [Understanding ChartField Combination Editing](#)

## ChartField Combination Editing Template Page

Use the ChartField Combination Editing Template page (COMBO\_EDIT\_TMPL1) to define a template to tell the combination editing process which tables and fields to process and how to process them.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Combination Editing > ChartField Editing Template > ChartField Combination Editing Template**

This example illustrates the fields and controls on the ChartField Combination Editing Template page. You can find definitions for the fields and controls later on this page.

ChartField Combination Editing Template

Template AMEDIT

\*Descr AM ComboEdit Template

Record Names

Line Record AMIF\_CE2\_TMP

Line Error Log TSE\_AM\_LN\_FLD

Header Record AMIF\_CE2\_TMP

\*Map Option PS/AM

Field Names

GL Business Unit BUSINESS\_UNIT\_GL

Line Status

Personalize | Find | View All | First 1-3 of 3 Last

| Field Name     | *Status Code | Status Value |   |   |
|----------------|--------------|--------------|---|---|
| CF_EDIT_STATUS | Invalid      | I            | + | - |
| CF_EDIT_STATUS | Process      | P            | + | - |
| CF_EDIT_STATUS | Valid        | V            | + | - |

In the example screen shot, the JOURNALS combination template appears. This is a delivered template that is used in the background combination editing as well as the journal edit process. PeopleSoft delivers several templates for its applications that define the record names, field names, and line status values that are to be used in combination editing.

**Note:** You do not need to change the delivered templates for the various PeopleSoft application or create new templates unless you customize the system.

| Field or Control | Description                                                                                                                                                                           |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Line Record      | The name of the record that contains the ChartField combinations (journal lines) that the combination editing process edits.                                                          |
| Header Record    | The name of the record that contains the journal header of the accounting line entries that the combination editing process edits. This field is optional and you can leave it blank. |
| Line Error Log   | The name of the record that stores the error messages for individual lines of combinations for the combination editing error-checking process.                                        |
| Map Option       | Designates the application to which the template applies.                                                                                                                             |
| Transaction Date | The field name that the system uses for the transaction date.                                                                                                                         |
| GL Business Unit | The field name that the system uses for the General Ledger business unit.                                                                                                             |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Foreign Currency</b> | The field name that the application uses for the foreign currency code.                                                                                                                                                                                                                                                                                                    |
| <b>Field Name</b>       | The name of the field in which the status of the combination line is recorded.                                                                                                                                                                                                                                                                                             |
| <b>Status Code</b>      | <p>The combination editing process updates the lines with the status of each transaction by using the values that are specified.</p> <p><i>Invalid:</i> Indicates that the transaction failed due to an error.</p> <p><i>Process:</i> Indicates that the transaction is processing (not currently used).</p> <p><i>Valid:</i> Indicates a valid or passed transaction.</p> |
| <b>Status Value</b>     | Supply the value that the application uses to represent the corresponding status code for the combination, such as 0 for valid, or an 1 for invalid.                                                                                                                                                                                                                       |

## Ledger Template - Field Definitions Page

Use the Ledger Template - Field Definitions page (LEDGER\_TEMPLATE2) to link a ChartField combination editing template for the applicable application to a ledger template for combination ChartField editing during journal edit; it is also required for ChartField validation during journal edit whether you are using combination editing or not.

Navigation:

**General Ledger > Ledgers > Templates > Field Definitions**

This example illustrates the fields and controls on the Ledger Template - Field Definitions page . You can find definitions for the fields and controls later on this page.

Combination Edit Template

JOURNALS

For PeopleSoft applications that use the background combination editing process, you must link the combination edit template for the application to a ledger template on the Ledger Template - Fields Definition page. The Journal Edit process uses the specified combination edit template for ChartField validation during journal editing.

| Field or Control          | Description                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------|
| Combination Edit Template | Select the templates that are applicable to the ledger template from the drop-down list box. |

**Warning!** The Journal Edit process requires this template for ChartField validation. The Journal Edit process fails if this field is blank.

## ChartField Combination Editing Definition Page

Use the ChartField Combination Editing Definition page (COMBO\_CF\_DEFN) to define the combination of ChartFields to edit.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Combination Editing > Define CF Combination**

This example illustrates the fields and controls on the ChartField Combination Editing Definition page. You can find definitions for the fields and controls later on this page.

ChartField Combination Editing Definition

Personalize | Find | View All |

First 1-2 of 2 Last

| *ChartField | Anchor ChartField                   |  |  |
|-------------|-------------------------------------|--|--|
| Fund Code   | <input checked="" type="checkbox"/> |  |  |
| Department  | <input type="checkbox"/>            |  |  |

**Note:** The data that is entered using this page can also be loaded as an Application Data Set using the Data Migration Workbench. For more information about ADS and the Data Migration Workbench for FSCM applications, see [Understanding the Data Migration Workbench for Combination Editing](#)

| Field or Control       | Description                                                                                                                                                                       |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Combination Definition | Name each unique set of ChartFields for the new combination definition by SetID.                                                                                                  |
| ChartField             | <div>Specify the ChartFields that you want in the combination.</div> <div><b>Note:</b> The first ChartField that you enter is selected by default as the anchor ChartField.</div> |
| Anchor ChartField      | The anchor ChartField drives the combination edit rule. The system automatically designates the first ChartField that you list as the anchor ChartField.                          |

When you run the Combination Editing process, the system first searches for the anchor ChartField that you define in the combination definition and then matches the other nonanchor ChartFields in the combination.

For example, you define ACCOUNT as the anchor ChartField for the definition, with DEPTID and PRODUCT as valid ChartField combinations that are associated with the anchor.

You can then create ChartField value combinations using the Rule Definition page that you determine to be valid for this ACCOUNT, DEPTID and PRODUCT ChartField combination definition. The anchor ChartField drives the combination rule dealing with ChartField values that you define in the next step.

**Note:** For commitment control budget journal combination editing, Analysis Type (ANALYSIS\_TYPE), Category (RESOURCE\_CATEGORY) and Subcategory (RESOURCE\_SUB\_CAT) (Project Costing-related detail ChartFields), are not supported.

Rule Definition Page

Use the Rule Definition page (COMBO\_RULE1) to define the combination rule by specifying the SetID, naming the combination rule, and specifying the combination definition and effective dates that are for the rule.

Navigation:

Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Combination Editing > Combination Rule > Rule Definition

This example illustrates the fields and controls on the Rule Definition page. You can find definitions for the fields and controls later on this page.

**Note:** The data that is entered using this page can also be loaded as an Application Data Set using the Data Migration Workbench. For more information about ADS and the Data Migration Workbench for FSCM applications, see [Understanding the Data Migration Workbench for Combination Editing](#)

| Field or Control                          | Description                                                                                                                                                                                                                                               |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Effective Date From and Effective Date To | Specify the effective date range that determines the time frame in which the rule is valid. During journal editing, the program, by using journal date as its criteria, applies only valid combination rules to combinations that fall within this range. |
| Open Effective Date To                    | Select this option to specify an open-ended date for effective date to. The <b>Effective Date To</b> field becomes unavailable for entry and displays 01/01/2099.                                                                                         |
| Combination Definition                    | Identifies which ChartFields are included in this combination rule. You can modify this as long as no combination rules are based on this definition.                                                                                                     |

| <b>Field or Control</b>             | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Effective Date for Prompting</b> | <p>Enter an effective date for prompting detail ChartField values and PeopleSoft trees that are dated on or prior to this date.</p> <p>Because there is a range of dates rather than an effective date on the page, you might want to enter ChartFields from any time period within the range. You can specify the date from which to prompt for these ChartFields, but the default is to the current date.</p>                                                                                                                                                                                                                                               |
| <b>Non-Anchor ChartField Option</b> | <p>When you define a rule for the first time, the system displays the nonanchor ChartFields. You enter these ChartFields on the ChartField Combination Editing Definition page; however, the first ChartField that is entered is the anchor ChartField and does not appear on this page.</p>                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Value Required</b>               | <p>Select this check box for nonanchor ChartFields to specify that any nonblank valid value is required. When you select this check box, the system restricts you from entering values or tree nodes in the rule for the related nonanchor ChartField.</p> <hr/> <p><b>Note:</b> Selecting this check box provides an easy way for you to require a valid value for a ChartField without having to define each valid value in the rule.</p> <p>Using a blank tree node or level, you can accomplish much the same thing by defining a combination with a blank ChartField value as an Invalid Combination on the ChartField Combination Group page.</p> <hr/> |

## ChartField Combinations Page

Use the ChartField Combinations page (COMBO\_RULE2) to define the anchor ChartField and nonanchor ChartField values to include in the rule.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Combination Editing > Combination Rule > ChartField Combinations**

This example illustrates the fields and controls on the ChartField Combinations page. You can find definitions for the fields and controls later on this page.

If you select the **Value Required** check box on the Rule Definition page, this page is automatically populated.

| <b>Field or Control</b>       | <b>Description</b>                                                                                                                                                                                                                                                                                                       |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ascending Order</b>        | Select to sort the anchor ChartField in ascending order.                                                                                                                                                                                                                                                                 |
| <b>Descending Order</b>       | Select to sort the anchor ChartField in descending order.                                                                                                                                                                                                                                                                |
| <b>Sort Anchor</b>            | Click to sort the anchor ChartField in the selected order.                                                                                                                                                                                                                                                               |
| <b>Anchor ChartFields</b>     | This first level is the basis for the combination and cannot be changed.                                                                                                                                                                                                                                                 |
| <b>Non-Anchor ChartFields</b> | This second level identifies the nonanchor ChartFields that form combinations with the anchor ChartField.                                                                                                                                                                                                                |
| <b>Tree and Level</b>         | <p>These fields and the <b>Node/Value</b> field define the node prompts if the combination rule is based on a tree definition. This field identifies the tree and level that is the source of the ChartField values for the anchor and nonanchor ChartFields.</p> <p>You can select summer, winter, or spring trees.</p> |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>How Specified</b>    | <p>Use the <b>How Specified</b> radio buttons to point to one of the following sources of ChartField values for the selected anchor and nonanchor ChartFields:</p> <p>Click <b>Selected Detail Values</b> to include the individual ChartField values that you select in the <b>Value/Node</b> field.</p> <p>Click <b>Selected Tree Nodes</b> to activate the edit boxes where you can specify a tree name and level for trees with levels. Specify the node of the tree in the <b>Value/Node</b> field. You have the option to set up a tree with a node that contains an empty detail value.</p> |
| <b>Node/Value</b>       | <p>This field and the <b>Tree</b> and <b>Level</b> fields define the node prompts if the combination rule is based on a tree definition. Enter individual ChartField values when specifying selected detail ChartField values.</p> <hr/> <p><b>Note:</b> If the tree you select has a tree structure whose nodes are built on a view that references the delivered tree node record (rather than using the delivered record for tree node structures, TREE_NODE_TBL), you must customize these views.</p> <hr/>                                                                                    |

## ChartField Combination Editing Group Page

Use the ChartField Combination Editing Group page (COMBO\_GROUP) to link combination rules together in a combination group.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Combination Editing > Combination Group > ChartField Combination Editing Group**

This example illustrates the fields and controls on the ChartField Combination Editing Group page. You can find definitions for the fields and controls later on this page.

| Field or Control       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Combination Definition | Select the appropriate combination definition. This field is available when you create a new process group. It is a required field and must be the same as that defined for the rules in the group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Combo Editing Option   | <p>Specify one of the following types of table that you want to use:</p> <ul style="list-style-type: none"><li><i>Combo Data Table:</i> Use the COMBO_DATA_TBL to edit your ChartField combinations.</li><li><i>Master Selector Tables:</i> Use a set of master selector tables.</li></ul> <p>Batch editing edits the accounting, voucher line, or journal line combinations using one of the following :</p> <ul style="list-style-type: none"><li>COMBO_DATA_TBL that contains many rows of detail combinations.</li><li>Master selector tables that are multiple tables which store PeopleSoft tree ranges.</li></ul> <p>Both batch and online PeopleCode editing support multiple combo groups that are attached to a business unit, each using a different choice for the combo editing option.</p> |

| <b>Field or Control</b>     | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>User Defined</b>         | <p>This check box becomes available if you select <i>Combo Data Table</i> in the <b>Combo Editing Options</b> field. Select if you want to use the user-defined prepopulated combination data table during the Journal Edit process. Use this feature if you make modifications to meet the requirements by creating an approach to defining and maintaining a table of valid combinations. When you select this option, the system requires and prompts for a combination definition to identify which combination of ChartFields to validate.</p> <p>Do not select this check box for combination data if you want the Journal Edit process to consider the combination rules. The <b>User Defined</b> option recognizes the <b>Anchor Values Not in Rules</b> option and the <b>Combination Group Defines</b> option for either valid or invalid.</p>                                                                                                                                                                             |
| <b>Increment</b>            | <p>This check box becomes available when you select the <i>Master Selector Tables</i> option in the <b>Combo Editing Option</b> field.</p> <p>Select if you want the master selector tables to be incrementally updated. After you make changes to ChartField trees or to combination rules, the master selector tables are incrementally updated during combination build or batch journal editing.</p> <p>This field is only available for process groups that use static master selector tables.</p> <p>By default this check box is not selected, which disables the process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Retain Detail Values</b> | <p>This check box becomes available when you select the <i>Master Selector Tables</i> option in the <b>Combo Editing Option</b> field.</p> <p>Select this option to retain the combinations for the detail values in a permanent table called PS_COMB_EXPLODED after they are generated from the master selector tables during the build process. If this option is not selected, detail values are generated and cleared from temporary tables each time master selector tables are used to perform a combination edit.</p> <p>By default this check box is not selected.</p> <hr/> <p><b>Note:</b> Note. If you add a new value within a ChartField range that is setup for a tree node, selecting Retain Detail Values will not cause the new value to be included in the combination even when the Increment option for the Combination Group setup is selected.</p> <p>New values are included in the PS_COMB_EXPLODED table when the master selector table is rebuilt with the Retain Detail values option selected.</p> <hr/> |

| <b>Field or Control</b>           | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Anchor Values Not In Rules</b> | <p>This option defines what happens to those combinations that contain anchor ChartField values that are not included in the rules. Validation is always limited to the specified anchors; this option affects what you do with the other anchor values.</p> <p><i>Mark Valid:</i> Lines containing anchor ChartField values that are not included in a rule are marked valid by the system.</p> <p><i>Mark Invalid:</i> Lines containing anchor ChartField values that are not included in a rule are marked invalid by the system.</p>                                                                                                           |
| <b>Combination Group Defines</b>  | <p>This option defines whether the combinations that are defined in the group are valid or invalid combinations.</p> <hr/> <p><b>Note:</b> Never set the <b>Anchor Values Not In Rules</b> field to <i>Mark Invalid</i> and the <b>Combination Group Defines</b> field to <i>Invalid Combinations</i> because the system invalidate all combinations in this case.</p> <hr/> <p>You can set this field to:</p> <p><i>Valid Combinations:</i> Lines containing any combination in the group are marked valid by the system.</p> <p><i>Invalid Combinations:</i> Lines containing any combination in the group are marked invalid by the system.</p> |

**Note:** To use the PeopleSoft rules for Combination Editing, you must select at least one valid combination rule. You can add any number of rules by inserting additional rows.

## Journal Edit Options Page

Use the Journal Edit Options page (BUSINESS\_UNIT\_LED2) to Link a process group to ledger groups.

Assign a transaction source by process group if you want to limit combination edit processing for efficiency.

Navigation:

**Set Up Financials/Supply Chain > Business Unit Related > General Ledger > Ledger For A Unit > Journal Edit Options**

This example illustrates the fields and controls on the Ledgers For A Unit - Journal Edit Options page. You can find definitions for the fields and controls later on this page.

Designate which combination editing rules apply to specific transactions by tying combination editing groups (process groups) to ledger groups on this page. During the Journal Edit process, the system looks to the ledger group that is indicated on the journal to see which rules apply. The system also looks at the Source Option to determine which groups of transactions to process for each process group.

**Warning!** For subsystems that do not pass ledger groups with the accounting entry lines (for example, PeopleSoft Billing), be sure that you set up the ledger group as a journal generator default ledger group on the Ledgers For A Unit Definition page.

| <b>Field or Control</b>      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ChartField Combo Edit</b> | Add any number of process groups by inserting additional rows.                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Process Group</b>         | <p>After you specify a combination editing process group, the transaction editing process edits each applicable transaction against each combination group individually to determine if it is valid or invalid.</p> <p>You can attach process groups with different editing options—including the <b>Combination Group Defines</b> option as either valid or invalid—for the same business unit and ledger group.</p> <p>This field is not available for summary ledgers.</p> |

| <b>Field or Control</b>   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Source Option</b>      | <p>Select one of the following options:</p> <p><i>Specific Transaction Source</i> – Select this option to specify the transaction source (or sources) of the transactions to be edited by combination edit process. This option increases processing efficiency by validating only those transactions with sources that are applicable for the rules defined in the process group.</p> <p><i>All Transaction Sources</i> - (default value) This option edits all transactions against the process group during the combination edit process.</p> |
| <b>Transaction Source</b> | <p>This link appears if you select the <i>Specific Transaction Source</i> option. Click this link to access the Combo Edit Transaction Source page where you define the transaction source (or sources) of the transactions to process for a given process group. The combination edit program only processes those sources that are defined for the process group.</p>                                                                                                                                                                          |

**Note:** If you do not want to use combination editing, turn it off by not entering combination editing groups in the **Process Group** field on the Journal Edit Options page. If no process groups are entered in this field, the system does not apply any combination editing rules. If you receive a combination editing error after you remove all groups, check to ensure that the combination template is attached to the ledger template. This template applies only to journals, not to feeder system transactions.

## Combo Edit Transaction Source Page

Use the Combo Edit Transaction Source secondary page (COMBO\_TRAN\_SOURCE) to define the name of the transaction source that is associated with a given process group.

Navigation:

**Set Up Financials/Supply Chain > Business Unit Related > General Ledger > Ledger For A Unit > Journal Edit Options**

Select the **Specific Transaction Source** option and click the **Transaction Source** link.

This example illustrates the fields and controls on the Transaction Source Link. You can find definitions for the fields and controls later on this page.

Business Unit: US001    Ledger Group: RECORDING    Process Group: AM\_COM\_GRP

**Transaction Source**    Personalize | Find | View All | First 1-4 of 4 Last

| Combo Edit Transaction Source |                                |     |
|-------------------------------|--------------------------------|-----|
| 1                             | Asset Management Transaction   | + - |
| 2                             | Commitment Control Bud Journal | + - |
| 3                             | Human Capital Management       | + - |
| 4                             | Project Accounting Line        | + - |

OK    Cancel

Select one or more Combo Edit Transaction Sources to associate with a given process group. The combination edit program processes for validation only those transactions for this process group.

For a list of the delivered Combo Edit Transaction Sources:

See [Defining Combination Editing by Transaction Source](#).

---

**Note:** You can add new transaction sources, if necessary, by adding new translate values to the COMBO\_TRAN\_SRC field.

---

## Running the Build Combination Data Process

To run the Build Combination Data process, use the Build Combination Data component (COMBO\_BUILD\_REQ).

### Page Used to Run the Build Combination Process

| Page Name                                           | Definition Name | Usage                                                                             |
|-----------------------------------------------------|-----------------|-----------------------------------------------------------------------------------|
| <a href="#">Build Combination Data Request Page</a> | COMBO_BUILD_REQ | Run the process to build either the COMBO_DATA_TBL or the master selector tables. |

## Understanding Running the Build Combination Data Process

Run the Build Combination Data process (FS\_CEBD) to build either of the following:

- COMBO\_DATA\_TBL, which is populated by the combination explode process.
- A static set of master selector tables.

You can then edit voucher lines or accounting entry lines against these tables in the feeder systems as well as journal lines as part of the journal editing process in General Ledger. Combination editing uses either the COMBO\_DATA\_TBL or a static set of master selector tables but not both in a particular edit, for both online or background combination editing.

## Build Combination Data Request Page

Use the Build Combination Data Request page (COMBO\_BUILD\_REQ) to run the process to build either the COMBO\_DATA\_TBL or the master selector tables.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Combination Editing > Build Combination Data > Build Combination Data Request**

This example illustrates the fields and controls on the Build Combination Data Request page. You can find definitions for the fields and controls later on this page.

| Request Number | Process Frequency | Business Unit | Ledger Group | Build Option     | As of Date | Use Wildcard in Combination | Use Active Values Only              | Run Publish Only         | Publish to HRMS/SA |
|----------------|-------------------|---------------|--------------|------------------|------------|-----------------------------|-------------------------------------|--------------------------|--------------------|
| 1              | Always            | US001         | RECORDING    | Build Data Table | 11/30/2012 | <input type="checkbox"/>    | <input checked="" type="checkbox"/> | <input type="checkbox"/> | Process Groups     |

**Note:** You can run the explosion process at any time to maintain valid combinations. However, check the system space limitations before running the explosion process in PeopleSoft applications to avoid exceeding available space.

The build combination data process populates either the COMBO\_DATA\_TBL or the master selector tables.

If you choose the build data table option, the process analyzes the rules for a business unit and ledger group to produce all possible combinations of ChartField values and inserts these combinations into the data table. This is referred to as exploding the COMBO\_DATA\_TBL. The benefit of exploding the combination rules can be an increase in performance at Journal Edit time.

If you choose the build selector tables option, the process analyzes the rules and trees to produce valid ranges of ChartField values and stores the ranges in the master selector tables. The master selector tables are smaller and easier to maintain.

**Note:** By using the Retain Detail Values option with the master selector tables you can gain additional efficiency by retaining the tables for future use rather than expanding the tree ranges and repopulating the TAO tables with each edit.

After you define the detail ledger group for the business unit, and after you tie the combination editing group to that ledger, you are ready to run the Build Combination Data request.

| <b>Field or Control</b>            | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>As of Date</b>                  | Determines that the COMBO_DATA_TBL are built for the ChartFields and ChartField values as they exist on that particular date. Use the <b>Update</b> button to update the <b>As of Date</b> for all rows.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Process Frequency</b>           | <p><i>Once:</i> Select to process the current request the next time that build combination data processing is executed.</p> <p><i>Don't:</i> Once executed, the process changes frequency to this value.</p> <p><i>Always:</i> Select to process each time that build combination data is executed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Build Option</b>                | <p><i>Build Data Table:</i> Select to process the combination groups that are associated with the business unit and ledger group that have COMBO_DATA_TBL as their combination edit option. This option explodes all the valid combinations that are defined in the combination rules to the data table. This normally enhances performance of the Journal Edit process. But you must balance the decision to use this option with the projected number of combinations that you have and the system space limitations to avoid exceeding available space.</p> <p><i>Build Selector Table:</i> Select to process the combination groups that are associated with the business unit and ledger group that have master selector tables as their combination edit option. Build the combination rules and tree definitions into ranges of ChartField values and store the ranges in the master selector tables. The <b>As of Date</b> field is replaced by the <b>From Date</b> and <b>To Date</b> fields when you select this option. Use the <b>From Date</b> and <b>To Date</b> fields to limit the effective-dated trees and tree ranges that you want to include in the master selector tables.</p> |
| <b>Use Wildcard in Combination</b> | Select this option to reduce the number of combinations that are within the combination data table. With this option selected, the system uses the wildcard character % to represent a ChartField that has the value required option that is selected for that rule. Select this option when you explode the data table if many of the rules use the value required option. This option is not available when you build master selector tables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Use Active Values Only</b>      | Select to use only the active ChartField values as of the as of date when building the COMBO_DATA_TBL. If you select this option, combination editing considers the ChartField combination invalid even if the ChartField values that you use are active at the date of the transaction. Use this option to reduce the COMBO_DATA_TBL size. However, you should not select this option if you need to edit transactions earlier than the inactive date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Field or Control</b>                                                                      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Run Publish Only</b>                                                                      | This option is available only when you have PeopleSoft HCM applications installed. You have the option to run the Application Engine program HR_ACCT_CD, which publishes combination editing information for HCM application needs. Select this option if you want to bypass the combination editing build process and run only the publish process.                                                                                       |
| <b>Publish to HRMS/SA</b> (publish to Human Resources Management System/Services Accounting) | This option is available when you have PeopleSoft HCM applications installed or processing specific transaction sources. Select the <b>Process Group</b> link to transfer to another page (COMB_BLD_PG_REQ) or COMBO_TRAN_SRC_COB to select the process groups to publish or process. This runs the Application Engine program, HR_ACCT_CD, to publish selected data from COMBO_DATA_TBL by using the HR_ACCT_CD_LOAD application service. |

Because the system does not consider the combination rules during the actual editing while using the COMBO\_DATA\_TBL, you must ensure that the data table is always in sync with the combination rules whenever you modify combination rule tree information or add or inactivate a ChartField. The COMBO\_DATA\_TBL does not update automatically if new ChartFields are added to a combination rule or a tree. You must rebuild the table to maintain consistency with the chart of accounts.

---

**Note:** If you choose the option to build the master selector tables for a business unit in error, but all the combination edit groups that are attached to the business units have an edit option of COMBO DATA TABLE, nothing happens in the explode process.

---

## Selecting the Process Groups

To select the process groups that the combination build will use for a given business unit, select the **Process Groups** link from the Build Combination Data Request page:

This example illustrates the fields and controls on the Select process groups to publish page. You can find definitions for the fields and controls later on this page.

## Using User-Defined Combination Data

The user-defined combination data feature in combination editing enables you to use your own prepopulated combination data table during the journal editing process. You enter the data by specifying valid ChartField combinations in the data table without using the combination rules. Journal edit validates journal lines against this table and does not consider any combination rules. If you want the Journal Edit process to consider the combination rules, you cannot use this option.

**Note:** If you use the user-defined combination data feature, you are fully responsible for maintaining the integrity of the data in the combination data table.

To use a user-defined combination table:

1. Specify the combination table name in the **Combo Data** field on the Ledger Template - Record Definitions Page.
2. Store the combination data in the combination table.

PeopleSoft supports combination editing on any table that is in the system, but the table must conform to the same structure as the default table COMBO\_DATA\_TBL. You can use the default table (COMBO\_DATA\_TBL) or change to a table of any name having the same structure. You can also use several different tables, one for each ledger template.

3. Create a combination definition with the ChartFields that are to be edited.
4. Create a combination group by using the combination definition that is defined in step 2.
5. Select the **Combo Editing Option** and click the **User Defined** check box on the ChartField Combination Editing Group page.
6. Tie the combination group that is defined in step 3 to the appropriate ledger group on the Ledgers for A Unit page.

Verify that the **PROCESS\_GROUP** field on the combination table contains the name of the combination group that is defined in step 3.

7. The **COMBINATION** field on the combination table must be populated with the same name as the **PROCESS\_GROUP** field.

---

## Working with Combination Objects

To copy, rename, or delete combination objects, use the Combo Copy/Rename/Delete component (RUN\_GLS4003).

## Understanding Viewing Combination Editing Data

PeopleSoft provides functionality for viewing the combination editing data.

Use this functionality to:

- Review combination groups.
- Query combination data.
- Create a query online and download results to a spreadsheet.

## Selector Tables Page

Use the Selector Tables page (COMBO\_SEL\_INQ) to review a listing of the combination groups that you create for a business unit and ledger group that use the master selector tables.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Combination Editing > Review Combination Build > Selector Tables**

This example illustrates the fields and controls on the Selector Tables page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Selector Tables' page with two tabs: 'Selector Tables' and 'Combo Data'. Below the tabs are three input fields: 'Business Unit' with a search icon, 'Ledger Group' with a search icon, and 'Combo Edit Transaction Source' with a dropdown arrow. A 'Search' button is to the right. Below these is a table titled 'Combination Groups' with columns: Business Unit, Ledger Group, SetID, Process Group, Date From, and Date To. The table contains three rows of data.

| Business Unit | Ledger Group | SetID | Process Group | Date From  | Date To    |
|---------------|--------------|-------|---------------|------------|------------|
| US003         | RECORDING    | SHARE | BSACCTS       | 01/01/1900 | 01/01/2099 |
| US003         | RECORDING    | SHARE | INCSTMT       | 01/01/1900 | 01/01/2099 |
| US004         | RECORDING    | SHARE | IS_EXCP       | 01/01/1900 | 01/01/2099 |

Use the:

- Selector Tables page for reviewing combination groups that use master selector tables.
- Combo Data page for reviewing combination groups that use the COMBO\_DATA\_TBL.

| Field or Control                             | Description                                                                                                                     |
|----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <b>Business Unit</b> and <b>Ledger Group</b> | These are required fields. Use the wildcard character (%) to view a listing of all business unit and ledger group combinations. |
| <b>Search</b>                                | Click to retrieve a listing of valid combination groups.                                                                        |

## Review Combination Data Page

Use the Review Combination Build - Combo Data page (COMBO\_BLD\_INQ) to review a listing of the combination groups that you have created for a business unit and ledger group that use the COMBO\_DATA\_TBL.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Combination Editing > Review Combination Build > Combo Data**

You can use the appropriate inquiry page, either the Review Combination Data page (Set Up Financials/Supply Chain, Common Definitions, Design ChartFields, Combination Editing, Review Combination Data, Review Combination Data) or the Review Budgets Combination Data page **Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Combination Editing > Review Budgets Combo Data > Review Budgets Combination Data** .

Use the Review Combination Data page (COMBO\_INQ) to query the contents of the combination tables to review valid combinations.

Use % as wildcard character.

Navigation:

## Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Combination Editing > Review Combination Data > Review Combination Data

This example illustrates the fields and controls on the Review Combination Data page. You can find definitions for the fields and controls later on this page.

Select the SetID and combination group you want to query. You can click the <b>Search</b> button at this point to return all combination data for the entered SetID and group.                                                                                                    |
|                                                                                                             | Click the <b>Informational only</b> button to view details of the combination group                                                                                                                                                                                                                          |
| <b>Rule</b>                                                                                                                                                                                    | You can further limit the results that the query returns by selecting a specific combination rule.                                                                                                                                                                                                           |
| <b>Business Unit for Prompting</b>                                                                                                                                                             | Enter a business unit to provide the correct set ID for ChartField prompting. The business unit entered in this field does not provide criteria to further refine or limit the query but is necessary because the SetID for combination data might be different than the SetID for the relevant ChartFields. |
| <b>Account, Alt Account, Oper Unit, Fund, Dept, Program Code, Class, Budget Reference, Product, Project, Affiliate, Fund Affiliate, Operating Unit Affiliate, Book Code, Stat, or Currency</b> | Further refine the query by limiting it to a specific ChartField value.                                                                                                                                                                                                                                      |
| <b>Search</b>                                                                                                                                                                                  | Click the <b>Search</b> button to retrieve a listing of value combinations based on the search criteria.                                                                                                                                                                                                     |

You can navigate to specific rows that are retrieved by using the first row, last row, next and previous buttons. You can also limit or increase the number of rows returned by using the **Max Rows Displayed** field.

Review Combination Selector Table Data Page

Use the Review Combination Selector Table Data page (COMBO\_INQ\_SEL) to query ChartField combinations that are stored in the master selector table.

Use % as wildcard or nonblank character.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Design ChartFields >Combination Editing >Review Combo Selector Tbl Data >Review Combination Selector Table Data**

This example illustrates the fields and controls on the Review Combination Selector Table Data page. You can find definitions for the fields and controls later on this page.

| A1 | ▼       | fx  | Rule         |            |                 |               |              |            |
|----|---------|-----|--------------|------------|-----------------|---------------|--------------|------------|
|    | A       | B   | C            | D          | E               | F             | G            | H          |
| 1  | Rule    | Seq | Account From | Account To | Department From | Department To | Product From | Product To |
| 2  | REVENUE | 3   | 401000       | 401000     | 27000           | 27999         |              |            |
| 3  | REVENUE | 3   | 401000       | 401000     | 27000           | 27999         | CONFIG       | CONFIG     |
| 4  | REVENUE | 3   | 401000       | 401000     | 27000           | 27999         | INSTAL       | INSTAL     |
| 5  | REVENUE | 3   | 401000       | 401000     | 27000           | 27999         | MAINT        | MAINT      |
| 6  | REVENUE | 5   | 400000       | 400000     |                 |               |              |            |

In this example, the query is created for the demo data ChartField combination group called *INCSTMT* and the combination rule called *REVENUE*. In this example, the page displays the ChartFields that are associated with this process group, rule, account, department, and product. Other combination groups using different ChartFields, display those ChartFields.

## Running ChartField Combination Reports

This topic lists the pages that are used to specify parameters for running standard ChartField combination reports.

## Pages Used to Run ChartField Combination Reports

| <i><b>Page Name</b></i>                                         | <i><b>Definition Name</b></i> | <i><b>Usage/Navigation</b></i>                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ChartField Combination Editing Rule Report Page                 | RUN_GLS4002                   | Go to <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Design ChartFields &gt; Combination Editing &gt; Combination Rule Report &gt; Combination Rule</b> to specify the run parameters for the Combination Rule SQR Report (GLS4002). This report lists information on a combination edit rule for a selected SetID.                                       |
| ChartField Combination Editing Group Report Page (BI Publisher) | RUN_GLC4003                   | Go to <b>Set Up Financials/Supply Chain &gt; Common Definitions &gt; Design ChartFields &gt; Combination Editing &gt; Combination Group Report &gt; ChartField Combination Editing Group Report</b> to specify the run parameters for the Combination Group BI Publisher report (GLX4003). This report lists information on combination edit groups for a selected SetID. |

# Configuring ChartFields

---

## Understanding PeopleSoft ChartField Configuration

Oracle's PeopleSoft applications deliver a full suite of commercial, education, and government functionality and supports it with a comprehensive set of ChartFields. However, you can use ChartField configuration to perform various modifications to these ChartFields to better serve your particular accounting model.

ChartField configuration involves the following major tasks:

- Analyzing your reporting requirements and determining the ChartFields needed to support them.
- Completing the Standard ChartField Configuration or, if necessary, the Advanced ChartField Configuration page.
- Running the ChartField Configuration process to apply your configurations to the system.
- Performing any manual tasks associated with your configurations.
- Performing product-specific analysis and ChartField configuration tasks, such as those for PeopleSoft Mobile Time and Expense.

This topic discusses:

- Checklist for a successful configuration.
- ChartField configuration and ChartField types.
- Project ChartFields.
- ChartField configuration scope and levels.
- ChartField reporting requirements analysis.

---

**Note:** The following instructions assume a high level of competence in PeopleTools and use of Application Designer.

---

See the product documentation for *PeopleTools: Application Designer Developer's Guide*.

## Checklist for a Successful Configuration

Use this section as a checklist to focus on areas of particular importance and in gathering information needed to plan and perform your ChartField configuration. This section also helps to identify areas where mistakes are commonly made.

---

**Important!** Oracle strongly recommends that you read this section and understand the full implications of each point before proceeding with the actual configuration.

---

Before running the full configuration:

- Access Oracle's My Oracle Support website for information about configuration of ChartFields for Mobile Time and Expense.
- If you are upgrading from a previous PeopleSoft release, thoroughly read the Upgrade documentation for your upgrade path—this is critical.
- Thoroughly read this topic on configuring ChartFields—this is also critical.
- Get agreement functionally and technically as to how to use each of the delivered ChartFields and which configuration actions are appropriate, such as activate and relabel.
- Consider taking the ChartField Assessment Fit-Gap Workshop offered by PeopleSoft Global Services.
- Do not approach ChartField configuration as an iterative process. Thoroughly plan and implement it in a single configuration process if possible.
- Run the PeopleSoft Full Configuration AE (Application Engine) process (FS\_CFCONFIG) before using the system if you make any changes to the Standard Configuration or Advanced Configuration pages. Deselect any unlicensed Project Costing, Expense, Resource Management product, and Services Procurement check boxes on the Installation Options Products page before running the Configure process so that ChartFields related to these products are automatically inactivated and do not appear on pages containing these ChartFields.
- Do not load new ChartField values (such as Accounts or Departments) until the configuration is complete and indexes have been rebuilt per the Configuration Steps report.
- Note that objects modified by the full configuration will be reported as *changed* on Upgrade Compare reports.

---

**Note:** To segregate these changes from your inhouse customizations, create a new user ID that is used only to run the configuration. Objects modified by that configuration user can then be isolated in compares.

---

- Before running the process, ensure that your environment has the recommended database settings for ChartField Configuration.
- If you are set up for multilanguage and plan to relabel or add new ChartFields, sign in using the base language and ensure that the language code on the User Profile page is also set to the base language so that base and foreign language labels are applied accordingly.
- Ensure that your Structured Query Report (SQR) environment has been configured correctly (PeopleSoft Asset Management installations only).
- Run SYSAUDIT and verify that all errors have been corrected.
- Run the Preview Configuration process to preview the manual steps that will be required.
- Back up your database.
- Turn off process scheduler traces (TraceAE=0, TraceSQL=0, and TracePC=0 in psprcs.cfg file).

Turning the trace on can double processing time.

- Ensure that all users are signed out of the system before running the full configuration process.

This applies to standard and advanced configuration as explained in this topic.

- After initiating the full configuration, shut down the app server and monitor the progress of the process using your OS monitor (Task Manager) or the timestamp on the AE logs produced by the process.

After running the full configuration:

- Check the message log in PeopleSoft Process Monitor for error messages.
- Check the PeopleSoft Application Engine log files (.stdout and .trc files) for error messages.
- If reordering ChartFields, check the Bulkops.log file for "unable to process <page>" error messages.

*Skipping* certain pages is normal for the process.

- Verify that all configuration actions have a Complete (standard actions) or Auto Configuration Complete (advanced actions) status using the Configuration Status - Action Status page.
- If the full configuration process fails before completion, correct the error and restart the process using the Process Monitor.

Do not initiate a new process instance until the first instance is successfully completed.

- If the standard AE logs do not provide sufficient information about an error, setting TraceAE=3 in the pspres.cfg will produce a detailed AET trace file.
- Copy AMCHARTS.SQC to your SQR directory (Asset Management installations only).
- Perform the required manual steps outlined on the Configuration Steps report and when completed, set the status in the Product Status page from Auto Configuration Complete to Complete.

## ChartField Configuration and ChartField Types

Each ChartField falls into one of the following three categories based on its ability to be configured:

- Fully Configurable—Any ChartField configuration action can be taken.
- Partially Configurable—Only selective ChartField configuration actions can be taken.
- Non-Configurable—These ChartFields are required and cannot be configured.

In addition, a ChartField is either a standard or affiliate ChartField.

While both standard and affiliate ChartFields are used to classify and report on financial transactions, affiliate ChartFields do not have their own set of values. Instead, they use values from a related standard ChartField to facilitate interunit and intraunit accounting. After a ChartField is defined as standard or affiliate, it cannot be changed to the other type.

The following table summarizes the configuration characteristics of the delivered set of ChartFields:

| <b>ChartFields</b>                                                                                                                                                                                                                                                                                                                                                                                   | <b>Valid Configuration Actions</b>                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Project ChartFields

The project ChartFields are related ChartFields, which have the following display order:

- PC Business Unit
- Project
- Activity
- Source Type
- Category
- Subcategory

Project ChartFields are unique in that their display order in the overall sequence of all ChartFields is always the same in relation to the position of the Project ChartField. While you cannot directly change the display order of the other five project ChartFields, you can change the display order of the Project ChartField and the other five project ChartFields maintain their relative positions with respect to the Project ChartField. Their relative positions are as shown in the previous listing of ChartFields. The six project ChartFields must move as a group with any reordering of the display sequence for the Project ChartField and all other ChartFields reordered around this requirement.

Additionally, Resource Analysis Type is not considered a ChartField and as such is not included in the previous list of project ChartFields, nor is it included on either the Standard or Advanced Configuration pages.

While the project ChartFields are displayed on both the Standard and Advanced Configuration pages, project ChartFields are subject only to standard configuration. Because standard configuration can be done using either the Standard or Advanced Configuration page, the project ChartFields are available on both configuration pages.

---

**Note:** If you have not licensed the PeopleSoft Project Costing, Expenses, Resource Management or Services Procurement products, deselect the check boxes on the Installation Options Products page for any unlicensed products before running the Configure process so that ChartFields related to these products are automatically inactivated and are no longer available on pages that would otherwise contain the related ChartFields.

---

See [Project ChartFields](#).

## Resource Analysis Type

Resource Analysis Type is displayed between the Activity and Source Type ChartFields on the Journal Line page. The value of this field is typically derived programmatically based on the transaction and is not available for input on most transaction entry pages. However, an exception to this is Journal Entry, where this field is available for input. Consequently, this field is added to the Journal Entry line page between the Activity and Source Type ChartFields.

If the Project ChartField is reordered during ChartField configuration, the Resource Analysis Type also retains this relative position and is reordered along with the Projects ChartFields in the display.

Like the Projects ChartFields (other than Project ID), Resource Analysis Type is not available if the PeopleSoft Project Costing application is not installed.

## Activation and Inactivation of Projects ChartFields

Projects ChartFields are delivered already activated. If any of the PeopleSoft Project Costing, Expenses, or Resource Management applications are not installed, some of the Projects ChartFields are automatically inactivated by navigating to the Configuration page, saving, and then running the Configure process:

- If the Project Costing application is installed, all project ChartFields remain activated.
- If the Project Costing application is not installed and either the PeopleSoft Expenses or Resource Management application is installed, PC Business Unit, Activity, and the Project ChartField remain activated, and Source Type, Resource Category, and Subcategory are inactivated.
- If none of the Project Costing, Expenses, or Resource Management applications are installed, the system inactivates the PC Business Unit, Activity, Source Type, Resource Category, and Subcategory ChartFields if they are not already inactivated.

Inactivation of the Project ChartField is not allowed if the PeopleSoft Project Costing, Expenses, or Resource Management applications are installed .

Inactivation of Source Type is not allowed if any row in the Project Costing Definition (BUS\_UNIT\_TBL\_PC) has the field Category Edit Option (CAT\_EDIT\_OPTION) set to Related (REL).

Inactivation of Category is not allowed if any row in the Project Costing Definition (BUS\_UNIT\_TBL\_PC) has the field Subcategory Edit Option (SUB\_EDIT\_OPTION) set to Related (REL).

## Assumptions and Restrictions on Display Lengths of Project ChartFields

In the PeopleSoft system ChartFields normally reside in a grid. However, in some applications the PC Business Unit, Project, and Activity ChartFields typically reside outside a grid, as in the PeopleSoft Project Costing application. This prevents the configuration process from changing the display length of these fields. However, though the display length of ChartFields cannot be changed when they appear outside a grid, data entry is restricted to the display length specified on the Standard Configuration page. For example, even though **Project** appears as a 15-character field in the grid, data entry can be restricted to 10 characters if that is the display length that you specify on the Standard Configuration page.

## Balancing and Interunit Restrictions on Project ChartFields

No balancing occurs on the Projects ChartFields. Although the Project ChartField can be specified as a balancing ChartField, this is not true of the other five Projects ChartFields. Therefore, they do not appear in the IntraUnit Related ChartField drop-down list box on the configuration page.

## Other Project ChartField Configuration Restrictions

ChartField Inheritance is supported for fully configurable ChartFields only. It is not supported for project ChartFields because they are partially configurable.

If a PeopleSoft application maintains grid tabs that are embedded between ChartFields, a manual step is necessary in the ChartField configuration process that requires you to review and modify these pages. This is because the configuration process automatically moves embedded grid tabs to the end of the ChartField block.

## ChartField Configuration Scope and Levels

The ChartField Configuration process can be used to configure ChartFields for:

- *Products installed during your initial PeopleSoft implementation.* The full configuration process updates all records and pages in the database containing ChartFields. It also produces a Configuration Steps report that lists the definitions or programs that must be updated manually for each installed product. Use the Standard ChartField or Advanced ChartField Configuration component.
- *Products installed after the initial ChartField Configuration.* The full configuration process updates all records and pages in the database containing ChartFields if any additional configuration actions have been requested since the initial ChartField Configuration. It also produces a Configuration Steps report that lists the definitions and programs that must be updated manually for each installed product. Use the Standard ChartField or Advanced ChartField Configuration component.
- *Projects containing upgrade objects or application updates and fixes.* Depending on the configuration actions selected when your products were configured, you might need to apply those actions in the future to projects containing upgrade objects or application updates and fixes. Oracle will inform you when this is required. Use the CF Configuration by Project page.

## ChartField Reporting Requirements Analysis

When planning how to configure your ChartFields to meet your reporting requirements, consider the following questions:

- How many ChartFields do you need?
- Can the existing active ChartFields meet your requirements or do you need to activate any of the expansion ChartFields 1, 2, or 3?
- Do you need to add additional ChartFields beyond the expansion ChartFields? This affects future upgrades and application fixes, making them more complex. Oracle recommends using all of the delivered ChartFields first before considering adding a new one.
- What should the length of each ChartField be?
- What descriptive labels (long and short) do you want to appear on pages and reports for each ChartField?
- In what order do you want the ChartFields to be displayed?
- Do you use alternate account functionality? If so, the alternate account must be active.
- Have you implemented PeopleSoft Project Costing, Expenses, Resource Management, or Services Procurement? If so, PC Business Unit & Activity must be active.
- Have you implemented PeopleSoft Expenses, Asset Management, or Resource Management? If so, the Department ChartField must be active.
- Are you using the InterUnit functionality? If so, Affiliate must be active.
- Are you using the IntraUnit functionality? If so, one or both IntraUnit Affiliate ChartFields must be active.
- How many intraunit balancing ChartFields do you require, if any, and what are their related ChartFields?
- Do you want to rename any of the delivered ChartFields? Oracle strongly discourages this because it makes applying future upgrades and application fixes more complex. Instead, Oracle recommends that you relabel the ChartField.
- Do you want to delete any of the delivered ChartFields? Oracle strongly discourages this because it makes applying future upgrades and application fixes more complex. Instead, Oracle recommends that you inactivate the ChartField.
- Do you want to reduce the field length of any of the delivered ChartFields? Oracle strongly discourages this because it makes applying future upgrades and application fixes more complex. Instead, Oracle recommends that you reduce the display length of the ChartField.

---

## Using Standard ChartField Configuration

To configure ChartFields, use the Standard Configuration component (STANDARD\_CF\_TMPLT).

## Pages Used for Standard ChartField Configuration

| <i><b>Page Name</b></i>                                | <i><b>Definition Name</b></i> | <i><b>Usage</b></i>                                                                                                                                         |
|--------------------------------------------------------|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Standard ChartField Configuration Page</a> | STANDARD_CF_TMPLT             | Perform Standard ChartField Configuration such as changing display order, changing display length, relabeling, and activating or inactivating a ChartField. |
| Change ChartField Labels Page                          | FS_CF_TMPLT_CONFIG            | Add or modify long and short names for the ChartFields.<br><br>See the <a href="#">Standard ChartField Configuration Page</a> .                             |
| Preview Configuration Page                             | FS_CF_PAGE_DEMO               | Preview the results before completing configuration.<br><br>See the <a href="#">Standard ChartField Configuration Page</a> .                                |

## Understanding Using Standard ChartField Configuration

The following configuration actions can be performed using the standard configuration:

- Change the display order of ChartFields on pages and reports.
- Relabel long and short names (descriptions) of ChartFields.
- Inactivate or activate ChartFields.
- Change the display length of ChartFields on pages and reports.
- Change Related ChartFields for IntraUnit Affiliate ChartFields.

Inactivated ChartFields are not displayed on pages, reports, or prompt lists and are not included in indexes. While not displayed, they are not removed from records or pages. This significantly reduces configuration time and effort.

After a standard configuration, no additional manual database changes are required other than rebuilding indexes, recreating views, and updating nVIsion reports.

---

**Note:** Oracle recommends that, if possible, the standard configuration be used exclusively, because it minimizes the need to reapply ChartField configuration actions when you subsequently upgrade or apply application fixes.

---

## Standard ChartField Configuration Page

Use the Standard ChartField Configuration page (STANDARD\_CF\_TMPLT) to perform Standard ChartField Configuration such as changing display order, changing display length, relabeling, and activating or inactivating a ChartField.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Configure > Standard Configuration > Standard ChartField Configuration**

Alternatively, you can select the Standard Configuration tab on the Advanced Configuration page.

This example illustrates the fields and controls on the Standard ChartField Configuration page. You can find definitions for the fields and controls later on this page.

This page initially displays the ChartFields as delivered.

| Field or Control | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b>    | <p>An <i>Active</i> ChartField appears on pages, reports, and prompt lists.</p> <p>An <i>Inactive</i> ChartField does not appear on pages, reports, and prompt lists. However, it is not removed from records and pages.</p> <p>Expansion ChartFields 1, 2, and 3 are delivered inactive but can be activated if the delivered active ChartFields are not sufficient for your requirements.</p> |

**Warning!** Do not change the status of a ChartField after you have run the full configuration and are using the system in production. Status determines whether ChartFields are displayed on pages, reports, and prompt lists throughout the system.

| <b>Field or Control</b>                            | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Order</b>                                       | You change the order of display by directly changing the sequence of order numbers in this field. Inactive ChartFields are given the order value of 99. An order number is required when a ChartField is <i>Active</i> . When you activate an inactive ChartField, the system assigns it the next available number, which you can change to place the newly activated ChartField in any desired sequence. Final reordering is done when you save the page or press the <b>Configure</b> button to remove gaps or duplicates in the numbering sequence as well as when you reposition the project ChartFields as a group.  |
| <b>Field Long Name</b> and <b>Field Short Name</b> | Displays the current long name and short name for the ChartField. These labels, rather than the database field name of the ChartField, appear on pages, reports, and prompt lists. To relabel the description of a ChartField, click the Relabel link and supply a new long name and short name for both base language and foreign language, if applicable.                                                                                                                                                                                                                                                               |
| <b>Relabel</b>                                     | Click this link to access the Change ChartField Labels page (FS_CF_TMPLT_CONFIG), where you can supply a new ChartField long name and short name to be used as labels in the base language. If multiple base language labels exist or foreign language translations exist for the labels of a ChartField, this link becomes available to allow editing of these labels.                                                                                                                                                                                                                                                   |
| <b>Display Length</b>                              | Enter a new value to change display length on pages. The display length cannot be greater than the actual field length of the ChartField. For added ChartFields, this value becomes the ChartField length by default. You can later change the value.                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Affiliate Type</b>                              | Standard ChartFields have no affiliate type. An Affiliate ChartField is either an interunit or intraunit affiliate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>IntraUnit Related ChartField</b>                | A unique IntraUnit Related ChartField of the same or smaller ChartField length must be specified for each IntraUnit Affiliate ChartField that is Active. If this represents a new ChartField that is being added in the same configuration process run, you must wait to specify it as an IntraUnit Related ChartField until you have completed all of the steps required to add the ChartField. When the ChartField is successfully added, you can specify it as an IntraUnit Related ChartField and run a separate configuration process. (The Business Unit field is required for the InterUnit Affiliate ChartField.) |
| <b>Activate</b>                                    | Click the check boxes next to the fields that you want to activate and then click the <b>Activate</b> button.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Inactivate</b>       | <p>Click the check boxes next to the fields that you want to inactivate, and then click the <b>Inactivate</b> button.</p> <hr/> <p><b>Note:</b> You cannot inactivate the <b>Project</b> ChartField if you have installed any the following PeopleSoft applications: Project Costing, Expenses, and Resource Management. You can inactivate the <b>Source Type</b>, <b>Category</b>, and <b>Subcategory</b> ChartFields only when they are not associated with the Project Costing business unit. You cannot inactivate the <b>Source Type</b> and <b>Category</b> ChartFields if they are defined as required input controls on the Project Costing Options page (BUS_UNIT_OPT_PC).</p> <hr/> |
| <b>Preview</b>          | Click the <b>Preview</b> button prior to clicking the <b>Configure</b> button to preview what the ChartField grid display will look like after configuration on the Preview Configuration page (FS_CF_PAGE_DEMO).                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Configure</b>        | Refer to the section on running and verifying the ChartField configuration before initiating the configuration using the <b>Configure</b> button.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

See [Running and Verifying the ChartField Configuration Program](#).

---

**Warning!** Do not inactivate or delete a ChartField if you have transaction data posted to that ChartField. If you do so, you will not be able to view that ChartField on pages and reports and might errors might occur when you are altering tables for which that ChartField is defined as a key.

---

---

**Warning!** If you make any changes to the Standard or Advanced Configuration pages, you must run the Full Configuration process to implement those changes before using the system. If you have saved changes but want to cancel them before running the Full Configuration, use the Configuration Status - Action Status page to cancel the undesired configuration actions. This will reset the ChartField to its previous configuration.

---

## Using Advanced ChartField Configuration

### Pages Used for Advanced ChartField Configuration

| <b>Page Name</b>                            | <b>Definition Name</b> | <b>Usage</b>                                                                                              |
|---------------------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------|
| <a href="#">Advanced Configuration Page</a> | FS_CF_TEMPLATE         | Perform advanced ChartField configuration such as adding, deleting, renaming and resizing of ChartFields. |

## Understanding Using Advanced ChartField Configuration

The following configuration actions can be performed using Advanced Configuration:

- Add new ChartFields.
- Delete ChartFields.
- Resize ChartFields.
- Rename ChartFields.

Use advanced configuration when the standard configuration and delivered ChartFields do not meet your requirements. Note that these configuration actions must be applied to new objects containing ChartFields received using an upgrade or by applying application fixes. Therefore, Oracle recommends that the standard configuration be used exclusively, if possible, to meet your ChartField requirements.

This list suggests ways to use the Standard Configuration in place of the Advanced Configuration:

- Activate an inactive ChartField instead of adding a new ChartField.
- Inactivate a ChartField instead of deleting it.
- Change the display length rather than the field length when reducing the size of a ChartField.
- Relabel a ChartField instead of renaming it.

PeopleSoft software enables you to have many ChartFields, each of which may be up to 30 characters in length. Due to platform-specific index length limitations, however, the combined field length of your ChartFields might cause this limit to be exceeded on a given table, although this is highly unlikely. These

index limits are shown below and represent the total length of all key fields on a table excluding inactive ChartFields because inactive fields are not included in the index:

| <b><i>RDBMS Platform</i></b>                | <b><i>Max Index Length ANSI</i></b>                                             | <b><i>Max Index Length Unicode</i></b>                                            | <b><i>Max # of Columns in an Index</i></b> | <b><i>Max # of Columns in a Table</i></b>       |

\* Subtract one byte for each key field defined as a Date, Time, Datetime, or Long Character field (key columns that allow NULL).

\*\* Subtract one byte for each key field defined as Date, Time, Datetime or Long Character. Subtract four bytes for each key field defined as Character. When summing the field lengths of the key fields, double the field length of each key field defined as Character.

For example, if FLD1 is a character key field with length 3, during the index size calculation the length is doubled to 6. You must also add four bytes so that the final length is ten bytes for the index size calculation.

## Advanced Configuration Page

Use the Advanced Configuration page (FS\_CF\_TEMPLATE) to perform advanced ChartField configuration such as adding, deleting, renaming and resizing of ChartFields.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Configure > Advanced Configuration > Advanced Configuration**

You can also access the Standard Configuration page from this page by selecting the Standard Configuration tab.

