SERIAL#	NUMBER	Serial number of the propagation sender process
SPID	VARCHAR2 (24)	Process identification number of the propagation sender process
PROPAGATION_NAME	VARCHAR2 (128)	Name of the propagation
STATE	VARCHAR2 (128)	State of the propagation sender process: <ul style="list-style-type: none"> • Initializing • Initializing propagation receiver • Browsing LCRs • Evaluating rules • Dequeueing LCRs • Sending LCRs • Waiting for apply to be enabled • Waiting for apply database to start • Waiting for propagation to be enabled • Waiting for capture to terminate • Waiting for a subscriber to be added • Suspended due to a dropped subscriber • Suspended for auto split/merge • Waiting on empty queue

When the SCHEDULE_STATUS column is not SCHEDULE OPTIMIZED, the state is the value of the SCHEDULE_STATUS column.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.137 V\$PROXY_ARCHIVEDLOG

V\$PROXY_ARCHIVEDLOG contains descriptions of archived log backups that were taken using the proxy copy functionality.

In a proxy copy, the media manager takes over the operations of backing up and restoring data. Each row represents a backup of one control file.

Column	Datatype	Description
RECID	NUMBER	Proxy copy record identifier
STAMP	NUMBER	Proxy copy stamp
DEVICE_TYPE	VARCHAR2 (17)	Type of media device that stores the proxy copy
HANDLE	VARCHAR2 (513)	Name or "handle" for the proxy copy
COMMENTS	VARCHAR2 (81)	Comments about the proxy copy
MEDIA	VARCHAR2 (65)	A comment that contains further information about the media manager that created this backup
MEDIA_POOL	NUMBER	Number of the media pool in which the proxy copy is stored
TAG	VARCHAR2 (32)	Tag for the proxy copy
STATUS	VARCHAR2 (1)	Status of the backup set: <ul style="list-style-type: none"> A - Available U - Unavailable X - Expired D - Deleted
DELETED	VARCHAR2 (3)	Indicates whether this record has been deleted (YES) or not (NO)
THREAD#	NUMBER	Number of the redo thread
SEQUENCE#	NUMBER	Log sequence number
RESETLOGS_CHANGE#	NUMBER	RESETLOGS SCN of the database incarnation to which this archived log belongs
RESETLOGS_TIME	DATE	RESETLOGS time stamp of the database incarnation to which this archived log belongs
FIRST_CHANGE#	NUMBER	First SCN of this redo log
FIRST_TIME	DATE	Time when Oracle switched into the redo log
NEXT_CHANGE#	NUMBER	First SCN of the next redo log in the thread
NEXT_TIME	DATE	First time stamp of the next redo log in the thread
BLOCKS	NUMBER	Size of this archived redo log (in operating system blocks)

Column	Datatype	Description
BLOCK_SIZE	NUMBER	Block size for the copy (in bytes)
START_TIME	DATE	Time when the proxy copy was initiated
COMPLETION_TIME	DATE	Time when the proxy copy was completed
ELAPSED_SECONDS	NUMBER	Duration of the proxy copy
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS stamp
TERMINAL	VARCHAR2 (3)	Indicates whether this record corresponds to a terminal archived redo log, as defined in V\$ARCHIVED_LOG (YES) or not (NO)
KEEP	VARCHAR2 (3)	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)
KEEP_UNTIL	DATE	If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.
KEEP_OPTIONS	VARCHAR2 (11)	Additional retention options for this backup set: <ul style="list-style-type: none"> LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent NOLOGS - Indicates a consistent backup made when the database was mounted NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root n: Where n is the applicable container ID for the rows containing data

9.138 V\$PROXY_ARCHIVELOG_DETAILS

V\$PROXY_ARCHIVELOG_DETAILS contains information about all available archive log proxy copies.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp
COPY_KEY	NUMBER	Copy identifier
THREAD#	NUMBER	Redo thread number
SEQUENCE#	NUMBER	Redo log sequence number

Column	Datatype	Description
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the database when this log was written
RESETLOGS_TIME	DATE	Resetlogs time of the database when this log was written
HANDLE	VARCHAR2 (513)	Proxy copy handle identifies the copy for restore
MEDIA	VARCHAR2 (65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the <code>POOL</code> operand of the Recovery Manager <code>BACKUP</code> command.
TAG	VARCHAR2 (32)	Proxy copy tag
FIRST_CHANGE#	NUMBER	First change number in the archived log
NEXT_CHANGE#	NUMBER	First change number in the next log
FIRST_TIME	DATE	Timestamp of the first change
NEXT_TIME	DATE	Timestamp of the next change
OUTPUT_BYTES	NUMBER	Total output bytes written
COMPLETION_TIME	DATE	Completion time
OUTPUT_BYTES_DISPLAY	VARCHAR2 (3)	Displayable format for output bytes
KEEP	DATE	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (<code>YES</code>) or not (<code>NO</code>)
KEEP_UNTIL	VARCHAR2 (11)	If specified, then this is the date after which the backup becomes obsolete. If this column is <code>NULL</code> , then the backup never expires.
KEEP_OPTIONS	VARCHAR2 (4000)	Additional retention options for this backup set: <ul style="list-style-type: none"> • <code>LOGS</code> - Indicates a long-term backup made with the <code>LOGS</code> keyword, which is now deprecated • <code>BACKUP_LOGS</code> - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent • <code>NOLOGS</code> - Indicates a consistent backup made when the database was mounted • <code>NULL</code> - Indicates that this backup has no <code>KEEP</code> options and becomes obsolete based on the retention policy
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.139 V\$PROXY_ARCHIVELOG_SUMMARY

V\$PROXY_ARCHIVELOG_SUMMARY provides summary information about the output proxy archive log file.

Column	Datatype	Description
NUM_FILES_BACKED	NUMBER	Number of archived log files backed up
NUM_DISTINCT_FILES_BACKED	NUMBER	Number of distinct archived log files backed up
MIN_FIRST_CHANGE#	NUMBER	Minimum first change SCN
MAX_NEXT_CHANGE#	NUMBER	Maximum first change SCN
MIN_FIRST_TIME	DATE	Minimum first change time. Forms the redo range, along with MAX_NEXT_TIME.
MAX_NEXT_TIME	DATE	Maximum next change time
OUTPUT_BYTES	NUMBER	Total output size, in bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.140 V\$PROXY_COPY_DETAILS

V\$PROXY_COPY_DETAILS contains information about all available control file and datafile proxy copies.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp
COPY_KEY	NUMBER	Copy identifier
FILE#	NUMBER	Absolute datafile number, or 0 if this is a control file backup
HANDLE	VARCHAR2(513)	Proxy copy handle identifies the copy for restore
MEDIA	VARCHAR2(65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.
TAG	VARCHAR2(32)	Proxy copy tag
CREATION_CHANGE#	NUMBER	Datafile creation change number
CREATION_TIME	DATE	Datafile creation timestamp
CHECKPOINT_CHANGE#	NUMBER	Checkpoint change number of the datafile when the copy was made
CHECKPOINT_TIME	DATE	Checkpoint timestamp of the datafile when the copy was made
OUTPUT_BYTES	NUMBER	Total output bytes written
COMPLETION_TIME	DATE	Completion time

Column	Datatype	Description
CONTROLFILE_TYPE	VARCHAR2 (1)	Type of control file: <ul style="list-style-type: none"> B - Normal control file S - Standby control file
KEEP	VARCHAR2 (3)	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)
KEEP_UNTIL	DATE	If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.
KEEP_OPTIONS	VARCHAR2 (11)	Additional retention options for this backup set: <ul style="list-style-type: none"> LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent NOLOGS - Indicates a consistent backup made when the database was mounted. NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy
OUTPUT_BYTES_DISPLAY	VARCHAR2 (4000)	Displayable format for output bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root n: Where n is the applicable container ID for the rows containing data

9.141 V\$PROXY_COPY_SUMMARY

V\$PROXY_COPY_SUMMARY provides summary information about the output proxy datafile and control file.

Column	Datatype	Description
NUM_COPIES	NUMBER	Number of copies created
NUM_DISTINCT_COPIES	NUMBER	Number of distinct copies (that contain datafiles with different checkpoints)
MIN_CHECKPOINT_CHANGE#	NUMBER	Minimum checkpoint change SCN
MAX_CHECKPOINT_CHANGE#	NUMBER	Maximum checkpoint change SCN
MIN_CHECKPOINT_TIME	DATE	Minimum checkpoint change time
MAX_CHECKPOINT_TIME	DATE	Maximum checkpoint change time
OUTPUT_BYTES	NUMBER	Total output bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2 (4000)	Displayable format for output bytes

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.142 V\$PROXY_DATAFILE

V\$PROXY_DATAFILE contains descriptions of datafile and control file backups that are taken with Proxy Copy. Each row represents a backup of one database file.

Column	Datatype	Description
RECID	NUMBER	Proxy copy record ID
STAMP	NUMBER	Proxy copy record stamp
DEVICE_TYPE	VARCHAR2 (17)	Type of the device on which the copy resides
HANDLE	VARCHAR2 (513)	Proxy copy handle identifies the copy for restore
COMMENTS	VARCHAR2 (81)	Comment returned by the operating system or storage subsystem. This value is informational only. It is not needed for restore.
MEDIA	VARCHAR2 (65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the <code>POOL</code> operand of the Recovery Manager <code>BACKUP</code> command
TAG	VARCHAR2 (32)	Proxy copy tag
STATUS	VARCHAR2 (1)	Status of the backup set: <ul style="list-style-type: none"> A - Available U - Unavailable X - Expired D - Deleted
DELETED	VARCHAR2 (3)	Indicates whether this record has been deleted (YES) or not (NO)
FILE#	NUMBER	Absolute datafile number, or 0 if this is a control file backup
CREATION_CHANGE#	NUMBER	Datafile creation change number
CREATION_TIME	DATE	Datafile creation Timestamp
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the datafile when the copy was made
RESETLOGS_TIME	DATE	Resetlogs timestamp of the datafile when the copy was made
CHECKPOINT_CHANGE#	NUMBER	Checkpoint change number of the datafile when the copy was made
CHECKPOINT_TIME	DATE	Checkpoint timestamp of the datafile when the copy was made
ABSOLUTE_FUZZY_CHANGE#	NUMBER	Highest change in any block of the file, if known
RECOVERY_FUZZY_CHANGE#	NUMBER	Highest change written to the file by media recovery

Column	Datatype	Description
RECOVERY_FUZZY_TIME	DATE	Timestamp of the highest change written to the file by media recovery
INCREMENTAL_LEVEL	NUMBER	If this backup is part of an incremental backup strategy, then 0. Otherwise null.
ONLINE_FUZZY	VARCHAR2 (3)	Indicates whether this copy was made after a crash or offline immediate (or is a copy of a copy which was taken improperly while the database was open) (YES) or not (NO). Recovery will need to apply all redo up to the next crash recovery marker to make the file consistent.
BACKUP_FUZZY	VARCHAR2 (3)	Indicates whether this is a copy taken using the BEGIN BACKUP END BACKUP technique (YES) or not (NO). The BEGIN BACKUP END BACKUP technique is used internally when proxy copies of open files are created. Recovery will need to apply all redo up to the end backup marker to make this copy consistent.
BLOCKS	NUMBER	Size of the copy (in blocks). Also the size of the datafile when the copy was made.
BLOCK_SIZE	NUMBER	Block size of the datafile
OLDEST_OFFLINE_RANGE	NUMBER	If the file number is 0 (that is, this is a control file backup), the RECID of the oldest offline range record in this control file copy. 0 for datafile copies.
START_TIME	DATE	Starting time
COMPLETION_TIME	DATE	Completion time
ELAPSED_SECONDS	NUMBER	Number of elapsed seconds
CONTROLFILE_TYPE	VARCHAR2 (1)	Type of control file: <ul style="list-style-type: none"> • B - Normal control file • S - Standby control file
KEEP	VARCHAR2 (3)	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)
KEEP_UNTIL	DATE	If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.
KEEP_OPTIONS	VARCHAR2 (11)	Additional retention options for this backup set: <ul style="list-style-type: none"> • LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated • BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent • NOLOGS - Indicates a consistent backup made when the database was mounted. • NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS stamp
FOREIGN_DBID	NUMBER	Foreign DBID of the database from which this datafile was transported. The value is 0 if the file backed up is not a foreign database file.
PLUGGED_READONLY	VARCHAR2 (3)	Indicates whether this is a proxy copy of a transported read-only foreign file (YES) or not (NO)

Column	Datatype	Description
PLUGIN_CHANGE#	NUMBER	SCN at which the foreign datafile was transported into the database. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_CHANGE#	NUMBER	SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_TIME	DATE	Time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
BACKED_BY_PDB	VARCHAR2(3)	Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: <ul style="list-style-type: none"> YES: The backup was taken when connected to the PDB NO: The backup was taken when connected to the root container
GUID	RAW(16)	The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.

9.143 V\$PROXY_PDB_TARGETS

V\$PROXY_PDB_TARGETS provides information about the target of a proxy PDB.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <i>n</i>: Where <i>n</i> is the container ID of a proxy PDB
TARGET_PORT	NUMBER	Port number that the target of the proxy PDB has registered with the listener, and which will be used by the proxy PDB to connect to the target
TARGET_HOST	VARCHAR2(128)	Host name where the target of the proxy PDB is running, and which will be used by the proxy PDB to connect to the target
TARGET_SERVICE	VARCHAR2(128)	Service name that the target of the proxy PDB has registered with the listener, and which will be used by the proxy PDB to connect to the target
TARGET_USER	VARCHAR2(128)	User name used by the proxy PDB to connect to the target of the proxy PDB. If null, the name of the connected user will be used.

**See Also:**

Oracle Multitenant Administrator's Guide for information about creating proxy PDBs

9.144 V\$PWFILERS_USERS

V\$PWFILERS_USERS lists all users in the password file, and indicates whether the user has been granted the SYSDBA, SYSOPER, SYSASM, SYSBACKUP, SYSDG, and SYSKM privileges.

Column	Datatype	Description
USERNAME	VARCHAR2 (128)	Name of the user that is contained in the password file
SYSDBA	VARCHAR2 (5)	Indicates whether the user can connect with SYSDBA privileges (TRUE) or not (FALSE)
SYSOPER	VARCHAR2 (5)	Indicates whether the user can connect with SYSOPER privileges (TRUE) or not (FALSE)
SYSASM	VARCHAR2 (5)	Indicates whether the user can connect with SYSASM privileges (TRUE) or not (FALSE)
SYSBACKUP	VARCHAR2 (5)	Indicates whether the user can connect with SYSBACKUP privileges (TRUE) or not (FALSE)
SYSDG	VARCHAR2 (5)	Indicates whether the user can connect with SYSDG privileges (TRUE) or not (FALSE)
SYSKM	VARCHAR2 (5)	Indicates whether the user can connect with SYSKM privileges (TRUE) or not (FALSE)
ACCOUNT_STATUS	VARCHAR2 (30)	Account status: <ul style="list-style-type: none"> • OPEN • EXPIRED • EXPIRED (GRACE) • LOCKED (TIMED) • LOCKED • EXPIRED & LOCKED (TIMED) • EXPIRED & LOCKED • EXPIRED (GRACE) & LOCKED
PASSWORD_PROFILE	VARCHAR2 (128)	Password profile name
LAST_LOGIN	TIMESTAMP (9) WITH TIME ZONE	The time of the last user login
LOCK_DATE	DATE	Date the account was locked if account status was LOCKED
EXPIRY_DATE	DATE	Date of expiration of the account
EXTERNAL_NAME	VARCHAR2 (1024)	Shows Certificate DN or Principal Name of externally authenticated users
AUTHENTICATION_TYPE	VARCHAR2 (8)	Indicates the authentication mechanism for the user: <ul style="list-style-type: none"> • EXTERNAL - CREATE USER <i>user1</i> IDENTIFIED EXTERNALLY; • GLOBAL - CREATE USER <i>user2</i> IDENTIFIED GLOBALLY; • PASSWORD - CREATE USER <i>user3</i> IDENTIFIED BY <i>password</i>;

Column	Datatype	Description
COMMON	VARCHAR2 (3)	This column has a value of YES if an administrative privilege (for example, SYSDBA) was granted with CONTAINER=ALL. Otherwise, the column has a value of NO.
PASSWORD_VERSIONS	VARCHAR2 (12)	Shows the list of versions of the password hashes (also known as "verifiers") existing for the account. The values for this column can include: <ul style="list-style-type: none"> • 11G: If a SHA-1 hash exists • 12C: If a de-optimized PBKDF2-based hash exists For more information about the 12C verifier, see <i>Oracle Database Concepts</i> . Note that any combination of these verifiers can exist for any given account.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.145 V\$PX_INSTANCE_GROUP

V\$PX_INSTANCE_GROUP provides information about the instance groups being used for parallel operations by the current session.

Column	Datatype	Description
QC_INSTANCE_GROUP	VARCHAR2 (64)	The instance group being used by this session for parallel operations. This value repeats for every row returned.
WHY	VARCHAR2 (23)	Where the current instance group name comes from, as follows: SERVICE - the instance group being used is from the session's service name PARALLEL_INSTANCE_GROUP - the instance group being used is being used because the PARALLEL_INSTANCE_GROUP initialization parameter has been set. The value repeats for every row returned.
INSTANCE_NUMBER	NUMBER	Instance number of the instance providing this instance group. There will be one row for each instance in the instance group that the Query Coordinator is using.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

**See Also:**["PARALLEL_INSTANCE_GROUP"](#)

9.146 V\$PX_PROCESS

V\$PX_PROCESS contains information about the sessions running parallel execution.

Column	Datatype	Description
SERVER_NAME	VARCHAR2 (4)	The name of the PX server (P000, P001, and so on)
STATUS	VARCHAR2 (9)	The state of the PX server (IN USE or AVAILABLE)
PID	NUMBER	The process identifier
SPID	VARCHAR2 (24)	Operating system process ID
SID	NUMBER	The session ID of the PX server, if in use
SERIAL#	NUMBER	The session serial number of the PX server, if in use
IS_GV	VARCHAR2 (5)	Indicates whether a PX server process in parallel is a normal process or a GV\$ process. Possible values: <ul style="list-style-type: none"> FALSE: The PX server process in parallel is a normal process TRUE: The PX server process in parallel is a GV\$ process
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.147 V\$PX_PROCESS_DETAIL

V\$PX_PROCESS_DETAIL lists statistics for each of the active PX (Parallel Execution) servers on an instance.

Column	Datatype	Description
SPID	VARCHAR2 (24)	Operating system process ID
SERVER_NAME	VARCHAR2 (7)	Name of the PX server (P000, P001, and so on)
STATISTIC	VARCHAR2 (30)	Name of the statistic: <ul style="list-style-type: none"> Start Time Cleanup Start Time Cleanup End Time
VALUE	VARCHAR2 (64)	String representation of the value the statistic For example, if the value of the statistic is a timestamp, this column displays a string containing the timestamp information.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

**Note:**

This view is available starting with Oracle Database 23c.

9.148 V\$PX_PROCESS_SYSSTAT

V\$PX_PROCESS_SYSSTAT contains information about the sessions running parallel execution.

Column	Datatype	Description
STATISTIC	VARCHAR2 (30)	<p>Name of the statistic:</p> <ul style="list-style-type: none"> • <code>Buffers Allocated</code> - Number of times a message buffer has been allocated • <code>Buffers Current</code> - Number of message buffers currently being used • <code>Buffers Freed</code> - Number of times a message buffer has been freed • <code>Buffers HWM</code> - Maximum number of concurrently allocated message buffers • <code>Chunk Lists</code> - Number of memory chunk lists • <code>Memory Chunks Allocated</code> - Number of large memory chunks allocated by PX servers • <code>Memory Chunks Current</code> - Number of large memory chunks currently being used • <code>Memory Chunks Freed</code> - Number of large memory chunks freed • <code>Memory Chunks HWM</code> - Maximum number of concurrently allocated chunks • <code>Memory Chunks Permanent</code> - Number of large memory chunks allocated permanently • <code>Server Sessions</code> - Total number of sessions created by all PX servers • <code>Servers Available</code> - Number of PX servers available to perform parallel operations • <code>Servers Cleaned Up</code> - Number of times PMON had to clean up a PX server. This should only happen during nonstandard termination of a parallel operation. If this number is large, then you should determine the cause. • <code>Servers Highwater</code> - Maximum number of concurrent PX server processes If this number is equal to the <code>PARALLEL_MAX_SERVERS</code> initialization parameter, then consider increasing the parameter. This could allow you to increase your throughput, especially if your system is under-utilized and the <code>V\$SYSSTAT</code> statistic "Parallel operations downgraded to serial" is large. • <code>Servers In Use</code> - Number of PX servers currently performing parallel operations • <code>Servers Shutdown</code> - Number of times a PX server process has been shut down. A PX server process will be shut down if it has not been used recently. If this value is large, then consider increasing the parameter. This will improve performance by avoiding the latency of PX server process creation. • <code>Servers Started</code> - Number of times the system has had to create a PX server process
VALUE	NUMBER	Value of the statistic

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.149 V\$PX_SERVER

V\$PX_SERVER lists statistics for each of the active PX (Parallel Execution) servers on an instance.

Column	Datatype	Description
SERVER_NAME	VARCHAR2 (4)	Name of the PX server
STATUS	VARCHAR2 (4)	Current status of the PX server: <ul style="list-style-type: none"> BUSY IDLE
SESSIONS	NUMBER	Number of sessions that have used this PX server
IDLE_TIME_CUR	NUMBER	Amount of time spent idle while processing statements in the current session
BUSY_TIME_CUR	NUMBER	Amount of time spent busy while processing statements in the current session
CPU_SECS_CUR	NUMBER	Amount of CPU time (in seconds) spent on the current session
MSGG_SENT_CUR	NUMBER	Number of messages sent while processing statements for the current session
MSGG_RCVD_CUR	NUMBER	Number of messages received while processing statements for the current session
IDLE_TIME_TOTAL	NUMBER	Total amount of time (in minutes) this PX server has been idle
BUSY_TIME_TOTAL	NUMBER	Total amount of time (in minutes) this PX server has been active
CPU_SECS_TOTAL	NUMBER	Total amount of CPU time (in seconds) this PX server has used to process statements
MSGG_SENT_TOTAL	NUMBER	Total number of messages this PX server has sent
MSGG_RCVD_TOTAL	NUMBER	Total number of messages this PX server has received
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

**Note:**

This view is available starting with Oracle Database 23c.

9.150 V\$PX_SESSION

V\$PX_SESSION contains information about the sessions running parallel execution.

Column	Datatype	Description
SADDR	RAW(4 8)	Session address
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Session serial number
QCSID	NUMBER	Session identifier of the parallel coordinator
QCSERIAL#	NUMBER	Session serial number of the parallel coordinator
QCINST_ID	NUMBER	Instance number on which the parallel coordinator is running
SERVER_GROUP	NUMBER	The logical group of PX servers to which this cluster database process belongs
SERVER_SET	NUMBER	The logical set of PX servers to which this cluster database process belongs. A single PX server group will have at most two PX server sets.
SERVER#	NUMBER	The logical number of the cluster database process within a PX server set
DEGREE	NUMBER	The degree of parallelism being used by the PX server set
REQ_DEGREE	NUMBER	The degree of parallelism that was requested by the user when the statement was issued and before any resource, multiuser, or load balancing reductions
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.151 V\$PX_SESSTAT

V\$PX_SESSTAT contains information about the sessions running parallel execution.

Column	Datatype	Description
SADDR	RAW(4 8)	Session address
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Session serial number
QCSID	NUMBER	Session identifier of the parallel coordinator
QCSERIAL#	NUMBER	Session serial number of the parallel coordinator

Column	Datatype	Description
QCINST_ID	NUMBER	Instance number on which the parallel coordinator is running
SERVER_GROUP	NUMBER	The logical group of PX servers to which this cluster database process belongs
SERVER_SET	NUMBER	The logical set of PX servers that this cluster database process belongs to. A single PX server group will have at most two PX server sets.
SERVER#	NUMBER	The logical number of the cluster database process within a PX server set
DEGREE	NUMBER	The degree of parallelism being used by the PX server set
REQ_DEGREE	NUMBER	The degree of parallelism that was requested by the user when the statement was issued and before any resource, multiuser, or load balancing reductions
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.152 V\$QMON_COORDINATOR_STATS

V\$QMON_COORDINATOR_STATS displays statistics of the non-sharded queue primary process. There is one row per instance. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
QMNC_PID	VARCHAR2 (24)	Non-sharded queue primary process ID
STATUS	VARCHAR2 (24)	Current status of the coordinator: <ul style="list-style-type: none"> DEAD INITIALIZING RUNNING TASK COORDINATOR WAITING ADDING SERVER
NUM_SERVERS	NUMBER	Number of QMON servers currently running
LAST_SERVER_START_TIME	TIMESTAMP (3) WITH TIME ZONE	Last server startup time
LAST_SERVER_PID	VARCHAR2 (24)	Process ID of the last server process (Qnnn) created
NEXT_WAKEUP_TIME	TIMESTAMP (3) WITH TIME ZONE	Next wakeup time of the coordinator
NEXT_READY_TIME	TIMESTAMP (3) WITH TIME ZONE	Ready time of the first delayed task
NEXT_EXPIRY_TIME	TIMESTAMP (3) WITH TIME ZONE	Expiry time of the next ready task

Column	Datatype	Description
LAST_WAIT_TIME	TIMESTAMP (3) WITH TIME ZONE	Time when the coordinator went to sleep
LAST_FAILURE	VARCHAR2 (32)	Last failure encountered
LAST_FAILURE_TIME	TIMESTAMP (3) WITH TIME ZONE	Last failure time
MAX_TASK_LATENCY	VARCHAR2 (40)	Maximum task latency across all the servers (in seconds)
MIN_TASK_LATENCY	VARCHAR2 (40)	Minimum task latency across all the servers (in seconds)
TOTAL_TASK_LATENCY	NUMBER	Cumulative latency across all the tasks (in seconds)
TOTAL_TASKS_EXECUTED	NUMBER	Cumulative number of tasks serviced by all the servers
MAX_SERVERS	NUMBER	Maximum number of servers present at any point of time
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

9.153 V\$QMON_SERVER_STATS

V\$QMON_SERVER_STATS displays information and statistics about the active queue monitor server processes. There is one row per live queue monitor server process. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
QMNC_PID	VARCHAR2 (24)	Non-sharded queue primary process ID
SERVER_PID	VARCHAR2 (24)	Process ID of the server
SERVER_NAME	VARCHAR2 (48)	Name of the server
STATUS	VARCHAR2 (40)	Current state of the server: <ul style="list-style-type: none"> • UNUSED • RUNNING • IDLE WAIT • EXITING • NOT ACTIVE
SERVER_START_TIME	TIMESTAMP (3) WITH TIME ZONE	Start time of the server
TASK_NAME	VARCHAR2 (32)	Current executing task
TASK_NUMBER	NUMBER	Unique task number of the running task
TASK_START_TIME	TIMESTAMP (3) WITH TIME ZONE	Start time of the running task
LAST_WAIT_TIME	TIMESTAMP (3) WITH TIME ZONE	Time when the server last waited
MAX_LATENCY	NUMBER	Maximum task latency for this server (in seconds)
MIN_LATENCY	NUMBER	Minimum task latency for this server (in seconds)
TOTAL_LATENCY	NUMBER	Cumulative task latency for this server (in seconds)
NUM_TASKS	NUMBER	Number of tasks processed by the server
LAST_FAILURE	VARCHAR2 (128)	Last failure encountered by the server

Column	Datatype	Description
LAST_FAILURE_TIME	TIMESTAMP(3) WITH TIME ZONE	Last failure time
LAST_FAILURE_TASK	VARCHAR2(32)	Task being run at the time of the last failure
LAST_FAILURE_TASKNUM	NUMBER	Unique task number of the failed task
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

9.154 V\$QMON_TASK_STATS

V\$QMON_TASK_STATS displays information and statistics based on different queue monitor tasks in the system (spilling, time manager activity, and so on). There is one row per kind of task. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
TASK_NAME	VARCHAR2(32)	Name of the task
TASK_TYPE	VARCHAR2(40)	Type of the task
LAST_CREATED_TASKNUM	NUMBER	Unique task number last created for this task
NUM_TASKS	NUMBER	Number of tasks currently present
TOTAL_TASK_RUN_TIME	NUMBER	Cumulative task run time
TOTAL_TASK_RUNS	NUMBER	Cumulative task runs
TOTAL_TASK_FAILURES	NUMBER	Cumulative failures
METRIC_TYPE	VARCHAR2(50)	Type of metric gathered for this task type
METRIC_VALUE	NUMBER	Value of this metric
LAST_FAILURE	VARCHAR2(32)	Last failure encountered while executing this type of task
LAST_FAILURE_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when the last failure occurred
LAST_FAILURE_TASKNUM	NUMBER	Task number of the last failed task for this task
REMARK	VARCHAR2(64)	Remarks about the task
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

9.155 V\$QMON_TASKS

V\$QMON_TASKS displays information and statistics about all queue background tasks in the system, which would be served by queue monitor servers. There is one row per task. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
TASK_NAME	VARCHAR2(32)	Task name
TASK_NUMBER	NUMBER	Unique task number

Column	Datatype	Description
TASK_TYPE	VARCHAR2 (40)	Task type
TASK_SUBMIT_TIME	TIMESTAMP (3) WITH TIME ZONE	Task submit time
TASK_READY_TIME	TIMESTAMP (3) WITH TIME ZONE	Task ready time
TASK_EXPIRY_TIME	TIMESTAMP (3) WITH TIME ZONE	Time when this task expires
TASK_START_TIME	TIMESTAMP (3) WITH TIME ZONE	Last actual start time for the task
TASK_STATUS	VARCHAR2 (32)	Status of the task
SERVER_NAME	VARCHAR2 (48)	Name of the QMON server running this task
MAX_RETRIES	NUMBER	Maximum retry count for the task
NUM_RUNS	NUMBER	Number of runs of the task if repeatable
NUM_FAILURES	NUMBER	Number of failures encountered while running the task
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

9.156 V\$QUARANTINE

V\$QUARANTINE provides information about quarantined objects.

Column	Datatype	Description
OBJECT	VARCHAR2 (64)	Type of quarantined object (description of the memory)
ADDRESS	RAW (8)	Address of the object
BYTES	NUMBER	Amount of memory used by the object (this is the minimum amount; the actual amount may be unknown)
ERROR	VARCHAR2 (128)	Oracle error causing quarantine
TIMESTAMP	TIMESTAMP (6) WITH TIME ZONE	Time the object was quarantined
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.157 V\$QUARANTINE_SUMMARY

V\$QUARANTINE_SUMMARY provides a summary of quarantine for each pluggable database (PDB).

Column	Datatype	Description
OBJECT_COUNT	NUMBER	Number of objects in quarantine
OBJECT_LIMIT	NUMBER	Limit on the number of objects that can be in quarantine before a termination will occur
MEMORY_TOTAL	NUMBER	Number of bytes in quarantine
MEMORY_LIMIT	NUMBER	Limit on the amount of memory that can be in quarantine before a termination will occur
RECENT_COUNT	NUMBER	Number of objects recently placed in quarantine (within the last hour)
RECENT_LIMIT	NUMBER	Limit on the number of recently quarantined objects before a termination will occur
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

"V\$QUARANTINE" for additional details on objects recently placed into quarantine

9.158 V\$QUEUE

V\$QUEUE contains information on the shared server message queues.

Column	Datatype	Description
PADDR	RAW(4 8)	Address of the process that owns the queue
TYPE	VARCHAR2(10)	Type of queue: <ul style="list-style-type: none"> COMMON - Processed by servers DISPATCHER
QUEUED	NUMBER	Number of items in the queue
WAIT	NUMBER	Total time that all items in this queue have waited (in hundredths of a second). Divide by TOTALQ for average wait per item.
TOTALQ	NUMBER	Total number of items that have ever been in the queue
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.159 V\$QUEUEING_MTH

V\$QUEUEING_MTH displays all available queuing resource allocation methods.

Column	Datatype	Description
NAME	VARCHAR2 (40)	Name of the queuing resource allocation method
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.160 V\$RECOVER_FILE

V\$RECOVER_FILE displays the status of files needing media recovery.

Column	Datatype	Description
FILE#	NUMBER	File identifier number
ONLINE	VARCHAR2 (7)	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in ONLINE_STATUS.
ONLINE_STATUS	VARCHAR2 (7)	Online status (ONLINE, OFFLINE)
ERROR	VARCHAR2 (18)	Why the file must be recovered: NULL if reason unknown, or OFFLINE NORMAL if recovery not needed
CHANGE#	NUMBER	SCN where recovery must start
TIME	DATE	Time of SCN when recovery must start
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.161 V\$RECOVERY_AREA_USAGE

V\$RECOVERY_AREA_USAGE displays usage information about recovery areas.