This example illustrates the fields and controls on the Advanced Configuration page. You can find definitions for the fields and controls later on this page.

| <b>Delete</b>             | <p>Click the check boxes next to the fields that you want to delete, and then click the <b>Delete</b> button. Account, alternate account, department, project, and affiliate cannot be deleted. Also, you cannot delete your last remaining standard or affiliate ChartField.</p> <p>Oracle recommends that you inactivate a ChartField rather than delete it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Add New ChartField</b> | <p>Click this button to access the Add New ChartField dialog box and then select either to add a Standard or IntraUnit Affiliate ChartField. Click <b>OK</b> to access the Add New ChartField secondary page.</p> <p>Enter the field length of the new ChartField that will be added to the database by the configuration process.</p> <p>If you selected the <b>IntraUnit Affiliate</b> check box, IntraUnit Affiliate is also selected by the system on the Add New ChartField secondary page, indicating that you are adding an IntraUnit Affiliate ChartField. In this case, you must also select an IntraUnit Related ChartField. These two fields do not appear on the page when you are adding a Standard ChartField. You cannot add additional <i>Interunit</i> ChartFields.</p> <p><b>Model</b> lists the prompt tables that exist for a selected ChartField that are also copied to the <b>New Name</b> column. Because counterpart prompt tables are required for the new ChartField, modify the New Name prompt table names to reflect the name of the new ChartField.</p> <p>The new prompt table names entered have to be manually created in the PeopleSoft Application Designer and will be listed in the Configuration Steps Report. Make sure that the prompt tables are created before opening any of the records containing ChartFields.</p> |
| <b>Preview</b>            | Click the <b>Preview</b> button prior to clicking the <b>Configure</b> button to preview what the ChartField grid display will look like after configuration on the Preview Configuration page (FS_CF_PAGE_DEMO).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Configure</b>          | Refer to the section on running and verifying the ChartField configuration before initiating the configuration using the <b>Configure</b> button.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

See Running and Verifying the ChartField Configuration Program.

## Running and Verifying the ChartField Configuration Program

To run and verify the ChartField configuration program, use the Standard Configuration (STANDARD\_CF\_TMPLT) and ChartField Definition (CF\_CHRTFLD\_DEFN) components.

### Pages Used to Run and Verify the ChartField Configuration Process

| <i>Page Name</i>                                       | <i>Definition Name</i> | <i>Usage</i>                                                                                                                                                                                                                                                                                          |

| <u>Product Status Page</u> | INQ_CFLNLOG_DTL        | <p>Inquire on the status of a ChartField configuration action by installed product.</p> <p>Also use to mark the status of products complete for a particular ChartField configuration action.</p>                                                                                                                                                                                                                            |

## Understanding Running and Verifying the ChartField Configuration Program

After setting up either a standard or advanced ChartField configuration, you are ready to:

- Run the ChartField configuration program.
- Monitor the progress of the configuration by ChartField configuration action and product.
- Cancel an action that has not been processed.
- Mark products complete when all manual steps have been performed for advanced configuration actions.
- Verify the success of the standard or advanced ChartField configuration.

## Standard ChartField Configuration Page

Use the Standard ChartField Configuration page (STANDARD\_CF\_TMPLT) to perform Standard ChartField Configuration such as changing display order, changing display length, relabeling, and activating or inactivating a ChartField.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Configure > Define CF Standard Config > Standard ChartField Configuration**

You can also access the Standard ChartField Configuration page by selecting the Standard Configuration tab on the Advanced Configuration page.

Use the Advanced Configuration page (FS\_CF\_TEMPLATE) to perform advanced ChartField configuration such as adding, deleting, renaming and resizing of ChartFields.

(You can access the Standard Configuration page from this page by selecting the Standard Configuration tab.)

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Configure</b>               | <p>Click the <b>Configure</b> button to access the Process Scheduler Request page and initiate the configuration process.</p> <p>Click the <b>Run Full Configuration</b> button and then the <b>OK</b> button to run the configuration process and produce the Configuration Steps report of required manual steps.</p> <p>The ChartField Configuration program accesses and processes several pages.</p> <p><u>See Pages Used to Run and Verify the ChartField Configuration Process .</u></p> <p>If you want to review the required manual steps prior to committing to a full configuration, select <b>Preview Configuration Steps</b> and click <b>OK</b>. This generates only the Configuration Steps report.</p> <p>After you run the full configuration, you cannot change the ChartField Configuration Pages or cancel requested configuration actions until the configuration process is successfully completed.</p> |

---

**Warning!** Because the process performs large numbers of updates to PeopleTools tables, no users should be logged on to the database while the process runs to avoid potential locking issues. For the same reason, after you initiate the full configuration process, you should immediately shut down the application server until the process finishes. You can monitor the progress of the process using the monitoring facility provided by your operating system (such as Task Manager on NT). The process also updates the AE\_FS\_CFCONFIG\_XXX.STDOUT file (where XXX is your Process Instance number). The size of this file remains 0 until the process finishes.

---

Before running the process, ensure that your environment has the following recommended database settings:

### Oracle

- Rollback Tablespace = 1536MB.
- Rollback Segment sizing: Initial Extent + (Next Extent \* Maxextents) = 1024MB (approximate).
- dml\_locks = 1024 (set in init.ora).
- Changing the dml\_locks setting requires recycling the instance.

### Informix

- Log Space = 1800MB.
- LOCKS = 2,500,000.

Sybase—Log Space = 2000MB.

### DB2/Unix

- Update the locking mode to share: db2set DB2\_RR\_TO\_RS=yes (This sets Lock mode requested = Next Key Share (NS)).
- Include the following command in the DBMCFG.SQL configuration file: UPDATE DBM CFG USING QUERY\_HEAP\_SZ 64000.
- Log file size (4KB) (LOGFILSIZ) = 24000
- Number of primary log files (LOGPRIMARY) = 20
- Use the following minimum TableSpace sizes (these might need to be increased):
  - BDAPP: 9720
  - BDAPPIDX: 2680
  - BDLARGE: 1191
  - FAAP: 11312
  - FSLARGEIDX: 13568
  - LCAPP: 28572
  - LCAPPIDX: 2600
- Recycle the instance after changing the setting.

DB2/OS390—No changes recommended.

MSS 2000—Log Space = 1500MB.

See also *PeopleTools: PeopleSoft Process Scheduler*.

## Dynamic Edit Tables Page

Use the Dynamic Edit Tables page (FS\_FLD\_PROMPT) to retrieve prompt table names that are to be assigned dynamically through PeopleCode.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Configure > Define CF Dynamic Edit Tables**

Dynamic Edit Tables are used by the Get Edit Tables PeopleCode function to retrieve prompt table names that are to be assigned dynamically through PeopleCode. For example, when ChartFields are refreshed in the Ledger Group component in General Ledger, their associated prompt tables are assigned from here. This page is automatically maintained by the ChartField Configuration Utility. You should not need to update this page unless you are performing a customization that requires the Get Edit Tables function.

## Action Status Page

Use the Action Status page (INQ\_CFHDRLOG\_SUM) to inquire on the status of a ChartField configuration action.

Navigation:

Click the **Configuration Status** link on either the Advanced Configuration or Standard ChartField Configuration page.

The following statuses can appear on both the Action Status and Product Status pages:

| <i><b>Field or Control</b></i>     | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Not Yet Begun</i>               | A ChartField configuration action has been requested and saved on the Standard Configuration or Advanced page but the full configuration has not been successfully completed.                                                                                                                                                                                                                                                                                                                                                                                       |
| <i>Auto Configuration Complete</i> | The full Configuration process has finished successfully. This status is used only for advanced ChartField configuration actions.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <i>Complete</i>                    | <p>For standard ChartField configuration actions, this status is set by the full Configuration process and indicates that it has finished successfully. Manual tasks listed on the Configuration Steps report must still be completed.</p> <p>For advanced ChartField configuration actions, this status is set manually by means of the <b>Mark Complete</b> button on the Product Status page. When all products are complete for a ChartField configuration action, the status of the action is automatically changed to Complete on the Action Status page.</p> |

**Note:** When the full configuration has successfully finished, standard actions will be marked complete although they might still require manual steps, such as rebuilding indexes or updating reports. Make sure that you review the Configuration Steps Report to determine the additional manual steps necessary to complete the configuration.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Product Status</b>   | Select to access the Product Status page and display the status of each installed product for the ChartField configuration action selected. Update the Product Status page by running either the full Configuration or preview Configuration steps process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Cancel</b>           | <p>Click the <b>Cancel</b> button to cancel ChartField configuration actions that you do not want to be processed by the full Configuration program. After this program has been run for a ChartField configuration action, that action cannot be canceled.</p> <p>In addition, you cannot cancel a Reorder action. Instead, specify the desired order on the Standard Configuration page.</p> <p>When canceling an inactivate, add, or delete action, verify the order on the Standard Configuration page and make adjustments as necessary.</p> <p>When canceling a relabel action, only the default label is reset to its previous value. Any additional base language or foreign language labels need to be updated manually.</p> |

## Product Status Page

Use the Product Status page (INQ\_CFLNLOG\_DTL) to inquire on the status of a ChartField configuration action by installed product.

Also use to mark the status of products complete for a particular ChartField configuration action. You update the Product Status page by running either the full Configuration or preview Configuration steps process.

Navigation:

Click the **All Products Status** link on the bottom of the Actions page or click the **Product Status** link for a row on the Action Status page.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mark Complete</b>    | When you complete the manual steps associated with an advanced ChartField configuration action for a product, click the <b>Mark Complete</b> button to mark the product complete. This changes the status from Auto Configuration Complete to Complete and allows additional ChartField configuration actions to be requested when all products are marked complete. |

## Verifying Configuration Action Results

Access the Configuration Status Action Status page and verify that the configuration program has successfully processed each configuration action. No configuration actions with a status of *Not Yet Begun* should exist. If they do, the configuration process might not have finished successfully and following the steps below will help you identify the problem.

Review the Message Log produced by the Full Configuration Application Engine process for any errors that might have occurred. Any errors should be corrected and the process restarted (if it did not finish successfully) before proceeding to the manual configuration tasks.

---

**Note:** Do not make additional changes to the Standard Configuration or Advanced Configuration pages until this process finishes successfully.

---

The full configuration process uses the PeopleSoft PeopleTools Bulk Operations feature to modify records and pages for the Add, Delete, and Reorder configuration actions. When the full configuration has finished, review the Bulk Operations log file (BulkOps.log) for any errors and a record of what has or has not been processed. The log is located in %PS\_CFG\_HOME%/appserv/prcs/<domain>/log\_output or (if that directory cannot be updated) in %PS\_HOME%. Skipping certain records and pages that do not require updating is normal for the utility. If the utility updates a record or page that is questionable due to the complexity of the object, the record or page is written to a project called BLK\_*FieldName*. Review the contents of any BLK\_*FieldName* project created by the utility.

If you have requested a Reorder or Change Display Length configuration action and the Message Log contains an error message indicating that the process was unable to update order or display length on one or more pages, review the BulkOps.log file to identify the specific pages that were not processed. You must update these pages manually.

Finally, if you have activated or inactivated ChartFields, review the Application Engine TRC file for the process instance for any error messages to ensure that all index definitions were updated properly. Any indexes not updated by the configuration process can be updated in Application Designer by opening and resaving the record definition and then rebuilding the index.

---

**Note:** For more information about the Bulk Operations feature, consult the PeopleTools documentation.

---

For more information, see *PeopleTools: PeopleSoft Application Designer*

---

## Performing Manual Configuration Tasks

This topic provides an overview and discusses how to:

- Perform one-time manual configuration tasks.
- Perform product-specific manual configuration tasks.
- Running the Configuration Steps report and inquiry.

## Understanding a Manual Configuration

Generally, the following items do not require manual modification as a result of performing a ChartField configuration:

- Record definitions
- Pages
- PeopleCode
- SQL Objects
- View Text
- Application Engine
- COBOL
- SQR

Depending on the configuration actions that you request, the following objects might require manual modification:

- Queries
- Message Definitions
- Component Interfaces
- File Layouts
- Mass Change Types/Templates
- Delivered PS/nVision layouts

All ChartField configuration actions require that certain manual steps be performed to complete the configuration. Standard actions typically require many fewer steps than advanced actions. The manual steps are listed in the order they should be performed on the Configuration Steps report that is produced by running either the full configuration process or the preview configuration steps process.

The Preview Configuration Steps process produces the report without performing any database updates. This enables you to make changes to your ChartField configuration actions prior to running the full

configuration. The full configuration process produces the same report in addition to applying the appropriate database updates.

The Configuration Steps Report first lists the tasks that need to be performed only *one-time* for all installed products, and then the *product* tasks that need to be performed for each installed product. If product is blank, that definition is used in multiple products and will be listed only once.

The manual tasks listed and discussed subsequently are a comprehensive listing of tasks for all ChartField configuration actions. The Configuration Steps report lists only the tasks that are appropriate for the actions that are requested.

See the product documentation for *PeopleTools: PeopleSoft Application Designer Developer's Guide*.

## Performing One-Time Manual Configuration Tasks

The following table summarizes the manual configuration tasks listed on the Configuration Steps report that typically need to be performed only once regardless of the number of products installed. However, some of these tasks might need to be repeated during a subsequent project-based configuration.

Required steps must be performed for the system to function properly. Optional steps do not affect the functioning of the system, but typically affect the appearance of pages and reports.

This table of sample sequence numbers indicates the order in which the steps are performed. (Gaps occur in the number sequence.)

| Seq # | Common Tasks                                                                                                                                                                                                           | Notes/Require/Optional                                                                                                                                   |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 00010 | Run Full Configuration Process                                                                                                                                                                                         | Applies only when the Preview Configuration Steps process is run<br>Required for all actions except changing the IntraUnit Affiliate Related ChartField. |
| 00020 | Define new ChartField Validation Table                                                                                                                                                                                 | Required only for an Add action.<br>Does not apply to IntraUnit Affiliate ChartFields.                                                                   |
| 00040 | Create new ChartField Prompt Views                                                                                                                                                                                     | Required only for an Add action.                                                                                                                         |
| 00060 | Define new ChartField Definition page (Set Up Financials/Supply Chain, Common Definitions, Design ChartFields, Configure, ChartField Definition).<br><br>(may need to create component in Application Designer first). | Required only for an Add action. Does not apply to the IntraUnit Affiliate ChartField.                                                                   |
| 00070 | Create a table listing Query reports                                                                                                                                                                                   | Add action only (optional). Does not apply to the IntraUnit Affiliate ChartField.                                                                        |

| <b>Seq #</b> | <b>Common Tasks</b>              | <b>Notes/Require/Optional</b>                                                                                                                                      |
|--------------|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10010        | Alter Tables/Create Indexes      | Required for: <ul style="list-style-type: none"> <li>• Add</li> <li>• Delete</li> <li>• Rename</li> <li>• Resize</li> </ul>                                        |
| 10020        | Create Indexes                   | Applies only when Activate/Inactivate is requested without an Add, Delete, Rename, or Resize.                                                                      |
| 10040        | Create Views                     | Required for: <ul style="list-style-type: none"> <li>• Add</li> <li>• Delete</li> <li>• Rename</li> <li>• Change IntraUnit Related CF</li> <li>• Resize</li> </ul> |
| 10050        | Add new TableSet Record Group    | Required for Add (does not apply to IntraUnit Affiliate ChartFields)                                                                                               |
| 10060        | Update the Table Listing Reports | Required for Resize and Rename. Optional for Relabel.                                                                                                              |

**Note:** Create the related language tables first. These tables have a suffix of *Lxxx*, for example, OPER\_UNIT\_LANG or OPER\_UNIT\_LN.

### **Define New ChartField Validation Tables (Seq.# 00020)**

In the PeopleSoft Application Designer, copy the Model table listed in the Configuration Steps Report by selecting File, Save As, and name the new validation table as shown in the report. If the table already exists, replace it. Complete the following steps:

When prompted whether to save a copy of the PeopleCode, answer *Yes*.

When the new validation table is in place, highlight the model ChartField and select Insert, Field to add the new ChartField.

Compare the attributes of the model ChartField to the new one, and modify the new field attributes to match the model.

Copy any PeopleCode associated with the model ChartField to the new ChartField and modify it as needed.

Delete the model ChartField from the new validation table.

Change the name of the Related Language Record in the Record Properties, if present, to the correct record for the new ChartField.

Change the description of the table in Record Properties.

Save the new validation table.

Use Build, Current Object to create the new table. Acknowledge any warning messages by clicking **OK**.

Follow the same procedure for each new validation table listed.

---

**Note:** Create the related language tables first. These tables have a suffix of `_Lxxx`, for example, `OPER_UNIT_LANG` or `OPER_UNIT_LN`.

---

### Create New ChartField Prompt Views (Seq.# 00040)

In the Application Designer, copy the Model prompt view listed in the Configuration Steps Report by selecting File, Save As, and name the new prompt view as shown in the report.

When prompted whether to save a copy of the PeopleCode, answer *Yes*.

When the new prompt view is in place, highlight the model ChartField and select Insert, Field to add the new ChartField.

Compare the attributes of the model ChartField to the new one and modify the new field attributes to match the model.

Copy any PeopleCode associated with the model ChartField over to the new ChartField and modify it as needed.

Delete the model ChartField from the new prompt view.

Modify the view text to reference the new ChartField name. Ensure that the SQL Objects (%Sql) reference the new ChartField name or new validation table name as appropriate.

Change the name of the Related Language Record in the Record Properties, if present, to the correct record for the new ChartField.

Change the description of the prompt view in the Record Properties.

Save the new prompt view.

Follow the same procedure outlined for each new prompt view listed.

The views will be built in Seq.# 10040.

---

**Warning!** Complete this step before opening records containing ChartFields in Application Designer or you might receive an error stating that a prompt table cannot be found.

---

### Define New ChartField Definition Page and Component (Seq.# 00060)

Copy the Model page listed in the report and use the name provided for the new page.

When prompted whether to save the associated PeopleCode, answer *Yes*.

Ensure that all references to the old validation table are replaced.

Review any Page PeopleCode that was copied from the existing page and modify or delete it as appropriate.

Copy the Model component, including PeopleCode, replacing references to the Model ChartField and validation table with the new ChartField and validation table. Use the same name as the new page and add the new page to it.

Copy the following two message definitions, including PeopleCode, replacing references to the Model ChartField and validation table with the new ChartField and validation table:

- <model ChartField name>\_CF\_FULLSYNC
- <model ChartField name>\_CF\_SYNC

In Application Designer under Tools, Register Component, add the new component to the DESIGN\_CHARTFIELDS menu, the portal registry, and the appropriate permission lists.

Use the following values and accept the default values provided for fields not included in the following list:

- Menu Name: DESIGN\_CHARTFIELDS
- Bar Name: USE
- Portal Name: EMPLOYEE
- Folder Name: EPCO\_DESIGN\_CHARTFIELDS\_HIDDEN
- Content Reference Name: EP\_<new component name>\_GBL (for example, EP\_OPERATING\_UNIT\_GBL)
- Content Reference Label: <Long Name of the new ChartField>
- Long Description: <Long Name of the new ChartField>
- Sequence Number: 99xx (where xx is a number you assign)
- Node Name: ERP
- Permission Lists: <select based on your security setup>

### Create a Table Listing Query Reports (Seq.# 00070)

Access PeopleTools, Security, Query Security, Query Access Manager and open QUERY\_TREE\_ERP.

Click the ChartFields Access Group, click the **Insert Child Record** icon, enter the name of the validation table for the new ChartField, click **Add**, and save the tree.

Access Reporting Tools, Query, Query Manager and select the Model query listed in the report. Using this query as a model, build a new query to represent the new ChartField using the name specified on the report. Do *not* copy this query to make the new query, because the new query should refer to the validation table of the new ChartField.

See [Managing ChartFields for Reports](#).

In Application Designer under Tools, Register Component, add the new component to the DESIGN\_CHARTFIELDS menu, the portal registry, and the appropriate permission lists.

Use the following values and accept the default values provided for fields not included in the following list:

- Menu Name: DESIGN\_CHARTFIELDS
- Bar Name: REPORT
- Portal Name: EMPLOYEE
- Folder Name: EPCO\_DESIGN\_CHARTFIELDS\_HIDDEN
- Content Reference Name: EP\_<new component name>\_GBL (for example, EP\_RUN\_FIN9000\_GBL)
- Content Reference Label: <Long Name of the new ChartField>
- Long Description: <Long Name of the new ChartField>
- Sequence Number: 99xx (where xx is a number you assign)
- Node Name: ERP
- Permission Lists: <select based on your security setup>

Modify FS\_PANELS\_WRK.PB\_SELECT\_CF FieldChange PeopleCode to include the new ChartField by cloning all PeopleCode related to the Model ChartField. The CheckSecurity and Xfer2Page functions parameters are Menu Bar Name, Menu Item Name, and Component Item Name respectively.

### **Alter Tables/Create Indexes (Seq. #10010)**

Build the objects in the project listed on the report. Verify the Build Settings by selecting the Create tab on the Build Settings page:

## Verifying Build Settings: Create tab

Select the Alter tab to verify build settings:

## Verifying Build Settings: Alter tab

Acknowledge any warning messages by clicking **OK**.

**Create Indexes (Seq.# 10020)**

Build the objects in the project listed on the report.

Select the **Create Indexes** check box.

Verify that Build Settings are set as indicated in Seq #10010.

This task and Seq.# 10010 are mutually exclusive.

### Create Views (Seq.# 10040)

Build the objects in the project listed on the report.

Select the **Create Views** check box.

Verify that Build Settings are set as indicated in step #10010.

### Add a New TableSet Record Group (Seq.# 10050)

Add a new record group for each new ChartField you are adding under PeopleTools, Utilities, Administration, Record Group using FS\_ and select the next available number. Add all the records and views listed in the report to the appropriate record group.

### Update the Table Listing Report (Seq.# 10060)

Update the report listed to reflect the ChartField configuration actions requested.

## Performing Product-Specific Configuration Tasks

The following table summarizes the *product-specific* manual configuration tasks that might be listed on the report:

| <b>Seq #</b> | <b>Product Tasks</b> | <b>Notes/Require/Optional</b>                                                                                                       |
|--------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| 20010        | Update Pages         | Required for Add<br><br>Optional for:<br><ul style="list-style-type: none"> <li>• Reorder</li> <li>• Change Display Size</li> </ul> |
| 40010        | Update Queries       | Required for:<br><ul style="list-style-type: none"> <li>• Add</li> <li>• Delete</li> </ul>                                          |

| <b>Seq #</b> | <b>Product Tasks</b>                                                                 | <b>Notes/Require/Optional</b>                                                                                                                                                                                                                                                          |
|--------------|--------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 40020        | Update Reports and Queries<br>See <a href="#">Managing ChartFields for Reports</a> . | Required for: <ul style="list-style-type: none"> <li>• Add</li> <li>• Delete</li> <li>• Rename</li> <li>• Resize</li> </ul> Optional for: <ul style="list-style-type: none"> <li>• Activate/Inactivate</li> <li>• Relabel</li> <li>• Reorder</li> <li>• Change display size</li> </ul> |
| 70030        | Copy AMCHARTS.SQC to your SQR folder                                                 | Required for: <ul style="list-style-type: none"> <li>• Add</li> <li>• Delete</li> <li>• Rename</li> </ul>                                                                                                                                                                              |
| 80010        | Update Mass Change Templates                                                         | Required for: <ul style="list-style-type: none"> <li>• Add</li> <li>• Delete</li> </ul>                                                                                                                                                                                                |
| 80020        | Update Mass Change Types                                                             | Required for: <ul style="list-style-type: none"> <li>• Add</li> <li>• Delete</li> </ul>                                                                                                                                                                                                |
| 80030        | Update Delivered PS/nVision Layouts                                                  | Required for: <ul style="list-style-type: none"> <li>• Add</li> <li>• Rename</li> <li>• Delete</li> </ul> Optional for Resize.                                                                                                                                                         |
| 80040        | Update Message Definitions                                                           | Optional for Activate/Inactivate.                                                                                                                                                                                                                                                      |

| <b>Seq #</b> | <b>Product Tasks</b>                                                    | <b>Notes/Require/Optional</b>                                                                                                                                  |
|--------------|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 80050        | Update File Layouts                                                     | Required for: <ul style="list-style-type: none"> <li>• Add</li> <li>• Rename</li> <li>• Delete</li> <li>• Resize</li> </ul> Optional for Activate /Inactivate. |
| 80070        | Update Component Interfaces                                             | Required for: <ul style="list-style-type: none"> <li>• Add</li> <li>• Delete</li> </ul> Optional for Activate/Inactivate.                                      |
| 90010        | Mark Actions complete on the Configuration Status - Action Status page. | Required for: <ul style="list-style-type: none"> <li>• Add</li> <li>• Rename</li> <li>• Delete</li> <li>• Resize</li> </ul>                                    |

**Note:** Review System Setup Data - If using the Business Request and Approval process for ChartFields, update the Business Request Setup and Core Table Fields pages. This is required for Add, Rename, and Delete.

See [Setting Up and Using Business Request and Approval](#).

## Update Pages (Seq.# 20010)

Update the pages listed to reflect the ChartField configuration actions requested.

For newly-added ChartFields, check the page field names where multiple grids occur on a page. The page field names should be unique for each field on the page. Modify added ChartFields on the multiple grids to conform to page field-naming specific for each grid.

## Update Queries (Seq.# 40010)

Access PeopleTools and update the queries listed to reflect the ChartField configuration actions requested.

For newly added ChartFields, select the new field to be included in the query. Click the **Edit** button for the new ChartField and change the column number to reflect the desired position of the ChartField. Edit the field properties and criteria and make any changes necessary to match the model ChartField.

## Update Reports and Queries (Seq.# 40020)

For added or deleted ChartFields, update the query associated with each report listed. Update the reports listed to reflect the ChartField configuration actions requested.

You must modify the reports listed if any ChartFields are set to an Inactive status. You must remove Inactive ChartFields from these reports. You can do this by opening each report and using the Verify Database function, remove the Inactive fields.

---

**Note:** See [Managing ChartFields for Reports](#).

---

## Copy AMCHARTS.SQC to your SQR Folder (Seq. # 70030)

This step is required only if PeopleSoft Asset Management is installed.

In Process Monitor, click the **Details** link for the AMCFBULD SQR Report process and then select the **View Log/Trace** link. Right-click the AMCHARTS.SQC entry and copy that file to your %HOME%\SQR folder.

## Update Mass Change Templates (Seq.# 80010)

Access PeopleTools, Mass Changes, and select Templates.

For newly added ChartFields, access each template listed and select the Criteria and Fields tab to update each template with the new ChartField in every instance that the model ChartField name appears.

For deleted ChartFields, delete all rows that contain a reference to the deleted ChartField.

## Update Mass Change Types (Seq.# 80020)

Access PeopleTools, Mass Changes, Types, and select the Record and Join Fields tab.

For newly added ChartFields, access each type listed and select the Criteria and Fields tab to update each template with the new ChartField in every instance that the model ChartField name appears.

For deleted ChartFields, delete all rows that contain a reference to the deleted ChartField. Also update the other pages in the component.

## Update Delivered PS/nVision Layouts (Seq.# 80030)

Access PS/nVision from Application Designer. For newly added or renamed fields, open each layout listed and enter the new name or new ChartField on the layout, if appropriate.

For deleted ChartFields, remove each reference to the deleted ChartField.

For resized ChartFields, verify that the new length will fit the space provided.

## Update Message Definitions (Seq.# 80040)

If you are inactivating any of the delivered ChartFields, you might also want to exclude them from Message Definitions. If so, open the Messages listed and disable the Include flag on the inactivated ChartField.

## Update File Layouts (Seq.# 80050)

Update the file layouts listed to reflect the ChartField configuration actions requested.

If you are inactivating any of the delivered ChartFields, you might also want to exclude them from File Layout Definitions. If so, delete the inactivated ChartField from the definitions listed.

## Update Component Interfaces (Seq.# 80070)

Update the component interfaces listed to reflect the ChartField configuration actions requested.

If you are inactivating any of the delivered ChartFields, you can also delete the inactivated ChartField from the listed component interfaces.

Oracle delivers a component interface for each ChartField that can be used to load values for the ChartField rather than having you enter the values through its online page.

When you add a new ChartField, you can create an associated component interface by copying the component interface for one of the delivered fully configurable ChartFields, such as Operating Unit, and updating the copy to use the new ChartField.

## Mark Actions Complete (Seq.# 90010)

When you complete the manual steps associated with an Advanced ChartField action for a product, mark the product complete using the **Mark Complete** button on the Configuration Status - Action Status page under the **Product Status** link. This changes the status from Auto Configuration Complete to Complete.

When all products are marked complete for a particular Advanced ChartField action, the status of the action is set to Complete. This step does not apply to Standard ChartField actions because their status is set to *Complete* by the full configuration process.

## Review System Setup Data

If you are using the Business Request and Approval process, follow the steps for adding a new ChartField as documented in the Application Fundamentals documentation, [Setting Up and Using Business Request and Approval](#), to add the new ChartField to the Business Request Setup and Core Table Fields pages.

When deleting an existing ChartField, navigate to the Business Request Setup page (Set Up Financials/ Supply Chain, Common Definitions, Business Request Configuration, Business Request Setup, Business Request Setup), and deselect its Enabled check box if it is selected.

When renaming an existing ChartField, deselect the Enabled check box on the Business Request Setup page as described in the previous paragraph (for deleting the ChartField with the old name); then follow the Business Request setup process as described in the first paragraph for adding the new row for the new ChartField name. You can clone all the information from the old (disabled) ChartField name.

## Verify Results

Review your most frequently used pages, enter transactions, and run critical processes to verify that your requested ChartField actions have been applied properly.

If you have installed General Ledger, also verify that:

- If you are using the Journal Import feature, you update the Excel file JRNL1.XLS to reflect the ChartField configuration actions requested.
- If you are using summary ledgers, you review your summary ledger definitions and update as appropriate.

## Running the Configuration Steps Report and Inquiry

The Configuration Steps Report lists the manual steps that are necessary to complete the configuration process and the objects and definitions that require modification. It is automatically initiated from both the Preview Configuration Steps and full configuration processes. The report is grouped by PeopleSoft product. Objects common to multiple products are separately grouped together and listed first. These common objects have no product indicated.

The manual steps can also be accessed through the Configuration Steps inquiry page.

---

## Performing ChartField Configurations for New Products and Application Fixes

### Page Used to Configure ChartFields for Projects Containing Application Fixes

| <i>Page Name</i>                     | <i>Definition Name</i> | <i>Usage</i>                                                                                                               |
|--------------------------------------|------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <u>Configuration by Project Page</u> | RUN_CF_CONFIG          | Configure updates and fixes to conform to your ChartField configurations before applying the update or fix to your system. |

### Configuration by Project Page

Use the Configuration by Project page (RUN\_CF\_CONFIG) to configure updates and fixes to conform to your ChartField configurations before applying the update or fix to your system.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Design ChartFields > Configure > ChartField Config by Project**

This example illustrates the fields and controls on the Configuration by Project page. You can find definitions for the fields and controls later on this page.

**Configuration by Project**

Use this page to configure objects delivered through a software fix to conform to your ChartField configuration

| Field or Control           | Description                                                                                                                                                                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CF Configuration ID</b> | Enter values to differentiate between runs if you want to run a configuration on each Project you are applying. In this way, you generate a Configuration report for each CF configuration ID without overwriting a previous configuration report. |
| <b>Project</b>             | Enter the project name delivered with a software update or fix.                                                                                                                                                                                    |

The project configuration processes only the configuration actions that are in a *Complete* status. It compares the object list from the project against the CF\_XXXX project and lists the objects that need manual changes. PS/nVision reports that are included in the fix need to be looked at manually.

## Configuring ChartFields for Products Installed After an Initial Configuration

When a configuration of all installed products has been done previously and a new product is installed, the full configuration process must be run again to apply the requested configuration actions to the new product or products.

## Reviewing ChartField Configuration Programs and Processes

This topic discusses:

- The ChartField configuration driver.
- The ChartField manual configuration program.
- The ChartField auto configuration program.

Both standard and advanced configuration use the PeopleSoft Auto Configuration and Manual Configuration programs. Two modes are available:

- Full Configuration is initiated from the ChartField templates and applies all incomplete template actions to the entire database. This would normally be done when the system is first implemented or when new ChartField actions are made on the template.
- Project Configuration is initiated from the CF Configuration by Project page and applies completed template actions to objects that are contained in the projects listed on the run control page. You would normally use project configuration when applying fixes.

## ChartField Configuration Driver

Full Configuration uses the PeopleSoft Application Engine Program FS\_CFCONFIG to call the Manual and Auto-Configuration programs. It also schedules the Configuration report. This driver enables both programs to run as one process.

A commit is taken after each step. In the event of a program abend, you should investigate the reason for the problem, correct it, and then restart the program. This enables the program to restart from the last step that was committed.

Two reasons exist for restarting the program:

Some of the configuration actions (for example, Add a new ChartField) are long-running because they update many database records. Restarting will cut down overall processing time.

The content of the Configuration report is determined by the Manual Configuration and is based on the outstanding actions. If you cancel the program that ended abnormally and start a new program instance, the reporting will show only the outstanding actions at the time the program was started. All actions that were successfully processed prior to the abend will no longer be listed.

The program is structured in the following way:

- Initialization: This step determines whether the processing is for a Full Configuration or a Project Configuration. If a Project Configuration, the list of projects is held in a global array that is passed to both the manual and automatic configuration programs. It also determines the model and partially configurable ChartFields. These are loaded into strings that are used in later processing to determine the records that will need to be built (for example, create views and indexes and alter tables).
- Calls the Manual Configuration program.
- Calls the Automatic Configuration program.
- Schedules the Configuration BI Publisher report (CFX001).

## ChartField Manual Configuration Program

Manual Configuration uses an Application Engine program (FS\_CFMANUAL) to create a report listing all the manual steps that you need to perform to complete the configuration process for both Standard and Advanced Configurations. The Manual Configuration program is always run prior to the Auto Configuration program.

The program enables you to run the configuration for all installed products or for a newly installed product, or you can run it for a specific project containing objects intended to be applied as a software fix.

Initiate the program through the Standard or Advanced Configuration pages by selecting the Preview Configuration Steps process if you want to initially just preview the manual steps needed. You can also choose the Run Full Configuration process if you want to proceed with database updates by calling the ChartField Auto Configuration program.

The program removes any actions that are not necessary because the ChartField might already be in the state specified by that action. This cuts down processing time and reduces the number of manual tasks reported on the Configuration report. Product Logs are then created for each combination of a noncompleted action and an installed product.

The program then looks at each of the Manual Configuration tasks and the Product Log and checks to determine whether the action or actions selected apply for that task. If they do, the task is listed including all the objects affected that need to be acted upon. The objects are grouped by product if it is product-specific with common objects to multiple products listed first. To determine the product that the object is used for, the program looks at the CF\_xxx (where xxx is the product code) project for a list of exception objects as well as the FS\_CF\_ADD, FS\_CF\_DELETE and FS\_CF\_REORDER projects. These projects include objects that are not currently dynamic or sensitive to record changes. It also looks at the ChartField Related Program page for PS/nVision reports COBOL and SQR programs in the ChartField Related program are currently empty. It also looks at the Mass Change programs page.

The program also looks at the ChartField Definition page for non product-specific tasks such as ChartField validation records, definition pages, and reports and Query for the single ChartField.

The program changes the status of the ChartField actions and Product Log from N to P at completion.

## ChartField Auto Configuration Program

Auto Configuration is an Application Engine program (FS\_CFUPDATE) that automatically performs application metadata updates. These are the direct and related updates that are necessary for records and pages that are required to accommodate the additions or changes that you make on the ChartField Configuration pages.

Within the Application Engine process, the system uses built-in PeopleCode functions to update metadata and perform your specified configurations such as changing field labels, renaming tables, resizing grid field display, changing actual field size, and inserting or deleting fields in records and pages. This ensures that the caching of modified PeopleTools objects is correctly observed.

Full configuration will process ChartField Actions only that have a status of P. This status value indicates to the program that the prerequisite Manual Configuration program has been run. On completion of the process, the status is set to Complete (U for advanced actions and C for standard actions).

Project Configuration processes only completed ChartField actions (for example, status values U and C) and leaves their status unchanged at the end of the run.

For installations that use PeopleSoft Asset Management, this program also schedules the AMCFBULD SQR process. The SQR creates the AMCHARTS.SQC required by Asset Management.

The SQC contains the ChartField definitions, as specified on the template, that are used in Asset Management SQR processing.

The program is structured by ChartField configuration action. It uses a *restartable* Do/Select of each ChartField for the chosen action. In the event of program failure, this enables the program to be restarted in the middle of a Do/Select loop.

A database commit is performed after each step. The PeopleCode functions that are used to update the application metadata commit their changes on completion independent of the commit scheme specified for the Application Engine program.

In the event of a restart following a program failure, the same PeopleCode function can be called again to perform an update that it previously completed. This is not problematic because the PeopleCode functions used by the program have been developed to handle the scenario without throwing any further errors.

However, in the event of a program failure, you might see some of the metadata changes that have been made because of the PeopleCode commit policy. Therefore, the ChartField Configuration Process *must* continue to completion before you permit general access to the Application Designer and other PeopleTools that affect metadata.

The program is structured in the following way:

- **Initialization:** In addition to setting some global variables used throughout the program, it also generates two sets of application designer projects, Bulk Operations Projects and Build Projects that facilitate the creation of database objects (Tables, Views, Indexes). If project configuration has been initiated, the bulk operation projects are generated from any records and pages contained in the projects on the run control page. If full configuration has been initiated, the system automatically determines the records and pages that will be affected by the chosen bulk operation. It does this by cross-referencing the records and pages that incorporate the model and partially configurable ChartFields. Due to some technical considerations, bulk operation APIs might not be able to automatically modify every record or page that is delivered by Oracle. A number of exclusion projects are reserved that identify these objects, such as:

---

**Note:** Exclusion projects might not exist in your system. They are delivered only if the PeopleSoft software has specific pages that must be excluded for an action.

---

- FS\_CF\_ADD - excludes objects that cannot be processed by BulkInsertField().
- FS\_CF\_DELETE - excludes objects that cannot be processed by BulkDeleteField().
- FS\_CF\_REORDER - excludes objects that cannot be processed by BulkModifyPageFieldOrder().

This step also builds the following Application Designer projects that facilitate database administration and must be performed before the system is ready for use. It does this by analyzing the ChartField actions that are going to be processed. The projects are:

- FS\_CF\_ALTER\_TABLE - tables containing ChartFields that must be altered. This contains records (parent records if the field is held in a subrecord) that include the model ChartField and deleted, renamed, and resized ChartFields.
- FS\_CF\_CREATE\_INDEX - tables containing ChartFields that require their indexes to be created. This contains records (parent records if the field is held in a subrecord) that include ChartFields that have been activated or inactivated.
- FS\_CF\_CREATE\_VIEW - views containing ChartFields that must be created. This contains records (parent records if the field is held in a subrecord) that include the model ChartField and deleted and renamed ChartFields. It also includes views affected by the intraunit related ChartField changes. Additional views that do not contain ChartFields but reference other views in their view text also need to be built but cannot easily be identified programmatically. They are defined in a PeopleSoft-delivered project called FS\_CF\_VIEW\_EXCEPTIONS. The records in this project are also added to the view build project.

- **Activate/Inactivate** - This step updates the contents of the ChartField inheritance and the bank ChartField inheritance application tables. If the ChartField is activated, records are added to these tables. Inactivating a ChartField removes corresponding data from these tables. The ChartField metadata properties are updated using the PeopleCode function SetDBFieldNotUsed(). This action applies only to full configuration.
- **Delete** - This step deletes data from the ledger group ChartField, ChartField inheritance, and bank ChartField inheritance application tables. The ChartField is removed from all records and pages contained in the projects built during the initialization step using PeopleCode function BulkDeleteField(). The ChartField metadata properties are made inactive by the PeopleCode function SetDBFieldNotUsed(). The results of the bulk operation are reported in a file called BulkOps.Log
- **Add** - This step adds data to the ledger group ChartField, ChartField inheritance, and bank ChartField inheritance application tables. If the field does not already exist, it creates a new field using the PeopleCode functions SetDBFieldCharDefn(), SetDBFieldAuxFlag, SetDBFieldFormatLength(), and SetDBFieldLabel(). The field is then added to all records and pages contained in the projects built during the initialization step using PeopleCode functions BulkInsertField() and SetRecFieldEditTable(). If the new field is an Intraunit ChartField, it will also put the prompt tables whose names were entered on the ChartField Template into the TableSet Record Group of the related ChartField. The prompt tables are added to the ChartField record listing that PeopleSoft maintains for internal processing purposes and also updates the dynamic edit prompt table. The results of the bulk operation are reported in a file called BulkOps.Log.
- **Relabel** - This step updates the base and, if appropriate, the foreign language labels that were modified on the template. It uses PeopleCode function SetDBFieldLabel(). This action applies only to full configuration.
- **Resize** - This step updates the field length for a ChartField using PeopleCode function SetDBFieldLength(). This action applies only to full configuration.
- **Reorder** - This step changes the order and display size of the ChartFields on pages contained in the projects built during the initialization step. It uses PeopleCode function BulkModifyPageFieldOrder() to modify the order and display length of ChartFields contained in Grids. It also uses PeopleCode function SetDBFieldFormatLength() to change the display length of the ChartField when the field appears in a nongrid edit box. The results of the bulk operation are reported in a file called BulkOps.Log.
- **IntraUnit** - This step moves the SetID records that are associated with the IntraUnit ChartField from the record group of the previous related ChartField into the record group of new related ChartField.
- **Rename** - This step renames the field using the PeopleCode function RenameDBField(). It also modifies the page field name on all pages contained in the projects built during the initialization step using PeopleCode function SetPageFieldPageFieldName(). Rename will change all metadata referencing the old field name as well as application data that uses the field FIELDNAME in its record. Some ChartField names are held in application tables in records that do not use the field FIELDNAME. Additional processing in this step modifies the data in these application tables.
- **Product Log** - This step updates the status on the Product Log files that are viewable through the Product Status page.
- **SQL** - This step generates the common SQL objects used throughout PeopleSoft software that enable the software to dynamically react to your ChartField Configuration. It also schedules the AM SQR referred to previously.

# Summarizing ChartFields Using Trees

---

## Understanding ChartField Summarization with Trees

It is advisable to use trees for organizing and maintaining the ChartFields for completeness as well as for efficiency in reporting. Trees provide an intuitive, visual representation of how detail values in the chart of accounts fit into the big picture or reporting structure. Design tree structures, either detail or summary, from the top down by using PeopleSoft Tree Manager. Next, add ChartField values as leaves to the branches of the tree. In the following example of a balance sheet detail tree, The BALSHEET tree node is a child node of the ALLACCOUNTS tree node, and the (000000) - All Accounts, is a detail value reporting to the BALSHEET tree node. If you click the ASSETS -Asset Accounts, a range of detail asset accounts appears. You can create one or more trees for each ChartField, depending on your reporting needs. Ideally, design your trees with all of your reporting needs in mind so that each tree can be used for the majority of your reports and processes. Create additional trees for a ChartField if the primary tree classifies values differently than is required by a given report.

When new ChartField values are added to control tables, they should be added to the trees; if not, the tree becomes invalid until the missing values are added to the tree. It is good practice to build trees with ranges of detail values wherever possible to avoid having to update the trees with individual new values often. To create financial reports or generate rules for processes such as summary ledgers, allocations, ChartField combination editing, or year end close, specify the appropriate tree and indicate the level, node or branch from which data is to be used.

The following image shows a portion of the ACCTROLLUP tree, which uses the ACCOUNT structure for the ACCOUNT ChartField:

This example illustrates the fields and controls on the Tree Viewer page - example of an Account tree. You can find definitions for the fields and controls later on this page.

[Using Trees to Summarize ChartFields](#)

## Prerequisites

Before you use PeopleSoft Tree Manager to create your trees, do the following:

- Define all ChartFields and ChartField values to be used.
- Define the organizational structure.

- Define ChartField summarization levels.
- Define reporting relationships.

---

## Creating and Maintaining Trees

The following topic lists the steps that are used in creating PeopleSoft trees:

- Use PeopleSoft Tree Manager.
- Define tree structures.
- Create a new tree.
- Branch tree nodes.
- Copy trees.
- Maintain ChartFields in PeopleSoft Tree Manager.
- Maintain trees.

These steps are detailed within the PeopleTools documentation referenced below.

See *PeopleTools: Tree Manager*.

| <a href="#">Tree Flattener Request Page</a> | OI_TFLT_REQ            | Run the PS/FS Tree Flattener process (OI_TFLT), which allows you to schedule a request periodically to pick up changes that occur in the tree definitions and ChartField values. |

## Understanding Tree Flattener

PeopleSoft delivers the Tree Flattener functionality, which is used to flatten tree data (and delete flattened tree data) for specified PeopleSoft trees. Once you have run the PS/FS Tree Flattener process (OI\_TFLT), you can use PS Query to include the flattened tree data and filter the data by tree nodes and tree levels.

You can use the Tree Flattener for the following types of trees:

- Trees with strictly enforced levels (level determines the hierarchy of the nodes).
- Trees with loosely enforced levels (Node determines the tree hierarchy).
- Trees with no levels (Node determines the tree hierarchy).
- Trees with nodes and levels.

---

**Note:** A tree should not have more than 15 nodes and levels. If a tree has 16 or more nodes and levels, then the tree flattener process does not work.

---

- GL batch processes such as Allocations, Multi-Currency, Year End Close, ADB Calculations, and Build ChartField security.
- OTBI

---

**Note:** PeopleSoft does not support tree flattener functionality for Tree Definitions that allow duplicate values or for Tree Structures that support dynamic values based on the node value.

---

## ChartField Effective Dated Rows

The Tree Flattener feature maintains a Detail List Table for every ChartField, such as Account (DL\_TFLT\_ACCOUNT), that saves account, effective date, and effective end date. The effective end date is stored when a new effective date is introduced for an account. This is used for General Ledger processes that use a request date or a transaction date to select ChartField effective dated rows that belong to a tree node and level and ranges.

---

**Note:** Maintaining ChartField effective dated row (EDR) data is critical to the Tree Flattener process.

---

The system stores ChartField Data with effective date ranges in multiple EDR tables such as GL Accounts (GL\_ACCOUNT\_TBL) and Account EDR (GL\_ACCOUNT\_EDR). The [Effective Date Range Map Page](#) is used to store this information.

### Example of Adding, Changing, or Removing ChartField Effective Dated Rows

ChartField online components maintain the effective dated range (EDR) data when an effective date is modified, added, or deleted.

These examples illustrate the department table (DEPT\_EDR) when an effective data is added on January 1, 2014:

| <b>DEPTID</b> | <b>EFFDT</b> | <b>INEFFDT</b> |
|---------------|--------------|----------------|
| 12000         | 01-JAN-1900  | 31-DEC-2013    |
| 12000         | 01-JAN-2014  | 31-DEC-9999    |

This example illustrates the department table (DEPT\_EDR) when an effective date is changed from 01/01/1900 to 01/01/2000:

| <b>DEPTID</b> | <b>EFFDT</b> | <b>INEFFDT</b> |
|---------------|--------------|----------------|
| 12000         | 01-JAN-2000  | 31-DEC-2013    |
| 12000         | 01-JAN-2014  | 31-DEC-9999    |

This example illustrates the department table (DEPT\_EDR) when the current effective date is removed 01/01/2014:

| <b>DEPTID</b> | <b>EFFDT</b> | <b>INEFFDT</b> |
|---------------|--------------|----------------|
| 12000         | 01-JAN-2000  | 31-DEC-9999    |

The Tree Definition and Properties page is used to define trees.

This example illustrates the fields and controls on the Tree Definition and Properties page.

### Tree Definition and Properties

\*Tree Name:

\*Structure ID:

\*Effective Date:  \*Status:

\*Description:

\*Category:  [Define Tree Levels](#)

\*Use of Levels:  [Performance Options](#)

\*SetID:

#### Audits

☒ All Detail Values in this Tree

☐ Allow Duplicate Detail Values

#### Item Counts

|               |    |
|---------------|----|
| Node Count:   | 71 |
| Leaf Count:   | 87 |
| Level Count:  | 7  |
| Branch Count: | 0  |

The Audits section determines how you want to handle detail values.

When the **All Detail Values in this Tree** check box is selected, tree log entries are impacted when you add, change, or remove effective dates using the online component. The Tree Flattener process identifies the need to refresh the data, which is performed during the subsequent run of the process.

When the **All Detail Values in this Tree** check box is not selected, then the Tree Flattener process only refreshes log entries when the modified ChartField value exists in the tree range, or is a value in the tree node or leaf.

For more information about the Tree Definition and Properties page, see *PeopleTools: Tree Manager*, “Saving and Configuring Trees”.

## Effective Date Range Map Page

Use the Effective Date Range Map page (EDR\_CF\_DEFN) to map each ChartField table to an EDR table.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Design ChartFields >Effective Date Range Data >EDR Mapping Definition**

This example illustrates the fields and controls on the Effective Date Range Map page.

| Effective Date Range Map |                   |                                                           |                             |  |  |
|--------------------------|-------------------|-----------------------------------------------------------|-----------------------------|--|--|
| Chartfield EDR Tables    |                   | Personalize   Find   View All       First 1-13 of 13 Last |                             |  |  |
| ChartField               | *Validation Table |                                                           | *Effective Date Range Table |  |  |
| Account                  | GL_ACCOUNT_TBL    |                                                           | GL_ACCOUNT_EDR              |  |  |
| Alternate Account        | ALTACCT_TBL       |                                                           | ALTACCT_EDR                 |  |  |

The names of the tables that contain ChartField effective-date range data is delivered as system data.

**Note:** The Project ChartField is not listed because project data is not effective dated.

Build Chartfield EDR Request Page

Use the Chartfield EDR Request page (EDR\_CF\_REQ) to run the build effective date range process, which creates missing effective dated entries in the EDR table.

Navigation:

Set Up Financials/Supply Chain >Common Definitions >Design ChartFields >Effective Date Range Data >Build CF Date Range Rqst

This example illustrates the fields and controls on the Build Chartfield EDR Request page.

| Build Chartfield EDR Request |             |                                                       |                |
|------------------------------|-------------|-------------------------------------------------------|----------------|
| Run Control ID CF23          |             | Report Manager Process Monitor                        | <div>Run</div> |
| Process Request Parameters   |             | Personalize   Find   View All       First 1 of 1 Last |                |
| *Process Frequency           | *Field Name | SetID                                                 |                |
| Always                       | Account     | SHARE                                                 |                |

**Note:** When the Tree Flattener feature is initially installed, you must run this process. After the initial run, you can run the process when ChartField effective dates are added, changed, or removed.

This process synchronizes the effective dated entries in the EDR table when ChartField effective dates are modified, added, or deleted.

SetID can be blank to run this process for all SetIDs.

## OTBI Tree Fields Page

Use the OTBI Tree Fields page (OI\_TFLT\_FIELDS) to manage the flattened table for each detail tree field. The delivered metadata supports flattened tree data for General Ledger ChartFields including Project ID.

Navigation:

**Set Up Financials/Supply Chain > Operational Reporting > Tree Flattener > Tree Fields**

This example illustrates the fields and controls on the OTBI Tree Fields page.

OTBI Tree Fields

**Detail Tree Fields**
Personalize | Find | View All | 
First 1-10 of 10 Last

| Field Name        | *Flatten Table                               |  |  |
|-------------------|----------------------------------------------|--|--|
| Account           | <input type="text" value="OI_TFLT_ACCOUNT"/> |  |  |
| Alternate Account | <input type="text" value="OI_TFLT_ALTACCT"/> |  |  |
| Operating Unit    | <input type="text" value="OI_TFLT_OPRUNIT"/> |  |  |
| Fund Code         | <input type="text" value="OI_TFLT_FUNDCD"/>  |  |  |
| Department        | <input type="text" value="OI_TFLT_DEPT"/>    |  |  |
| Program Code      | <input type="text" value="OI_TFLT_PROGCD"/>  |  |  |
| Class Field       | <input type="text" value="OI_TFLT_CLASSFD"/> |  |  |
| Budget Reference  | <input type="text" value="OI_TFLT_BUDREF"/>  |  |  |
| Product           | <input type="text" value="OI_TFLT_PRODUCT"/> |  |  |
| Project           | <input type="text" value="OI_TFLT_PROJID"/>  |  |  |

You can add your own detail tree fields and flatten tables. The PS/FS Tree Flattener process supports any detail tree fields with a field value length that is less than or equal to 30 characters.

**Note:** You cannot change the flatten tree table or delete a row if the flattened tree table had data.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                    |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Name</b>       | Detail tree fields upon which the Tree Flattener tables are based. PeopleSoft delivers the ChartFields and respective tables to be used in the PS/FS Tree Flattener process (OI_TFLT). You can add your own fields and respective tables to use in this process.                                      |
| <b>Flatten Table</b>    | PeopleSoft delivers a record for each delivered ChartField to be used in storing the flattened tree data. You can add your own records to be used in the tree flattening process for user-defined ChartFields. It is not recommended that you change the flatten table for the delivered ChartFields. |

## Tree Field Tables Page

Use the Tree Field Tables page (OI\_TFLT\_FIELDS) to map ChartFields to flattened tree tables.

Navigation:

**Set Up Financials/Supply Chain >Operational Reporting >Tree Flattener >Assign CF Tree Flattened Tbl**

This example illustrates the fields and controls on the Tree Field Tables page.

| Tree Field Tables        |                       |                             |                        |

| (check box)             | Select more than one row to perform an action from the Actions drop-down list box on each row at the same time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Status</b>           | <p>Displays one of these status:</p> <ul style="list-style-type: none"> <li>• <i>Current</i>: Flattened data reflects the specified tree and is not updated by the Tree Flattener process (unless the Force Refresh option is selected).</li> </ul> <p>The tree definition must be valid and active. If the tree definition is active but not valid (saved as draft) then the system sets the status to current. This allows users to maintain tree data in draft mode without having to worry about the impact to the batch processes.</p> <ul style="list-style-type: none"> <li>• <i>No Data</i>: Flattened data does not exist but will be updated by the Tree Flattener process.</li> <li>• <i>Stale</i>: Flattened data does not reflect the specified tree and/or ChartField data changes that have been made since the last time the tree was flattened.</li> </ul> <p>It will be updated by the Tree Flattener process. This can be caused by:</p> <ul style="list-style-type: none"> <li>• User modified the tree definition</li> <li>• User added, modified or deleted a ChartField effective dated row.</li> <li>• There is an active and valid effective dated tree definition that is more current than the flatten tree data. The logic uses the system date as the relative date for the current effective dated tree definition.</li> <li>• There is no tree definition (the user has deleted the tree)</li> <li>• Tree definition is inactive</li> </ul> <ul style="list-style-type: none"> <li>• <i>Lock</i>: prevents the refresh or deletion of the flattened data for the tree and prevents GL processes from using that data.</li> </ul> <p>The user can delete a log entry from the page but only after the flatten tree data is deleted.</p> |
| <b>Refresh</b>          | Click the Refresh button to initiate the tree flattener process, which flattens tree data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Delete Data</b>      | Click the Delete Data button to delete the flattened data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                  |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Lock</b>             | Click the Lock button to inactivate the Refresh and Delete Data buttons. When you click the Lock button, the Refresh and Delete Data buttons cannot be selected.    |
| <b>Actions</b>          | Click the drop down box to perform these actions to all selected rows: <ul style="list-style-type: none"> <li><i>Delete Data</i></li> <li><i>Refresh</i></li> </ul> |

## Tree Flattener Request Page

Use the Tree Flattener Request page (OI\_TFLT\_REQ) to run the PS/FS Tree Flattener process (OI\_TFLT), which allows you to schedule a request periodically to pick up changes that occur in the tree definitions and ChartField values.