Column	Datatype	Description
FILE_TYPE	VARCHAR2 (23)	File type: <ul style="list-style-type: none"> CONTROL FILE REDO LOG ARCHIVED LOG BACKUP PIECE IMAGE COPY FLASHBACK LOG REMOTE ARCHIVED LOG
PERCENT_SPACE_USED	NUMBER	Percent of the recovery area that is in use
PERCENT_SPACE_RECLAIMABLE	NUMBER	Percent of the recovery area that is reclaimable
NUMBER_OF_FILES	NUMBER	Number of files in the recovery area
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.162 V\$RECOVERY_FILE_DEST

V\$RECOVERY_FILE_DEST displays information about the disk quota and current disk usage in the fast recovery area.

Column	Datatype	Description
NAME	VARCHAR2 (513)	Location name. This is the value specified in the DB_RECOVERY_FILE_DEST initialization parameter.
SPACE_LIMIT	NUMBER	Maximum amount of disk space (in bytes) that the database can use for the fast recovery area. This is the value specified in the DB_RECOVERY_FILE_DEST_SIZE initialization parameter.
SPACE_USED	NUMBER	Amount of disk space (in bytes) used by fast recovery area files created in current and all previous fast recovery areas. Changing fast recovery areas does not reset SPACE_USED to 0.
SPACE_RECLAIMABLE	NUMBER	Total amount of disk space (in bytes) that can be created by deleting obsolete, redundant, and other low priority files from the fast recovery area
NUMBER_OF_FILES	NUMBER	Number of files in the fast recovery area
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- "DB_RECOVERY_FILE_DEST"
- "DB_RECOVERY_FILE_DEST_SIZE"

9.163 V\$RECOVERY_FILE_STATUS

V\$RECOVERY_FILE_STATUS contains one row for each datafile for each RECOVER statement. This view contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY_FILE_STATUS will be empty to all other Oracle users.

Column	Datatype	Description
FILENUM	NUMBER	Number of the file being recovered
FILENAME	VARCHAR2 (513)	Filename of the datafile being recovered
STATUS	VARCHAR2 (13)	Status of the recovery: <ul style="list-style-type: none"> • IN RECOVERY • CURRENT • NOT RECOVERED
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

Oracle Database Backup and Recovery User's Guide

9.164 V\$RECOVERY_LOG

V\$RECOVERY_LOG lists information about archived logs that are needed to complete media recovery. This information is derived from the log history view, V\$LOG_HISTORY.

V\$RECOVERY_LOG contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY_LOG will be empty to all other Oracle users.

Column	Datatype	Description
THREAD#	NUMBER	Thread number of the archived log
SEQUENCE#	NUMBER	Sequence number of the archived log
TIME	DATE	Time of the first entry (lowest SCN) in the log
ARCHIVE_NAME	VARCHAR2 (513)	Name of the file when archived, using the naming convention specified by the LOG_ARCHIVE_FORMAT initialization parameter See Also: "LOG_ARCHIVE_FORMAT"
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

"V\$LOG_HISTORY" and *Oracle Database Backup and Recovery User's Guide*

9.165 V\$RECOVERY_PROGRESS

V\$RECOVERY_PROGRESS can be used to track database recovery operations to ensure that they are not stalled, and also to estimate the time required to complete the operation in progress.

On non-coordinator instances, V\$RECOVERY_PROGRESS is not populated.

On the coordinator instance (the instance where MRP0 was started to start recovery), V\$RECOVERY_PROGRESS has the same set of rows as before, except the following rows in the ITEM column are always 0 (not used) with Multi-Instance Redo Apply:

- Active Apply
- Maximum Apply Rate
- Apply Time per Log
- Checkpoint Time per Log
- Recovery ID

V\$RECOVERY_PROGRESS is a subview of V\$SESSION_LONGOPS.

Note:

This view is populated on the instance where the MRP0 process is started if recovery is running in Multi-Instance Redo Apply mode. Not all the columns will be populated.

Column	Datatype	Description
START_TIME	DATE	Start time of the recovery operation
TYPE	VARCHAR2 (64)	Type of recovery operation being performed: <ul style="list-style-type: none"> • CRASH RECOVERY • INSTANCE RECOVERY • MEDIA RECOVERY
ITEM	VARCHAR2 (32)	Item being measured. When TYPE is CRASH RECOVERY or INSTANCE RECOVERY, the possible values are: <ul style="list-style-type: none"> • Log Files • Redo Blocks When TYPE is MEDIA RECOVERY, the possible values are: <ul style="list-style-type: none"> • Active Apply Rate • Average Apply Rate • Maximum Apply Rate • Redo Applied • Log Files • Last Applied Redo • Active Time • Elapsed Time • Apply Time per Log • Checkpoint Time per Log • Standby Apply Lag • Recovery ID
UNITS	VARCHAR2 (32)	The units of measurement for each item
SOFAR	NUMBER	Amount of work done so far
TOTAL	NUMBER	Total amount of work expected
TIMESTAMP	DATE	Timestamp of the last redo record applied
COMMENTS	VARCHAR2 (248)	Miscellaneous notes; currently displays the SCN for the last applied redo
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

- ["V\\$SESSION_LONGOPS"](#)
- ["Background Processes"](#) for more information about the MRP0 process
- *Oracle Database Backup and Recovery User's Guide* for more information about performing database recovery

9.166 V\$RECOVERY_SLAVE

V\$RECOVERY_SLAVE is used to track database media recovery processes to monitor their performance statistics and analyze a media recovery session.

Note:

This view is deprecated. Oracle recommends that you instead use the V\$RECOVERY_WORKER view.

See Also:

"V\$RECOVERY_WORKER"

9.167 V\$RECOVERY_STATUS

V\$RECOVERY_STATUS contains statistics of the current recovery process. This view contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V\$RECOVERY_STATUS will be empty to all other Oracle users.

Column	Datatype	Description
RECOVERY_CHECKPOINT	DATE	Point in time to which the recovery has occurred. If no logs have been applied, this is the point in time the recovery starts.
THREAD	NUMBER	Number of the redo thread currently being processed
SEQUENCE_NEEDED	NUMBER	Log sequence number of the log needed by the recovery process. The value is 0 if no log is needed.
SCN_NEEDED	VARCHAR2 (16)	Low SCN of the log needed by recovery. The value is 0 if unknown or no log is needed.
TIME_NEEDED	DATE	Time when the log was created. The value is midnight on 1/1/88 if the time is unknown or if no log is needed.
PREVIOUS_LOG_NAME	VARCHAR2 (513)	Filename of the log
PREVIOUS_LOG_STATUS	VARCHAR2 (13)	Status of the previous log. Contains one of the following values: RELEASE; WRONG NAME; MISSING NAME; UNNEEDED NAME; NONE
REASON	VARCHAR2 (13)	Reason recovery is returning control to the user (NEED LOG LOG REUSED THREAD DISABLED)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

**See Also:**

Oracle Database Backup and Recovery User's Guide

9.168 V\$RECOVERY_WORKER

V\$RECOVERY_WORKER is used to track database media recovery processes to monitor their performance statistics and analyze a media recovery session.

Column	Datatype	Description
START_TIME	DATE	Start time of the recovery process
TYPE	VARCHAR2 (64)	Type of recovery process being performed: <ul style="list-style-type: none">• Media Recovery Applier # (where # represents the worker ID number)• Media Recovery Log Merger• Serial Media Recovery

Column	Datatype	Description
ITEM	VARCHAR2 (32)	<p>Item being measured.</p> <p>When TYPE is Media Recovery Applier #, the possible values are:</p> <ul style="list-style-type: none"> • Recovery ID • Process ID • Number of Redo Cache Full • Number of Redo Cache Copy • Number of CV Cached • CV Applied OK • CV Applied Stuck • CV Applied Repair • CV Applied Corrupt • CV Applied Ckpt • CV Applied Reapplied • Total CV Processed Size • Total CV Applied • Number of Buffer Cache Full • Number of Buffer Retries • Number of Max Reads Issued • Number of Unrcv Condition • Number of Influx Buffer Flushed • Number of Reap Request • Number of Reap Wait IO • Number of Reap No Buffer • Number of Wait All Read • Number of Buffer Pinged • Buffer Ping Time • Read Issue Time • Number of Read Request Issued <p>When TYPE is Media Recovery Log Merger, the possible values are:</p> <ul style="list-style-type: none"> • Recovery ID • Process ID • Number of Redo Cache Full • Number of Redo Cache Copy • Number of CV Cached • Total Redo Read Bytes • Total CV Parsed <p>When TYPE is Serial Media Recovery, the possible values include values from the other two TYPES.</p>
UNITS	VARCHAR2 (32)	The units of measurement for each item
SOFAR	NUMBER	Amount of work done so far
TOTAL	NUMBER	Total amount of work expected
COMMENTS	VARCHAR2 (248)	Miscellaneous notes, which may display the recovery ID and process ID for current recovery session

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

**Note:**

This view is available starting with Oracle Database 23c.

**See Also:**

Oracle Database Backup and Recovery User's Guide

9.169 V\$REDO_DEST_RESP_HISTOGRAM

V\$REDO_DEST_RESP_HISTOGRAM provides statistical information for each redo transport destination.

Column	Datatype	Description
DEST_ID	NUMBER	A nonnegative integer value representing a SYNC standby destination
TIME	VARCHAR2 (20)	A text string that shows the last wall-clock time that a bucket was hit
DURATION	NUMBER	A positive integer value that represents a bucket of seconds, 1, 2, 3, up to 300 seconds, followed by 5 additional buckets that represent 600, 1200, 2400, 4800, and 9600 (>= 4801) seconds
FREQUENCY	NUMBER	A nonnegative integer that shows the number of times a particular bucket was hit by the destination specified by DEST_ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.170 V\$REQDIST

V\$REQDIST lists statistics for the histogram of shared server dispatcher request times, divided into 12 buckets, or ranges of time. The time ranges grow exponentially as a function of the bucket number.

Column	Datatype	Description
BUCKET	NUMBER	Bucket number: 0 - 11; the maximum time for each bucket is $(4 * 2^N) / 100$ seconds
COUNT	NUMBER	Count of requests whose total time to complete (excluding wait time) falls in this range
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.171 V\$RESERVED_WORDS

V\$RESERVED_WORDS displays a list of all SQL keywords. To determine whether a particular keyword is reserved in any way, check the RESERVED, RES_TYPE, RES_ATTR, and RES_SEMI columns.

Column	Datatype	Description
KEYWORD	VARCHAR2 (128)	Name of the keyword
LENGTH	NUMBER	Length of the keyword
RESERVED	VARCHAR2 (1)	Indicates whether the keyword cannot be used as an identifier (Y) or whether the keyword is not reserved (N)
RES_TYPE	VARCHAR2 (1)	Indicates whether the keyword cannot be used as a type name (Y) or whether the keyword is not reserved (N)
RES_ATTR	VARCHAR2 (1)	Indicates whether the keyword cannot be used as an attribute name (Y) or whether the keyword is not reserved (N)
RES_SEMI	VARCHAR2 (1)	Indicates whether the keyword is not allowed as an identifier in certain situations, such as in DML (Y) or whether the keyword is not reserved (N)
DUPLICATE	VARCHAR2 (1)	Indicates whether the keyword is a duplicate of another keyword (Y) or whether the keyword is not a duplicate (N)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.172 V\$RESOURCE

V\$RESOURCE contains resource name and address information.

Column	Datatype	Description
ADDR	RAW(4 8)	Address of the resource object
TYPE	VARCHAR2(2)	Resource type; the resource types are listed in Table 9-1
ID1	NUMBER	Resource identifier #1
ID2	NUMBER	Resource identifier #2
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.173 V\$RESOURCE_LIMIT

V\$RESOURCE_LIMIT displays information about global resource use for some of the system resources. Use this view to monitor the consumption of resources so that you can take corrective action, if necessary. Many of the resources correspond to initialization parameters listed in [Table 9-5](#).

Some resources, those used by DLM for example, have an initial allocation (soft limit), and the hard limit, which is theoretically infinite (although in practice it is limited by SGA size). During SGA reservation/initialization, a place is reserved in SGA for the INITIAL_ALLOCATION of resources, but if this allocation is exceeded, additional resources are allocated up to the value indicated by LIMIT_VALUE. The CURRENT_UTILIZATION column indicates whether the initial allocation has been exceeded. When the initial allocation value is exceeded, the additional required resources are allocated from the shared pool, where they must compete for space with other resources.

A good choice for the value of INITIAL_ALLOCATION will avoid the contention for space. For most resources, the value for INITIAL_ALLOCATION is the same as the LIMIT_VALUE. Exceeding LIMIT_VALUE results in an error.

Column	Datatype	Description
RESOURCE_NAME	VARCHAR2(128)	Name of the resource (see Table 9-5)
CURRENT_UTILIZATION	NUMBER	Number of (resources, locks, or processes) currently being used
MAX_UTILIZATION	NUMBER	Maximum consumption of this resource since the last instance start-up
INITIAL_ALLOCATION	VARCHAR2(40)	Initial allocation. This will be equal to the value specified for the resource in the initialization parameter file (UNLIMITED for infinite allocation).
LIMIT_VALUE	VARCHAR2(40)	Unlimited for resources and locks. This can be greater than the initial allocation value (UNLIMITED for infinite limit).

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Table 9-5 Values for the RESOURCE_NAME Column

Resource Name	Corresponds to
DML_LOCKS	See " DML_LOCKS "
ENQUEUE_LOCKS	This value is computed by the Oracle Database. See V\$ENQUEUE_LOCK to obtain more information about the enqueue locks.
GES_LOCKS	Global Enqueue Service locks
GES_PROCS	Global Enqueue Service processes
GES_RESS	Global Enqueue Service resources
MAX_SHARED_SERVERS	See " MAX_SHARED_SERVERS "
PARALLEL_MAX_SERVERS	See " PARALLEL_MAX_SERVERS "
PROCESSES	See " PROCESSES "
SESSIONS	See " SESSIONS "
SORT_SEGMENT_LOCKS	This value is computed by the Oracle Database
TEMPORARY_LOCKS	This value is computed by the Oracle Database
TRANSACTIONS	See " TRANSACTIONS "

9.174 V\$RESTORE_POINT

V\$RESTORE_POINT displays information about restore points.

Column	Datatype	Description
SCN	NUMBER	Database SCN when the restore point was created
DATABASE_INCARNATION#	NUMBER	Database incarnation number when the restore point was created
GUARANTEE_FLASHBACK_DATABASE	VARCHAR2(3)	Indicates whether flashback log files will be kept to ensure a flashback to this point (YES) or not (NO)
STORAGE_SIZE	NUMBER	Approximate number of bytes of disk space currently tied up supporting this restore point, and which would no longer be tied up if this restore point is the oldest restore point and it is dropped. This will always be zero for non-guaranteed restore points.
TIME	TIMESTAMP(9)	Wall-clock time when the restore point was created
RESTORE_POINT_TIME	TIMESTAMP(9)	Time that was specified when the restore point was created. If a time was not specified, this value is NULL.

Column	Datatype	Description
PRESERVED	VARCHAR2 (3)	Indicates whether the restore point must be explicitly deleted (YES) or not (NO)
NAME	VARCHAR2 (128)	Name of the restore point
PDB_RESTORE_POINT	VARCHAR2 (3)	Indicates whether there is a PDB restore point for this PDB (YES) or not (NO)
CLEAN_PDB_RESTORE_POINT	VARCHAR2 (3)	Indicates whether there is a clean PDB restore point for this PDB (YES) or not (NO)
PDB_INCARNATION#	NUMBER	Pluggable database (PDB) incarnation number. This value is meaningful only for PDB restore points.
REPLICATED	VARCHAR2 (3)	This column is useful in Oracle Data Guard environments. It indicates the method by which a restore point was created. Possible values: <ul style="list-style-type: none"> YES - The restore point was automatically replicated from the primary database to this database when this database was a standby database. The string <code>_PRIMARY</code> is appended to the name of such a restore point. NO - The restore point was created by a user and was not replicated from the primary database.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.175 V\$RESULT_CACHE_DEPENDENCY

V\$RESULT_CACHE_DEPENDENCY displays the depends-on relationship between cached results and dependencies.

Column	Datatype	Description
RESULT_ID	NUMBER	Cached result
DEPEND_ID	NUMBER	Dependency object
OBJECT_NO	NUMBER	Dictionary object number of the dependency object
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.176 V\$RESULT_CACHE_MEMORY

V\$RESULT_CACHE_MEMORY displays all the memory blocks and their status.

Column	Datatype	Description
ID	NUMBER	Unique block identifier (that is, the block number)
CHUNK	NUMBER	Chunk to which the block belongs, relative to the subcache in which the memory object resides (the upper 27 bits of the ID)
OFFSET	NUMBER	Offset of the block within its chunk, relative to the subcache in which the memory object resides (the lower 5 bits of the ID)
SUBCACHE_ID	NUMBER	Subcache ID
FREE	VARCHAR2 (3)	Indicates whether the block is free (YES) or not (NO)
OBJECT_ID	NUMBER	Cache object to which the memory block belongs; NULL if the memory block is not allocated to a cache object (FREE = YES)
POSITION	NUMBER	Position of the block in the cached object; NULL if the memory block is not allocated to a cache object (FREE = YES)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.177 V\$RESULT_CACHE_OBJECTS

V\$RESULT_CACHE_OBJECTS displays all the objects (both cached results and dependencies) and their attributes.

Column	Datatype	Description
ID	NUMBER	Identifier for the cache object (also the ID of the first block)
TYPE	VARCHAR2 (10)	Type of the cache object: <ul style="list-style-type: none"> Dependency Result Temp
STATUS	VARCHAR2 (9)	Status of the object: <ul style="list-style-type: none"> New - Result is still under construction Published - Result is available for use Bypass - Result will be bypassed from use Expired - Result has exceeded expiration time Invalid - Result is no longer available for use
BUCKET_NO	NUMBER	Internal hash bucket for the object
HASH	NUMBER	Hash value for the object
NAME	VARCHAR2 (387)	Name (for example, SQL prefix or PL/SQL function name)

Column	Datatype	Description
NAMESPACE	VARCHAR2 (10)	Namespace: <ul style="list-style-type: none"> • SQL • PLSQL • KEY VECTOR
CREATION_TIMESTAMP	DATE	Time when the object was created
CREATOR_UID	NUMBER	UID that created the object
DEPEND_COUNT	NUMBER	Number of dependencies (TYPE = Result) or dependents (TYPE = Dependency)
BLOCK_COUNT	NUMBER	Total number of blocks in the cached object
SCN	NUMBER	Build SCN (TYPE = Result) or invalidation SCN (TYPE = Dependency)
COLUMN_COUNT ¹	NUMBER	Number of columns in the cached result
PIN_COUNT ¹	NUMBER	Number of active scans on this result
SCAN_COUNT ¹	NUMBER	Total number of scans initiated on the cached result
ROW_COUNT ¹	NUMBER	Total number of rows in the cached result
ROW_SIZE_MAX ¹	NUMBER	Size of the largest row (in bytes)
ROW_SIZE_MIN ¹	NUMBER	Size of the smallest row (in bytes)
ROW_SIZE_AVG ¹	NUMBER	Average size of a row (in bytes)
BUILD_TIME ¹	NUMBER	Amount of time (in hundredths of a second) it took to build the cached result
LRU_NUMBER ¹	NUMBER	LRU list position (the larger the value, the more recent the usage)
OBJECT_NO ²	NUMBER	Dictionary object number of the dependency object
INVALIDATIONS ²	NUMBER	Number of times the object has invalidated its dependents
TIME_SAVED	NUMBER	Amount of time (in microseconds) saved by reuse
INVALIDATION_COST	NUMBER	Amount of time (in microseconds) spent on invalidation
SPACE_OVERHEAD ¹	NUMBER	Overhead (in bytes) for the result
SPACE_UNUSED ¹	NUMBER	Unused space (in bytes) for the result
CACHE_ID	VARCHAR2 (387)	CacheId for the result (object name if it's a dependency)
CACHE_KEY	VARCHAR2 (387)	CacheKey for the result (object name if it's a dependency)
CHECKSUM	NUMBER	Checksum for the result object. The checksum is computed over all the blocks in the result cache object minus the object header.
EDITION_ID	NUMBER	Shows the edition's object ID that was in use when the result was calculated
DB_LINK	VARCHAR2 (3)	Possible values: <ul style="list-style-type: none"> • YES: The result cache object references a remote database object • NO: The result cache object does not reference a remote database object

Column	Datatype	Description
GLOBAL	VARCHAR2 (3)	Possible values: <ul style="list-style-type: none"> • YES: The object was fetched from the result cache of a remote database instance • NO: The object was recomputed on this instance, either because it was not available on a remote database instance or because the system deemed it was inefficient to fetch the object from a remote database instance
SUBCACHE_ID	NUMBER	Subcache ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

¹ This column is valid only for TYPE = Result; otherwise, its value is NULL.

² This column is valid only for TYPE = Dependency; otherwise, its value is NULL.

9.178 V\$RESULT_CACHE_STATISTICS

V\$RESULT_CACHE_STATISTICS displays various result cache settings and usage statistics.

Column	Datatype	Description
ID	NUMBER	Statistic number
NAME	VARCHAR2 (128)	Name of the statistic (see Table 9-6)
VALUE	VARCHAR2 (81)	Value of the statistic
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Table 9-6 V\$RESULT_CACHE_STATISTICS and V\$RESULT_SUBCACHE_STATISTICS Statistics

Statistic Name	Description
Block Count Current	Number of memory blocks currently allocated
Block Count Maximum	Maximum number of memory blocks allowed
Block Size (Bytes)	Size of each memory block
Create Count Failure	Number of cache results that failed to create
Create Count Success	Number of cache results successfully created
Delete Count Invalid	Number of invalid cached results deleted

Table 9-6 (Cont.) V\$RESULT_CACHE_STATISTICS and V\$RESULT_SUBCACHE_STATISTICS Statistics

Statistic Name	Description
Delete Count Valid	Number of valid cached results deleted
Find Copy Count	Number of results copied directly out of the cache
Find Count	Number of cached results that were successfully found
Global Load Rate	Rate at which cached results were fetched from remote instances (in bytes per 10 milliseconds)
Global Prune By Self Count	Number of times this instance did not provide a cached result to a remote instance because this instance deemed it inefficient to do so
Global Prune Count	Number of times this instance did not fetch a cached result from a remote instance because it was deemed inefficient to do so
Hash Chain Length	Average length of items in the hash chain
Invalidation Count	Total number of invalidations
Result Size Maximum (Blocks)	Maximum number of blocks allowed for a single result
Subcache Count	Number of subcaches in the result cache

**See Also:**

"V\$RESULT_SUBCACHE_STATISTICS"

9.179 V\$RESULT_SUBCACHE_STATISTICS

V\$RESULT_SUBCACHE_STATISTICS displays various result cache settings and usage statistics on a per subcache basis.

Column	Datatype	Description
ID	NUMBER	Statistic number
NAME	VARCHAR2 (128)	Name of the statistic This view displays the same statistics as the V\$RESULT_CACHE_STATISTICS view. See Table 9-6 in the documentation for V\$RESULT_CACHE_STATISTICS.
VALUE	VARCHAR2 (81)	Value of the statistic
SUBCACHE_ID	NUMBER	Subcache ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

**See Also:**`"V$RESULT_CACHE_STATISTICS"`

9.180 V\$RMAN_BACKUP_JOB_DETAILS

V\$RMAN_BACKUP_JOB_DETAILS displays details about backup jobs.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Together, with SESSION_KEY and SESSION_STAMP, used to uniquely identify job output from V\$RMAN_OUTPUT
SESSION_STAMP	NUMBER	Together, with SESSION_KEY and SESSION_RECID, used to uniquely identify job output from V\$RMAN_OUTPUT
COMMAND_ID	VARCHAR2 (33)	Either a user-specified SET COMMAND ID or a unique command ID generated by RMAN
START_TIME	DATE	Start time of the first BACKUP command in the job
END_TIME	DATE	End time of the last BACKUP command in the job
INPUT_BYTES	NUMBER	Sum of all input file sizes backed up by this job
OUTPUT_BYTES	NUMBER	Output size of all pieces generated by this job
STATUS_WEIGHT	NUMBER	Used internally by Enterprise Manager
OPTIMIZED_WEIGHT	NUMBER	Used internally by Enterprise Manager
OBJECT_TYPE_WEIGHT	NUMBER	Used internally by Enterprise Manager
OUTPUT_DEVICE_TYPE	VARCHAR2 (17)	Can be DISK, SBT, or *. An * indicates more than one device (in most cases, it will be DISK or SBT).
AUTOBACKUP_COUNT	NUMBER	Number of autobackups performed by this job
BACKED_BY_OSB	VARCHAR2 (3)	A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.
AUTOBACKUP_DONE	VARCHAR2 (3)	YES or NO, depending upon whether or not a control file autobackup was done as part of this backup job
STATUS	VARCHAR2 (23)	One of the following values: <ul style="list-style-type: none"> • RUNNING WITH WARNINGS • RUNNING WITH ERRORS • COMPLETED • COMPLETED WITH WARNINGS • COMPLETED WITH ERRORS • FAILED

Column	Datatype	Description
INPUT_TYPE	VARCHAR2(13)	Contains one of the following values. If the user command does not satisfy one of them, then preference is given in order, from top to bottom of the list. <ul style="list-style-type: none"> DB FULL RECVR AREA DB INCR DATAFILE FULL DATAFILE INCR ARCHIVELOG CONTROLFILE SPFILE
OPTIMIZED	VARCHAR2(3)	YES or NO, depending on whether optimization was applied. Applicable to backup jobs only.
ELAPSED_SECONDS	NUMBER	Number of elapsed seconds
COMPRESSION_RATIO	NUMBER	Compression ratio
INPUT_BYTES_PER_SEC	NUMBER	Input read-rate-per-second
OUTPUT_BYTES_PER_SEC	NUMBER	Output write-rate-per-second
INPUT_BYTES_DISPLAY	VARCHAR2(4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on
INPUT_BYTES_PER_SEC_DISPLAY	VARCHAR2(4000)	Input read-rate-per-second. These values are in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
OUTPUT_BYTES_PER_SEC_DISPLAY	VARCHAR2(4000)	Output write-rate-per-second. These values are in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
TIME_TAKEN_DISPLAY	VARCHAR2(4000)	Time taken, shown in user-displayable format <nn>h:<nn>m:<nn>s
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root n: Where n is the applicable container ID for the rows containing data

9.181 V\$RMAN_BACKUP_SUBJOB_DETAILS

V\$RMAN_BACKUP_SUBJOB_DETAILS merges similar operations within an RMAN session into a single row. For example, if there are four `BACKUP DATAFILE <n>` commands, three `RECOVERY COPY OF DATAFILE` commands, and one `BACKUP RECOVERY AREA` command, this view will contain three rows - one each for `BACKUP`, `ROLLFORWARD`, and `COPY_DISK_TO_TAPE` operation.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Together with SESSION_KEY and SESSION_STAMP, used to uniquely identify job output from V\$RMAN_OUTPUT
SESSION_STAMP	NUMBER	Together with SESSION_KEY and SESSION_RECID, used to uniquely identify job output from V\$RMAN_OUTPUT
OPERATION	VARCHAR2 (33)	Can be BACKUP, ROLLFORWARD, VALIDATE, or COPY_DISK_TO_TAPE. A row for each suboperation type for the session will be in the output view.
COMMAND_ID	VARCHAR2 (33)	Either a user-specified SET COMMAND ID or a unique command ID generated by RMAN
START_TIME	DATE	Start time of the first BACKUP command in the job
END_TIME	DATE	End time of the last BACKUP command in the job
INPUT_BYTES	NUMBER	Sum of all input file sizes backed up by this job
OUTPUT_BYTES	NUMBER	Output size of all pieces generated by this job
STATUS_WEIGHT	NUMBER	Used internally by Enterprise Manager
OBJECT_TYPE_WEIGHT	NUMBER	Used internally by Enterprise Manager
OPTIMIZED_WEIGHT	NUMBER	Used internally by Enterprise Manager
OUTPUT_DEVICE_TYPE	VARCHAR2 (17)	Can be DISK, SBT, or *. An * indicates more than one device (in most cases, it will be DISK or SBT).
BACKED_BY_OSB	VARCHAR2 (3)	A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.
AUTOBACKUP_DONE	VARCHAR2 (3)	YES or NO, depending upon whether or not a control file autobackup was done as part of this job
STATUS	VARCHAR2 (23)	One of the following values: <ul style="list-style-type: none"> • RUNNING WITH WARNINGS • RUNNING WITH ERRORS • COMPLETED • COMPLETED WITH WARNINGS • COMPLETED WITH ERRORS • FAILED
INPUT_TYPE	VARCHAR2 (13)	Contains one of the following values. If the user command does not satisfy one of them, then preference is given in order, from top to bottom of the list. <ul style="list-style-type: none"> • DB FULL • RECVR AREA • DB INCR • DATAFILE FULL • DATAFILE INCR • ARCHIVELOG • CONTROLFILE • SPFILE
OPTIMIZED	VARCHAR2 (3)	YES or NO, depending on whether optimization was applied. Applicable to backup jobs only.
AUTOBACKUP_COUNT	NUMBER	Number of autobackups performed by this job
COMPRESSION_RATIO	NUMBER	Compression ratio

Column	Datatype	Description
INPUT_BYTES_DISPLAY	VARCHAR2 (4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
OUTPUT_BYTES_DISPLAY	VARCHAR2 (4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.182 V\$RMAN_BACKUP_TYPE

V\$RMAN_BACKUP_TYPE displays information about RMAN backup types.

Column	Datatype	Description
WEIGHT	NUMBER	Used to set precedence order of different backup types in reports.
INPUT_TYPE	VARCHAR2 (13)	Used to represent possible filters used in creating various reporting screens.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.183 V\$RMAN_COMPRESSION_ALGORITHM

V\$RMAN_COMPRESSION_ALGORITHM provides descriptions of supported compression algorithms. It is used by the RMAN client.

Column	Datatype	Description
ALGORITHM_ID	NUMBER	Algorithm ID
ALGORITHM_NAME	VARCHAR2 (64)	Name of the algorithm (for example, LOW, MEDIUM, DEFAULT, or HIGH)
INITIAL_RELEASE	VARCHAR2 (18)	First Oracle Database release when this compression algorithm was available
TERMINAL_RELEASE	VARCHAR2 (18)	Last Oracle Database release that supported using this compression algorithm to create new backups. Existing backups can always be restored, even if they use a deprecated compression algorithm.
ALGORITHM_DESCRIPTION	VARCHAR2 (64)	Description of the algorithm

Column	Datatype	Description
ALGORITHM_COMPATIBILITY	VARCHAR2 (18)	Required database compatibility level for the algorithm (for example, 11.2.0 for <code>DEFAULT</code>)
IS_VALID	VARCHAR2 (3)	Indicates whether the algorithm is valid with regard to the compatibility setting (<code>YES</code>) or not (<code>NO</code>). The value is <code>YES</code> if <code>ALGORITHM_COMPATIBILITY <= DATABASE_COMPATIBILITY</code> .
REQUIRES_ACO	VARCHAR2 (3)	Indicates whether the algorithm requires the Advanced Compression Option (<code>YES</code>) or not (<code>NO</code>)
IS_DEFAULT	VARCHAR2 (3)	Indicates whether the algorithm is the default compression algorithm that RMAN uses to create compressed backup sets (<code>YES</code>) or not (<code>NO</code>)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.184 V\$RMAN_CONFIGURATION

V\$RMAN_CONFIGURATION lists information about RMAN persistent configuration settings.

Column	Datatype	Description
CONF#	NUMBER	A unique key identifying this configuration record within the target database that owns it.
NAME	VARCHAR2 (65)	The type of configuration. All options of the <code>CONFIGURE</code> command are valid types except: <ul style="list-style-type: none"> <code>CONFIGURE EXCLUDE</code> (described in <code>RC_TABLESPACE</code>) <code>CONFIGURE AUXNAME</code> (described in <code>RC_DATAFILE</code>) <code>CONFIGURE SNAPSHOT CONTROLFILE</code> (stored only in control file)
VALUE	VARCHAR2 (1025)	The <code>CONFIGURE</code> command setting. Example: <code>RETENTION POLICY TO RECOVERY WINDOW OF 10 DAYS</code>
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.185 V\$RMAN_ENCRYPTION_ALGORITHMS

V\$RMAN_ENCRYPTION_ALGORITHMS displays supported encryption algorithms. It is used by the RMAN client to validate user-requested algorithms.

This view lists AES128, AES192, and AES256 encryption algorithms for the current release. The default algorithm is AES256.