Navigation:

**Set Up Financials/Supply Chain > Operational Reporting > Tree Flattener >Tree Flattener Request**

This example illustrates the fields and controls on the Tree Flattener Request page.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Process Type</b>     | <p>Select one of these values:</p> <ul style="list-style-type: none"> <li><i>Flatten Tree</i>: Select to flatten the request data.</li> <li><i>Delete Values</i>: Select to clear values from the flatten tree tables.</li> </ul> <p>This option is not necessary before running the Flatten Tree process (Process Type = Flatten Tree) because the process automatically removes old tree data from the flatten tree tables before inserting new flatten tree data.</p> <p>When this option is selected, the system displays only the <b>OTBI Source Instance</b> field.</p> |

| <b>Field or Control</b>     | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Request Date Option</b>  | <p>Select a date option that is used when selecting effective dated tree data.</p> <ul style="list-style-type: none"> <li>• <i>As of Date</i>: Select to enter a user-defined date for the selected tree.</li> <li>• <b>System Date</b>: Select to use the system date to select the closest effective data for the selected tree.</li> </ul> <p>This option is not used if you specify a Tree Effective Date.</p> |
| <b>Field Name</b>           | Select a detail tree field to be used when flattening the corresponding tree data.                                                                                                                                                                                                                                                                                                                                 |
| <b>SetID</b>                | Select the tree SetID if applicable. The SetID is required for flattening trees that are keyed by SetID.                                                                                                                                                                                                                                                                                                           |
| <b>Business Unit</b>        | Enter a business unit. This field is available if Project Costing is installed to select project trees that are keyed by business unit. You can specify trees that are maintained by SetID or Business Unit. The tree flattener process supports trees that are keyed by SetID or Set Control Value.                                                                                                               |
| <b>Tree Name</b>            | Select a tree name, which is required when you select <i>Flatten Tree</i> in the <b>Process Type</b> field.                                                                                                                                                                                                                                                                                                        |
| <b>Tree Effective Date</b>  | (Optional) Enter the tree effective date.                                                                                                                                                                                                                                                                                                                                                                          |
| <b>OTBI Source Instance</b> | Enter a unique number (process instance plus request sequence number), which is used by the flatten tree process to identify the tree data when <i>Delete Values</i> is selected in the <b>Process Type</b> field.                                                                                                                                                                                                 |
| <b>Force Refresh</b>        | Select to refresh the tree data even if the flattened tree data has a status of Current on the Flatten Tree Log Page. This is typically used if the structure of the tree has been changed.                                                                                                                                                                                                                        |

## Adding a New ChartField to the Tree Flattener and EDR Process

When adding a new ChartField during the ChartField Configuration process, the effective date range and flatten tables are automatically updated. Therefore, when adding a new ChartField, you do not need to update the [Tree Field Tables Page](#) or the [Effective Date Range Map Page](#).

# Securing Bank Accounts in FSCM

---

## Understanding Bank Account Encryption

The National Automated Clearing House Association (NACHA) sets data security requirements for originators to protect Direct Deposit Bank Account Numbers used in the initiation of Automated Clearing House (ACH) entries by rendering them unreadable when stored electronically. To comply with these rules you must perform a small amount of setup. It is also important to understand how PeopleSoft encrypts, decrypts, and masks bank account numbers.

Part of the NACHA requirements indicate that you must have a secure transmission when sending or receiving bank account information. PeopleSoft is not responsible for this. You must work with your financial institution to guarantee secure transmissions.

---

**Note:** This feature requires PeopleTools 8.57.15 or above.

---

## Bank Account Encryption in FSCM Products

PeopleSoft FSCM has many products that store and send bank account numbers.

These products include:

- Accounts Payables
- Accounts Receivables
- Billing
- Cash & Treasury
- eBill Payments
- eSettlements
- Expenses
- Financial Gateway
- Global Components
- Inventory
- Supplier Lifecycle Management

## Masking Bank Account Numbers

Bank account numbers are masked to 16 characters regardless of the original length. The first two digits of a masked bank account number is a system-assigned prefix and the last four digits are displayed.

This example illustrates how the system creates the 16-character bank account number:

| <b><i>Prefix</i></b> | <b><i>Mask characters</i></b> | <b><i>Last four characters of bank account number</i></b> |
|----------------------|-------------------------------|-----------------------------------------------------------|
| 00                   | XXXXXXXXXX                    | 2134                                                      |

### Masking Logic for the External Accounts Page

**Note:** This masking logic applies only to the "External Accounts Page" (PeopleSoft Banks Setup and Processing). For all other pages, the masked bank account number always has a prefix of "00".

If the last four digits of two bank account numbers are the same, a two-digit prefix is assigned sequentially. For example, if the last four digits of two bank account numbers are the same, the system assigns "00" as the prefix for the first bank account number, and assigns "01" as the prefix for the second bank account number.

This example illustrates the generic masking for bank account numbers. Two bank account numbers (lines 2 and 3) have the same last four digits. Notice that the Mask Value appears to be the same:

| <b><i>Line</i></b> | <b><i>Bank ID</i></b> | <b><i>Account Number</i></b> | <b><i>Mask Value</i></b> |
|--------------------|-----------------------|------------------------------|--------------------------|
| 1                  | 123456                | 1284366237                   | XXXXXX6237               |
| 2                  | 123456                | 1107395556                   | XXXXXX5556               |
| 3                  | 123456                | 1268375556                   | XXXXXX5556               |
| 4                  | 1212                  | 436712                       | XX6712                   |
| 5                  | 15875                 | 81933                        | X1933                    |

This example illustrates the same two account numbers (lines 2 and 3) have the same last four digits. Notice that the Mask Value appears different due to the prefix added and all masked bank account numbers are 16 characters in length:

| <b><i>Line</i></b> | <b><i>Bank ID</i></b> | <b><i>Account Number</i></b> | <b><i>Mask Value</i></b> |
|--------------------|-----------------------|------------------------------|--------------------------|
| 1                  | 123456                | 1284366237                   | 00XXXXXXXXXX6237         |

| <i>Line</i> | <i>Bank ID</i> | <i>Account Number</i> | <i>Mask Value</i> |
|-------------|----------------|-----------------------|-------------------|
| 2           | 123456         | 1107395556            | 00XXXXXXXXXX5556  |
| 3           | 123456         | 1268375556            | 01XXXXXXXXXX5556  |
| 4           | 1212           | 436712                | 00XXXXXXXXXX6712  |
| 5           | 15875          | 81933                 | 00XXXXXXXXXX1933  |

The two-digit prefix is always displayed at the beginning of a masked bank account number. The system assigns "00" to the first occurrence. When a bank account number is entered into the system and the last four-digits are a duplicate of another bank account number, the system assigns "01" as the prefix. If a third bank account number is entered with the same last four digits, the system assigns "02" as the prefix, and so on.

### International Bank Account Number

When the encryption process runs the IBAN ID is also masked in all tables with the last four digits unmasked. There is no prefix logic for IBAN numbers.

## Page and Field Configurator

If you previously used the Page and Field Configurator "Masking Page" (Enterprise Components) to mask the bank account number field, remove the row from the Configure Fields for Masking section.

If you don't remove the bank account number from this section, when you select the "Unmask" button on an FSCM page, the bank account number changes to the value selected in the **Mask Character** field (all X's or all \*'s).

---

## Setting Up Bank Account Encryption

Prior to using the Bank Account Encryption feature, you must set up Algorithm Keysets and Encryption Profiles in PeopleTools setup. Then, you must run the Bank Account Number Encryption process to encrypt and mask bank account number in existing FSCM tables.

To set up Algorithm Keysets and Encryption Profiles in PeopleTools:

1. Define Algorithm Keysets using the Algorithm Keyset page (PeopleTools, Security, Encryption, Encryption Algorithm Keyset).

For existing Algorithm ID's, create a Keyset ID and Key Value. You must create two Keyset IDs; one for encryption and one for decryption. The Keyset ID and Key Value should be the same for the encryption and decryption Algorithm ID's.

PeopleSoft delivers Keyset ID's with empty Key Values. You must set the Key Value per your business and security requirements.

See PeopleTools: Administration Tools, Security Administration, Securing Data with PeopleSoft Encryption Technology.

2. Verify two delivered Algorithm Chain ID's using the Algorithm Chain page (PeopleTools, Security, Encryption, Encryption Algorithm Chains).

| <b>Algorithm Chain ID</b> | <b>Algorithm Chain Description</b> | <b>Algorithm ID</b>   |
|---------------------------|------------------------------------|-----------------------|
| FSCM_AES_CBC_256_DEC      | FSCM Account Number Decryption     | aes_ks256_cbc_decrypt |
| FSCM_AES_CBC_256_ENC      | FSCM Account Num Encrypt           | aes_ks256_cbc_encrypt |

3. Select a **Parameter Value** from the look up option on the Encryption Profile page (PeopleTools, Security, Encryption, Define Encryption Profiles).

- **Encryption Profile ID** is *FSCM\_ACCT\_NUM\_DECRYPT* and **Algorithm Chain ID** is *FSCM\_AES\_CBC\_256\_DEC*.
- **Encryption Profile ID** is *FSCM\_ACCT\_NUM\_ENCRYPT* and **Algorithm Chain ID** is *FSCM\_AES\_CBC\_256\_ENC*.

4. (Optional) Test your encryption profiles using the Encryption Demo page (PeopleTools, Security, Encryption, Test Encryption Profiles).

This test converts a bank account number to an encrypted value and converts an encrypted value to a bank account number.

To encrypt and mask bank account number in existing FSCM tables, use the [Bank Account Number Encryption Page](#).

## Page Used to Set up Bank Account Encryption

After setting up Algorithm Keysets and Encryption Profile ID's in PeopleTools, run the Bank Account Number Encryption process to encrypt and mask bank account numbers in existing FSCM tables.

| <b>Page Name</b>                                    | <b>Definition Name</b> | <b>Usage</b>                                                                               |
|-----------------------------------------------------|------------------------|--------------------------------------------------------------------------------------------|
| <a href="#">Bank Account Number Encryption Page</a> | CRYPTPRFL_CONF         | Encrypt and mask bank account numbers in existing FSCM tables. This is a one-time process. |

## Bank Account Number Encryption Page

Use the Bank Account Number Encryption page (CRYPTPRFL\_CONF) to encrypt and mask bank account numbers in existing FSCM tables. This is a one-time process.

Navigation:

## Setup Financials/Supply Chain >Common Definitions >Encryption Configuration >Bank Account Number Encryption

This example illustrates the fields and controls on the Bank Account Number Encryption page after the FSCM\_CRYPTAE process has run.

The screenshot displays the 'Bank Account Number Encryption' page. The top navigation bar includes 'Employee Self Service' and the page title. The main content area is divided into two sections: 'Encryption Profile Details' and 'Process Encryption'. In the 'Encryption Profile Details' section, the 'Encryption Profile ID' is 'FSCM\_ACCT\_NUM\_ENCRYPT' and the 'Decryption Profile ID' is 'FSCM\_ACCT\_NUM\_DECRYPT'. The 'Profile Status' is 'Valid', and a 'Validate Profiles' button is available. The 'Process Encryption' section shows a 'Run Control ID' of '1', a 'Report Manager', and a 'Process Monitor'. A 'Run' button is present. A note indicates that this is a one-time process and provides instructions on running the encryption process and avoiding other transactions. At the bottom, there are 'Save' and 'Notify' buttons.

**Note:** When running this process, make sure that other processes are not running as this process updates many FSCM tables and data could be compromised.

When running this process for the first (and only) time:

1. Select the delivered encryption and decryption profile Id's.
2. Select the **Validate Profiles** button.

This step confirms and validates the algorithm keysets for both profiles. If the **Profile Status** changes to *Valid*, the Run button appears. If the **Profile Status** does not change to Valid, check the algorithm keysets for both Profile ID's.

3. Select the Run button to run the FSCM\_CRYPTAE process, which encrypts and masks bank account numbers and IBAN ID's in existing FSCM tables.

# Setting Up and Using Business Request and Approval

---

## Understanding the Business Request and Approval Process

Business Request and Approval is a configurable workflow process for requesting the setup of SetID-driven fields and values for such fields as ChartFields. You can request additions or modifications to field values and submit them for approval. Upon final approval, the process saves the new field value and commits changes to the corresponding base tables. It also provides an audit trail of the setup and approval of these values.

Perform the following high-level steps to set up and use the Business Request and Approval process:

1. Set up the Business Request functionality to enable the field or fields to be used in the request and approval process.
2. Set up the Business Request Template(s) to define field information for the enabled fields, such as business justification and associated trees, for example.
3. Configure the approval workflow according to your organization's requirements for approval of requests for new or modified field values.
4. Define and use ChartField Request and Approval.
5. Approve and manage ChartField requests.
6. Inquire on Business Requests.

---

## Setting Up and Using Business Request and Approval

### Pages Used in Setting Up the Business Request

| <i>Page Name</i>                   | <i>Definition Name</i> | <i>Usage</i>                                                                           |
|------------------------------------|------------------------|----------------------------------------------------------------------------------------|
| <u>Business Request Setup Page</u> | FLD_REQ_SETUP          | Enable each field that you want to use in the request approval process.                |
| <u>Core Table Fields Page</u>      | FLD_REQ_S_FLDS         | Includes the core table information for each field on the Business Request Setup page. |

| <b>Page Name</b>                      | <b>Definition Name</b> | <b>Usage</b>                                                                                           |

## Understanding the Business Request and Approval Process

Business Request and Approval is a configurable workflow process for requesting the setup of SetID-driven fields and values for such fields as ChartFields. You can request additions or modifications to field values and submit them for approval. Upon final approval, the process saves the new field value and commits changes to the corresponding base tables. It also provides an audit trail of the setup and approval of these values.

Perform the following high-level steps to set up and use the Business Request and Approval functionality:

1. Set up the Business Request functionality to enable the field or fields to be used in the request-approval process.
2. Set up the Business Request Template(s) to define field information for the enabled fields, such as business justification and trees, for example.
3. Configure the Approval workflow.
4. Define and use the ChartField Request and Approval.
5. Inquire on Business Request.

## Business Request Setup Page

Use the Business Request page (FLD\_REQ\_SETUP) to enable each field that you want to use in the request-approval process. This is the starting point for the Business Request and Approval functionality.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Business Request Configuration > Setup Business Request.**

This example illustrates the fields and controls on the Business Request Setup - Request Fields tab. You can find definitions for the fields and controls later on this page.

This page contains the core table field information of each field on the Business Request Setup page. For the delivered ChartFields, the core table fields that are currently available on the corresponding entry page cannot be deleted from the page.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Label</b>      | The default field labels appear as delivered. You can change the field label for any field (except those with a Hyperlink display type). For English, it is good practice to keep the delivered field labels unchanged, as they match those currently implemented on the delivered ChartField entry pages. For language implementations other than English, however, you must enter that language's field labels here so that they may appear on the ChartField Request page.                                                                                                                                                                                                                                               |
| <b>Edit Table</b>       | Enter an edit record for the Prompt display type field names to be used for validation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Display Option</b>   | <p>If the core table field is required on the base table and has no default value defined on the record definition, its Display Option is set to <i>Required</i> and the field is disabled on this page. All other fields are delivered as <i>Optional</i>.</p> <p>There are some fields for the Account and Alternate Account tables that are set to <i>Optional</i> but are also disabled on this page. Due to the complicated relationships of those fields, the validations have to be handled by the ChartField Request page.</p> <p>If a core table field's Display Option is not disabled on the Business Request Setup page, it can be overridden on the Business Request Template page, which is SetID-driven.</p> |

## Business Request Template Page

Use the Business Request Template page (FLD\_REQ\_TMPLT) to create or update a template for each field for which you want to create business requests for approval of new values or updates to existing values. You can copy a template for a given field to another SetID as well.

The Business Request Template page is SetID-driven and contains not only the core information that is copied from the Business Request Setup – Core Table Fields page when creating a new template, but also includes the business justification, trees and questions that you need to set up the process.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Business Request Configuration > Add Business Request Template**

This example illustrates the fields and controls on the Business Request Template Page. You can find definitions for the fields and controls later on this page.

| 1 If adding a new Operating Unit, does it need to be added to any existing SpeedTypes? | <input checked="" type="checkbox"/> |                                                   |

| Field or Control     | Description                                                                                                                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Edit Table</b>    | Enter an edit record for the Field Name to be used for validation. This field is populated by default with the base table for the field.                                                                                                |
| <b>Copy to SetID</b> | This field is only visible after you have saved a new Business Request Template. Select the SetID for which you want to copy the existing template for a given field, thus creating a new template under the new SetID that you supply. |
| <b>Copy</b>          | Once you select a SetID for the Copy to SetID field, and tab out of the field, the Copy button is enabled. Click the Copy button to create the new template for the field under the new SetID.                                          |

**Note:** The Tree information is not copied to the new template, as Tree is SetID-driven and the trees appropriate for the current SetID may not be valid for the new SetID.

## Core Information

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Display Option</b>   | <p>Display Option values are:</p> <ul style="list-style-type: none"> <li><i>Do Not Display</i> - Field does not appear on the ChartField Request page.</li> <li><i>Optional</i> - Field appears on the ChartField Request page, but its value is not required.</li> <li><i>Required</i> - Field appears on the ChartField Request page and its value is required.</li> </ul> |

## Business Justification

The following are the delivered fields that you can choose for the Business Justification grid. You are required to enter their field labels here, which will appear on the ChartField Request page. You can add more fields using Application Designer; however, you must follow the naming convention, field type and length below:

| <b>Display Type</b> | <b>Field Name Prefix</b> | <b>Delivered Number</b> | <b>Field Type and Length</b> |
|---------------------|--------------------------|-------------------------|------------------------------|
| Character           | FLD_REQ_U_CHAR           | 1, 2, 3, 4              | Character 254                |
| Check Box           | FLD_REQ_U_CHKBOX         | 1, 2, 3, 4              | Character 1                  |
| Date                | FLD_REQ_U_DATE           | 1, 2, 3, 4              | Date 10                      |
| Drop Down List      | FLD_REQ_U_DDLST          | 1, 2, 3, 4              | Character 4                  |
| Number              | FLD_REQ_U_NBR            | 1, 2, 3, 4              | Signed Number 23.3           |

**Note:** To be able to select these Drop Down List fields, you need to define the corresponding translate values first in Application Designer. Otherwise, you are not able to select those fields.

For more information, see *PeopleTools: PeopleSoft Application Designer Developer's Guide*.

**Note:** Any changes that you make to the Business Request Setup page are not carried over to templates that already exist; you must manually apply those changes to the templates, if required.

**Note:** Business Request templates can be changed without any restrictions. However, template changes are only reflected on newly created ChartField requests. Existing ChartField requests are not impacted by Business Request template changes.

## Configuring the Approval Framework for Business Requests

### Pages Used to Configure Approval Framework for Business Requests

| <i>Page Name</i>                               | <i>Definition Name</i> | <i>Usage</i>                                                                                                                                                                                                                    |

## Understanding Configuring the Approval Framework for Business Requests

To configure Approval Framework for business requests:

- Complete the Field Approval Transaction Registry and Configuration.
- Create and modify Notification Template Definitions.
- Define approval roles and User Lists for Approval Framework.
- Set up approval Process Definitions (rules).

## Completing the Field Approval Transaction Registry and Configuration

Use the Approval Framework Register (EOAW\_TXN) and Configure Transaction (EOAW\_TXN\_CONFIG) components to initiate the request approval process for fields enabled on the Business Request Setup page.

Use the Register Transactions page (EOAW\_TXN) to register the Business Request approval transaction.

Navigation:

**Enterprise Components >Approvals >Approvals >Transaction Registry >Register Transactions.**  
Select the FieldRequestApproval value.

This example illustrates the fields and controls on the Register Transactions page - FieldRequestApproval (1 of 2).

PeopleSoft delivers the FieldRequestApproval process ID for registry of Business Request transactions for approval. The values presented in this example are delivered specifically for using the Approval Framework within the Business Request functionality.

For more information, see the PeopleSoft Enterprise Components documentation: Approval Framework., “Defining the Approval Transaction Registry”, “Setting Up the Transaction Registry”.

Use the Configure Transactions page (EOAW\_TXN\_NOTIFY) to route a request for approval, process final approval or denial.

Navigation:

**Enterprise Components >Approvals >Approvals >Transaction Configuration >Configure Transactions**

This example illustrates the fields and controls on the Configure Transactions page (FieldRequestApproval).

PeopleSoft delivers the following events configured for the FieldRequestApproval process ID to be used by the Business Request Approval transactions:

*Route for Approval, On Final Approval, On Final Denial, Push Back, Hold Step, On Reassign, and On Terminate.*

For more information, see *Approval Framework, Defining the Approval Transaction Registry, Configuring Approval Transactions, “Creating and Modifying Notification Template Definitions”*.

Use the notification templates delivered through the Generic Template Definition component (WL\_TEMPLATE\_GEN) to notify field value creation or modification in the request and approval workflow.

Navigation:

**PeopleTools >Workflow >Notifications >Generic Templates >Generic Template Definition**

This example illustrates the fields and controls on the Generic Template Definition Page.

Generic Template Definition

Field Name: %4  
Field Action: %5  
Field Value: %6  
Effective Date: %7

Below is the list of available variables for this template.

You can use template variables within your subject or message text.

The following variables can also be used:

%Date, %DateTime, %Time, %ServerTimeZone, %EmailAddress, %NotificationPriority, %NotificationToList, %NotificationCCList

**Template Variables**

| *Value | *Description   |   |   |
|--------|----------------|---|---|
| %1     | URL            | + | - |
| %2     | Request ID     | + | - |
| %3     | SetID          | + | - |
| %4     | Field Name     | + | - |
| %5     | Field Action   | + | - |
| %6     | Field Value    | + | - |
| %7     | Effective Date | + | - |
| %8     | Description    | + | - |
| %9     | Requester      | + | - |

PeopleSoft delivers Generic Template Definitions for the following email notifications:

- Field Request Approval
- Field Request Approved
- Field Request Denied
- Field Request Pushed Back
- Field Request Updated

- Field Request On Hold

These templates include the structure that is used for the email notifications to be sent for each action. You can use these templates as delivered or tailor them to suit your specific needs.

This example illustrates the fields and controls on the The following presents a sample email for the Field Request Approval. You can find definitions for the fields and controls later on this page.

## Defining Approval Roles & User Lists for Approval Framework

PeopleSoft delivers a sample Field Request Approver role name for specific use in the Business Request Approval process. To view the role, access the Roles component.

Navigation:

**PeopleTools >Security >Permissions and Roles >Roles**

The following presents the Members page of this component to display the users that are assigned to this sample role name. Be sure to create your own approval role name or use this one but change the members to the valid field request approvers for your organization:

This example illustrates the fields and controls on the Roles Component - Members Tab.

General | Permission Lists | **Members** | Dynamic Members | Workflow | Role Grant | Links | Role Queries | Audit

Role Name: Field Request Approver  
Description: Field Request Approver

User ID:  Search

| Members |                    |                                 | Personalize | Find | View All |  |  | First | 1-9 of 9 | Last |
|---------|--------------------|---------------------------------|-------------|------|----------|--|--|-------|----------|------|

| Route Control Type | Field Name |  |  |
|--------------------|------------|--|--|
| 1                  |            |  |  |

PeopleSoft delivers the sample FieldRequestApproverList User List Definition value for use in the Business Request Approval process, which points to the sample delivered role name, Field Request Approver.

For more information, see PeopleSoft Enterprise Components documentation: Approval Framework, “Defining Notification Templates and Users for Approval Framework”, “Defining Users for Approval Framework”, “Setting Up Approval Process Definitions (Rules)”.

## Setting Up Approval Process Definitions

To set up approval process definitions, use the Approval Process Setup component (EOAW\_PRCs).

This section presents examples of the delivered setup that shows how to:

- Define approval processes.
- Define approval criteria.
- Define paths for approval processes.
- Define steps for approval processes.

## Setup Process Definitions Page

Use the Setup Process Definitions page (EOAW\_PRCS\_MAIN) to define the stages, paths and steps of the Business Request approval definition process.

PeopleSoft delivers the FieldRequestApprovalRule definition ID to define the approval process rules for the Business Request Approval process. You can modify this definition ID or create your own.

Navigation:

**Enterprise Components >Approvals >Approvals >Approval Process Setup >Setup Process Definitions.**

This example illustrates the fields and controls on the Setup Process Definitions Page.

**Setup Process Definitions**

## Understanding ChartField Request and Approval

When you define a Business Request for approval, you can:

- Include information about the complete title description for the Business Request.
- Define ChartField Attributes for the Business Request, if applicable.
- Add or modify supporting documents as attachments for the Business Request.
- Select information for copying.
- Select Account/Alt Account information for mapping, if applicable.
- Display associated errors that happened when inserting/updating the base table(s) via the corresponding Component Interface action.

- Access the Approval Flow page from the ChartField Request page, to view or modify the approval flow.
- Use the PeopleSoft Fluid Pending Approvals page to take action on the ChartField Request.

## Setting Up Mobile Approvals for ChartField Requests

Perform these general steps to set up Mobile Approvals for ChartField Requests:

1. Verify the setup field on the "Register Transactions Page" (Approval Framework), for the FieldRequestApproval process ID.

See [Completing the Field Approval Transaction Registry and Configuration](#).

2. On the "Configure Transactions Page" (Approval Framework), for the FieldRequestApproval process ID, the User Utilities Package should be *FLDREQ\_FLUID\_APPR* and the User Utilities Path should be *FieldRequestUserUtilities*.

See [Completing the Field Approval Transaction Registry and Configuration](#)

3. On the "Mobile Approval Options - Transactions Page" (Enterprise Components), verify or add this information:
  - a. On the Transaction tab, add transaction ID *FLDREQ* for process ID *FieldRequestApproval*, and select Allow Mass Approvals.
  - b. On the Actions tab, select approval actions for transaction ID *FLDREQ*.
  - c. On the Images tab, for transaction ID *FLDREQ*, enter *ImagePS\_STRUCHG\_FL* in the Small, Medium, and Large Image fields.
4. Verify the setting on the "CAVF Configuration Setup Page" (Enterprise Components), for the *FLD\_REQ\_ATTACHMENT* Configuration ID, to allow attachments.

## ChartField Request Page

Use the ChartField Request page (FLD\_REQUEST) to create a new ChartField request, update an existing ChartField request, and define a business request for approval.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Design ChartFields >Define Values >Submit ChartField Request.**

This example illustrates the fields and controls on the ChartField Request page. You can find definitions for the fields and controls later on this page.

| Field Action     | <div>Field values are:</div> <ul style="list-style-type: none"><li>Add - Displays if your request is to add a new ChartField value.</li><li>Update - Displays if your request is to modify an existing ChartField value.</li></ul> <div>Based on the Field Action, the Field Value that you enter is validated against the prompt. For Add requests, if the value that you enter exists in the core base table, you are precluded from adding the request and receive a message stating so. For Update requests, the value must exist in the prompt edit table or you receive a message to that effect. The request itself is also validated against the request table to make sure no incomplete request exists for the same value.</div> |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Request ID</b>       | When creating a new ChartField Request, the Request ID is system-generated to prevent duplication of requests. Specify the SetID and the Field Name. The system will provide the corresponding information from the predefined template and dynamically construct the Request page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Field Name</b>       | For the prompting on Field Name, only those defined on the Template of the entered SetID are shown in the list: You must select a Field Name and a Field Value for your ChartField request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Field Value</b>      | <p>Enter a value that corresponds with the field that you entered in the Field Name.</p> <p>When searching for an existing value, you can enter criteria for all of the field values that are required for adding the request, as well as the requester, the user that entered the request, and the status of the request (Approved, Canceled, Component Interface Error, Denied, Need Action, Newly Created, and Pending Approval).</p> <p>When adding a new value, this field can be left blank. However, it is important that the value be entered by one of the approvers before the request receives final approval; otherwise, the system assigns <i>Blank Value</i> as the status, and no value is inserted into the ChartField base table. In this case, the approver must select <i>Update Blank Value</i> as the action in order to assign a new value.</p> |
| <b>Request Status</b>   | <p>Displays current ChartField Request status. Values are:</p> <ul style="list-style-type: none"> <li>• Approved</li> <li>• <b>Blank Value</b></li> <li>• Cancelled</li> <li>• Component Interface Error</li> <li>• Denied</li> <li>• Need Attention</li> <li>• Newly Created</li> <li>• Pending Approval</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Request Action</b>   | <p>After you have entered the required fields for a new ChartField Request and you save the page successfully, the Request Action field appears. Select one of the following actions:</p> <ul style="list-style-type: none"> <li>• <i>Approve</i>: Select to approve the request.</li> <li>• <i>Cancel</i>: Select to disable the request. Request Status field changes to Cancelled.</li> <li>• <i>Deny</i>: Select to deny the request.</li> <li>• <i>Execute Component Interface</i>: Select to correct component interface errors.</li> <li>• <i>Hold</i>: Select to place the approval process on-hold so that you can seek more information.</li> </ul> <hr/> <p><b>Note:</b> After one step has been put on-hold, it still can be approved or denied by the approver who put it on-hold. Other approvers on the same step will be either bypassed if the step only requires one approval, or still needed to approve or deny this step if it requires multiple approvals. This is determined by the Approval Framework and the corresponding rule setup. If the approver chooses a Hold or Pushback action (if the step is eligible for pushback), for the step they already put on-hold, nothing will happen (the step remains on Hold).</p> <hr/> <ul style="list-style-type: none"> <li>• <i>Mark 'Needs Attention'</i>: Select to change the Request Status field to <i>Needs Attention</i>.</li> <li>• <i>Mark 'New'</i>: Select to change the Request Status field to <i>Newly Created</i>.</li> <li>• <i>Pushback</i>: Select to push back the request for modification.</li> <li>• <i>Submit for Approval</i>: Select to route the request to the designated approvers. This action changes the Request Status field to <i>Pending Approval</i>. The person who re-submits the request for approval becomes the requester.</li> </ul> <p>The request remains open to allow changes. When a change is made and the request is saved, the system updates the Updated By and Updated Date/Time fields to track the change. Approval Workflow reminds approvers that the Field Value field should not be blank.</p> <ul style="list-style-type: none"> <li>• <i>Update Blank Value</i>: Select to insert the value into the ChartField base table for a Blank Value status request, after you have completed the value.</li> </ul> <p>This option is only available to approvers who have approved the request.</p> |
| <b>GO</b>               | Click this button after making a selection in the Request Action field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Core Information

Fields under the Core Information group box are copied over from the corresponding business request template. The Long Description, Attributes and Account / Alt-Account Mapping links are also included under this group box when they are enabled on the template. All the Required fields are prefixed with a “\*” on their labels. Upon save, validations are enforced if no values on those required fields.

## Business Justification

Fields in the Business Justification group box are derived from the corresponding Business Request Template. The Attachments link is also included in this group box. See [Business Request Template Page](#).

## Trees

| <b><i>Field or Control</i></b>      | <b><i>Description</i></b>                                                                                                                                                                                                                              |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Insert Value Under Node</b>      | <p>Select the node for which you want to add below. You can specify a new node, however, this option is only available for summer trees.</p> <p>To insert a value under a new node for a spring or winter tree, you should go to the tree manager.</p> |
| <b>Move/Add Node to Parent Node</b> | Select a parent node for which you want to move to. This is a required field when adding a new node.                                                                                                                                                   |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Node/Leaf</b>        | <p>Select Leaf or Node. Leaf appears by default.</p> <ul style="list-style-type: none"> <li>For spring trees, you can choose either a Leaf or Node.</li> <li>For summer trees, sets to Leaf and is unavailable.</li> <li>For winter trees, sets to Node and is unavailable.</li> </ul> <hr/> <p><b>Note:</b> When inserting the requested value as a spring tree node, the tree will be saved as Draft Tree as the new tree node does not have a specified range; for example, detail values (leaves). In all other scenarios, the tree will be saved as Valid Tree if no other tree audit errors exist.</p> <hr/> |
| <b>Auto Update</b>      | Select to indicate that upon final approval of the request, the tree is updated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Update Status</b>    | <p>Displays the update status as: None, Success, Saved as Draft &amp; Failed.</p> <hr/> <p><b>Note:</b> For trees with <i>Saved as Draft</i> or <i>Failed</i> auto update status, you must manually fix the tree audit issue(s) or perform the update using Tree Manager, as the requested value is already inserted (updated) in the base table and the request is closed.</p> <hr/>                                                                                                                                                                                                                              |

## Long Description Page

Use the Long Description page (FLD\_REQ\_LONG\_DESCR) to enter more details regarding the ChartField Request.

Navigation:

Click the **Long Description** link, if available, on the ChartField Request page. See [Business Request Template Page](#) for Display Options of a given field. This determines whether a link or field displays on the ChartField Request page.

## ChartField Attribute Values Page

Use the ChartField Attribute Values page (FLD\_REQ\_ATTRIB) to attach ChartField Attributes and Attribute values for the Business Request, if applicable.

Click the **Attributes** link, if applicable, on the ChartField Request page to view details or add attributes and values.

This example illustrates the fields and controls on the ChartField Attribute Values page.

| Chartfield Attributes                                                   |                  |                          |                |                                                                                                                              |                            |                                    |

| <input type="button" value="OK"/> <input type="button" value="Cancel"/> |                  |                          |                |                                                                                                                              |                            |                                    |

For more information, see “Creating Generic ChartField Attributes”, [ChartField Request Page](#)

## Acct / Alt-Acct Mapping

Click the **Account / Alt-Account Mapping** link when available (can only be enabled for Account & Alt-Account) on the ChartField Request page to view details of the Alternate Accounts that are mapped to the requested account and vice versa or modify mappings.

**Note:** Click the Account / Alt-Account Mapping link when available (can only be enabled for Account & Alt-Account) on the ChartField Request page to view details of the Alternate Accounts that are mapped to the requested account and vice versa or modify mappings.

For more information see “Using Alternate Account”, [Adding and Mapping Accounts and Alternate Accounts](#)

## Request Copy Page

Use the Request Copy (FLD\_REQ\_COPY\_SEC) page to copy information from an existing request to a new one. The SetID and Field Name combination, must be the same for both requests.

Navigation:

Click the **Copy** button on the saved ChartField Request page to open the Request Copy page.

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                           |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Value</b>      | Enter a value that is appropriate for the Field Action Field.<br>This field is not required when the field action is <i>Add</i> .<br>However, the field is required when the field action is <i>Update</i> . |

**Note:** Attachments, Account, and Alt-Account Mappings are not copied to the new request because they are not appropriate for the new request. However, when copying to a new Update request, the existing Account / Alt-Account Mapping is derived from the base table to the new Update request.

## Request Attachments Page

Use the Request Attachments page (FLD\_REQ\_ATT\_SEC) to add, modify, or delete supporting documents as attachments for the ChartField Request.

This example illustrates the fields and controls on the Approval Flow page. You can find definitions for the fields and controls later on this page.

Click the **Multiple Approvers** link to view the names of the approvers. If there is only one approver or reviewer in a step, the user’s name appears as the link (Smith, Jane as pictured in the example): The status appears for each step of the approval process path. Once the approvals are received from the first step, the statuses change accordingly for the next step in the path.

| Field or Control           | Description                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------|
| Start New Path             | Click to start a new approval path and select to insert reviewers or approvers.                            |
| Save Approval Flow Changes | This button appears only after changes are made to the Approval Flow page, such as adding adhoc approvers. |

Click the **plus** buttons within an existing path to add adhoc approvers to the approval path. A minus sign appears in the upper right corner of the adhoc approver to easily remove, if needed.

You can enter comments in the space that is provided. Comments are required when the approver selects to *Deny*, *Hold*, *Pushback* or *Update* a request.

## Pending Approvals - Field Request Page (Fluid)

Use the Pending Approvals - Field Request (EOAWMA\_MAIN\_FL) page in Fluid to take approval actions on requests to add or modify ChartFields.

Navigation:

Select the Approval tile and then select Field Request.

This example illustrates the fields and controls on the Pending Approvals - Field Request Page (Fluid).

This page is designed in Page Composer in Large Form Factor (LFF) and Small Form Factor (SFF). You can change the first column that displays the ChartField to add or update.

## Field Request (detail) Page (Fluid)

Use the Field Request (EOAWMA\_TXNDTL\_FL) page in Fluid to view transaction details and take approval actions on requests to add or modify ChartFields.

Navigation:

From the Approval tile, select Field Request, and then select an approval transaction.

From a user's Worklist, click the Field Request Approval link.

This example illustrates the fields and controls on the Field Request (detail) Page (Fluid).

## Managing the Business Request and Approval Process

Use the Manage Business Request Approval component (FLD\_REQ\_APPROVAL) to handle the mass business request approval functionality and the Request Approval Attachments page (FLD\_REQ\_ATT\_APPR) to view and add attachments.

### Pages Used to Manage the Business Request and Approval Process

| Page Name                                             | Definition Name  | Usage                                                                                                                                                                                                      |
|-------------------------------------------------------|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Manage Business Request Approval Page</a> | FLD_REQ_APPROVAL | Process Business Request Approval.                                                                                                                                                                         |
| <a href="#">Request Approval Attachments Page</a>     | FLD_REQ_ATT_APPR | Displays attachments for Business Request approval, if the <i>Show to Approver</i> option was selected when the attachment was added by the requester from the Request Attachments page (FLD_REQ_ATT_SEC). |

| <b>Page Name</b>                   | <b>Definition Name</b> | <b>Usage</b>                                                                                                                                        |
|------------------------------------|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Approval Flow Page</a> | FLD_REQ_AF_MONITOR     | Access the Approval Flow page from the Manage Business Request Approval page. View or modify the approval flow (add ad hoc approvers, for example). |

## Manage Business Request Approval Page

Use the Manage Business Request Approval Page (FLD\_REQ\_APPROVAL) to process Business Request Approvals.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Business Request Configuration >Config Business Request Apprvl.**

This example illustrates the fields and controls on the Manage Business Request Approval page. You can find definitions for the fields and controls later on this page.

| <b>Field or Control</b>    | <b>Description</b>                                                                                                                                                                                                 |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Exclude Blank Value</b> | Select this check box to exclude records that have blank values from your search. Records that have blank values indicate that the initial definition is not complete. See <a href="#">ChartField Request Page</a> |

Select your criteria to filter the business request results and click the **Search** button to return resulting business requests. Click the **Request ID** link for a business request to drill down and review details of the request before taking action.

**Note:** The requests returned on the Manage Business Request Approval page are those where the current user is an approver but the Request Status is not Approved, Cancelled, or Component Error.

| <b>Field or Control</b>                                                                                     | <b>Description</b>                                                                                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  (View Approval Flow icon) | Click the <b>View Approval Flow</b> icon to access the <a href="#">Approval Flow Page</a> to review or modify the approval path(s), details, and statuses.                                                                                              |
| <b>Attachments (n)</b>                                                                                      | Click this link to access the <a href="#">Request Approval Attachments Page</a> where you can review attachments for a Business Request approval. This link parenthetically displays the number of attachments that are associated with the request ID. |

## Request Approval Attachments Page

Use the Request Approval Attachments page (FLD\_REQ\_ATT\_APPR) to review attachments for Business Request approval, if the *Show to Approver* option was selected when the attachment was added by the requester from the Request Attachments page (FLD\_REQ\_ATT\_SEC).

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Business Request Configuration >Config Business Request Apprvl** Click the **Attachments** link.

This example illustrates the fields and controls on the Request Approval Attachments page.

Request Approval Attachments

Request ID SAMPLE-Request-001

Details

| File Name                                   | Description       | User   | Name           | Date/Time Stamp       |
|---------------------------------------------|-------------------|--------|----------------|-----------------------|
| <a href="#">Attachment_to_Approvers.doc</a> | Show to approvers | SAMPLE | Theresa Monroe | 06/21/2012 10:12:20AM |

Adding large attachments can take some time to upload, therefore, it is advisable to save the transaction before adding large attachments.

Add Attachment

## Approval Flow Page

Use the Approval Flow page (FLD\_REQ\_AF\_MONITOR) to view or modify the approval flow. As an example, you can add ad hoc approvers.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Business Request Configuration >Config Business Request Apprvl**. Click the **View Approval Flow** icon.

You can also access the Approval Flow page from the [ChartField Request Page](#).

For field information details, see [Approval Flow Page](#).

## Inquiring on Business Requests

This topic discusses how to review existing business requests including their current status, attachments, and approval flow; and display attachments for the Business Request Inquiry component.

### Pages Used to Inquire on Business Requests

| <i>Page Name</i>                              | <i>Definition Name</i> | <i>Usage</i>                                                                                                        |
|-----------------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------|
| <a href="#">Business Request Inquiry Page</a> | FLD_REQ_INQUIRY        | Review existing business requests, their current status, as well as view associated attachments, and approval flow. |
| <a href="#">Request Attachments Page</a>      | FLD_REQ_ATT_INQ        | Displays attachments for the Business Request Inquiry component.                                                    |
| <a href="#">Approval Flow Page</a>            | FLD_REQ_AF_MONITOR     | Access the Approval Flow page from the Business Request Inquiry page. View (only) the approval flow                 |

### Business Request Inquiry Page

Use the Business Request Inquiry page (FLD\_REQ\_INQUIRY) to review details and statuses of existing business requests.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Business Request Configuration >Inquiry Business Request**

Enter search criteria to refine your search for existing business requests. SetID is the only required field.

This example illustrates the fields and controls on the Business Request Inquiry page. You can find definitions for the fields and controls later on this page.

## Request Attachments Page

Use the Request Attachments page (FLD\_REQ\_ATT\_INQ) to display attachments for the Business Request Inquiry component.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Business Request Configuration >Inquiry Business Request** Click the **View Attachments** icon.

## Approval Flow Page

When accessed from the Business Request Inquiry page, use the Approval Flow page (FLD\_REQ\_AF\_MONITOR) to review details of the approval path and status.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Business Request Configuration >Inquiry Business Request** Click the **View Approval Flow** icon.

When you access the Approval Flow page from the Business Request Inquiry, you are only able to view the details. You are not able to make any changes. To make changes within the Approval Flow page, you must access it from either the ChartField Request Page or from the Manage Business Request Approval page.

# Setting up and Using Fluid Financial Structure Requests

---

## Understanding Fluid Financial Structure Requests

Oracle PeopleSoft delivers the Fluid Financial Structure Requests feature to automate the creation and maintenance of values that represent the financial structure of a business. This brings the earlier process closer to the financial system itself and allows for the efficient use of resources, reduce erroneous and inaccurate requests, providing for configurable and automated approvals along with improved controls by connecting the request to the actual change itself. You can therefore manage the lifecycle of ChartFields and Trees in a way leading to an optimized process, simplified user experience and accelerated mobility.

Click to watch a short video about [Fluid Financial Structure Requests](#).

Reviewer Roles and Permission Lists applicable are:

- Auditor — An Auditor (FSR\_AUDITOR) role has read only access for requests and is granted EPGL4100 permissions.

---

**Note:** The Auditor role does not have access to the Discussion Service.

---

- System Reviewer — A System Reviewer (FSR\_SYSTEM\_REVIEWER) role can access the ChartField Definitions page and update a request. This role is also the administrator of the Discussion Service.
- Business Reviewer — A Business Reviewer role can access the ChartField Definitions page and update a request. You should grant this role EOFD2000 and EPGL4200 or similar, permissions via the Structure Request Template and apply appropriate configurations.
- Approver — An Approver role has rights similar to Business Reviewer and is granted EOAW2000 permissions, along with component interface security and full access for all methods. If granted EOFD2000 and EPGL4200 or similar, permissions this role can access the Discussion Service and Requests through the Discussion Service respectively.

This topic provides an overview of the Fluid Financial Structure and details that include:

- Structure Request Template
- Financial Structure Request
- Impact Analysis
- Discussion Service
- Structure Request Approval

## Structure Request Template

The Structure Request Template is configurable and provides the ability to configure ChartField definitions and copy of templates. The information in the template is driven by combinations of Set IDs, field names and template types. Every template has one or more groups of Business Reviewer roles assigned; and every Business Reviewer role is assigned to a template. When you add a detail request line and apply the template in the request process flow, it is routed to business reviewers assigned to the template for entry of pending details, data validation, impact analysis and submission. You may assign different Business Reviewers for various combinations of Set IDs, ChartFields and Template Types.

The content of a Structure Request Template is contained over four or five pages as under:

- Template definition
- Core information (available only for template type ChartField )
- Business justification
- Questions
- Checklist

The information you define in a structure request template is rendered on a financial structure request detail. If an existing template or list of Business Reviewers is updated, you may only apply this to a Financial Structure Request created in the future.

The tile for the Structure Request Template is available only to a few like administrators. It is not available on the Home page by default but you add there as necessary.

## Financial Structure Request

A business or finance user specifies the kind of ChartField or Tree maintenance to be carried out on the Financial Structure Request page. This allows reviewers to then validate data, analyze impact, follow up on approval statuses and link to the available discussion service.

The Fluid Financial Structure Request feature supports the following:

- Tree only request
- Request with multiple lines
- Automate impact analysis
- Subsequent follow checklist
- Uptake discussion service framework

When the general level information of a master request is saved, it is routed to a System Reviewer for entry of high level information like Set IDs, ChartFields and Template Types. The detail request line is then routed to business reviewers for further action.

A Structure Request Detail is a specific ChartField or Tree request basis the template applied that allows Business Reviewers with detail request line level permissions to access detail requests.

The Impact Analysis process evaluates and identifies potential impacts on system settings, generates a detailed impact analysis report and allows to take appropriate action.

## Discussion Service

The Discussion Service is an independent communication tool that uses the PeopleTools and Enterprise Components framework. Topic discussions and attachments here are managed at either of master or detail requests.

## Structure Request Approval

The Fluid Approval Framework of Enterprise Components provides the Structure Request Approval at the detail request level.

---

# Setting Up and Using Fluid Financial Structure Requests

## Pages Used to Set Up and Use Fluid Financial Structure Requests

| <i>Page Name</i>                                                   | <i>Definition Name</i> | <i>Usage</i>                                                                                                   |
|--------------------------------------------------------------------|------------------------|----------------------------------------------------------------------------------------------------------------|
| <a href="#">Structure Request Template Page</a>                    | GL_BO_REQ_TMPLT_FL     | Define, modify or view information on the Structure Request Template page.                                     |
| <a href="#">Financial Structure Request Page</a>                   | GL_BO_REQUEST_FL       | Inquire about, create, update or copy requests.                                                                |
| <a href="#">Structure Request Detail - Request Assignment Page</a> | GL_BO_REQ_DTL_FL       | View or update the Structure Request Detail page.                                                              |
| <a href="#">ChartField Values Page</a>                             | GL_ACCOUNT             | View the ChartFields link to the associated Structure Request Detail page.                                     |
| <a href="#">Discussion Service Page</a>                            | EOFD_DSCN_LST_FL       | View the communication panel between requester, reviewers and approvers from business and finance departments. |

For a given Structure Request Detail, a link is added to the effective date row on the ChartField Values page. If you do not have permissions to access the request (not being a creator, reviewer, approver or auditor), the link has access control. The ChartField value appears as a link after the request is complete.

## Structure Request Template Page

Use the Structure Request Template page (GL\_BO\_REQ\_TMPLT\_FL) to define, modify or view information on the Structure Request Template page.

---

**Note:** You can copy an existing template from one Set ID to another and make necessary changes than creating a new one.

---

## Navigation:

From the Finance & Accounting Homepage, select the **Structure Template** tile.

This example illustrates the fields and controls on the Structure Request Template page. You can find definitions for the fields and controls later on this page.

Use the left panel to access the various sub pages.

- Template Definition

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                    |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Set ID</b>           | Displays the Set ID the template belongs to.                                                                                                                                                                                                                                                                          |
| <b>Field Name</b>       | <p>Displays the ChartField the template is associated with.</p> <hr/> <p><b>Note:</b> When you add new template, the ChartFields to select are those set to Enabled on the Business Request Setup page.</p> <hr/>                                                                                                     |
| <b>Template Type</b>    | <p>Indicates the type of change the template handles. The available template options are:</p> <ul style="list-style-type: none"> <li>• ChartField — Applies to a ChartField request with or without a Tree impact.</li> <li>• Tree Only — Applies to a Tree update request not led by a ChartField change.</li> </ul> |
| <b>Template Name</b>    | Indicates the name of the template.                                                                                                                                                                                                                                                                                   |
| <b>Edit Table</b>       | The table value is auto populated by default from the field name specified on the Business Request Setup page.                                                                                                                                                                                                        |

| <b>Field or Control</b>       | <b>Description</b>                                                                                                                                           |

| <b>Business Reviewer Role</b> | Specify the reviewer role for the template.                                                                                                                  |
| <b>Description</b>            | Enter a detailed description for the template.                                                                                                               |
| <b>Copy</b>                   | Click to copy all non canceled lines with most details.<br><br><b>Note:</b> Copying generates discussion threads automatically.                              |

- Core Information

---

**Note:** The Core Information page is displayed when the template type is ChartField and contains core table fields for each field on the Business Request Setup page.

---

- Business Justification

---

**Note:** The Business Justification page allows you to predefine questions in the request template; answers are restricted to a given format.

---

- Questions

---

**Note:** The Questions page allows you to predefine questions in the request template and mark them as optional or required with no format restrictions.

---

- Checklist

---

**Note:** The Checklist page allows you to predefine subsequent actions related to changes managed by the template and is copied to detail requests for status follow ups.

## Financial Structure Request Page

Use the Financial Structure Request page (GL\_BO\_REQUEST\_FL) to inquire about, create, update or copy a request.

Navigation:

From any homepage, select the Structure Request tile, and then select a row.

This example illustrates the fields and controls on the Financial Structure Request Page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Financial Structure Request' page. At the top, there's a header with 'Search Results' and 'Financial Structure Request'. Below this, the 'General Information' section contains fields for Request ID (000000001), User ID (BOSS1), Requester (John), Email Address (no-reply@oracle.com), Telephone (510/668-1111), and Request Comment (Request new bank account). It also shows Request Status (In Progress), Entered By (VP1 Kenneth Schumacher), Reason for Request (New Bank Account), and Confidentiality (No). A 'Save' button is visible. Below this is the 'Discussion / Attachments' section with a 'Discussion / Attachments (1)' link. The 'Request Lines' section shows a table with 2 rows:

| ID | Status    | Business Unit | SetID | Field Name | Template Type | Justification | Request Detail |
|----|-----------|---------------|-------|------------|---------------|---------------|----------------|
| 1  | In Review | US001         | SHARE | ACCOUNT    | ChartField    |               | Request Detail |
| 2  | In Review | US001         | SHARE | DEPTID     | Tree Only     |               | Request Detail |

Financial Structure Requests have components on two levels, Master Request General and Request Line

| Field or Control      | Description                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Request ID</b>     | Displays the ID auto assigned by the system when you save a request.                                                                                                                     |
| <b>User ID</b>        | Enter User ID of the requester (if entered by someone else). This allows the discussion service to identify you during a discussion on a topic.                                          |
| <b>Requester</b>      | Displays the name of the person who enters the request as available in the user profile; if entered by someone else the name of the requester is displayed.                              |
| <b>Email Address</b>  | Displays the requester's email ID.                                                                                                                                                       |
| <b>Telephone</b>      | Enter the requester's telephone number.<br><br><b>Note:</b> This is a mandatory field.                                                                                                   |
| <b>Request Status</b> | Displays Master Request General level status. The available options are: <ul style="list-style-type: none"> <li>New</li> <li>In Progress</li> <li>Canceled</li> <li>Completed</li> </ul> |
| <b>Entered By</b>     | View the name of the person who enters the request.                                                                                                                                      |

| <b><i>Field or Control</i></b>  | <b><i>Description</i></b>                                                                              |
|---------------------------------|--------------------------------------------------------------------------------------------------------|
| <b>Reason for Request</b>       | <p>Enter a label for the request.</p> <hr/> <p><b>Note:</b> This is a mandatory field.</p> <hr/>       |
| <b>Confidential</b>             | Select the request as Yes to make the request visible only to those involved in the process, else No.  |
| <b>Request Comment</b>          | Describe the requested changes in detail.                                                              |

| <b>Status</b>           | <p>Displays Request Line level status. The available options are:</p> <ul style="list-style-type: none"> <li>In Review <ul style="list-style-type: none"> <li>Actions available are: <ul style="list-style-type: none"> <li>Impact Analysis</li> <li>Cancel Request</li> <li>Submit</li> </ul> </li> </ul> </li> <li>Pending Approval <ul style="list-style-type: none"> <li>Actions available are: <ul style="list-style-type: none"> <li>Impact Analysis</li> <li>Cancel Request</li> </ul> </li> </ul> </li> <li>Approved <hr/> <p><b>Note:</b> Action available is Impact Analysis.</p> <hr/> </li> <li>Denied <ul style="list-style-type: none"> <li>Actions available are: <ul style="list-style-type: none"> <li>Cancel Request</li> <li>Submit</li> </ul> </li> </ul> </li> <li>Error <hr/> <p><b>Note:</b> Action available is Cancel Request.</p> <hr/> </li> <li>Canceled</li> <li>Completed</li> </ul> <hr/> <p><b>Note:</b> If you have permissions to approve or cancel Detail Requests, Component Interface Security should be granted to your permission list to prevent request errors.</p> <hr/> |
| <b>Justification</b>    | Click to view business justifications and questions for the request detail line. User has option to provide additional information to explain the business justification further.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Request Detail</b>   | Click to access the request details for the given request line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Note:** When a Master Request without a Request Line is saved, the status is designated as New; you can cancel a request when New. When a Request Line is created the status is designated differently. Both of the status types are listed above.

**Note:** A Master Request is treated as approved and moved to the PeopleSoft system for execution if the request detail is single and is approved or multiple request details and all such are approved or some approved and the rest canceled.

| <b>Cancel</b>           | Click to cancel the request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Submit</b>           | Click to submit the request for approval.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Structure Request Detail - Tree Information Page

The Structure Request Detail - Tree Information page allows you to update a tree structure and node information.

Use the Tree Information button to access the Tree Manager - Tree Viewer in Classic Plus.

---

**Note:** You must fix tree audit issues, with a Saved as Draft or Failed, auto update status manually or use the Tree Manager to perform updates. Even if the statuses are such the value of the request is inserted into the base table and the request itself closed.

---

## ChartField Values Page

Use the ChartField Values page (GL\_ACCOUNT) to view the ChartFields link to the associated Structure Request Detail page.

Navigation:

**Setup Financials /Supply Chain > Common Definitions > Design ChartFields >Define Values >ChartField Values**

This example illustrates the fields and controls on the ChartField Values page.

## Discussion Service Page

Use the Discussion Service page (EOFD\_DSCN\_LST\_FL) to view the communication panel between requester, reviewers and approvers from business and finance departments.

Navigation:

**Click the Discussion Service /Attachment link.**

This example illustrates the fields and controls on the Discussion Service page. You can find definitions for the fields and controls later on this page.

The functions available are:

1. Real time online chat.
2. Attachment management.
3. Discussion thread administration.
4. Notification / Discussion message.

---

**Note:** The default discussion subject for Master request is Reason for Request and for Detail are Set ID value and ChartField label respectively. You can modify this on the discussion thread Administration page.

# Using Entry Events

---

## Understanding Entry Events

An entry event is a user-defined code that you enter in a PeopleSoft application transaction. The entry event transaction consists of one or more processes that comprise steps that the system uses to post additional debit and credit accounting entries to the general ledger with minimal user input. In addition, the U.S. federal government requires that organizations use entry events to categorize specific core accounting entries and generate additional debit and credit entries specific to these codes.

To enter entry event codes on the transaction lines for various applications, you must first set up the codes to use specific entry event processes and steps that come with the PeopleSoft system. These processes and steps are linked to predefined entry event source transaction definitions, which identify the source and target records for specific types of transactions. After you set up entry event codes, you select or enter them on the transaction line of a PeopleSoft application. You can select the entry event processor to run, or the processor sometimes runs automatically as part of the application's normal processing procedures. This depends on the application that you use. The entry event processor runs each process and step that is set up for the entry event code, and the processor generates the appropriate accounting entries based on the debit and credit accounts that you set up for the entry event code.

This topic lists prerequisites and discusses:

- Basic setup of entry events.
- Entry event source transaction definitions.
- Optimize process performance.
- Entry event processes and steps.
- Entry event codes.
- PeopleSoft products that use entry events.
- Entry event processing.
- Source document adjusting entries and entry event processing.
- Upward and downward adjustments.
- Entry event user preference options.

## Prerequisites

Before you set up and use entry events, you must:

- Establish SetIDs.

- Set up ChartFields.
- Set up business units and any application-specific entry event information.
- Set up ledgers and ledger groups.
- Enable entry events for each PeopleSoft application listed on the Installation Options - Entry Events page.
- Set up Commitment Control budgets, if applicable.
  - Enable entry events for Commitment Control ledger groups for each business unit on the Ledgers For A Unit - Commitment Control Options page.

You must set up at least one detail Commitment Control ledger group. This detail ledger group serves as the source of PeopleSoft Purchasing transaction data for the entry event processor.

- Select the **Entries Must Balance** check box on the Commitment Control - Control Budget Options page to setup offset accounts for handling Purchasing transactions as encumbrances and preencumbrances in Commitment Control.
- Set up the offset accounts for Purchasing on the Commitment Control - Budget Definitions Offsets page.

Enter a deferred surcharge account for the Budget Entry Offset and deferred discount accounts for these source transaction types: PO\_POENC and REQ\_PREENC.

- Set up an expiration ChartField for your budgets on the Budget Definitions - Expiration ChartField page.

The information that you enter on this page determines whether a fund is expired when you run the budget processor for a document, enabling you to make upward and downward adjustments as necessary.

---

**Note:** Entry events is not supported by funding source functionality.

---

See [Entry Event Page](#).

See "Setting Up Control Budget Definitions" (PeopleSoft Commitment Control).

See "Understanding Source Transaction Type Setup" (PeopleSoft Commitment Control).

See [Understanding Ledgers](#).

See "Budget Definition - Prior Year Adjustment ChartField Page" (PeopleSoft Commitment Control).

## Basic Setup of Entry Events

Enable entry events for each of the applications listed on the Installation Options - Entry Events page. Entry event processing depends on the following setup:

- Entry event source transaction definitions, which are part of the PeopleSoft sample data delivered with your PeopleSoft applications.

- Entry event processes and steps, which are part of the PeopleSoft sample data delivered with your PeopleSoft applications.
- Entry event codes, which you define based on examples provided in the PeopleSoft sample data.

---

**Note:** Do not modify entry event source transaction definitions, and modify entry event processes and steps only under special circumstances.

---

## Entry Event Source Transaction Definitions

Each PeopleSoft product comes with predefined entry event source transactions. It is important that you do not modify these definitions, because they are essential to entry event processing. They identify a source record and a target record for the various types of transactions that use entry events, and they enable the system to distinguish one transaction from another. After you enter an entry event transaction in an application, the entry event processor selects the original subsystem accounting transactions in the source record and writes the created transactions to the target record. A list of the predefined entry event source transaction definitions appears later in this topic.

---

**Important!** Do not modify entry event source transaction definitions.

---

## Optimize Entry Event Process Performance

Create the following indexes in your environment to improve the performance of the Entry Event process:

- Create a new index on PS\_KK\_SOURCE\_HDR with following fields: PROCESS\_INSTANCE, KK\_SOURCE\_TRAN, BUSINESS\_UNIT, PO\_ID, KK\_TRAN\_ID, and KK\_TRAN\_DT.
- Create a new index on PS\_KK\_REFERENCED with following fields: KK\_REFD\_ID, KK\_REFD\_DT, KK\_REFD\_LN, KK\_TRAN\_ID, KK\_TRAN\_DT, KK\_TRAN\_LN.
- Create a new index on PS\_KK\_SOURCE\_HDR with following fields: KK\_SOURCE\_TRAN, BUSINESS\_UNIT, KK\_PROCESS\_STATUS, KK\_TRAN\_ID, KK\_TRAN\_DT.
- Create a new custom index on PS\_KK\_ACTIVITY\_LOG with following fields: KK\_TRAN\_ID, KK\_TRAN\_DT, EE\_PROC\_STATUS.

After creating the above indexes, run Update Statistics on the above records.

## Entry Event Processes and Steps

Each entry event process is associated with an entry event source transaction definition, and it comprises steps that define the source accounting transaction criteria and the data structures that the system uses to store the accounting transactions. When you enter a transaction in an application, select an entry event code and run the entry event processor, the system runs the entry event processes along with the associated steps. A list of the predefined processes for each product is provided later in this topic.

See [PeopleSoft Products That Use Entry Events](#).

---

**Important!** Normally you should not modify entry event processes and steps; however special considerations exist if you are setting up Commitment Control budgets using entry events.

---

See "Setting Up Budget Journal Entry Event Codes" (PeopleSoft Commitment Control).

## Entry Event Codes

For each product, you can use the predefined entry event codes contained in the PeopleSoft sample data as examples for setting up your own entry event codes. When you define an entry event code, you select the predefined entry event processes and steps to associate with the code. You also set up the debit and credit accounts that are generated when the entry event processor runs.

For example, if you enter an entry event code on a purchase order (PO), the selected entry event code must contain the entry event process POPOST. A list of the predefined processes for each product is provided later in this topic.

See [Entry Event Code Definition Page](#).

## PeopleSoft Products That Use Entry Events

Each PeopleSoft product uses different entry event source transaction definitions, processes, steps, and codes. Some products require that you perform additional activities to use entry events.

You normally enter entry event codes into product documents on the distribution line. The entry event codes that appear within each product depend on the processes that are set up for the codes.

The following applications use entry events:

- General Ledger.
- Purchasing.
- Payables.
- Receivables.
- Billing.
- Project Costing.

Entry event transactions do not need to be associated with Commitment Control budgeting, with the following exceptions:

- Entry events used in General Ledger budget adjustments that adjust preencumbrance, encumbrance, or collected revenue amounts for specific Commitment Control budgets.
- Entry events used in Project Costing budgets that post project budget amounts for specific Commitment Control budgets.
- Entry events used in Purchasing for requisitions and POs that are set up to account for the preencumbrance and encumbrance amounts in Commitment Control budgeting.

---

**Note:** The system loads all Billing entry events into Receivables, where they are processed for entry event generation.

---

For each product, the following table lists:

- Transaction types that use entry events.
- Predefined entry event source transaction definitions.
- Predefined entry event processes.
- Additional setup requirements.

## Entry Event Processing

After you set up entry event codes, you create the transaction or document and run the entry event processor based on the application's instructions. The order in which the entry event processor runs depends on the type of document or transaction that you process. Six methods of entry event processing exist:

- Normal accounting transaction entry event processing.
- PeopleSoft Purchasing document entry event processing.
- Commitment Control budget journal entry event processing.
- Commitment Control budget close entry event processing.
- Commitment Control general ledger budget adjustment journal entry event processing.
- Project Costing budget entry event processing.

### Normal Accounting Transaction Entry Event Processing

Here are the steps for normal accounting transaction processing with entry events:

1. You edit transaction lines as usual.
2. The entry event processor runs and generates the additional accounting lines based on the procedures and steps that are set up for the entry event code.

3. If the transactions are controlled by a budget, the budget processor runs to update the budget records.
4. After all the accounting lines are generated, Journal Generator creates journals from the Payables, Receivables, and Billing transactions.

---

**Note:** General Ledger automatically generates journal lines for online journal entry transactions.

---

5. The system posts the journals to the respective ledgers in General Ledger.

## PeopleSoft Purchasing Document Entry Event Processing

Accounting entries are normally neither generated nor posted for purchase requisitions and POs. However, if you use commitment-controlled budgets, the Commitment Control feature tracks purchase requisitions and POs as preencumbrances and encumbrances, respectively. You set up specific entry event codes to generate the preencumbrance and encumbrance accounting lines that the system eventually posts to the appropriate actuals ledgers in General Ledger.

Here are the steps for Purchasing document processing with entry events:

1. You enter and edit the purchase requisition or PO.
2. The budget processor runs and updates the preencumbrance or encumbrance budget record based on the purchasing document that you enter.

---

**Note:** If the document is a purchase requisition, the preencumbrance amount is updated for a specific budget and the remaining amount of the budget is updated. If it is a PO and a preencumbrance amount was already created, the preencumbrance amount is liquidated and the encumbrance amount is updated.

---

3. The entry event processor runs and generates accounting lines for the purchasing document based on the accounts that you set up in the entry event code.
4. Journal Generator creates a journal from the accounting lines.
5. The journal is posted to General Ledger.

## Commitment Control Budget Journal Entry Event Processing

To process Commitment Control budget journals with entry events:

1. Select **Commitment Control > Budget Journals > Enter Budget Journals**.
2. Enter a commitment control budget journal and select the appropriate entry event code.
3. Select Post Journal to edit and process the budget journal and run the entry event processor.

When you post Commitment Control budget journals online, entry event transactions are created when the journal is posted and the Skip Entry Event Processing check box on the User Preferences - General Ledger page for this operator is *not enabled*. Similarly, when a Commitment Control budget journal is posted through batch processing, entry event transactions are created when the journal is posted unless the user selects the Skip Entry Event Processing check box. In both cases, if entry event processing is bypassed, you can run the Entry Event processor in batch mode.

## Commitment Control Budget Close Entry Event Processing

To process Commitment Control budget close using entry events:

1. Perform the Commitment Control Budget Close process.
2. Run the Entry Event Processor to generate the accounting lines.
3. Run Journal Generator to create the accounting journals.
4. Post the journals to the actuals ledgers set up for the business unit.

See [Using Entry Events with Commitment Control Budgets](#).

## Commitment Control General Ledger Budget Adjustment Journal Entry Event Processing

To adjust a Commitment Control budget's preencumbrance, encumbrance, or collected revenue amount, you create a budget adjustment journal to update the amounts for the budget and use entry event codes to update the amounts for the appropriate actual ledger. The process is similar to the process for a Purchasing document; however, you do not adjust the original document in Purchasing.

To process Commitment Control budget adjustments with entry events:

1. Create a journal entry and—depending on the type of adjustment that you need to make—select preencumbrance, encumbrance, or collected revenue as the Commitment Control amount type.
2. Create the journal lines and select the entry event code for a budget adjustment journal.
3. Save and then run Journal Edit online or using batch.
4. Run budget checking to update the budget record for the adjustment.

---

**Note:** For example, if it is an adjustment to an encumbrance amount, the amount of the encumbrance is updated along with the remaining amount of the budget.

---

5. Run the entry event processor to generate the adjustment's accounting lines based on the entry event code.
6. Run Journal Generator to generate the accounting journal.
7. Post the journal to the appropriate ledger.

## Project Costing Budget Entry Event Processing

To process entry events for project costing:

1. Set entry event options on the Installation Options – Entry Event page for General Ledger.

---

**Note:** The Project Costing budget uses the General Ledger Entry Event option to process entry events. Installation options of required or optional determine how the Project Costing Budget Entry Event Interface Processor (PC\_TO\_EE) is run.

---

2. Establish commitment control budget definitions and setup entry event steps within the PC entry event processes, and codes.

---

**Note:** When you define commitment control project budget definitions, make sure the PC Business Unit is another ChartField other than Project ID. Define a step for each ledger and ledger group combination that will impact Project Costing budgeting.

---

3. On the Ledgers For A Unit - Commitment Control Options page, set the Entry Event Option for each commitment control ledger group that will be used in Project Costing budgets.
4. Select the entry event codes that are applicable for your project costing budget rows on the Commitment Control Detail tab of the Project Budget Items - Adjust Budget Items page.
5. Save, finalize, and successfully budget-check your budget plan.

The Project Costing Budget Entry Event Interface Processor (PC\_TO\_EE) initiates the Entry Event Generator (FS\_EVENTGEN) to process Project Costing budget data and generate supplemental accounting entries that support entry event generation and inquiry drill down to the project costing source data.

The Project Costing Budget Entry Event Interface Processor (PC\_TO\_EE) can be run in two ways:

- If entry events are specified as *Required* for the Commitment Control Ledger Group on the Ledgers For A Unit - Commitment Control Options page, the finalized budget plan initiates the Project Costing to Commitment Control Application Engine Budget Posting Interface process (PC\_TO\_KK) and after budgets are successfully posted to the ledger, the final step in the Project Costing to Commitment Control process is to automatically call the Project Costing Budget Entry Event Interface Processor (PC\_TO\_EE) process.
- If the system fails to generate the entry event journal accounting entries, or if entry events are specified as *Optional* for the Commitment Control Ledger Group on the Ledgers For A Unit - Commitment Control Options page, you manually run the Project Costing Budget Entry Event Interface Processor process (PC\_TO\_EE) on the Entry Event Budgets run control page in Project Costing to reprocess budget entry events.

## Source Document Adjusting Entries and Entry Event Processing

Occasionally, the entry event processor creates transactions for a document and then a user makes changes to the document in the source system. The system handles the entry event processing differently depending on the application:

- Payables.

The posting processes create the adjusting entries, including the accounts that are set up for the entry event code, and these adjustments are processed as normal accounting entries.

- Purchasing.

Purchasing does not create adjusting entries. Instead, the entry event processor reverses the change in the document and inserts adjusting entries in the target record. You must process the entire document again to recreate the entry event transactions. For example, if you change a PO that was created from a requisition, the process must be reprocessed.

- Commitment Control as the source record.

In normal processing, the Commitment Control feature deletes and inserts lines for a document every time budget checking runs. The Commitment Control processor inserts new lines with the entry event process status *Not Generated*. When the entry event processor runs, these lines are regenerated. If this is a previously generated document, the document in the entry event accounting record is reversed because the system inserts reversing entries and creates entry event transactions for the document based on the rows in the source record. The entry event processor creates adjustments and does not require any additional setup from the user.

---

**Note:** Adjustment processing creates additional lines in the entry event accounting record.

---

See [Processing Entry Events](#).

## Upward and Downward Adjustments

PeopleSoft entry events are used to automatically generate separate budgetary debit and credit accounts for upward and downward adjustments to POs and vouchers that are processed after the funding has expired

See [Using Entry Event Codes for Upward and Downward Adjustments in Unexpired and Expired Funding](#).

## Entry Event User Preference Options

You can select these check boxes on the User Preferences - General Ledger page to enable specific users to:

- **Allow GL Entry Event Bypass** in General Ledger.

Select this check box to enable a specific user to bypass entering a required entry event field when creating a journal entry in General Ledger and the Entry Event field is set to Required for General Ledger on the Installation Options - Entry Event page.

- **Skip Entry Event Processing** during Commitment Control budget posting.

Select this check box to bypass entry event processing when online posting a budget journal in Commitment Control.

See [User Preferences - General Ledger Page](#).

---

## Setting Up Entry Events

To set up entry events, use the Entry Event Code Definition component (EE\_EVENT\_CODE\_DEFN), the Entry Event Process Definition component (EE\_PROCESS\_STEP), and the Entry Event Source Definition component (EE\_SRC\_DEFN).

---

**Note:** Entry event source definitions, entry event processes and steps are predefined in the system. Do not change this setup.

---

|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Entry Event Process and Description</b> | Displays the process name and description. Entry event processes and steps are normally predefined. However, you can modify processes and steps to accommodate added or modified entry event codes. |
| <b>EE Step</b> (entry event step)          | Builds And statements in a Where clause to select rows from the source record.                                                                                                                      |
| <b>Description</b>                         | Enter a description of the entry event step.                                                                                                                                                        |
| <b>Entry Event Source Transaction</b>      | Select the source transaction to associate with the step.                                                                                                                                           |
| <b>Reversal Flag</b>                       | Select to reverse the source transaction.                                                                                                                                                           |
| <b>Default Distribution Account</b>        | Select to have the process post to the default distribution account that you identify on the Entry Event Code Definition page.                                                                      |
| <b>Upward/Downward Step</b>                | Select for the entry event processor to use this step for processing entry events codes that are associated with upward and downward adjustments.                                                   |
| <b>Field Name</b>                          | Select field names from a list of values in the source record that are defined according to the system source transaction setup.                                                                    |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Value</b>      | Enter values for all fields except the APPL_JRNL_ID field, which uses the APPL_JRNL_ID template as a field value. The APPL_JRNL_ID value for the General Ledger business unit is selected at run time. The system uses the field value mapping to build Where clauses that differentiate the various lines to create the additional entries. All fields listed have And statements in the Where clause. |

**Note:** The PeopleSoft system delivers the entry event processes and steps with your products in the sample data. However, you can add, update, and correct processes and steps using this page.

## Entry Event Code Definition Page

Use the Entry Event Code Definition page (EE\_EVENT\_CODE\_DEFN) to define entry event codes that are selected or entered into the application's detail distribution lines as part of an accounting transaction.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Entry Event > Entry Event Code Definition**

This example illustrates the fields and controls on the Entry Event Code Definition page. You can find definitions for the fields and controls later on this page.

**Entry Event Code Definition**

Entry Event Process: \*Entry Event Process: GLJE      \*Effective Date: 01/01/1900      \*Status: A

Entry Event Step: \*Entry Event Step: GLJE      Account:      Journal Template:      ☒ Source Record Jnl Template

| Line | DR/CR | Account | Short Desc | Alt Acct | Short Desc |
|------|-------|---------|------------|----------|------------|
| 1    | DR    | 643000  | Insurance  |          |            |
| 2    | CR    | 100038  | JPBnk-Col  |          |            |

| <b>Field or Control</b> | <b>Description</b>                                                                                                          |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>SetID</b>            | Enter the same SetID that you use to set up the business unit and ChartFields. This prevents entry event processing errors. |
| <b>Entry Event</b>      | Create a code to represent the type of entry event process to run.                                                          |
| <b>Description</b>      | Enter a short description of the entry event code. The description appears on reports, lists, and inquiries.                |

| <b>Field or Control</b>                                             | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Entry Event Process</b>                                          | Select the entry event process that applies to the entry event code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Entry Event Step</b>                                             | Select the step that applies to the selected entry event code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Account</b>                                                      | Enter the default distribution account for use on the Entry Event Process Definition page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Source Record Jrnl Template</b> (source record journal template) | Select to carry the journal generator template identified in the source transaction to the entry event transactions. Some source transaction records have the journal generator template (APPL_JRNL_ID) populated during the posting process. Some documents (such as budget journals) do not use a journal generator template and do not require that you select this check box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Journal Template</b>                                             | <p>If you do not select the <b>Source Record Jrnl Template</b> option, you must select a journal template to use for the transaction. You receive an error if you select both the source record journal template and a journal template.</p> <p>Typically, documents that are posted through a posting program (voucher post, payment post, AR Update) use a journal template. Other documents that are not posted do not have the journal template populated in the document. The Entry Event processor populates the journal template on the Entry Event accounting record so that they can be journal-generated.</p> <hr/> <p><b>Note:</b> You receive the default journal template, such as EE_PCBUD for Project Costing , EE_PURCH for Purchasing and EE_BUDGET for PeopleSoft General Ledger budget transactions in the DEMO database. You can use these journal templates as guides for setting up the templates in your database.</p> <hr/> |
| <b>Offset Accounts</b>                                              | Add the accounts and alternate accounts, if required, to debit and credit for this entry event code during processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>DR/CR</b> (debit and credit)                                     | Enter <i>DR</i> or <i>CR</i> for offset accounts that are automatically generated when the entry event generator is run. You can have two or more DR/CR pairs associated with each entry event code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Alt Acct</b> (alternate account)                                 | Select DR/CR for alternate accounts, if applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

---

**Note:** If an entry event code is copied from one document to other documents, it must be defined as a valid code for the entry event process associated with each type of document. For example, if an entry event code is entered into a PO that can be copied to a voucher, the entry event code definition must include the entry event process for the PO and the entry event process for the voucher. If the code is not defined for both, a processing error occurs due to an invalid entry event code.

## Setting up and Processing Entry Event for Various Applications and Transactions

This topic discusses how to:

- Use a single entry event code in multiple documents or products.
- Use entry events for requisitions and PO reversals and closures.
- Process vouchers, payments, and cash-clearing transactions with entry events.
- Use entry event codes for upward and downward adjustments in both unexpired and expired funding.
- Process Receivables transactions and direct journals with entry events.

## Using a Single Entry Event Code in Multiple Documents or Products

To use an entry event code in multiple documents or for multiple products, you must identify each process and its steps in the entry event code definition. Using the PeopleSoft procure-to-pay process as an example, you can enter an entry event code one time in the requisition document. It then flows through the entire process creating entry event transactions for each document. Before an entry event code can successfully move between documents and products, you first must set it up to run for each of the processes in the procure-to-pay cycle.

The PeopleSoft procure-to-pay cycle consists of several documents and processes. Entry event processing uses the following processes:

- REQPOST
- POPOST
- VCHRPOST
- PAYMENT

You must set up an entry event code and associate it with all four processes.

See [Entry Event Code Definition Page](#).

### Example of Defining One Entry Event Code to Use with Multiple PeopleSoft Applications

Here is an example of how to define an entry event code for multiple PeopleSoft applications:

1. Set up the PROCURE entry event code.

| <b>Term</b>        | <b>Definition</b>            |
|--------------------|------------------------------|
| <b>Entry Event</b> | PROCURE                      |
| <b>Description</b> | Requisition to Cash Clearing |

2. In the Entry Event Process group box, add the REQPOST process.

| <b>Term</b>                | <b>Definition</b> |
|----------------------------|-------------------|
| <b>Entry Event Process</b> | REQPOST           |
| <b>Effective Date</b>      | 01/01/1900        |
| <b>Status</b>              | A                 |

3. In the Entry Event Step group box, add the REQPOST step.

| <b>Term</b>                        | <b>Definition</b>   |
|------------------------------------|---------------------|
| <b>Entry Event Step</b>            | REQPOST             |
| <b>Account</b>                     | 696800 (example)    |
| <b>Source Record Jrnl Template</b> | Not applicable (NA) |
| <b>Journal Template</b>            | EE_PURCH            |

4. In the Offset Accounts group box, add the preencumbrance and general expenses offset accounts.

| <b>Term</b>                   | <b>Definition</b>             |
|-------------------------------|-------------------------------|
| <b>DR/CR</b>                  | DR                            |
| <b>Account and Short Desc</b> | 696700 (example) - Preenc Res |
| <b>DR/CR</b>                  | CR                            |
| <b>Account and Short Desc</b> | 696500 (example) - GenExpOffs |

5. In the Entry Event Process group box, add the POPOST process.

| <b>Term</b>                | <b>Definition</b> |
|----------------------------|-------------------|
| <b>Entry Event Process</b> | POPOST            |
| <b>Effective Date</b>      | 01/01/1900        |
| <b>Status</b>              | A                 |

6. In the Entry Event Step group box, add the POPOST step.

| <b>Term</b>             | <b>Definition</b> |
|-------------------------|-------------------|
| <b>Entry Event Step</b> | POPOST            |
| <b>Account</b>          | 696800 (example)  |

| <b>Term</b>                        | <b>Definition</b>                                  |
|------------------------------------|----------------------------------------------------|
| <b>Source Record Jrnl Template</b> | Select if a source record journal template exists. |
| <b>Journal Template</b>            | EE_PURCH                                           |

7. In the Offset Accounts group box, add the encumbrance and general expenses offset accounts.

| <b>Term</b>                           | <b>Definition</b>                |
|---------------------------------------|----------------------------------|
| <b>DR/CR, Account, and Short Desc</b> | DR, 696600 (example), Enc Res    |
| <b>DR/CR, Account, and Short Desc</b> | CR, 696500 (example), GenExpOffs |

8. In the Entry Event Process group box, add the VCHRPOST process.

| <b>Term</b>                | <b>Definition</b> |
|----------------------------|-------------------|
| <b>Entry Event Process</b> | VCHRPOST          |
| <b>Effective Date</b>      | 01/01/1900        |
| <b>Status</b>              | A                 |

9. In the Entry Event Step group box, add the ACCRUAL step.

| <b>Term</b>                        | <b>Definition</b>   |
|------------------------------------|---------------------|
| <b>Entry Event Step</b>            | ACCRUAL             |
| <b>Account</b>                     | 696800 (example)    |
| <b>Source Record Jrnl Template</b> | Select this option. |
| <b>Journal Template</b>            | NA                  |

10. In the Offset Accounts group box, add the general expenses and accounts payable offset accounts.

| <b>Term</b>                           | <b>Definition</b>                 |
|---------------------------------------|-----------------------------------|
| <b>DR/CR, Account, and Short Desc</b> | DR, 696500 (example), GenExpOffs  |
| <b>DR/CR, Account, and Short Desc</b> | CR, 200000 (example), Accts Paybl |

11. In the Entry Event Process group box, add the PAYMENT process.

| <b>Term</b>                | <b>Definition</b> |
|----------------------------|-------------------|
| <b>Entry Event Process</b> | PAYMENT           |
| <b>Effective Date</b>      | 01/01/1900        |
| <b>Status</b>              | A                 |

12. In the Entry Event Step group box, add the PAYMENT step.

## Using Entry Events with Requisition and Purchase Order Reversals and Closures

The PeopleSoft Purchasing procure-to-pay process illustrates how you can use the same entry event code to handle reversals and closures.

### Entry Event Requisition Reversal and Close

When you create and source a requisition to a PO, the Commitment Control budget processor liquidates the preencumbrance amount and increases the encumbrance amount. To ensure that the entry event accounting lines that you generated with the requisition are also reversed, the predefined entry event REQPOST process contains these predefined entry event steps:

- REQCLOSE
- REQPOST
- REQREVSAL

When you create and source a requisition to a PO, the Commitment Control budget processor liquidates the preencumbrance amount for the budget and increases the encumbrance amount for the budget.

This also occurs in the entry event transactions if you add the REQREVSAL step to the existing entry event process REQPOST. This ensures the correct setup of the debit and credit accounts so that they credit the proprietary account for preencumbrance and debit the general expense offsets.

The entry event processor also creates closure entries for a closed requisition with a portion that is not sourced to a PO. You must set up the REQCLOSE step for the REQPOST process. You set up the debit and credit accounts similarly to the REQREVSAL step to credit the proprietary account for preencumbrance and debit the general expense offsets.

To create the reversing and closing entry event transactions for the requisition, you must run the entry event processor for the requisition after you create and budget-check the PO. You can run the entry event processor for all business units, the business unit for the requisition, or the specific requisition that you created. Select **Purchasing > Requisition > Review Requisition Information > Accounting Entries** and use the accounting entries inquiry to review all of the entries, the entry event reversals, and the closures for the requisition.

### Exceptions to the Reversal and Close Processes

Here are some exceptions to using the reversal and close process:

- Closing a PO that is sourced from a requisition.

When you source a requisition to a PO and the PO is canceled or closed, you can leave the requisition open to source it to another PO. If you keep the requisition open, the system cannot create reversal or closure entry event transactions until you source the requisition to another PO and budget-check the PO. However, if you close the requisition, the system creates the reversal and closure entries.

- Closing a PO without processing the entry events for the requisition.

Because the entry event process for Purchasing uses the output from the Commitment Control processor, no changes occur to the entry event transactions until you budget-check the source document (PO or requisition) and run the entry event processor. In a rare case, you might create,

budget-check and source a requisition to a PO, and then budget-check the PO and attempt to close it without running the entry event processor on the requisition. You cannot close the PO until you run the entry event processor on the requisition.

- Copying a PO to a voucher.

During the procurement process, you can copy a PO and its associated entry event code into a voucher. However, the entry event code setup must contain the VCHRPOST process for the system to create the entry event transactions when you post the voucher. Regardless of whether you copy the entry event code to the voucher and process it within Payables, when you budget-check the voucher, you can create reversals and closure entries for the copied PO. If the entry event code used in the distribution lines of the copied PO has the steps POREVERSAL and POCLOSE defined for the POPOST process, you can create closing and reversal entries for the PO.

- Closing or finalizing a voucher without creating entry events for a PO.

As with sourcing a requisition to a PO, the entry event processor uses the output from the Commitment Control processor to create entry event transactions. You cannot close or finalize a voucher that you created from a PO until you run the entry event processor on the PO. There may be a rare case where you create, budget-check, copy a PO to a voucher, and then budget-check the voucher. If you attempt to close the voucher without running the entry event processor on the PO, an error occurs requiring you to run the entry event processor on the PO.

## Processing Vouchers, Payments, and Cash Clearing Transactions with Entry Events

You can set up entry events to create transactions for vouchers, payments, and cash clearing. You must set up the entry event codes with the predefined VCHRPOST, PAYMENT, and CASHCLRNG processes and steps. Depending on the entry event transactions that you want to create for an entry event code, you must set up different steps for each process. In some cases, you do not set up the CASHCLRNG process for an entry event code. You can set up the following processes and steps to create the pro forma entries:

| <b>Process</b> | <b>Steps</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Once you create and budget-check a voucher, you can generate entry event transactions by running the entry event generator at the same time as voucher post or separately by selecting **Accounts Payable > Batch Processes > Vouchers > Voucher Entry Event**. The Accounts Payable Voucher Post process must create entry event transactions before steps included in the VCHRPOST process can create them.

The voucher that you pay includes the payment accounting information. If you enter an entry event code on the voucher or you copy an entry event code to the voucher from a PO, the system carries the code to the payments created for that voucher. When you create payments from vouchers, you can generate entry event transactions by running the entry event generator at the same time as payment post, or separately by selecting **Accounts Payable > Batch Processes > Payment > Payment Entry Event**. The Accounts Payable Payment Post process must create entry event transactions before steps included in the PAYMENT process can create them. If you use Payables, you must set up cash clearing steps for the PAYMENT process associated with an entry event code to create payment entry event transactions.

If you set up cash clearing for Payables and you want to create entry event cash clearing entries, you need to associate the entry event code with the CASHCLRNG process and the step CASHCLR. All reconciled payments create entry event transactions if you associate an entry event code with the CASHCLRNG process. The system can run the entry event processor to generate entry event transactions simultaneously with the Cash Clearing process, or you can generate them separately by selecting **Accounts Payable > Batch Processes > Payment > Cash Clearing Entry Event**.

## Using Entry Event Codes for Upward and Downward Adjustments in Unexpired and Expired Funding

Upward and downward adjustments include adjustments for both unexpired and expired funding. Each has entry event configuration to handle different accounting.

Adjustments for unexpired funding are very similar to adjustments for expired funding where changes to purchase order or voucher transactions are recorded as upward or downward adjustments. The difference is that the funding is still current for unexpired adjustments and therefore the accounting is not the same. To be considered unexpired, the Unexpired checkbox must be selected for the Prior Year Adjustment ChartField on the Budget Definition page, and the budget date must fall between the Begin and Expiration dates as defined on the Budget Definition page. Additionally, for new POs or vouchers the Budget Fiscal Year must be less than the Accounting Fiscal Year. For a PO change order or Voucher adjustment, the Original Budget Fiscal Year must be less than the Adjustment Accounting Fiscal Year.

Funding is designated as expired on the Prior Year Adjustment ChartField tab of the Commitment Control Budget Definition page. If the budget date on a PO or voucher is between the defined expired and end dates, the funding is considered expired and could be subject to upward or downward adjustment accounting.

In the following cases, the system must automatically generate separate budgetary debit and credit accounts for U.S. federal government adjustments to POs and vouchers that are processed after the funding has an unexpired or expired status:

- When an existing PO is either increased or decreased in a period during which the funding has changed to unexpired or expired state.
- When a new PO is entered against a period in which funding has changed to an unexpired or expired state and no goods, services, or invoices were received.
- When a voucher is processed against an existing PO for more or less than the PO amount in a period during which the funding has changed to an unexpired or expired state.
- When a voucher that is not tied to a PO is entered in a period during which the funding has changed to an unexpired or expired state.
- When an adjustment voucher is entered in a period during which the funding has changed to an unexpired or expired state.

This section discusses:

- Entry event definitions for upward and downward adjustments in PeopleSoft Purchasing and Payables.
- Upward and downward adjustments in PeopleSoft Purchasing.
- Upward and downward adjustments in PeopleSoft Payables.
- Upward and downward adjustment reversals.

To generate these budgetary debit and credit accounts, you select an entry event code when you enter the adjustment to the PO or when you enter the PO voucher that points to the predefined entry event source transaction definitions and the predefined entry event processes and steps.

Before you can enter and process these upward and downward adjustments in an unexpired or expired funding period, you must:

- Set up an Prior Year Adjustment ChartField for your budgets.

Navigate to **Commitment Control > Define Control Budgets > Budget Definitions > Prior Year Adjustment ChartField** to access the Prior Year Adjustment page. The information that you enter on this page determines whether a fund is unexpired or expired when you run the budget processor for a document.

- Create entry event data to use in Purchasing or Payables to automatically generate and update the budgetary debit or credit accounts for the adjustment if the fund is unexpired or expired.
- Verify that the users who enter and process the Purchasing or Payables upward and downward adjustments have permission to override budget-checking errors for expired-year funding.

See [User Preferences - General Ledger Page](#).

See [Entry Event Page](#).

## Entry Event Definitions for Upward and Downward Adjustments in PeopleSoft Purchasing and Payables

Access the Budget Definitions - Prior Year Adjustment ChartField page (Commitment Control, Define Control Budgets, Budget Definitions, Prior Year Adjustment ChartField).

To use entry events for creating budgetary account adjustments in Purchasing and Payables:

1. Verify that the following entry event source definitions exist.

---

**Warning!** These values are predefined; do not change them.

3. Use the entry event codes for the predefined upward and downward adjustments as the basis for setting up your own entry event codes.

## Upward and Downward Adjustments Processing in PeopleSoft Purchasing

This section discusses how to process upward and downward adjustments in Purchasing.

PO upward and downward adjustments are initiated by any change to a PO that applies to expired or unexpired year funding.

Here are some important considerations:

- The accounting date entered on the Purchase Order Header page is used for the accounting date on the resulting entry event transactions.

The budget date on the PO distribution line is checked against the Prior Year Adjustment ChartField dates and attributes to determine whether funding is current, unexpired, or expired. Changing the budget date can affect whether the funding is in an expired year. Changing the accounting or budget date for funding subject to unexpired can affect whether the funding changes to an unexpired state.

- If a PO has expired-year funding and has been budget-checked in current year, but the entry events have never been generated, the adjustment amount is calculated by taking the current budget-checked PO amount minus the last amount budget-checked in the current year.

- If a PO has expired-year funding and has never been budget-checked while in the current year, no adjustments are necessary.

See "Purchasing Options Page" (PeopleSoft Purchasing).

See "Creating Requisitions Online" in the PeopleSoft Purchasing documentation "Understanding the Requisition Business Process" (PeopleSoft Purchasing).

Here is an example of upward adjustment for unexpired funding. Suppose the existing PO, PO 2, is for 7,000.00 USD against a fund subject to unexpired funding adjustments. Due to a contract adjustment, the PO increases to 8,600.00 USD. The organization received no goods, services, or invoices. The budget date is between the begin and expiration dates on the Prior Year Adjustment ChartFields tab of the Budget Definition page and the Original Budget Fiscal Year is less than the Adjustment Fiscal Year. This would be classified as an unexpired upward adjustment.

To enter and process the PO for the unexpired upward adjustment:

1. Enter the 1,600.00 USD upward adjustment change order to PO 2.
2. Approve the PO change order.
3. Budget check the PO change order. The budget processor checks the Prior Year Adjustment ChartField attributes and dates to see if the funding is subject to unexpired.
4. Once the PO passes budget checking, run the entry event processor to generate the entry events.

The EE processor checks to see if the Original Budget Fiscal Year is less than the Adjustment Accounting Fiscal Year and therefore, requires unexpired adjustment accounting. The system calculates the difference between the PO current amount and the lines posted to the Entry Event accounting line record.

In this example, the entry event processor generates the following budgetary accounting lines:

- 4450 (Allotments - Unexpired Authority) — \$1,600.00.
- 4881 (Upward Adjustment of Prior Year Unpaid Unexpended Obs) — <\$1,600.00> .
- Proprietary accounting entries: NONE.

Here is an example of upward adjustment for expired funding. Suppose that the existing PO called PO 1 is for 7,000.00 USD against an expired fund. Due to a contract adjustment, the PO increases to 8,600.00 USD. The organization received no goods, services, or invoices. Budget date is between the expired and end dates on the Prior Year Adjustment ChartFields tab on the Budget Definition page. This would be an expired upward adjustment to the PO.

To enter and process the PO for the expired upward adjustment:

1. Enter the 1,600.00 USD upward adjustment change order to PO #1.
2. Approve the PO change order.

The Commitment Control budget processor checks the Prior Year Adjustment ChartField to see if this change applies to expired-year funding. If the fund year has expired, the budget processor issues an error and stops processing.

3. Check the budget error messages.

4. If the error message indicates that budget checking failed because the fund year has expired, then override the budget error.
5. Rerun the budget processor to ensure that the budget information is valid.
6. Once the budget is valid, run the entry event processor to generate the entry events.

The system calculates the difference between the PO's current amount and the lines posted to the entry event accounting line record.

---

**Note:** Your standard general ledger budgetary accounts may be different than the accounts used in this example.

---

In this example, the entry event processor generates the following budgetary accounting lines:

- 4650 (Allotments - Expired Authority) - \$1,600.00.
- 4881 (Upward Adjust of Prior Year Unpaid Unexpended Obs) - <\$1,600.00>.
- Proprietary accounting entries: NONE.

See “Creating Requisitions Online” in the PeopleSoft Purchasing documentation "Understanding the Requisition Business Process" (PeopleSoft Purchasing).

## Upward and Downward Adjustments Processing in PeopleSoft Payables

This section discusses how to process upward and downward adjustments for Payables.

Payables voucher upward adjustments are created when:

- The PO voucher is greater than the PO.
- The voucher has no PO associated with it but has unexpired or expired year funding.
- The PO voucher is less than the PO and is marked as final.

Here are some important considerations:

- If a voucher is finalized at the header level, all voucher distribution lines in the voucher can have adjustments.
- If the voucher is finalized at the line level, all voucher distributions for the line can have adjustments.
- If the voucher is finalized at the distribution level, only distributions that are marked as final can have adjustments.
- If a PO is in unexpired funding and the voucher is in unexpired funding (current year), no adjustments to the voucher are necessary.
- If the PO is in expired-year funding and the voucher is in expired funding, no adjustments need to be made to the voucher.
- If the voucher has not been created from a PO and the voucher is in unexpired or expired funding, there should be an adjustment for the full amount of the voucher.

---

**Note:** Your standard general ledger budgetary accounts and proprietary accounts may be different than the accounts used in these examples.

---

Here is an example for expired funding. Suppose that a PO exists for 8,600.00 USD against an expired fund. A PO voucher was created for 9,000.00 USD against the PO.

Use these steps to enter and process the voucher for the upward adjustment:

1. Ensure that the PO voucher was entered into Payables for 9,000.00 USD and applies to expired-year funding.
2. The budget processor fails the PO voucher.
3. Budget checking fails and issues a budget-checking error for the voucher indicating that the voucher applies to an expired funding year. Unexpired funding will not cause a budget checking failure.
4. Override the budget checking for this voucher.
5. Run budget checking again to ensure that the voucher budget status is valid.
6. Run Voucher Posting to generate the proprietary accounting entries.
  - 6100 (Operating Expense) - 9,000.00 USD
  - 2110 (Accounts Payable) - <9,000.00> USD
7. Run the entry event processor to generate the accounting entries.

The processor calculates the difference between the voucher and the PO and adjusts the budgetary entries upward.

The system generates the following budgetary entries:

- 4650 (Allotments - Expired Authority) - 400.00 USD
- 4881 (Upward Adjust of Prior Year Unpaid Unexpended Obs.) - <400.00> USD
- 4801 (Unexpended Obligations - Unpaid) - 9,000.00 USD
- 4901 (Unexpended Authority) <9,000.00> USD
- 3100 (Unexpended Appropriations) - 9,000.00 USD
- 5700 (Expended Appropriations) - <9,000.00> USD

Payables voucher downward adjustments are created when the following characteristics apply to the voucher:

- The PO voucher is less than the PO.
- The voucher has unexpired or expired year funding.
- The voucher is marked final.

For example, a PO exists for 4,700.00 USD against an expired fund. A PO voucher is processed against the PO for 2,700.00 USD.

Use these steps to enter and process the voucher for the expired downward adjustment:

1. Ensure that the PO voucher is entered into Payables for 2,700.00 USD and applies to expired-year funding.
2. Because the PO amount is greater than the voucher amount, the commitment control budget processor does not issue an error, and it passes the budget checking.
3. Run Voucher Posting to generate the following accounting entries.
  - 6100 (Operating Expense) - 2,700.00 USD
  - 2110 (Accounts Payable) - <2,700.00> USD

4. Run the entry event processor to generate the following accounting entries.

The processor calculates the difference between the voucher and the PO and adjusts the budgetary entries downward.

The system generates the following budgetary entries:

- 4871 (Downward Adjustment of Prior Year - Unpaid Unexpended Obs) - 2000.00 USD
- 4650 (Allotments - Expired Authority) - <2000.00> USD
- 4801 (Unexpended Obligations - Unpaid) - 2,700.00 USD
- 4901 (Unexpended Authority) <2,700.00> USD
- 3100 (Unexpended Appropriations) - 2,700.00 USD
- 5700 (Expended Appropriations) - <2,700.00> USD

See “Entering and Processing Vouchers Online: General Voucher Entry Information” in “Entering Regular Vouchers” (PeopleSoft Payables).

## Upward and Downward Adjustments Reversals

This section discusses how the system handles upward and downward adjustments reversals.

Reversal processing for entry event generated adjustments is required when the voucher has been posted and:

- The voucher is unposted, then any adjustments created for a voucher are reversed.
- The voucher is partialized, then the voucher is selected for reverse processing based on:
  - Whether the voucher is budget checked and in unexpired or expired year funding.
  - Whether the voucher has been posted at least once.
  - Whether the voucher is partialized at the distribution level.

If so, only final distributions that have been processed can have adjustments.

## Processing Receivables Transactions and Direct Journals with Entry Events

You can set up entry events to create transactions for items, payments, credit cards, drafts, direct debits and direct journals. You must set up the entry event codes with the predefined ARUPDATE and ARDIRJRNL processes and steps.

For all Receivables transactions except Direct Journals, the Entry Event process can be run as part of the AR posting job, Receivables Update (ARUPDATE). Navigate to **Accounts Receivable >Receivables Update >Request Receivables Update**. On the Receivables Update - Options page of the run control request, select the **Process Entry Events** check box to automatically run the Entry Event process after ARUPDATE runs. You can also use the Options page to automatically run Journal Generator to create GL journals. You must enter the accounting definition name for the standard entries (*ARDEFN*), and if you want to create GL journals for the supplemental (entry event) entries, enter *EGAROIDEFN* in the Entry Event Definition Name field.

This example illustrates the fields and controls on the Options page for running the Entry Event process as part of Receivables Update.

| Receivable Update Request                                        |          | Options                                                  |                            |
|------------------------------------------------------------------|----------|----------------------------------------------------------|----------------------------|
| Run Control ID                                                   | ARUPDATE | Report Manager                                           | Process Monitor            |
|                                                                  |          | <input type="button" value="Run"/>                       |                            |
| <input checked="" type="checkbox"/> Process GL Journal Generator |          | <input checked="" type="checkbox"/> Process Entry Events |                            |
| <b>Accounting Definition</b>                                     |          |                                                          |                            |
| SetID                                                            | SHARE    | Accounting Definition Name                               | ARDEFN                     |
|                                                                  |          |                                                          | Receivables Definition     |
| SetID                                                            | SHARE    | Entry Event Definition Name                              | EGAROIDEFN                 |
|                                                                  |          |                                                          | Open Item Acctg Definition |

For all Receivables transactions, including Direct Journals, the Entry Event process can be run as a stand-alone process on the Request Entry Event Processor page (PST\_EE\_RUN\_REQUEST). Navigate to **Accounts Receivable >Receivables Update >Request Entry Event Processor**.

This example illustrates the fields and controls on the Request Entry Event Processor page for running Receivables transactions, including Direct Journals.

**Request Entry Event Processor**

Run Control ID ARUPDATE Report Manager Process Monitor Run

**Process Request Parameters**

Request ID  Description

Process Frequency

\*Entry Event Process  Process Option

**Selection Criteria**

Business Unit

For Direct Journal transactions, the Entry Event processor is expecting the journal to be posted successfully to the General Ledger before creating Entry Event entries. The process flow for Direct Journals would be as follows:

1. Enter a Direct Journal and mark it complete.
2. (Optional) Run the budget processor if necessary.
3. Run Journal Generator to generate GL journals using the accounting definition ARDIRJRNL.
4. Run the Entry Event processor.
5. Run Journal Generator to generate GL journals for the Entry Event entries, using the accounting definition EGARDJDEFN.

You can use the Modify Accounting Entries page to view both the standard and supplemental (entry event) accounting entries for Direct Journals.

See "Journaling Payments Directly to the General Ledger" (PeopleSoft Receivables).

Use the Journal Entry Drill Down page to view the GL journals for both the standard and supplemental (entry event) accounting entries.

See "Reviewing the Source Accounting Entries for Journal Lines" (PeopleSoft Receivables) .

---

## Using Entry Events with Commitment Control Budgets

This topic lists prerequisites and discusses how to:

- Set up and process Commitment Control budget journals with entry events.
- Set up automatic generation of parent budgets, adjustments, and transfers that involve entry events.
- Set up and close Commitment Control budgets with entry events.

### Prerequisites

Before you can use entry events with Commitment Control budgets, you must set up Commitment Control.

---

**Note:** The entry event feature is not supported by funding source functionality.

---

See "Setting Commitment Control Options" (PeopleSoft Commitment Control)"Setting Commitment Control Installation Options" (PeopleSoft Commitment Control)

## Setting Up and Processing Commitment Control Budget Journals with Entry Events

You can enter entry event codes in budget journals to create entry event transactions. Although the PeopleSoft system comes with a predefined BUDG entry event process and its associated steps, you may need to modify the existing steps depending on your budget ledger and budget ledger group names. The BUDG process comes with the following steps:

| <b>Process</b> | <b>Steps</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BUDG           | <ul style="list-style-type: none"> <li>• ALLOT (prepare allotment budgets).</li> <li>• APPORT (prepare apportionment budget).</li> <li>• APPR XFER (appropriation transfer).</li> <li>• APPROP (prepare appropriation budgets).</li> <li>• ORG (establish operating plan).</li> <li>• CORG (close operating plan).</li> <li>• ORG XFER (organization transfer).</li> <li>• PRJGRT IND (prepare grant indirect charge budget).</li> <li>• PROJ_GRT (prepare project or grant budgets).</li> <li>• REVEST (prepare revenue estimates).</li> <li>• RORG (roll operating plan).</li> <li>• CHILD (child budget).</li> <li>• PARENT (parent budget).</li> </ul> |

The predefined process has two fields for each entry event step. The ledger and ledger group names for the entry event budget journals should appear as the field values for each of these steps. Consequently, you may need to modify the predefined field values for the step and replace them with the organization's budget ledger and ledger group name values. The predefined field names are:

- ASSOCIATED\_LEDGER
- ASSOCIATED\_LED\_GRP

For example, to create an entry event transaction for a budget journal with the ledger group CC\_ORG and the ledger CC\_ORG\_BUD, you would access the Entry Event Process definition page (Set Up Financials/Supply Chain, Common Definitions, Entry Event, Process, Entry Event Process Definition) for the predefined entry event process BUDG and the entry event step ORG, and you would:

1. Scroll to the Field Name and Field Value group box.
2. Enter the field value CC\_ORG\_BUD next to the field name ASSOCIATED\_LEDGER.
3. Enter the field value CC\_ORG next to the field name ASSOCIATED\_LED\_GRP.

---

**Important!** Do not change the field names.

---

4. Create a new entry event code (such as BUDG 1), or select the predefined entry event code BUDGPOST for the SetID FEDRL.
5. Access the Entry Event Code Definition page (Set Up Financials/Supply Chain, Common Definitions, Entry Event, Code Definition, Entry Event Code Definition).
  - If you are modifying the predefined entry event code BUDGPOST, change the offset accounts to the organization's accounts.
  - If you are creating a new entry event code, add the following information and enter the appropriate accounts for the organization:

| <i><b>Field or Control</b></i>     | <i><b>Description</b></i> |
|------------------------------------|---------------------------|
| <b>Entry Event Process</b>         | BUDG                      |
| <b>Effective Date</b>              | 01/01/1900                |
| <b>Status</b>                      | A                         |
| <b>Entry Event Step</b>            | ORG                       |
| <b>Account</b>                     | NA                        |
| <b>Source Record Jrnl Template</b> | NA                        |
| <b>Journal Template</b>            | EE_BUDGET                 |
| <b>Offset Accounts</b>             | User-defined              |

---

**Note:** You must add steps for each type of budget used by the organization. These steps are predefined for the BUDG process.

---

## Setting Up Automatic Generation of Parent Budgets, Adjustments, and Transfers that Involve Entry Events

Entry event is supported by the automatic generation of parent budgets from originating child budget journals, adjustment journals, and transfer journals.

The use of entry events and automatic generation of parent budgets is discussed in the commitment control topic dealing with the posting of budget journals.

See "Generate Parent Budgets, Budget Adjustments, and Budget Transfers Automatically" (PeopleSoft Commitment Control).

## Setting Up and Closing Commitment Control Budgets with Entry Events

When you close Commitment Control budgets, the budget closing process creates budget journals that are posted to the budget ledger. Typically you either choose to close out the remaining balance of the budget for the period or roll forward the remaining balance into the next fiscal year and period. In both situations the budget closing process creates budget journals. If you enabled entry event in the Installation Options, you have the option of selecting an entry event code when you close the budgets. The budget journals are created in adjustment periods and the Entry Event processor also creates the closing entries in the budget journal adjustment periods. When you run journal generator for these accounting entries, it retains the adjustment periods so that they are posted in the specified ledger with budget journal adjustment period dates.

This topic discusses how to:

- Set up entry events for Commitment Control budget close.
- Process entry events in Commitment Control budget close.

### Setting Up Entry Events for Commitment Control Budget Close

To set up entry events for Commitment Control budget close:

1. Set up the entry event process BUDG with two entry event steps based on the entry event source transactions:
  - GL\_BUD\_CLS for step CORG
  - GL\_BUDROLL for step RORG
2. Associate the appropriate ledger group and ledger.
3. Create an entry event code such as CLOSEYEAR for the process BUDG and add these steps:
  - CORG
  - RORG
4. Add the accounts to which you want to post the budget close accounting entries for each entry event step.

**Note:** Refer to the sample Entry Event Process Definition pages (Set Up Financials/Supply Chain, Common Definitions, Entry Event, Process, Entry Event Process Definition)

This example illustrates the fields and controls on the Entry Event Process Definition page - budget close step. You can find definitions for the fields and controls later on this page.

## Processing Entry Events in Commitment Control Budget Close

Example:

- Budget for FY 2011: 1000.00 USD.
- Expended: 400.00 USD.
- Remainder: 600.00 USD.
- Entry Event Code: CLOSEYEAR.
  - Entry Event Step: CORG and account 4610 (DR) and 4510 (CR).

- Entry Event Step: RORG for account 4510 (DR) and 4610 (CR).

Based on this example, after you run the Commitment Control Budget Close process, select the Entry Event Processor to generate these accounting lines with which Journal Generator creates journals that are posted to the ledger and ledger group specified on the Entry Event Process Definition page.

| <b><i>Account</i></b> | <b><i>Fiscal Year</i></b> | <b><i>Accounting Period</i></b> | <b><i>Amount</i></b> |
|-----------------------|---------------------------|---------------------------------|----------------------|
| 4610                  | 2011                      | 998                             | 600.00 USD           |
| 4510                  | 2011                      | 998                             | <600.00> USD         |
| 4510                  | 2012                      | 0                               | 600.00 USD           |
| 4610                  | 2012                      | 0                               | <600.00> USD         |

# Using Alternate Account

---

## Understanding Alternate Accounts

In addition to the following overview, this section also discusses:

- Alternate account mapping and SetID sharing.
- Prerequisites.

PeopleSoft delivers alternate account functionality for its applications as an optional feature to meet the accounting and reporting requirements of multinational organizations that operate in locations, jurisdictions, or countries where statutory or local chart of accounts and reporting rules are mandatory.

By using alternate account, you can enter and maintain both a statutory (local) account value and a corporate (internal) account value at the detail transaction level within General Ledger, as well as within its feeder applications. Alternate account operates with and fully supports the conventional corporate chart of accounts that is required for internal management and external financial reporting. You can also perform year-end closing on alternate account only.

Throughout this documentation ALTACCT, AltAccount, alternate account and local or statutory account are synonymous terms and are used interchangeably.

In addition, ACCOUNT, account, and internal or corporate account are synonymous terms and are also used interchangeably.

Implementing alternate account in General Ledger and its feeder systems, such as Receivables and Payables, requires close coordination of ChartFields, business units and ledgers within the system. Alternate account is best put into place when it is a part of the original overall implementation plan; however, you can add it at a later date.

---

**Note:** Alternate account is intended to fulfill a journal line statutory, or local, reporting requirement. Non-statutory ledger reporting can best be served by using trees, summary ledgers, and PS/nVision to manipulate the account structure and fulfill corporate ledger balance reconciliation and reporting requirements. Do not use the alternate account feature for ledger-level reporting requirements that are not associated with statutory compliance. The alternate account feature increases maintenance as it requires an additional detail chart of alternate accounts.