Column	Datatype	Description
ALGORITHM_ID	NUMBER	Number to identify the algorithm
ALGORITHM_NAME	VARCHAR2 (64)	Name of the algorithm (for example, AES128, AES192, or AES256)
ALGORITHM_DESCRIPTION	VARCHAR2 (64)	Description of the algorithm
IS_DEFAULT	VARCHAR2 (3)	Indicates whether this is the default encryption algorithm for CFB encryption mode (YES) or not (NO). CFB encryption mode is used when the COMPATIBLE initialization parameter is set to a value less than 23.0.0.0. Otherwise, refer to the IS_DEFAULTXTS column. This value is set by Oracle Database and may vary for each Release (that is, it is not dependent on user-specified RMAN configuration).
RESTORE_ONLY	VARCHAR2 (3)	Indicates whether this algorithm can be used for restore only (YES) or not (NO). If the value is NO, then the algorithm is also allowed for backup. This column is useful in determining whether an encryption algorithm is deprecated for backup purpose.
IS_DEFAULTXTS	VARCHAR2 (3)	Indicates whether this is the default encryption algorithm for XTS encryption mode (YES) or not (NO). XTS encryption mode is used when the COMPATIBLE initialization parameter is set to a value greater than or equal to 23.0.0.0. Otherwise, refer to the IS_DEFAULT column. This value is set by Oracle Database and may vary for each Release (that is, it is not dependent on user-specified RMAN configuration).
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root n: Where n is the applicable container ID for the rows containing data

9.186 V\$RMAN_OUTPUT

V\$RMAN_OUTPUT displays messages reported by RMAN.

This is an in-memory view and is not recorded in the controlfile. The view can hold 32768 rows.

Column	Datatype	Description
SID	NUMBER	Session ID of the session which is running this RMAN operation
RECID	NUMBER	Record ID of the corresponding V\$RMAN_STATUS row
STAMP	NUMBER	Timestamp of the corresponding V\$RMAN_STATUS row
SESSION_RECID	NUMBER	Record ID of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)
SESSION_STAMP	NUMBER	Timestamp of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)
OUTPUT	VARCHAR2 (130)	Output text reported by RMAN
RMAN_STATUS_RECID	NUMBER	Owning V\$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V\$RMAN_STATUS record stamp
SESSION_KEY	NUMBER	Session identifier
GUID	NUMBER	The guid of the pluggable database (PDB) that did the RMAN operation. V\$RMAN_OUTPUT captures the rman output. If a PDB sysdba did the backup, the guid of the PDB is displayed in V\$RMAN_OUTPUT. If root did the backup, then guid of the root is displayed in V\$RMAN_OUTPUT. Root A root user can see all of V\$RMAN_OUTPUT rows (that is, the rows owned by all PDBs), but a PDB user can only see that PDB's V\$RMAN_OUTPUT rows (that is, no rows from root or other PDBs).
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root n: Where n is the applicable container ID for the rows containing data

9.187 V\$RMAN_STATUS

V\$RMAN_STATUS displays the finished and on-going RMAN jobs. For on-going jobs, this view displays progress and status. The jobs which are in progress are stored only in memory while the finished jobs are stored in the controlfile.

Column	Datatype	Description
SID	NUMBER	Session ID of the session which is running this RMAN operation
RECID	NUMBER	Record ID of the row in the controlfile
STAMP	NUMBER	Timestamp of the row (RECID + STAMP is unique)
PARENT_RECID	NUMBER	Record ID of the parent row of this row (corresponding V\$RMAN_STATUS row with ROW_LEVEL = ROW_LEVEL - 1)
PARENT_STAMP	NUMBER	Timestamp of the parent row of this row (corresponding V\$RMAN_STATUS row with ROW_LEVEL = ROW_LEVEL - 1)
SESSION_RECID	NUMBER	Record ID of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)

Column	Datatype	Description
SESSION_STAMP	NUMBER	Timestamp of the session (corresponding V\$RMAN_STATUS row with ROW_LEVEL = 0)
ROW_LEVEL	NUMBER	Level of the row. The session has level 0.
ROW_TYPE	VARCHAR2 (19)	Type of the row: <ul style="list-style-type: none"> SESSION COMMAND RECURSIVE OPERATION
COMMAND_ID	VARCHAR2 (33)	Command ID set by the RMAN SET COMMAND ID command. If not set, then RMAN will create a unique number.
OPERATION	VARCHAR2 (33)	Name of the command in the execution explained by this row
STATUS	VARCHAR2 (23)	Status of the operation: <ul style="list-style-type: none"> RUNNING RUNNING WITH WARNINGS RUNNING WITH ERRORS COMPLETED COMPLETED WITH WARNINGS COMPLETED WITH ERRORS FAILED
MBYTES_PROCESSED	NUMBER	Percentage of the job completed; null if not applicable for the operation
START_TIME	DATE	Start time of the job
END_TIME	DATE	End time of the job
INPUT_BYTES	NUMBER	Number of input bytes read
OUTPUT_BYTES	NUMBER	Number of output bytes written
OPTIMIZED	VARCHAR2 (3)	YES, if backup optimization was applied during the backup job. Otherwise, NO.
OBJECT_TYPE	VARCHAR2 (13)	Identifies types of objects backed up
OUTPUT_DEVICE_TYPE	VARCHAR2 (17)	DISK, SBT_TAPE, or *. An * indicates that output was written to more than one device type.
OSB_ALLOCATED	VARCHAR2 (3)	A value of YES means an Oracle Secure Backup channel was allocated during the specified operation identified by the V\$RMAN_STATUS view.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.188 V\$RO_USER_ACCOUNT

V\$RO_USER_ACCOUNT is populated only on Oracle databases that are open in read-only mode. When a database is read-only, security data cannot be stored in normal

catalogue tables. Instead, the security data is stored in an in-memory table that is queried through this view.

In an Oracle Data Guard environment, some of the security information for user accounts on the standby is inherited from the primary server. For example, if the account is locked out unlimited on the primary, then it will be locked on the standby database(s). The information stored on the standby is volatile information that user actions on the standby database(s) can affect, such as the number of failed logins, and the time the account was locked on the standby due to failed access attempts. Note that failed login attempts on standbys do not affect the account status on primaries.

If this view is queried from the root in a multitenant container database (CDB), then only common users and the `SYS` user are returned.

If this view is queried from a pluggable database (PDB), only rows that pertain to the current PDB are returned.

Column	Datatype	Description
USERID	NUMBER	User ID number
PASSW_EXPIRED	NUMBER	Indicates whether the password has expired (1) or not (0)
PASSW_IN_GRACE	NUMBER	Indicates whether the account is in grace (1) or not (0)
PASSW_LOCKED	NUMBER	Indicates whether the account is locked (1) or not (0)
PASSW_LOCK_UNLIM	NUMBER	Indicates whether the account is locked for an unlimited time (1) or not (0)
FAILED_LOGINS	NUMBER	The number of failed login attempts. The count is not cumulative; it is reset upon successful logon to the account
EXPIRATION_AFTER_GRACE	TIMESTAMP (3)	The expiration time after grace
PASSW_LOCK_TIME	TIMESTAMP (3)	The time the account was locked out
CON_ID	NUMBER	The ID of the container where the failed login occurred. For users that are not common users, the <code>CON_ID</code> is the PDB ID where the failed login attempt occurred. For common users, the <code>CON_ID</code> is 0. The login attempts that occurred on a PDB are not displayed when you query <code>V\$RO_USER_ACCOUNT</code> from another PDB. You only see the failed login attempts of any users (that are not common users) if those failed login attempts occurred on the same PDB from which you are querying <code>V\$RO_USER_ACCOUNT</code> . The failed login attempts of common users (and of the <code>SYS</code> user) are only displayed when <code>V\$RO_USER_ACCOUNT</code> is queried from the root of a CDB, not when it is queried from a PDB. In a non-CDB, the value is always 0.
USERNAME	VARCHAR2 (128)	User name

9.189 V\$ROLLNAME

`V$ROLLNAME` lists the names of all online rollback segments. It can only be accessed when the database is open.

Column	Datatype	NULL	Description
USN	NUMBER		Rollback (undo) segment number

Column	Datatype	NULL	Description
NAME	VARCHAR2 (30)	NOT NULL	Rollback segment name
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.190 V\$ROLLSTAT

V\$ROLLSTAT contains rollback segment statistics.

Column	Datatype	Description
USN	NUMBER	Rollback segment number
LATCH	NUMBER	Latch for the rollback segment
EXTENTS	NUMBER	Number of extents in the rollback segment
RSSIZE	NUMBER	Size (in bytes) of the rollback segment. This value differs by the number of bytes in one database block from the value of the BYTES column of the *_SEGMENTS view. See Also: <i>Oracle Database Administrator's Guide</i> for more information about space management for rollback segments
WRITES	NUMBER	Number of bytes written to the rollback segment
XACTS	NUMBER	Number of active transactions
GETS	NUMBER	Number of header gets
WAITS	NUMBER	Number of header waits
OPTSIZE	NUMBER	Optimal size of the rollback segment
HWMSIZE	NUMBER	High watermark of the rollback segment size
SHRINKS	NUMBER	Number of times the size of a rollback segment decreases
WRAPS	NUMBER	Number of times rollback segment is wrapped
EXTENDS	NUMBER	Number of times rollback segment size is extended
AVESHINK	NUMBER	Average shrink size
AVEACTIVE	NUMBER	Current size of active extents, averaged over time.
STATUS	VARCHAR2 (15)	Rollback segment status: <ul style="list-style-type: none"> • ONLINE • PENDING OFFLINE • OFFLINE • FULL
CUREXT	NUMBER	Current extent
CURBLK	NUMBER	Current block

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.191 V\$ROWCACHE

V\$ROWCACHE displays statistics for data dictionary activity. Each row contains statistics for one data dictionary cache.

Column	Datatype	Description
CACHE#	NUMBER	Row cache ID number
TYPE	VARCHAR2 (11)	Parent or subordinate row cache type
SUBORDINATE#	NUMBER	Subordinate set number
PARAMETER	VARCHAR2 (32)	Name of the initialization parameter that determines the number of entries in the data dictionary cache
COUNT	NUMBER	Total number of entries in the cache
USAGE	NUMBER	Number of cache entries that contain valid data
FIXED	NUMBER	Number of fixed entries in the cache
GETS	NUMBER	Total number of requests for information on the data object
FASTGETS	NUMBER	Reserved for internal use
GETMISSES	NUMBER	Number of data requests resulting in cache misses
SCANS	NUMBER	Number of scan requests
SCANMISSES	NUMBER	Number of times a scan failed to find the data in the cache
SCANCOMPLETES	NUMBER	For a list of subordinate entries, the number of times the list was scanned completely
MODIFICATIONS	NUMBER	Number of inserts, updates, and deletions
FLUSHES	NUMBER	Number of times flushed to disk
DLM_REQUESTS	NUMBER	Number of DLM requests
DLM_CONFLICTS	NUMBER	Number of DLM conflicts
		This column is obsolete and is maintained for backward compatibility.
DLM_RELEASES	NUMBER	Number of DLM releases
		This column is obsolete and is maintained for backward compatibility.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.192 V\$ROWCACHE_PARENT

V\$ROWCACHE_PARENT displays information for parent objects in the data dictionary. There is one row per lock owner, and one waiter for each object. This row shows the mode held or requested. For objects with no owners or waiters, a single row is displayed.

Column	Datatype	Description
INDX	NUMBER	Index of the row
HASH	NUMBER	Hash value
ADDRESS	RAW (4 8)	Address of the parent object
CACHE#	NUMBER	Parent cache ID
CACHE_NAME	VARCHAR2 (64)	Parent cache name
EXISTENT	VARCHAR2 (1)	Indicates whether the object is an existing object
LOCK_MODE	NUMBER	Mode the lock is held in
LOCK_REQUEST	NUMBER	Mode the lock is requested in
TXN	RAW (4 8)	Transaction currently locking the object
SADDR	RAW (4 8)	Address of the session
INST_LOCK_REQUEST	NUMBER	Mode in which instance lock is being requested. This column is only relevant for Real Application Clusters.
INST_LOCK_RELEASE	NUMBER	Whether the instance lock needs to be released. This column is only relevant for Real Application Clusters.
INST_LOCK_TYPE	VARCHAR2 (2)	Type of instance lock. This column is only relevant for Real Application Clusters.
INST_LOCK_ID1	RAW (4)	ID associated with the instance lock. This column is only relevant for Real Application Clusters.
INST_LOCK_ID2	RAW (4)	ID associated with the instance lock. This column is only relevant for Real Application Clusters.
KEY	RAW (100)	Contents of the key. This column is only relevant for Real Application Clusters.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.193 V\$ROWCACHE_SUBORDINATE

V\$ROWCACHE_SUBORDINATE displays information for subordinate objects in the data dictionary.

Column	Datatype	Description
INDX	NUMBER	The index
HASH	NUMBER	The hash value
ADDRESS	RAW(4 8)	Address of the subordinate object
CACHE#	NUMBER	The parent cache ID
SUBCACHE#	NUMBER	The subcache ID
SUBCACHE_NAME	VARCHAR2(64)	The subcache name
EXISTENT	VARCHAR2(1)	Whether the object is an existing object
PARENT	RAW(4 8)	Address of the parent object
KEY	RAW(100)	The contents of the key
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.194 V\$RSRC_CONS_GROUP_HISTORY

V\$RSRC_CONS_GROUP_HISTORY displays a history of consumer group statistics for each entry in V\$RSRC_PLAN_HISTORY that has a non-NULL plan.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

A new window is created in V\$RSRC_CON_GROUP_HISTORY when a pluggable database (PDB) changes its resource plan. The plan windows inside a PDB are not impacted by a multitenant container database (CDB) resource plan change.

Since PDB plans can be set independently across different PDBs, V\$RSRC_CON_GROUP_HISTORY will not cover the same time period across different PDBs. Therefore, this view is not useful for comparing statistics across different PDBs.

Column	Datatype	Description
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.
ID	NUMBER	Consumer group object ID (a unique number, consistent across database shutdowns and startups)
NAME	VARCHAR2 (30)	Name of the consumer group
REQUESTS	NUMBER	Cumulative number of requests that were executed in the consumer group
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU on the resmgr: cpu quantum wait event because of resource management (in milliseconds). This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU on the resmgr: cpu quantum wait event because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS	NUMBER	Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_EXCLUSIVE	NUMBER	Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_WON	NUMBER	Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero.
ACTIVE_SESS_LIMIT_HIT	NUMBER	Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit
UNDO_LIMIT_HIT	NUMBER	Number of times that queries in the consumer group were canceled because the consumer group reached its UNDO_POOL limit
SWITCHES_IN_CPU_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_TIME limit
SWITCHES_OUT_CPU_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_TIME limit

Column	Datatype	Description
SWITCHES_IN_IO_MEGABYTES	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_OUT_IO_MEGABYTES	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_IN_IO_REQUESTS	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit
SWITCHES_OUT_IO_REQUESTS	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit
SWITCHES_IN_IO_LOGICAL	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit
SWITCHES_OUT_IO_LOGICAL	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit
SWITCHES_IN_ELAPSED_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SWITCHES_OUT_ELAPSED_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SQL_CANCELED	NUMBER	Number of times that SQL queries running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and CANCEL_SQL was specified as the Resource Manager plan's SWITCH_GROUP
ACTIVE_SESS_KILLED	NUMBER	Number of times that sessions running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and KILL_SESSION was specified as the Resource Manager plan's SWITCH_GROUP
IDLE_SESS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because they were idle for too long (reached MAX_IDLE_TIME)
IDLE_BLK_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because they were idle too long (reached MAX_IDLE_BLOCKER_TIME) and were blocking other sessions
QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group have spent in the QUEUED state because of the active session limit (in milliseconds)
QUEUE_TIME_OUTS	NUMBER	Number of times that requests from sessions in the consumer group timed out because they were queued for too long (reached QUEUEING_P1)
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests

Column	Datatype	Description
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
PGA_LIMIT_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because their untunable PGA usage exceeded the SESSION_PGA_LIMIT limit
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.195 V\$RSRC_CONSUMER_GROUP

V\$RSRC_CONSUMER_GROUP displays data related to currently active resource consumer groups.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

Statistics in V\$RSRC_CONSUMER_GROUP are reset when a pluggable database (PDB) changes its resource plan. They are not impacted by multitenant container database (CDB) resource plan changes.

Since PDB plans can be set independently across different PDBs, V\$RSRC_CONSUMER_GROUP will not cover the same time period across different PDBs. Therefore, this view is not useful for comparing statistics across different PDBs.

Column	Datatype	Description
ID	NUMBER	Consumer group object ID (a unique number, consistent across database shutdowns and startups)
NAME	VARCHAR2 (32)	Name of the consumer group
ACTIVE_SESSIONS	NUMBER	Number of currently active sessions in the consumer group
EXECUTION_WAITERS	NUMBER	Number of currently active sessions waiting for an execution time slice in which they will be able to use CPU
REQUESTS	NUMBER	Cumulative number of requests that were executed in the consumer group
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU on the resmgr: cpu quantum wait event because of resource management (in milliseconds). This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU on the resmgr: cpu quantum wait event because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS	NUMBER	Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_EXCLUSIVE	NUMBER	Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_WON	NUMBER	Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero.
QUEUE_LENGTH	NUMBER	Number of sessions waiting in the queue
CURRENT_UNDO_CONSUMPTION	NUMBER	Current amount (in KB) of undo consumed by the consumer group
ACTIVE_SESSION_LIMIT_HIT	NUMBER	Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit
UNDO_LIMIT_HIT	NUMBER	Number of times that queries in the consumer group were canceled because the consumer group reached its UNDO_POOL limit
SWITCHES_IN_CPU_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_TIME limit
SWITCHES_OUT_CPU_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_TIME limit

Column	Datatype	Description
SWITCHES_IN_IO_MEGABYTES	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_OUT_IO_MEGABYTES	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_IN_IO_REQUESTS	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit
SWITCHES_OUT_IO_REQUESTS	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit
SWITCHES_IN_IO_LOGICAL	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit
SWITCHES_OUT_IO_LOGICAL	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit
SWITCHES_IN_ELAPSED_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SWITCHES_OUT_ELAPSED_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SQL_CANCELED	NUMBER	Number of times that SQL queries running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and CANCEL_SQL was specified as the Resource Manager plan's SWITCH_GROUP
ACTIVE_SESSIONS_KILLED	NUMBER	Number of times that sessions running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and KILL_SESSION was specified as the Resource Manager plan's SWITCH_GROUP
IDLE_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because they were idle for too long (reached MAX_IDLE_TIME)
IDLE_BLK_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because they were idle too long (reached MAX_IDLE_BLOCKER_TIME) and were blocking other sessions
QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group have spent in the QUEUED state because of the active session limit (in milliseconds)
QUEUE_TIME_OUTS	NUMBER	Number of times that requests from sessions in the consumer group timed out because they were queued for too long (reached QUEUEING_P1)
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests

Column	Datatype	Description
CURRENT_PQS_ACTIVE	NUMBER	Number of active parallel statements in the consumer group. This value does not include parallel statements that are never queued, such as GV\$ queries.
CURRENT_PQ_SERVERS_ACTIVE	NUMBER	Number of active parallel servers in the consumer group. This value does not include servers running parallel statements that are never queued, such as GV\$ queries.
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)
CURRENT_PQS_QUEUED	NUMBER	Number of sessions in the consumer group that are waiting in the parallel statement queue trying to run parallel statements
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
PGA_LIMIT_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because their untunable PGA usage exceeded the SESSION_PGA_LIMIT limit
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

9.196 V\$RSRC_CONSUMER_GROUP_CPU_MTH

V\$RSRC_CONSUMER_GROUP_CPU_MTH displays all resource allocation methods defined for resource consumer groups.

Column	Datatype	Description
NAME	VARCHAR2 (40)	Name of the CPU resource allocation method
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

9.197 V\$RSRC_PDB

V\$RSRC_PDB displays data related to currently active resource consumer groups by pluggable database (PDB).

When the `STATISTICS_LEVEL` is set to `TYPICAL` or `ALL`, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

Statistics in V\$RSRC_PDB are reset when a multitenant container database (CDB) changes its resource plan. They are not impacted by PDB resource plan changes.

V\$RSRC_PDB covers the same time period for all PDBs. This view is specifically designed for comparing statistics across different PDBs.

Since V\$RSRC_PDB does not contain information at the consumer group level, it is not useful for comparing consumer groups inside a PDB.

Column	Datatype	Description
PDB_NAME	VARCHAR2 (32)	PDB name
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.

Column	Datatype	Description
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
CURRENT_PQS_ACTIVE	NUMBER	Number of active parallel statements in the consumer group. This value does not include parallel statements that are never queued, such as GV\$ queries.
CURRENT_PQ_SERVERS_ACTIVE	NUMBER	Number of active parallel servers in the consumer group. This value does not include servers running parallel statements that are never queued, such as GV\$ queries.
CURRENT_PQS_QUEUED	NUMBER	Number of sessions in the consumer group that are waiting in the parallel statement queue trying to run parallel statements
SGA_BYTES	NUMBER	The current SGA usage by this PDB in bytes
BUFFER_CACHE_BYTES	NUMBER	The current usage of buffer cache by this PDB in bytes
SHARED_POOL_BYTES	NUMBER	The current usage of shared pool by this PDB in bytes
PGA_BYTES	NUMBER	The current usage of PGA by this PDB in bytes

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

"V\$RSRC_CONSUMER_GROUP"

9.198 V\$RSRC_PDB_HISTORY

V\$RSRC_PDB_HISTORY displays a history of consumer group statistics for each entry in V\$RSRC_PDB that has a non-NULL plan by pluggable database (PDB).

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

A new window is created in V\$RSRC_PDB_HISTORY when a multitenant container database (CDB) changes its resource plan. The plan windows for the CDB are not impacted by a PDB resource plan change.

V\$RSRC_PDB_HISTORY covers the same time period for all PDBs. This view is specifically designed for comparing statistics across different PDBs.

Since V\$RSRC_PDB_HISTORY does not contain information at the consumer group level, it is not useful for comparing consumer groups inside a PDB.

Column	Datatype	Description
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V\$RSRC_PDB entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.
PDB_NAME	VARCHAR2 (32)	PDB name
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.

Column	Datatype	Description
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's <code>PARALLEL_QUEUE_TIMEOUT</code> limit
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

"V\$RSRC_CONS_GROUP_HISTORY"

9.199 V\$RSRC_PLAN

V\$RSRC_PLAN displays the names of all currently active resource plans.

Column	Datatype	Description
ID	NUMBER	Resource plan ID (a unique number, consistent across database shutdowns and startups). This is also the data dictionary object ID.
NAME	VARCHAR2 (32)	Name of the resource plan
IS_TOP_PLAN	VARCHAR2 (5)	Indicates whether the resource plan is the current top plan (TRUE) or whether the resource plan is a subplan of the current top plan (FALSE)
CPU_MANAGED	VARCHAR2 (3)	Indicates whether the resource plan has parameters that specify a policy for how the Resource Manager should schedule sessions to manage CPU usage (ON) or whether Resource Manager is not managing CPU usage (OFF)
CPU_SCOPE	VARCHAR2 (13)	Scope of the policy for how the Resource Manager should schedule sessions to manage CPU usage. Possible values: <ul style="list-style-type: none"> OFF - Resource Manager is not managing CPU usage (CPU_MANAGED = OFF) INSTANCE_ONLY - Resource Manager is managing CPU usage only within the database instance SERVER_WIDE - Resource Manager is using server-level inter-instance CPU resource management
INSTANCE_CAGING	VARCHAR2 (3)	Indicates whether instance caging is enabled (ON) or disabled (OFF). Instance caging is enabled if the CPU_COUNT initialization parameter is explicitly modified to a value other than 0 and Resource Manager is enabled.
PARALLEL_SERVERS_ACTIVE	NUMBER	Total number of active parallel servers on the instance
PARALLEL_SERVERS_TOTAL	NUMBER	The value of PARALLEL_SERVERS_TARGET for the instance. Parallel statements are queued if the total number of active parallel servers exceeds this value.

Column	Datatype	Description
PARALLEL_EXECUTION_MANAGED	VARCHAR2 (32)	<p>State of parallel statement queuing:</p> <ul style="list-style-type: none"> • OFF - Parallel statement queuing is disabled • STARTUP - Parallel statement queuing is enabled. This is a temporary state that can occur when an Oracle RAC database is undergoing configuration changes • FIFO - Parallel statement queuing is enabled. All parallel statements are managed in a single Oracle RAC FIFO queue • FULL - Parallel statement queuing is enabled. All parallel statements are managed in per-consumer group queues according to the current resource plan. This state is used when a resource plan that contains resource allocation directives (MGMT_P*) is enabled. • DISABLED - Parallel statement queuing is disabled. This state can occur when memory is unavailable for use by parallel statement queuing in the System Global Area (SGA). Restart the Oracle instance to re-enable parallel statement queuing. <p>For an Oracle RAC database, only the instance running as primary Database Resource Manager (DBRM) shows the correct state of parallel statement queuing. All other instances default to the value FULL. A single instance database always shows the correct value for this field.</p>
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data
DIRECTIVE_TYPE	VARCHAR2 (32)	<p>The type of directive used by this PDB:</p> <ul style="list-style-type: none"> • DEFAULT_DIRECTIVE: The default plan directive • PDB: A PDB directive • PROFILE: A profile directive
SHARES	NUMBER	Resource allocation for this PDB, expressed in shares
UTILIZATION_LIMIT	NUMBER	Maximum percentage of the container's resources allowed for this PDB
PARALLEL_SERVER_LIMIT	NUMBER	Maximum percentage of the parallel target the PDB can use before queuing subsequent parallel queries
MEMORY_MIN	NUMBER	<p>The percentage of Exadata Smart Flash Cache and Exadata PMEM cache that is guaranteed to the PDB</p> <p>This percentage is based on the total amount of space allocated to the CDB for Exadata Smart Flash Cache and Exadata PMEM cache.</p> <p>See <i>Oracle Exadata System Software User's Guide</i> for more information.</p>

Column	Datatype	Description
MEMORY_LIMIT	NUMBER	The maximum percentage of Exadata Smart Flash Cache and Exadata PMEM cache that the PDB can use This percentage is based on the total amount of space allocated to the CDB for Exadata Smart Flash Cache and Exadata PMEM cache. See <i>Oracle Exadata System Software User's Guide</i> for more information.
PROFILE	VARCHAR2 (32)	The value of the DB_PERFORMANCE_PROFILE initialization parameter for this PDB
CPU_COUNT	NUMBER	Value of the CPU_COUNT initialization parameter in the container to which the data pertains
CPU_MIN_COUNT	NUMBER	Value of the CPU_MIN_COUNT initialization parameter in the container to which the data pertains

The resource plan with CON_ID=ROOT is the CDB resource plan.

9.200 V\$RSRC_PLAN_CPU_MTH

V\$RSRC_PLAN_CPU_MTH displays all available CPU resource allocation methods defined for resource plans.

Column	Datatype	Description
NAME	VARCHAR2 (40)	Name of the resource allocation method
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- *Oracle Database PL/SQL Packages and Types Reference* for information on defining resource allocation methods for consumer plans with the `DBMS_RESOURCE_MANAGER` package

9.201 V\$RSRC_PLAN_HISTORY

V\$RSRC_PLAN_HISTORY displays a history of when a resource plan was enabled, disabled, or modified on the instance. Up to 15 of the most recent entries are shown. Once the database is opened, this view shows at least one row. The row with the most recent `START_TIME` and with `END_TIME` equal to `NULL` gives information about the current resource plan.

Column	Datatype	Description
SEQUENCE#	NUMBER	A sequential counter that uniquely describes a row. When the instance is restarted, this value is reset to zero.
ID	NUMBER	Resource plan ID; NULL if the Resource Manager was disabled
NAME	VARCHAR2 (30)	Resource plan name; NULL if the Resource Manager was disabled
START_TIME	DATE	Time that the resource plan was enabled
END_TIME	DATE	Time that the resource plan was disabled; NULL if the row contains the current resource plan information
ENABLED_BY_SCHEDULER	VARCHAR2 (5)	Indicates whether the plan was enabled by a Job Scheduler window (<code>TRUE</code>) or not (<code>FALSE</code>)
WINDOW_NAME	VARCHAR2 (128)	Job Scheduler window that triggered the resource plan event; NULL if a user triggered the resource plan event
ALLOWED_AUTOMATED_SWITCHES	VARCHAR2 (5)	Indicates whether automated plan switches were allowed after this resource plan event (<code>TRUE</code>) or whether automated plan switches were disabled after this resource plan event (<code>FALSE</code>)
		See Also: the <code>SWITCH_PLAN</code> procedure
CPU_MANAGED	VARCHAR2 (3)	Indicates whether the resource plan has parameters that specify a policy for how the Resource Manager should schedule sessions to manage CPU usage (<code>ON</code>) or whether Resource Manager is not managing CPU usage (<code>OFF</code>)
CPU_SCOPE	VARCHAR2 (13)	Scope of the policy for how the Resource Manager should schedule sessions to manage CPU usage. Possible values: <ul style="list-style-type: none"> • <code>OFF</code> - Resource Manager is not managing CPU usage (<code>CPU_MANAGED = OFF</code>) • <code>INSTANCE_ONLY</code> - Resource Manager is managing CPU usage only within the database instance • <code>SERVER_WIDE</code> - Resource Manager is using server-level inter-instance CPU resource management

Column	Datatype	Description
INSTANCE_CAGING	VARCHAR2 (3)	Indicates whether instance caging is enabled (ON) or disabled (OFF). Instance caging is enabled if the CPU_COUNT initialization parameter is explicitly modified to a value other than 0 and Resource Manager is enabled.
PARALLEL_EXECUTION_MANAGER_AGED	VARCHAR2 (32)	<p>State of parallel statement queuing:</p> <ul style="list-style-type: none"> • OFF - Parallel statement queuing is disabled • STARTUP - Parallel statement queuing is enabled. This is a temporary state that can occur when an Oracle RAC database is undergoing configuration changes • FIFO - Parallel statement queuing is enabled. All parallel statements are managed in a single Oracle RAC FIFO queue • FULL - Parallel statement queuing is enabled. All parallel statements are managed in per-consumer group queues according to the current resource plan. This state is used when a resource plan that contains resource allocation directives (MGMT_P*) is enabled. • DISABLED - Parallel statement queuing is disabled. This state can occur when memory is unavailable for use by parallel statement queuing in the System Global Area (SGA). Restart the Oracle instance to re-enable parallel statement queuing. <p>For an Oracle RAC database, only the instance running as primary Database Resource Manager (DBRM) shows the correct state of parallel statement queuing. All other instances default to the value FULL. A single instance database always shows the correct value for this field.</p>
CPU_COUNT	NUMBER	Value of the CPU_COUNT initialization parameter in the container to which the data pertains
CPU_MIN_COUNT	NUMBER	Value of the CPU_MIN_COUNT initialization parameter in the container to which the data pertains
CON_ID	NUMBER	<p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • n: Where n is the applicable container ID for the rows containing data

9.202 V\$RSRC_SESSION_INFO

V\$RSRC_SESSION_INFO displays Resource Manager statistics per session.

Column	Datatype	Description
SID	NUMBER	Session identifier
CURRENT_CONSUMER_GROUP_ID	NUMBER	Object ID of the consumer group in which the session currently belongs; NULL if the session has not yet logged in
CURRENT_CONSUMER_GROUP	VARCHAR2 (32)	The name of the consumer group in which the session currently belongs

Column	Datatype	Description
ORIG_CONSUMER_GROUP_ID	NUMBER	Object ID of the consumer group in which the session was placed by the consumer group mappings; NULL if the session has not yet logged in This group may not be the current group because the SWITCH_GROUP directive in the current plan may have changed the session's current group. This group may not equal the MAPPED_CONSUMER_GROUP because the MAPPED_CONSUMER_GROUP may not be part of the current plan.
MAPPING_ATTRIBUTE	VARCHAR2 (32)	Session attribute that was used to map the session into its original consumer group; NULL if no mapping was used See Also: "DBA_RSRC_GROUP_MAPPINGS" for more details
MAPPED_CONSUMER_GROUP	VARCHAR2 (32)	Consumer group to which the session was originally mapped; NULL if no mapping was used This may not correspond to the original consumer group, because the mapped group may not be part of the current plan. See Also: "DBA_RSRC_GROUP_MAPPINGS" for more details
STATE	VARCHAR2 (32)	Current state of the session: <ul style="list-style-type: none"> • NOT MANAGED - Session has not logged in or the current Resource Manager plan does not require the session to be managed at this point in time • RUNNING - Session is currently running on the CPU • WAITING FOR CPU - Session is ready to run. It is waiting for a CPU quantum to run. • QUEUED - Session is queued because the active session limit was reached • IDLE - Session is idle • IDLE BLKR - Session is idle and blocking another session • WAITING - Session is currently in a wait See Also: "V\$SESSION_WAIT" for the wait type • WAITING_FOR_IO - Session is waiting to submit an I/O request • UNBOUND - Session is not bound to any process • EXITING - Session is about to terminate
ACTIVE	VARCHAR2 (5)	Indicates whether the session is currently active (TRUE) or not (FALSE). This includes when one of the following conditions is true: <ul style="list-style-type: none"> • Session is in the top call • Session has a transaction in progress • Session is using temporary space objects • Session holds user enqueues
CURRENT_IDLE_TIME	NUMBER	Number of seconds the session has been idle (in states IDLE or IDLE BLKR) while in this consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This value is reset to zero when the session becomes active.
CURRENT_CPU_WAIT_TIME	NUMBER	Amount of time (in milliseconds) the session has waited for CPU because of resource management (in state WAIT FOR CPU) while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This does not include waits due to latch or enqueue contention, I/O waits, and so on. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.