---

Alternate account is designed for international companies to meet local or national statutory requirements at the journal line or transaction level. Therefore, it is available in General Ledger, as well as general ledger feeder applications, subsystems, and other products, as detailed in the following list:

- Payables
- Receivables
- Asset Management

- Billing
- Expenses
- General Ledger
- Inventory
- Cash Management
- Deal Management
- Risk Management
- Order Management
- Project Costing
- Purchasing

General Ledger is not required to use alternate account with other PeopleSoft products.

You map ALTACCT and ACCOUNT values to one another in either a one-to-one or one-to-many relationship.

The basic level of reporting is defined by the level of detail in the statutory chart of accounts. The most common scenario is that of one or many account values mapped to one alternate account value. This mapping is done by using the Alternate Account page.

If you map one account value to one or many alternate account values, you use the Account page. The mapping of one corporate (internal) account to many statutory alternate accounts is less common. In this scenario, ALTACCT level detail does not contain the basic elements of the transactions in support of detailed alternate account reporting.

You can also provide values for ACCOUNT to ALTACCT and ALTACCT to ACCOUNT suspense. The Journal Edit process uses these entries as the suspense account and alternate account if an Account or Altacct value that is used in a journal is not mapped to an alternate account or account. Suspense entries are errors that must be corrected. If you leave the suspense fields blank, the Journal Edit process also shows the line as an error that must be corrected.

Although you can map an account to multiple alternate accounts and also map an alternate account to multiple accounts, you enter transactions in a one-to-one relationship.

When you enter a transaction in the General Ledger or its feeder systems by using a primary Account ChartField, or corporate accounts, the system also enters the transaction to the alternate account.

Similarly, when you enter a transaction to the Alternate Account ChartField, statutory accounts, the system enters the transaction to the corporate or primary account ChartField.

You can override these values by selecting other values from prompt lists that display only mapped values.

Alternate account relationships can be different for various countries or local reporting entities using PeopleSoft SetID functionality.

You can also designate an alternate account value as a Control Account to make certain that control account updates are generated only through system processes. This helps to ensure that the total of the detail that is in the various related feeder systems, such as Payables, Billing and Accounts Receivable, equals the total of the control account that is maintained by the feeder system for the general ledger.

You can do consolidations over alternate account when you designate alternate account as the anchor ChartField. This provides added flexibility for multinational companies that prepare consolidated statutory financial statements in compliance with local or government reporting requirements.

## Alternate Account Mapping and SetID Sharing

You map a corporate chart of accounts to one or many statutory charts of accounts. For example, you could have one chart of accounts for each country or local office that requires statutory accounting and reporting. When you couple this with the ability to share SetIDs, you have a very efficient solution.

One account value identified by a SetID can be mapped to 1 or many alternate account values. In turn, 1 alternate account value identified by a SetID can be mapped to 1 or many account values. However, any given account or alternate account can be a part of only 1 such mapping.

The following rules govern mapping:

- Within the same SetID, an account can only be mapped once to an alternate account in the same SetID. In turn, within the same SetID an alternate account can only be mapped once to an account in the same SetID.
- If you attempt to map a given account to an alternate account or map an alternate account to an account that is already mapped within the same SetID, you receive an error message indicating that the account or alternate account is already mapped.
- Within a given SetID, you can map an account to multiple alternate accounts as long as each alternate account is in a different SetID; an alternate account that is within a given SetID can be mapped to multiple accounts as long as each account is in a different SetID.

Consider the following examples:

### Example 1 - Account>AltAcct Mappings (Same SetID for Account and Alternate Account):

Mapping #3 is not valid because ALTACCT 101000 is already mapped in Mapping #1 within the same SetID to ACCOUNT 100100.

Mapping #5 is not valid because ACCOUNT 140100 is already mapped in Mapping #4 within the same SetID to ALTACCT 140000.

| <i>Mapping #</i> | <i>ACCOUNT SetID</i> | <i>ACCOUNT</i> | <i>ALTACCT SetID</i> | <i>ALTACCT</i> | <i>Is Mapping Valid?</i> |
|------------------|----------------------|----------------|----------------------|----------------|--------------------------|
| #1               | MFG                  | 100100         | MFG                  | 101000         | Yes                      |
| #1               | MFG                  | 100100         | MFG                  | 101002         | Yes                      |

| <b>Mapping #</b> | <b>ACCOUNT SetID</b> | <b>ACCOUNT</b> | <b>ALTACCT SetID</b> | <b>ALTACCT</b> | <b>Is Mapping Valid?</b> |
|------------------|----------------------|----------------|----------------------|----------------|--------------------------|
| #2               | MFG                  | 109000         | MFG                  | 101003         | Yes                      |
| #3               | MFG                  | 109100         | MFG                  | 101000         | No                       |
| #4               | FS                   | 140100         | FS                   | 140000         | Yes                      |
| #4               | FS                   | 140101         | FS                   | 140000         | Yes                      |
| #5               | FS                   | 140100         | FS                   | 140500         | No                       |

### **Example 2 - Account>AltAcct Mappings (Different SetIDs for Account and Alternate Account):**

In Example 2, Mappings #1 and #2 have an ACCOUNT value mapped to several ALTACCT values having different SetIDs.

Mapping #3a is not valid because the same ACCOUNT value in the same SetID (101000 in CORP) is already a part of the one account to many alternate account mappings in Mapping #1.

Mapping #3b is not valid because the same ALTACCT value in the same SetID (101003 in FRNC) is mapped to the same SetID (CORP) for the account values.

Likewise, mapping #4 is not valid because the same ALTACCT value in the same SetID (106001 in SPAN) is mapped to the same SetID (CORP) for the account values.

| <b>Mapping #</b> | <b>ACCOUNT SetID</b> | <b>ACCOUNT</b> | <b>ALTACCT SetID</b> | <b>ALTACCT</b> | <b>Is Mapping Valid?</b> |
|------------------|----------------------|----------------|----------------------|----------------|--------------------------|
| #1               | CORP                 | 101000         | FRNC                 | 101001         | Yes                      |
| #1               | CORP                 | 101000         | FRNC                 | 101002         | Yes                      |
| #1               | CORP                 | 101000         | SPAN                 | 102001         | Yes                      |
| #1               | CORP                 | 101000         | SPAN                 | 101002         | Yes                      |
| #1               | CORP                 | 101000         | GMNY                 | 103001         | Yes                      |
| #1               | CORP                 | 101000         | GMNY                 | 103002         | Yes                      |

| <b>Mapping #</b> | <b>ACCOUNT SetID</b> | <b>ACCOUNT</b> | <b>ALTACCT SetID</b> | <b>ALTACCT</b> | <b>Is Mapping Valid?</b> |
|------------------|----------------------|----------------|----------------------|----------------|--------------------------|
| #2               | CORP                 | 105000         | FRNC                 | 105001         | Yes                      |
| #2               | CORP                 | 105000         | SPAN                 | 106001         | Yes                      |
| #2               | CORP                 | 105000         | GMNY                 | 107001         | Yes                      |
| #3a              | CORP                 | 101000         | FRNC                 | 101003         | No                       |
| #3b              | CORP                 | 100000         | FRNC                 | 101003         | No                       |
| #4               | CORP                 | 110000         | SPAN                 | 106001         | No                       |

### Prompting for Account and Alternate Account and TableSet Sharing

To enable prompting for ACCOUNT and ALTACCT for a specific business unit, you must set up the appropriate SetIDs for these prompts by creating tableset sharing definitions.

The following are examples of tableset sharing definitions for ACCOUNT and ALTACCT:

| <b>Set Control Value</b> | <b>Business Unit</b> | <b>TableSet Record Group</b> | <b>ACCOUNT SetID</b> | <b>ALTACCT SetID</b> |
|--------------------------|----------------------|------------------------------|----------------------|----------------------|
| M60                      | M60                  | FS_05                        | CORP                 |                      |
|                          |                      | FS_40                        |                      | FRNC                 |
| M61                      | M61                  | FS_05                        | CORP                 |                      |
|                          |                      | FS_40                        |                      | SPAN                 |
| M62                      | M62                  | FS_05                        | CORP                 |                      |
|                          |                      |                              |                      | GMNY                 |

In the above table, each business unit that is defined by the set control value has access only to the designated SetIDs for the specific business unit. For example, when you create a journal for Business Unit M60, the prompting on ACCOUNT and ALTACCT appears as CORP and FRNC, respectively. Business Unit M60 does not have access to any ACCOUNTS or ALTACCTS under any other SetIDs.

## Prerequisites

In order to use alternate accounts, the following prerequisites apply.

- If you plan to identify specific business units that may use alternate accounts, you must set up the general ledger business units first.
- If you plan to enable subsystem applications to use alternate accounts, you must associate the business unit for the application to a general ledger business unit that is also using the Alternate Account feature on the Ledgers For A Unit page.

[Entering and Maintaining ChartField Values](#)

"Defining General Ledger Business Units" (PeopleSoft General Ledger)

## Enabling Alternate Accounts

To enable alternate accounts, use the Installation component (INSTALLATION) and the Ledgers For A Unit component (BUSINESS\_UNIT\_LED). Use the EM\_BUS\_UNIT\_LED component interface to load data into the tables for the BUSINESS\_UNIT\_LED component.

### Pages Used to Enable Alternate Account

| <i>Page Name</i>                     | <i>Definition Name</i> | <i>Usage</i>                                                                                                                                                                                                                                                  |
|--------------------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Installation Options - Overall Page  | INSTALLATION_FS1       | Enables the use of alternate accounts.<br><br>See <a href="#">Enabling Alternate Account at the Installation Level</a> .                                                                                                                                      |
| Ledgers For A Unit - Definition Page | BUSINESS_UNIT_LED1     | You can enable a particular ledger group in a business unit for alternate accounts, provided that alternate account is enabled at the installation level.<br><br>See <a href="#">Enabling Alternate Account at the Ledger Group and Business Unit Level</a> . |

### Enabling Alternate Account at the Installation Level

Use the Installation Options - Overall page (INSTALLATION\_FS1) to enable the use of alternate accounts.

Navigation:

**Set Up Financials/Supply Chain >Install >Installation Options >Overall**

To enable alternate account at the installation level, select the **Enable Alternate Account** check box. When you select this check box, pages and views in the various applications show alternate account related fields and enable dynamic prompting. In addition, journal generator creates journal entries at a minimum level of ACCOUNT and ALTACCT.

If you do not select this check box, the various products do not display alternate account fields and prompt lists, and journal generator only creates journal entries at a minimum level of ACCOUNT.

## Enabling Alternate Account at the Ledger Group and Business Unit Level

Use the Ledgers For A Unit - Definition page (BUSINESS\_UNIT\_LED1) to enable a particular ledger group in a business unit for alternate accounts, provided that alternate account is enabled at the installation level.

Navigation:

**Set Up Financials/Supply Chain >Business Unit Related >General Ledger >Ledgers For A Unit >Definition.**

To enable alternate accounts at the business unit and ledger group level:

1. Select a business unit that requires the use of alternate accounts.
2. Select the **Enable Alternate Accounts** check box for each detail ledger group that might require the use of alternate accounts. The **Acct > Alt Suspense** and **Alt > Acct Suspense** fields become available for entry. Typically suspense accounts hold offsetting values to ensure balanced ledgers and journals. You must later return to these suspense accounts to correct the distribution.
3. Select the alternate suspense account for the first field and the account suspense account for the second field.

---

**Note:** If you select the **Enable Alternate Account** check box but do not define a mapping option for the alternate account on the Account or Alternate Account page, the system uses the suspense account that you define on the Ledgers For A Unit - Definition page.

---

## Adding and Mapping Accounts and Alternate Accounts

To add and map accounts and alternate accounts, use the Account component (GL\_ACCOUNT) and the Alternate Account component (ALTACCT). Use the ACCOUNT\_CF component interface and the ALTACCT\_CF component interface to load data into the tables for these components.

Add or update on the *one* side of the *one to many* relation. For example, to map one account to many alternate accounts, enter the mappings using the GL\_ACCOUNT (Account) component.

## Pages Used to Add or Map Alternate Accounts

| <b>Page Name</b>                                        | <b>Definition Name</b> | <b>Usage</b>                                                                                                                                                                                                                                                                                                                                                            |

|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Account SetID</b>                                                              | If any accounts are already mapped to this alternate account, the SetID of the account displaying in the Mapped Accounts group box appears in the <b>Account SetID</b> field. Click the <b>Add a New Row</b> button to select another account SetID. This enables the <b>Account</b> field that is in the Mapped Accounts group box. You can then select an account for the selected SetID to map to this alternate account. If you click the <b>Add a New Row</b> button in the <b>Mapped Accounts</b> group box, you can map a second account by using the same SetID as the first account. |
| <b>Add Account</b>                                                                | Click this link to add a new account to the chart of accounts that does not exist for the selected SetID. This takes you to the Account ChartField definition page, where you enter the information for the new account and select apply. You return to the Map to Account page where you can now select the SetID and new account to add to the page.                                                                                                                                                                                                                                        |
| <b>One Account to One or Many Altacct and One Altacct to One or Many Accounts</b> | <p>One of these options is selected by the system when you link the account value with one or more alternate account values or you link one alternate account value to more than one accounts.</p> <hr/> <p><b>Note:</b> You must specify a default alternate account before you can save this page.</p>                                                                                                                                                                                                                                                                                      |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mapped Accounts</b>  | Scroll to enter the accounts from the selected SetID that you want to map or link to this alternate account. Later, when you enter an alternate account value as part of a transaction, you can use only the account values that you define in this scroll. The selection of either <b>One Account to One or Many Altacct</b> or <b>One Altacct to One or Many Accounts</b> check box determines the relationship of these ChartFields. The selections on opposing mapping pages for alternate account and account are grayed to prevent many-to-many relationships |
| <b>Default Account</b>  | Select an account in the scroll to enable the system to use that account as the default account on transaction entry pages. The system uses this account during processing for a particular alternate account. If you enter the alternate account first on the journal line, the analytical account appears by default based on the value that you specify on this page. You must specify a default account before you can save the page.                                                                                                                           |

## Map to Alternate Account Page

Use the Map to Alternate Account page (ACC\_XREF) to map a corporate chart of accounts to one or many statutory charts of accounts.

For example, you could have one chart of accounts for each country or local office that requires statutory accounting and reporting.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Design ChartFields >Define Values >ChartField Values >Account >Map to Alternate Account**

This example illustrates the fields and controls on the Account - Map to Alternate Account page. You can find definitions for the fields and controls later on this page.

The screenshot displays the 'Map to Alternate Account' page. At the top, there are tabs for 'Account' and 'Map to Alternate Account'. Below the tabs, the page shows the following information:

- SetID:** SHARE
- Account:** 100002
- USBK - Disbursements Account**

The 'Mapped Alternate Account Setids' section includes a 'Find | View All' link and a 'First 1 of 2 Last' indicator. Below this, there is a table for 'Mapped Alternate Accounts' with the following columns: 'Default AltAcct', 'Alternate Account', and 'Description'. The table contains one row with the following data:

| Default AltAcct | Alternate Account | Description             |
|-----------------|-------------------|-------------------------|
|                 | 550000            | Comptes Courants Banque |

The 'Mapping Mode' section shows two options: 'One Account to One or Many AltAccts' (unchecked) and 'One AltAcct to One or Many Accounts' (checked).

Use this page to map the one account value to one or more alternate account values or to map the account value to only one alternate account. This page works like the Alternate Account - Map to Account page

that is described previously. The difference is that you map an account to one or more alternate accounts by using this page, while on the previous alternate account page you map an alternate account to one or more accounts.

# Defining Accounting Calendars

## Understanding Accounting Calendars Based on Open and Close Periods

You can establish an accounting period configuration based on the beginning and ending period dates that you normally use, and combine these periods to create calendars. These accounting calendars define the time periods to which you post transactions for different transaction types, ledger groups, ledger codes, and business units. Set up calendars along with ledger codes, ledger groups, and business units according to your accounting environment.

PeopleSoft General Ledger supports multiple calendars, so you can keep separate calendars for actuals, for budget and forecast activity, and for special reporting or transitional needs. Only one calendar can be active for a ledger at a given time.

The PeopleSoft system uses the following calendar definition options:

| <b><i>Term</i></b>      | <b><i>Definition</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Calendar Builder</b> | Use to create a base calendar that is the starting point for creating other calendars such as the detail calendar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Detail Calendar</b>  | Define detail calendars to include the number and duration of accounting periods in your fiscal year and the beginning and ending dates for each period. This option also identifies the adjustment periods for the calendar. Posting is directly tied to the ledger group's calendar. Transactions are posted to the open period that corresponds to the journal date and to the adjustment period that you specify on the journal header. You can have any number of periods or years open at any time. If you use Asset Management, you can set up your depreciation allocations based on the detail calendars that you define. |
| <b>Summary Calendar</b> | (Optional) Use summary calendars to group detail calendar periods for inquiries and reporting, such as quarterly reports and semiannual reviews. While you must use detail calendars to control the posting of journals to a detail ledger, you use summary calendars with a summary ledger to further collapse your data across detail calendar periods. The accounting period on your summary ledger data corresponds to the summary calendar periods that you define. While you can associate a detail calendar with your summary ledger, you <i>cannot</i> use a summary calendar with your detail ledger.                     |

| <b>Term</b>                                                 | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Business Calendar</b>                                    | <p>(Optional) Use to create the business (or working) calendar that identifies holidays and nonworking days. Once you define one or more of these calendars, link it to the business unit in the <b>Holiday List ID</b> field on the General Ledger Definition - Definition page. The only ledgers that recognize the business calendar are those with a default ledger type of Standard ledger template set up on the Ledger Template - Record Definitions page.</p> <p>When you enter journals on the journal entry pages or run the Journal Generator process (FS_JGEN), the system edits the journal date to ensure that it falls on a working day. The Journal Edit process (GL_JEDIT) checks the journal date to verify that it falls on a working day in that business calendar. If the process finds that the journal date is not a working day, it marks the journal as an error. Because you cannot change the journal date, copy the journal to another date using the Copy Journal function, and delete the original journal (the one marked as in error).</p> <p>For reversals, the Journal Edit process, not the Journal Post process (GL_JP), populates the reversal date. If you selected either <i>End of Next Period</i> or <i>Beginning of Next Period</i> for the reversal date on the journal header, the Journal Edit process changes the date if the date is not a working date. If you selected <i>Beginning of Next Period</i>, it uses the first valid working day in the next period. If you selected <i>End of Next Period</i>, it uses the last valid working day in the next period.</p> <p>You can enter a specific journal date for reversals only when you enter journals using the Journal Entry pages. If you specify a date, the system edits the date at that time and requires you to enter a valid working date.</p> <p>Used to manually define fiscal and nonfiscal detail budget period calendars for use with Commitment Control budgets.</p> |
| <b>Budget Period Calendar</b>                               | Use to manually define fiscal and nonfiscal detail budget period calendars for use with Commitment Control budgets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Budget Period Calendar Builder</b>                       | Use to automatically define budget period calendars for use with Commitment Control budgets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Summary BP Calendar</b> (summary budget period calendar) | Use to create a summary budget period calendar, based on a predefined detail budget period calendar, for use with Commitment Control budgets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Scheduling Options</b>                                   | Use to define scheduling options for various activities.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

"Defining Commitment Control Budget Period Calendars" (PeopleSoft Commitment Control)

## Adjustments and Other Special Periods

You can have as many adjustment periods (up to 3 digits) as necessary to capture adjustments according to your business practices. Define these adjustment periods on your detail calendars. For example, you can set up adjustment periods to capture adjustments for different parts of the year: one to capture adjustments for the first half of the year, one for the second half of the year, and one for the full year. You can set up adjustment periods to capture different types of adjustments: one for supervisor-related adjustments to that supervisor's department journals, one for adjustments based on internal audits, one for adjustments based on external audits, and one for adjustments related to a tax authority.

General Ledger maintains the following special periods that are not stored in normal calendar periods, so that they do not distort the period-to-period or year-to-year results. You can include them when you run reports, inquiries, or other processes such as summary ledgers.

| <b>Term</b>       | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Period 0</i>   | Use to store the balance forward amounts or the balance at the beginning of each year. For balance sheet accounts, this represents the opening balance. Although normally zero for profit and loss accounts, this period can contain inception-to-date totals for the ChartFields that you specify on the P/L Roll Forward Options page in your closing rule. General Ledger updates this period only during the closing process. |
| <i>Period 998</i> | Use to store adjustment entries. You can create other adjustment periods to use instead of, or in addition to, the default adjustment period. Indicate an adjusting entry when you enter journals by selecting the <b>Adjustment Entry</b> check box on the Journal Entry - Header page.                                                                                                                                          |
| <i>Period 999</i> | Use to store the results of year-end closing. The year-end closing entry to book the current year net income to retained earnings is posted here. General Ledger updates this period during the closing process only.                                                                                                                                                                                                             |

**Note:** Set up adjustment periods *sequentially*—for example, 901 through 912, corresponding to accounting periods 1 to 12.

## Open Periods

General Ledger stores in its ledgers the activity for each accounting period defined in the calendar for the business unit and ledger group. Determine the beginning and end date of each period according to the calendar associated with each business unit and ledger group. Additionally, identify which periods are open (periods in which transactions can be posted) for each business unit, transaction type, ledger group, and ledger code.

Many PeopleSoft applications identify their open periods from the associated General Ledger business unit's calendar and open periods. When General Ledger closes periods for a business unit, all applications associated with that business unit are closed at the same time and transactions cannot be entered into the closed period. This is to ensure that no entries are recorded after financial statements are created.

You can also book accounting transactions according to different and often conflicting accounting principles for one business unit in one ledger and maintain these entries in compliance with the various rules promulgated by governments and regulatory organizations. To use multiple generally accepted accounting principles (GAAP), the PeopleSoft system uses book codes and ledger codes to create subsets of a ledger that enable you to simultaneously enter transactions into the subsets while maintaining their balances according to the accounting principles applicable to each subset. These book codes and ledger codes facilitate making prior period adjustments.

Transaction types as defined by the PeopleSoft system enable you to control which transactions are open and closed for further processing within a business cycle for both General Ledger journal entries and individual application transactions.

The following PeopleSoft applications can require open period date ranges independently of General Ledger and each other. For the applications that can have separate open period ranges, the open periods are defined for each business unit. Date ranges for open periods in an application can be the same as the open period date ranges for the associated general ledger business unit or they can be different. You can change these dates for applications by entering lag days or by changing the beginning and ending dates for the open period:

- Asset Management
- Billing
- Expenses
- Payables
- Accounts Receivable
- Project Costing
- Inventory

Lag days can be at the beginning of the period, at the end of the period, or both. When you enter beginning lag days, the system calculates the first open date based on the from open period and year plus the lag days. For example, suppose that the from open period and year is second period 2003, and the first date of that period (as defined for the associated general ledger business unit) is April 1, 2003. If you enter -3 lag days for Accounts Payable (AP), the system calculates the first date of the open period for accounts payable as March 29, 2003. The system calculates end lag days in a similar manner.

Begin lag days enables you to enter transactions in an accounting period before the General Ledger start date of that accounting period. End lag days closes the accounting period before the General Ledger close date for the accounting period. Application transactions that you enter after the application-calculated close date are applied to the next period, even though the period is still open in General Ledger.

Lag days can be zero or a negative number only. This prevents you from inadvertently defining an application's open period end date (that is, the period closing date) as later than the period closing date as assigned for the associated General Ledger business unit.

Some customers have many legal entities that require their own set of books. The resulting number of ledgers and business units require the ability to perform mass updates rather than individually updating each business unit and ledger group's open periods. Mass updates enable you to change the open periods for a number of business units and ledger groups at the same time. Additionally, you can migrate mass changes that you make for General Ledger to other applications.

## Individual and Mass Updating of Open Periods

Once you identify open periods, you can update them using any of the following methods:

- Individual updates by business unit (for applications) or by business unit and ledger group (for General Ledger) using the Open Period Update page or the Open Periods Mass Update page.
- Mass updates across business units (for applications) or across business units and ledger groups (for General Ledger) using the Open Periods Mass Update page.
- Mass updates to applications' open periods using the migrate feature on the Open Periods Mass Update page.

This feature migrates open period changes from General Ledger to other applications.

Post journal entries to the open periods defined on the Open Periods Mass Update page or the Open Period page only.

An advantage of using lag days to define date ranges for an application's open period is evident when you perform mass updates. You enter period beginning and end dates, which are applied to each of the business unit and transactions types within the application. If you have lag days defined for each of the business units, the lag days remain the same, and the application date range is calculated relative to the date range for the associated general ledger business unit. For example, suppose that the first date of the open period is April 1, 20X3 with –3 lag days making the application's period start date March 29, 20X3. When you change the period start date to April 5, 20X3, the –3 lag days still apply, and the period start date for the application becomes April 2, 20X3. With lag days, you can make one change that affects many business units but still results in different period start and end dates for each business unit.

| <b>Unit</b> | <b>General Ledger Period Start</b> | <b>Lag Days</b> | <b>Calculated Application Period Start</b> | <b>Changed GL Period Start (Mass Update)</b> | <b>Lag Days (Same)</b> | <b>New Application Period Start (After Mass Update)</b> |
|-------------|------------------------------------|-----------------|--------------------------------------------|----------------------------------------------|------------------------|---------------------------------------------------------|
| US004       | April 1, 20X3                      | –3              | March 29, 20X3                             | May 1, 20X3                                  | –3                     | April 28, 20X3                                          |
| US005       | April 1, 20X3                      | 0               | April 1, 20X3                              | May 1, 20X3                                  | 0                      | May 1, 20X3                                             |
| US006       | April 1, 20X3                      | –2              | March 30, 20X2                             | May 1, 20X3                                  | –2                     | April 29, 20X3                                          |

**Note:** This assumes that there is no business calendar associated with the business unit.

Another way to define period start and end dates for an application business unit differently from the associated general ledger business unit is to enter different period start dates and period end dates. The result is the same, but you lose the advantage of mass updates.

---

**Note:** If you must make adjustments to a closed period, reopen the closed period, and if the ledgers or journals for that period have been archived, restore the archived ledgers or journals before you make adjustments.

## Setting Up Calendar Builder

Use the base calendar to define other calendars, such as a detail daily calendar for average daily balances or a detail monthly calendar.

To set up Calendar Builder, use the Calendar Builder component (CALENDAR\_BUILDER).

### Page Used to Set Up Calendar Builder

| 912               | Adjustment Period 12       | 912          | + | - |
| 998               | Standard Adjustment Period | 998          | + | - |

You can define a detail calendar from scratch, or you can use a base calendar, defined in Calendar Builder, to create a detail calendar and further define it using the Calendar Periods page.

| Field or Control         | Description                                                                                                                                                                                                                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Calendar</b>          | Enter the calendar ID or name to appear on prompt lists, inquiries, and reports. If you select a calendar that you built using Calendar Builder, you can change the name.                                                                                                                                                |
| <b>Periods in a Year</b> | Enter the number of periods based on the type of calendar. Do not count adjustment periods or special system-maintained periods (0, 998, 999). PS/nVision reporting uses the number of periods that you enter here to identify TimeSpans that roll from one year into another, such as a <i>rolling</i> 12-month report. |
| <b>End Date Default</b>  | Select an end date default. Options are: <b>Year</b> , <b>Month</b> , <b>BiMonth</b> , <b>Quarter</b> , <b>SemiAnnual</b> , and <b>Days</b> .                                                                                                                                                                            |
| <b>Specify</b>           | Enter the number of days to include on your calendar if you select <b>Days</b> in the <b>End Date Default</b> field. For example, enter 365.                                                                                                                                                                             |

| <b>Field or Control</b>  | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Detail Periods</b>    | To create a new detail calendar rather than set one up in Calendar Builder, enter the first row of detail and include the <b>Year, Period, Begin Date, End Date, Period Name,</b> and <b>Abbreviation</b> values for period 1. When you add one or more rows, the system updates each row with the correct year, period, begin, and end dates. Enter the period name and abbreviation for each new row only. Every day of the year must be included in a period; <i>do not</i> leave gaps between period dates, and <i>do not</i> allow dates to overlap.                                                    |
| <b>Adjustment Period</b> | <p>The period 998 is the default period for fiscal year-end adjustments. If you have only one adjustment period, accept the default.</p> <p>If you have other adjustment periods, enter them in addition to or as a replacement for the default adjustment period. Enter an adjustment period, period name, and abbreviation for each adjustment period. Adjustment period (for example, 901 or 902) identifies the adjustment period. The adjustment period <i>cannot</i> be an actual period (such as 1 through 12 for a monthly calendar) or any of the system-maintained periods (such as 0 or 999).</p> |

Use this page of a detail calendar if you are using Asset Management. In each calendar that you establish, define the number of periods across which to allocate annual depreciation.

| Field or Control                                                        | Description                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Alloc of Yearly Depreciation</b> (allocation of yearly depreciation) | The depreciation allocation period that you establish here is used to determine how much of the annual depreciation calculated in Asset Management for each asset is allocated to each defined period. You can set up as many periods for as many years as you want by adding lines to the detail calendar. You can also modify the depreciation allocation on this page. |

## Defining Summary Calendars

To define Summary Calendars, use the Summary Calendar component (SUMMARY\_CALENDAR).

Page Used to Define Summary Calendars

| Page Name             | Definition Name  | Usage                                                                                                                   |
|-----------------------|------------------|-------------------------------------------------------------------------------------------------------------------------|
| Summary Calendar Page | SUMMARY_CALENDAR | Summarizes the detail calendar into a specified number of periods used with summary ledgers to produce summary reports. |

Summary Calendar Page

Use the Summary Calendar page (SUMMARY\_CALENDAR) to summarizes the detail calendar into a specified number of periods used with summary ledgers to produce summary reports.

| Field or Control  | Description                                                                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Summary Calendar  | Enter the calendar's name or title to appear on pages, reports, and online inquiries.                                                                                                                                  |
| Periods in a Year | Specify the number of periods in the accounting year for this calendar. PS/nVision reporting uses the number of periods to identify TimeSpans that roll from one year into another, such as a rolling 12-month report. |
| Detail Calendar   | Select a detail calendar. Every summary calendar must be based on a detail calendar.                                                                                                                                   |

| <b>Field or Control</b>                                   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Fiscal Year, Period, Period Name, and Abbreviation</b> | Enter the information for each summary fiscal year, each summary period in that year, and a period name and abbreviation for each period. You can define as many years on a calendar as necessary, including years for storing historical information.                                                                                                                                                                                                                                                                                                                                                                  |
| <b>From Period and To Period</b>                          | Enter the detail calendar periods to summarize in each summary period. In addition to grouping periods, such as combining monthly accounting periods into quarterly results, you can specify a from period of 1 in all ranges, and use this to store year-to-date balances in each summary period on your summary ledger. Your year-to-date summary periods can match your detail calendar periods. For example, a monthly detail calendar is summarized into a monthly year-to-date calendar. You can also combine detail periods such as a monthly detail calendar summarized into a quarterly year-to-date calendar. |

You also assign business calendars to bank accounts to identify the normal working week and bank holidays. |

### Business Calendar Page

Use the Business Calendar page (BUS\_CALENDAR\_HOL) to create a list of holidays and nonworking days for PeopleSoft applications.

General Ledger uses the business calendar to verify that the journal date is a working day. You also assign business calendars to bank accounts to identify the normal working week and bank holidays.

Navigation:

**Set Up Financials/Supply Chain > Common Definitions > Calendar/Schedules > Business Calendar > Business Calendar**

This example illustrates the fields and controls on the Business Calendar page. You can find definitions for the fields and controls later on this page.

## Setting Up a Business Calendar

To set up a business calendar:

1. Enter a description of the calendar, such as the name of a country or business unit.
2. Select the normal business days of the week to include.
3. Enter the total hours worked each day of the week.
4. Enter the calendar year of the holidays.
5. Click the **Search** button to enter, delete, or display holidays for the entered year.
6. Add rows with the date and holiday name for each holiday in that year.

The system displays the day of the week.

## Defining and Updating Open Periods and Adjustment Periods

To define and updated an Open Period, use the Open Period Update component (OPEN\_PERIOD\_UPDATE) and the Open Periods Mass Update component (OPEN\_CLOSE\_PERIODS).

## Pages Used to Define and Update Open Periods and Adjustment Periods

| <i><b>Page Name</b></i>                   | <i><b>Definition Name</b></i> | <i><b>Usage</b></i>                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>Open Period Update Page</u>            | OPEN_PERIOD_SINGLE            | Define open periods for a general ledger business unit and ledger group where you can set periods by transaction types, and then define these periods by ledger code and adjustment types.                                                                                                                                            |
| <u>Open Period Display Page</u>           | OPEN_PERIOD_SINGLE            | View existing open periods and adjustment periods for a business unit and ledger group.                                                                                                                                                                                                                                               |
| <u>Open Period Mass Update Page</u>       | OPEN_CLOSE_PERIODS            | Make mass changes to open periods for general ledger business units and ledger groups or an application's business units, and migrate General Ledger open period changes to specified applications. You can also make changes to the open periods for a single business unit and ledger group or business unit and transaction group. |
| <u>Adjustment Period Mass Update Page</u> | OPEN_ADJ_MASS_UPD             | Make mass changes to adjustment periods for general ledger business units and ledger groups.                                                                                                                                                                                                                                          |

### Open Period Update Page

Use the Open Period Update page (OPEN\_PERIOD\_SINGLE) to define open periods for a general ledger business unit and ledger group where you can set periods by transaction types, and then define these periods by ledger code and adjustment types.

Navigation:

**Set Up Financials/Supply Chain > Business Unit Related > General Ledger > Open Periods > Open Period Update > Open Period Update**

This example illustrates the fields and controls on the Open Period Update page for PeopleSoft Receivables. You can find definitions for the fields and controls later on this page.

|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PeopleSoft Product, Business Unit, and Ledger Group</b> | <p>When you set up a ledger group and ledger for a general ledger business unit, on the Ledgers For a Unit page, you can click <b>Update Open Periods</b> to access the Open Period page. You can set up the periods for this general ledger business unit and ledger group. For general ledger business units and ledgers, you can also set up open periods by ledger code and then define the open periods for general ledger transaction types by ledger code and adjustment types.</p> <p>When you set up a business unit for an application, such as Receivables, click the <b>Update Open Periods</b> link on the Accounting Options 1 page to access the Update Periods page. You can enter the open period parameters for the application's business unit, display all of the application's transaction types, and set up the open periods for each type by using lag days.</p> |
| <b>Show all transactions types</b>                         | Select this option for a subsystem application business unit and a list of all the transaction types defined for the specific application becomes available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Ledgers for a Unit</b>                                  | Select this link to access the Ledgers For A Unit page to setup or to modify data for such things as Ledger Code, adjustment types, and open periods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Trans Type</b> (transaction types)                      | <p>Define the beginning and ending period dates for each transaction type to control which transactions and subsystems are open and closed for further processing within a business cycle. Transaction types are system defined and cannot be accessed by the user.</p> <p>When you enter a transaction with a specific business unit and ledger group in a journal entry in General Ledger or a transaction in one of the subsystem applications, and you save the transaction, the system looks at the date of the transaction and the transaction type. It checks that the transaction date is within the open period set up for that transaction type. If the date is within the open period, processing can continue. If the date is outside the open period, an error message appears, and you cannot continue processing until you change the date.</p>                          |

| <b>Field or Control</b>                 | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ledger Code</b>                      | <p>Select ledger codes for general ledger business unit transaction types only. You can set up open periods for detail ledgers by ledger code instead of ledger group on the Ledgers For A Unit Definition page. When you click <b>Update Open Periods by Ledger Code</b> for a general ledger business unit ledger, select the ledger code and adjustment type that you want this business unit to use.</p> <p>Ledger codes group one or more book codes to create a subset of a ledger. Each subset can represent a balance maintained according to specific GAAP imposed on either a local or corporate entity or both. Each ledger code represents the balances for one particular GAAP reporting. Book codes and ledger codes enable you to set up open and close periods for multiple GAAPs.</p> <p>The <b>Ledger Code</b> field becomes available when you activate the book code at the installation level and choose to update by ledger code on the Ledgers For a Unit page.</p> <hr/> <p><b>Note:</b> Once you have decided to use the Book Code feature, do not change it from on to off in the normal course of operations. However, this might occur at installation or first use of the feature. The update open periods function and book code options work together (ledger code and adjustment type); if you change the book code option, then a corresponding change and <i>save</i> for the open period is necessary.</p> <hr/> <p>See "Understanding Multiple GAAPs and Prior Period Adjustments" (PeopleSoft Global Options and Reports).</p> |
| <b>Adjust Type</b> (adjustment type)    | <p>If you select Update Open Periods by Ledger Code on the Ledger For A Unit Definition page, when you select a ledger code, select an adjustment type value for your General Ledger transaction types.</p> <p>Specify an adjustment type for a selected ledger code, when the specified ledger code's period closes earlier than the periods of other ledger codes within the same ledger. (The ledger code that closes the latest should not have an adjustment type.) Adjustment types are defined for each combination of ledger code and book code that share accounts with other ledger code and book code combinations. These codes are used when working with multiple GAAPs and prior period adjustments that specify different rules regarding different closing dates and prior period adjustments.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>From Year</b> and <b>From Period</b> | <p>Enter the beginning open year and period for each transaction type. You can open multiple fiscal years, but define the years in the calendar that this ledger uses.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Field or Control</b>             | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Begin Lag</b>                    | <p>Enabled only for subsystem applications, not General Ledger. Use lag days to calculate accounting period start and end dates relative to General Ledger accounting period start and end dates. For example, if an application's period start date is defined in terms of -3 lag days, then the application's period start date is always 3 days earlier than the associated General Ledger open period start date. Enter lag days expressed as a negative number.</p> <hr/> <p><b>Important!</b> Be careful when you enter lag days. For example, if you enter -3 in the <b>End Lag</b> field, but 0 in the <b>Begin Lag</b> field, one period ends three days before the next period starts.</p> <hr/> <p><b>Note:</b> If you have a business calendar associated with your business unit, the system calculations treats lag days as working days. For example, if the start date for a General Ledger period is June 1, 2004 (a Tuesday), and you enter -3 lag days for the application, the system considers this to be -3 <i>working days</i>. The resulting close date for the application is May 27 (a Thursday).</p> <hr/> |
| <b>First Open</b>                   | <p>The system calculates the first open date based on the information that you enter.</p> <p>For General Ledger, the first open date is taken from the beginning date for the opening accounting period as defined on the detail calendar.</p> <p>For other applications, first open is based on the beginning date for the from year and from period, plus lag days. For example, suppose that the period starts on April 1 and you specify -3 as the begin lag value; the system calculates that the first open date of the period is March 29. You can change this date for each transaction type. Changing this date does not change the lag days. This enables you to override the calculated period start date for an application's period for one time only. When the next mass update occurs, the first open date is calculated as defined.</p>                                                                                                                                                                                                                                                                               |
| <b>To Year</b> and <b>To Period</b> | <p>Select to indicate the last year and period that are currently open for the ledger or ledger code. You can open across multiple fiscal years, but you must define the years in the calendar that this ledger uses.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>End Lag</b>                      | <p>Enabled only for subsystem applications, not General Ledger. Enter lag days expressed as a negative number. When you enter an end lag number such as -4, it subtracts the number of days from the to year and to period and displays the new date in the <b>Last Open</b> date field. For example, suppose that the to year and to period is December 2004, and you enter -4 for the end lag value; when you save, the last open date becomes December 27, 2004.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Field or Control</b>  | <b>Description</b>                                                                                                                                                                                                                                                                                                  |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Last Open</b>         | The system calculates this date similarly to the way that it calculates first open date. For products other than General Ledger, you can change this date. Changing the date does not change the lag days.                                                                                                          |
| <b>Adjustment Period</b> | Set up adjustment periods on your detail calendars for a business unit. They are available for General Ledger open periods only. This enables you to selectively indicate that specific adjustment periods are either open or closed during the selected adjustment year and to select a default adjustment period. |
| <b>Adjustment Year</b>   | Enter an adjustment year for each adjustment period. The year must be previously set up as a calendar. Identify the calendar on the Ledgers For A Unit Definition page.                                                                                                                                             |
| <b>Is Open</b>           | Select to indicate that each adjustment period is open. If deselected, the adjustment period is closed. This option gives you control over each adjustment period to prevent users from performing adjustments in the wrong period.                                                                                 |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                        |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>          | Select to indicate the default adjustment period for this ledger. A default adjustment period must be selected and there can be only one. |

---

**Note:** If you do not enable **Use Book Code** on the Ledgers For A Unit - Definition page, the **Update Open Periods by Ledger Code** option is removed and you can open and close periods by ledger group only.

## Open Period Display Page

Use the Open Period Display page (OPEN\_PERIOD\_SINGLE) to view existing open periods and adjustment periods for a business unit and ledger group.

Navigation:

**Set Up Financials/Supply Chain > Business Unit Related > General Ledger > Open Periods > Open Period Display**

See also the [Open Period Update Page](#).

## Open Period Mass Update Page

Use the Open Period Mass Update page (OPEN\_CLOSE\_PERIODS) to make mass changes to open periods for general ledger business units and ledger groups or an application's business units, and migrate General Ledger open period changes to specified applications.

You can also make changes to the open periods for a single business unit and ledger group or business unit and transaction group.

Navigation:

**Set Up Financials/Supply Chain > Business Unit Related > General Ledger > Open Periods > Open Periods Mass Update > Open Period Mass Update**

This example illustrates the fields and controls on the Open Period Mass Update page for General Ledger. You can find definitions for the fields and controls later on this page.

## Performing a Mass Update

To perform a mass update:

- Enter the selection criteria for General Ledger on the Open Periods page.  
Use a wildcard (%) to select all business units and all ledger groups, or select a specific business unit and enter a wildcard for all ledger groups, or enter a wildcard for all business units and a specific ledger group. Click the **Search** button. A list of open periods appears based on your selection criteria.
- Click the **Select All** button to select every open period on the list for mass update.  
Click the **Clear All** button to reverse this action and select rows individually.
- Enter the open period changes in the **Update Selected Rows** group box, and click the **Apply** button.  
The system applies the changes to each selected business unit and ledger group.

## Migrating Mass General Ledger Open Periods to Subsystems

To migrate mass General Ledger open periods to selected subsystems:

- Enter *GL* as the product on the Open Periods page, complete the selection criteria, and click the **Search** button.
- Select the business units and ledger groups whose changes you want to migrate to other applications.

**Note:** When you activate the book code, multiple open periods exist for a general ledger business unit ledger group. If you select more than one during migration, the one in the lower row overrides the one in the higher row.

- Select the applications in the **Migrate Selected to Subsystems** group box to which you want to migrate the current open period setup for General Ledger, and click the **Apply** button.

The system migrates the open period changes to the selected subsystems associated with the selected business units and ledger groups.

## Changing an Open Period for a Specific Business Unit and Ledger Group

To change an open period for a specific business unit and ledger group:

1. Enter selection criteria on the Open Periods page, and click the **Search** button.
2. Select the business unit and ledger group for General Ledger or a business unit for other applications that you want to change.
3. Click the **Edit Current Row** button, to make changes to the fields.

When you enter a new from year, the system calculates the to year and the first open and last open dates. You can change these.

4. Click the **Save** button.

The system calculates the first open and last open dates based on your change.

## Adjustment Period Mass Update Page

Use the Adjustment Period Mass Update page (OPEN\_ADJ\_MASS\_UPD) to make mass changes to adjustment periods for general ledger business units and ledger groups.

Navigation:

**Set Up Financials/Supply Chain > Business Unit Related > General Ledger > Open Periods > Mass Update Adjustment Periods**

This example illustrates the fields and controls on the Adjustment Period Mass Update page. You can find definitions for the fields and controls later on this page.

## Selection Criteria

The page is applicable only to General Ledger. You must select a calendar code for the **Calendar** field. All other criteria fields are optional and serve to narrow the range of adjustment periods returned in the adjustment periods section at the bottom of the page after you select the **Search** button.

## Update Selected Rows

In this section you can choose to:

- Open or close an adjustment period or periods.
- Change the adjustment year for an adjustment period or periods.
- Change the default adjustment period to another period.
- Synchronize the adjustment periods for the selected business unit and ledger group with the adjustment periods from an updated detail calendar.

While you can add and remove adjustment periods using the Detail Calendar component (DETAIL\_CALENDAR), this type of change is not automatically reflected, or synchronized with the GL business unit and ledger group adjustment periods. You can synchronize this type of change by selecting the **Sync Calendar Adj Periods** check box, and then selecting the check box for each Business Unit and Ledger Group to be change. If you added an adjustment period to the detail

calendar, it is added to the business unit and ledger group you selected. If you deleted an adjustment period from the detail calendar it is removed from the business unit and ledger group.

After selecting the **Select** check boxes for the rows you want to change, click the **Apply** button to update the selected rows.

See Understanding Accounting Calendars Based on Open and Close Periods.

# Setting Up Ledgers

---

## Understanding Ledgers

A *ledger* consists of posted balances that represents a set of books for a business unit. Ledgers store the posted net activity for a set of ChartField values by accounting period and by fiscal year. Because a ledger supports a single chart of accounts, separate ledgers are defined for business units having a unique chart of accounts. Ledgers are maintained primarily through journal entries, and can store actual, budget, forecast, statistical, or other types of data at many levels.

PeopleSoft General Ledger supports detail, multiple, and summary ledgers. You can define as many ledgers as necessary to record financial, budget, and nonfinancial transactions to maintain historical data.

This topic discusses:

- Ledger templates
- Ledger tables
- Detail ledgers
- Ledger groups
- Ledgers for a unit
- Ledger error processing
- Multibook ledgers
- Summary ledgers
- TimeSpans
- Import and export ledgers

---

**Note:** Deselect all check boxes on the Installation Options - Products page for products that you have not licensed and are not using. As delivered, all check boxes for all products whether licensed or unlicensed are selected on the Products page and this can result in unnecessary setup for the unlicensed products. For example, if General Ledger is selected on the Products page and you have not licensed the product, there are fields that are only applicable to General Ledger that are then available for input of values on the ledgers for a unit and the ledger template page.

---

## Prerequisites

Before you set up ledgers:

- Deselect the check boxes on the Installation Options - Products page for all products that you have not licensed.

See [Installation Options - Overall Page](#).

- Set up general ledger business units.
- Set up ChartField values.
- Set up accounting calendars.

## Ledger Templates

PeopleSoft provides several ledger templates, each of which defines the physical attributes of a ledger. A ledger template is linked to multiple ledgers that you can then add to a *ledger group*. This template relationship ensures that all ledgers within a ledger group share the same physical layout. General Ledger uses these templates to identify all of the records and fields required to update and to report on their associated ledgers.

To store debit amounts separately from credit amounts in your ledgers, create the fields, modify the tables, and identify the fields in the ledger template according to the configuring instructions provided for the PeopleSoft Separate Debit/Credit feature.

---

**Note:** Deselect all check boxes on the Installation Options - Products page for products that you have not licensed and are not using. As delivered, all check boxes for all products whether licensed or unlicensed are selected on the Products page and this can result in unnecessary setup for the unlicensed products. For example, if General Ledger is selected on the Products page and you have not licensed the product, there are fields that are only applicable to General Ledger that are then available for input of values on the ledger template.

---

## Ledger Tables

Ledgers are stored in tables within a database. The key fields in a ledger table are **Business Unit, Ledger, ChartFields, Fiscal Year, and Accounting Period**; **Net Period Activity** is not a key field.

Before posting, General Ledger validates data posted to the ledger table against other tables in the system. You set up the tables used for validation to enable the system to post transactions to the ledger. Remember:

- When you post journal entries, the system stores net period activity (debits and credits combined) for each ChartField combination.
- The system does not store year-to-date balances, but calculates these balances for reports.
- The calendar for a ledger determines whether the amount of time in an accounting period is a week, a month, a quarter, or other period.
- You can store multiple ledgers (such as actuals, budgets, or statistics) with identical ChartFields on a single table.
- You can balance debits and credits for ledgers at the ledger level, business unit, or at the ChartField level.

## Detail Ledgers

A *detail ledger* is used to store a journal's accounting transaction details. After setting up ledger templates, define detail ledgers and associate them with a ledger group. They are termed detail ledgers to distinguish them from summary ledgers, which are used to record summarized activity.

## Ledger Groups

You combine ledger templates and detail ledgers in an appropriate ledger group. A ledger group can have one primary ledger and zero to nine secondary ledgers. Each ledger within the ledger group shares a common physical structure based on the ledger template, and also has unique characteristics, such as its own base currency. General Ledger posts to the ledgers within the group according to the rules that you establish. The application can also manage multibook transactions that post to all ledgers within a group simultaneously.

The ledger group name can be descriptive of the purpose or ledgers it contains (such as, ACTUALS or BUDGETS). The name is unique across all ledger groups defined for a business unit and forms a unique key on the ledger table. Typically, the names of the individual ledgers within the group describe the type of currency or use of the ledger within the group, such as local, functional, and reporting. The name of the ledger group can also be the name of the primary ledger. For example, if you are not using the multibook feature, you might name your ledger ACTUALS and also name the ledger group ACTUALS.

Non commitment control ledger group types include Average Daily Balance, Standard, Budget, and Translation. Commitment control only uses the ledger group types Commitment Control Expense and Commitment Control Revenue.

Average Daily Balance, Budget, and Translation ledger groups have only one primary ledger and no secondary ledgers, while Standard ledger groups have one primary ledger and from zero to nine secondary ledgers.

The Commitment Control Expense ledger group type typically contains a budget, pre-encumbrance, encumbrance, and expense ledger. The Commitment Control Revenue ledger group type typically contains a budget, recognized revenue, and collected revenue ledger.

The **Keep Ledgers in Sync** check box in combination with the **AutoGenerate Lines** option determines how the system posts transactions. If you select the Keep Ledgers in Sync option or the Auto-Generate Lines option, the system posts transactions to every ledger in the group. When you select either option, the Journal Edit process generates additional journal lines for the other ledgers within the ledger group. For example, when you enter a two line journal entry for a ledger group that contains three ledgers, the system creates four additional lines, two lines for each additional ledger. If you do not select the Keep Ledgers in Sync or the Auto-Generate Lines options, the system posts transactions only to those ledgers with transaction entries, and does not generate secondary lines for other ledgers in the ledger group.

The **Inherit Base Currency of Business Unit** option determines if the ledgers in the group use the base currency of the business unit for conversions. This feature adds the flexibility for sharing ledger groups across business units with different base currencies. For example, a multinational organization based in Canada has five subsidiaries located in different countries around the world. If the subsidiaries select the **Inherit Base Currency of Business Unit** option, they can each have a ledger group with a secondary ledger that has a currency code of CAD (Canadian dollars) for the Reporting ledger. The primary ledger shares the base currency of the business unit and represents the functional currency of each country where the business unit is located. If the organization does not select the **Inherit Base Currency of**

**Business Unit** option, it must define five different ledger groups, each with a primary ledger that has a base currency that matches the base currency of the business unit.

You can define a secondary ledger as a translation ledger by selecting the **Translation** check box for ledger groups. This option is applicable only when you select the **Keep Ledgers in Sync** option (KLS) for the ledger group. You cannot define a primary ledger as a Translation ledger. You often use Translation ledgers for multibook ledgers.

## Ledgers for a Unit

After you define your ledgers and calendars, specify in the Ledgers For A Unit component which detail ledgers, ledger groups, and calendars each general ledger business unit uses.

For each detail ledger to which a business unit posts, specify:

- Whether it is a balanced ledger.
- The periods that are currently open.
- The year and adjustment period for posting any adjustments.
- The rules for handling journal processing, currency, and approval options.

---

**Note:** Deselect all check boxes on the Installation Options - Products page for products that you have not licensed and are not using. As delivered, all check boxes for all products whether licensed or unlicensed are selected on the Products page and this can result in unnecessary setup for the unlicensed products. For example, if General Ledger is selected on the Products page and you have not licensed the product, there are fields that are only applicable to General Ledger that are then available for input of values on the ledgers for a unit page.

---

By associating calendars to ledgers, to business units, and by sharing calendars and ledgers across business units, you can efficiently and effectively capture accounting data.

## Ledger Error Processing

When you define a ledger in the Ledgers For A Unit component, you determine how to process a journal entry entered with errors for that ledger. In General Ledger, you can specify these error processing options in the following locations:

- For the business unit level, access the General Ledger Definition - Journal Options page.
- For the ledger and ledger group level, access the Ledgers For A Unit - Journal Edit Options page.
- For the source level, access the Journal Source Journal Options page.

Settings generally *override*, from the source to the ledger group and then to the business unit level. Conversely, the *default* is from the business unit to the ledger and then to the source level. For example, a ledger setting overrides a business unit setting, but a source setting overrides both a setting at the ledger level and at the business unit level for the same option.

When you enter and edit a journal entry, the system identifies any errors.

General Ledger cannot post a journal if one or more of the following error conditions exist:

| <b>Error</b>             | <b>Cause</b>                                                                                          |
|--------------------------|-------------------------------------------------------------------------------------------------------|
| Closed Accounting Period | The journal entry date does not fall within an open period.                                           |
| Journal Balance Errors   | There is an invalid ChartField value or ChartField combination.                                       |
| Journal Amount Errors    | The foreign amount has a different sign than the monetary amount (base amount).                       |
| Control Total Errors     | The journal line totals do not match the control totals that you entered at the journal header level. |

## Multibook Ledgers

The PeopleSoft *Multibook* feature enables you to maintain multiple ledgers, sharing the same physical structure, in different base currencies, resulting in a real-time balance in multiple currencies. This functionality is also called *dual-book* due to the requirement for a company to carry one set of books in its local currency (functional currency) and another set of books in the currency of its parent company (reporting currency).

Multibook supports multiple base currencies, each in the form of a ledger, defined for a business unit. Optionally, you can post a single transaction to all base currencies (all ledgers) or to only one of those base currencies (an individual ledger). With multibook, the system automatically converts transactions to the applicable base currency and then posts to the corresponding ledger. This gives you full drill-down support and cross-currency comparisons at both the summary and the transaction levels.

You can use a secondary multibook ledger within a ledger group as a currency translation ledger. This ledger can function as your reporting ledger because it maintains real-time balances for all accounts in the specified currency during the accounting period. At the end of the accounting period, you can run the Translate Within Ledger process to generate a translation gain or loss adjustment within the multibook translation ledger for any selected account.

PeopleSoft maintains translation ledgers differently from other secondary ledgers within a multibook ledger group. Typically, when the system posts a transaction to a multibook ledger group, it uses the transaction currency amount of the primary ledger as the transaction amount of the secondary ledger. However, translation ledgers use the base currency amount of the primary ledger as the transaction amount. For multibook translation ledgers, the system generates lines with the transaction currency and foreign amount equal to that of the base currency and base amount of the primary ledger.

Within a ledger group, an *in-sync accounting entry* is a group of accounting entries for one transaction that the system distributes to different ledgers. These accounting entries have the same ChartFields, transaction currency, and foreign amounts. PeopleSoft applications support multibook and generate in-sync accounting entries to most ledgers within a ledger group. For the currency translation ledger, the Journal Edit process adds the in-sync entries before posting and creates completely in-sync journals. The Journal Generator recognizes these lines as in-sync accounting entries and generates the in-sync journal entries in General Ledger. You can specify the field order on the Journal Generator Accounting Entry Definition page. When generating the journal entry, the Journal Generator process uses these fields to determine how to group accounting entries for one transaction and generates an in-sync journal.

---

**Note:** Some PeopleSoft products may not include the currency translation ledger. Refer to the individual product documentation to see if this feature is available.

---

## Summary Ledgers

*Summary ledgers* store combined account balances from detail ledgers. You use summary ledgers primarily in PS/nVision reporting. Summary ledgers increase reporting speed and efficiency by eliminating the need to summarize detail ledger balances each time that you request a report. Instead, General Ledger summarizes detail ledger balances in a background process according to the criteria that you select and stores them in summary ledgers.

You can incrementally update summary ledgers with changes made since the summary ledgers were last created or updated in one of two ways:

- Update the summary ledgers at the same time that you post changes to the detail ledgers as part of the Journal Post process.

This updates only preexisting summary ledgers, which include business unit, summary ledger name, fiscal, and accounting period information.

- Start the Build Summary Ledger process using PeopleSoft Process Scheduler with an increment option to update summary ledgers.

## TimeSpans

*TimeSpans* enable you to select and retrieve ledger balances for use in allocations, inquiries, and PS/nVision reporting. TimeSpans control the number of periods that you can extract and summarize data from the ledger table. Typical TimeSpans in General Ledger include activity for the current period, year-to-date amounts for the selected items, and balance forward amounts for balance sheet accounts.

You can express many TimeSpans relative to the current period, so that they automatically adapt the content of a report to the as of date that you specify when you execute the report. You can define other TimeSpans for specific periods.

General Ledger uses the calendar to validate absolute periods and years that you enter for a TimeSpan. These periods and years must exist on the calendar that you specify. Use TimeSpans to retrieve balance forward amounts and adjustments that the system stores in special calendar periods.

General Ledger includes many commonly used TimeSpans; however, you can define as many additional TimeSpans as necessary. Generate the FIN0003 report to list and display information about these TimeSpans.

## Import and Export Ledgers

You can import and export flat file ledgers to and from third-party reporting software. A process in General Ledger enables you to import a flat file from another product or external system that contains rows of ledger data. This functionality is often used to combine distributed ledger data from different General Ledger systems to perform consolidation, summarization and corporate reporting.

You can also select or add a flat file format and create flat file ledgers using a general ledger process that exports them to third-party reporting software systems. This functionality is often used in those countries

requiring delivery of ledger data in a particular format for use in producing statutory reports in a required format.

You can also exchange ledger data between distributed General Ledger systems using the Ledger Publish Enterprise Integration Point (IP) and Ledger Load processing. This functionality is designed to work together with Consolidation.

## Defining a Ledger Template

To define ledger templates, use the Ledger Template component (LEDGER\_TEMPLATE).

### Pages Used to Define a Ledger Template

| <b><i>Page Name</i></b>                             | <b><i>Definition Name</i></b> | <b><i>Usage</i></b>                                                                                                                                                                      |
|-----------------------------------------------------|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <a href="#">Templates - Record Definitions Page</a> | LEDGER_TEMPLATE1              | Specify the record names for a ledger template. Do this only if you are adding a new template or modifying the default records of the templates delivered with the system.               |
| <a href="#">Templates - Field Definitions Page</a>  | LEDGER_TEMPLATE2              | Specify the field names for a ledger template. Do this only if you are modifying the default fields or if you are adding the fields to store debit amounts separate from credit amounts. |

### Understanding How to Define a Ledger Template

PeopleSoft provides several ledger templates that include default records and fields that support the ChartFields and other field and record definitions delivered with the system. Do not change the system-generated set of default values unless you modify your system or if you have multiple sets of ChartFields.

To define ledger templates:

- Create or modify ledger template record definitions.
- Create or modify ledger template field definitions.
- Modify tables to store separate debit and credit balances.

---

**Note:** Deselect all check boxes on the Installation Options - Products page for products that you have not licensed and are not using. As delivered, all check boxes for all products whether licensed or unlicensed are selected on the Products page and this can result in unnecessary setup for the unlicensed products. For example, if General Ledger is selected on the Products page and you have not licensed the product, there are fields that are only applicable to General Ledger that are then available for input of values on the ledger template.

---

## Templates - Record Definitions Page

Use the Templates - Record Definitions page (LEDGER\_TEMPLATE1) to specify the record names for a ledger template.

Do this only if you are adding a new template or modifying the default records of the templates delivered with the system.

Navigation:

**General Ledger >Ledgers >Templates >Record Definitions**

This example illustrates the fields and controls on the Templates - Record Definitions page.

| Record Definitions                                                                                                 |                                          | Field Definitions                                                                                                      |                                       |

| <b>Default</b>                                    | <p>Click the <b>Get Template Default</b> button to apply a set of default records to every template in the system. You can modify these values.</p> <p>If you select <i>Commitment Control</i> as the default ledger type, the system automatically populates the record and field names. These are required fields and cannot be modified.</p> <hr/> <p><b>Note:</b> The <b>Get Template Default</b> button is not available to a Commitment Control ledger type.</p> <hr/>                                                                                                                                                                                                                                                                                                |
| <b>Record (Table) Name</b>                        | Represents the ledger record that you use to store the balances for each ChartField combination that has posted activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Ledger Tmp</b> (ledger temporary)              | Indicates a worktable used in ledger processing. Detail and Summary templates both require this worktable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Ledger Tmp2</b> (ledger temporary 2)           | Indicates a worktable used in ledger processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Journal Line</b>                               | Stores detail lines containing the monetary and statistical amounts for each journal entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Journal Line Tmp</b> (journal line temporary)  | Indicates a worktable used in journal processing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Secured Rptg Vw</b> (secured reporting view)   | <p>(Optional) Specifies a ledger reporting view (LED_RPTG_VW for General Ledger and LED_RPTG_KK_VW for Commitment Control) to secure access to the ledger by authorized user IDs during PS/nVision reporting. Because this is an optional security field, if you do not specify a ledger reporting view, PS/nVision provides reporting directly against the ledger.</p> <hr/> <p><b>Note:</b> Use the Ledger Security page to specify which user IDs have access to this ledger data. If you specify a reporting view and an unauthorized user tries to access the ledger, PS/nVision displays all zeros for ledger amounts on the report.</p> <hr/> <p>See PeopleTools: PS/nVision, Setting Up PS/nVision Security, Implementing PS/nVision Ledger-Based Data security</p> |
| <b>Account ChartField</b>                         | Identifies the record that stores the account ChartField values. In the standard PeopleSoft General Ledger system, this is the GL_ACCOUNT_TBL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Combo Data</b> (combination data)              | Stores the data used for ChartField combination editing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Jrnl Gen Tmp</b> (journal generator temporary) | Indicates a worktable used by Journal Generator process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Field or Control</b>                                              | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Incremental Ledger Stage Tbl</b> (incremental ledger stage table) | <p>Enter the table that acts as a temporary holding table for ledger rows. When the system posts journals to the ledger, the posing process stored additional rows in this table. This allows processes such as the Summary Ledger and Multi-Currency Translation process to run incrementally, and to pick up additional ledger entries from this table.</p> <p>This field is only required on Detail templates. It is not required on Summary templates.</p> <p>Previous to Update Image 13, this field was Summary Ledger Stage Tbl.</p> |
| <b>Consolidations Log</b>                                            | Identifies the record to update for the consolidations log during the consolidation process.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Consolidation Equity Temp</b> (consolidation equity temporary)    | Identifies the worktable used to calculate equity elimination in the consolidation process.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Closing Record Names

The following fields apply to the closing process.

| <b>Field or Control</b>                                              | <b>Description</b>                                                                                                                                                                   |
|----------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Closing Log</b>                                                   | Identifies the record to update for the close log during the closing process.                                                                                                        |
| <b>Closing Tmp</b> (closing temporary)                               | Identifies a worktable that is used in the closing process. This table and the Closing RE Tmp table have the same structure, and both are required for the closing process.          |
| <b>Closing RE Tmp</b> (closing retained earnings temporary)          | Identifies a retained earnings worktable that is used in the closing process. This table and the Closing Tmp table have the same structure; both are required for the close process. |
| <b>Closing ChartField Table</b>                                      | Identifies the table that stores the closing ChartFields values.                                                                                                                     |
| <b>Closing Account Tmp</b> (closing account temporary)               | Identifies a worktable that stores account information for the business unit being closed.                                                                                           |
| <b>Closing Journal Header Tmp</b> (closing journal header temporary) | Identifies a worktable that stores the header of the source journal that results from the interim closing process or the year end closing process.                                   |

| <b>Field or Control</b>                                                                                                                  | <b>Description</b>                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Closing Journal Line Tmp</b> (closing journal line temporary) and <b>Closing Journal Line Tmp2</b> (closing journal line temporary 2) | Identifies worktables that store the lines of the source journal that results from the interim closing process or the year end closing process. |

## Multicurrency Record Names

The following fields apply to multicurrency processing.

| <b>Field or Control</b>                                                                                      | <b>Description</b>                                                                     |
|--------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| <b>MultiCurrency Log</b>                                                                                     | Identifies the record to update for the currency log during the multicurrency process. |
| <b>MultiCurrency Tmp</b> (multicurrency temporary) and <b>MultiCurrency Tmp1</b> (multicurrency temporary 1) | Identifies worktables that are used in multicurrency processing.                       |

## ADB (Average Daily Balancing) Record Names

The following fields apply to ADB ledger processing.

| <b>Field or Control</b>                                                                                                                                              | <b>Description</b>                                                                                                                                                  |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ADB Ledger</b>                                                                                                                                                    | Stores the balances in a daily ledger when ADB is activated.                                                                                                        |
| <b>Ledger ADB Tmp</b> (ledger average daily balance temporary), <b>Ledger ADB Tmp2</b> (ledger ADB temporary 2), and <b>Ledger ADB Tmp3</b> (ledger ADB temporary 3) | Identifies a worktable that Ledger ADB Posting uses during ADB processing to post daily balances.                                                                   |
| <b>ADB Ledger Adj. Holding Tbl</b> (ADB ledger adjustments holding table) and <b>ADB Ledger Adj. Holding Tbl 2</b> (ADB ledger adjustments holding table 2)          | Stores adjustments to daily balances from the Journal Post process. During ADB processing, the system posts the balances from these tables to the ADB ledger table. |

## Ledger Loader Record Names

The following fields apply to ledgers loaded from another PeopleSoft or third-party system.

| <b>Field or Control</b>                                                                                                       | <b>Description</b>                                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ledger Load Staging Table</b>                                                                                              | Stores values used in ledger load processing (ChartField value mapping) and Ledger Publish Enterprise Integration Point, which Consolidations uses. |
| <b>Led Load Temp Record</b> (ledger load temporary record) and <b>Led Load Temp Record 2</b> (ledger load temporary record 2) | Identifies work records used in ledger load processing                                                                                              |

## Templates - Field Definitions Page

Use the Templates - Field Definitions page (LEDGER\_TEMPLATE2) to specify the field names for a ledger template.

Do this only if you are modifying the default fields or if you are adding the fields to store debit amounts separate from credit amounts.

Navigation:

**General Ledger >Ledgers >Templates >Field Definitions**

The system populates fields on the Field Definitions page with default values based on the default ledger type that you select on the Templates - Record Definitions page. You can modify these values and add fields to store debit amounts separate from credit amounts.

| <b>Field or Control</b>    | <b>Description</b>                                                                                                                                                               |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Account</b>             | Contains the field name of the account ChartField. The system uses this field name only for background processing. The online PeopleCode still refers to the Account field name. |
| <b>Monetary Amount</b>     | A required field that contains the monetary (base currency) amount of the journal line.                                                                                          |
| <b>Statistical Amount</b>  | (Optional) Contains the statistical amount of the journal line.                                                                                                                  |
| <b>Posted Total Amount</b> | Contains the net balance of the debit and credit amounts for each ChartField combination that has been posted to the ledger.                                                     |

| <b>Field or Control</b>          | <b>Description</b>                                                                                                                                                                                                     |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Posted Total Debits</b>       | If populated, and if you selected the <b>Separate Debit/Credit</b> option for the ledger on the Ledgers For A Unit - Definition page, the system populates these fields and tracks separate debit and credit balances. |
| <b>Posted Total Credits</b>      | If populated this means that you selected the <b>Separate Debit/Credit</b> option for the ledger on the Ledgers For A Unit page, resulting in the tracking of separate debits and credits.                             |
| <b>Combination Edit Template</b> | Required for journal edit processing. Select <i>JOURNALS</i> .                                                                                                                                                         |

**Warning!** Even if you are not using ChartField combination editing, select the *JOURNALS* combination template. You must populate this field to run the journal edit process.

## Defining a Detail Ledger

General Ledger posts journal entries directly to detail ledgers (usually in a background process). There is no limit to the number or types of ledgers that you can define.

To define detail ledgers, use the Detail Ledger component (DETAIL\_LEDGER).

## Page Used to Define a Detail Ledger

| <b>Page Name</b>                   | <b>Definition Name</b> | <b>Usage</b>                                                                         |
|------------------------------------|------------------------|--------------------------------------------------------------------------------------|
| <a href="#">Detail Ledger Page</a> | LEDGER_DETAIL1         | Define a detail ledger ID and name, and link the detail ledger to a ledger template. |

## Detail Ledger Page

Use the Detail Ledger page (LEDGER\_DETAIL1) to define a detail ledger ID and name, and link the detail ledger to a ledger template.

Navigation:

**General Ledger > Ledgers > Detail Ledgers > Detail Ledger**

| <i>Field or Control</i>   | <i>Description</i>                                          |
|---------------------------|-------------------------------------------------------------|
| <b>Ledger Description</b> | Enter a description of the selected detail ledger.          |
| <b>Ledger Template</b>    | Link the detailed ledger to an appropriate ledger template. |

## Linking Ledgers to a Ledger Group

To link ledgers to a ledger group, use the Detail Ledger Groups component (DETAIL\_LEDGER\_GROU).

## Pages Used to Set Up Ledger Groups

| <i>Page Name</i>                       | <i>Definition Name</i> | <i>Usage</i>                                                                                                                                                 |
|----------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>Ledger Groups - Definition Page</u> | LEDGER_GROUP           | Define a ledger group, link it to a ledger template, assign ledger details to the group, and identify the unique attributes of each ledger within the group. |
| <u>Ledger Groups - ChartField Page</u> | LEDGER_GROUP2          | Define ChartFields for this ledger group. The system generates a set of default edit tables, which you can modify.                                           |
| <u>Ledger Groups - Balancing Page</u>  | LEDGER_GROUP3          | Specify the ChartField balancing options for the journals generated to the detail ledger.                                                                    |

## Ledger Groups - Definition Page

Use the Ledger Groups - Definition page (LEDGER\_GROUP) to define a ledger group, link it to a ledger template, assign ledger details to the group, and identify the unique attributes of each ledger within the group.

Navigation:

**General Ledger >Ledgers >Ledger Groups >Definition**

This example illustrates the fields and controls on the Ledger Groups - Definition page. You can find definitions for the fields and controls later on this page.

|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description       | Enter a description for this detail ledger group to appear on pages, inquiries, prompt lists, and reports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Ledger Template   | Select a ledger template to link to this ledger group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Ledger Group Type | <p>The values are:</p> <p><i>Average Daily Balance:</i> Allows a primary ledger and no secondary ledgers.</p> <p><i>Budget:</i> Allows a primary ledger and no secondary ledgers.</p> <p><i>Standard:</i> Allows a primary ledger and up to nine secondary ledgers.</p> <p><i>Translation:</i> Allows a primary ledger and no secondary ledgers.</p> <p><i>Commitment Control Expense:</i> Used for Commitment Control budgets.</p> <p><i>Commitment Control Revenue:</i> Used for Commitment Control budgets.</p> <p>The selection that you make here affects the choice of attributes in the Ledger Details grid. It also affects the set of ChartFields that appear on the Chartfield page.</p> |

| <b>Field or Control</b>      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Keep Ledgers in Sync</b>  | <p>Select to have the system post journal entries to all ledgers in the ledger group. Select the <b>Balance by all Currencies</b> option on the General Ledger Business Unit Definition - Currency Options page and the Journal Source - Currency Options page.</p> <p>Deselect to have the system post journal entries to all ledgers in the ledger group or to a single ledger based on your choices on the journal entry's Header page and on the Journal Generator Template - Defaults page.</p> <p>Do not select if you need to distinguish prior period adjustments. For example, suppose that you keep one ledger to store entries for local reporting and another ledger for corporate reporting. Local regulations require that you post adjusting entries dated through the 15<sup>th</sup> of the month to the prior period, and corporate books require that the period closes on the 5<sup>th</sup>. When you make an adjusting entry dated the 10<sup>th</sup>, post the adjustment to different periods in the two ledgers—prior period for the local ledger, current for the corporate—resulting in an out-of-sync scenario.</p> |
| <b>Ledger</b>                | <p>Select the ledgers that you want to link to this ledger group from the list of detail ledgers associated with the ledger template (as you identified on the Detail Ledger page). You can specify one primary ledger and up to nine secondary ledgers for ledger groups that have a group type of <i>Standard</i>.</p> <hr/> <p><b>Note:</b> You can select only one ledger for Average Daily Balance, Translation, and static Budget ledger group types (this does not refer to commitment control ledgers).</p> <hr/>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Primary</b>               | Select if the ledger is the primary ledger in a group or if it is the only ledger in the ledger group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Translation</b>           | <p>Select if this is a currency translation ledger. This option is available only when you select <b>Keep Ledgers in Sync</b>. You can define any non-primary ledger as a translation ledger.</p> <hr/> <p><b>Note:</b> Journal processing and multicurrency processing handle currency translation ledgers differently from normal secondary ledgers.</p> <hr/>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>OpenItem</b>              | Select to enable the OpenItem accounting feature and to track OpenItem transactions in the ledger.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>VAT</b>                   | Select to maintain VAT balances in the ledger.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Inherit Base Currency</b> | You can define a base currency for the ledger, or you can select this option to inherit the base currency of the business unit to use in the ledger.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Field or Control</b>  | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Base Currency</b>     | If you did not select Inherit Base Currency, specify the base currency to apply to this ledger.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Default Rate Type</b> | <p>When you select Keep Ledgers in Sync for a ledger group, and you enter a journal against the primary ledger, the system automatically generates the journal entry lines for the secondary ledgers. The Default Rate Type influences the rate type that is used for the secondary lines.</p> <p>The following hierarchy applies:</p> <ol style="list-style-type: none"> <li>1. The system checks for a value in rate type for the ledger.<br/><br/>If a value exists, the system populates the Default Rate Type with the Rate Type value and uses it for the secondary lines.</li> <li>2. The system checks for a rate type on the primary journal line.<br/><br/>If one exists, it uses that type for the secondary line.</li> <li>3. If there is no value in <b>Rate Type</b> or on the primary journal line, the system uses the <b>Default Rate Type</b> value.</li> </ol> |
| <b>Rate Type</b>         | Identifies the currency exchange rate type that is always used in the auto-generated journal lines for the secondary ledgers. (See the explanation under <b>Default Rate Type</b> for more information.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Note:** The setup for commitment control detail ledger groups differs slightly from other ledger types. See the commitment control documentation for additional instructions.

## Ledger Groups - ChartField Page

Use the Ledger Groups - Chartfield page (LEDGER\_GROUP2) to define ChartFields for the ledger group.

The system generates a set of default edit tables, which you can modify.

Navigation:

**General Ledger >Ledgers >Ledger Groups >Chartfield**

This example illustrates the fields and controls on the Ledger Groups - Chartfield page. You can find definitions for the fields and controls later on this page.

| Project                  | PROJECT_ID_VW  | PROJECT_ID_VW            |
| Book Code                | BOOK_CODE_TBL  | BOOKCODE_ALL_VW          |

The set of ChartFields is based on the ledger group type that you select on the Ledger Group - Definition page.

Click the **Use the Default ChartFields** button to generate a set of default edit-table names and reporting views for the ChartFields in the ledger. The **Edit Table** field value comes from the effective-dated edit table that you specify on the Design ChartFields - Dynamic Edit Tables page. Use the **View – No Effective Date** fields for reporting prompts when you do not want to limit the selection by effective date, because historical rows might contain ChartFields that are no longer active. To change these values, click the **Lookup** button.

## Ledger Groups - Balancing Page

Use the Ledger Groups - Balancing page (LEDGER\_GROUP3) to specify the ChartField balancing options for the journals generated to the detail ledger.

Navigation:

**General Ledger >Ledgers >Ledger Groups >Balancing**

This example illustrates the fields and controls on the Ledger Groups - Balancing page. You can find definitions for the fields and controls later on this page.

Balancing fields control the totals on the Journal Entries - Total page. The Journal Edit process also requires that the amounts entered for these ChartFields be in balance.

When you select additional ChartFields for balancing, all unique occurrences of the combination of values must balance. If they do not, the Journal Edit process uses the rules set up for balancing journals (for example, suspend or recycle) on the Journal Edit Options page.

| Field or Control            | Description                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| Default                     | Click the <b>Use Default ChartFields</b> button to update and clear the current <b>ChartFields</b> group box information.         |
| IntraUnit Balancing Entries | Select to indicate that the selected balancing ChartFields for the detail ledgers in this ledger group include intraunit entries. |
| Balance                     | Select to indicate that you want this ChartField to balance for the ledgers in this ledger group.                                 |

| <b>Field or Control</b>  | <b>Description</b>                                                                                                                                                                                                                                                                  |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Affiliate</b>     | Select to indicate that you want to use an affiliate ChartField, which identifies intercompany activity by tracking the business unit associated with the transaction. This provides a method to map transactions between business units while using a single intercompany account. |
| <b>Business Unit</b>     | Always selected to balance because General Ledger always balances detail ledgers by business unit.                                                                                                                                                                                  |
| <b>Currency Code</b>     | Always selected because General Ledger always balances detail ledgers by currency code.                                                                                                                                                                                             |
| <b>Account</b>           | You cannot select this ChartField because PeopleSoft cannot balance a ledger by account.                                                                                                                                                                                            |
| <b>Alternate Account</b> | You cannot select this ChartField because cannot balance a ledger by alternate account.                                                                                                                                                                                             |
| <b>Statistics Code</b>   | You cannot select this ChartField to balance a ledger by statistics code.                                                                                                                                                                                                           |
| <b>Book Code</b>         | This is a default ChartField for balancing because General Ledger always balances detail ledgers by book code, even if you do not enable the Book Code feature.                                                                                                                     |
| <b>Adjustment Type</b>   | This is a default ChartField because General Ledger always balances detail ledgers by adjustment type, even if you do enable <b>Book Code</b> .                                                                                                                                     |

## Defining Ledgers for a Business Unit

To define ledgers for a business unit, use the Ledger For A Unit component (BUSINESS\_UNIT\_LED). Use the EM\_BUS\_UNIT\_LED component interface to load data into the tables for this component.

|--------------------------------------------------------------------|------------------------|-----------------------------------------------------------------------------------|
| <u>Ledgers For A Unit - Commitment Control Ledger Options Page</u> | BUSINESS_UNIT_LED5     | Specifies the default ledger options for the specified Commitment Control ledger. |

## Understanding Defining Ledgers for a Business Unit

Because ledgers and calendars are stored in tables, you can share them with business units. This enables business units to share common ledger definitions while retaining their own unique calendars and closing schedules.

When you define ledgers for a business unit, you can:

- Define journal edit error options for a ledger group.
- Define default currency options for a ledger.
- Define default journal post options for a ledger.
- Define default approval options for a ledger.
- Define default Commitment Control ledger options.

---

**Note:** Deselect all check boxes on the Installation Options - Products page for products that you have not licensed and are not using. As delivered, all check boxes for all products whether licensed or unlicensed are selected on the Products page and this can result in unnecessary setup for the unlicensed products. For example, if General Ledger is selected on the Products page and you have not licensed the product, there are fields that are only applicable to General Ledger that are then available for input of values on the ledgers for a unit page.

---

## Ledgers For A Unit - Definition Page

Use the Ledgers For A Unit - Definition page (BUSINESS\_UNIT\_LED1) to identify the detail ledgers, ledger groups, and calendars used by this business unit and identify specific characteristics for each ledger.

Navigation:

**Set Up Financials/Supply Chain >Business Unit Related >General Ledger >Ledger For A Unit >Definition**

This example illustrates the fields and controls on the Ledgers For A Unit - Definition page. You can find definitions for the fields and controls later on this page.

| Field or Control    | Description                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ledger Type</b>  | <p>Select the ledger type for this business unit. Values are:</p> <p><i>Detail Ledger:</i> Select to associate detail ledgers to this business unit.</p> <p><i>Summary Ledger:</i> Attach to business units using the Ledger Set for Summary Ledgers - Ledger Set page.</p> <p><i>Commitment Control Ledger:</i> Select to set up Commitment Control ledgers.</p> |
| <b>Ledger Group</b> | <p>If you select <i>Detail Ledger</i> as the ledger type, select a ledger group from a list you defined in the Ledger Group component.</p>                                                                                                                                                                                                                        |
| <b>Ledger</b>       | <p>If you select <i>Summary Ledger</i> as the ledger type, this field becomes available. Although summary ledgers are listed in this field, you attach summary ledgers to business units using the Ledger Set for Summary Ledgers - Ledger Set page.</p>                                                                                                          |
| <b>Calendar ID</b>  | <p>Select the calendar for this ledger from a list of calendars on the Calendar Period page.</p>                                                                                                                                                                                                                                                                  |

| <b>Field or Control</b>              | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Period End Cutoff Definition</b>  | Click to open the "Period End Cutoff Definition Page" (PeopleSoft General Ledger) where the period end cutoff schedule for associated Business Unit, Ledger, and Fiscal Year is defined. If Period End Cutoff Definition has not been setup then the user can create a new definition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Update Open Periods</b>           | <p>You can elect to Update Open Periods by selecting a ledger group or ledger code for detail ledgers. <i>By Ledger Group</i> is used to identify open periods and adjustment periods based on the ledger group and transaction type. <i>By Ledger Code</i> is used when working with multiple generally accepted accounting principles (GAAP) and prior-period adjustments. If you do not perform this activity, all periods in the ledger are closed and no journal posting is permitted.</p> <p>If you specify an adjustment period, the Journal Entry page uses it as the default for adjusting journals. You can post year end adjustments to special adjustment periods separate from the last accounting period of the year. Typically, you want your adjustments year to match your fiscal year.</p> |
| <b>Balanced Ledger</b>               | Select to indicate that this ledger is balanced ledger (debits equal credits) and to make available the journal balance error processing options on the Journal Options page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Allow Ledger Load Updates</b>     | <p>Select to have the Flat File Ledger Import and Ledger Load (ChartField Value Mapping) processes to update detail ledgers, and Ledger Publish Enterprise Integration Point to subscribe and update summary ledgers.</p> <hr/> <p><b>Note:</b> Ledger Publish processing always publishes ledger data into the IP regardless of this option. However, you must select this option for summary ledgers to enable the IP subscription process to update the target table. For detail ledgers, the IP subscription process always processes detail ledger data and stores it in a staging table. Afterward, the Ledger Load process selects the detail ledger data for ledgers that have this option selected.</p> <hr/>                                                                                       |
| <b>Direct Budgets Ledger Updates</b> | Select to update a standard budget ledger (not commitment control related) directly by using online pages and using the general ledger posting process. If deselected, the system will not perform online adjustments to standard budget ledgers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Enable Separate Debit/Credit</b>  | Select to enable the storing of credit and debit balances separately on the ledger. Normally, General Ledger posts net balances for all posted ChartField combinations to the ledger. When you enable this feature, PeopleSoft automatically performs the necessary table modifications to store debits and credits separately without customization.                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Field or Control</b>                                                          | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Separate DR/CR Amount Fields</b> (separate debit and credit amount fields)    | <p>Select to indicate upon journal entry whether a journal amount is a debit or credit. You must have previously selected the <b>Enable Separate Debit/Credit</b> option.</p> <p>Normally, General Ledger determines whether a journal is a debit or a credit based on its sign. If the journal entry amount is positive, the system treats it as a debit; if negative, as a credit.</p> <p>If you select this option, the system displays separate debit and credit entry fields on the Create/Update Journal Entries - Lines page. A negative entry in either of the amount fields is considered a reversal of that type of amount. For example, a negative 5.00 EUR in the debit amount field causes the ledger debit amount to be reduced by 5.00 EUR.</p> <p>If you do not select Separate DR/CR Amount Fields but you select <b>Enable Separate Debit/Credit</b>, the Journal Entry - Lines page displays an <b>N/R</b> (normal/reversal) field, in which you indicate whether the amount entered is normal (positive is a debit, negative is a credit) or a reversal (positive is a credit reversal, negative is a debit reversal).</p> <hr/> <p><b>Note:</b> The <b>Separate DR/CR Amount Fields</b> check box enables you to enter debits and credits only in their own fields on the journal entry pages. However, you cannot store these debits and credits and post them separately to the ledger. To store the fields separately in the ledger, select <b>Enable Separate Debit/Credit</b>.</p> <hr/> |
| <b>Journal Generator Default</b> (journal generator default ledger group)        | Select to indicate that this is the default ledger group for this business unit. When the system generates journals from other PeopleSoft applications, it uses this ledger group when no ledger group is specified on an accounting entry line.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Enable Alternate Account</b>                                                  | Select to enable the <b>Acct -&gt; Alt Suspense</b> and <b>Alt -&gt; Acct Suspense</b> fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Acct -&gt; Alt Suspense</b> (suspense alternate account for unmapped account) | Select to accommodate a transaction with an account that is not mapped to an alternate account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Alt -&gt; Acct Suspense</b> (suspense account for unmapped alternate account) | Used if a transaction is entered with an alternate account that is not mapped to an account.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Amortization Template</b>                                                     | Select the amortization template to be used while creating an Amortization style voucher in AP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Journal Source</b>                                                            | Select the source from which amortization journals are created. This field is mandatory if you have selected an Amortization template.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Field or Control</b>               | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Amortization Calendar</b>          | <p>Select from the list of summary calendars – Quarterly Calendar or Annual Calendar. The lookup displays only those summary calendars set up on the Summary Calendar page, which are defined for the specific Calendar ID:</p> <ul style="list-style-type: none"> <li>• Quarterly Calendar</li> <li>• Annual Calendar</li> </ul>                                                                                                 |
| <b>Amortization Document Type</b>     | <p>Select the amortization document type. This field is available only if you have enabled document sequencing within the Installation Options component and on the General Ledger Definition page for the business unit.</p> <hr/> <p><b>Note:</b> Amortization document type requires sequence type of automatic numbering.</p> <hr/>                                                                                           |
| <b>Report Average Balances</b>        | <p>If selected, enables the Average Daily Balance (ADB) feature for this ledger.</p>                                                                                                                                                                                                                                                                                                                                              |
| <b>ADB Calendar</b>                   | <p>If you selected <b>Report Average Balances</b>, select a detail calendar (typically the daily calendar) to use for calculating your average balance.</p>                                                                                                                                                                                                                                                                       |
| <b>Maintain Balances by Date Code</b> | <p>Select to maintain separate balances for journal date, settlement date, and ADB date. The date code can be selected on the journal entry for capturing multiple transaction dates for compliance with International Accounting Standards (IAS). The journal edit process balances journals by date code when selected.</p> <hr/> <p><b>Warning!</b> Selecting this option increases processing demand on the system.</p> <hr/> |
| <b>View Date Code Map</b>             | <p>Click this link to access the Date Code Map page and view the listing of available date codes: <i>Journal Date</i>, <i>Settlement Date</i>, and <i>ADB Date</i>.</p>                                                                                                                                                                                                                                                           |
| <b>Filter Posted Activity</b>         | <p>Select to enable specifying of account types (such as asset, liability, expense, and so on) that you want to post to the ADB ledger.</p>                                                                                                                                                                                                                                                                                       |
| <b>Filter</b>                         | <p>After you select <b>Filter Posted Activity</b>, click this link to access the Include Account Types Posted to ADB Ledger page, where you select the account types that you want to post to the ADB ledger.</p>                                                                                                                                                                                                                 |

**Warning!** While you can also use the Ledgers For A Unit - Definition page to remove ledgers for a given business unit, you cannot remove a ledger if journal entries have already been posted for that business unit.

## Ledgers For A Unit - Journal Edit Options Page

Use the Ledgers For A Unit - Journal Edit Options page (BUSINESS\_UNIT\_LED2) to define how the system processes journal error processing for the ledger.

Navigation:

**Set Up Financials/Supply Chain >Business Unit Related >General Ledger >Ledger For A Unit >Journal Edit Options.**

This example illustrates the fields and controls on the Ledgers For A Unit - Journal Edit Options page. You can find definitions for the fields and controls later on this page.

**Note:** If you define error processing at the ledger level, it overrides all error handling that you specify at the business unit level for journals using only the selected ledger.

| Field or Control | Description                                                                                                                                                                                                                                                  |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Document Type    | If you use PeopleSoft Document Sequencing, specify a document type for every journal that you enter. If you specify a document type in this field, the system sets to this document type all journals for this ledger group entered through a journal entry. |

| <b>Field or Control</b>           | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Journal Balance Option</b>     | <p>Available only if you selected the Balanced Ledger option on the Ledgers For A Unit - Definition page.</p> <p>When you define ledgers, specify them as balanced or unbalanced. Journal entries for balanced ledgers (such as an actuals ledger) must be in balance before you can post them. A journal balance error occurs when an unbalanced journal is targeted to a balanced ledger. You can post unbalanced journals only to ledgers that have been set up as unbalanced ledgers (such as a standard budget ledger).</p> <p>Select from the following values to correct the balance error:</p> <p><i>Default to Higher Level Value:</i> Uses the error-processing options that you defined on the General Ledger Business Unit - Definition page.</p> <p><i>Recycle:</i> Marks journal entries containing errors as invalid and does not allow them to be posted. After you make the corrections and re-edit the journal, you can post the journal successfully.</p> <p><i>Suspend:</i> For journal balance and journal amount errors, posts the amount required to bring each journal into balance (if it is out of balance) to a suspense account. For journal edit errors, it posts the amounts from those lines that reference invalid ChartFields. This value is not available for control total errors.</p> |
| <b>Journal Edit Errors Option</b> | <p>As you enter journal lines, General Ledger verifies that all ChartField values are valid as of the journal entry date.</p> <p>Select from the following values to correct the edit error:</p> <ul style="list-style-type: none"> <li>• <i>Default to Higher Level Value</i></li> <li>• <i>Recycle</i></li> <li>• <i>Suspend</i></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Field or Control</b>             | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Journal Amount Errors Option</b> | <p>As you enter journal lines, General Ledger verifies that the foreign amounts and the monetary amounts are the same sign. A journal amount error occurs if the foreign amount has a different sign than the monetary amount (for example, if the journal has a foreign amount that is 10 and a monetary amount that is –200).</p> <p>Select from the following values to correct the amount error:</p> <ul style="list-style-type: none"> <li>• <i>Accept</i>: Indicates that you want the Journal Edit process to accept the monetary and foreign amounts as correct and continue processing, even though the amounts have different signs.</li> <li>• <i>Default to Higher Level Value</i></li> <li>• <i>Recycle</i></li> <li>• <i>Suspend</i></li> </ul> |
| <b>Control Total Errors</b>         | <p>(Optional) As you enter journal lines, General Ledger displays a running total of the number of lines, debits, credits, and units that you entered in the journal. A control total error occurs if the journal line totals do not match the control totals that you entered at the journal header level.</p> <p>Select from the following values to correct the control total error:</p> <ul style="list-style-type: none"> <li>• <i>Default to Higher Level Value</i></li> <li>• <i>N/A</i>: Ignores any previously set control totals.</li> </ul> <p>This value can be used to ignore control total errors when there are journal amount errors.</p> <ul style="list-style-type: none"> <li>• <i>Recycle</i></li> </ul>                                  |
| <b>Position Accounting</b>          | <p>Select to enable Position Accounting, which uses the options that you created on the Position Accounting - Position Account page. The Position Accounting feature enables the Journal Edit process to generate position accounting entries, which track profits and losses due to holding assets in multiple currencies.</p>                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Field or Control</b>                 | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Journal Date &lt; Open From Date</b> | <p>The Accounting Period Closed error message appears if the journal date is outside of the date range that you set up. The journal date determines the period to which a journal is posted and must be within the range of the current open periods before it can be posted. You can define the beginning and ending dates for each period in the Detail Calendar - Calendar Periods page. Use the Open Period Updates page to define the range of periods that are currently open for each ledger group.</p> <p>The only exception to using the journal date to determine the period to which the journal should be posted is adjusting entries, which fall into special adjustment periods as defined on the detail calendar.</p> <p>If the journal date is less than the open-from date, select from the following values to correct the error:</p> <ul style="list-style-type: none"> <li>• <i>Change to Open From Date</i></li> <li>• <i>Default to Higher Level Value</i></li> <li>• <i>Recycle</i></li> </ul> |
| <b>Journal Date &gt; Open To Date</b>   | <p>The Accounting Period Closed error message also appears if the journal date is greater than the open to date.</p> <p>Select from the following values to correct the error:</p> <ul style="list-style-type: none"> <li>• <i>Change to Open To Date</i></li> <li>• <i>Default to Higher Level Value</i></li> <li>• <i>Recycle</i></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Balance Suspense ChartFields</b>     | <p>If you select <i>Suspend</i> for <b>Journal Balance Option</b>, click this link to access the Balance Suspense ChartFields page, where you specify the suspense account for journal balance errors for the ledger group. Define the entire ChartField combination.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Field or Control</b>          | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Process Group</b>             | Select the process group that contains the multiple combination edit rules for this ledger group. Define process groups on the Combination Group page. During combination editing, the system references the ledger group indicated on a transaction to see which rules apply. It then applies these rules during the Journal Edit process. Journal lines that fail validation using one of the rules in the group are marked in error.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Transaction Source Option</b> | <p>Select to limit the combination edit process for a transaction source by process group. This effectively reduces processing time as it targets only those transactions of a given transaction source, avoiding unnecessary processing of data. Select one of the following options:</p> <p><i>Specific Transaction Source</i> - Select this option to specify the transaction source (or sources) of the transactions to be edited by the combination edit process. This option increases processing efficiency by validating only those transactions with sources that are applicable for the rules defined in the process group.</p> <p><i>All Transaction Sources (default value)</i> - Select this option to edit all transactions against the process group during the combination edit process.</p> |
| <b>Transaction Source</b>        | This link appears if you select the <i>Specific Transaction Source</i> option. Click the link to access the <a href="#">Combo Edit Transaction Source Page</a> where you define the transaction source (or sources) of the transactions to process for a given process group. The combination edit program only processes those sources that are defined for the process group.                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Set Up Financials/Supply Chain >Business Unit Related >General Ledger >Ledger for a Unit >Currency Options.**

This example illustrates the fields and controls on the Ledgers For A Unit - Currency Options page. You can find definitions for the fields and controls later on this page.

| Field or Control                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Rounding Adjustment Option</b>     | <p>Select an option that determines how the system handles an out of balance situation due to rounding. This can happen when the amount of each line is individually converted and base currency totals are out of balance. Depending on the option you select the difference for each foreign currency is:</p> <ul style="list-style-type: none"> <li><i>Adjust Last Journal Line</i> - Applied to the last line for the currency.</li> <li><i>Add Adjusting Journal Line</i> - Entered as a new base currency adjustment line.</li> <li><i>Skip Rounding Adjustment</i> - Not created. The system does not make an adjustment.</li> </ul> <p>For additional information, see: <a href="#">Rounding Adjustment Option</a>.</p> |
| <b>Rounding Adjust ChartFields</b>    | <p>Select this link to access the Rounding Adjustment ChartFields page. When there is an unbalanced condition between the debit and credit rows due solely to rounding on conversion from foreign Amount to Base Amount, select a default balancing group, ChartField, and ChartField Value to be used during the editing process.</p>                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Translate Ledger Exchange Rate</b> | <p>Select to control the exchange rate default of the translate ledger consistently for all processing. Select <i>Default to a Higher Level Value</i>, <i>Inherit from Primary Ledger</i>, or <i>Retain Exchange rate</i>.</p> <p>See "General Ledger Definition - Currency Options Page" (PeopleSoft General Ledger).</p>                                                                                                                                                                                                                                                                                                                                                                                                      |

## Rounding Adjustment Option

When a ledger group contains multiple ledgers with a secondary ledger, or ledgers that have the same base currency as the primary ledger, and if journals contain multiple foreign currency transactions, the following applies:

If you choose to use different rate types for currency conversion in primary and secondary ledgers that have the same base currency and in a single ledger group, or if imbalances occur because of rounding and truncation of foreign currency conversions, when you have journals with multiple currencies posting to the ledger group, you cannot use *Add Adjusting Journal Line* to handle the balancing of journals. If you attempt to do so, the journal edit process errors out the journal and issues an error message.

For example, assume you have a primary ledger and a secondary ledger in the same ledger group that use GBP as the base currency. You have KLS selected and require that journal entries balance by base currency. If you then generate a journal in various currencies and a journal edit returns the result that the base amount of the secondary ledger in GBP is out of balance, you must select *Adjust Last Journal Line* for that journal to be balanced by the system.

The system cannot use *Add Adjusting Journal Line* under the circumstances described in the example. Under these conditions, when you must use *Adjust Last Journal Line*, the system selects the last line in a balancing set for balance by base currency where the transaction currency is not equal to the base currency to add or subtract the amount necessary to balance the base currency of the secondary ledger.

The last line is not necessarily the last line of the journal. The system groups all lines in balancing sets when balancing the journal. The journal edit selects the last line for a balancing set where the transaction currency does not equal the base currency and calculates the amount necessary to balance the set. Each set must balance for the total journal to be in balance.

## Ledgers For A Unit - Approval Options Page

Use the Ledgers For A Unit - Approval Options page (BUSINESS\_UNIT\_LED4) to specify default journal approval options for the specified ledger.

Navigation:

**Set Up Financials/Supply Chain >Business Unit Related >General Ledger >Ledger For A Unit >Approval Options.**

This example illustrates the fields and controls on the Ledgers For A Unit - Approval Options page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'Ledgers For A Unit - Approval Options' page. At the top, there's a navigation bar with 'Employee Self Service' and 'Ledgers For A Unit'. Below this, there are tabs for 'Journal Edit Options', 'Currency Options', 'Journal Post Options', and 'Approval Options'. The 'Approval Options' tab is selected. The page displays the 'Business Unit' as 'US001' and the 'Ledger Group' as 'RECORDING'. There are search and navigation controls at the top of the main content area. The main content area is titled 'Detail Ledgers' and shows three sections: 'Journal', 'Budget Journal', and 'Control Budget Journal'. Each section has an 'Approval Option' dropdown menu. The 'Journal' section also has a checkbox for 'Journal Unpost Approval'.

You have the option to use either the Approval Framework method (recommended) or Virtual Approver method for the journal approval and standard budget journal approval processes. You select the approval methodology for the respective journal approval on the [Installation Options - General Ledger Page](#). The selection choices on the Approval Options page depend on which approval method you selected:

- Approval Framework method (recommended), the Approval Framework provides its own Business Process and Approval Rule Set to communicate with PeopleTools.
- Virtual Approver method, the **Business Process Name** and **Approval Rule Set** fields appear on this page.

See "Understanding Configurable Workflow" (PeopleSoft General Ledger).

See "Understanding the Journal Entry Approval Process" (PeopleSoft General Ledger).

---

**Note:** You can define the approval options at the business unit, ledger group or source level. When you define approval options at the source level, they override any approval handling that you specified at the business unit or ledger group levels for journals using that source only.

This field appears only when you select the Virtual Approver method from the Installation Options - General Ledger page.</p>                                                                                                                                                                                                                                                                                                                                           |
| <b>Approval Rule Set</b>                                                                                | <p>Select a workflow approval rule set of the previously specified business process with which you approve journal entries. This field appears only when you select the Virtual Approver method from the Installation Options - General Ledger page.</p>                                                                                                                                                                                                                                                                                             |

## Control Budget Journal

Enable the Approval Framework approval workflow process for Commitment Control budget journals at the ledger level. You can also define the approval options at the business unit or source level. Options are:

- *Default to Higher Level*: Select to use the approval option that you define on the business unit General Ledger Definition - Approval Options page.
- *Not Required*: (default) Select if you do not want to enable approval workflow for Commitment Control budget journals at the ledger level.
- *Required*: Select to enable approval workflow for Commitment Control budget journals at the ledger level.

## Setting Up and Using Multibook Ledgers

To set up multibook ledgers, use the following components:

- Installation Options (INSTALLATION)
- Ledger Template (LEDGER\_TEMPLATE)

- Detail Ledger (DETAIL\_LEDGER)
- Detail Ledger Group (DETAIL\_LEDGER\_GROU)

## Pages Used to Set Up and Use Multibook Ledgers

| <b>Page Name</b>                                   | <b>Definition Name</b> | <b>Usage</b>                                                                                                                                                                                                                                                 |
|----------------------------------------------------|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <u>Overall Page</u>                                | INSTALLATION_FS1       | Select the Create Multibook Accounting Entries in Subsystems option.                                                                                                                                                                                         |
| <u>Templates - Record Definitions Page</u>         | LEDGER_TEMPLATE1       | You can create or modify the record names for a ledger template; however, do this only if you are adding a new template or modifying the default records of the templates delivered with the system.                                                         |
| <u>Templates - Field Definitions Page</u>          | LEDGER_TEMPLATE2       | You can create or modify the field names for a ledger template; however, do this only if you are modifying the default fields or if you are adding the fields to store debit amounts separate from credit amounts (separate debit and credit configuration). |
| <u>Detail Ledger Page</u>                          | LEDGER_DETAIL1         | Define a detail ledger ID and name, and link the detail ledger to a ledger template.                                                                                                                                                                         |
| <u>Ledger Groups - Definition Page</u>             | LEDGER_GROUP           | Define a ledger group, link it to a ledger template, assign ledger details to the group, and identify the unique attributes of each ledger within the group.                                                                                                 |
| <u>Ledger Groups - ChartField Page</u>             | LEDGER_GROUP2          | Define default ChartFields for this ledger group. The system generates a set of default values, which you can modify.                                                                                                                                        |
| <u>Ledger Groups - Balancing Page</u>              | LEDGER_GROUP3          | Specify the ChartField balancing options for the journals generated to the detail ledger.                                                                                                                                                                    |
| <u>Create/Update Journal Entries - Header Page</u> | JOURNAL_ENTRY1         | Select the multibook transaction ledger group.                                                                                                                                                                                                               |
| <u>Create/Update Journal Entries - Lines Page</u>  | JOURNAL_ENTRY2_IE      | Enter transaction amounts and currency codes for one or more ledgers included in the multibook ledger group.                                                                                                                                                 |

## Prerequisite

Before you set up and process multibook ledgers, set up base currencies.

## Overall Page

Use the Overall (INSTALLATION\_FS1) page to select the create Multibook Accounting Entries in Subsystems option.

Navigation:

**Setting Up Financials/Supply Chain >Install >Installation Options.** Click the **Overall** link

To set up your system for multibook processing:

1. Select the **Multibook Accounting Entries in Subsystems** check box only if you want other PeopleSoft applications to create in-sync accounting entries.
2. Review ledger templates and define detail ledgers.
3. Link multiple detail ledgers to a ledger group using the Ledger Group - Definition page.

### Related Links

[Defining a Ledger Template](#)

[Defining a Detail Ledger](#)

[Linking Ledgers to a Ledger Group](#)

## Create/Update Journal Entries - Header Page

Use the Create/Update Journal Entries - Header page (JOURNAL\_ENTRY1) to select the ledger group that you set up for multibook transactions, or select the ledger group and a specific ledger within that group.

Navigation:

**General LedgerJournalsJournal EntryCreate/Update Journal EntriesHeader**

When you select **Keep Ledgers in Sync** on the Ledger Group - Definition page, the system automatically selects the AutoGenerate Lines option.

When you enter a transaction for the entire group, the system converts the transaction amount to the base currency of each ledger in the group and posts it to each ledger within the group. The conversion rate is determined at the transaction level. If the transaction is for one specific ledger in the group, the system posts the transaction only to that ledger.

## Create/Update Journal Entries - Lines Page

Use the Create/Update Journal Entries - Lines page to enter transaction amounts and currency codes for one or more ledgers included in the multibook ledger group.

Navigation:

## General Ledger > Journals > Journal Entry > Create/Update Journal Entries > Lines.

The **Ledger** field in the journal line record is an addition to the existing key fields: **Business Unit**, **Journal ID**, **Journal Date**, and **Unpost Sequence**. Based on the ledger group that you enter, the system determines how many secondary ledgers are in the ledger group; it creates one journal line for each ledger. The ChartField values and transaction amounts are the same on each of these lines, with the exception of the translation ledger. The translation ledger has different amounts that populate the **Monetary (Base Currency) Amount**, **Currency Code**, **Exchange Rate Type**, and **Exchange Rate** fields; the base currency in the ledger determines these values.

After you enter all of the transaction lines, select the Journal Edit process, which automatically generates journal lines as supporting transaction details for each ledger.

### Example 1: Multibook Transaction

Assume that you have a Local ledger with NOK as the base currency and a Reports ledger with EUR as the base currency. Both are part of the ledger group Actuals. You enter the transaction in CHF with a CHF 100 debit to rent expense (account 1000) and a CHF 100 credit to accounts payable (account 2000). You enter the local lines, and the system automatically generates the reports lines. The four journal lines appear as follows:

| <i>Jrnl Ln</i> | <i>Ledger Group</i> | <i>Ledger</i> | <i>Acct</i> | <i>Frgrn Amt</i> | <i>Frgrn CC</i> | <i>Mntry Amt</i> | <i>CC</i> | <i>Rate Type</i> | <i>Excg Rate</i> |
|----------------|---------------------|---------------|-------------|------------------|-----------------|------------------|-----------|------------------|------------------|
| 1              | ACTUALS             | LOCAL         | 1000        | 100              | CHF             | 50               | NOK       | CURR             | 0.5              |
| 1              | ACTUALS             | REPORTS       | 1000        | 100              | CHF             | 25               | EUR       | CURR             | 0.25             |
| 2              | ACTUALS             | LOCAL         | 2000        | <100>            | CHF             | <50>             | NOK       | CURR             | 0.5              |
| 2              | ACTUALS             | REPORTS       | 2000        | <100>            | CHF             | <25>             | EUR       | CURR             | 0.25             |

### Example 2: Translation Ledger

In this example, Reports is defined as a translation ledger. Both Local and Reports are part of the ledger group Actuals. The transaction was entered in CHF with the same amount as above. The four journal lines appear as follows:

| <i>Jrnl Ln</i> | <i>Ledger Group</i> | <i>Ledger</i> | <i>Acct</i> | <i>Frgrn Amt</i> | <i>Frgrn CC</i> | <i>Mntry Amt</i> | <i>CC</i> | <i>Rate Type</i> | <i>Exchg Rate</i> |
|----------------|---------------------|---------------|-------------|------------------|-----------------|------------------|-----------|------------------|-------------------|
| 1              | ACTUALS             | LOCAL         | 1000        | 100              | CHF             | 50               | NOK       | CURR             | 0.5               |
| 1              | ACTUALS             | REPORTS       | 1000        | 50               | NOK             | 25               | EUR       | CURR             | 0.5               |
| 2              | ACTUALS             | LOCAL         | 2000        | <100>            | CHF             | <50>             | NOK       | CURR             | 0.5               |

| <i>Jrnl Ln</i> | <i>Ledger Group</i> | <i>Ledger</i> | <i>Acct</i> | <i>Frgn Amt</i> | <i>Frgn CC</i> | <i>Mntry Amt</i> | <i>CC</i> | <i>Rate Type</i> | <i>Exchg Rate</i> |
|----------------|---------------------|---------------|-------------|-----------------|----------------|------------------|-----------|------------------|-------------------|
| 2              | ACTUALS             | REPORTS       | 2000        | <50>            | NOK            | <25>             | EUR       | CURR             | 0.5               |

When you enter the Local lines, the system automatically generates the Report lines. For a translation ledger, the foreign amount and transaction currency of Reports are the monetary (base currency) amount and currency code of the primary ledger, Local.

The header record for the journal lines contains summary information including ledger, total debits, total credits, edit status, and posted status. The amounts carried on the header are in the denomination of the base currency for the business unit.

## Understanding Combining Accounts Using Summary Ledgers

General Ledger has default summary ledgers in which you can store balances without additional modification. However, you can create additional summary ledgers and modify existing ledgers.

Using the Summary Ledger component (SUMMARY\_LEDGER) and the Ledger Set for Summary Ledgers component (LEDGER\_SET\_SLED), you can:

- Create a summary ledger table.
- Define a summary ledger.
- Set up ledger sets.
- Generate or update a summary ledger.
- Update summary ledgers incrementally through posting.
- View a summary ledger status table.

## Prerequisites

Before you set up a summary ledger record and create a summary ledger table:

1. Decide how to summarize your data either directly from the detail ledger or from data that is rolled up in trees.

---

**Note:** When you summarize data directly from the detail ledger, the field lengths for the summary ledger ChartFields must be the same as the detail ledger ChartFields that you summarize.

---

2. If you obtain summary ledger data from roll up trees, set up a tree for each ChartField that you want to summarize.

For example, to create a table for a summary ledger that summarizes accounts by departments, set up one tree that rolls up the departments that you want to summarize and one tree that rolls up accounts. Also, when you summarize data using trees, the field lengths for summary ledger ChartFields must be exactly 20 characters long to accommodate the maximum length of a tree node name.

3. Determine which summary ledger record definitions are required fields.

| <b><i>Required Fields</i></b>                             | <b><i>Possible ChartFields to Summarize</i></b> | <b><i>Field Type</i></b> |
|-----------------------------------------------------------|-------------------------------------------------|--------------------------|
| BUSINESS_UNIT                                             |                                                 | CHARACTER                |
| LEDGER                                                    |                                                 | CHARACTER                |
| At least one ChartField to summarize.<br>See next column. | ACCOUNT                                         | CHARACTER                |
|                                                           | OPERATING_UNIT                                  | CHARACTER                |

| <b>Required Fields</b> | <b>Possible ChartFields to Summarize</b> | <b>Field Type</b> |
|------------------------|------------------------------------------|-------------------|
|                        | DEPTID                                   | CHARACTER         |
|                        | PRODUCT                                  | CHARACTER         |
|                        | PROJECT_ID                               | CHARACTER         |
|                        | STATISTICS_CODE                          | CHARACTER         |
| FISCAL_YEAR            |                                          | NUMBER            |
| ACCOUNTING_PERIOD      |                                          | NUMBER            |
| POSTED_TOTAL_AMT       |                                          | SIGNED NUMBER     |
| DTMSTAMP_SEC           |                                          | DATETIME          |
| PROCESS_INTSTANCE      |                                          | NUMBER            |

---

**Note:** When you set up your summary ledger record definition, position all ChartFields to be summarized between the **LEDGER** and **FISCAL\_YEAR** fields to ensure that the system populates the summary ledger table correctly. This order is applicable only to the PeopleSoft Application Designer, not the physical storage of the table.