Column	Datatype	Description
CPU_WAIT_TIME	NUMBER	Cumulative amount of time (in milliseconds) the session has waited for CPU (in its lifetime) because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on.
CURRENT_CPU_WAITS	NUMBER	Number of times the session had to wait for CPU because of resource management while in this consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This does not include waits due to latch or enqueue contention, I/O waits, and so on. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.
CPU_WAITS	NUMBER	Cumulative number of times the session had to wait for CPU (in its lifetime) because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on.
CURRENT_CONSUMED_CPU_TIME	NUMBER	Amount of CPU time (in milliseconds) consumed by the session while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by the session (in its lifetime) (in milliseconds)
CURRENT_ACTIVE_TIME	NUMBER	Amount of time (in milliseconds) the session has been active while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. Active time is time spent running and waiting while executing a call. It does not include the time a session waited for CPU resources. If SWITCH_TIME_IN_CALL is used, then this is reset at the end of every call.
ACTIVE_TIME	NUMBER	Cumulative amount of active time (in milliseconds) consumed by the session (in its lifetime)
CURRENT_QUEUED_TIME	NUMBER	Amount of time (in milliseconds) the current request from the session has been queued (in state QUEUED). If the session does not have a request currently queued up, then this number will be zero.
QUEUED_TIME	NUMBER	Total amount of time (in milliseconds) the session has spent in the QUEUED state (in its lifetime)
CURRENT_YIELDS	NUMBER	Number of times the session had to yield the CPU to other sessions (due to quantum expiration) while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. If SWITCH_TIME_IN_CALL is used, then this is reset at the end of every call.
YIELDS	NUMBER	Cumulative number of times the session had to yield CPU to other sessions due to quantum expiration (in its lifetime)
CURRENT_UNDO_CONSUMPTION	NUMBER	Current amount (in KB) of undo consumed by the session; NULL if the current Resource Manager plan does not have an UNDO_POOL directive
MAX_UNDO_CONSUMPTION	NUMBER	Maximum amount of undo consumed (in KB) during the session's lifetime. This value may not be updated because the current Resource Manager plan may not have an UNDO_POOL directive.
SQL_CANCELED	NUMBER	Number of times SQL queries running in the session were canceled due to exceeding the Resource Manager plan's SWITCH_TIME limit.

Column	Datatype	Description
QUEUE_TIME_OUTS	NUMBER	Number of times requests from the session timed out because they queued longer than the Resource Manager plan's limit
ESTIMATED_EXECUTION_LIMIT_HIT	NUMBER	Number of times requests from the session were not run because the optimizer's estimated time to execute the query exceeded the MAX_EST_EXEC_TIME limit
CURRENT_IO_SERVICE_TIME	NUMBER	Current I/O wait time of the session (in milliseconds) for the current SQL operation
IO_SERVICE_TIME	NUMBER	Cumulative amount of I/O wait time by the session (in its lifetime) (in milliseconds)
CURRENT_IO_SERVICE_WAITS	NUMBER	Current I/O waits by session for the current SQL operation
IO_SERVICE_WAITS	NUMBER	Cumulative I/O waits by session (in its lifetime)
CURRENT_SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read by the session for the current SQL operation
SMALL_READ_MEGABYTES	NUMBER	Total number of single block megabytes read by the session (in its lifetime)
CURRENT_LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read by the session for the current SQL operation
LARGE_READ_MEGABYTES	NUMBER	Total number of multiblock megabytes read by the session (in its lifetime)
CURRENT_SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written by the session for the current SQL operation
SMALL_WRITE_MEGABYTES	NUMBER	Total number of single block megabytes written by the session (in its lifetime)
CURRENT_LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written by the session for the current SQL operation
LARGE_WRITE_MEGABYTES	NUMBER	Total number of multiblock megabytes written by the session (in its lifetime)
CURRENT_SMALL_READ_REQUESTS	NUMBER	Number of single block read requests by the session for the current SQL operation
SMALL_READ_REQUESTS	NUMBER	Total number of single block read requests by the session (in its lifetime)
CURRENT_SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests by the session for the current SQL operation
SMALL_WRITE_REQUESTS	NUMBER	Total number of single block write requests by the session (in its lifetime)
CURRENT_LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests by the session for the current SQL operation
LARGE_READ_REQUESTS	NUMBER	Total number of multiblock read requests by the session (in its lifetime)
CURRENT_LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests by the session for the current SQL operation
LARGE_WRITE_REQUESTS	NUMBER	Total number of multiblock write requests by the session (in its lifetime)

Column	Datatype	Description
CURRENT_PQ_ACTIVE_TIME	NUMBER	Amount of time that the current active parallel statement has been executing for the current SQL operation, not including the amount of time that the statement has been queued (in milliseconds). If the parallel statement is queued, then the value is 0.
PQ_ACTIVE_TIME	NUMBER	Cumulative amount of time that parallel statements have been executed over the lifetime of the session (in milliseconds)
DOP	NUMBER	Degree of parallelism for the active or queued parallel statement, if there are any in the session
PQ_SERVERS	NUMBER	The number of active parallel servers if the session is active and running the parallel query. If the query is queued, the number of parallel servers that this query is trying to run with is shown.
ESTIMATED_EXECUTION_TIME	NUMBER	Estimated execution time for the parallel statement, as estimated by the optimizer (in milliseconds). You can compare this value to CURRENT_PQ_ACTIVE_TIME to estimate how much longer the parallel statement will run.
CURRENT_PQ_QUEUED_TIME	NUMBER	Amount of time that the current parallel statement in the session has been queued (in milliseconds) for the current SQL operation. If the session does not have a queued parallel statement, then the value is 0.
PQ_QUEUED_TIME	NUMBER	Total amount of time that the session has spent in the PQ_QUEUED state in its lifetime (in milliseconds)
PQ_QUEUED	NUMBER	Number of times that parallel statements in the session have been queued
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements in the session timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
PQ_ACTIVE	VARCHAR2 (5)	Indicates whether the session is actively running a parallel statement (TRUE) or not (FALSE).
PQ_STATUS	VARCHAR2 (44)	The status of the parallel statement running in this session: <ul style="list-style-type: none"> • Active: The parallel statement is currently active and running • Queued: The parallel statement is queued and is not a possible candidate to be run next • Queue head: The parallel statement is queued due to the global systemwide limit and is the next parallel statement to be dequeued and run • Queue head - waiting on CG limit: The parallel statement is queued due to the consumer group limit and is the one to be run next from the session's consumer group • Queue head - waiting on service availability: The parallel statement is queued since there are not enough parallel servers available for the service this session is running on. This session is the one to be run next from the session's service • Queue head - waiting on PDB limit: The parallel statement is queued due to the PDB limit and is the one to be run next from the session's PDB • NULL: The session currently does not involve a parallel execution
CURRENT_LOGICAL_IOS	NUMBER	Number of logical I/O requests by the session for the current SQL operation

Column	Datatype	Description
LOGICAL_IOS	NUMBER	Total number of logical I/O requests in this session's lifetime
CURRENT_ELAPSED_TIME	NUMBER	Elapsed time of the session's current SQL operation
ELAPSED_TIME	NUMBER	Total elapsed time for all of this session's SQL operations in its lifetime
LAST_ACTION	VARCHAR2 (48)	The most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: <ul style="list-style-type: none"> CANCEL_SQL KILL_SESSION LOG_ONLY SWITCH TO <CG NAME> For the last value, <CG NAME> is the name of the consumer group that the SQL operation was switched to. If the Resource Plan has since been changed then <CG NAME> is the ID of the consumer group.
LAST_ACTION_REASON	VARCHAR2 (30)	The reason for the most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: <ul style="list-style-type: none"> SWITCH_CPU_TIME SWITCH_IO_REQS SWITCH_IO_MBS SWITCH_ELAPSED_TIME SWITCH_IO_LOGICAL
LAST_ACTION_TIME	DATE	The time of the most recent action that was taken on this SQL operation by Resource Manager
CURRENT_PGA	NUMBER	Amount of PGA memory (in bytes) used by the session for the current SQL operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.203 V\$RSRCMGRMETRIC

V\$RSRCMGRMETRIC displays information about resources consumed and wait times per consumer group.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources. Metrics are collected and stored every minute when CPU utilization is not being monitored.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)

Column	Datatype	Description
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.
CONSUMER_GROUP_ID	NUMBER	Consumer group object ID (a unique number, consistent across database shutdowns and startups)
CONSUMER_GROUP_NAME	VARCHAR2 (30)	Name of the consumer group
CPU_CONSUMED_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group, in milliseconds
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
NUM_CPUS	NUMBER	Number of CPUs that the Resource Manager is utilizing. If instance caging is enabled, then this column is equal to the value of the CPU_COUNT initialization parameter. If instance caging is not enabled, then this column is equal to the total number of CPUs in the system.
RUNNING_SESSIONS_LIMIT	NUMBER	Maximum number of sessions in the consumer group that can run simultaneously. The value of this column is NUM_CPUS multiplied by the consumer group's MAX_UTILIZATION_LIMIT directive in the current Resource Manager plan.
AVG_RUNNING_SESSIONS	NUMBER	Average number of sessions in the consumer group that are currently running
AVG_WAITING_SESSIONS	NUMBER	Average number of sessions in the consumer group that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.
CPU_UTILIZATION_LIMIT	NUMBER	Maximum percentage of CPU that the consumer group can use at any time, with respect to the total number of CPUs in the system. The value of this column is RUNNING_SESSIONS_LIMIT divided by the number of CPUs in the system. If instance caging is enabled, then this value is derived using the CPU_COUNT initialization parameter.
AVG_CPU_UTILIZATION	NUMBER	Average percentage of CPU consumed by the consumer group, with respect to the total number of CPUs in the system
CPU_DECISIONS	NUMBER	Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.
CPU_DECISIONS_EXCLUSIVE	NUMBER	Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.
CPU_DECISIONS_WON	NUMBER	Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.
IO_REQUESTS	NUMBER	I/O requests
IO_MEGABYTES	NUMBER	I/O megabytes

Column	Datatype	Description
AVG_ACTIVE_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were running during the 1-minute metric window
AVG_QUEUED_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were queued during the 1-minute metric window
AVG_ACTIVE_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window
AVG_QUEUED_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window
PARALLEL_SERVERS_LIMIT	NUMBER	The number of parallel servers allowed to be used by this consumer group during the 1-minute metric window
PLAN_NAME	VARCHAR2 (30)	Resource Manager plan name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

"STATISTICS_LEVEL"

9.204 V\$RSRCMGRMETRIC_HISTORY

V\$RSRCMGRMETRIC_HISTORY displays a history (the last one hour) of resource manager metrics, taken from V\$RSRCMGRMETRIC. When a resource plan is set, this history is cleared and restarted. This view provides information about resources consumed and wait times per consumer group.

The columns for V\$RSRCMGRMETRIC_HISTORY are the same as those for V\$RSRCMGRMETRIC.

See Also:

"V\$RSRCMGRMETRIC"

9.205 V\$SRPCPDBMETRIC

V\$SRPCPDBMETRIC displays information about resources consumed and wait times per PDB.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources. Metrics are collected and stored every minute when CPU utilization is not being monitored.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V\$RSRC_PLAN_HISTORY entry to which these PDB statistics apply. When the instance is restarted, this value is reset to zero.
CPU_CONSUMED_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the PDB, in milliseconds
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
NUM_CPUS	NUMBER	Number of CPUs that the Resource Manager is utilizing. If instance caging is enabled, then this column is equal to the value of the CPU_COUNT initialization parameter. If instance caging is not enabled, then this column is equal to the total number of CPUs in the system.
RUNNING_SESSIONS_LIMIT	NUMBER	Maximum number of sessions in the PDB that can run simultaneously. The value of this column is NUM_CPUS multiplied by the PDB's MAX_UTILIZATION_LIMIT directive in the current Resource Manager plan.
AVG_RUNNING_SESSIONS	NUMBER	Average number of sessions in the PDB that are currently running
AVG_WAITING_SESSIONS	NUMBER	Average number of sessions in the PDB that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.
CPU_UTILIZATION_LIMIT	NUMBER	Maximum percentage of CPU that the PDB can use at any time, with respect to the total number of CPUs in the system. The value of this column is RUNNING_SESSIONS_LIMIT divided by the number of CPUs in the system. If instance caging is enabled, then this value is derived using the CPU_COUNT initialization parameter.
AVG_CPU_UTILIZATION	NUMBER	Average percentage of CPU consumed by the PDB, with respect to the total number of CPUs in the system
IOPS	NUMBER	I/O operations per second during the previous minute for this PDB
IOMBPS	NUMBER	I/O megabytes per second during the previous minute for this PDB
IOPS_THROTTLE_EXEMPT	NUMBER	Indicates how much of the I/O per second in the current PDB was exempted from throttling. For example, if the value in the IOPS column is 20 I/Os and the value in the IOPS_THROTTLE_EXEMPT column is 5 I/Os, then 5 I/Os of the 20 I/Os in that second were exempted from throttling. I/O throttling is defined by the MAX_IOPS database initialization parameter.

Column	Datatype	Description
IOMBPS_THROTTLE_EXEMPT	NUMBER	Indicates how many megabytes of I/O executed per second in the current PDB were exempted from throttling. For example, if the value in the IOMBPS column is 200 megabytes and the value in the IOMBPS_THROTTLE_EXEMPT column is 50 megabytes, then 50 megabytes of the 200 megabytes were exempt from throttling. I/O megabytes per second throttling is defined by the MAX_MBPS database initialization parameter.
AVG_IO_THROTTLE	NUMBER	Average throttle time per I/O operation in milliseconds during the previous minute for this PDB
AVG_ACTIVE_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were running during the 1-minute metric window
AVG_QUEUED_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were queued during the 1-minute metric window
AVG_ACTIVE_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window
AVG_QUEUED_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window
PARALLEL_SERVERS_LIMIT	NUMBER	The number of parallel servers allowed to be used by this PDB during the 1-minute metric window
SGA_BYTES	NUMBER	The current SGA usage by this PDB in bytes
BUFFER_CACHE_BYTES	NUMBER	The current usage of the buffer cache by this PDB in bytes
SHARED_POOL_BYTES	NUMBER	The current usage of the shared pool by this PDB in bytes
PGA_BYTES	NUMBER	The current PGA usage by this PDB in bytes
PLAN_NAME	VARCHAR2 (30)	Resource Manager plan name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

"STATISTICS_LEVEL"

9.206 V\$RSRCPDBMETRIC_HISTORY

V\$RSRCPDBMETRIC_HISTORY displays a history (the last one hour) of resource manager metrics for a PDB, taken from V\$RSRCPDBMETRIC. When a resource plan is set, this history is cleared

and restarted. This view provides information about resources consumed and wait times per consumer group.

The columns for V\$RSRCPDBMETRIC_HISTORY are the same as those for V\$RSRCPDBMETRIC.

See Also:

"V\$RSRCPDBMETRIC"

9.207 V\$RULE

V\$RULE displays rule statistics. This view has a row for every rule loaded into shared memory.

Column	Datatype	Description
RULE_SET_OBJECT_ID	NUMBER	Rule set object ID
EVALUATION_CONTEXT_OBJECT_ID	NUMBER	Evaluation context object ID
RULE_OWNER	VARCHAR2(128)	Owner of the rule
RULE_NAME	VARCHAR2(128)	Name of the rule
RULE_CONDITION	VARCHAR2(200)	Rule condition
TRUE_HITS	NUMBER	Number of times the rule evaluated to TRUE
MAYBE_HITS	NUMBER	Number of times the rule evaluated to MAYBE
SQL_EVALUATIONS	NUMBER	Number of evaluations of the rule that were performed by issuing SQL
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

9.208 V\$RULE_SET

V\$RULE_SET displays rule set statistics. This view has a row for every rule set loaded into shared memory.

Note:

Querying the V\$RULE_SET view may have a negative impact on performance if a database has a large library cache.

Column	Datatype	Description
OWNER	VARCHAR2 (128)	Owner of the rule set
NAME	VARCHAR2 (128)	Name of the rule set
CPU_TIME	NUMBER	Total CPU time (in hundredths of a second) spent in evaluation of the rule set
ELAPSED_TIME	NUMBER	Total elapsed time (in hundredths of a second) spent in evaluation of the rule set
FIRST_LOAD_TIME	DATE	First time the current cached copy of the rule set was loaded
LAST_LOAD_TIME	DATE	Last time the current cached copy of the rule set was loaded
LAST_LOADING_TIME	NUMBER	Total elapsed time (in hundredths of a second) spent to load the rule set the last time it was loaded
SHARABLE_MEM	NUMBER	Shared memory (in bytes) used by the rule set
RELOADS	NUMBER	Number of times the rule set object was reloaded in shared memory
INVALIDATIONS	NUMBER	Number of times the rule set object was invalidated
EVALUATIONS	NUMBER	Number of evaluations on the rule set
FIRST_HIT_EVALUATIONS	NUMBER	Number of evaluations on the rule set, with <code>stop_on_first_hit</code> set to <code>TRUE</code>
SIMPLE_RULES_ONLY_EVALUATIONS	NUMBER	Number of evaluations on the rule set, with <code>simple_rules_only</code> set to <code>TRUE</code>
SQL_FREE_EVALUATIONS	NUMBER	Number of evaluations on the rule set which did not internally issue SQL to evaluate rules
SQL_EXECUTIONS	NUMBER	Total number of SQL statements executed during evaluation of the rule set
CONDITIONS_PROCESSED	NUMBER	Total number of fast (indexed) conditions processed during evaluation of the rule set
TRUE_RULES	NUMBER	Total number of <code>TRUE</code> rules returned during evaluation of the rule set
MAYBE_RULES	NUMBER	Total number of <code>MAYBE</code> rules returned during evaluation of the rule set
VARIABLE_VALUE_FUNCTION_CALLS	NUMBER	Total number of calls made to user-defined functions to retrieve variable values (specified by the <code>variable_value_function</code> field in <code>RES\$VARIABLE_TYPE</code>) made during evaluation of the rule set
VARIABLE_METHOD_FUNCTIONS_CALLS	NUMBER	Total number of calls made to user-defined functions to retrieve variable method values (specified by the <code>variable_method_function</code> field in <code>RES\$VARIABLE_TYPE</code>) made during evaluation of the rule set
EVALUATION_FUNCTION_CALLS	NUMBER	Total number of calls made to user-defined evaluation functions (specified as the <code>evaluation_function</code> argument to the <code>DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT</code> procedure) made during evaluation of the rule set
RESULT_CACHE_HITS	NUMBER	Number of result cache hits across all the sessions evaluating this rule set
IS_RESULT_CACHE	VARCHAR2 (3)	Indicates whether this rule set result can be cached (<code>YES</code>) or not (<code>NO</code>)
RESULT_CACHE_ELEMENTS	NUMBER	Number of elements cached within the result cache

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.• 1: This value is used for rows containing data that pertain to only the root• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

**See Also:**

Oracle Database PL/SQL Packages and Types Reference for more information about the `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedure

9.209 V\$RULE_SET_AGGREGATE_STATS

V\$RULE_SET_AGGREGATE_STATS displays statistics aggregated over all evaluations on all rule sets. This view has a row for each type of statistic.

Column	Datatype	Description
NAME	VARCHAR2 (80)	<p>Name of the statistic:</p> <ul style="list-style-type: none"> rule set evaluations (all) - Total number of evaluations on all rule sets rule set evaluations (first_hit) - Total number of evaluations on rule sets with stop_on_first_hit set to TRUE rule set evaluations (simple_rules_only) - Total number of evaluations on rule sets with simple_rules_only set to TRUE rule set evaluations (SQL free) - Total number of evaluations on rule sets which did not internally issue SQL to evaluate rules rule set evaluation time (CPU) - Total CPU time (in hundredths of a second) spent in evaluations on rule sets rule set evaluation time (elapsed) - Total elapsed time (in hundredths of a second) spent in evaluations on rule sets rule set SQL executions - Total number of SQL statements executed during evaluations on rule sets rule set conditions processed - Total number of fast (indexed) conditions processed during evaluations on rule sets rule set true rules - Total number of TRUE rules returned during evaluations on rule sets rule set maybe rules - Total number of MAYBE rules returned during evaluations on rule sets rule set user function calls (variable value function) - Total number of calls made to user-defined functions to retrieve variable values (specified by the variable_value_function field in RE\$VARIABLE_TYPE) made during evaluations on rule sets rule set user function calls (variable method function) - Total number of calls made to user-defined functions to retrieve variable method values (specified by the variable_method_function field in RE\$VARIABLE_TYPE) made during evaluations on rule sets rule set user function calls (evaluation function) - Total number of calls made to user-defined evaluation functions (specified as the evaluation_function argument to the DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT procedure) made during evaluations on rule sets
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

 **See Also:**

Oracle Database PL/SQL Packages and Types Reference for more information about the `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedure

Dynamic Performance (V\$) Views: V\$\$SCHEDULER_IN_MEMORY_TRACE to V\$ZONEMAP_USAGE_STATS

This chapter contains the dynamic performance views V\$\$SCHEDULER_IN_MEMORY_TRACE to V\$ZONEMAP_USAGE_STATS.

10.1 V\$\$SCHEDULER_IN_MEMORY_TRACE

V\$\$SCHEDULER_IN_MEMORY_TRACE displays in-memory trace and other information about all processes executing scheduler-related actions.

Column	Datatype	Description
SID	NUMBER	ID of the session generating scheduler trace
SERIAL#	NUMBER	Serial number of the session generating scheduler trace
USER#	NUMBER	Oracle identifier of the user generating scheduler trace
USERNAME	VARCHAR2 (128)	Name of the user generating scheduler trace
PROCESSNAME	VARCHAR2 (5)	Name of the process generating scheduler trace
PADDR	RAW (8)	Address of the process state object generating scheduler trace
SPID	VARCHAR2 (24)	Operating system identifier of the process generating scheduler trace
PID	NUMBER	Oracle identifier of the process generating scheduler trace
TRACE_ST	CLOB	Scheduler trace generated by the process
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none">0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.1: This value is used for rows containing data that pertain to only the root<i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Note:

This view is available starting with Oracle Database 23c.

10.2 V\$\$SCHEDULER_RUNNING_JOBS

V\$\$SCHEDULER_RUNNING_JOBS displays information about running Scheduler jobs.

Column	Datatype	Description
SESSION_ID	NUMBER	Identifier of the session running the Scheduler job
SESSION_SERIAL_NUM	NUMBER	Session serial number
JOB_ID	NUMBER	ID of the running Scheduler job
PADDR	RAW(4 8)	Process address
OS_PROCESS_ID	VARCHAR2(12)	Operating system process ID
SESSION_STAT_CPU	INTERVAL DAY(2) TO SECOND(3)	CPU statistics for the session
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.3 V\$SECUREFILE_SHRINK

V\$SECUREFILE_SHRINK displays information about SecureFiles Shrink tasks.

Column	Datatype	Description
LOB_OBJD	NUMBER	Database object number for the LOB segment
SHRINK_STATUS	VARCHAR2(40)	Status of the shrink task: <ul style="list-style-type: none"> • RUNNING • COMPLETE • ERROR
START_TIME	TIMESTAMP(3) WITH TIME ZONE	Date and time at which the shrink task started
END_TIME	TIMESTAMP(3) WITH TIME ZONE	Data and time at which the shrink task ended If SHRINK_STATUS = RUNNING, the value of this column is NULL.
BLOCKS_MOVED	NUMBER	Number of blocks relocated during the shrink task
BLOCKS_FREED	NUMBER	Number of blocks freed during the shrink task
BLOCKS_ALLOCATED	NUMBER	Number of blocks allocated from the tablespace during the shrink task This value includes only blocks allocated by the shrink process. Blocks allocated by other database processes are not included.
EXTENTS_ALLOCATED	NUMBER	Number of extents allocated from the tablespace during the shrink task This value includes only extents allocated by the shrink process. Extents allocated by other database processes are not included.
EXTENTS_FREED	NUMBER	Number of extents freed during the shrink task
EXTENTS_SEALED	NUMBER	Number of candidate extents selected and sealed during the shrink task

Column	Datatype	Description
AUTOMATIC	NUMBER	Indicates whether the shrink task was started automatically (1) or manually (0)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

**Note:**

This view is available starting with Oracle Database 23c.

10.4 V\$SECUREFILE_TIMER

V\$SECUREFILE_TIMER displays information about time taken (in microseconds) by functions of SecureFiles. These timer values are collected per session.

Column	Datatype	Description
NAME	VARCHAR2 (50)	Name of the function
LAYER_ID	NUMBER	ID of the layer that the function belongs to: <ul style="list-style-type: none"> 0 - Entire Subtree 1 - Delta Updates 2 - Write gather cache 3 - Deduplication 4 - Compression & Encryption 5 - Inode 6 - Space 7 - Utilities 8 - Row-Column Intersection
OWNTIME	NUMBER	Total time taken by the function
MAXTIME	NUMBER	Maximum time taken by a single call
MINTIME	NUMBER	Minimum time taken by a single call
INVOCATIONS	NUMBER	Number of times the function was invoked
LAYER_NAME	VARCHAR2 (50)	Name of the layer to which the function belongs

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.5 V\$SEGMENT_STATISTICS

V\$SEGMENT_STATISTICS displays information about segment-level statistics.

Column	Datatype	Description
OWNER	VARCHAR2 (128)	Owner of the object
OBJECT_NAME	VARCHAR2 (128)	Name of the object
SUBOBJECT_NAME	VARCHAR2 (128)	Name of the subobject
TABLESPACE_NAME	VARCHAR2 (30)	Name of the table space to which the object belongs
TS#	NUMBER	Tablespace number
OBJ#	NUMBER	Dictionary object number of the object
DATAOBJ#	NUMBER	Data object number of the object
OBJECT_TYPE	VARCHAR2 (18)	Type of the object
STATISTIC_NAME	VARCHAR2 (64)	Name of the statistic
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.6 V\$SEGSTAT

V\$SEGSTAT displays information about segment-level statistics.

Column	Datatype	Description
TS#	NUMBER	Tablespace number
OBJ#	NUMBER	Dictionary object number
DATAOBJ#	NUMBER	Data object number
STATISTIC_NAME	VARCHAR2 (64)	Name of the statistic

Column	Datatype	Description
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.7 V\$SEGSTAT_NAME

V\$SEGSTAT_NAME displays information about segment-level statistics properties.

Column	Datatype	Description
STATISTIC#	NUMBER	Statistic number
NAME	VARCHAR2 (64)	Name of the statistic
SAMPLED	VARCHAR2 (3)	Indicates whether the statistic was collected by sampling (YES) or not (NO)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.8 V\$SERV_MOD_ACT_STATS

V\$SERV_MOD_ACT_STATS displays the same set of performance statistics as V\$SERVICE_STATS except for a specific combination of service/module/action names.

When aggregation is enabled for the service name, module, and action name, then this view provides the timing and work done for calls issued for the business transaction.

Column	Datatype	Description
AGGREGATION_TYPE	VARCHAR2 (21)	Aggregation statistic type: <ul style="list-style-type: none"> SERVICE_MODULE - Action value is NULL and the entry is an aggregate for all actions within a given module SERVICE_MODULE_ACTION - Action value is NULL only for an empty action, and the aggregation is on the level of service/module/action
SERVICE_NAME	VARCHAR2 (64)	Service name from V\$SERVICES
MODULE	VARCHAR2 (65)	Module name from DBA_ENABLED_AGGREGATIONS

Column	Datatype	Description
ACTION	VARCHAR2 (65)	Action name from DBA_ENABLED_AGGREGATIONS
STAT_ID	NUMBER	Statistic identifier
STAT_NAME	VARCHAR2 (64)	Derived statistic name from V\$STATNAME and V\$SESS_TIME_MODEL
VALUE	NUMBER	Cumulative value (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- "V\$SERVICE_STATS"
- "V\$STATNAME"
- "V\$SESS_TIME_MODEL"

10.9 V\$SERVICE_EVENT

V\$SERVICE_EVENT displays aggregated wait counts and wait times for each wait statistic.

Column	Datatype	Description
SERVICE_NAME	VARCHAR2 (64)	Service name from V\$SERVICES
SERVICE_NAME_HASH	NUMBER	Service name hash from V\$SERVICES
EVENT	VARCHAR2 (64)	Name of the wait event; derived statistic name from V\$EVENT_NAME See Also: "Oracle Wait Events"
EVENT_ID	NUMBER	Identifier of the wait event
TOTAL_WAITS	NUMBER	Total number of waits for the event by the service
TOTAL_TIMEOUTS	NUMBER	Total number of timeouts for the event by the service
TIME_WAITED	NUMBER	Total amount of time waited for the event by the service (in hundredths of a second)
AVERAGE_WAIT	NUMBER	Average amount of time waited for the event by the service (in hundredths of a second)
MAX_WAIT	NUMBER	Maximum amount of time waited for the event by the service (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time waited for the event by the service (in microseconds)
CPU	NUMBER	Total amount of CPU time consumed by the service while implementing the wait event itself (in microseconds)

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.10 V\$SERVICE_REGION_METRIC

V\$SERVICE_REGION_METRIC displays the metric values captured for the most recent 30-second intervals for the workload against each service region available on the database.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
SERVICE_ID	NUMBER	Service number (internal)
SERVICE_NETWORK_NAME	VARCHAR2 (512)	Network name for the service
REGION_NAME	VARCHAR2 (30)	Region name
CALLSPERSEC	NUMBER	Number of user calls per second to the services
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

See Also:

- ["V\\$CHUNK_METRIC"](#)

10.11 V\$SERVICE_STATS

V\$SERVICE_STATS displays a minimal set of performance statistics. These call rate statistics are used for making run-time routing decisions, for tracking service levels, and for per-instance diagnostics per call rate. The elapsed timing for each call provides a relative value across instances for how well a node is processing SQL calls issued under a service name. When aggregation is enabled for the Service Name, then this view provides the timing and work done for calls issued for the whole service.

Column	Datatype	Description
SERVICE_NAME_HASH	NUMBER	Service name hash from V\$SERVICES
SERVICE_NAME	VARCHAR2 (64)	Service name from V\$SERVICES
STAT_ID	NUMBER	Statistic identifier
STAT_NAME	VARCHAR2 (64)	Derived statistic name from V\$STATNAME and V\$SESS_TIME_MODEL
VALUE	NUMBER	For statistics that measure time (such as the DB CPU, background elapsed time, or parse time elapsed statistics), this column displays a cumulative value in microseconds. For other statistics that do not measure time (such as the db block changes, execute count, or logons cumulative statistics), this column displays the appropriate numeric value for the statistic.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

 **See Also:**

- "V\$SERVICES"
- "V\$STATNAME"
- "V\$SESS_TIME_MODEL"
- *Oracle Database Performance Tuning Guide* for more information about using database statistics to manage the performance of Oracle Database

10.12 V\$SERVICE_WAIT_CLASS

V\$SERVICE_WAIT_CLASS displays aggregated wait counts and wait times for each wait statistic.

An aggregation of these wait classes is used when thresholds are imported.

Column	Datatype	Description
SERVICE_NAME	VARCHAR2 (64)	Service name from V\$SERVICES
SERVICE_NAME_HASH	NUMBER	Service name hash from V\$SERVICES
WAIT_CLASS_ID	NUMBER	Identifier of the wait class
WAIT_CLASS#	NUMBER	Number of the wait class
WAIT_CLASS	VARCHAR2 (64)	Name of the wait class
TOTAL_WAITS	NUMBER	Total number waits from this wait class by the service

Column	Datatype	Description
TIME_WAITED	NUMBER	Total amount of time spent in waits from this wait class by the service (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time spent in waits from this wait class by the service (in microseconds)
CPU	NUMBER	Total amount of CPU time consumed by the service while implementing waits from this wait class (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.13 V\$SERVICEMETRIC

V\$SERVICEMETRIC displays metric values measured on the most recent time interval period for services executing inside the database. Service metrics are measured in 5-second and 1-minute intervals.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin timestamp for the interval period
END_TIME	DATE	End timestamp for the interval period
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Group ID for the service metric group
SERVICE_NAME_HASH	NUMBER	Service name hash
SERVICE_NAME	VARCHAR2 (64)	Service name
CTMHASH	NUMBER	Service create timestamp hash value
ELAPSEDPERCALL	NUMBER	Elapsed time per call (in microseconds). This column is deprecated in favor of the DBTIMEPERCALL column.
CPUPERCALL	NUMBER	CPU time per call (in microseconds)
DBTIMEPERCALL	NUMBER	Elapsed time per call (in microseconds)
CALLSPERSEC	NUMBER	Number of user calls per second
DBTIMEPERSEC	NUMBER	Database time per second
GOODNESS	NUMBER	Indicates how attractive a given instance is with respect to processing the workload that is presented to the service. A lower number is better. This number is internally computed based on the GOAL (LONG or SHORT) that is specified for the particular service.
DELTA	NUMBER	Indicates the predicted increase in the goodness for every additional session that is routed to this instance

Column	Datatype	Description
FLAGS	NUMBER	Flags that can be any of the following values: <ul style="list-style-type: none"> 0x01 - Service is BLOCKED from accepting new connections 0x02 - Service is VIOLATING the set threshold on some metric 0x04 - Goodness is UNKNOWN
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.14 V\$SERVICEMETRIC_HISTORY

V\$SERVICEMETRIC_HISTORY displays a recent history of the metric values measured in predefined time interval periods for services executing inside the database. Service metrics are measured in 5-second and 1-minute intervals.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin timestamp for the interval period
END_TIME	DATE	End timestamp for the interval period
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Group ID for the service metric group
SERVICE_NAME_HASH	NUMBER	Service name hash
SERVICE_NAME	VARCHAR2 (64)	Service name
CTMHASH	NUMBER	Service create timestamp hash value
ELAPSEDPERCALL	NUMBER	Elapsed time per call (in microseconds). This column is deprecated in favor of the DBTIMEPERCALL column.
CPUPERCALL	NUMBER	CPU time per call (in microseconds)
DBTIMEPERCALL	NUMBER	Elapsed time per call (in microseconds)
CALLSPERSEC	NUMBER	Number of user calls per second
DBTIMEPERSEC	NUMBER	Database time per second
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.15 V\$SERVICES

V\$SERVICES displays information about the services in the database.