---

4. Define all of the ChartFields to summarize.

Use unique naming conventions that differentiate them from detail ledger ChartFields, so that you can modify field specifications (such as field length) to accommodate the summary ledger without affecting tables that already use the detail ledger ChartField. This also creates a unique set of summary ledger fields that you can reuse in other summary ledger record definitions.

For example, *ACCOUNT* might be *ACCOUNT\_SUM*.

---

**Note:** Any modifications that you make to a detail ledger field's type, length, format, and description affects *every* table that uses the field.

---

5. Define all of the required fields, including new ones that you want to add to the table.
6. Determine whether you want to summarize balances in currencies other than the base currency.

To summarize, include the *CURRENCY\_CD* field in your summary ledger record definition.

7. Determine whether you want to summarize data based on the statistics code ChartField.

To summarize, include the *STATISTICS\_CD* field in your summary ledger record definition.

---

**Note:** If you do not include the *STATISTICS\_CD* field in your summary ledger record definition, by default the system summarizes only detail ledger rows where the *STATISTICS\_CD* field contains blank values and does not generate summarized balances for the ChartField.

---

8. Determine whether you want to use drill-down during PS/nVision reporting.

To use drill-down, include the account ChartField in your summary ledger record definition. Although this ChartField is not required, summarize this ChartField to enable drill-down during PS/nVision reporting.

9. Determine whether you want to track the date and time of each summary ledger update.

To track, include the *DTTM\_STAMP\_SEC* field.

## Related Links

[Using Trees to Summarize ChartFields](#)

## Creating a Summary Ledger Table

To create or modify summary ledgers, create a summary ledger table in which to store summary ledger data.

To create a summary ledger table:

1. Create a new record for the summary ledger record definition.
2. Add summary ledger fields to the record.

In the new record, add the required ChartFields and amount fields to the record definition, and to the ChartFields that you want to summarize. Ensure that you add the fields in the correct order.

3. Position the ChartFields that you want to summarize between the **LEDGER** and **FISCAL\_YEAR** fields, and rename them.

For example, if you are creating a summary ledger table that summarizes accounts by operating unit and department, add these fields:

- **BUSINESS\_UNIT**
- **LEDGER**
- **ACCOUNT** (a ChartField to be summarized that you should name *ACCOUNT\_SUM*)
- **OPERATING\_UNIT** (a ChartField to be summarized that you should name *OPERATING\_UNIT\_SUM*)
- **DEPTID** (a ChartField to be summarized that you should name *DEPTID\_SUM*)
- **FISCAL\_YEAR**
- **ACCOUNTING\_PERIOD**
- **POSTED\_TOTAL\_AMT**

- **POSTED\_BASE\_AMT** (for multicurrency purposes)
- **POSTED\_TRAN\_AMT** (for multicurrency purposes)
- **BASE\_CURRENCY** (for multicurrency purposes)

---

**Note:** If you are using multicurrency in General Ledger, include all ledger amount fields (**POSTED\_TOTAL\_AMT**, **POSTED\_BASE\_AMT**, and **POSTED\_TRAN\_AMT**) for reporting in the summary ledgers. The summary ledger process definition and request reads the summary ledger table, and it summarizes amount fields that you include.

---

4. Insert existing fields (such as **BUSINESS\_UNIT** and **LEDGER**) into the record definition.

In the new file, select each field required for your summary ledger. PeopleSoft Application Designer adds the field with the correct parameters to your record definition.

5. Add the required fields exactly as they appear in the detail ledger.

Do not rename or change the required field parameters.

6. Define new fields, and add them to the record definition.
7. Define the field in PeopleSoft Application Designer, add the new field to the record definition for the ChartFields that you want to summarize, and enter properties for the field.
8. Save the record definition frequently.
9. Specify which fields in your summary ledger record definition are key fields that uniquely identify rows of data.

Designate **BUSINESS\_UNIT**, **LEDGER**, **FISCAL\_YEAR**, **ACCOUNTING\_PERIOD**, **CURRENCY\_CD**, and all of the ChartFields as key fields by selecting the **Key** check box. All key fields should be at the top of the record as defined in PeopleSoft Application Designer. Designate all ChartFields as *Summarized*.

10. Save the summary ledger record definition.
11. Create the table using PeopleSoft Application Designer's Build feature.

See the product documentation for *PeopleTools: Application Designer Developer's Guide*.

## Summary Ledger Page

Use the Summary Ledger page (LEDGER\_SUMMARY1) to specify the ledger template that defines the records and fields for the summary ledger and specify the ChartFields to summarize (after defining a summary ledger table that stores the summary balances).

Navigation:

**General Ledger >Summary Ledgers >Define Summary Ledger >Summary Ledger**

This example illustrates the fields and controls on the Summary Ledger page. You can find definitions for the fields and controls later on this page.

**Note:** Summary ledgers support summarization of ADB (average daily balance) target ledgers. However, summarizing daily ledgers is not supported.

**Note:** You can define Summary Ledgers across Commitment Control Ledgers using the associated detail template. Incremental updates though are not supported for Summary Ledgers.

| Field or Control         | Description                                                                                                                                                                                                                            |

|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>How Specified</b>    | <p>Select from the following values:</p> <p><i>All Detail Values:</i> Retain detail ChartField values in that ChartField.</p> <p><i>All Nodes at a Level:</i> Summarizes every node at a selected tree level.</p> <p><i>Children at a Level:</i> Includes all tree nodes at a given tree level that are children of the specified tree nodes. In this case, you select the parent node names in the <b>Values</b> scroll area.</p> <p><i>Detail - Selected Parents:</i> and <i>Selected Tree Nodes:</i> Enter the tree to use (in <b>Tree Name.</b>) You can then select tree nodes (in <b>Values/Nodes</b>) that contain the detail values that you want to include in the summary ledger on the tree. The ledger includes all detail values summarized by that node. If you select a tree that uses levels, the system displays an optional <b>Level</b> edit box, enabling you to limit prompting in this field to selected levels.</p> <p><i>Selected Detail Values:</i> Select certain detail values (such as USA and Canada Sales departments, or all P&amp;L accounts) in the <b>Values/Nodes</b> field.</p> |

---

**Note:** The field length for the summary ledger ChartFields is a critical factor in defining a summary ledger. It is dependent on whether you specify the summary ledger ChartFields by using detail values or tree nodes.

General Ledger uses the information that you entered on the Define Summary Ledger - Definition page and on the Ledger Set for Summary Ledgers - Ledger Set page to update summary ledger balances. After you define all of your requests, run the background process each time that you want to generate or update a summary ledger. Each time the system processes a summary request, it erases the results of any earlier summary request of the same period.

The Build Summary Ledger Request page enables you to specify one or more business units for summary ledger processing. This facilitates processing and improves performance, whether you process your business units by group or by individual business unit.

| Field or Control | Description                                                                            |
|------------------|----------------------------------------------------------------------------------------|
| Fiscal Year      | The year that the detail calendar uses to determine the summarized accounting periods. |

Request Type

These options determine what you want the background process to do with the summary ledger.

| <b>Increment</b>        | <p>Select to update the summary ledgers incrementally with changes made since the summary ledger was last created or updated. The process checks the status table for an appropriate entry in which to apply the increment. If an entry is found, the process performs the increment action and updates the status row. If no row is found, the Create process runs and inserts a status row.</p> <hr/> <p><b>Note:</b> To use the <b>Increment</b> option, select <b>Enable Incremental Sum Ledgers</b> option on the Ledgers For A Unit - Journal Post Options page for the detail ledger group.</p> <hr/> |

## Tree Effective Date

These fields determine the use of the effective date.

| <b>Field or Control</b>    | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Period End Date</b> | Select to have the system use the version of the tree that is effective as of the end date of each period summarized.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Use Date override</b>   | <p>Select any past or future date.</p> <p>You typically run summary ledgers for a single period as part of your monthly closing, but you can also use this field to select a range of periods. The periods are determined by the summary or detail calendar associated with this ledger. If you select a range of ledgers and not all of the ledgers contain the requested periods, only the valid combinations run. On the message log, the system identifies the successful completion or an error for each combination that you select. For example, suppose that you select a range of ledgers where the first two use a monthly calendar and the third is based on a quarterly calendar. If you select period 6, the first two summary ledgers run successfully, and the system indicates that an error occurred while processing the third ledger because there is no period 6 in a quarterly calendar. Refer to the Ledgers For A Unit page or to the summary ledger set to verify which calendar the system uses for each summary ledger.</p> |

## Business Unit

Identify the business units or range of business units for which to process the summary ledger.

| <b>Field or Control</b>                        | <b>Description</b>                                                                                                                                                                |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Business Unit From</b> and Business Unit To | Select a business unit or range of business units for summary ledger processing for a given request.                                                                              |
| <b>Process</b>                                 | Select the business units or groups of business units for summary ledger processing. Those business units or range of business units that are not selected will not be processed. |

## Period Type

You identify the period and whether its period is a balance forward period or a year end adjustment period.

| <b>Field or Control</b>    | <b>Description</b>                                                                                                                                                                                                                                                  |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Balance Forward</b>     | Select after each annual close to prepare for the new year's processing. General Ledger uses Period 0 to store balance-forward amounts. Summarize the beginning balances loaded during the implementation process so that they are available for summary reporting. |
| <b>Year-End Adjustment</b> | Select to summarize any adjustments that you entered. You typically summarize the year end adjustments before you run an annual close. If you select this option, you can specify the adjustment periods to include. Adjustment periods are not combined.           |

## Updating Summary Ledgers Incrementally Through Posting

General Ledger provides the option to update summary ledgers incrementally. This reduces system processing time.

To update summary ledgers incrementally through posting:

1. On the Ledgers For A Unit - Journal Post Options page, select Enable Incremental Sum Ledgers for each business unit and detail ledger combination for which you want defined summary ledgers to be updated incrementally.
2. On the Ledger Set for Summary Ledgers - Ledger Set page for the appropriate ledger set, select Post to Summary Ledger for any combinations that you want to run through the posting process.

---

**Note:** This option only allows summary ledger incremental updates. Whether the incremental updates actually occur depends on what you select for the Skip Summary Ledger Update option (see step 3).

---

- Verify that the Skip Summary Ledger Update option on the User Preferences - General Ledger page is *not* selected.

If you run posting through the Journal Post Request page, be sure that this option on that page is not selected.

---

**Note:** Select the Skip Summary Ledger Update option on the User Preferences - General Ledger page when you run the Journal Post process and you do *not* want to incrementally update summary ledgers at the same time. You can always update the summary ledger incrementally later through posting or from the Build Summary Ledger - Request page.

---

You can run posting through a remote call (clicking the Go button on the Create/Update Journal Entries - Lines page), as part of the Journal Edit process, or directly from other background processes that create and post journals (such as the Journal Generator process or the Currency Translation process). Do not select the Skip Summary Ledger Update option on the User Preferences - General Ledger page.

- Run the posting process.

Posting calls the summary ledger process for each business unit and ledger group requested. This process adds all defined summary ledgers that meet the following criteria:

- The Post to Summary Ledger option on the Ledger Set for Summary Ledgers - Ledger Set page is selected.
- There is a row in the status table, as determined by the BUSINESS\_UNIT, LEDGER, FISCAL\_YEAR, and ACCOUNTING\_PERIOD fields.

## Review Incremental Process Status Page

Use the Review Incremental Process Status page (SLED\_STAT\_INQ) to view the status of an incremental process.

Navigation:

**General Ledger > Monitor Background Process > Review Incremental Led Status**

This example illustrates the fields and controls on the Review Incremental Process Status page.

| <b>Marked</b>               | Select this check box to indicate which rows you want to clear or unlock.                                                  |
| <b>Locked</b>               | Displays <i>Y</i> or <i>N</i> to indicate whether the record is locked and being used by an incremental process.           |

## Using TimeSpans

To define TimeSpans, use the TimeSpans component (TIME\_SPAN).

### Page Used to Set Up TimeSpans

| <b>Page Name</b>               | <b>Definition Name</b> | <b>Usage</b>                                      |
|--------------------------------|------------------------|---------------------------------------------------|
| <a href="#">TimeSpans Page</a> | TIME_SPAN              | Define TimeSpans for ledger reports or inquiries. |

### TimeSpans Page

Use the TimeSpans page (TIME\_SPAN) to define TimeSpans for ledger reports or inquiries.

When you select and retrieve ledger balances for use in allocations, inquiries, and PS/nVision reporting, TimeSpans control the number of periods for which data is extracted and summarized from the ledger table.

## Importing and Exporting Ledgers

To import a flat file from another product or external system that contains rows of ledger data, use the Flat File Ledger Import component (LOAD\_LED\_PNL).

To export flat file ledgers, use the Export Ledger Data component (RUN\_GLS7500) and Ledger File Formats component (LED\_FILE\_FORMATS).

## Pages Used to Import and Export Flat File Ledgers

| <b>Page Name</b>                                     | <b>Definition Name</b> | <b>Usage</b>               |
|------------------------------------------------------|------------------------|----------------------------|
| <a href="#">Flat File Ledger Import Request Page</a> | LOAD_LED_PNL           | Import a flat file ledger. |

|----------------------------------------|------------------------|----------------------------------------------------------------------------------------|
| <u>Ledger Flat File Formats Page</u>   | LEDGER_FILE_TBL        | Add flat file export formats to be used by the Ledger File Creation process (GLS7500). |
| <u>Export Ledger Data Request Page</u> | RUN_GLS7500            | Export a ledger file to another system.                                                |

## Understanding Importing and Exporting Ledgers

You can import a flat file from another product or external system that contains rows of ledger data using the Flat File Ledger Import component (LOAD\_LED\_PNL). This functionality is often used to combine distributed ledger data from different General Ledger systems to perform consolidation, summarization and corporate reporting.

You can also select or add a flat file format and export flat file ledgers to third-party reporting software systems. To export flat file ledgers, use the Export Ledger Data component (RUN\_GLS7500) and Ledger File Formats component (LED\_FILE\_FORMATS). This functionality is often used in those countries requiring delivery of ledger data in a particular format for use in producing statutory reports in a required format.

Use these components to:

- Import ledger data from a flat file.
- Add flat file ledger export formats.
- Export ledger data to a flat file.

In addition to flat file import and export, you can also exchange ledger data between distributed General Ledger systems using the Ledger Publish Enterprise Integration Point and Ledger Load processing. This functionality is designed to work together with Consolidation. Please see Consolidation documentation for details of this process, and "Integrating and Transferring among Applications" documentation for integration details.

## Flat File Ledger Import Request Page

Use the Flat File Ledger Import Request page (LOAD\_LED\_PNL) to import a flat file ledger.

Navigation:

**General Ledger >Ledgers >Import Ledger from Flat File >Flat File Ledger Import Request**

This example illustrates the fields and controls on the Flat File Ledger Import Request page. You can find definitions for the fields and controls later on this page.

The PeopleSoft Application Engine process (GL\_LED\_IMP) imports detail ledger data from a flat file directly into a standard detail ledger or a standard budget ledger. This process imports data only into ledgers with **Allow Ledger Load Updates** option selected on the Ledgers for a Unit - Definition page.

---

**Warning!** The PeopleSoft Application Engine Flat File Ledger Import process performs minimal validation on the imported data. It does not check against combination editing or Commitment Control budgets during import.

---

To import data from a flat file ledger:

1. Click **Add** to upload and attach the ledger file.
2. Click **View** to review the file's contents online (or you can download the file to your computer).
3. Click **Delete** to remove the ledger file attached to this run control.
4. Select a **Character Set** for the flat file being imported. For example, you might specify ISO\_8859-6 for Arabic or JIS\_X\_0208 for Japanese Kanji if the file was prepared in that character set.
5. Select the desired **Validate ChartFields** option for your import processing.

You can choose to validate none of the ChartFields or you can choose to validate All Common ChartFields.

6. Click **Run** to import the flat file using the PeopleSoft Application Engine process.
7. Click **Process Monitor** to access the Process List page, where you can view the status and progress of the PeopleSoft Application Engine process.
8. Click **Report Manager** to access the Administration page, where you can view the process report online, check the status of the process, and see content details of the report and the distribution list.

## File Format for the Flat File Ledger Import Process

The File Layout object (GL\_LED\_IMPORT) determines the file format.

The following table shows the file format for the Flat File Ledger Import process. The layout varies depending on the first column with the following meaning:

| <b>Field or Control</b> | <b>Description</b>                                            |
|-------------------------|---------------------------------------------------------------|
| <b>#</b>                | Comments.                                                     |
| <b>S</b>                | Standard detail ledger. Data is imported into PS_LEDGER.      |
| <b>B</b>                | Standard budget ledger. Data is imported into PS_LEDGER_BUDG. |

**Note:** The File Layout GL\_LED\_GL is predefined as shown below. If you prefer the CSV format, you may customize it by changing the file format from FIXED to CSV using Application Designer. This change of format without modifying the fields will not affect the ledger import process.

| <b>Column</b>          | <b>Length</b> | <b>Description</b> |
|------------------------|---------------|--------------------|
| Column                 | Length        | Description        |
| 1                      | 1             | #                  |
| 2                      | 100           | Comments           |
| Standard Detail Ledger |               |                    |
| Column                 | Length        | Description        |
| 1                      | 1             | S                  |
| 2                      | 5             | Business Unit      |
| 7                      | 10            | Ledger             |
| 17                     | 10            | Account            |
| 27                     | 10            | Alternate Account  |
| 37                     | 10            | Department         |
| 47                     | 8             | Operating Unit     |
| 55                     | 6             | Product            |

| <b>Column</b> | <b>Length</b> | <b>Description</b>          |
|---------------|---------------|-----------------------------|
| 61            | 5             | Fund Code                   |

[Defining Ledgers for a Business Unit](#)

## Ledger Flat File Formats Page

Use the Ledger File Formats page (LEDGER\_FILE\_TBL) to add flat file export formats to be used by the Ledger File Creation process (GLS7500).

Navigation:

**General Ledger > Ledgers > Ledger File Formats > Ledger File Formats**

This example illustrates the fields and controls on the Ledger File Formats page. You can find definitions for the fields and controls later on this page.

PeopleSoft delivers ledger file formats for a group of financial regulatory reports that are required by organizations in France and Belgium. However, you can add new formats.

To add new formats:

1. Modify the Map-Output-File procedure of GLS7500.SQR.

Typically you clone the code of the three other delivered formats in the Map-Output-File procedure and use a new layout of your own. This requires some SQR programming knowledge to write a few lines of code.

2. Add a ledger file format for the correct SetID on the Ledger File Formats page.

Ensure that the layout matches the one that you added to the SQR code in Step 2. Enter a description of the file, enter the name of the ledger export output file, and enter or select the file extension.

## Export Ledger Data Request Page

Use the Export Ledger Data Request page (RUN\_GLS7500) to export a ledger file to another system.

Navigation:

**General Ledger > Ledgers > Export Ledger Data > Export Ledger Data Request**

To create a ledger file for export:

1. Enter the business unit, ledger, fiscal year, and period.  
Select the appropriate flat file in the Layout field to create the flat file.
2. Click **Run** to initiate the Ledger File Creation process.
3. Click **Report Manager** to view the report; click **Process Monitor** to monitor the status of the Ledger File Creation GLS7500 process.

---

**Note:** The Ledger File Creation process works only for ledgers on whose Ledgers For A Unit - Definition page you selected **Enable Separate Debit/Credit**.

# Using Journal Generator

---

## Understanding Journal Generator

The Journal Generator process (FS\_JGEN) creates journals from accounting entries from the following data sources:

- Non-PeopleSoft systems.
- Oracle's PeopleSoft applications in the same database, such as PeopleSoft Payables, Contracts, and Purchasing.
- Oracle's PeopleSoft applications from another database, such as PeopleSoft Payroll and Student Financials.

Journal Generator does the following:

- Transforms accounting entries into PeopleSoft General Ledger journals.
- Optionally edits and posts the journals created in Journal Generator.
- Supports journals for multiple general ledger (GL) business units as well as multiple ledgers.
- Supports debit and credit entries and negative correcting entries.

For non-PeopleSoft systems, the following examples are provided to interact with Journal Generator:

- A generic accounting entry definition named GENERIC.
- A journal generator template named GENERIC.
- A generic accounting entry table (PS\_JGEN\_ACCT\_ENTRY) used as an interface between external systems and Journal Generator.

It is not used by delivered PeopleSoft subsystems.

Use it or clone it to load transactions to be processed by Journal Generator. Create journal entries using these generic definitions, or use your own modified definitions.

## Convert Accounting Entries to PeopleSoft Journals

This diagram summarizes how Oracle's PeopleSoft applications and non-PeopleSoft applications are used in creating journal entries using the Journal Generator and how journals are prepared for General Ledger processing:

How PeopleSoft applications create journal entries

Accounting entries are created in other application systems, both PeopleSoft and non-PeopleSoft.

PeopleSoft entry event and interunit and intraunit processes also create accounting entries that can be processed by Journal Generator.

If you have installed Commitment Control, budget checking can be done with journal edit and validation.

The Journal Generator process transforms accounting entries into general ledger journals. Subsystem applications can create journals from the application business unit to different general ledger business units, as well as to different ledger groups and ledgers for a General Ledger business unit.

General Ledger validates journals according to the criteria that you set up in your general ledger system. It automatically validates a journal when you request a journal edit. The Journal Entry Errors page displays any errors that the system encountered; you can then access the appropriate Journal Entry page to correct the errors. After the system validates the journals with no error, you can request posting to your general ledger. You can initiate the Journal Edit and Budget Check (GL\_JEDIT2) and Journal Post (GL\_JP) processes from Journal Generator, or initiate them later in a separate process.

## Journal Generator Required Field Names

This table lists the fields that must be in the Accounting Entry table to run Journal Generator. Fields shown in upper case are exact field names that are required in the table. Mixed-case field names indicate that you can specify the field name on the Accounting Entry Definition page:

| <b>Field Name</b>                 | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Accounting Date                   | Reflects the date of the accounting entry recognized in general ledger.                                                                                                                                                                                                                                                                                                                                    |
| Foreign Amount                    | Foreign (transaction currency) amount.                                                                                                                                                                                                                                                                                                                                                                     |
| Monetary Amount                   | Base currency amount.                                                                                                                                                                                                                                                                                                                                                                                      |
| ACCOUNTING_PERIOD and FISCAL_YEAR | The Journal Generator process populates the accounting period and fiscal year after it distributes the accounting entry to a general ledger journal based on the journal date.                                                                                                                                                                                                                             |
| APPL_JRNL_ID                      | Journal generator template ID. Identifies the journal defaults and summarization options for the accounting entry.                                                                                                                                                                                                                                                                                         |
| BUSINESS_UNIT                     | Application business unit.                                                                                                                                                                                                                                                                                                                                                                                 |
| BUSINESS_UNIT_GL                  | General Ledger business unit for the entry.                                                                                                                                                                                                                                                                                                                                                                |
| CURRENCY_CD                       | Currency code for the base currency amount.                                                                                                                                                                                                                                                                                                                                                                |
| FOREIGN_CURRENCY                  | Currency code of the foreign amount.                                                                                                                                                                                                                                                                                                                                                                       |
| GL_DISTRIB_STATUS                 | General Ledger Distribution Status indicates the posting status for the distribution lines. The value is <i>N</i> (none) when the accounting entry is created and ready for the Journal Generator process. The Journal Generator process changes the value to <i>D</i> (distributed) when it distributes the accounting entry to a general ledger journal. The Journal Generator ignores any other values. |

| <b>Field Name</b>           | <b>Description</b>                                                                                                                                                                                    |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JOURNAL_ID and JOURNAL_DATE | The Journal Generator process populates the journal ID and journal date fields after it distributes the accounting entry to a general ledger journal.                                                 |
| JOURNAL_LINE                | Populated by the Journal Generator after it distributes the accounting entry to a general ledger journal if the Cross Product Drill Down option on the Accounting Entry Definition page is selected.  |
| LEDGER                      | Specific ledger to which an accounting entry posts. If this field is blank, Journal Generator uses by default the primary ledger of the ledger group.                                                 |
| LEDGER_GROUP                | Ledger group to which an accounting entry posts. If this field is blank, the Journal Generator creates the journal to the default ledger group specified on the Ledger for a Unit - Definitions page. |
| PROCESS_INSTANCE            | Populated by Journal Generator when it distributes the accounting entry to a general ledger journal.                                                                                                  |

This table lists optional fields for the Journal Generator process. Uppercase fields are exact field names that are used in the Accounting Entry table. Mixed-case names indicate that you can specify the field name on the Accounting Entry Definition page:

| <b>Field Name</b>                   | <b>Description</b>                                                                                                                                                                    |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Statistical Amount                  | Statistical amount.                                                                                                                                                                   |
| Journal Ref (journal reference)     | Journal line reference used to track the source of the transaction.                                                                                                                   |
| Journal Descr (journal description) | Journal description used to describe a transaction.                                                                                                                                   |
| Open Item Key                       | Open item key provides the link between related open item entries.                                                                                                                    |
| ChartFields                         | ChartFields that map directly to the General Ledger ChartFields. The Journal Generator process uses these ChartFields when it summarizes the accounting entries and creates journals. |
| KK_AMOUNT_TYPE                      | Commitment Control Amount Type provides commitment control accounting entries for budget checking in General Ledger on the journals created.                                          |

| <b>Field Name</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DOC_TYPE          | Use document type for document sequencing. Use this field and the Document Type mapping feature on the journal generator template to group accounting entries according to the general ledger document type into different journals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| DOC_SEQ_NBR       | Sequence number of the document.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DOC_SEQ_DATE      | Date the document sequence number was assigned or validated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| MOVEMENT_FLAG     | <p>Defines the sign of the amount if you enabled the Separate Debit/Credit option. Otherwise Journal Generator ignores this flag. The values are:</p> <p><i>N</i>: Natural sign of the monetary amount of the transaction. This is the default. For suspense balancing, base currency rounding adjustments, currency position, and interunit from and to lines, this field is always N.</p> <p><i>R</i>: Reverse sign of the monetary amount of the transaction. If the Enable Separate Debit/Credit option is selected on the Ledgers For A Unit - Definition Page and you enabled separate debits and credits for your system, you can toggle this field to represent a reversing debit or credit amount.</p> |
| ADB_DATE          | If the Average Daily Balance Date field exists on the accounting entry table, Journal Generator uses it to populate the ADB date of the journal header.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| BOOK_CODE         | If the Book Code field exists in the accounting entry table and if Book Code has been activated on the Overall Installation Options page, Journal Generator groups accounting entries into different journals according to the Book Code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Using Journal Generator with Commitment Control

Whether Journal Generator processing includes budget checking depends on the system source and the *Skip Commitment Control in GL* option in the accounting entry definition.

### Accounting Entry Definition System Source with an Application Subsystem That Supports Commitment Control

General Ledger does not perform commitment control budget checking when journals are created with this type of definition because the entries are budget checked in the feeder, or subsystem.

The *Budget Check* option on the Journal Generator request page is not applicable for these entries.

Journal Generator processing occurs under these conditions:

- If KK\_AMOUNT\_TYPE exists on the accounting entry table:

Journal Generator processes only those entries with a `KK_AMOUNT_TYPE` value of *1*, indicating actuals.

- If `KK_AMOUNT_TYPE` is not in the accounting entry table:

Journal Generator assumes that all entries are actuals, and processes them.

## Accounting Entry Definition System Source Without an Application Subsystem That Supports Commitment Control

The *Skip Commitment Control in GL* option determines if General Ledger performs budget checking for journals created from this definition.

The Budget Check option on the Journal Generator request page specifies if Journal Edit includes budget checking as part of its edit process, which is called by Journal Generator after it creates journals. This is applicable only to journals generated from an accounting entry definition with Skip Commitment Control in GL deselected.

Journal Generator processing occurs under these conditions:

- If `KK_AMOUNT_TYPE` exists on the accounting table:

Only those entries specified in the accounting entry definition are processed. If you specify *Actualize*, then Journal Generator processes only those entries with `KK_AMOUNT_TYPE = 1` for actuals. If you leave the option blank (which means all entries), then Journal Generator processes all entries. Journal Generator creates a journal for each different `KK_AMOUNT_TYPE` value that it finds in the source table.

- If `KK_AMOUNT_TYPE` is not in the accounting table:

Journal Generator assumes that all entries are actuals, and processes them all.

## Prerequisites

Before you begin:

- Define the date range for extracting accounting entries on the Open Period page.
- Review your record definitions for the ledger on the Ledger Template - Record Definitions page.

Journal Generator uses the following record names to create the journals:

- Journal line record (`JRNL_LN`).
- Journal generator temporary record (`JGEN_WRK_TMP`).
- Journal header record (`JRNL_HEADER`).

`JRNL_HDR_REC` is a field on `LED_TMPLT_TBL` to specify the journal header record. The `JRNL_HDR_REC` field is not on the Ledger Template - Record Definitions page because General Ledger does not support a journal header record name other than `JRNL_HEADER`. However, Journal Generator can support a dynamic journal header record name. You can use the recommended SQL tools to update

LED\_TMPLT\_TBL.JRNL\_HDR\_REC with another journal header record name for the specified ledger template.

---

**Warning!** If you install General Ledger, do not change the journal header record name. Otherwise, the journals that you create will not post to General Ledger.

---

- On the Ledger Template - Field Definitions page, review the field definitions.

For third-party system transactions, Journal Generator summarizes debits together and credits together instead of summarizing them to the net amount if the following conditions are true:

- Posted Total Debits and Posted Total Credits fields contain values.
- You selected the Enable Separate Debit/Credit option for the ledger on the Ledgers For A Unit page.

Additionally, you can make adjustment entries for reversing debit and reversing credit in the accounting entries. Journal Generator summarizes these reversing entries separately.

- On the Detail Ledger - Definition page, verify :
  - That the ledger template and the detail ledger are linked.
  - That multiple ledgers within the same journal belong to the same ledger group, as shown on the ledger group page.

When Journal Generator creates journals, it posts accounting entries based on the settings for the ledger group. It creates a distinct journal header for each ledger group.

- That the Keep Ledgers in Sync field setting. The Keep Ledgers in Sync option determines if journal entries post to all ledgers in the ledger group or only to a single specified ledger.

The journals that the Journal Generator process creates depend on whether this option is selected or deselected and whether the Accounting Entry in Sync option in the journal generator template is selected.

- Which journals Journal Generator creates depends on these settings:
  - The Keep Ledgers in Sync option, on the Detail Ledger Group - Definition page, decides if journal entries post to a single specified ledger (deselected) or to all ledgers in the ledger group (selected).
  - The Accounting Entry in Sync option in the journal generator template, used for multibook, has many implications.
  - Whether you specified the ledger group and ledger for the accounting entry lines.
- Review the Ledgers For a Unit pages.
  - On the Definitions page, verify the ledger groups for the business unit. The Journal Generator process generates journals for different ledger groups for the same general ledger business unit. If the ledger group field is blank in the Accounting Entry table, Journal Generator uses the default

ledger group defined on the Ledgers For a Unit - Definitions page for the journals of this general ledger business unit.

- On the Definitions page, verify the ledger definitions for the business unit.
- On the Journal Edit Options page, verify the journal edit option definitions.

The journal balance option, journal edit errors option, journal amount errors option, and control total option determine the journal error processing.

- On the Currency Options page, verify the currency option definitions.

The currency options determine the balancing, base currency adjustments, and rounding adjustments for the journals. The Foreign Currencies per Journal option determines if the Journal Generator process creates separate journals for each foreign currency. If you select Only One Foreign currency or No Foreign Currencies, the system creates one journal for each foreign currency.

- On the Journal Post Options page, verify the journal post options.
- On the Approval Options page, verify the approval options, which determine the approval rules for standard journals and budget journals.
- On the Commitment Control Options page, verify the commitment control options.

## Setting Up for Journal Generator

To set up the journal generator, use the Accounting Entry Definition component (JRNLGEN\_DEFN), Journal Generator Template - Defaults component (JRNLGEN\_APPL\_ID) and the Journal Generator Template - Summarization component (JRNLGEN\_APPL\_ID).

## Pages Used to Set Up for Journal Generator

| <i>Page Name</i>                                           | <i>Definition Name</i> | <i>Usage</i>                                                                                                                                    |

| <u>Journal Generator Template - Summarization Page</u> | JRNL_GEN_SUM           | Define how Journal Generator summarizes accounting entries when it generates journals. Summarize at the account or ChartField level. The generator creates a distinct journal header for each ledger group; multiple ledgers can be in one journal as long as they belong to the same ledger group. |

## Understanding Journal Generator Setup

The Journal Generator process creates general ledger journals for any application. The process uses the record and field names from the accounting entry definition to extract data from the Accounting Entry table and create journals.

It extracts data from any table in the database as long as the table contains the required fields listed in the Reviewing Journal Generator Required Field Names.

Your application may contain field names that are different from the required fields in the Accounting Entry table but have the same attributes. If this is the case, create a view in your system's distribution line table and point the Journal Generator to it by specifying its name in the Accounting Entry Record field on the Accounting Entry Definition page.

If you changed or added fields and want to pass values associated with these fields to journals—that is, retain detail—you insert the new fields in five tables: Accounting Entry, Journal Generator Work (JGEN\_WRK\_TMP), Journal Generator Dynamic State Records (FS\_JGEN\_UPD\_AET and FS\_JGEN\_PRV\_AET), and Journal Line. The fields must have the identical field names and attributes in each table. Finally, in the journal generator template select Retain Detail.

Non-PeopleSoft systems can use the GENERIC accounting entry definition or create their own modified accounting entry definition.

| <b>Record Update</b>            | Select an accounting entry record update name. This is the record that Journal Generator updates. It is the accounting entry table that Journal Generator updates with journal information after it creates the journal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>System Source</b>            | <p>Identifies the source of an accounting entry from which a transaction arises. For example, the source of receivables transactions is Accounts Receivable.</p> <p>Journal Generator uses system source to:</p> <ul style="list-style-type: none"> <li>• Derive the prompt table for the application business units when it defines the request.</li> <li>• Format the system source field on the journal header.</li> <li>• Determine whether general ledger enables you to perform commitment control budget check for journals created from this system source.</li> </ul> <p>This works in conjunction with the <b>Skip Commitment Control in GL</b> check box.</p> <p>For a non-PeopleSoft application, select the JrnlGen - Other value.</p> <p>For a PeopleSoft application, select one of the other System Source values.</p> |
| <b>Page Name</b>                | For cross-product drilldown, each product that generates journals to General Ledger can supply a drill page for each of its accounting line tables. In the <b>Page Name</b> field, enter the names of the drill pages to display the corresponding accounting line table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Cross Product Drill Down</b> | <p>Select this check box to enable cross product drilldown. This feature enables you to identify the source of accounting transactions across product lines. This option causes Journal Generator to populate the journal line number and other journal key fields in the Accounting Entry table. Using these field values, the system enables you to drill down from account balances in General Ledger to specific transactions in other PeopleSoft applications for detailed supporting information.</p> <hr/> <p><b>Note:</b> The accounting line table must have a unique index if you use the cross-product drilldown feature.</p> <hr/>                                                                                                                                                                                         |

| <b><i>Field or Control</i></b>       | <b><i>Description</i></b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Skip Commitment Control in GL</b> | <p>When the system source supports commitment control, the system selects the <b>Skip Commitment Control in GL</b> check box and makes it unavailable for deselecting, because commitment control functions are done at the application level.</p> <p>When the system source does not support commitment control, you can choose to do a commitment control budget check in general ledger by leaving this deselected, or choose not to do so by selecting this option. Some of the applications that do not support commitment control include: Asset Management, Contracts, Global Payroll, Cash Management, and any external systems.</p> |

| <b>Field or Control</b>               | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Commitment Control Amount Type</b> | <p>The values that appear for this field depend on the contents of the accounting entry record. When you enter a value for the accounting entry record name, the system looks at that record's record definition to see if it contains a field named KK_AMOUNT_TYPE. Only if the system finds KK_AMOUNT_TYPE in the record definition, does the <b>Commitment Control Amount Type</b> field become enabled for you to enter data. If KK_AMOUNT_TYPE does not exist in the record table, then the system assumes that all accounting entries are actuals transactions.</p> <p>Select one of the following values:</p> <p><i>(none)</i>: All values are selected.</p> <p><i>Actuals</i>: The actual amount of the expenditure or the recognized revenue.</p> <p><i>Collected</i>: The amount of revenue collected.</p> <p><i>Reg/Col</i>: Combination of actuals and collected. For an expense transaction, the actual amount of the expenditure. For a revenue transaction, the actual amount of the recognized revenue and the amount of revenue collected.</p> <p><i>Dynamic</i>: Specify this amount type when you enter the transaction. Not applicable to generic transactions.</p> <p><i>Encum</i>: Encumbrance is often the second step in the procurement life cycle, and usually takes the form of a purchase order or contract. It is used to record the legal obligation to spend funds.</p> <p><i>Planned</i>: The amount that you plan to spend. This amount is only an estimate and the process does not use it to determine if you have exceeded the budgeted amount.</p> <p><i>Pre-Encum</i>: Preencumbrance is often the first step in the procurement life cycle, and usually takes the form of a requisition. It often precedes an encumbrance (purchase order), although it is not mandatory that a preencumbrance exist in order to create an encumbrance. The requisition is used to indicate the intent to consider, not the legal requirement, to make a purchase or to obligate funds.</p> |

## Field Names

Enter the field names to identify the columns in the Accounting Entry table that the Journal Generator uses to create the journal.

| <b>Field or Control</b>                    | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accounting Date</b>                     | <p>Reflects the date of the accounting entry to be recognized in general ledger.</p> <hr/> <p><b>Note:</b> ACCOUNTING_DT appears by default, but it can be changed to another field name from the Accounting Entry table.</p> <hr/>                                                                                                                                                                     |
| <b>Monetary Amount</b>                     | The base currency amount.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Foreign Amount</b>                      | The foreign (transaction currency) amount.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Statistical Amount</b>                  | (Optional) The statistical amount.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Journal Ref</b> (journal reference)     | <p>(Optional) The journal line reference used to track the source of the transaction. The journal line reference is populated from the defined field name if you select the <b>Retain Detail</b> option on the Journal Generator Template - Summarization page.</p> <p>If no field name is defined, the system takes the journal line reference from the Journal Generator template defaults.</p>       |
| <b>Journal Descr</b> (journal description) | <p>(Optional) Describe a transaction. This is populated from the defined field name if you select the <b>Retain Detail</b> option on the Journal Generator Template - Summarization page.</p> <p>If no field name is defined, the system takes the journal line description from the Journal Generator template defaults.</p>                                                                           |
| <b>Open Item Key</b>                       | <p>If the open item key is mapped to a field in the subsystem table, then the Open Item value carries over to General Ledger if you select the <b>Retain Detail</b> summarization option on the Journal Generator Template - Summarization page.</p> <p>If no field name is defined, the system does not create an open item record even if the account of the transaction is an open item account.</p> |
| <b>Settlement Date</b>                     | Reflects the date of the accounting entry to be recognized (in addition to the Accounting Date) if the Date Code is enabled for tracking and posting. See <a href="#">Ledgers For A Unit - Journal Post Options Page</a> .                                                                                                                                                                              |
| <b>Last Update Date Time</b>               | Includes the Date Timestamp field that reflects when the journal has been generated through the Journal Generator process.                                                                                                                                                                                                                                                                              |

## ChartField Mapping

Expand this grid to perform mapping.

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Name</b>              | Specify the accounting entry field names that map directly to the General Ledger ChartField names.                                                                                                                                                                                                                                                                     |
| <b>ChartField</b>              | Specify general ledger ChartField names. If you select the <b>Summarize to All ChartField Level</b> option on the Journal Generator Template - Summarization page, Journal Generator uses the listed ChartFields when it summarizes the accounting entries and creates journals. The ChartFields that are not listed have a blank value in the newly created journals. |
| <b>Summarize ChartFields</b>   | Specifies the ChartFields that are summarized if the <b>Summarize by Selected ChartFields</b> on the Journal Generator Template - Summarization page is selected. The ChartFields that are not selected have a blank value in the newly created journals.                                                                                                              |

**Note:** Journal Generator limits you to mapping a field once. For example, you cannot map **Journal Ref** and **Open Item Key** to the same field name. They must be mapped to different field names.

## MultiBook Order By

Specify the field names for in-sync multibook accounting.

Within a ledger group, the accounting entries for one transaction that are distributed to different ledgers are referred to as *in-sync* accounting entries. These accounting entries have the same ChartFields, foreign currency, and foreign amounts. PeopleSoft applications that support multibook generate in-sync accounting entries to all ledgers within a ledger group.

If the **Accounting Entry In Sync** option is selected in the journal generator template, Journal Generator recognizes the in-sync accounting entries and marks them for the Journal Edit process to create any missing in-sync journals. When it generates the journal, Journal Generator uses the **MultiBook Order By** fields to determine how to group accounting entries for one transaction.

If the application subsystem supports multibook in sync, it sends in-sync entries, including those for the translation ledger, to the Journal Generator process. Journal Generator uses the **MultiBook Order By** fields to determine multibook entries for the same transaction.

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                                                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field Name</b>              | If you create new accounting entries from third party systems, you can enter field names in the sort order required to group the new accounting entries. |

---

**Warning!** Do not change any of the values in these fields as delivered. The values are set for the delivered accounting entries and any changes can cause serious data problems.

---

---

**Note:** PeopleSoft Purchasing does not support multibook entries.

---

## Transaction Group Fields

Use this section to indicate that you want to hold, purge, and reload entire transactions if the transaction has an error against the accounting line. Enter the field names that are required to define a 'whole transaction'. The system considers a 'whole transaction' to have all field names, specified in this section, within the transaction.

This section is only displayed when the System Source value is *JrnlGen – Other*.

These fields are used when the system preprocesses transactions prior to the Journal Generator (FS\_JGEN) process.

---

**Note:** PeopleSoft delivers system data in these fields, but you should verify that they are valid for your organization.

---

For additional information about required field names for Journal Generator, see [Journal Generator Required Field Names](#).

## Journal Generator Template - Defaults Page

Use the Journal Generator Template - Defaults page (JRNL\_GEN\_DEFAULTS) to specify Journal Generator defaults.

Navigation:

**General Ledger > Journals > Subsystem Journals > Journal Generator Template > Defaults**

This example illustrates the fields and controls on the Journal Generator Template - Defaults page . You can find definitions for the fields and controls later on this page.

The defaults and summarization options that you set up using the journal generator templates determine how journal generator summarizes accounting entries and creates journals. Typically, you set up Journal Generator templates for each application system source that distributes to the general ledger, as well as each *type* of transaction. For example, you can have a template for depreciation expense from Asset Management. For systems other than PeopleSoft systems, you can use the GENERIC journal generator template or create a modified journal generator template.

Journal Generator groups accounting entries together that share the same general ledger business unit, ledger group, book code (the field BOOK\_CODE exists in the accounting entry table and Book Code has been activated on the Overall Installation Options page), journal template, journal date, general ledger document type, average daily balance date (the field ADB\_DATE exists in the accounting entry table), and the commitment control amount type (field KK\_AMOUNT\_TYPE exists in the accounting entry table). Accounting entries with different foreign currencies might not be grouped in the same journal, depending on the currency balancing option for the:

- Source.
- Business unit ledger group.
- General ledger business unit.

## Options

If a PeopleSoft application that supports the multibook feature has generated in-sync accounting entries for this template, select the **Accounting Entry In Sync** check box. PeopleSoft applications that support multibook generate in sync accounting entries to most ledgers within a ledger group. The exception is that some products may not include the currency translation ledger. See the individual product documentation to determine if this feature is available for your product. If the **Accounting Entry In Sync** check box is selected, Journal Generator recognizes in-sync accounting entries and generates in-sync journals. The journals created by Journal Generator depend on the following:

| <b>Field or Control</b>         | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accounting Entry In Sync</b> | <p>If <b>Accounting Entry In Sync</b> is selected, the following occurs:</p> <ul style="list-style-type: none"> <li>Journal Generator recognizes in-sync accounting entries and generates in-sync journals.</li> </ul> <p>It groups in-sync accounting entries by the multibook accounting entries order by fields specified on the Accounting Entry Definition page if you select the <b>Retain Detail</b> option on the Journal Generator Template - Summarization page. It also groups in-sync accounting entries by the ChartFields and foreign currency if you select the summarized option (ChartField Account) on the Journal Generator Template - Summarization page.</p> <ul style="list-style-type: none"> <li>The system sets the Auto-Gen flag to <i>Yes</i> on the journal header.</li> </ul> <p>If Journal Generator creates journal lines to all the ledgers within the ledger group from the accounting entries, then the Journal Edit process (GL_JEDIT2) does not create new journal lines.</p> <p>However, if Journal Generator does not create journal lines to all the ledgers within the ledger group, then the Journal Edit process creates journal lines to ledgers that do not have matched journal lines.</p> <ul style="list-style-type: none"> <li>The default ledger group of the general ledger business unit is used by the system if the LEDGER_GROUP field on the Accounting Entry lines is blank.</li> </ul> <p>The system uses the primary ledger of the ledger group if the <b>Ledger</b> field on the accounting entry line is blank.</p> <p>You must select the <b>Accounting Entry In Sync</b> check box if the subsystem is creating multibook in-sync accounting entries for Journal Generator.</p> <p>If <b>Keep Ledgers in Sync</b> is selected and <b>Accounting Entry In Sync</b> is deselected, the following occurs:</p> <ul style="list-style-type: none"> <li>The lines in the Accounting Entry table are the entries from the primary ledger or another ledger.</li> </ul> <p>The Auto-Gen flag is set to <i>Yes</i> on the journal header. Journal Edit creates the lines for the rest of the ledgers within the ledger group.</p> <ul style="list-style-type: none"> <li>The system uses the default ledger group of the general ledger business unit if the ledger group on the accounting entry lines is blank.</li> </ul> |

| <b>Field or Control</b>       | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                               | <p>The primary ledger of the ledger group is used by the system if the ledger on the accounting entry line is blank.</p> <p>If the <b>Keep Ledgers in Sync</b> check box is not selected, and the <b>Accounting Entry In Sync</b> field is also deselected, the following occurs:</p> <ul style="list-style-type: none"> <li>• The Journal Generator process creates journal lines for the specified ledgers as <i>not</i> in-sync journals.</li> <li>• The Journal Generator process sets the <b>Auto-Gen</b> field to <i>No</i> on the journal header and does not create new journal lines.</li> </ul> <p>The Accounting Entry In Sync check box should not be used with the RECPTACCRL journal generator template (PeopleSoft Purchasing).</p>                                                                 |
| <b>Create One Journal Per</b> | <p>This controls how the source accounting entries are grouped into journals. Values are:</p> <p><i>Application Business Unit:</i> Creates one journal per general ledger business unit, per application business unit. This means that accounting entry lines with different application business units go into different journals.</p> <p><i>General Ledger Business Unit:</i> Creates one journal per general ledger business unit. This means that accounting lines with different values for the general ledger business unit go into different journals. Accounting lines having the same value in the <b>BUSINESS_UNIT_GL</b> field but different values in the <b>BUSINESS_UNIT</b> field (as in Accounts Payable or Accounts Receivable) results in one journal for the general ledger business unit.</p> |

For example, as this table shows, the following accounting entries go into the same business unit journal for US003:

| <b>Application BU</b> | <b>Voucher ID</b> | <b>BU_GL</b> | <b>Foreign Amount</b> |
|-----------------------|-------------------|--------------|-----------------------|
| US001                 | VCHR1200          | US003        | 300                   |
| US003                 | VCHR1202          | US003        | -300                  |

## Reversal Code

Select a **Reversal Code** option to specify when reversing entries are to be automatically generated. Reversal options become effective at the time this entry is posted.

| <b>Field or Control</b>         | <b>Description</b>                                                                                                                                                                                                                                 |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Do Not Generate Reversal</b> | Journal Generator does not create the reversal entry, but it marks the journals with the reversal code. When the journals are posted later in a separate process, the system creates the reversal entry.                                           |
| <b>Beginning of Next Period</b> | Creates a reversing entry dated the first business day of the next accounting period. It uses the business calendar that you assigned to the business unit on the General Ledger Definition - Definition page to determine the first business day. |
| <b>End of Next Period</b>       | Creates a reversing entry dated the last business day of the next accounting period. It uses the business calendar that you assigned to the business unit on the General Ledger Definition - Definition page to determine the last business day.   |
| <b>Next Day</b>                 | Creates a reversing entry dated the next business day. It uses the business calendar that you assigned to the business unit on the General Ledger Definition - Definition page to determine the next business day.                                 |

## Journal Header Fields

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Journal Source</b>   | Identifies the originating entity responsible for the journal entries, and also determines how the foreign currencies are grouped for each journal.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Journal ID Mask</b>  | Enter a <i>unique</i> journal ID mask to identify information such as the source or purpose of journal entries. Spaces are not allowed. A 10-character alphanumeric ID identifies PeopleSoft-system journals. The system automatically generates IDs based on the number or letter that you enter here. For example, if you enter <i>AP</i> , the system supplies the remaining eight characters based on the next available journal ID number. If you do not specify a journal ID mask, you can let the system automatically assign the journal IDs by accepting the default : <i>NEXT</i> . |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Journal Date</b>     | <p>Determines the journal date for the journals created and indirectly the number of journals created. From the <i>Journal Date</i> options, select the source of the header and line date for journals that use a business calendar.</p> <p>See <u>Defining Business Calendars</u>.</p> <p><i>Accounting Date on Transaction</i>: Uses the accounting date on the accounting entries as the journal date. This selection may result in multiple journals.</p> <p><i>Begin Date - From Period</i>: Uses the first open date of the From (year) Period set up on the Open Period page.</p> <p><i>Begin Date - To Period</i>: Uses the beginning date of the open To (year) Period set up on the Open Period page.</p> <p><i>Current Date</i>: Accepts the current system date when the process is run.</p> <p><i>End Date – From Period</i>: Uses the ending date of the open From (year) Period set up on the Open Period page.</p> <p><i>End Date – To Period</i>: Uses the last open date of the To (year) Period set up on the Open Period page.</p> <p><i>Period End – Accounting Date</i>: Uses the period-end date that corresponds to the accounting date. This selection might result in multiple journals.</p> <p><i>Process Date</i>: This refers to the Journal Process Date option specified on the General Ledger Business Unit Definition - Journal Options page. On that page, you can specify the process date defined for the business unit, or the current date.</p> <p><i>Specify Date</i>: If you select this, the Date field is available for you to enter a specific date.</p> |

| <b>Field or Control</b>                           | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Alt. Journal Date</b> (alternate journal date) | <p>Determines the journal date for the journals created if the journal date determined from the journal date option is not within the open accounting period's range. Select one of these values:</p> <p><i>Begin Date - From Period:</i> Uses the first open date of the From (year) Period set up on the Open Period page.</p> <p><i>Begin Date - To Period:</i> Uses the beginning date of the open To (year) Period set up on the Open Period page.</p> <p><i>End Date - From Period:</i> Uses the ending date of the open From (year) Period set up on the Open Period page.</p> <p><i>End Date - To Period:</i> Uses the last open date of the To (year) Period set up on the Open Period page.</p> <p><i>Retain Primary Journal Date:</i> The system uses the date that you specify as the journal date in this journal generator template.</p> |
| <b>Stay in Period</b>                             | <p>Journal Generator derives the journal date according to the journal date options previously described. However, if you select the <b>Stay in Period</b> check box and the derived journal date is a not a working day, Journal Generator uses the next working day for the journal date. If the next working day is not in the same period, Journal Generator uses the day prior to the derived journal date for the journal date.</p> <p>If you deselect the <b>Stay in Period</b> check box, Journal Generator changes journal dates that fall on nonworking days to the next working day, regardless of the accounting period.</p>                                                                                                                                                                                                               |
| <b>Descr</b> (description)                        | (Optional) Identifies information about the journal. It is useful for explaining any abnormalities in the journal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Reference</b>                                  | Tracks the source of the transaction for the journal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default GL Document Type</b>                   | The system uses the default GL document type to assign a document type on the journal header when you create journals through Journal Generator. Select a default GL document type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Field or Control</b>        | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Currency Effective Date</b> | <p>If you want to set the currency effective date on the journal header to be the average daily balance (ADB) date, select <i>ADB Date</i> in the template. Otherwise, the default is the journal date.</p> <p>If the ADB date does not exist on your accounting entry table, or if it is null, then the ADB date on the Journal Header will default to journal date. In this instance, selecting a currency effective date option does not make any difference because the currency effective date is always equal to the journal date.</p> <p>However, when the ADB date exists on your accounting table and it is not null, then Journal Generator can populate the ADB date from the accounting lines even if this date is different from the journal date.</p> <p>In addition to other existing groupings, Journal Generator also groups accounting lines into different journals by ADB date.</p> |

## Document Type Mapping

If you use document sequencing, expand the **Document Type Mapping** grid to map application document types to general ledger document types. Document type mapping applies to all journals generated, whether they are summarized or retain detail.

If the application document type is not found on this mapping, it is assigned to the default GL document type. You can map multiple application document types to one GL document type, but you cannot map multiple general ledger document types to a single application document type. Each of the different GL document types results in a different journal.

## Journal Generator Template - Summarization Page

Use the Journal Generator Template - Summarization page (JRNL\_GEN\_SUM) to define how Journal Generator summarizes accounting entries when it generates journals.

Summarize at the account or ChartField level. The generator creates a distinct journal header for each ledger group; multiple ledgers can be in one journal as long as they belong to the same ledger group.

Navigation:

## General Ledger > Journals > Subsystem Journals > Journal Generator Template > Summarization

This example illustrates the fields and controls on the Journal Generator Template - Summarization page. You can find definitions for the fields and controls later on this page.

### Primary Summarization Option

These options identify how Journal Generator distributes account values from the application system source to General Ledger. In addition to the specified options, Journal Generator summarizes by entry event whenever that field exists on the accounting entry table and the summarization option is not **Retain Detail**.