Column	Datatype	Description
SERVICE_ID	NUMBER	Service ID
NAME	VARCHAR2 (64)	Name of the service
NAME_HASH	NUMBER	Service name hash
NETWORK_NAME	VARCHAR2 (512)	Network name
CREATION_DATE	DATE	Creation date
CREATION_DATE_HASH	NUMBER	Creation date hash
GOAL	VARCHAR2 (12)	Runtime Load Balancing Goal being used to create run-time load balancing and connection load balancing advice: <ul style="list-style-type: none"> NONE SERVICE_TIME - Connections are balanced by response time THROUGHPUT - Connections are balanced by throughput
DTP	VARCHAR2 (1)	Indicates whether or not Distributed Transaction Processing is enabled for this service. When Distributed Transaction Processing is set to Y (YES), it means that the service is offered at exactly one instance at a time for XA affinity. Possible values: <ul style="list-style-type: none"> Y - YES N - NO
AQ_HA_NOTIFICATION	VARCHAR2 (3)	Indicates whether FAN - Fast Application Notification for OCI connections is set (YES) or not (NO)
CLB_GOAL	VARCHAR2 (5)	Connection load balancing goal used with statistics that are sent to the listeners to determine how new connections are distributed: <ul style="list-style-type: none"> LONG - is using session count SHORT - is using service time or throughput
COMMIT_OUTCOME	VARCHAR2 (3)	For Transaction Guard, indicates whether the database service associated with the user session has the COMMIT_OUTCOME service attribute enabled (YES) or not (NO). This attribute applies on a per session basis and is set at connect time. When COMMIT_OUTCOME = YES: <ul style="list-style-type: none"> Transaction Guard manages the commit status for all supported transaction types. The outcome of a COMMIT transaction is known. If there is an outage, the application can use DBMS_APP_CONT.GET_LTXID_OUTCOME to return a reliable status for the last in-flight work. A logical transaction ID (LTXID) is set for each user session at login and at each successful commit. See Also: For information about preserving the commit outcome, see <i>Oracle Database Development Guide</i> . For information about logical transaction IDs, see <i>Oracle Database Development Guide</i>
RETENTION_TIME	NUMBER	For Transaction Guard, when COMMIT_OUTCOME = YES, this value indicates the amount of time (in seconds) that the commit outcome is retained in the database.

Column	Datatype	Description
REPLAY_INITIATION_TIME OUT	NUMBER	For Application Continuity, this option specifies the difference between the time (in seconds) of original execution of the first operation of a request and the time that the replay is ready to start after a successful reconnect. Application Continuity will not replay after the specified amount of time has passed. This option is intended to avoid the unintentional execution of a request when a system is recovered after a long period of time. The default is 5 minutes (300 seconds).
SESSION_STATE_CONSISTE NCY	VARCHAR2 (128)	Describes how non-transactional is changed during a request. This parameter is considered only if <code>failover_type</code> is set to <code>TRANSACTION</code> for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If non-transactional values change after the request starts, the default value of <code>DYNAMIC</code> should be set. Almost all applications should use <code>DYNAMIC</code> mode. If you are unsure, use <code>DYNAMIC</code> mode.
GLOBAL	VARCHAR2 (3)	Indicates whether the service is global. A global service is managed by Global Service Manager (GSM) and can be provided by multiple databases that contain replicated data. Possible values: <ul style="list-style-type: none"> • YES: Indicates the service is global • NO: Indicates the service is not global
PDB	VARCHAR2 (128)	Name of a pluggable database (PDB) associated with a given service. Will contain <code>NULL</code> if a database is a non-CDB or if the service is not associated with a PDB (that is, connecting to a CDB using this service will cause a user to connect to the root.)
SQL_TRANSLATION_PROFIL E	VARCHAR2 (261)	A non-NULL value specifies the initial SQL translation profile for subsequent database connections that use the service and do not specify a SQL translation profile. A NULL value has no effect.
MAX_LAG_TIME	VARCHAR2 (128)	The maximum replication lag (in seconds) that is acceptable for a data replica to be used for providing the database service. Can only be specified for global services.
STOP_OPTION	VARCHAR2 (128)	Stop option for sessions of this service for planned maintenance
FAILOVER_RESTORE	VARCHAR2 (128)	Indicates whether sessions recover their commonly used session state (like NLS, schema) when they are failed over with TAF
DRAIN_TIMEOUT	NUMBER	Number of seconds to wait for sessions to be drained
TABLE_FAMILY_ID	NUMBER	Sharded table family ID associated with the service
PLACEMENT_TEMPLATE	VARCHAR2 (64)	Reserved for future use
COMMIT_OUTCOME_FASTPAT H	VARCHAR2 (3)	Reserved for future use
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.16 V\$SES_OPTIMIZER_ENV

V\$SES_OPTIMIZER_ENV displays the contents of the optimizer environment used by each session. When a new session is first created, it automatically inherits its optimizer environment from the optimizer environment defined at the instance level by V\$SYS_OPTIMIZER_ENV. The value of certain parameters can be dynamically modified by issuing an ALTER SESSION statement.

Column	Datatype	Description
SID	NUMBER	Session identifier. This column can be used to join with V\$SESSION on the SID column.
ID	NUMBER	Unique identifier of the parameter in the optimizer environment
NAME	VARCHAR2 (40)	Name of the parameter
SQL_FEATURE	VARCHAR2 (64)	Associated feature control ID
ISDEFAULT	VARCHAR2 (3)	Indicates whether the parameter is set to the default value (YES) or not (NO)
VALUE	VARCHAR2 (25)	Value of the parameter for the session
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

"V\$SYS_OPTIMIZER_ENV"

10.17 V\$SESS_IO

V\$SESS_IO displays I/O statistics for each user session.

Column	Datatype	Description
SID	NUMBER	Session identifier
BLOCK_GETS	NUMBER	Block gets for this session
CONSISTENT_GETS	NUMBER	Consistent gets for this session
PHYSICAL_READS	NUMBER	Physical reads for this session
BLOCK_CHANGES	NUMBER	Block changes for this session
CONSISTENT_CHANGES	NUMBER	Consistent changes for this session
OPTIMIZED_PHYSICAL_READS	NUMBER	Number of physical reads from Database Smart Flash Cache for this session

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

10.18 V\$SESS_TIME_MODEL

V\$SESS_TIME_MODEL displays the session-accumulated time for various operations. The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation.

The time values are 8-byte integers and can therefore hold approximately 580,000 years of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

Column	Datatype	Description
SID	NUMBER	Session ID (same as in V\$SESSION)
STAT_ID	NUMBER	Statistic identifier for the time statistic
STAT_NAME	VARCHAR2 (64)	Name of the statistic (see Table 10-1)
VALUE	NUMBER	Amount of time (in microseconds) that the session has spent in this operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. 1: This value is used for rows containing data that pertain to only the root <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data

Table 10-1 V\$SESS_TIME_MODEL and V\$SYS_TIME_MODEL Statistics

Statistic Name	Description
DB time	Amount of elapsed time (in microseconds) spent performing Database user-level calls. This does not include the elapsed time spent on instance background processes such as PMON.
DB CPU	Amount of CPU time (in microseconds) spent on database user-level calls. This does not include the CPU time spent on instance background processes such as PMON.
background elapsed time	Amount of elapsed time (in microseconds) consumed by database background processes.

Table 10-1 (Cont.) V\$SESS_TIME_MODEL and V\$SYS_TIME_MODEL Statistics

Statistic Name	Description
background CPU time	Amount of CPU time (in microseconds) consumed by database background processes.
sequence load elapsed time	Amount of elapsed time spent getting the next sequence number from the data dictionary. If a sequence is cached, then this is the amount of time spent replenishing the cache when it runs out. No time is charged when a sequence number is found in the cache. For non-cached sequences, some time will be charged for every nextval call.
parse time elapsed	Amount of elapsed time spent parsing SQL statements. It includes both soft and hard parse time.
hard parse elapsed time	Amount of elapsed time spent hard parsing SQL statements.
SQL execute elapsed time	Amount of elapsed time SQL statements are executing. Note that for select statements this also includes the amount of time spent performing fetches of query results.
connection management call elapsed time	Amount of elapsed time spent performing session connect and disconnect calls.
failed parse elapsed time	Amount of time spent performing SQL parses which ultimately fail with some parse error.
failed parse (out of shared memory) elapsed time	Amount of time spent performing SQL parses which ultimately fail with error ORA-04031.
hard parse (sharing criteria) elapsed time	Amount of elapsed time spent performing SQL hard parses when the hard parse resulted from not being able to share an existing cursor in the SQL cache.
hard parse (bind mismatch) elapsed time	Amount of elapsed time spent performing SQL hard parses when the hard parse resulted from bind type or bind size mismatch with an existing cursor in the SQL cache.
PL/SQL execution elapsed time	Amount of elapsed time spent running the PL/SQL interpreter. This does not include time spent recursively executing/parsing SQL statements or time spent recursively executing the Java VM.
PL/SQL compilation elapsed time	Amount of elapsed time spent running the PL/SQL compiler.
inbound PL/SQL rpc elapsed time	Time inbound PL/SQL remote procedure calls have spent executing. It includes all time spent recursively executing SQL and JAVA, and therefore is not easily related to "PL/SQL execution elapsed time".
Java execution elapsed time	Amount of elapsed time spent running the Java VM. This does not include time spent recursively executing/parsing SQL statements or time spent recursively executing PL/SQL.
RMAN cpu time (backup/restore)	Amount of CPU time (in microseconds) spent in RMAN backup and restore operations.
repeated bind elapsed time	Amount of elapsed time spent giving new values to bind variables (rebinding).
OLAP engine elapsed time	Amount of time spent performing OLAP session transactions. This includes time spent on database user-level calls, SQL statement execution, and PL/SQL execution within the OLAP transaction.
OLAP engine CPU time	Amount of CPU time spent on OLAP session transactions. This includes time spent on database user-level calls, SQL statement execution, and PL/SQL execution within the OLAP transaction.

The relationships between the statistics listed in [Table 10-1](#) form two trees in which all the time reported by a child in the tree is contained within the parent in the tree. The following are the relationship trees; the number is the level in the given tree.

- ```

1) background elapsed time
 2) background cpu time
 3) RMAN cpu time (backup/restore)
1) DB time
 2) DB CPU
 2) connection management call elapsed time
 2) sequence load elapsed time
 2) sql execute elapsed time
 2) parse time elapsed
 3) hard parse elapsed time
 4) hard parse (sharing criteria) elapsed time
 5) hard parse (bind mismatch) elapsed time
 3) failed parse elapsed time
 4) failed parse (out of shared memory) elapsed time
 2) PL/SQL execution elapsed time
 2) inbound PL/SQL rpc elapsed time
 2) PL/SQL compilation elapsed time
 2) Java execution elapsed time
 2) repeated bind elapsed time

```

The relationship between a parent and a child in the tree indicates containment only. Keep the following in mind regarding the tree:

- Children do not necessarily add up to the parent.
- Children are not necessarily exclusive (that is, they may overlap).
- The union of children does not necessarily cover the whole of the parent.

## 10.19 V\$SESSION

V\$SESSION displays session information for each current session.

| Column  | Datatype    | Description                                                                                                                                                                                                                                                                                                           |
|---------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SADDR   | RAW (4   8) | Session address                                                                                                                                                                                                                                                                                                       |
| SID     | NUMBER      | Session identifier                                                                                                                                                                                                                                                                                                    |
| SERIAL# | NUMBER      | Session serial number. Used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID.                                                                                      |
| AUDSID  | NUMBER      | Auditing session ID <ul style="list-style-type: none"> <li>• If the database is configured for unified auditing, then this column displays the unified auditing session ID</li> <li>• If the database is configured for mixed mode auditing, then this column displays the traditional auditing session ID</li> </ul> |

| Column     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PADDR      | RAW (4   8)    | Address of the process that owns the session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| USER#      | NUMBER         | Oracle user identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| USERNAME   | VARCHAR2 (128) | Oracle username                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| COMMAND    | NUMBER         | <p>Command in progress (last statement parsed).</p> <p>You can find the command name for any value <i>n</i> returned in this <b>COMMAND</b> column by running this SQL query:</p> <pre>SELECT command_name    FROM v\$sqlcommand   WHERE command_type = n;</pre> <p>A value of 0 in this <b>COMMAND</b> column means the command is not recorded in <b>V\$SESSION</b>.</p>                                                                                                                                                                                                                                                                                                                               |
| OWNERID    | NUMBER         | <p>Identifier of the user who owns the migratable session; the column contents are invalid if the value is 2147483644</p> <p>For operations using parallel worker processes, interpret this value as a 4-byte value. The low-order 2 bytes represent the session number and the high-order bytes represent the instance ID of the query coordinator.</p>                                                                                                                                                                                                                                                                                                                                                 |

| CLIENT_INFO               | VARCHAR2(64) | Information set by the DBMS_APPLICATION_INFO.SET_CLIENT_INFO procedure                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| FIXED_TABLE_SEQUENCE      | NUMBER       | This contains a number that increases every time the session completes a call to the database and there has been an intervening select from a dynamic performance table. This column can be used by performance monitors to monitor statistics in the database. Each time the performance monitor looks at the database, it only needs to look at sessions that are currently active or have a higher value in this column than the highest value that the performance monitor saw the last time. All the other sessions have been idle since the last time the performance monitor looked at the database. |

| Column          | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| FAILOVER_TYPE   | VARCHAR2 (13) | Indicates whether failover is enabled for this session: <ul style="list-style-type: none"> <li>NONE - Failover is disabled for this session.</li> <li>SESSION - Transparent application failover (TAF) is enabled for this session and the client can fail over its session following a disconnect.</li> <li>SELECT - TAF is enabled for this session and the client can fail over queries. The application must not set session state after the initial setup. (Transactions are not included at failover.)</li> <li>TRANSACTION - Application Continuity (AC) is enabled for this session. This feature is available with the Oracle Real Application Clusters (RAC), Oracle RAC One Node, and Oracle Active Data Guard options. AC hides outages from end users and applications by recovering the database sessions following recoverable outages and planned maintenance.</li> <li>AUTO - Transparent Application Continuity (TAC) is enabled for this session. This feature is the automated version of Application Continuity (AC) that makes decisions on your behalf. TAC is on by default for Oracle Autonomous Database Cloud and can also be on by default for your applications.</li> </ul> <p><b>See Also:</b></p> <ul style="list-style-type: none"> <li><i>Oracle Database Net Services Administrator's Guide</i> for more information on TAF</li> <li><i>Oracle Real Application Clusters Administration and Deployment Guide</i> for more information on AC</li> <li><i>Oracle Real Application Clusters Administration and Deployment Guide</i> for more information on TAC</li> </ul> |

| Column                        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FAILOVER_METHOD               | VARCHAR2 (10) | Indicates the transparent application failover method for the session: <ul style="list-style-type: none"> <li>NONE - Failover is disabled for this session</li> <li>BASIC - Client itself reconnects following a disconnect</li> <li>PRECONNECT - Backup instance can support all connections from every instance for which it is backed up</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                 |
| FAILED_OVER                   | VARCHAR2 (3)  | Indicates whether the session is running in failover mode and failover has occurred (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| RESOURCE_CONSUMER_GROUP       | VARCHAR2 (32) | Name of the session's current resource consumer group                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PDML_STATUS                   | VARCHAR2 (8)  | If ENABLED, the session is in a PARALLEL DML enabled mode. If DISABLED, PARALLEL DML enabled mode is not supported for the session. If FORCED, the session has been altered to force PARALLEL DML.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PDDL_STATUS                   | VARCHAR2 (8)  | If ENABLED, the session is in a PARALLEL DDL enabled mode. If DISABLED, PARALLEL DDL enabled mode is not supported for the session. If FORCED, the session has been altered to force PARALLEL DDL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PQ_STATUS                     | VARCHAR2 (8)  | If ENABLED, the session is in a PARALLEL QUERY enabled mode. If DISABLED, PARALLEL QUERY enabled mode is not supported for the session. If FORCED, the session has been altered to force PARALLEL QUERY.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CURRENT_QUEUE_DURATION        | NUMBER        | If queued (1), the current amount of time the session has been queued. If not currently queued, the value is 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CLIENT_IDENTIFIER             | VARCHAR2 (64) | Client identifier of the session                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| BLOCKING_SESSION_STATUS       | VARCHAR2 (11) | This column provides details on whether there is a blocking session: <ul style="list-style-type: none"> <li>VALID - there is a blocking session, and it is identified in the BLOCKING_INSTANCE and BLOCKING_SESSION columns</li> <li>NO HOLDER - there is no session blocking this session</li> <li>NOT IN WAIT - this session is not in a wait</li> <li>UNKNOWN - the blocking session is unknown</li> </ul>                                                                                                                                                                                                                                                                                                                          |
| BLOCKING_INSTANCE             | NUMBER        | Instance identifier of the blocking session. This column is valid only if BLOCKING_SESSION_STATUS has the value VALID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BLOCKING_SESSION              | NUMBER        | Session identifier of the blocking session. This column is valid only if BLOCKING_SESSION_STATUS has the value VALID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| FINAL_BLOCKING_SESSION_STATUS | VARCHAR2 (11) | The final blocking session is the final element in the wait chain constructed by following the sessions that are blocked by one another starting with this session. In the case of a cyclical wait chain, one of the sessions in the wait chain will be chosen as the final blocker. <p>This column provides details on whether there is a final blocking session:</p> <ul style="list-style-type: none"> <li>VALID - there is a final blocking session and it is identified in the FINAL_BLOCKING_INSTANCE and FINAL_BLOCKING_SESSION columns</li> <li>NO HOLDER - there is no session blocking this session</li> <li>NOT IN WAIT - this session is not in a wait</li> <li>UNKNOWN - the final blocking session is unknown</li> </ul> |

| CREATOR_ADDR               | RAW (4   8)   | Address of the creating process or circuit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CREATOR_SERIAL#            | NUMBER        | Serial number of the creating process or circuit                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ECID                       | VARCHAR2 (64) | Execution context identifier (sent by Application Server)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Column                     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TRANSLATION_PROFILE_ID | NUMBER         | Object number of the SQL translation profile                                                                                                                                                                                                                                                                                                                                                                                      |
| PGA_TUNABLE_MEM            | NUMBER         | The amount of tunable PGA memory (in bytes).<br>Untunable memory is PGA_ALLOC_MEM from V\$PROCESS minus PGA_TUNABLE_MEM from V\$SESSION.                                                                                                                                                                                                                                                                                          |
| SHARD_DDL_STATUS           | VARCHAR2(8)    | Indicates whether shard DDL is enabled in the current session (ENABLED) or not (DISABLED).<br><br>This value is only relevant for the shard catalog database.                                                                                                                                                                                                                                                                     |
| CON_ID                     | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |
| EXTERNAL_NAME              | VARCHAR2(1024) | External name of the database user. For enterprise users, returns the Oracle Internet Directory DN.                                                                                                                                                                                                                                                                                                                               |
| PLSQL_DEBUGGER_CONNECTED   | VARCHAR2(5)    | Indicates whether the session is connected to a PL/SQL debugger. Possible values: <ul style="list-style-type: none"> <li>TRUE</li> <li>FALSE</li> </ul>                                                                                                                                                                                                                                                                           |

<sup>1</sup> The P1RAW, P2RAW, and P3RAW columns display the same values as the P1, P2, and P3 columns, except that the numbers are displayed in hexadecimal.

## 10.20 V\$SESSION\_BLOCKERS

V\$SESSION\_BLOCKERS displays the blocker sessions for each blocked session. Each row represents a blocked and blocker session pair. If a session is blocked by multiple sessions there will be multiple rows for that blocked session. The maximum number of blocker sessions displayed for a single blocked session is 30. If a session is not blocked by other sessions, then there will be no row in this view for that session.

| Column | Datatype | Description                                 |
|--------|----------|---------------------------------------------|
| SID    | NUMBER   | Blocked session's Oracle session identifier |

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESS_SERIAL#         | NUMBER        | Blocked session's Oracle session serial number                                                                                                                                                                                                                                                                                                                                                                                                  |
| WAIT_ID              | NUMBER        | A number identifying the wait for the blocked session                                                                                                                                                                                                                                                                                                                                                                                           |
| WAIT_EVENT           | NUMBER        | Resource or event number for which the blocked session is waiting                                                                                                                                                                                                                                                                                                                                                                               |
| WAIT_EVENT_TEXT      | VARCHAR2 (64) | Resource or event for which the blocked session is waiting                                                                                                                                                                                                                                                                                                                                                                                      |
| BLOCKER_INSTANCE_ID  | NUMBER        | Blocker session's instance identifier                                                                                                                                                                                                                                                                                                                                                                                                           |
| BLOCKER_SID          | NUMBER        | Blocker session's Oracle session identifier                                                                                                                                                                                                                                                                                                                                                                                                     |
| BLOCKER_SESS_SERIAL# | NUMBER        | Blocker session's Oracle session serial number                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.21 V\$SESSION\_CONNECT\_INFO

V\$SESSION\_CONNECT\_INFO displays information about network connections for all currently logged in sessions.

| Column                 | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                    | NUMBER          | Session identifier (can be used to join this view with V\$SESSION)                                                                                                                                                                                                                                                                                                                                                                                            |
| SERIAL#                | NUMBER          | Session serial number. Used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID. (Can be used to join this view with V\$SESSION.)                                                                                                                                                                             |
| AUTHENTICATION_TYPE    | VARCHAR2 (26)   | How the user was authenticated: <ul style="list-style-type: none"> <li>DATABASE - Username/password authentication</li> <li>OS - Operating system external user authentication</li> <li>NETWORK - Network protocol or ANO authentication</li> <li>PROXY - OCI proxy connection authentication</li> <li>SERVER</li> <li>PASSWORD</li> <li>EXTERNAL ADAPTERS</li> <li>INTERNAL</li> <li>GLOBAL</li> <li>EXTERNAL</li> <li>PASSWORD BASED GLOBAL USER</li> </ul> |
| OSUSER                 | VARCHAR2 (128)  | External username for this database user                                                                                                                                                                                                                                                                                                                                                                                                                      |
| NETWORK_SERVICE_BANNER | VARCHAR2 (4000) | Product banners for each Oracle Net service used for this connection (one row per banner)                                                                                                                                                                                                                                                                                                                                                                     |

| Column                   | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_CHARSET           | VARCHAR2 (40)   | Client character set as specified in the NLS_LANG environment variable or in the OCIEnvNlsCreate () call; Unknown if the Oracle client is older than release 11.1 or the connection is through the JDBC thin driver                                                                                                                                                                                                                                   |
| CLIENT_CONNECTION        | VARCHAR2 (13)   | Client server connection flags: <ul style="list-style-type: none"> <li>• Heterogeneous</li> <li>• Homogeneous</li> </ul>                                                                                                                                                                                                                                                                                                                              |
| CLIENT_OCI_LIBRARY       | VARCHAR2 (27)   | OCI client library: <ul style="list-style-type: none"> <li>• Home-based</li> <li>• Full Instant Client</li> <li>• Light Weight Instant Client</li> <li>• OCI</li> <li>• Unknown</li> </ul>                                                                                                                                                                                                                                                            |
| CLIENT_VERSION           | VARCHAR2 (40)   | Client library version number                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CLIENT_DRIVER            | VARCHAR2 (30)   | Client driver name                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CLIENT_LOBATTR           | VARCHAR2 (23)   | Client LOB flags: <ul style="list-style-type: none"> <li>• Client Temp Lob Rfc On</li> <li>• Client Temp Lob Rfc Off</li> </ul>                                                                                                                                                                                                                                                                                                                       |
| CLIENT_REGID             | NUMBER          | Query cache registration ID sent by the client                                                                                                                                                                                                                                                                                                                                                                                                        |
| CLIENT_CONNECTION_STRING | VARCHAR2 (4000) | Connection string used to establish the connection                                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID                   | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.22 V\$SESSION\_CURSOR\_CACHE

V\$SESSION\_CURSOR\_CACHE displays information on cursor usage for the current session.

 **Note:**  
The V\$SESSION\_CURSOR\_CACHE view is not a measure of the effectiveness of the SESSION\_CACHED\_CURSORS initialization parameter.

| Column    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAXIMUM   | NUMBER   | Maximum number of cursors to cache. Once you hit this number, some cursors will need to be closed in order to open more. The value in this column is derived from the initialization parameter <code>SESSION_CACHED_CURSORS</code> .                                                                                                                                                                                                            |
| COUNT     | NUMBER   | Current number of cursors (whether they are in use or not)                                                                                                                                                                                                                                                                                                                                                                                      |
| OPENS     | NUMBER   | Cumulative total of cursor opens minus one. This is because the cursor that is currently open and being used for this query is not counted in the <code>OPENS</code> statistic.                                                                                                                                                                                                                                                                 |
| HITS      | NUMBER   | Cumulative total of cursor open hits                                                                                                                                                                                                                                                                                                                                                                                                            |
| HIT_RATIO | NUMBER   | Ratio of the number of times an open cursor was found divided by the number of times a cursor was sought                                                                                                                                                                                                                                                                                                                                        |
| CON_ID    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.23 V\$SESSION\_EVENT

`V$SESSION_EVENT` displays information on waits for an event by a session. Note that the `TIME_WAITED` and `AVERAGE_WAIT` columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you want this column to reflect true wait times, then you must set `TIMED_STATISTICS` to `true` in the parameter file; doing this will have a small negative effect on system performance.

| Column         | Datatype      | Description                                                                                                                               |
|----------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| SID            | NUMBER        | Session identifier                                                                                                                        |
| EVENT          | VARCHAR2 (64) | Name of the wait event; derived statistic name from <code>V\$EVENT_NAME</code><br><b>See Also:</b> " <a href="#">Oracle Wait Events</a> " |
| TOTAL_WAITS    | NUMBER        | Total number of waits for the event by the session                                                                                        |
| TOTAL_TIMEOUTS | NUMBER        | Total number of timeouts for the event by the session                                                                                     |

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIME_WAITED       | NUMBER        | Total amount of time waited for the event by the session (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                            |
| AVERAGE_WAIT      | NUMBER        | Average amount of time waited for the event by the session (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                          |
| MAX_WAIT          | NUMBER        | Maximum amount of time waited for the event by the session (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                          |
| TIME_WAITED_MICRO | NUMBER        | Total amount of time waited for the event by the session (in microseconds)                                                                                                                                                                                                                                                                                                                                                                      |
| CPU               | NUMBER        | Total amount of CPU time consumed by the session while implementing the wait event itself (in microseconds)                                                                                                                                                                                                                                                                                                                                     |
| EVENT_ID          | NUMBER        | Identifier of the wait event                                                                                                                                                                                                                                                                                                                                                                                                                    |
| WAIT_CLASS_ID     | NUMBER        | Identifier of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                  |
| WAIT_CLASS#       | NUMBER        | Number of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                      |
| WAIT_CLASS        | VARCHAR2 (64) | Name of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.24 V\$SESSION\_FIX\_CONTROL

V\$SESSION\_FIX\_CONTROL displays information about Fix Control (enabled/disabled) for the current session.

| Column                    | Datatype      | Description                                                                   |
|---------------------------|---------------|-------------------------------------------------------------------------------|
| SESSION_ID                | NUMBER        | Session identifier (can be used to join this view with V\$SESSION)            |
| BUGNO                     | NUMBER        | Bug number (as fix control identifier)                                        |
| VALUE                     | NUMBER        | Current value set for the fix control                                         |
| SQL_FEATURE               | VARCHAR2 (64) | Feature control ID                                                            |
| DESCRIPTION               | VARCHAR2 (64) | Description of the fix control                                                |
| OPTIMIZER_FEATURE_ENABLED | VARCHAR2 (25) | Version on (and after) which the fix is enabled by default                    |
| EVENT                     | NUMBER        | Event formerly used to control the fix                                        |
| IS_DEFAULT                | NUMBER        | Indicates whether the current value is the same as the default (1) or not (0) |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.25 V\$SESSION\_LONGOPS

V\$SESSION\_LONGOPS displays the status of various operations that run for longer than 6 seconds (in absolute time). These operations currently include many backup and recovery functions, statistics gathering, and query execution, and more operations are added for every Oracle release.

To monitor query execution progress, you must be using the cost-based optimizer and you must:

- Set the `TIMED_STATISTICS` or `SQL_TRACE` parameters to `true`
- Gather statistics for your objects with the `DBMS_STATS` package

You can add information to this view about application-specific long-running operations by using the `DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS` procedure.