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>How Specified Option</b>    | <p>Select to retain full details, or select a summarization level from the following values:</p> <p><b>Summarize to Account, AltAcct:</b> Summarizes accounting entries at the account and alternate account level. All other ChartFields are blank. If alternate account is disabled at the ledger group level, it summarizes to account level only.</p> <p><b>Summarize to All ChartFields:</b> Summarizes accounting entries to the level of all ChartFields that are listed on the Accounting Entry Definition page.</p> <p><b>Summarize by Selected CF's:</b> Summarizes accounting entries by ChartFields that have the Summarize ChartField check box selected on the Accounting Entry Definition page.</p> <p><b>Retain Detail:</b> Distributes accounting entries in full detail. When this is selected, the Project ChartFields can be mapped on the Accounting Entry Definition page and Journal Generator populates the Project ChartFields in the journals that it creates.</p> |

| <b>Field or Control</b>      | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>How Account Specified</b> | <p>Your selection in the <b>How Specified Option</b> group box affects the accounts selected in this option. You can specify accounts or a tree to indicate the accounts that you want. It is recommended that you use trees whenever possible to reduce future maintenance should ChartField values change. Select an option for How Account Specified from the following values:</p> <p><b>All Account Values:</b> Distributes all the accounting entries according to the how specified option.</p> <p><b>Selected Account Values:</b> Distributes the selected account values according to the how specified option. Activates the Selected Values/Nodes and the Alternate Summarization Option fields.</p> <p><b>Selected Tree Nodes:</b> Distributes the account values that are defined by the tree name, tree level, and selected nodes according to the how specified option. Activates the <b>Selected Values/Nodes</b> and <b>Alternate Summarization Option</b> fields, as well as the <b>Tree Name</b> and <b>Level</b> fields. Enter the name of the tree and the level to use for summarization.</p> |
| <b>Tree Name</b>             | Specify the name of the tree to use for summarization.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Selected Values/Nodes</b> | Enter either accounts or tree nodes depending on the <b>How Account Value Specified</b> option.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Alternate Summarization Option

The **Alternate Summarization Option** check boxes provide the same options as the **Primary Summarization** option for the accounts that are not selected in the **Selected Values/Nodes** field. Select the **How Default Specified** value. Choose to retain detail, or to summarize one of three ways.

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Generating Journal Entries

To generate journal entries, use the Generate Journals Request component (JRNLGEN\_REQUEST).

### Page Used to Generate Journal Entries

## Understanding Generating Journal Entries

This topic discusses:

- Journal Generator Preprocesses
- Journal Generator Process

### Journal Generator Preprocesses

The ISO Currency Control Project and ISO 4217:2008 require organizations that have multicurrency transaction to show the decimal relationship between business units and currency. PeopleSoft has three processes to the FS\_JGEN (Journal Generator) process:

- PS\_FS\_JGEN\_PRE – Journal Generator Precheck
- PS\_FS\_JGEN\_PRG – Journal Generator Purge

- PS\_FS\_JGEN\_RPT – Journal Generator Report

When the Journal Generator process is initiated and the system source is JrnlGen – Other, these process automatically run based on the Business Process Weaver (BPW) for FS\_JGEN . The purpose of these preprocesses is to check currency precision:

- If the currency precision is not equal to what is specified on the Currency Code page (CURRENCY\_CD\_TBL), then the Precheck process identifies transactions that have a precision issue and holds all related entries so that they are not processed when the FS\_JGEN process runs
- If the currency precision is valid, then those transactions are processed through the FS\_JGEN process.

When currency precision errors are found, the Journal Generator Error Accounting Lines (FSX6001) report is generated for you to correct the transactions. This report provides application business unit and the key fields for all accounting entry lines and an error description. Only the accounting lines that have a currency precision error appear on this report. The key fields are determined from your accounting entry record.

After the transactions have been corrected, you should run the Journal Generator Purge process to remove the error accounting lines and reload the corrected ones. Then you should rerun the Precheck process to check the newly loaded transactions again. If the new transactions pass the Precheck process, then Journal Generator process creates journals for these accounting lines

Two Business Process Weaver (BPW) definitions support this feature:

- FS\_JGEN combines the Precheck and Journal Generator processes so that Precheck automatically runs before Journal Generator.
- FS\_JGEN\_PRG combines the Report and Purge processes so that the Purge process automatically runs after the Report process.

To setup your system for the Journal Generator Pre-processes:

- You must be on PeopleSoft 9.2.005 or higher.
- You must complete the Transaction Group Fields section on the Accounting Entry Definition page.

## Journal Generator Process

Selecting journals for Journal Generator processing is the final step required to process accounting entries.

After the system runs the Preprocesses, Journal Generator extracts accounting entries (for transactions that pass the Precheck process) from the accounting entry tables. These accounting entries are used to generate the actual journal entries for editing and posting.

Each time you run Journal Generator, it creates journals for all (or one) application business unit as well as all (or one) ledger group, and all (or one) Journal Generator template set up for those business units, depending on the options that you define on the Journal Generator Request page.

Using the Generate Journals Request component (JRNLGEN\_REQUEST), you can:

- Run Journal Generator processing.
- Change journals created by Journal Generator.

- Delete journals created by Journal Generator.

Generate Journals Request Page

Use the Generate Journals Request page (JRNL\_GEN\_REQUEST) to initiate Journal Generator processing.

Navigation:

General Ledger > Journals > Subsystem Journals > Generate Jrnl From Subsystem

This example illustrates the fields and controls on the Generate Journals Request page. You can find definitions for the fields and controls later on this page.

| Field or Control | Description                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Edit             | Select this check box to run the Journal Edit process. No prerequisites are required.                                          |
| Budget Check     | Select this check box to run the Budget Check process. You must run the Journal Edit process before running this budget check. |
| Post             | Select this check box to run the Post process. You must run edit and budget check before posting.                              |

**Note:** If you select none of these check boxes, no additional processes are run.

## Process Request Parameters

| <b>Field or Control</b>           | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Request Number</b>             | To identify the process request, the system assigns this unique number to each run. You can create multiple requests. Use the scroll arrows to view requests already set up for the current user ID and run control ID.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>SetID</b>                      | This is required to extract the accounting entry definition for the request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Accounting Definition Name</b> | Identify which accounting entry definition the system should use when it creates the journal header and lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Application Business Unit</b>  | <p>Journal Generator:</p> <ul style="list-style-type: none"> <li>Extracts accounting entries for the request according to the option that you select.</li> <li>Creates journal entries for one or all application business units.</li> </ul> <p>The application business unit can be other than the general ledger business unit.</p> <p>The prompt for this field depends on the system source of the accounting definition name. For example, if the system source of the accounting definition is JmlGen-AP, Journal Generator uses the Payables business unit table. If the system source is JGen-Other, no prompt table is available.</p> |
| <b>Ledger Group</b>               | Journal Generator creates journal entries for the specified General Ledger ledger group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Template</b>                   | Journal Generator creates journal entries for the specified journal generator template. The SetID of the prompt values is derived from the SetID entered earlier on the page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>From Date Option</b> | <p>Select a value to further define which accounting entries Journal Generator extracts with this request. Journal Generator compares these dates to the accounting dates associated with each accounting entry. Select from the following values:</p> <p><i>Specify Date:</i> Uses the date specified to identify the period.</p> <p><i>Current Date:</i> Uses the date on which Journal Generator is run.</p> <p><i>Begin Date - From Period:</i> Uses the beginning date of the from period in the ledger.</p> <p><i>Begin Date - To Period:</i> Uses the beginning date of the to period in the ledger.</p> <p><i>No From Date:</i> Uses all open dates of the ledger before the chosen to date. This means that the system processes all dates up to the date in the <b>To Date</b> field.</p> <p><i>Process Date:</i> Date specified on the business unit journal process date option. It can be a specified date defined on the business unit, or it can be the current date.</p> |
| <b>From Date</b>        | Enter a to date if <i>Specify Date</i> is selected in the <b>From Date Option</b> field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>To Date Option</b>   | <p>Select a value to further define which accounting entries Journal Generator extracts with this request. Journal Generator compares these dates to the accounting dates associated with each accounting entry. Select from the following values:</p> <p><i>Specify Date:</i> Uses the date specified to identify the period.</p> <p><i>Current Date:</i> Uses the date on which Journal Generator is run.</p> <p><i>End Date - From Period:</i> Uses the ending date of the from period in the ledger.</p> <p><i>End Date - To Period:</i> Uses the ending date of the to period in the ledger.</p> <p><i>Process Date:</i> Date specified on the business unit journal process date option. It can be a specified date defined on the business unit, or it can be the current date.</p>                                                                                                                                                                                               |
| <b>To Date</b>          | Enter a to date if <i>Specify Date</i> is selected in the <b>To Date Option</b> field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

---

**Note:** The application business unit and general ledger business unit that exist in the Accounting Entry table can differ. One business unit must be designated to derive the SetIDs for the control records during the batch processing. The control records are ledger group and ledger definition tables, calendar tables, journal source table, and journal generator template table. The general ledger business unit is the business unit to derive the SetIDs for these control records. In one particular request, whether all or one business unit is selected, Journal Generator might have multiple general ledger business units to process and cannot determine the associated SetID at the point at which the request is defined. Therefore, the prompt SetID that you see in the **Ledger Group** field and Journal Generator template may not necessarily be the same as the SetIDs used by the batch programs.

---

## Changing Journals Created by Journal Generator

When a journal comes from a subsystem, you can enable a specific user to change a journal that the Journal Generator process creates. On the Define User Preferences - General Ledger page, select this option, which allows a specific user to update the ChartField and amounts on the Journal Entry page for a journal that was created by the Journal Generator process. The ChartFields can be changed, even though the budget status is valid for the journal. Otherwise, all the fields are unavailable and the user can only edit and post the journal.

However, the business unit field is unavailable and cannot be changed on journal lines created from Journal Generator.

---

**Warning!** If you select Change Journal from Journal Generator and then change the ChartField values and re-edit the journal, you can create inconsistencies between the subsystem data and the general ledger data. Also, for journals that are generated for a subsystem that supported Commitment Control, the journal does not budget check again even though the ChartField values or the amount are changed.

For example, if the ChartField entered in the subsystem is Account 5011, Fund 100, Dept ID 200, and you change the ChartField to Account 5011, Fund 100, Dept ID 300, the accounting entry created in the subsystem is different from the one posted in the ledger. If the transaction is impacting the budget for department 200 initially, after the modification, it still impacts department 200 instead of 300 because it was budget checked in the feeder application, or subsystem.

The Journal Generator process always skips budget checking under the following circumstances:

---

- When journals are generated by a subsystem that supports commitment control.
- When you select the **Skip Commitment Control in GL** check box on the Accounting Entry Definition page.

The system does not budget check again an altered journal generated journal, whether or not you select **Change Journal from Journal Generator** on the Define User Preferences - General Ledger page.

For subsystems that do not support commitment control, including external source non-PeopleSoft applications, you can select **Skip Commitment Control in GL** on the accounting entry definition page. In this case, the journal-generated journals must be budget checked in General Ledger.

## Deleting Journals Created by Journal Generator

The Journal Generator process gets rows from the Accounting Entry table when the value in the GL\_DISTRIB\_STATUS field is N. The process changes this value to D when it distributes the accounting entry to a general ledger journal. When a journal that was created from Journal Generator has an error, you can delete the journal on the journal entry page, and the system changes the value in the GL\_DISTRIB\_STATUS field in the Accounting Entry table to N. Then you can correct the error at the accounting entry level and rerun the Journal Generator process to create a new journal.

# Using Interunit and Intraunit Accounting and ChartField Inheritance

---

## Understanding PeopleSoft Interunit and Intraunit Functionality

The PeopleSoft interunit and intraunit functionality includes common setup pages and shared processing to manage interunit and intraunit transactions across its products. You can create a transaction that crosses business units within the same ledger group, and entities, or balancing ChartFields without having to explicitly enter the interunit or intraunit balancing accounting entries. The interunit unit processor creates the interunit and intraunit balancing entries automatically when you have implemented this functionality.

With interunit and intraunit processing, the system uses the minimal number of accounting lines that you must provide and it automatically completes the entire transaction by generating the necessary balancing lines or entries for both the appropriate entities and accounts.

To use centralized interunit and intraunit processing effectively, your accounting environment must be such that you allow cross-entity entries directly to balance sheet, expense or to clearing accounts at some level or levels among the related entities in your organization. Once you establish the necessary accounting protocols to be used in conjunction with interunit and intraunit functionality, minimal input is required from you for the system to complete the cross entity balancing entries necessary when transactions occur between related entities or sets of balanced books.

*Partial or minimal* interunit and intraunit entries can be unbalanced or cross-entity and are created and processed by many procedures in the various PeopleSoft products.

This topic discusses:

- Balancing ChartFields.
- Affiliate ChartFields.
- Balancing methods.
- Anchor entity.
- Product interface and system transaction categorization.
- Organizational and legal categorization of transactions.
- Inter/IntraUnit templates.
- Interunit pairs.
- Summarization of interunit and intraunit journal lines.
- Products using interunit and intraunit processing.

## Balancing ChartFields

Balancing ChartFields and their relationship to a balanced set of accounts or books is central to interunit and intraunit processing and ChartField Inheritance.

Business unit and the ChartFields that you can designate to represent entities are said to be *balancing* when you require debit amounts to equal credit amounts for the purpose of maintaining a balanced set of accounts or books for a particular business unit and selected ChartField values. For example, if for a Business Unit, Department and Fund are Balancing ChartFields, then transactions involving values for any of these ChartFields must have debit amounts equal to credit amounts.

## Affiliate ChartFields

You can use Affiliate ChartField values when interunit or intraunit transactions are maintained using the same Account ChartField value among several related entities (such as business units, funds or operating units). For example, each entity within your organization might use account 140000 as the common interunit receivable account and 201000 as the common interunit payable account. However, when using the same accounts for all entities, an Affiliate ChartField value must be assigned to the accounting line or journal line to readily identify the entity with which the receivable or payable is shared.

Affiliate ChartFields *cannot* be used as standard standalone ChartFields. They must be used in association with another *related* ChartField. This is because the Affiliate ChartField values are the values of the *related* ChartField. There is no separate Affiliate ChartField page where you enter Affiliate values as with the stand alone ChartFields, such as Account or Department.

For example, business unit is required as the InterUnit Related ChartField for Affiliate. It provides the values available in the drop down list box for the Affiliate field on the Journal Entry page. PeopleSoft also delivers intraunit affiliate ChartField functionality for the fund and operating unit ChartFields.

While you could assign each entity different accounts to identify entities among the various interunit or intraunit transactions, this probably entail a larger number of interunit or intraunit accounts having to be created and maintained. An advantage in using affiliate ChartFields is that you can have fewer accounts to maintain.

## Balancing Methods

The Balancing Method is a means of ChartField value retrieval to complete *partial* or out of balance entries and is accomplished by the following methods:

### Due To and Due From Balancing

In Due To and Due From Balancing the system generates additional interunit unit receivable and payable journal lines to bring the overall accounting transaction into balance from your partial cross-book interunit unit entry.

For example, assume that you create a cross-entity entry to transfer an asset from one business unit to another. The system generates the interunit receivable entry for the source or Anchor Business Unit and an interunit payable entry for the receiving or Non-Anchor Business Unit to bring the books for each business unit into balance.

There are three Due To and Due From Balancing methods for interunit transactions as follows:

| <b>Term</b>            | <b>Definition</b>                                                                                                                                                                                                                               |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Indirect Method</b> | The Due To and Due From ChartFields used to balance each business unit in the transaction are retrieved from the affiliated business unit's Inter/IntraUnit Template definition.                                                                |
| <b>Direct Method</b>   | The Due To and Due From ChartFields used to balance each business unit in the transaction are retrieved from the business unit's own Inter/IntraUnit Template definition.                                                                       |
| <b>Pairs Method</b>    | The Due To and Due From ChartFields used to balance each business unit in the transaction are retrieved from a definition for the pair of business units involved in the transaction. Pairs are defined on the InterUnit Pair Maintenance page. |

## Offset Inheritance Balancing

For transactions that include system-generated entries (often as offset entries), the system-generated entries can be defined to inherit ChartField values from the other entries in the transaction (such as the distribution lines you entered) to create an expanded balanced transaction and distribute offsets as needed.

For example, you enter a voucher that records expenses for two different funds. Using Offset Inheritance, the offsetting entries are properly distributed by the system to the appropriate payable accounts for the two funds.

## Edit Only Balancing

Even if you have not implemented interunit and intraunit functionality, a journal might not be in balance for reasons other than interunit activity. The Journal Edit process uses the rules that you set up for balancing journals on the Journal Edit Options page to either recycle such journals or do Edit-Only Balancing and provide a suspense account to automatically balance the entry.

Edit-Only Balancing is primarily applicable when a transaction is out of balance due to rounding or an error. It is not applicable to interunit and intraunit processing.

[Using ChartField Inheritance](#)

## Anchor Entity

The following information describes an anchor entity and its purpose.

## Interunit

Anchor Business Unit typically refers to what is termed the *source, sending, initiating, or charging* entity. For example, if business unit US001 pays rents for US002 and US003, US001 can be designated as the Anchor Business Unit.

## Intraunit

Anchor values for balancing ChartFields serve a similar purpose. For example, within business unit US001, if cash from Fund 100 is used to pay expenses attributable to funds 200 and 300, Fund 100 can be designated the anchor.

## Purpose of the Anchor Entity

When transactions involve three or more entities, the anchor designation is essential for determining which entity serves as the central *hub* for the inter and intraunit balancing entries. The anchor designation also affects the transaction currency in a multicurrency situation for the due to and from lines that are generated by the processor.

See [Reviewing Sample Parameters Provided at Run Time](#).

## Designating an Anchor Entity

In most of the subsystem applications, the anchor entity is determined by the nature of the transaction. For example, for an accounts payable voucher the anchor entity is always the entity to which the supplier liability is recorded. If there are distribution lines that are booked to different business units, these trigger the generation of interunit balancing entries.

In general ledger journal entry, the anchor business unit is the unit entered on the journal header.

Unless you select the IntraUnit Balancing Entries check box on the Detail Ledger Group – Balancing page, inter and intraunit processing does not create *IntraUnit* balancing entries for balancing ChartFields, such as Fund, even if different fund values appear in the same journal.

The Anchor Business Unit is readily apparent in interunit transactions; however, determining which is the Anchor Fund and how journal lines should be grouped when a transaction involves multiple funds requires additional steps. You can indicate on the journal entry which fund values are Anchors and assign a Group Number to journal lines to assist the inter and intraunit processor in creating the balancing lines.

For General Ledger Allocations, the pool values are used as the anchor values.

## Product Interface and System Transaction Categorization

PeopleSoft delivers one or more System Transactions for each product primarily to provide the following:

- An interface to the Inter/IntraUnit Central Processor for each product or application and its transactions that might require system generated inter and intraunit balancing lines.
- Segregation of inter and intraunit payables and receivables by type of System Transaction, such as accounts payable voucher or general ledger journal.
- Definition of options that are appropriate only to a particular System Transaction, such as whether to create an AP (accounts payable) Voucher and an AR (accounts receivable) Item for an InterUnit Bill.

The System Transaction provides predefined information about the tables and fields involved in an application transaction and supplies run-time parameters to the Centralized Inter/IntraUnit Processor.

There are some cases where there are multiple System Transaction Codes for a product, even when all of the technical details for the interface to the central processor are the same, such as AP (accounts payable) Vouchers and AP (accounts payable) Payments. This allows you to associate each system transaction with a different user-defined Transaction Code, which is the key to how you set up ChartFields for InterUnit and IntraUnit payable and receivable entries.

Transaction Codes are defined on the Transaction Code page. Each Transaction Code that you define can be mapped to one or more of the System Transactions on the System Transaction Map page, but each System Transaction can have only one Transaction Code for all products with the exception of general ledger. Once mapped, System Transactions determine the Transaction Codes available to a product for further categorization. If your inter and intraunit accounting does not differ across products and transactions you can define a single Transaction Code and map it to all the System Transactions.

Only the General Ledger System Transaction *GLJ* (general ledger journal) allows the mapping of multiple Transaction Codes so you can create additional subset categorizations for an inter and intraunit transaction. For example, you could create the following Transaction Codes and map them both to the General Ledger System Transaction.

- ADVANCES (Intercompany cash advances)
- INTEREST (Interest on Intercompany advances)

This enables you to further segregate and categorize interunit transactions within General Ledger by maintaining all advances in a separate category of interunit activity and inter company interest on these advances in another category.

---

**Note:** When setting up business units across products, you must include all business units in the same ledger group to use the interunit processor functionality.

---

## Organizational and Legal Categorization of Transactions

PeopleSoft provides functionality to distinguish between Inter Entity and Intra Entity transactions within the interunit category, enabling you to apply the required accounting treatment. However, while there may be different legal entities, all business units in an interunit transaction must share the same ledger group name to generate interunit entries.

The following terms define transactions between and within business units:

| <b>Term</b> | <b>Definition</b>                                                                                                                      |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------|
| InterEntity | A transaction involving two or more General Ledger business units, when each related business unit represents a separate legal entity. |
| IntraEntity | Transactions involving two or more General Ledger business units, when all business units are part of the same legal entity.           |

| <b>Term</b> | <b>Definition</b>                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| InterUnit   | Any transactions involving two or more General Ledger business units within the same ledger group. These can be either InterEntity or IntraEntity, depending on how the business units are defined and how they are mapped in the legal entity hierarchy.                                                                                                                                   |
| IntraUnit   | A transaction within a single General Ledger business unit that involves more than one value in a lower level Balancing ChartField, such as a Fund or Department. The generic description of intraunit can be substituted with more specific terms, such as inter operating unit, inter department, or inter fund, depending on which ChartField requires balancing within a business unit. |

For intraunit activity, the available Accounting Entry Types on the IntraUnit Template page are intraunit receivable and intraunit payable. Additional Accounting Entry Types are available only for Transaction Codes mapped to specific System Transactions. These include intraunit expense and intraunit revenue for the Billing Invoice System Transaction, and IntraUnit In Transit for the Cost Management InterUnit Transfer System Transaction.

For interunit activity, the available Accounting Entry Types on the InterUnit Template page depend on whether you choose to use the legal entity option for your installation. The following table is an example of possible organizational and legal relationships between several business units:

| <b>Business Unit</b> | <b>Belongs to Legal Entity Unit</b> |
|----------------------|-------------------------------------|
| USLE1                | USLE1                               |
| USLE2                | USLE2                               |
| US001                | US001                               |
| US002                | USLE1                               |
| US003                | USLE1                               |
| US004                | US001                               |
| US005                | US001                               |
| US006                | USLE2                               |

In this example USLE1 and USLE2 represent two legal entities to which several of the business units belong. Note that US004 and US005 belong to the US001 legal entity.

If you select the Use Legal Entity for InterUnit option on the Installation Options - Overall page, the following selected combinations illustrate possible Accounting Entry Types applicable to various combinations of inter and intraunit transactions for the business units involved:

| <b><i>Transactions Between</i></b> | <b><i>Applicable Accounting Entry Types Using Legal Entity</i></b> |
|------------------------------------|--------------------------------------------------------------------|
| USLE1 and US003                    | IntraEntity Payable and Receivable                                 |
| US004 and US005                    | IntraEntity Payable and Receivable                                 |
| US001 and USLE2                    | InterEntity Payable and Receivable                                 |
| US006 and US003                    | InterEntity Payable and Receivable                                 |

If you *do not* select the Use Legal Entity for interunit option, the following selected combinations illustrate the possible Accounting Entry Types applicable to various combinations of inter and intraunit transactions for the business units involved:

| <b><i>Transactions Between</i></b> | <b><i>Applicable Accounting Entry Types Not Using Legal Entity</i></b> |
|------------------------------------|------------------------------------------------------------------------|
| USLE1 and US003                    | InterUnit Payable and Receivable                                       |
| US004 and US005                    | InterUnit Payable and Receivable                                       |
| US001 and USLE2                    | InterUnit Payable and Receivable                                       |
| US006 and US003                    | InterUnit Payable and Receivable                                       |

## Interunit and Intraunit Templates

*Interunit* ChartFields are determined by the InterUnit Template when you use either the Direct or Indirect interunit method.

Intraunit ChartFields are always determined by the IntraUnit Template.

---

**Note:** Interunit methods do not apply to *intra* unit transactions.

---

You provide the appropriate InterUnit and IntraUnit Template for a business unit in the General Ledger Definition component.

When the interunit method is Direct, the ChartFields for the balancing entries to one business unit are retrieved using its own SetID and InterUnit Template Code.

When the interunit method is Indirect, the ChartFields for the balancing entries to one business unit are retrieved using its own SetID, but the affiliate business unit's template. The prompting on the

Business Unit Definition only ensure that the template is defined for the SetID of the business unit being maintained, so you must ensure that the template is defined for each related business unit.

---

**Note:** If you use the pairs interunit method, the ChartField values are not determined by the template but are determined by the values that you enter on the InterUnit Pairs page.

---

Using InterUnit and IntraUnit Templates you associate Transaction Codes with Accounting Entry Types for which you provide ChartField values to complete the partial inter and intraunit entries.

To accommodate different ChartField values across business units, the InterUnit and IntraUnit Template tables are keyed by SetID. The SetID entered for the template is used as the Set Control Value to determine which SetID is used to validate the ChartFields that you enter for the template.

When processing transactions, the general ledger business unit to which the entry is written is used as the Set Control Value to determine the SetID used to access the appropriate InterUnit or IntraUnit Template.

Business units should only share the same inter and intraunit SetID if they also share the same SetIDs for all their ChartFields and their Detail Ledger definitions.

For example, consider the source of receivable accounting entry ChartField values for a transaction from business unit US001 to business unit LE001, when legal entity is not a factor.

| <b>Balancing Method</b> | <b>SetID</b>                               | <b>Template</b>                                                                  |
|-------------------------|--------------------------------------------|----------------------------------------------------------------------------------|
| Direct                  | The InterUnit SetID of LE001, the To Unit. | The InterUnit Template on the Business Unit Definition for LE001, the To Unit.   |
| Indirect                | The InterUnit SetID of LE001, the To Unit. | The InterUnit Template on the Business Unit Definition for US001, the From Unit. |

---

**Note:** The SetID used to retrieve the InterUnit Template is always the SetID of the business unit to which the accounting entry is written. Only the template source differs in that the Direct method retrieves the template from the business unit to which the entries are written but the Indirect method retrieves the template from the affiliate business unit.

---

## Interunit Pairs

You must define ChartFields and other options used for interunit transactions on the InterUnit Pairs page when you choose to use the Pairs Method. The Direct or Indirect Method does not apply to pairs.

An InterUnit Pairs definition is keyed by the from business unit, the to business unit and Transaction Code. For each of these combinations you specify the interunit receivable and interunit payable ChartFields. Separate InterEntity and IntraEntity definitions are not necessary because any given pair of business units can only be one or the other.

All ChartField validation is based on the SetIDs associated with the business units. The business unit used as the Set Control Value for ChartField prompting and validation depends on the Accounting Entry Type. When maintaining interunit pair data, refer to the following table to determine which entry types belong to which business unit.

| <i><b>From Business Unit</b></i>                                         | <i><b>To Business Unit</b></i>                                                             |
|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| Receivables                                                              | Payable                                                                                    |
| Revenue (for Billing Invoices)                                           | Expense (for Billing Invoices)                                                             |
| In Transit (for interunit transfers if the Source is the Ownership Unit) | In Transit (for interunit transfers if the Destination is the Ownership Unit)              |
| Cost of Goods (for interunit transfers)                                  | Accrued Payables (for interunit transfers)<br>Customer Shipments (for interunit transfers) |

## Summarization of Interunit and Intraunit Journal Lines

When you want to reduce the number of journal lines generated by interunit or intraunit processing and find that it is not necessary to maintain separate interunit or intraunit balancing, you can choose to use summarization on the Installation Options, Overall page. In addition, you must either not setup affiliates or deselect affiliates for account, fund or operating unit if you want to summarize interunit or intraunit journal lines.

All non-monetary fields on journal lines must be identical to successfully summarize them. Affiliate must not be used, otherwise journal lines cannot be identical and are not summarized by the system. This requirement enables you to selectively use summarization by specifying affiliates in some Ledger Groups but not in others.

You can use interunit with intraunit summarization together and interunit and intraunit journal lines are not combined. If you specify affiliate for business unit, you can summarize by business unit and not by fund or operating unit. Summarization can be selected at installation or at a later date. If selected at a later date, the result is that there will be additional and perhaps unnecessary journal lines.

---

**Note:** If you are using the Sybase database, there is a limitation of a maximum of 31 columns in a group by clause. For this reason system-generated lines even if sharing the same ChartField combination, will not be grouped or summarized together into a single journal line; but separate detail lines will be created.

---

## MultiBook Considerations

When sequence numbers are assigned to lines generated by the interunit processor for multi-ledger ledger groups, it is normal for gaps to occur in the numbers. The happens because the sequence number calculated for a line is based on the number of lines that precede it, but it also gives secondary ledger lines the same sequence number as their corresponding primary ledger line. For example, if two interunit balancing lines are created for a multibook ledger group containing three ledgers, they are numbered as follows (assuming the first sequence number is 101):

| <b>Ledger Group</b> | <b>Ledger</b> | <b>Sequence Field</b> |
|---------------------|---------------|-----------------------|
| LEDGRP1             | LED1          | 101                   |
| LEDGRP1             | LED2          | 101                   |
| LEDGRP1             | LED3          | 101                   |
| LEDGRP1             | LED1          | 104                   |
| LEDGRP1             | LED2          | 104                   |
| LEDGRP1             | LED3          | 104                   |

The first three lines have the same sequence number (101) because they all represent the same transaction line. The second three lines start with 104 because there are three lines before them ( $101 + 3 = 104$ ).

If you use a multi-ledger ledger group in your interunit transactions that does *not* have the **Keep Ledgers in Sync** check box checked, each line within a transaction (such as, a payable and receivable line) must specify the same ledger name. The ledgers may be defined under different set control values, but the ledger names must be the same for lines within a transaction.

## Products Using Interunit and Intraunit Processing

The inter and intraunit processor is automatically called from the general ledger journal edit process and from each process in other products that generates accounting entries and feed transactions to General Ledger, such as PeopleSoft Accounts Payable Voucher Post and Receivables Update. The implementation of Centralized Inter/IntraUnit processing and ChartField Inheritance impacts the following PeopleSoft products:

- General Ledger
- Payables
- Receivables - Deduction Management
- Asset Management
- Inventory - Cost Management
- Billing
- Projects
- Expenses
- Treasury - Cash Management
- Contracts

- Grants

Refer to documentation for the individual PeopleSoft products for specific information about setting up and using inter and intraunit processing and ChartField Inheritance for a particular product.

## Setting Up Interunit and Intraunit Processing

To set up interunit and intraunit processing, use the following components:

- Installation Options (INSTALLATION)
- Detail Ledger Group (DETAIL\_LEDGER\_GROU)
- InterUnit Template (IU\_INTER\_TMPLT)
- IntraUnit Template (IU\_INTRA\_TMPLT)
- General Ledger Definition (BUS\_UNIT\_TBL\_GL)
- InterUnit Pair Maintenance (IU\_INTER\_PR\_BASIC)
- InterUnit Transaction Code (IU\_TRAN\_CD)
- Interunit Transaction Mapping (IU\_TRAN\_MAP)

## Pages Used to Set Up Centralized Interunit and Intraunit Processing

| <b>Field or Control</b>            | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>IntraUnit Balancing Entries</b> | <p>Select and the system automatically generates intraunit balancing entries for transactions that involve multiple values of a balanced ChartField. You cannot select this option unless at least one ChartField is balanced, that is, one <b>Balance</b> check box must be selected that is available. If you do not have this check box selected, or if the journal is not in balance for other reasons, then the journal edit process uses the rules that you set up for balancing journals on the Journal Edit Options page to either recycle or use a suspense account.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Balance</b>                     | <p>A balanced detail ledger requires that debit amounts equal the credit amounts for business unit, base currency code, book code and adjustment type. To choose additional balancing ChartFields for the ledger group select the check box if it is available for another ChartField. Some ChartFields such as account and alternate account cannot be balancing ChartFields and the check box is unavailable.</p> <p>When you change the value of this check box for a standard or translation ledger group, the system verifies that the new setting is valid for the existing ChartField inheritance groups.</p> <p>See <a href="#">Dealing with ChartField Inheritance Groups Requiring Special Validation with Balanced ChartFields</a>.</p> <p>For balancing ChartFields, the system checks for business units that use the ledger group, as defined on the Ledgers for a Unit page in conjunction with the SetIDs that business units use for ledger groups. If a business unit that is tied to the ledger group has a blank inheritance value for the balancing ChartField, you receive a warning.</p> |

|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Use Affiliate</b>        | <p>This field is available only if the ChartField has an affiliate associated with it on the Standard or Advanced ChartField Configuration page.</p> <p>Affiliate is used when it is not apparent from the ChartField account value which entities are involved in an interunit or intraunit transaction.</p> <p>For example business unit US001 uses the account ChartField value 114000 to designate interunit receivables from all other related business units.</p> <p>If US001 has elected to Use affiliate and it paid rent for US002 of 200.00 USD and for US003 rent in the amount of 300.00 USD, the interunit and intraunit processor creates two interunit receivables for the books of US001. A debit is created of 200.00 USD to the 114000 account labeled with the affiliate value US002 and it also creates a debit of 300.00 USD in the 114000 account with the affiliate value US003.</p> <p>The standard ChartFields shipped with PeopleSoft products include two intraunit affiliate ChartFields. One is associated with the Fund ChartField and the other with Operating Unit ChartField. You may add additional intraunit affiliate ChartFields and associate the standard ones with other related ChartFields using the Standard or Advanced ChartField Configuration page.</p> |
| <b>Affiliate ChartField</b> | Displays and is derived from the Standard or Advanced ChartField Configuration page.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Transaction Code Page

Use the Transaction Code page (IU\_TRAN\_CD) to define transaction codes that enable you to categorize interunit and intraunit balances.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Inter/Intra Unit >Define Transaction Code**

This example illustrates the fields and controls on the Transaction Code page. You can find definitions for the fields and controls later on this page.

| *Transaction Code | *Description            |  |
|-------------------|-------------------------|--|
| AP                | Payables Transactions   |  |
| APPMNT            | Payables Payments       |  |
| APVCHR            | Payables Vouchers       |  |
| BIIVC             | Billing InterUnit Bills |  |
| GENERAL           | General Transactions    |  |
| INTRANS           | Inventory Transaction   |  |

**Note:** PeopleSoft ships transaction codes and system transaction mapping as sample data only and not as system data. You must define transaction codes according to the level of segregation of InterUnit and IntraUnit balances that you require.

| Field or Control | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | Click the <b>Add Multiple New Rows at Row</b> button to add additional rows for new transaction codes below the row selected. You can create one transaction code for each system transaction or create only as many as you need at the time to reflect the diversity of your interunit and intraunit accounting treatment. A transaction code can be associated with one or more system transactions. If you do not want to segregate transaction at this level of detail, you can use one transaction code and map it to all your system transactions. |

## System Transaction Map Page

Use the System Transaction Map page (IU\_TRAN\_MAP) to map transaction codes to system transactions, define the default transaction code, and access the transaction Options page.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Inter/Intra Unit >System Transaction Map**

This example illustrates the fields and controls on the System Transaction Map Page. You can find definitions for the fields and controls later on this page.

There is one row on the page for each system transaction, based on the PeopleSoft products you have installed. If you have created a new system transaction, for third party transactions for example, it appear here as well. If you insert a row—the **System Transaction** field is input capable—you can only select a system transaction that allows multiple transaction code instances. The only system transaction that allows multiple transaction codes is general ledger journal. You can only delete a row if it is not the default. This also applies only to general ledger journal.

**Note:** PeopleSoft ships transaction codes and system transaction mapping as sample data only and not as system data. You must define transaction codes according to the level of segregation of interunit and intraunit balances that you require.

| Field or Control          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Transaction</b> | All system transactions are listed on this page for the PeopleSoft products you have installed. When you add a new row, this field is input capable, but the only system transactions available to select are those whose <b>Allow Multiple Instances</b> check box is selected on the System Transaction page (that is <i>GL Journals</i> only).                                                                                                          |
| <b>Transaction Code</b>   | The first time you maintain this page, you must enter a default transaction code for every system transaction that is loaded onto the page. Additional transaction codes are only available if <i>Allow Multiple Instances</i> is selected on the System Transaction page. <i>Multiple Instances</i> is only available for the general ledger journal system transaction. However, the same transaction code can be used for multiple System Transactions. |
| <b>Default</b>            | A default transaction code must be specified for each System Transaction that appears on this page.<br><br>A row may not be deleted if the default option is selected.                                                                                                                                                                                                                                                                                     |
| <b>Options</b>            | Click this link to provide additional settings for interunit billing and interunit transfer system transactions.                                                                                                                                                                                                                                                                                                                                           |

## Transaction Options Page

Use the Transaction Options page (IU\_TRAN\_OPT1) to enter interunit and intraunit options for Billing and Inter/IntraUnit Transfers.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions > Inter/Intra Unit >System Transaction Map >Transaction Options.** Click an **Options** link.

This example illustrates the fields and controls on the Transaction Options for InterUnit Billing. You can find definitions for the fields and controls later on this page.

The **Option** link to access the Transaction Options page is present on the System Transaction Map page for the Billing Invoice and InterUnit Transfer System Transactions only. You can define different supporting document requirements for the applicable accounting entry types. If the legal entity distinction is enforced at the installation level you see *InterEntity*, *IntraEntity* and *IntraUnit* but if legal entity is not used you see *InterUnit* and *IntraUnit*.

These options govern the creation of supporting documents when the InterUnit Method is Direct or Indirect and ChartField values are derived from the InterUnit or IntraUnit Template. For the Pairs method, these options merely provide defaults when a new Interunit pair is defined. You can override any of them for a specific pair of business units.

For the transaction code mapped to the billing invoice system transaction you can choose to print an invoice, generate an accounts receivable open item, generate an AP (accounts payable) voucher, or any combination of the three. The accounts receivable option is available only if Receivables is installed. The accounts payable option is available only if Receivables and Payables are both installed. Both the accounts receivable and accounts payable options are not applicable for IntraUnit transactions.

For the transaction code mapped to the Cost Mgmt (management) InterUnit Transfer System Transaction you have the option to generate an intercompany bill, and define the ownership unit while the goods are in transit. The intercompany option is available only if Billing is installed, and if it is selected, the ownership unit must be the destination unit.

## Creating Additional Transaction Codes for Costing InterUnit Transfers

Although the system allows new transaction codes to be created, Costing InterUnit Transfers are handled differently because of the additional entry types that are required to create appropriate accounting entries.

When a new inventory transaction code is added and mapped to one or more of the Cost Mgt InterUnit Transfer (CMIUT), Cost Mgt Deplete Transaction (CMDEP), or Cost Mgt Ship on Behalf (CMSHB) system transactions, besides the usual IU Payable and IU Receivable entry types, PeopleSoft delivers the following additional applicable entry types:

- In Transit
- Cost of Goods
- Accrued Payable
- Cost of Sales

## InterUnit Template Page

Use the InterUnit Template page (IU\_INTER\_TMPLT) to provide ChartFields by transaction code for interunit balancing entries when using the direct or indirect interunit method.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Inter/Intra Unit >InterUnit Template**

This example illustrates the fields and controls on the InterUnit Template page. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'InterUnitTemplate' page. At the top, there are fields for 'SetID' (SHARE), 'InterUnit Template' (US001), and '\*Description' (US001 OPERATIONS). A 'Help Text' box states: 'For ledger groups in which a ChartField is balancing, the transaction value takes precedence and the value from the template will be overridden.' Below this, there is a 'Transactions' section with a '\*Transaction Code' field set to 'AP' and a link to 'Payables Transactions'. Further down, there is an 'Accounting Entries and ChartFields' section with a table of entries. The table has columns: Entry, Status, \*Account, Alt Acct, Oper Unit, Fund, Dept, Program, Class, and Bud Ref. Two entries are listed: 'IntraEntity Payable' (Active, 200207) and 'IntraEntity Receivable' (Active, 100207). Each entry has search icons for the account, unit, fund, department, program, class, and budget reference fields.

| <b>Field or Control</b>              | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Transaction Code</b>              | Multiple transaction codes can be added to the interunit template and additional settings entered when applicable.                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default Balancing Group</b>       | <p>This field is displayed only when one or more account attributes are active, such as book code and balance sheet indicator. When any account attributes are active, the data on this page is only for the default balance group displayed.</p> <p>See <a href="#">Setting Installation Options for Account Balancing Groups</a>.</p>                                                                                                                            |
| <b>Additional Balancing Groups</b>   | Click to set up interunit ChartFields for additional Balance Groups for this Transaction Code. This link is available when one or more Account Attributes are active, such as Book Code and Balance Sheet Indicator.                                                                                                                                                                                                                                               |
| <b>Insert All Applicable Entries</b> | Select this link to insert the Entry types that are applicable for your system settings. Two factors affect which entry types are active. They are the Use Legal Entity option on the Installation page (interunit versus Inter Entity and Intra Entity) and the System Transactions to which the Transaction Code is mapped (Revenue and Expense for Billing Invoice, Cost of Goods, Accrued Payable, Customer Shipments, and In Transit for InterUnit Transfer). |
| <b>Select Entries to Insert</b>      | Click this link to manually select which Entry types are inserted into the page.                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Entry Types</b>      | <p>The applicable Entry Types for a given Transaction Code depends on to which System Transaction or System Transactions this Transaction Code is linked. The Entry types that are available also vary depending on the Legal Entity option selected.</p> <p>If you do not select the Use Legal Entity for InterUnit option on the Overall Installation options page, the following core Entry types are available:</p> <ul style="list-style-type: none"> <li>• InterUnit Receivable</li> <li>• InterUnit Payable</li> </ul> <p>If the Use Legal Entity for interunit option is selected, the following core Entry types are available:</p> <ul style="list-style-type: none"> <li>• InterEntity Receivable</li> <li>• InterEntity Payable</li> <li>• IntraEntity Receivable</li> <li>• IntraEntity Payable</li> </ul> <p>If the Transaction Code is mapped to the Billing Invoice System Transaction, then interunit or corresponding InterEntity and IntraEntity Revenue and Expense Entry types are also available.</p> <p>If the Transaction Code is mapped to the Cost Mgt (Inventory) InterUnit Transfer System Transaction, then interunit or corresponding InterEntity and IntraEntity Cost of Goods, Accrued Payable, Customer Shipments and In Transit Entry types are also available.</p> |
| <b>Status</b>           | <p>Indicates whether the accounting entry type is Active or Inactive based on the current system settings. For example, you added a row for interunit payable while the Use Legal Entity option is turned off. You then activate the Use Legal Entity option. When you return to this page, you see that the status of the interunit payable entry is now inactive, because you should be defining InterEntity and IntraEntity Payable entries instead.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

The following applies to the ChartField grid on this page:

- There can be multiple rows in the grid depending on the product, System Transaction, Transaction Codes and Legal Entity option selected; however, only two rows are displayed in the grid at a time, unless you select the View All option on the grid.
- Account, AltAccount, the configurable ChartFields (except for the Affiliates), DeptID and Project ID are available on the grid.
- Affiliate ChartFields are not available because their values are automatically populated by the Central Inter/IntraUnit Processor.

- The SetID for the template is used as the Set Control Value to determine which SetID is used to prompt and validate each of the ChartFields in the grid.
- The Account ChartField is required. All other ChartFields are optional. If the ChartField is Balancing, its value on the Due To and Due From balancing entries is automatically inherited from the transaction without regard to the selection on this page.

## InterUnit Template - Select Entries to Insert Page

Use the InterUnit Template - Select Entries to Insert page (IU\_INTER\_ENTRY) to select which entry types to insert into the page.

An alternative to the Select all Applicable Entries button.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Inter/Intra Unit >InterUnit Template**

Click the **Select Entries to Insert** link.

This example illustrates the fields and controls on the Select Entries to Insert page. You can find definitions for the fields and controls later on this page.

## Current Settings

Displays all settings that affect the availability of entry types to the transaction code. If account attributes are active, such as book code and balance sheet indicator, the account balancing group is also displayed.

## Entry Types

| <b>Field or Control</b> | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Entry Type</b>       | The <i>InterUnit</i> , <i>InterEntity</i> , and <i>IntraEntity</i> entry types are available for selection, regardless of their status. This enables you to assign ChartFields to entry types that are not currently active, but may become so in the future.                                                                                                                                                                                                                                            |
| <b>Status</b>           | The status reflects whether the entry type is <i>Active</i> or <i>Inactive</i> given the current system settings. You can select entry types with an inactive status, but they are not used unless you change the settings. For example, you might be setting up entries for a transaction code that is not currently mapped to the billing invoice system transaction, but you might still want to setup interunit revenue and expense entries in anticipation of changing the mapping at a later time. |

## Reviewing Setup Examples Using the Interunit and Intraunit Templates

The following are three scenarios for setting up the interunit and intraunit template.

### Scenario A

The organizational and operational assumptions are:

- You use a corporate chart of accounts for business units ranging from US001 to US050.
- You use unique account values, rather than the affiliate ChartField, to segregate interunit balances by business unit trading partner.
- There is no segregation of interunit balances by the type of transaction.

Installation level options are:

- Interunit balancing method is indirect when unique account values are used to segregate balances by business unit, the method must be either indirect or pairs.
- Do not use legal entity.

Other assumed options are:

- Because all business units share the same corporate chart of accounts, all fifty business units can share the same SetID.
- Because there is no segregation by type of transaction, only one transaction code is required and it can be mapped to all system transactions.
- A separate interunit template must be defined for each business unit because each requires a unique account value. On each template, the one transaction code is added, and all applicable entry types are defined for it.

Under scenario A, if there is processing between US008 and US009, when the system generates the balancing entry for US008, it gets the appropriate ChartFields using the SetID for US008 and the InterUnit Template for US009 because the interunit balancing method is indirect.

## Scenario B

The organizational and operational assumptions are:

- You use a corporate chart of accounts for business units ranging from US001 to US999.
- You want to segregate interunit balances into ten different accounts according to the type of transaction (AP (accounts payable) Voucher, GL (general ledger) Journal, for example).
- You use the affiliate ChartField, rather than unique accounts to segregate balances by business unit trading partner.

Installation level options are:

- Interunit balancing method is direct.
- Do not use legal entity.

Other assumed options are:

- Because all business units share the same corporate chart of accounts, all business units can share the same SetID.
- Ten transaction codes are created and are mapped to the appropriate system transactions to segregate transactions in the ten desired categories.
- One interunit template can be used for all business units. On the one template, each of the ten transaction codes is added, and all applicable entry types are defined for each transaction code.

Under scenario B, if there is processing between US008 and US009, when the system generates the balancing entry for US008, it gets the appropriate ChartFields using the SetID and the interunit template for US008 because the interunit balancing method is direct.

## Scenario C

The organizational and operational assumptions are:

- You use a corporate chart of accounts for business units ranging from US001 to US989 but US990 through US999 share a different chart of accounts.
- You want to segregate interunit balances into ten different accounts according to the type of transaction (AP (accounts payable) Voucher, GL (general ledger) Journal, for example).
- You use the affiliate ChartField, rather than unique accounts, to segregate balances by business unit trading partner.

Installation level options are:

- Interunit balancing method is direct.
- Do not use legal entity.

Other assumed options are:

- Two interunit SetIDs are required, one for each chart of accounts.
- Ten transaction codes are created and are mapped to the appropriate system transactions to segregate transactions in the ten desired categories.
- The same interunit template name can be used for all business units, but two interunit template definitions must be maintained, one for each SetID. On each of the template definitions, each of the ten transaction codes is added, and all applicable entry types are defined for each transaction code.

Under scenario C, if there is processing between US008 and US009, when the system generates the balancing entry for US008, it gets the appropriate ChartFields using the SetID and the interunit template for US008 because the interunit balancing method is direct.

Under scenario C, for example, if there is processing between US989 and US999 when the system is generating the balancing entry for US989, it gets the appropriate ChartFields using the SetID and the interunit template for US989 because the interunit balancing method is direct.

## Interunit Pair Page

Use the InterUnit Pair page (IU\_INTER\_PR\_BASIC) to define ChartFields by transaction code for interunit balancing entries when the interunit method is pairs.

Override default options for interunit billing and interunit transfer transactions.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Inter/Intra Unit > Define InterUnit Pair**

This example illustrates the fields and controls on the InterUnit Pair page - AUS01 to JPN01. You can find definitions for the fields and controls later on this page.

The screenshot shows the 'InterUnit Pair' page with the following fields and controls:

- From GL Unit:** AUS01
- To GL Unit:** JPN01
- Transaction Code:** GENERAL
- Help Text:** For ledger groups in which a ChartField is balancing, the transaction value takes precedence and the value from the template will be overridden.
- Accounting Entries and ChartFields Table:**

| Entry                | Status | *Account | Oper Unit | Fund | Dept | Program | Class | Bud Ref | Product |
|----------------------|--------|----------|-----------|------|------|---------|-------|---------|---------|
| InterUnit Payable    | Active | 200114   |           |      |      |         |       |         |         |
| InterUnit Receivable | Active | 100117   |           |      |      |         |       |         |         |

This example illustrates the fields and controls on the InterUnit Pair page - JPN01 to AUS01. You can find definitions for the fields and controls later on this page.

Insert All Applicable Entries

Select Entries to Insert

Accounting Entries and ChartFields

Personalize | Find | View All | 1-2 of 2 | First | 1-2 of 2 | Last

| Entry                | Status | *Account | Oper Unit | Fund | Dept | Program | Class | Bud Ref | Product |
|----------------------|--------|----------|-----------|------|------|---------|-------|---------|---------|
| InterUnit Payable    | Active | 200117   |           |      |      |         |       |         |         |
| InterUnit Receivable | Active | 100114   |           |      |      |         |       |         |         |

Interunit pairs are applicable if you choose to use the pairs balancing method. It requires a detailed level of setup because ChartField pairs must be established between all business units that may potentially have related transactions.

**Note:** If you have a large number of business units you may want to use the InterUnit Pair Mass Maintenance feature rather than this page to maintain your business unit pairs. See the section on Using Mass Maintenance for Interunit Pairs for more information.

See [Using Mass Maintenance for Interunit Pairs](#).

This page displays the **Default Balancing Group** field and the Additional Balance Groups link if one or more account attributes are active.

| Field or Control            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| From GL Unit and To GL Unit | <p>The <b>From GL Unit</b> field indicates the business unit to which the interunit receivable is recorded.</p> <p>The <b>To GL Unit</b> field indicates the business unit to which the InterUnit Payable is recorded.</p> <p>The business unit used as the set control value for ChartField prompting and validation depends on the entry type.</p> <p>For the Receivable, Revenue, and Cost of Goods Entry types, the <b>From GL Unit</b> field value is the set control value.</p> <p>For the Payable, Expense, Accrued Payable, and Customer Shipments Entry types, the <b>To GL Unit</b> field value is the set control value.</p> <p>For the In Transit Entry type, the <b>From GL Unit</b> field value is used if the <b>Ownership Unit</b> field value is <i>Source</i> and the <b>To GL Unit</b> field value is used if the <b>Ownership Unit</b> field value is <i>Destination</i>.</p> |

| <b>Field or Control</b>                   | <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accounting Entries and ChartFields</b> | <p>In the above example, AUS01 account 200114 is an interunit payable and its counterpart in JPN01, is account 100114 an interunit receivable. There is a similar relationship for accounts 200117 and 100117.</p> <p>Account 200114 represents due to JPN01 from AUS01 and account 200117 represents due to AUS01 from JPN01.</p> <p>So, for the AUS01:JPN01 pair, the receivable is the AUS01 account for due from JPN01 (100117) and the payable is the JPN01 account for due to AUS01 (200114).</p> <p>For the JPN01:AUS01 pair, the receivable is the JPN01 account for due from AUS01 (100114) and the payable is the AUS01 account for due to JPN01 (200117).</p> <p>If you enter a voucher in AUS01 for an expense booked to JPN01, the processor goes to the AUS01: JPN01 pair to get both the AUS01 receivable and the JPN01 payable.</p> |

## Defining Interunit Pairs Options for Interunit Billing and Interunit Transfers - Example

Access the InterUnit Pair page.

Navigation:

**Set Up Financials/Supply Chain >Common Definitions >Inter/Intra Unit >InterUnit Pair >InterUnit Pair**

This example illustrates the fields and controls on the InterUnit Pair page - InterUnit Billing Options. You can find definitions for the fields and controls later on this page.

InterUnit Pair

From GL Unit AUS01  
To GL Unit NLD01  
Transaction Code BIIVC

AUSTRALIA OPERATIONS  
NETHERLANDS OPERATIONS  
Billing InterUnit Bills

**Help Text:**  
For ledger groups in which a ChartField is balancing, the transaction value takes precedence and the value from the template will be overridden.

| InterUnit Revenue    | Active | 100117   |           |      |      |         |       |         |         |

| <i>Field or Control</i>                                                           | <i>Description</i>                                                                                                                                        |
|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | Click to expand the <b>Inter Unit Billing Options</b> group box and see the following section for explanations of the field values that become available. |

## Interunit Billing Options

If the transaction code is linked to the billing invoice system transaction, there are additional entry types of interunit revenue and interunit expense. You may also override the default supporting document options, such as:

- **Print Invoice**
- **Generate AR** (accounts receivable) **Open Item**
- **Generate AP** (accounts payable) **Voucher**
- **AP Unit** (accounts payable business unit)
- **Supplier** (ID)
- **Supplier Location**

## Interunit Transfer Options

If the transaction code is linked to the Cost Management InterUnit Transfer System Transaction, there are additional entry types of InterUnit In Transit, Cost of Sales, and Accrued Payable. You must also establish InterUnit Billing Options, such as:

- **Ownership Unit**
- **InterCompany Processing flag**
- **BI Unit**
- **Customer**

The default values for these options come from the system transaction map and the GL (general ledger) business unit definition.

The options to Print an Invoice, Generate an AP Voucher and Generate an AR Item default from the options defined for the transaction code, which is mapped to the billing invoice system transaction.

The AP Unit (accounts payable unit) for the AP Voucher (accounts payable voucher) defaults from the GL Business Unit (general ledger business unit) definition for the **To GL Unit** field value of the pair. The supplier and location for the AP Voucher default from the GL Business Unit definition for the **From GL Unit** field value of the pair.

You can override any of these options here for this specific Pair. Changes made later to the **System Transaction Map** options or the **GL Business Unit** options do not affect existing interunit pair definitions.

## Interunit Pair - Select Entries to Insert Page

Use the InterUnit Pair - Select Entries to Insert page (IU\_PAIR\_ENTRY) to select which entry types to insert into the page.

An alternative to the Select all Applicable Entries button.

Navigation:

Set Up Financials/Supply Chain, Common Definitions, Inter/Intra Unit, InterUnit Pair, Select Entries to Insert

Click the **Select Entries to Insert** link.

### Current Settings

Displays all settings that affect the availability of entry types to the transaction code. If account attributes are active, such as book code and balance sheet indicator, the account balancing group is also displayed.

### Entry Types

All interunit, interentity and intraentity entry types are available for selection, regardless of their status.

| <i><b>Field or Control</b></i> | <i><b>Description</b></i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b>                  | <p>Indicates whether the accounting entry type is <i>Active</i> or <i>Inactive</i> based on the current system settings.</p> <p>For example, you add a row for interunit payable while the <b>Use Legal Entity</b> option is deselected. You then select the <b>Use Legal Entity</b> option. When you return to this page, you see that the status of the interunit payable entry is now inactive, because you should be defining interentity and intraentity payable entries instead.</p> <p>You might select entry types with an inactive status, but they will never be used unless you change the settings. For example, you may be setting up entries for a transaction code that is not currently mapped to the billing invoice system transaction, but you may still want to set up interunit revenue and expense entries in anticipation of changing the mapping at a later time.</p> |