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID              | NUMBER        | Identifier of the session processing the long-running operation. If multiple sessions are cooperating in the long-running operation, then <code>SID</code> corresponds to the main session.                                                                                                                                                                                                                                          |
| SERIAL#          | NUMBER        | Serial number of the session processing the long-running operation. If multiple sessions are cooperating in the long-running operation, then <code>SERIAL#</code> corresponds to the main session. <code>SERIAL#</code> is used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID. |
| OPNAME           | VARCHAR2 (64) | Brief description of the operation                                                                                                                                                                                                                                                                                                                                                                                                   |
| TARGET           | VARCHAR2 (64) | Object on which the operation is carried out                                                                                                                                                                                                                                                                                                                                                                                         |
| TARGET_DESC      | VARCHAR2 (32) | Description of the target                                                                                                                                                                                                                                                                                                                                                                                                            |
| SO FAR           | NUMBER        | Units of work done so far for the operation specified in the <code>OPNAME</code> column                                                                                                                                                                                                                                                                                                                                              |
| TOTALWORK        | NUMBER        | Total units of work for the operation specified in the <code>OPNAME</code> column                                                                                                                                                                                                                                                                                                                                                    |
| UNITS            | VARCHAR2 (32) | Units of measurement                                                                                                                                                                                                                                                                                                                                                                                                                 |
| START_TIME       | DATE          | Starting time of the operation                                                                                                                                                                                                                                                                                                                                                                                                       |
| LAST_UPDATE_TIME | DATE          | Time when statistics were last updated for the operation                                                                                                                                                                                                                                                                                                                                                                             |
| TIMESTAMP        | DATE          | Timestamp specific to the operation                                                                                                                                                                                                                                                                                                                                                                                                  |
| TIME_REMAINING   | NUMBER        | Estimate (in seconds) of time remaining for the operation to complete                                                                                                                                                                                                                                                                                                                                                                |

| Column              | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ELAPSED_SECONDS     | NUMBER         | Number of elapsed seconds from the start of the operations                                                                                                                                                                                                                                                                                                                                                                                      |
| CONTEXT             | NUMBER         | Context                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| MESSAGE             | VARCHAR2 (512) | Statistics summary message                                                                                                                                                                                                                                                                                                                                                                                                                      |
| USERNAME            | VARCHAR2 (30)  | User ID of the user performing the operation                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_ADDRESS         | RAW (4   8)    | Used with the value of the <code>SQL_HASH_VALUE</code> column to identify the SQL statement associated with the operation                                                                                                                                                                                                                                                                                                                       |
| SQL_HASH_VALUE      | NUMBER         | Used with the value of the <code>SQL_ADDRESS</code> column to identify the SQL statement associated with the operation                                                                                                                                                                                                                                                                                                                          |
| SQL_ID              | VARCHAR2 (13)  | SQL identifier of the SQL statement associated with the long operation, if any                                                                                                                                                                                                                                                                                                                                                                  |
| SQL_PLAN_HASH_VALUE | NUMBER         | SQL plan hash value; NULL if <code>SQL_ID</code> is NULL                                                                                                                                                                                                                                                                                                                                                                                        |
| SQL_EXEC_START      | DATE           | Time when the execution of the SQL started; NULL if <code>SQL_ID</code> is NULL                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_EXEC_ID         | NUMBER         | SQL execution identifier (see <code>V\$SQL_MONITOR</code> )                                                                                                                                                                                                                                                                                                                                                                                     |
| SQL_PLAN_LINE_ID    | NUMBER         | SQL plan line ID corresponding to the long operation; NULL if the long operation is not associated with a line of the execution plan                                                                                                                                                                                                                                                                                                            |
| SQL_PLAN_OPERATION  | VARCHAR2 (30)  | Plan operation name; NULL if <code>SQL_PLAN_LINE_ID</code> is NULL                                                                                                                                                                                                                                                                                                                                                                              |
| SQL_PLAN_OPTIONS    | VARCHAR2 (30)  | Plan operation options; NULL if <code>SQL_PLAN_LINE_ID</code> is NULL                                                                                                                                                                                                                                                                                                                                                                           |
| QCSID               | NUMBER         | Session identifier of the parallel coordinator                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID              | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.26 V\$SESSION\_OBJECT\_CACHE

`V$SESSION_OBJECT_CACHE` displays object cache statistics for the current user session on the local server (instance).

| Column           | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PINS             | NUMBER   | Number of object pins or look-ups in the cache                                                                                                                                                                                                                                                                                                                                                                                                  |
| HITS             | NUMBER   | Number of object pins that found the object already in the cache                                                                                                                                                                                                                                                                                                                                                                                |
| TRUE_HITS        | NUMBER   | Number of object pins that found the object already in the cache and in the desired state (thus, not requiring refresh from the database)                                                                                                                                                                                                                                                                                                       |
| HIT_RATIO        | NUMBER   | Ratio of HITS / PINS                                                                                                                                                                                                                                                                                                                                                                                                                            |
| TRUE_HIT_RATIO   | NUMBER   | Ratio of TRUE_HITS/PINS                                                                                                                                                                                                                                                                                                                                                                                                                         |
| OBJECT_REFRESHES | NUMBER   | Number of objects in the cache that were refreshed with a new value from the database                                                                                                                                                                                                                                                                                                                                                           |
| CACHE_REFRESHES  | NUMBER   | Number of times the whole cache (all objects) were refreshed                                                                                                                                                                                                                                                                                                                                                                                    |
| OBJECT_FLUSHES   | NUMBER   | Number of objects in the cache that were flushed to the database                                                                                                                                                                                                                                                                                                                                                                                |
| CACHE_FLUSHES    | NUMBER   | Number of times the whole cache (all objects) were flushed to the database                                                                                                                                                                                                                                                                                                                                                                      |
| CACHE_SHRINKS    | NUMBER   | Number of times the cache was shrunk to the optimal size                                                                                                                                                                                                                                                                                                                                                                                        |
| CACHED_OBJECTS   | NUMBER   | Number of objects currently cached                                                                                                                                                                                                                                                                                                                                                                                                              |
| PINNED_OBJECTS   | NUMBER   | Number of objects currently pinned                                                                                                                                                                                                                                                                                                                                                                                                              |
| CACHE_SIZE       | NUMBER   | Current size of the cache (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                            |
| OPTIMAL_SIZE     | NUMBER   | Optimal size of the cache (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                            |
| MAXIMUM_SIZE     | NUMBER   | Maximum size of the cache (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID           | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.27 V\$SESSION\_WAIT

V\$SESSION\_WAIT displays the current or last wait for each session.

| Column | Datatype      | Description                                                                                                                                                                                                                                         |
|--------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID    | NUMBER        | Session identifier; maps to V\$SESSION.SID                                                                                                                                                                                                          |
| SEQ#   | NUMBER        | A number that uniquely identifies the current or last wait (incremented for each wait)                                                                                                                                                              |
| EVENT  | VARCHAR2 (64) | If the session is currently waiting, then the resource or event for which the session is waiting. If the session is not in a wait, then the resource or event for which the session most recently waited.<br><b>See Also:</b> " Oracle Wait Events" |
| P1TEXT | VARCHAR2 (64) | Description of the first wait event parameter                                                                                                                                                                                                       |
| P1     | NUMBER        | First wait event parameter (in decimal)                                                                                                                                                                                                             |
| P1RAW  | RAW (8)       | First wait event parameter (in hexadecimal) <sup>1</sup>                                                                                                                                                                                            |
| P2TEXT | VARCHAR2 (64) | Description of the second wait event parameter                                                                                                                                                                                                      |

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P2                   | NUMBER        | Second wait event parameter (in decimal)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| P2RAW                | RAW (8)       | Second wait event parameter (in hexadecimal) <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Column                     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_TIME_WAITED_MICRO    | NUMBER   | Total time for the current wait (in microseconds)<br>A wait includes code within its beginning and end that can encounter other waits as part of its implementation. For example, a wait might need to acquire a latch to check state to determine when the wait is satisfied, and the latch itself might enter a wait. In this case, when the latch wait ends and returns to the outer wait, the latch time is included in the value of this column, while the value of WAIT_TIME_MICRO is reset to start after the latch wait. |
| HEUR_TIME_WAITED_MICRO     | NUMBER   | Heuristic wait time (in microseconds)<br>This value is calculated by attempting to group sequential waits that appear to be the same.                                                                                                                                                                                                                                                                                                                                                                                            |
| TIME_SINCE_LAST_WAIT_MICRO | NUMBER   | Time elapsed since the end of the last wait (in microseconds). If the session is currently in a wait, then the value is 0.                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID                     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                  |

<sup>1</sup> The P1RAW, P2RAW, and P3RAW columns display the same values as the P1, P2, and P3 columns, except that the numbers are displayed in hexadecimal.

| TOTAL_WAITS       | NUMBER        | Total number waits from this wait class by the session                                              |
| TIME_WAITED       | NUMBER        | Total amount of time spent in waits from this wait class by the session (in hundredths of a second) |
| TIME_WAITED_MICRO | NUMBER        | Total amount of time spent in waits from this wait class by the session (in microseconds)           |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU    | NUMBER   | Total amount of CPU time consumed by the session while implementing waits from this wait class (in microseconds)                                                                                                                                                                                                                                                                                                                                |
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.29 V\$SESSION\_WAIT\_HISTORY

V\$SESSION\_WAIT\_HISTORY displays the last 10 wait events for each active session.

| Column                     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                        | NUMBER        | Session identifier                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SEQ#                       | NUMBER        | Sequence of wait events; 1 is the most recent                                                                                                                                                                                                                                                                                                                                                                                                   |

Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| USER_SESSION_COUNT      | NUMBER   | Displays the current number of user sessions for the PDB                                                                                                                                                                                                                                                                                                                                                                                        |
| RECURSIVE_SESSION_COUNT | NUMBER   | Displays the current number of recursive sessions for the PDB                                                                                                                                                                                                                                                                                                                                                                                   |

## 10.31 V\$SESSMETRIC

V\$SESSMETRIC displays the metric values for all sessions.

| Column             | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME         | DATE     | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_TIME           | DATE     | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INTSIZE_CSEC       | NUMBER   | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                       |
| SESSION_ID         | NUMBER   | Session ID                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SESSION_SERIAL_NUM | NUMBER   | Session serial number                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CPU                | NUMBER   | CPU usage                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PHYSICAL_READS     | NUMBER   | Number of physical reads                                                                                                                                                                                                                                                                                                                                                                                                                        |
| LOGICAL_READS      | NUMBER   | Number of logical reads                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PGA_MEMORY         | NUMBER   | PGA size at the end of the interval                                                                                                                                                                                                                                                                                                                                                                                                             |
| HARD_PARSSES       | NUMBER   | Number of hard parses                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SOFT_PARSSES       | NUMBER   | Number of soft parses                                                                                                                                                                                                                                                                                                                                                                                                                           |
| PHYSICAL_READ_PCT  | NUMBER   | Physical read ratio                                                                                                                                                                                                                                                                                                                                                                                                                             |
| LOGICAL_READ_PCT   | NUMBER   | Logical read ratio                                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID             | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.32 V\$SESSTAT

V\$SESSTAT displays user session statistics. To find the name of the statistic associated with each statistic number (STATISTIC#), query the V\$STATNAME view.

| Column     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID        | NUMBER   | Session identifier                                                                                                                                                                                                                                                                                                                                                                                                                              |
| STATISTIC# | NUMBER   | Statistic number<br><b>Note:</b> Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.                                                                                                                                                                                                                           |
| VALUE      | NUMBER   | Statistic value                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.33 V\$SGA

V\$SGA displays summary information about the system global area (SGA).

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME   | VARCHAR2 (20) | SGA component group                                                                                                                                                                                                                                                                                                                                                                                                                             |
| VALUE  | NUMBER        | Memory size (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.34 V\$SGA\_CURRENT\_RESIZE\_OPS

V\$SGA\_CURRENT\_RESIZE\_OPS displays information about SGA resize operations which are currently in progress. An operation can be a grow or a shrink of a dynamic SGA component. All sizes are expressed in bytes.

| Column    | Datatype      | Description    |
|-----------|---------------|----------------|
| COMPONENT | VARCHAR2 (64) | Component name |

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPER_TYPE        | VARCHAR2 (13) | Operation type: <ul style="list-style-type: none"> <li>• STATIC</li> <li>• INITIALIZING</li> <li>• DISABLED</li> <li>• GROW</li> <li>• SHRINK</li> <li>• SHRINK_CANCEL</li> </ul>                                                                                                                                                                                                                                                                     |
| OPER_MODE        | VARCHAR2 (9)  | Operation mode: <ul style="list-style-type: none"> <li>• MANUAL</li> <li>• DEFERRED</li> <li>• IMMEDIATE</li> </ul>                                                                                                                                                                                                                                                                                                                                   |
| PARAMETER        | VARCHAR2 (80) | Name of the parameter for the resize operation                                                                                                                                                                                                                                                                                                                                                                                                        |
| INITIAL_SIZE     | NUMBER        | Parameter value at the start of the operation                                                                                                                                                                                                                                                                                                                                                                                                         |
| TARGET_SIZE      | NUMBER        | Desired value of the parameter after the resize                                                                                                                                                                                                                                                                                                                                                                                                       |
| CURRENT_SIZE     | NUMBER        | Current value of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                        |
| START_TIME       | DATE          | Start time of the operation                                                                                                                                                                                                                                                                                                                                                                                                                           |
| LAST_UPDATE_TIME | DATE          | Last time progress was made for the operation                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID           | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.35 V\$SGA\_DYNAMIC\_COMPONENTS

V\$SGA\_DYNAMIC\_COMPONENTS displays information about the dynamic SGA components. This view summarizes information based on all completed SGA resize operations since instance startup. All sizes are expressed in bytes.

| Column              | Datatype      | Description                                          |
|---------------------|---------------|------------------------------------------------------|
| COMPONENT           | VARCHAR2 (64) | Component name                                       |
| CURRENT_SIZE        | NUMBER        | Current size of the component                        |
| MIN_SIZE            | NUMBER        | Minimum size of the component since instance startup |
| MAX_SIZE            | NUMBER        | Maximum size of the component since instance startup |
| USER_SPECIFIED_SIZE | NUMBER        | Value of the user parameter for the component        |
| OPER_COUNT          | NUMBER        | Number of operations since instance startup          |

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LAST_OPER_TYPE | VARCHAR2 (13) | Last completed operation for the component: <ul style="list-style-type: none"> <li>• STATIC</li> <li>• INITIALIZING</li> <li>• DISABLED</li> <li>• GROW</li> <li>• SHRINK</li> <li>• SHRINK_CANCEL</li> </ul>                                                                                                                                                                                                                                         |
| LAST_OPER_MODE | VARCHAR2 (9)  | Mode of the last completed operation: <ul style="list-style-type: none"> <li>• MANUAL</li> <li>• DEFERRED</li> <li>• IMMEDIATE</li> </ul>                                                                                                                                                                                                                                                                                                             |
| LAST_OPER_TIME | DATE          | Start time of the last completed operation                                                                                                                                                                                                                                                                                                                                                                                                            |
| GRANULE_SIZE   | NUMBER        | Granularity of the grow or the shrink operation                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID         | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.36 V\$SGA\_DYNAMIC\_FREE\_MEMORY

V\$SGA\_DYNAMIC\_FREE\_MEMORY displays information about the amount of SGA memory available for future dynamic SGA resize operations.

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CURRENT_SIZE | NUMBER   | Amount of available memory (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID       | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.37 V\$SGA\_RESIZE\_OPS

V\$SGA\_RESIZE\_OPS displays information about the last 800 completed SGA resize operations. This does not include in-progress operations. All sizes are expressed in bytes.

| Column    | Datatype      | Description    |
|-----------|---------------|----------------|
| COMPONENT | VARCHAR2 (64) | Component name |

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPER_TYPE    | VARCHAR2 (13) | Operation type: <ul style="list-style-type: none"> <li>• STATIC</li> <li>• INITIALIZING</li> <li>• DISABLED</li> <li>• GROW</li> <li>• SHRINK</li> <li>• SHRINK_CANCEL</li> </ul>                                                                                                                                                                                                                                                                     |

| PARAMETER    | VARCHAR2 (80) | Name of the parameter for the resize operation                                                                                                                                                                                                                                                                                                                                                                                                        |
| INITIAL_SIZE | NUMBER        | Parameter value at the start of the operation                                                                                                                                                                                                                                                                                                                                                                                                         |
| TARGET_SIZE  | NUMBER        | Requested value of the parameter after the resize                                                                                                                                                                                                                                                                                                                                                                                                     |
| FINAL_SIZE   | NUMBER        | Real value of the parameter after the resize                                                                                                                                                                                                                                                                                                                                                                                                          |
| STATUS       | VARCHAR2 (9)  | Completion status of the operation: <ul style="list-style-type: none"> <li>• INACTIVE</li> <li>• PENDING</li> <li>• COMPLETE</li> <li>• CANCELLED</li> <li>• ERROR</li> </ul>                                                                                                                                                                                                                                                                         |
| START_TIME   | DATE          | Start time of the operation                                                                                                                                                                                                                                                                                                                                                                                                                           |
| END_TIME     | DATE          | End time of the operation                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.38 V\$SGA\_TARGET\_ADVICE

V\$SGA\_TARGET\_ADVICE displays information about the SGA\_TARGET initialization parameter.

| Column                 | Datatype | Description                                                            |
|------------------------|----------|------------------------------------------------------------------------|
| SGA_SIZE               | NUMBER   | Size of the SGA                                                        |
| SGA_SIZE_FACTOR        | NUMBER   | Ratio between the SGA_SIZE and the current size of the SGA             |
| ESTD_DB_TIME           | NUMBER   | Estimated DB_TIME for this SGA_SIZE                                    |
| ESTD_DB_TIME_FACTOR    | NUMBER   | Ratio between ESTD_DB_TIME and DB_TIME for the current size of the SGA |
| ESTD_PHYSICAL_READS    | NUMBER   | Estimated number of physical reads                                     |
| ESTD_BUFFER_CACHE_SIZE | NUMBER   | Estimated size of the buffer cache                                     |

| Column                | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTD_SHARED_POOL_SIZE | NUMBER   | Estimated size of the shared pool                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.39 V\$SGAINFO

V\$SGAINFO displays size information about the SGA, including the sizes of different SGA items, the granule size, and free memory.

| Column     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME       | VARCHAR2 (32) | Name of the SGA size item                                                                                                                                                                                                                                                                                                                                                                                                                       |
| BYTES      | NUMBER        | Size of the item (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                     |
| RESIZEABLE | VARCHAR2 (3)  | Indicates whether the item is resizeable (Yes) or not (No)                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID     | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.40 V\$SGASTAT

V\$SGASTAT displays detailed information on the system global area (SGA).

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| POOL   | VARCHAR2 (14) | Designates the pool in which the memory in <i>NAME</i> resides: <ul style="list-style-type: none"> <li>in-memory pool - Memory is allocated from the In-Memory pool</li> <li>java pool - Memory is allocated from the Java pool</li> <li>large pool - Memory is allocated from the large pool</li> <li>numa pool - Memory is allocated from the NUMA pool</li> <li>shared pool - Memory is allocated from the shared pool</li> <li>streams pool - Memory is allocated from the Streams pool</li> </ul> |
| NAME   | VARCHAR2 (26) | SGA component name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| BYTES  | NUMBER        | Memory size (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                        |

## 10.41 V\$SHARD\_ACK\_RECEIVER

V\$SHARD\_ACK\_RECEIVER displays information about ACK receiver processes.

| Column                      | Datatype      | Description                                                                                                                                                                                                           |
|-----------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                         | NUMBER        | Session identifier of the ACK receiver process                                                                                                                                                                        |
| SERIAL#                     | NUMBER        | Session serial number of the ACK receiver process                                                                                                                                                                     |
| RU_ID                       | NUMBER        | Replication unit (RU) identifier                                                                                                                                                                                      |
| STARTUP_TIME                | DATE          | ACK receiver start time                                                                                                                                                                                               |
| STATE                       | VARCHAR2 (27) | State of the ACK receiver: <ul style="list-style-type: none"> <li>INITIALIZING</li> <li>ACTIVE</li> <li>WAITING FOR ACK FROM SENDER</li> <li>POSTING USER TRANSACTION</li> <li>WAITING FOR EOS FROM SENDER</li> </ul> |
| STATE_CHANGED_TIME          | DATE          | Time at which the ACK receiver state last changed                                                                                                                                                                     |
| ACK_SENDER_PEER_ID          | NUMBER        | ACK sender's database identifier of the follower                                                                                                                                                                      |
| TOTAL_ACKS_RECEIVED         | NUMBER        | Total number of ACKs received                                                                                                                                                                                         |
| ACK_RECEIVED_TIME           | DATE          | Time at which ACK was last received                                                                                                                                                                                   |
| LAST_ACK_LOG_INDEX_RECEIVED | NUMBER        | Last received ACK log index                                                                                                                                                                                           |
| SPID                        | VARCHAR2 (12) | OS process identifier                                                                                                                                                                                                 |
| LCR_CREATE_TIME             | DATE          | Commit LCR creation time                                                                                                                                                                                              |

| TOTAL_TXNS_RECORDED     | NUMBER         | Total transactions recorded in error queue by this server                                                                                                                                                                                                                                                                                                                                                                                       |
| RU_ID                   | NUMBER         | Replication unit (RU) identifier                                                                                                                                                                                                                                                                                                                                                                                                                |
| DB_ID                   | NUMBER         | Database identifier                                                                                                                                                                                                                                                                                                                                                                                                                             |
| STARTUP_TIME            | DATE           | Apply server process start time                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                  | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note:**

This view is available starting with Oracle Database 23c.

## 10.47 V\$SHARD\_LCR\_LOGS

V\$SHARD\_LCR\_LOGS displays information about LCR logs.

| Column      | Datatype       | Description                                            |
|-------------|----------------|--------------------------------------------------------|
| INST_ID     | NUMBER         | Instance ID                                            |
| RU_ID       | NUMBER         | Replication unit (RU) ID                               |
| NAME        | VARCHAR2 (257) | Name and path of the log file                          |
| SIZE_GB     | NUMBER         | Size of the log file (in gigabytes)                    |
| ROTD_IDX    | NUMBER         | Rotated index                                          |
| CURR_FILE   | VARCHAR2 (1)   | Indicates whether the file is current (Y) or not (N)   |
| STIDX_HIGH  | NUMBER         | High 4 bytes of the starting log index in the log file |
| STIDX_LOW   | NUMBER         | Low 4 bytes of the starting log index in the log file  |
| ENDIDX_HIGH | NUMBER         | High 4 bytes of the ending log index in the log file   |

| Column     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENDIDX_LOW | NUMBER   | Low 4 bytes of the ending logindex in the log file                                                                                                                                                                                                                                                                                                                                                                                              |
| START_SEC  | NUMBER   | Time when this log file was first written to, measured in seconds from the epoch                                                                                                                                                                                                                                                                                                                                                                |
| CON_ID     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note:**

This view is available starting with Oracle Database 23c.

## 10.48 V\$SHARD\_LCR\_PERSISTER

V\$SHARD\_LCR\_PERSISTER displays information about LCR persister processes.

This view displays one row for each LCR persister for a replication unit (RU).

| Column                | Datatype      | Description                                                                                                                                                                                                                        |
|-----------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                   | NUMBER        | Session identifier of the LCR persister process                                                                                                                                                                                    |
| SERIAL#               | NUMBER        | Session serial number of the LCR persister process                                                                                                                                                                                 |
| RU_ID                 | NUMBER        | Replication unit (RU) identifier                                                                                                                                                                                                   |
| STARTUP_TIME          | DATE          | LCR persister process start time                                                                                                                                                                                                   |
| STATE                 | VARCHAR2 (30) | State of the LCR persister: <ul style="list-style-type: none"> <li>INITIALIZING</li> <li>ACTIVE</li> <li>READING FROM IO</li> <li>WRITING TO IO</li> <li>WAITING ON EMPTY QUEUE</li> <li>WAITING FOR BUFFERS TO PERSIST</li> </ul> |
| STATE_CHANGED_TIME    | DATE          | Time at which the LCR persister state last changed                                                                                                                                                                                 |
| PERSISTED_LOG_INDEX   | NUMBER        | Last persisted LCR log index                                                                                                                                                                                                       |
| IOBUF_INIT_US         | NUMBER        | Write buffer initialization time (in microseconds)                                                                                                                                                                                 |
| LEAD_IO_ISSUED_COUNT  | NUMBER        | Number of times I/O was issued on the leader                                                                                                                                                                                       |
| LEAD_IO_ISSUED_US     | NUMBER        | Time spent (in microseconds) during I/O on the leader                                                                                                                                                                              |
| LEAD_IO_ISSUED_BLKs   | NUMBER        | Number of blocks written on the leader                                                                                                                                                                                             |

This view is available starting with Oracle Database 23c.

## 10.50 V\$\$SHARD\_NETWORK\_RECEIVER

V\$\$SHARD\_NETWORK\_RECEIVER displays information about network receiver processes.

| Column       | Datatype       | Description                                                                 |
|--------------|----------------|-----------------------------------------------------------------------------|
| SID          | NUMBER         | Session identifier of the network receiver process                          |
| SERIAL#      | NUMBER         | Session serial number of the network receiver process                       |
| APPLY_NAME   | VARCHAR2 (128) | Name of the apply process                                                   |
| STARTUP_TIME | DATE           | Network receiver start time                                                 |
| RU_ID        | NUMBER         | Replication unit (RU) identifier                                            |
| SPILL_LWM    | NUMBER         | Highest log index of LCRs that an apply has persisted to its spilled tables |

| Column                             | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| LAST_SENT_LCR_TIME         | DATE          | Creation time of the last sent LCR                                                                                                                                                                                                                                                                                                                                                                                                              |
| ELAPSED_PROPAGATION_TIME   | NUMBER        | Amount of time taken to propagate LCRs (in what unit of time?)                                                                                                                                                                                                                                                                                                                                                                                  |
| AVAILABLE_LCRS             | NUMBER        | Number of LCRs available in outbound queue                                                                                                                                                                                                                                                                                                                                                                                                      |
| SPID                       | VARCHAR2 (12) | OS process identifier                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CONNECT_ERROR_COUNT        | NUMBER        | Number of network sender connection errors                                                                                                                                                                                                                                                                                                                                                                                                      |
| DB_ID                      | NUMBER        | Database identifier                                                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_BYTES_SENT           | NUMBER        | Total number of bytes sent                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID                     | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

#### Note:

This view is available starting with Oracle Database 23c.

## 10.52 V\$SHARD\_REPLICATION\_UNIT

V\$SHARD\_REPLICATION\_UNIT displays information about replication units (RUs) that are present in a shard.

This view displays one row for each RU.

| Column      | Datatype | Description                                                                                                                                                                                                    |
|-------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SHARD_ID    | NUMBER   | Shard database identifier                                                                                                                                                                                      |
| RU_ID       | NUMBER   | Replication unit (RU) identifier                                                                                                                                                                               |
| LEADER_ID   | NUMBER   | Leader's SHARD_ID for the corresponding RU                                                                                                                                                                     |
| ROLE        | NUMBER   | Role of the shard for the RU: <ul style="list-style-type: none"><li>• 1 - The shard is the leader</li><li>• 2 - The shard is the follower</li><li>• 3 - The shard is a candidate for leader election</li></ul> |
| TERM        | NUMBER   | Term number<br>This value is incremented each time a new leader is elected.                                                                                                                                    |
| COMMITIDX   | NUMBER   | LCRs with a log index of COMMITIDX or lower have consensus                                                                                                                                                     |
| OLDAPPIDX   | NUMBER   | Oldest log index that an apply process group may need                                                                                                                                                          |
| APPLYLWMIDX | NUMBER   | Position of apply low watermark on the follower                                                                                                                                                                |
| ONDISKIDX   | NUMBER   | Persisted log index                                                                                                                                                                                            |

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 10.53 V\$SHARED\_POOL\_ADVICE

V\$SHARED\_POOL\_ADVICE displays information about estimated parse time in the shared pool for different pool sizes. The sizes range from 10% of the current shared pool size or the amount of pinned library cache memory (whichever is higher) to 200% of the current shared pool size, in equal intervals. The value of the interval depends on the current size of the shared pool.

| Column                        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| SHARED_POOL_SIZE_FOR_ESTIMATE | NUMBER   | Shared pool size for the estimate (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                                |
| SHARED_POOL_SIZE_FACTOR       | NUMBER   | Size factor with respect to the current shared pool size                                                                                                                                                                                                                                                                                                                                                                                        |
| ESTD_LC_SIZE                  | NUMBER   | Estimated memory in use by the library cache (in megabytes)                                                                                                                                                                                                                                                                                                                                                                                     |
| ESTD_LC_MEMORY_OBJECTS        | NUMBER   | Estimated number of library cache memory objects in the shared pool of the specified size                                                                                                                                                                                                                                                                                                                                                       |
| ESTD_LC_TIME_SAVED            | NUMBER   | Estimated elapsed parse time saved (in seconds), owing to library cache memory objects being found in a shared pool of the specified size. This is the time that would have been spent in reloading the required objects in the shared pool had they been aged out due to insufficient amount of available free memory.                                                                                                                         |
| ESTD_LC_TIME_SAVED_FACTOR     | NUMBER   | Estimated parse time saved factor with respect to the current shared pool size                                                                                                                                                                                                                                                                                                                                                                  |
| ESTD_LC_LOAD_TIME             | NUMBER   | Estimated elapsed time (in seconds) for parsing in a shared pool of the specified size                                                                                                                                                                                                                                                                                                                                                          |
| ESTD_LC_LOAD_TIME_FACTOR      | NUMBER   | Estimated load time factor with respect to the current shared pool size                                                                                                                                                                                                                                                                                                                                                                         |
| ESTD_LC_MEMORY_OBJECT_HITS    | NUMBER   | Estimated number of times a library cache memory object was found in a shared pool of the specified size                                                                                                                                                                                                                                                                                                                                        |
| CON_ID                        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.54 V\$SHARED\_POOL\_RESERVED

V\$SHARED\_POOL\_RESERVED displays statistics that help you tune the reserved pool and space within the shared pool.

| Column                        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FREE_SPACE                    | NUMBER   | Total amount of free space on the reserved list in bytes <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                                 |

| USED_COUNT                    | NUMBER   | Number of used pieces of memory on the reserved list <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                                     |
| MAX_USED_SIZE                 | NUMBER   | Size of the largest used piece of memory on the reserved list in bytes <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                                   |
| REQUESTS                      | NUMBER   | Number of times that the reserved list was searched for a free piece of memory <sup>1</sup>                                                                                                                                                                                                                                                                                                                                                           |
| REQUEST_MISSES                | NUMBER   | Number of times the reserved list did not have a free piece of memory to satisfy the request, and started flushing objects from the LRU list <sup>1</sup>                                                                                                                                                                                                                                                                                             |
| LAST_MISS_SIZE                | NUMBER   | Request size of the last request miss in bytes, when the reserved list did not have a free piece of memory to satisfy the request and started flushing objects from the LRU list <sup>1</sup>                                                                                                                                                                                                                                                         |
| MAX_MISS_SIZE                 | NUMBER   | Request size of the largest request miss in bytes, when the reserved list did not have a free piece of memory to satisfy the request and started flushing objects from the LRU list <sup>1</sup>                                                                                                                                                                                                                                                      |
| REQUEST_FAILURES              | NUMBER   | Number of times that no memory was found to satisfy a request. If an internal flush (used to free up memory) does not meet a memory need, then the error ORA-04031 occurs. <sup>2</sup>                                                                                                                                                                                                                                                               |
| LAST_FAILURE_SIZE             | NUMBER   | Request size of the last failed request in bytes. If an internal flush (used to free up memory) does not meet a memory need, then the error ORA-04031 occurs. <sup>2</sup>                                                                                                                                                                                                                                                                            |
| ABORTED_REQUEST_THRESH<br>OLD | NUMBER   | Minimum size of a request in bytes which signals an ORA-04031 error without flushing objects <sup>2</sup>                                                                                                                                                                                                                                                                                                                                             |
| ABORTED_REQUESTS              | NUMBER   | Number of requests that signalled an ORA-04031 error without flushing objects <sup>2</sup>                                                                                                                                                                                                                                                                                                                                                            |
| LAST_ABORTED_SIZE             | NUMBER   | Last size of the request in bytes that returned an ORA-04031 error without flushing objects from the LRU list <sup>2</sup>                                                                                                                                                                                                                                                                                                                            |
| CON_ID                        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> These columns are valid only if the initialization parameter SHARED\_POOL\_RESERVED\_SIZE is set to a valid value.

<sup>2</sup> These columns contain values which are valid even if SHARED\_POOL\_RESERVED\_SIZE is not set.

## 10.55 V\$SHARED\_SERVER

V\$SHARED\_SERVER displays information on the shared server processes.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| BYTES        | NUMBER        | Total number of bytes in all messages                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| BREAKS       | NUMBER        | Number of breaks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CIRCUIT      | RAW (4   8)   | Address of the circuit currently being serviced                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| IDLE         | NUMBER        | Total idle time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| BUSY         | NUMBER        | Total busy time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| IN_NET       | NUMBER        | Total incoming network wait time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| OUT_NET      | NUMBER        | Total outgoing network wait time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| REQUESTS     | NUMBER        | Total number of requests taken from the common queue in this server's lifetime                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| BOUND_TIME   | NUMBER        | Time that a circuit and shared server have been bound (in centiseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| BOUND_REASON | VARCHAR2 (32) | Provides a reason (a short explanation) for why a shared server and circuit could not be unbound.<br>This column is empty when a circuit is not bound to a server.<br>When the server starts serving a circuit, BOUND_REASON is empty and remains empty unless the server tries unsuccessfully to unbind the circuit (after it finishes serving the current request).<br>When this column is not empty, it will be cleared once the server and circuit are unbound (that is, once the resources preventing the session migration to another shared server are released). |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                          |

## 10.56 V\$SHARED\_SERVER\_MONITOR

V\$SHARED\_SERVER\_MONITOR displays information for tuning the shared server.

| Column              | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MAXIMUM_CONNECTIONS | NUMBER   | Highest number of virtual circuits in use at one time since the instance started. If this value reaches the value set for the CIRCUICTS initialization parameter, then consider raising the value of CIRCUICTS.<br><b>See Also:</b> "CIRCUICTS"                                                                                                                                                                                                 |
| MAXIMUM_SESSIONS    | NUMBER   | Highest number of shared server sessions in use at one time since the instance started. If this reaches the value set for the SHARED_SERVER_SESSIONS initialization parameter, then consider raising the value of SHARED_SERVER_SESSIONS.<br><b>See Also:</b> "SHARED_SERVER_SESSIONS"                                                                                                                                                          |
| SERVERS_STARTED     | NUMBER   | Total number of shared servers started since the instance started (but not including those started during startup)                                                                                                                                                                                                                                                                                                                              |
| SERVERS_TERMINATED  | NUMBER   | Total number of shared servers stopped by Oracle since the instance started                                                                                                                                                                                                                                                                                                                                                                     |
| SERVERS_HIGHWATER   | NUMBER   | Highest number of servers running at one time since the instance started. If this value reaches the value set for the MAX_SHARED_SERVERS initialization parameter, then consider raising the value of SHARED_SERVERS.<br><b>See Also:</b> "SHARED_SERVERS"                                                                                                                                                                                      |
| DISPATCHERS_CPU     | NUMBER   | Total CPU time of all dispatchers since the instance started (in millionths of a second)                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID              | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.57 V\$SHARED\_SERVER\_STAT

V\$SHARED\_SERVER\_STAT displays statistics for all shared server processes. The statistics are cumulative from the start of the instance.

| Column   | Datatype | Description                                                  |
|----------|----------|--------------------------------------------------------------|
| MESSAGES | NUMBER   | Number of messages processed                                 |
| BYTES    | NUMBER   | Total number of bytes in all messages                        |
| IDLE     | NUMBER   | Total idle time (in hundredths of a second)                  |
| BUSY     | NUMBER   | Total busy time (in hundredths of a second)                  |
| IN_NET   | NUMBER   | Total incoming network wait time (in hundredths of a second) |
| OUT_NET  | NUMBER   | Total outgoing network wait time (in hundredths of a second) |

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REQUESTS | NUMBER   | Total number of requests taken from the common queue                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.58 V\$SORT\_SEGMENT

V\$SORT\_SEGMENT displays information about every sort segment in a given instance. The view is only updated when the tablespace is of the TEMPORARY type.

| Column          | Datatype      | Description                                            |
|-----------------|---------------|--------------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2 (30) | Name of the tablespace                                 |
| SEGMENT_FILE    | NUMBER        | File number of the first extent                        |
| SEGMENT_BLOCK   | NUMBER        | Block number of the first extent                       |
| EXTENT_SIZE     | NUMBER        | Extent size                                            |
| CURRENT_USERS   | NUMBER        | Number of active users of the segment                  |
| TOTAL_EXTENTS   | NUMBER        | Total number of extents in the segment                 |
| TOTAL_BLOCKS    | NUMBER        | Total number of blocks in the segment                  |
| USED_EXTENTS    | NUMBER        | Extents allocated to active sorts                      |
| USED_BLOCKS     | NUMBER        | Blocks allocated to active sorts                       |
| FREE_EXTENTS    | NUMBER        | Extents not allocated to any sort                      |
| FREE_BLOCKS     | NUMBER        | Blocks not allocated to any sort                       |
| ADDED_EXTENTS   | NUMBER        | Number of extent allocations                           |
| EXTENT_HITS     | NUMBER        | Number of times an unused extent was found in the pool |
| FREED_EXTENTS   | NUMBER        | Number of deallocated extents                          |
| FREE_REQUESTS   | NUMBER        | Number of requests to deallocate                       |
| MAX_SIZE        | NUMBER        | Maximum number of extents ever used                    |
| MAX_BLOCKS      | NUMBER        | Maximum number of blocks ever used                     |
| MAX_USED_SIZE   | NUMBER        | Maximum number of extents used by all sorts            |
| MAX_USED_BLOCKS | NUMBER        | Maximum number of blocks used by all sorts             |
| MAX_SORT_SIZE   | NUMBER        | Maximum number of extents used by an individual sort   |
| MAX_SORT_BLOCKS | NUMBER        | Maximum number of blocks used by an individual sort    |
| RELATIVE_FNO    | NUMBER        | Relative file number of the sort segment header        |
| TS#             | NUMBER        | Tablespace number                                      |

| Column        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| IS_LOCAL_TEMP | NUMBER   | Indicates whether the sort segment is allocated from a local temporary tablespace (1) or not (0).                                                                                                                                                                                                                                                                                                                                               |

## 10.59 V\$SPPARAMETER

V\$SPPARAMETER displays information about the contents of the server parameter file. If a server parameter file was not used to start the instance, then each row of the view will contain FALSE in the ISSPECIFIED column.

| Column         | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FAMILY         | VARCHAR2(80)   | For internal use only                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SID            | VARCHAR2 (80)  | SID for which the parameter is defined.                                                                                                                                                                                                                                                                                                                                                                                                         |
| NAME           | VARCHAR2 (80)  | Name of the parameter                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TYPE           | VARCHAR2 (11)  | Parameter type                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| VALUE          | VARCHAR2 (255) | Parameter value (null if a server parameter file was not used to start the instance)                                                                                                                                                                                                                                                                                                                                                            |
| DISPLAY_VALUE  | VARCHAR2 (255) | Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.                                                                                                                                                                                                                                                         |
| ISSPECIFIED    | VARCHAR2 (6)   | Indicates whether the parameter was specified in the server parameter file (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                |
| ORDINAL        | NUMBER         | Position (ordinal number) of the parameter value (0 if a server parameter file was not used to start the instance). Useful only for parameters whose values are lists of strings.                                                                                                                                                                                                                                                               |
| UPDATE_COMMENT | VARCHAR2 (255) | Comments associated with the most recent update (null if a server parameter file was not used to start the instance)                                                                                                                                                                                                                                                                                                                            |
| CON_ID         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.60 V\$SQL

V\$SQL lists statistics on shared SQL areas without the GROUP BY clause and contains one row for each child of the original SQL text entered. Statistics displayed in V\$SQL are normally

updated at the end of query execution. However, for long running queries, they are updated every 5 seconds. This makes it easy to see the impact of long running SQL statements while they are still in progress.

| Column                | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TEXT              | VARCHAR2 (1000) | First thousand characters of the SQL text for the current cursor                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_FULLTEXT          | CLOB            | Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the V\$SQLTEXT dynamic performance view.                                                                                                                                                                                                                                                                                      |
| SQL_ID                | VARCHAR2 (13)   | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SHARABLE_MEM          | NUMBER          | Amount of shared memory used by the child cursor (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PERSISTENT_MEM        | NUMBER          | Fixed amount of memory used for the lifetime of the child cursor (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                         |
| RUNTIME_MEM           | NUMBER          | Fixed amount of memory required during the execution of the child cursor                                                                                                                                                                                                                                                                                                                                                                                                            |
| SORTS                 | NUMBER          | Number of sorts that were done for the child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LOADED_VERSIONS       | NUMBER          | Indicates whether the context heap is loaded (1) or not (0)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| OPEN_VERSIONS         | NUMBER          | Indicates whether the child cursor is locked (1) or not (0)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| USERS_OPENING         | NUMBER          | Number of users that have any of the child cursors open                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FETCHES               | NUMBER          | Number of fetches associated with the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| EXECUTIONS            | NUMBER          | Number of executions that took place on this object since it was brought into the library cache                                                                                                                                                                                                                                                                                                                                                                                     |
| PX_SERVERS_EXECUTIONS | NUMBER          | Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)                                                                                                                                                                                                                                                                                                                                                       |
| END_OF_FETCH_COUNT    | NUMBER          | Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column. |
| USERS_EXECUTING       | NUMBER          | Number of users executing the statement                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| LOADS                 | NUMBER          | Number of times the object was either loaded or reloaded                                                                                                                                                                                                                                                                                                                                                                                                                            |
| FIRST_LOAD_TIME       | VARCHAR2 (76)   | Timestamp of the parent creation time                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| INVALIDATIONS         | NUMBER          | Number of times this child cursor has been invalidated                                                                                                                                                                                                                                                                                                                                                                                                                              |

| OPTIMIZER_COST           | NUMBER         | Cost of this query given by the optimizer                                                                                                                                                                                                                                                                                                                            |
| OPTIMIZER_ENV            | RAW (2000)     | Optimizer environment                                                                                                                                                                                                                                                                                                                                                |
| OPTIMIZER_ENV_HASH_VALUE | NUMBER         | Hash value for the optimizer environment                                                                                                                                                                                                                                                                                                                             |
| PARSING_USER_ID          | NUMBER         | User ID of the user who originally built this child cursor                                                                                                                                                                                                                                                                                                           |
| PARSING_SCHEMA_ID        | NUMBER         | Schema ID that was used to originally build this child cursor                                                                                                                                                                                                                                                                                                        |
| PARSING_SCHEMA_NAME      | VARCHAR2 (128) | Schema name that was used to originally build this child cursor                                                                                                                                                                                                                                                                                                      |
| KEPT_VERSIONS            | NUMBER         | Indicates whether this child cursor has been marked to be kept pinned in the cache using the <code>DBMS_SHARED_POOL</code> package                                                                                                                                                                                                                                   |
| ADDRESS                  | RAW (4   8)    | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                                                  |
| TYPE_CHK_HEAP            | RAW (4   8)    | Descriptor of the type check heap for this child cursor                                                                                                                                                                                                                                                                                                              |
| HASH_VALUE               | NUMBER         | Hash value of the parent statement in the library cache                                                                                                                                                                                                                                                                                                              |
| OLD_HASH_VALUE           | NUMBER         | Old SQL hash value                                                                                                                                                                                                                                                                                                                                                   |
| PLAN_HASH_VALUE          | NUMBER         | Numeric representation of the current SQL plan for this cursor. Comparing one <code>PLAN_HASH_VALUE</code> to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).                                                                                                                                    |
| FULL_PLAN_HASH_VALUE     | NUMBER         | Numeric representation of the complete SQL plan for this cursor. Comparing one <code>FULL_PLAN_HASH_VALUE</code> to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the <code>FULL_PLAN_HASH_VALUE</code> cannot be compared across databases releases. It is not backward compatible. |
| CHILD_NUMBER             | NUMBER         | Number of this child cursor                                                                                                                                                                                                                                                                                                                                          |
| SERVICE                  | VARCHAR2 (64)  | Service name                                                                                                                                                                                                                                                                                                                                                         |
| SERVICE_HASH             | NUMBER         | Hash value for the name listed in the <code>SERVICE</code> column                                                                                                                                                                                                                                                                                                    |
| MODULE                   | VARCHAR2 (64)  | Contains the name of the module that was executing when the SQL statement was first parsed, which is set by calling <code>DBMS_APPLICATION_INFO.SET_MODULE</code>                                                                                                                                                                                                    |
| MODULE_HASH              | NUMBER         | Hash value of the module listed in the <code>MODULE</code> column                                                                                                                                                                                                                                                                                                    |
| ACTION                   | VARCHAR2 (64)  | Contains the name of the action that was executing when the SQL statement was first parsed, which is set by calling <code>DBMS_APPLICATION_INFO.SET_ACTION</code>                                                                                                                                                                                                    |
| ACTION_HASH              | NUMBER         | Hash value of the action listed in the <code>ACTION</code> column                                                                                                                                                                                                                                                                                                    |
| SERIALIZABLE_ABORTS      | NUMBER         | Number of times the transaction failed to serialize, producing <code>ORA-08177</code> errors, per cursor                                                                                                                                                                                                                                                             |
| OUTLINE_CATEGORY         | VARCHAR2 (64)  | If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise the column is left blank.                                                                                                                                                                                                             |

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU_TIME           | NUMBER        | CPU time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                                                                                                                                                                                                                                                                                                                                        |
| ELAPSED_TIME       | NUMBER        | Elapsed database time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then <code>ELAPSED_TIME</code> is the cumulative time for the query coordinator, plus all parallel query worker processes.<br>Note that this column displays database time, not wall clock time. In some cases, <code>ELAPSED_TIME</code> can exceed the duration of the query. For example, this can occur for parallel queries. |
| OUTLINE_SID        | NUMBER        | Outline session identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CHILD_ADDRESS      | RAW(4   8)    | Address of the child cursor                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| SQLTYPE            | NUMBER        | Denotes the version of the SQL language used for this statement                                                                                                                                                                                                                                                                                                                                                                                                            |
| REMOTE             | VARCHAR2(1)   | Indicates whether the cursor is remote mapped (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                               |
| OBJECT_STATUS      | VARCHAR2(19)  | Status of the cursor: <ul style="list-style-type: none"> <li>VALID - Valid, authorized without errors</li> <li>VALID_AUTH_ERROR - Valid, authorized with authorization errors</li> <li>VALID_COMPILE_ERROR - Valid, authorized with compilation errors</li> <li>VALID_UNAUTH - Valid, unauthorized</li> <li>INVALID_UNAUTH - Invalid, unauthorized</li> <li>INVALID - Invalid, unauthorized but keep the timestamp</li> </ul>                                              |
| LITERAL_HASH_VALUE | NUMBER        | Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when <code>CURSOR_SHARING</code> is used. This is not the hash value for the SQL statement. If <code>CURSOR_SHARING</code> is not used, then the value is 0.                                                                                                                                                                                                     |
| LAST_LOAD_TIME     | VARCHAR2(76)  | Time at which the query plan was loaded into the library cache                                                                                                                                                                                                                                                                                                                                                                                                             |
| IS_OBSOLETE        | VARCHAR2(1)   | Indicates whether the cursor has become obsolete (Y) or not (N). This can happen if the number of child cursors is too large.                                                                                                                                                                                                                                                                                                                                              |
| IS_BIND_SENSITIVE  | VARCHAR2(1)   | Indicates whether the cursor is bind sensitive (Y) or not (N). A query is considered bind-sensitive if the optimizer peeked at one of its bind variable values when computing predicate selectivities and where a change in a bind variable value may cause the optimizer to generate a different plan.                                                                                                                                                                    |
| IS_BIND_AWARE      | VARCHAR2(1)   | Indicates whether the cursor is bind aware (Y) or not (N). A query is considered bind-aware if it has been marked to use extended cursor sharing. The query would already have been marked as bind-sensitive.                                                                                                                                                                                                                                                              |
| IS_SHAREABLE       | VARCHAR2(1)   | Indicates whether the cursor can be shared (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CHILD_LATCH        | NUMBER        | Child latch number that is protecting the cursor. This column is obsolete and maintained for backward compatibility.                                                                                                                                                                                                                                                                                                                                                       |
| SQL_PROFILE        | VARCHAR2(64)  | SQL profile used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                                                                |
| SQL_PATCH          | VARCHAR2(128) | SQL patch used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SQL_PLAN_BASELINE  | VARCHAR2(128) | SQL plan baseline used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PROGRAM_ID         | NUMBER        | Program identifier                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| PROGRAM_LINE#      | NUMBER        | Program line number                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Column                         | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXACT_MATCHING_SIGNATURE       | NUMBER      | Signature calculated on the normalized SQL text. The normalization includes the removal of white space and the uppercasing of all non-literal strings.                                                                                                                                                                                                                                                                                                       |
| FORCE_MATCHING_SIGNATURE       | NUMBER      | Signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>FORCE</code>                                                                                                                                                                                                                                                                                                                                                                   |
| LAST_ACTIVE_TIME               | DATE        | Time at which the query plan was last active                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BIND_DATA                      | RAW(2000)   | Bind data                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TYPECHECK_MEM                  | NUMBER      | Typecheck memory                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| IO_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER      | Number of I/O bytes which can be filtered by the Exadata storage system<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                                                        |
| IO_INTERCONNECT_BYTES          | NUMBER      | Number of I/O bytes exchanged between Oracle Database and the storage system                                                                                                                                                                                                                                                                                                                                                                                 |
| PHYSICAL_READ_REQUESTS         | NUMBER      | Number of physical read I/O requests issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                             |
| PHYSICAL_READ_BYTES            | NUMBER      | Number of bytes read from disks by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                                         |
| PHYSICAL_WRITE_REQUESTS        | NUMBER      | Number of physical write I/O requests issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                            |
| PHYSICAL_WRITE_BYTES           | NUMBER      | Number of bytes written to disks by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                                        |
| OPTIMIZED_PHY_READ_REQUESTS    | NUMBER      | Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                             |
| LOCKED_TOTAL                   | NUMBER      | Total number of times the child cursor has been locked                                                                                                                                                                                                                                                                                                                                                                                                       |
| PINNED_TOTAL                   | NUMBER      | Total number of times the child cursor has been pinned                                                                                                                                                                                                                                                                                                                                                                                                       |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER      | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                       |
| IO_CELL_OFFLOAD_RETURNED_BYTES | NUMBER      | Number of filtered bytes returned by Exadata cells (that is, the number of bytes returned after processing has been offloaded on the Exadata cells)<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                            |
| CON_ID                         | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>              |
| IS_REOPTIMIZABLE               | VARCHAR2(1) | This column shows whether the next execution matching this child cursor will trigger a reoptimization. The values are: <ul style="list-style-type: none"> <li>Y: If the next execution will trigger a reoptimization</li> <li>R: If the child cursor contains reoptimization information, but will not trigger reoptimization because the cursor was compiled in reporting mode</li> <li>N: If the child cursor has no reoptimization information</li> </ul> |

| Column                     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IS_RESOLVED_ADAPTIVE_PLAN  | VARCHAR2 (1)   | This column shows whether all of the adaptive parts of a plan have been resolved to the final plan. Once the plan is resolved, the plan hash value and the plan displayed by <code>DBMS_XPLAN</code> will not change through the end of execution. The values for this column are: <ul style="list-style-type: none"> <li>NULL: If the plan is not adaptive</li> <li>Y: If the plan is fully resolved</li> <li>N: If the plan is not yet fully resolved</li> </ul> <b>See Also:</b> <i>Oracle Database PL/SQL Packages and Types Reference</i> for more information about the <code>DBMS_XPLAN</code> package |
| IM_SCANS                   | NUMBER         | Number of In-Memory Column Store (IM column store) segment scans                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| IM_SCAN_BYTES_UNCOMPRESSED | NUMBER         | Uncompressed size of data scanned from the IM column store                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| IM_SCAN_BYTES_INMEMORY     | NUMBER         | In-memory size of data scanned from the IM column store                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DDL_NO_INVALIDATE          | VARCHAR2 (1)   | Indicates if a DDL statement updated a dependent object and did not invalidate this cursor. The values are: <ul style="list-style-type: none"> <li>N: There has not been a DDL statement that updated a dependent object without invalidating this cursor.</li> <li>Y: A DDL statement updated a dependent object and did not invalidate this cursor, but the cursor has not executed since this happened.</li> <li>X: A DDL statement updated a dependent object and did not invalidate this cursor, and the cursor has executed since this happened.</li> </ul>                                             |
| IS_ROLLING_INVALID         | VARCHAR2 (1)   | Indicates if this cursor is rolling invalidated. The values are: <ul style="list-style-type: none"> <li>N: This cursor is not rolling invalidated.</li> <li>Y: This cursor is rolling invalidated, but the cursor has not executed in this state.</li> <li>X: This cursor is rolling invalidated, and the cursor has executed in this state.</li> </ul>                                                                                                                                                                                                                                                       |
| IS_ROLLING_REFRESH_INVALID | VARCHAR2 (1)   | Indicates if this cursor is rolling invalidated and requires execution time refresh. The values are: <ul style="list-style-type: none"> <li>N: This cursor is not a cursor that is rolling invalidated and requires execution time refresh.</li> <li>Y: This cursor is rolling invalidated and requires execution time refresh, but the cursor has not executed in this state.</li> <li>X: This cursor is rolling invalidated and requires execution time refresh, and the cursor has executed in this state.</li> </ul>                                                                                      |
| RESULT_CACHE               | VARCHAR2 (1)   | Indicates whether the SQL statement used the result cache (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| SQL_QUARANTINE             | VARCHAR2 (128) | If the execution plan for this cursor is quarantined, then this column contains the name of the SQL quarantine configuration (corresponds to the <code>NAME</code> column in the <code>DBA_SQL_QUARANTINE</code> view). Otherwise, this column is null.                                                                                                                                                                                                                                                                                                                                                       |
| AVOIDED_EXECUTIONS         | NUMBER         | Number of times this cursor was prevented from being used due to the plan being quarantined                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| HEAP0_LOAD_TIME            | DATE           | Time at which heap0 of the library cache object was loaded                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Column                        | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HEAP6_LOAD_TIME               | DATE     | Time at which heap6 of the library cache object was loaded<br>A time difference of more than one minute between HEAP0_LOAD_TIME and HEAP6_LOAD_TIME indicates that heap6 has been partially reloaded. For example, the database might have aged out heap6 due to shared pool space pressure and reloaded it at a later time.                                                                                                                                                                                                                                 |
| RESULT_CACHE_REJECTION_REASON | NUMBER   | Numeric code representing the reason for a result cache rejection<br>This column is populated when the query contains a result cache row source (RESULT_CACHE=Y), but fails to create or finish writing a result object. The reason for this failure is recorded as a numeric code in this column. See <a href="#">Table 10-2</a> for a list of rejection codes and recommended remedial actions.<br>If the query does not contain a result cache row source (RESULT_CACHE=N) or the query reused an existing result, then the value of this column is null. |

**Table 10-2 Result Cache Rejection Reason Codes**

| Code | Reason for Result Cache Rejection                        | Recommended Remedial Action                                                                                                                                                                       |
|------|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0    | Success                                                  | N/A                                                                                                                                                                                               |
| 1000 | Result size exceeds per-result limit for in-memory       | Increase the value of one or both of the RESULT_CACHE_MAX_SIZE and RESULT_CACHE_MAX_RESULT initialization parameters, or enable spilling results to disk.                                         |
| 1001 | Result size exceeds per-result limit on disk             | Increase the value of one or both of the RESULT_CACHE_MAX_TEMP_SIZE and RESULT_CACHE_MAX_TEMP_RESULT initialization parameters.                                                                   |
| 2000 | Unable to acquire enqueues                               | The system is busy; try again later.                                                                                                                                                              |
| 2001 | Unable to acquire a DML locks on a referenced object     | The system is busy; try again later.                                                                                                                                                              |
| 2002 | Unable to acquire a row cache lock on referenced objects | The system is busy; try again later.                                                                                                                                                              |
| 2003 | Unable to allocate memory                                | The system is busy; try again later.                                                                                                                                                              |
| 3000 | Result cache ID for the query is blocklisted             | Remove the cache ID from the blocklist by using the DBMS_RESULT_CACHE package. Exercise caution because the query may have been intentionally blocklisted.                                        |
| 3001 | An object referenced in the query is blocklisted         | Remove the object ID from the blocklist by using the DBMS_RESULT_CACHE package. Exercise caution because the object may have been intentionally blocklisted.                                      |
| 4001 | Result cache is bypassed                                 | The result cache was bypassed with DBMS_RESULT_CACHE.BYPASS or by setting the RESULT_CACHE_MAX_SIZE initialization parameter to 0. Exercise caution because the bypass may have been intentional. |

Table 10-2 (Cont.) Result Cache Rejection Reason Codes

| Code | Reason for Result Cache Rejection                                    | Recommended Remedial Action                                                                                                                                                                                                                                                                                      |
|------|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4002 | Result cache is corrupt                                              | Reset the result cache by using <code>DBMS_RESULT_CACHE.FLUSH</code> . If that does not resolve the problem, then restart the PDB or instance.                                                                                                                                                                   |
| 4003 | RCBG process is down in Oracle RAC                                   | Restart the Oracle RAC instance                                                                                                                                                                                                                                                                                  |
| 4004 | The query was only partially executed                                | The cursor should be fully executed. If the cursor is being executed as part of PL/SQL, then it should be fetched from until the <code>NO_DATA_FOUND</code> error is returned. If the cursor is being executed as part of a SQL query, then do not cancel it by terminating the process (such as typing CTRL+C). |
| 4005 | Temporary space cannot be allocated because the RCBG process is down | Restart the Oracle RAC instance                                                                                                                                                                                                                                                                                  |
| 9999 | Unknown reason                                                       | Unknown                                                                                                                                                                                                                                                                                                          |

## 10.61 V\$SQL\_BIND\_CAPTURE

`V$SQL_BIND_CAPTURE` displays information on bind variables used by SQL cursors. Each row in the view contains information for one bind variable defined in a cursor. This includes:

- Reference to the cursor defining the bind variable  
(`hash_value`, `address`) for the parent cursor and (`hash_value`, `child_address`) for the child cursor.
- Bind metadata  
Name, position, data type, character set ID, precision, scale, and maximum length of the bind variable.
- Bind data

One of the bind values used for the bind variable during a past execution of its associated SQL statement. Bind values are not always captured for this view. Bind values are displayed by this view only when the type of the bind variable is simple (this excludes LONG, LOB, and ADT data types) and when the bind variable is used in the WHERE or HAVING clauses of the SQL statement.

Bind capture is disabled when the STATISTICS\_LEVEL initialization parameter is set to BASIC. This view can be joined with V\$SQLAREA on (HASH\_VALUE, ADDRESS) and with V\$SQL on (HASH\_VALUE, CHILD\_ADDRESS).

| Column          | Datatype       | Description                                                                                                                                                                                                                                                              |
|-----------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS         | RAW(4   8)     | Address of the parent cursor                                                                                                                                                                                                                                             |
| HASH_VALUE      | NUMBER         | Hash value of the parent cursor in the library cache. The hash value is a fixed index for the view and should always be used to speed up access to the view.                                                                                                             |
| SQL_ID          | VARCHAR2(13)   | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                 |
| CHILD_ADDRESS   | RAW(4   8)     | Address of the child cursor                                                                                                                                                                                                                                              |
| CHILD_NUMBER    | NUMBER         | Child cursor number                                                                                                                                                                                                                                                      |
| NAME            | VARCHAR2(128)  | Name of the bind variable                                                                                                                                                                                                                                                |
| POSITION        | NUMBER         | Position of the bind variable in the SQL statement                                                                                                                                                                                                                       |
| DUP_POSITION    | NUMBER         | If the binding is performed by name and the bind variable is duplicated, then this column gives the position of the primary bind variable.                                                                                                                               |
| DATATYPE        | NUMBER         | Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.                                                                                                                        |
| DATATYPE_STRING | VARCHAR2(15)   | Textual representation of the bind data type. Beginning in Oracle Database 12c, a text representation of a PL/SQL-only data type can appear in this column. If the actual data type is a PL/SQL sub type, the name of the data type, not the sub type will be displayed. |
| CHARACTER_SID   | NUMBER         | National character set identifier                                                                                                                                                                                                                                        |
| PRECISION       | NUMBER         | Precision (for numeric binds)                                                                                                                                                                                                                                            |
| SCALE           | NUMBER         | Scale (for numeric binds)                                                                                                                                                                                                                                                |
| MAX_LENGTH      | NUMBER         | Maximum bind length                                                                                                                                                                                                                                                      |
| WAS_CAPTURED    | VARCHAR2(3)    | Indicates whether the bind value was captured (YES) or not (NO)                                                                                                                                                                                                          |
| LAST_CAPTURED   | DATE           | Date when the bind value was captured. Bind values are captured when SQL statements are executed. To limit the overhead, binds are captured at most every 15 minutes for a given cursor.                                                                                 |
| VALUE_STRING    | VARCHAR2(4000) | Value of the bind represented as a string                                                                                                                                                                                                                                |
| VALUE_ANYDATA   | ANYDATA        | Value of the bind represented using the ANYDATA data type. This representation is useful to programmatically decode the value of the bind variable. This column is NULL if a PL/SQL-only data type appears in the DATATYPE column.                                       |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.62 V\$SQL\_BIND\_DATA

V\$SQL\_BIND\_DATA describes information related to bind variables.

V\$SQL\_BIND\_DATA describes, for each distinct bind variable in each cursor owned by the session querying this view:

- Actual bind data, if the bind variable is user defined
- The underlying literal, if the CURSOR\_SHARING parameter is set to FORCE and the bind variable is system generated. (System-generated binds have a value of 256 in the SHARED\_FLAG2 column.)

| Column          | Datatype    | Description                                                                                                                                       |
|-----------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| CURSOR_NUM      | NUMBER      | Cursor number for this bind                                                                                                                       |
| POSITION        | NUMBER      | Bind position                                                                                                                                     |
| DATATYPE        | NUMBER      | Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column. |
| SHARED_MAX_LEN  | NUMBER      | Shared maximum length for this bind from the shared cursor object associated with this bind                                                       |
| PRIVATE_MAX_LEN | NUMBER      | Private maximum length for this bind sent from the client                                                                                         |
| ARRAY_SIZE      | NUMBER      | Maximum number of array elements (for array binds only)                                                                                           |
| PRECISION       | NUMBER      | Precision (for numeric binds)                                                                                                                     |
| SCALE           | NUMBER      | Scale (for numeric binds)                                                                                                                         |
| SHARED_FLAG     | NUMBER      | Shared bind data flags                                                                                                                            |

## 10.63 V\$SQL\_BIND\_METADATA

V\$SQL\_BIND\_METADATA describes metadata related to bind variables.

V\$SQL\_BIND\_METADATA describes, for each distinct bind variable in each cursor owned by the session querying this view:

- Bind metadata provided by the client, if the bind variable is user defined
- Metadata based on the underlying literal, if the CURSOR\_SHARING parameter is set to FORCE and the bind variable is system-generated.

| Column     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS    | RAW (4   8)    | Memory address of the child cursor that owns this bind variable                                                                                                                                                                                                                                                                                                                                                                                 |
| POSITION   | NUMBER         | Bind position                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DATATYPE   | NUMBER         | Internal identifier for the bind data type. Beginning in Oracle Database 12c, a number representing a PL/SQL data type can appear in this column.                                                                                                                                                                                                                                                                                               |
| MAX_LENGTH | NUMBER         | Maximum length of the bind value                                                                                                                                                                                                                                                                                                                                                                                                                |
| ARRAY_LEN  | NUMBER         | Maximum number of array elements (for array binds only)                                                                                                                                                                                                                                                                                                                                                                                         |
| BIND_NAME  | VARCHAR2 (128) | User-defined or system-generated bind variable name (if used)                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID     | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.64 V\$SQL\_CS\_HISTOGRAM

V\$SQL\_CS\_HISTOGRAM summarizes the monitoring information stored by adaptive cursor sharing. This information is used to decide whether to enable extended cursor sharing for a query. It is stored in a histogram, whose bucket's contents are exposed by this view.

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS      | RAW(4   8)   | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                                                                                                                             |
| HASH_VALUE   | NUMBER       | Hash value of the parent statement in the library cache                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_ID       | VARCHAR2(13) | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                                                                                                                        |
| CHILD_NUMBER | NUMBER       | Number of the child cursor being monitored                                                                                                                                                                                                                                                                                                                                                                                                      |
| BUCKET_ID    | NUMBER       | Bucket number of the monitoring histogram                                                                                                                                                                                                                                                                                                                                                                                                       |
| COUNT        | NUMBER       | Value in this bucket of the histogram                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID       | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.65 V\$SQL\_CS\_SELECTIVITY

V\$SQL\_CS\_SELECTIVITY exposes the valid selectivity ranges for a child cursor in extended cursor sharing mode. A valid range consists of a low and high value for each predicate containing binds. Each predicate's selectivity (with the current bind value) must fall between the corresponding low and high values in order for the child cursor to be shared.

| Column       | Datatype     | Description                                                                               |
|--------------|--------------|-------------------------------------------------------------------------------------------|
| ADDRESS      | RAW(4   8)   | Address of the handle to the parent for this cursor                                       |
| HASH_VALUE   | NUMBER       | Hash value of the parent statement in the library cache                                   |
| SQL_ID       | VARCHAR2(13) | SQL identifier of the parent cursor in the library cache                                  |
| CHILD_NUMBER | NUMBER       | Number of the child cursor                                                                |
| PREDICATE    | VARCHAR2(40) | Predicate whose selectivity must fall between low and high values                         |
| RANGE_ID     | NUMBER       | Identifier for the range used to match up the low and high values for multiple predicates |
| LOW          | VARCHAR2(10) | Lower bound for allowable selectivity                                                     |
| HIGH         | VARCHAR2(10) | Upper bound for allowable selectivity                                                     |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.66 V\$SQL\_CS\_STATISTICS

V\$SQL\_CS\_STATISTICS contains the raw execution statistics used by the monitoring component of adaptive cursor sharing. A sample of the executions is monitored. This view exposes which executions were sampled, and what the statistics were for those executions. The statistics are cumulative for each distinct set of bind values.

| Column              | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS             | RAW(4   8)   | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                                                                                                                             |
| HASH_VALUE          | NUMBER       | Hash value of the parent statement in the library cache                                                                                                                                                                                                                                                                                                                                                                                         |
| SQL_ID              | VARCHAR2(13) | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                                                                                                                        |
| CHILD_NUMBER        | NUMBER       | Number of the child cursor being monitored                                                                                                                                                                                                                                                                                                                                                                                                      |
| BIND_SET_HASH_VALUE | NUMBER       | Hash of the values of the binds                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PEEKED              | VARCHAR2(1)  | Indicates if this is the bind set used to build the cursor (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                       |
| EXECUTIONS          | NUMBER       | Number of times this bind set has been executed and monitored                                                                                                                                                                                                                                                                                                                                                                                   |
| ROWS_PROCESSED      | NUMBER       | Cumulative number of rows processed by all row sources in the plan over all monitored executions with this bind set                                                                                                                                                                                                                                                                                                                             |
| BUFFER_GETS         | NUMBER       | Cumulative number of buffer gets over all monitored executions with this bind set                                                                                                                                                                                                                                                                                                                                                               |
| CPU_TIME            | NUMBER       | Cumulative CPU time (in microseconds) used by this cursor for monitored executions with this bind set                                                                                                                                                                                                                                                                                                                                           |
| CON_ID              | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.67 V\$SQL\_CURSOR

V\$SQL\_CURSOR displays debugging information for each cursor associated with the session querying this view.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CURNO         | NUMBER        | Cursor number                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| FLAG          | NUMBER        | Flags set in the cursor                                                                                                                                                                                                                                                                                                                                                                                                                         |
| STATUS        | VARCHAR2 (9)  | Status of the cursor; that is, what state the cursor is in                                                                                                                                                                                                                                                                                                                                                                                      |
| PARENT_HANDLE | RAW (4   8)   | Pointer to the parent cursor handle                                                                                                                                                                                                                                                                                                                                                                                                             |
| PARENT_LOCK   | RAW (4   8)   | Pointer to the parent cursor lock                                                                                                                                                                                                                                                                                                                                                                                                               |
| CHILD_LOCK    | RAW (4   8)   | Pointer to the child cursor lock                                                                                                                                                                                                                                                                                                                                                                                                                |
| CHILD_PIN     | RAW (4   8)   | Pointer to the child cursor pin                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PERS_HEAP_MEM | NUMBER        | Total amount of memory allocated from persistent heap for this cursor                                                                                                                                                                                                                                                                                                                                                                           |
| WORK_HEAP_MEM | NUMBER        | Total amount of memory allocated from the work heap for this cursor                                                                                                                                                                                                                                                                                                                                                                             |
| BIND_VARS     | NUMBER        | Total number of bind positions in the query currently parsed into this cursor                                                                                                                                                                                                                                                                                                                                                                   |
| DEFINE_VARS   | NUMBER        | Total number of define variables in the query currently parsed into this cursor                                                                                                                                                                                                                                                                                                                                                                 |
| BIND_MEM_LOC  | VARCHAR2 (64) | Which memory heap the bind variables are stored in: either the UGA or the CGA                                                                                                                                                                                                                                                                                                                                                                   |
| INST_FLAG     | VARCHAR2 (64) | Instantiation object flags                                                                                                                                                                                                                                                                                                                                                                                                                      |
| INST_FLAG2    | VARCHAR2 (64) | Instantiation object flags (continued)                                                                                                                                                                                                                                                                                                                                                                                                          |
| CHILD_HANDLE  | RAW (4   8)   | Pointer to the child cursor handle                                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID        | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.68 V\$SQL\_HISTORY

V\$SQL\_HISTORY displays SQL statements tracked by SQL history monitoring.

This view is populated only when the SQL\_HISTORY initialization parameter is set to true.

| Column       | Datatype      | Description                                                                                    |
|--------------|---------------|------------------------------------------------------------------------------------------------|
| KEY          | NUMBER        | Artificial key to efficiently read a specific SQL history data entry<br>For internal use only. |
| SQL_ID       | VARCHAR2 (13) | SQL identifier of the SQL statement                                                            |
| ELAPSED_TIME | NUMBER        | Elapsed time (in microseconds) for the SQL statement                                           |
| CPU_TIME     | NUMBER        | CPU time (in microseconds) for the SQL statement                                               |
| BUFFER_GETS  | NUMBER        | Number of buffer get operations for the SQL statement                                          |

| Column                         | Datatype      | Description                                                                                                                                                                                                                  |
|--------------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IO_INTERCONNECT_BYTES          | NUMBER        | Number of I/O bytes exchanged between Oracle Database and the storage system for the SQL statement                                                                                                                           |
| PHYSICAL_READ_REQUESTS         | NUMBER        | Number of physical read I/O requests issued by the SQL statement                                                                                                                                                             |
| PHYSICAL_READ_BYTES            | NUMBER        | Number of bytes read from disk by the SQL statement                                                                                                                                                                          |
| PHYSICAL_WRITE_REQUESTS        | NUMBER        | Number of physical write I/O requests issued by the SQL statement                                                                                                                                                            |
| PHYSICAL_WRITE_BYTES           | NUMBER        | Number of bytes written to disk by the SQL statement                                                                                                                                                                         |
| PLSQL_EXEC_TIME                | NUMBER        | PL/SQL execution time (in microseconds) for the SQL statement                                                                                                                                                                |
| JAVA_EXEC_TIME                 | NUMBER        | Java execution time (in microseconds) for the SQL statement                                                                                                                                                                  |
| CLUSTER_WAIT_TIME              | NUMBER        | Cluster wait time (in microseconds) for the SQL statement                                                                                                                                                                    |
| CONCURRENCY_WAIT_TIME          | NUMBER        | Concurrency wait time (in microseconds) for the SQL statement                                                                                                                                                                |
| APPLICATION_WAIT_TIME          | NUMBER        | Application wait time (in microseconds) for the SQL statement                                                                                                                                                                |
| USER_IO_WAIT_TIME              | NUMBER        | User I/O Wait Time (in microseconds) for the SQL statement                                                                                                                                                                   |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER        | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells for the SQL statement<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information |
| IO_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER        | Number of I/O bytes that can be filtered by the Exadata storage system for the SQL statement<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                   |
| SQL_TEXT                       | VARCHAR2(100) | Up to the first 100 characters of the text of the SQL statement                                                                                                                                                              |
| PLAN_HASH_VALUE                | NUMBER        | SQL plan hash value                                                                                                                                                                                                          |
| SQL_EXEC_ID                    | NUMBER        | SQL execution identifier                                                                                                                                                                                                     |
| SQL_EXEC_START                 | DATE          | Time at which the SQL statement execution started                                                                                                                                                                            |
| LAST_ACTIVE_TIME               | DATE          | Time at which the SQL statement execution was last active                                                                                                                                                                    |
| SESSION_USER#                  | NUMBER        | Unique ID number for the session user who issued the SQL statement                                                                                                                                                           |
| CURRENT_USER#                  | NUMBER        | Unique number identifying the current user                                                                                                                                                                                   |
| CHILD_NUMBER                   | NUMBER        | Child number of the SQL statement                                                                                                                                                                                            |
| SID                            | NUMBER        | Session ID for the SQL statement's session                                                                                                                                                                                   |
| SESSION_SERIAL#                | NUMBER        | Session serial number for the SQL statement's session                                                                                                                                                                        |
| MODULE_HASH                    | NUMBER        | Hash value for the module name corresponding to the executing session                                                                                                                                                        |
| ACTION_HASH                    | NUMBER        | Hash value for the action name corresponding to the executing session                                                                                                                                                        |
| SERVICE_HASH                   | NUMBER        | Hash value for the service name corresponding to the executing session                                                                                                                                                       |
| IS_FULL_SQLTEXT                | VARCHAR2(1)   | Indicates whether the <code>SQL_TEXT</code> column displays the entire SQL text (Y) or not (N)                                                                                                                               |
| ERROR_SIGNALLED                | VARCHAR2(1)   | Indicates whether the SQL statement generated an error (Y) or not (N)                                                                                                                                                        |

| Column         | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ERROR_NUMBER   | NUMBER       | If the SQL statement failed to execute, the error number (for example, 932 for error ORA-00932)                                                                                                                                                                                                                                                                                                                                                 |
| ERROR_FACILITY | VARCHAR2 (4) | If the SQL statement failed to execute, the error facility (for example, ORA for error ORA-00932)                                                                                                                                                                                                                                                                                                                                               |
| STATEMENT_TYPE | VARCHAR2 (5) | Type of SQL statement: <ul style="list-style-type: none"> <li>DDL</li> <li>DML</li> <li>PLSQL</li> <li>QUERY</li> <li>OTHER</li> </ul>                                                                                                                                                                                                                                                                                                          |
| IS_PARALLEL    | VARCHAR2 (1) | Indicates whether the SQL ran as a parallel execution (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID         | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.69 V\$SQL\_JOIN\_FILTER

V\$SQL\_JOIN\_FILTER displays performance information about the characteristics of join filters when they are used for a parallel cursor. (A join filter is a bitmap filter applied to table rows before a join operation in order to avoid parallel communication.)

| Column              | Datatype | Description                                                                                                      |
|---------------------|----------|------------------------------------------------------------------------------------------------------------------|
| QC_SESSION_ID       | NUMBER   | QC (Query Coordinator) session ID of the given cursor for the given parallel query                               |
| QC_INSTANCE_ID      | NUMBER   | QC (Query Coordinator) instance ID of the given cursor for the given parallel query                              |
| SQL_PLAN_HASH_VALUE | NUMBER   | SQL plan hash value of the given cursor for the given parallel query                                             |
| FILTER_ID           | NUMBER   | An ID that identifies the join filter in the given cursor and corresponds to the filter ID in the execution plan |

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LENGTH   | NUMBER   | Total size of the join filter field                                                                                                                                                                                                                                                                                                                                                                                                             |
| BITS_SET | NUMBER   | Number of bits set in this filter                                                                                                                                                                                                                                                                                                                                                                                                               |
| FILTERED | NUMBER   | Number of rows seen by the join filter                                                                                                                                                                                                                                                                                                                                                                                                          |
| PROBED   | NUMBER   | Number of rows of the right table that have been tested against the bitmap filter. This is the sum of the filtered rows plus the non-filtered rows.                                                                                                                                                                                                                                                                                             |
| ACTIVE   | NUMBER   | Whether the filter is active (Yes) or not (No)                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.70 V\$SQL\_MONITOR

V\$SQL\_MONITOR displays SQL statements whose execution have been (or are being) monitored by Oracle.

This view contains global, high-level information about simple and composite database operations.

Oracle Database monitors simple database operations, which are top SQL statements and PL/SQL subprograms, when any of the following conditions is true:

- The operations run in parallel.
- The operations have consumed at least 5 seconds of CPU or I/O time in a single execution.
- Tracking for the operations is forced by the `/*+ MONITOR */` hint.

For simple database operations, monitoring statistics are not cumulative over several executions. In this case, one entry in V\$SQL\_MONITOR is dedicated to a single execution of a SQL statement. If the database monitors two executions of the same SQL statement, then each execution has a separate entry in V\$SQL\_MONITOR.

For simple database operations, V\$SQL\_MONITOR has one entry for the parallel execution coordinator process and one entry for each parallel execution server process. Each entry has corresponding entries in V\$SQL\_PLAN\_MONITOR. Because the processes allocated for the parallel execution of a SQL statement are cooperating for the same execution, these entries share the same execution key (the combination of SQL\_ID, SQL\_EXEC\_START, and SQL\_EXEC\_ID).

Oracle Database monitors composite database operations when either of the following conditions is true:

- A database operation was started with `DBMS_SQL_MONITOR.BEGIN_OPERATION` and the operation has consumed at least 5 seconds of CPU or I/O time.

- Tracking for the operation is forced by setting `FORCE_TRACKING` to `Y` in `DBMS_SQL_MONITOR.BEGIN_OPERATION`.

For composite database operations, each row contains an operation whose statistics are accumulated over the SQL statements and PL/SQL subprograms that run in the same session as part of the operation.

The `V$SQL_MONITOR` view contains a subset of the statistics available in `V$SQL`. However, unlike `V$SQL`, monitoring statistics are not cumulative over several executions. Instead, one entry in `V$SQL_MONITOR` is dedicated to a single execution of a SQL statement. If the database monitors two executions of the same SQL statement, then each execution has a separate entry in `V$SQL_MONITOR`.

The primary key is the combination of the columns `SQL_ID`, `SQL_EXEC_START`, and `SQL_EXEC_ID`.

`V$SQL_MONITOR` has one entry for the parallel execution coordinator process, and one entry for each parallel execution server process. Each entry has corresponding entries in `V$SQL_PLAN_MONITOR`. Because the processes allocated for the parallel execution of a SQL statement are cooperating for the same execution, these entries share the same execution key (the composite `SQL_ID`, `SQL_EXEC_START`, and `SQL_EXEC_ID`). You can aggregate the execution key to determine the overall statistics for a parallel execution.

When the SQL statement being monitored is executing, statistics in `V$SQL_MONITOR` are generally refreshed in near real time, once every second. Once the execution ends, monitoring information is not deleted immediately. Instead, it is kept in `V$SQL_MONITOR` for at least one minute. The entry will eventually be deleted to reclaim its space as new statements are monitored.

| Column    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| KEY       | NUMBER         | Artificial join key to efficiently join <code>V\$SQL_MONITOR</code> with its corresponding plan level monitoring statistics stored in <code>V\$SQL_PLAN_MONITOR</code>                                                                                                                                                                                                                                                                                            |
| REPORT_ID | NUMBER         | Unique ID of the XML report stored in Automatic Workload Repository (AWR) for this monitored entity                                                                                                                                                                                                                                                                                                                                                               |
| STATUS    | VARCHAR2 (19)  | SQL execution status: <ul style="list-style-type: none"> <li>QUEUED - SQL statement is queued</li> <li>EXECUTING - SQL statement is still executing</li> <li>DONE (ERROR) - Execution terminated with an error</li> <li>DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched</li> <li>DONE (ALL ROWS) - Execution terminated and all rows were fetched</li> <li>DONE - Execution terminated (parallel execution)</li> </ul> |
| USER#     | NUMBER         | User ID of the database user who issued the SQL being monitored                                                                                                                                                                                                                                                                                                                                                                                                   |
| USERNAME  | VARCHAR2 (128) | User name of the database user who issued the SQL being monitored                                                                                                                                                                                                                                                                                                                                                                                                 |
| MODULE    | VARCHAR2 (64)  | Name of the executing module when sampled, as set by the <code>DBMS_APPLICATION_INFO.SET_MODULE</code> procedure                                                                                                                                                                                                                                                                                                                                                  |
| ACTION    | VARCHAR2 (64)  | Name of the executing action when sampled, as set by the <code>DBMS_APPLICATION_INFO.SET_ACTION</code> procedure                                                                                                                                                                                                                                                                                                                                                  |

| Column                    | Datatype        | Description                                                                                                                                                                                                                                                                                                                                        |
|---------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SERVICE_NAME              | VARCHAR2 (64)   | Service name of the user session                                                                                                                                                                                                                                                                                                                   |
| CLIENT_IDENTIFIER         | VARCHAR2 (64)   | Client identifier from the user session                                                                                                                                                                                                                                                                                                            |
| CLIENT_INFO               | VARCHAR2 (64)   | Client information for the user session                                                                                                                                                                                                                                                                                                            |
| PROGRAM                   | VARCHAR2 (84)   | Name of the operating system program that issued the monitored SQL                                                                                                                                                                                                                                                                                 |
| PLSQL_ENTRY_OBJECT_ID     | NUMBER          | Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack                                                                                                                                                                                                                                       |
| PLSQL_ENTRY_SUBPROGRAM_ID | NUMBER          | Subprogram ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack                                                                                                                                                                                                                                   |
| PLSQL_OBJECT_ID           | NUMBER          | Object ID of the currently executing PL/SQL subprogram; NULL if executing SQL                                                                                                                                                                                                                                                                      |
| PLSQL_SUBPROGRAM_ID       | NUMBER          | Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL                                                                                                                                                                                                                                                                      |
| FIRST_REFRESH_TIME        | DATE            | Time when monitoring of the SQL statement started, generally a few seconds after execution start time                                                                                                                                                                                                                                              |
| LAST_REFRESH_TIME         | DATE            | Time when statistics in V\$SQL_MONITOR were last updated for the SQL statement. Statistics are generally refreshed every second when the statement executes.                                                                                                                                                                                       |
| REFRESH_COUNT             | NUMBER          | Number of times V\$SQL_MONITOR statistics have been refreshed (generally once every second when the SQL statement executes)                                                                                                                                                                                                                        |
| DBOP_EXEC_ID              | NUMBER          | Database operation execution identifier for the current execution. If the type is SQL, the DBOP_EXEC_ID will be NULL.                                                                                                                                                                                                                              |
| DBOP_NAME                 | VARCHAR2 (30)   | Database operation name. If the type is SQL, the DBOP_NAME will be NULL.                                                                                                                                                                                                                                                                           |
| SID                       | NUMBER          | Session identifier executing (or having executed) the SQL statement being monitored                                                                                                                                                                                                                                                                |
| PROCESS_NAME              | VARCHAR2 (5)    | Process name identifier executing (or having executed) the statement; ora if the process is foreground, else the background process name (for example, p001 for PX server p001)                                                                                                                                                                    |
| SQL_ID                    | VARCHAR2 (13)   | SQL identifier of the statement being monitored                                                                                                                                                                                                                                                                                                    |
| SQL_TEXT                  | VARCHAR2 (2000) | Up to the first 2000 characters of the text of the SQL being monitored                                                                                                                                                                                                                                                                             |
| IS_FULL_SQLTEXT           | VARCHAR2 (1)    | Indicates whether the SQL_TEXT column has the entire SQL text (Y) or not (N)                                                                                                                                                                                                                                                                       |
| SQL_EXEC_START            | DATE            | Time when the execution started                                                                                                                                                                                                                                                                                                                    |
| SQL_EXEC_ID               | NUMBER          | Execution identifier. Together, the three columns SQL_ID, SQL_EXEC_START, and SQL_EXEC_ID represent the execution key. The execution key is used to uniquely identify one execution of the SQL statement.                                                                                                                                          |
| SQL_PLAN_HASH_VALUE       | NUMBER          | SQL plan hash value                                                                                                                                                                                                                                                                                                                                |
| SQL_FULL_PLAN_HASH_VALUE  | NUMBER          | Numeric representation of the complete SQL plan for this cursor. Comparing one SQL_FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the SQL_FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible. |

| Column                   | Datatype      | Description                                                                                                                                                                                                                                                                                |
|--------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXACT_MATCHING_SIGNATURE | NUMBER        | Signature calculated on the normalized SQL text. The normalization includes the removal of white space and the uppercasing of all non-literal strings.                                                                                                                                     |
| FORCE_MATCHING_SIGNATURE | NUMBER        | Same as EXACT_MATCHING_SIGNATURE but literals in the SQL text are replaced by binds                                                                                                                                                                                                        |
| SQL_CHILD_ADDRESS        | RAW(4   8)    | Address of the child cursor (can be used with SQL_ID to join with V\$SQL)                                                                                                                                                                                                                  |
| SESSION_SERIAL#          | NUMBER        | Session serial number executing the statement being monitored                                                                                                                                                                                                                              |
| PX_IS_CROSS_INSTANCE     | VARCHAR2(1)   | Indicates whether the SQL statement ran parallel across multiple instances (Y) or not (N)                                                                                                                                                                                                  |
| PX_MAXDOP                | NUMBER        | Maximum degree of parallelism for any plan operation executed on behalf of the monitored SQL                                                                                                                                                                                               |
| PX_MAXDOP_INSTANCES      | NUMBER        | Number of database instances touched at the maximum degree of parallelism                                                                                                                                                                                                                  |
| PX_SERVERS_REQUESTED     | NUMBER        | Total number of parallel execution servers requested to execute the monitored SQL                                                                                                                                                                                                          |
| PX_SERVERS_ALLOCATED     | NUMBER        | Actual number of parallel execution servers allocated to execute the query                                                                                                                                                                                                                 |
| PX_SERVER#               | NUMBER        | Logical parallel execution server process number executing (or having executed) the statement being monitored; NULL if this monitoring entry is not associated with an execution server. This is a logical number within the parallel server set (see SERVER# in V\$PX_SESSION).           |
| PX_SERVER_GROUP          | NUMBER        | Logical parallel execution server group number to which PX_SERVER# belongs (see SERVER_GROUP in V\$PX_SESSION); NULL if this monitoring entry is not associated with a parallel execution server. This value is generally 1 unless the SQL statement has one or more parallel sub-queries. |
| PX_SERVER_SET            | NUMBER        | Number (1 or 2) of the logical set of parallel execution servers to which PX_SERVER# belongs (see SERVER_SET in V\$PX_SESSION); NULL if this monitoring entry is not associated with a parallel execution server                                                                           |
| PX_QCINST_ID             | NUMBER        | Instance identifier where the parallel execution coordinator runs; NULL if PX_SERVER# is NULL                                                                                                                                                                                              |
| PX_QCSID                 | NUMBER        | Session identifier for the parallel execution coordinator; NULL if PX_SERVER# is NULL                                                                                                                                                                                                      |
| ERROR_NUMBER             | VARCHAR2(40)  | Error number encountered in case a SQL fails to execute successfully (for example, 932 in case of ORA-00932)                                                                                                                                                                               |
| ERROR_FACILITY           | VARCHAR2(4)   | Error facility in case a SQL fails to execute successfully (for example, ORA in case of ORA-00932)                                                                                                                                                                                         |
| ERROR_MESSAGE            | VARCHAR2(256) | Detailed error message displayed corresponding to the error number and error facility when a SQL fails to execute successfully                                                                                                                                                             |
| BINDS_XML                | CLOB          | Information about bind variables used with the SQL, such as name, position, value, data type, and so on (stored in XML format)                                                                                                                                                             |
| OTHER_XML                | CLOB          | Additional information about SQL execution stored in XML format                                                                                                                                                                                                                            |
| ELAPSED_TIME             | NUMBER        | Elapsed time (in microseconds); updated as the statement executes                                                                                                                                                                                                                          |

| Column                  | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QUEUING_TIME            | NUMBER         | Duration of time (in microseconds) spent by SQL in the statement queue                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CPU_TIME                | NUMBER         | CPU time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| FETCHES                 | NUMBER         | Number of fetches associated with the SQL statement; updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                            |
| BUFFER_GETS             | NUMBER         | Number of buffer get operations; updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DISK_READS              | NUMBER         | Number of disk reads; updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DIRECT_WRITES           | NUMBER         | Number of direct writes; updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| IO_INTERCONNECT_BYTES   | NUMBER         | Number of I/O bytes exchanged between Oracle Database and the storage system                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PHYSICAL_READ_REQUESTS  | NUMBER         | Number of physical read I/O requests issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PHYSICAL_READ_BYTES     | NUMBER         | Number of bytes read from disks by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PHYSICAL_WRITE_REQUESTS | NUMBER         | Number of physical write I/O requests issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PHYSICAL_WRITE_BYTES    | NUMBER         | Number of bytes written to disks by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| APPLICATION_WAIT_TIME   | NUMBER         | Application wait time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CONCURRENCY_WAIT_TIME   | NUMBER         | Concurrency wait time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                        |
| CLUSTER_WAIT_TIME       | NUMBER         | Cluster wait time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                            |
| USER_IO_WAIT_TIME       | NUMBER         | User I/O Wait Time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                           |
| PLSQL_EXEC_TIME         | NUMBER         | PL/SQL execution time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                        |
| JAVA_EXEC_TIME          | NUMBER         | Java execution time (in microseconds); updated as the statement executes                                                                                                                                                                                                                                                                                                                                                                                                                          |
| RM_LAST_ACTION          | VARCHAR2 (48)  | <p>The most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following:</p> <ul style="list-style-type: none"> <li>• CANCEL_SQL</li> <li>• KILL_SESSION</li> <li>• LOG_ONLY</li> <li>• SWITCH TO &lt;CG NAME&gt;</li> </ul> <p>For the last value, &lt;CG NAME&gt; is the name of the consumer group that the SQL operation was switched to. If the Resource Plan has since been changed then &lt;CG NAME&gt; is the ID of the consumer group.</p> |
| RM_LAST_ACTION_REASON   | VARCHAR2 (128) | <p>The reason for the most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following:</p> <ul style="list-style-type: none"> <li>• SWITCH_CPU_TIME</li> <li>• SWITCH_IO_REQS</li> <li>• SWITCH_IO_MBS</li> <li>• SWITCH_ELAPSED_TIME</li> <li>• SWITCH_IO_LOGICAL</li> </ul>                                                                                                                                                                      |

| Column                         | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RM_LAST_ACTION_TIME            | DATE           | The time of the most recent action that was taken on this SQL operation by Resource Manager                                                                                                                                                                                                                                                                                                                                                     |
| RM_CONSUMER_GROUP              | VARCHAR2 (128) | The current consumer group for this SQL operation                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID                         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CON_NAME                       | VARCHAR2 (128) | Container name of the object. The value of this column is NULL in non-CDBs.                                                                                                                                                                                                                                                                                                                                                                     |
| ECID                           | VARCHAR2 (64)  | Execution context identifier (sent by Application Server)                                                                                                                                                                                                                                                                                                                                                                                       |
| IS_ADAPTIVE_PLAN               | VARCHAR2 (1)   | Indicates whether the statistics are from an adaptive plan (Y) or not (N).                                                                                                                                                                                                                                                                                                                                                                      |
| IS_FINAL_PLAN                  | VARCHAR2 (1)   | Indicates whether the statistics are from the final plan (Y) or not (N).                                                                                                                                                                                                                                                                                                                                                                        |
| IN_DBOP_NAME                   | VARCHAR2 (30)  | If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the name of that DBOP                                                                                                                                                                                                                                                                                 |
| IN_DBOP_EXEC_ID                | NUMBER         | If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the execution ID of that DBO                                                                                                                                                                                                                                                                          |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER         | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                          |
| IO_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER         | Number of I/O bytes which can be filtered by the Exadata storage system<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                                           |
| IO_CELL_OFFLOAD_RETURNED_BYTES | NUMBER         | Number of filtered bytes returned by Exadata cells (that is, the number of bytes returned after processing has been offloaded on the Exadata cells)<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                               |
| CURRENT_USER#                  | NUMBER         | Unique number identifying the current user                                                                                                                                                                                                                                                                                                                                                                                                      |
| CURRENT_USERNAME               | VARCHAR2 (128) | Username for the current user                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PDB_REPORT_ID                  | NUMBER         | Unique ID of the XML report of a PDB monitored entity that is stored in the CDB's Automatic Workload Repository (AWR) tables                                                                                                                                                                                                                                                                                                                    |

## 10.71 V\$SQL\_MONITOR\_SESSTAT

V\$SQL\_MONITOR\_SESSTAT displays information about statistics that are exposed in V\$SESSTAT.

| Column     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| KEY        | NUMBER   | Artificial join key to efficiently join with other database operation views                                                                                                                                                                                                                                                                                                                                                                           |
| STATISTIC# | NUMBER   | Statistic number                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| VALUE      | NUMBER   | Value associated with the statistic                                                                                                                                                                                                                                                                                                                                                                                                                   |

## 10.72 V\$SQL\_MONITOR\_STATNAME

V\$SQL\_MONITOR\_STATNAME provides information about the plan line statistics exposed in V\$SQL\_PLAN\_MONITOR. A plan line statistic is identified by its group ID (column `GROUP_ID`) and its ID (column `ID`).

| Column      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| ID          | NUMBER         | Plan line statistic ID                                                                                                                                                                                                                                                                                                                                                                                                                          |
| GROUP_ID    | NUMBER         | Plan line statistic group ID                                                                                                                                                                                                                                                                                                                                                                                                                    |
| NAME        | VARCHAR2 (40)  | Short name for the statistic                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DESCRIPTION | VARCHAR2 (200) | Short description for the statistic                                                                                                                                                                                                                                                                                                                                                                                                             |
| TYPE        | NUMBER         | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                       |
| FLAGS       | NUMBER         | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 10.73 V\$SQL\_OPTIMIZER\_ENV

V\$SQL\_OPTIMIZER\_ENV displays the contents of the optimizer environment used to build the execution plan of a SQL cursor. This view can be joined with V\$SQLAREA on (HASH\_VALUE, ADDRESS) and with V\$SQL on (HASH\_VALUE, CHILD\_ADDRESS).

| Column        | Datatype      | Description                                                                                                                                                                                            |
|---------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS       | RAW (4   8)   | Address of the parent cursor                                                                                                                                                                           |
| HASH_VALUE    | NUMBER        | Hash value of the parent cursor in the library cache. The hash value is the fixed index for the view and should be used when querying V\$SQL_OPTIMIZER_ENV to avoid scanning the entire library cache. |
| SQL_ID        | VARCHAR2 (13) | SQL identifier                                                                                                                                                                                         |
| CHILD_ADDRESS | RAW (4   8)   | Address of the child cursor                                                                                                                                                                            |
| CHILD_NUMBER  | NUMBER        | Child cursor number                                                                                                                                                                                    |
| ID            | NUMBER        | Unique identifier of the parameter in the optimizer environment                                                                                                                                        |
| NAME          | VARCHAR2 (40) | Name of the parameter                                                                                                                                                                                  |
| ISDEFAULT     | VARCHAR2 (3)  | Indicates whether the parameter is set to the default value (YES) or not (NO)                                                                                                                          |
| VALUE         | VARCHAR2 (25) | Value of the parameter                                                                                                                                                                                 |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.74 V\$SQL\_PLAN

V\$SQL\_PLAN contains the execution plan information for each child cursor loaded in the library cache.

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS              | RAW(4   8)    | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                        |
| HASH_VALUE           | NUMBER        | Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V\$SQLAREA to add the cursor-specific information.                                                                                                                                                                |
| SQL_ID               | VARCHAR2(13)  | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                   |
| PLAN_HASH_VALUE      | NUMBER        | Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).                                                                                                                     |
| FULL_PLAN_HASH_VALUE | NUMBER        | Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible. |
| CHILD_ADDRESS        | RAW(4   8)    | Address of the child cursor                                                                                                                                                                                                                                                                                                                |
| CHILD_NUMBER         | NUMBER        | Number of the child cursor that uses this execution plan. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to add the child cursor-specific information.                                                                                                                                                  |
| TIMESTAMP            | DATE          | Date and time when the execution plan was generated                                                                                                                                                                                                                                                                                        |
| OPERATION            | VARCHAR2(120) | Name of the internal operation performed in this step (for example, TABLE ACCESS)                                                                                                                                                                                                                                                          |
| OPTIONS              | VARCHAR2(120) | A variation on the operation described in the OPERATION column (for example, FULL)                                                                                                                                                                                                                                                         |
| OBJECT_NODE          | VARCHAR2(160) | Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed.                                                                                                                            |
| OBJECT#              | NUMBER        | Object number of the table or the index                                                                                                                                                                                                                                                                                                    |
| OBJECT_OWNER         | VARCHAR2(128) | Name of the user who owns the schema containing the table or index                                                                                                                                                                                                                                                                         |
| OBJECT_NAME          | VARCHAR2(128) | Name of the table or index                                                                                                                                                                                                                                                                                                                 |

| Column            | Datatype        | Description                                                                                                                                                                                                                                       |
|-------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_ALIAS      | VARCHAR2 (261)  | Alias for the object                                                                                                                                                                                                                              |
| OBJECT_TYPE       | VARCHAR2 (80)   | Type of the object                                                                                                                                                                                                                                |
| OPTIMIZER         | VARCHAR2 (80)   | Current mode of the optimizer for the first row in the plan (statement line), for example, ALL_ROWS. When the operation is a database access (for example, TABLE ACCESS), this column indicates whether or not the object is analyzed.            |
| ID                | NUMBER          | A number assigned to each step in the execution plan                                                                                                                                                                                              |
| PARENT_ID         | NUMBER          | ID of the next execution step that operates on the output of the current step                                                                                                                                                                     |
| DEPTH             | NUMBER          | Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0. |
| POSITION          | NUMBER          | Order of processing for all operations that have the same PARENT_ID                                                                                                                                                                               |
| SEARCH_COLUMNS    | NUMBER          | Number of index columns with start and stop keys (that is, the number of columns with matching predicates)                                                                                                                                        |
| COST              | NUMBER          | Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                  |
| CARDINALITY       | NUMBER          | Estimate, by the cost-based optimizer, of the number of rows produced by the operation                                                                                                                                                            |
| BYTES             | NUMBER          | Estimate, by the cost-based optimizer, of the number of bytes produced by the operation                                                                                                                                                           |
| OTHER_TAG         | VARCHAR2 (140)  | Describes the contents of the OTHER column. See EXPLAIN PLAN for values.                                                                                                                                                                          |
| PARTITION_START   | VARCHAR2 (256)  | Start partition of a range of accessed partitions                                                                                                                                                                                                 |
| PARTITION_STOP    | VARCHAR2 (256)  | Stop partition of a range of accessed partitions                                                                                                                                                                                                  |
| PARTITION_ID      | NUMBER          | Step that computes the pair of values of the PARTITION_START and PARTITION_STOP columns                                                                                                                                                           |
| OTHER             | VARCHAR2 (4000) | Other information specific to the execution step that users may find useful. See EXPLAIN PLAN for values.                                                                                                                                         |
| DISTRIBUTION      | VARCHAR2 (80)   | Stores the method used to distribute rows from producer query servers to consumer query servers                                                                                                                                                   |
| CPU_COST          | NUMBER          | CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                              |
| IO_COST           | NUMBER          | I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                              |
| TEMP_SPACE        | NUMBER          | Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                             |
| ACCESS_PREDICATES | VARCHAR2 (4000) | Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.                                                                                                                             |
| FILTER_PREDICATES | VARCHAR2 (4000) | Predicates used to filter rows before producing them                                                                                                                                                                                              |
| PROJECTION        | VARCHAR2 (4000) | Expressions produced by the operation                                                                                                                                                                                                             |

| Column      | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIME        | NUMBER          | Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| QBLOCK_NAME | VARCHAR2 (128)  | Name of the query block                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| REMARKS     | VARCHAR2 (4000) | Remarks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| OTHER_XML   | CLOB            | Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML since multiple pieces of information can be stored there. This includes: <ul style="list-style-type: none"> <li>Name of the schema against which the query was parsed</li> <li>Release number of the Oracle Database that produced the explain plan</li> <li>Hash value associated with the execution plan</li> <li>Name (if any) of the outline or the SQL profile used to build the execution plan</li> <li>Indication of whether or not dynamic statistics were used to produce the plan</li> <li>The outline data, a set of optimizer hints that can be used to regenerate the same plan</li> <li>Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans. Note that in Oracle Database 12c, there will be extra rows in the plan table and V\$SQL_PLAN.</li> </ul> |
| CON_ID      | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## 10.75 V\$SQL\_PLAN\_MONITOR

V\$SQL\_PLAN\_MONITOR displays plan level monitoring statistics for each SQL statement found in V\$SQL\_MONITOR. Each row in V\$SQL\_PLAN\_MONITOR corresponds to an operation of the execution plan being monitored. As with V\$SQL\_MONITOR, statistics exposed in V\$SQL\_PLAN\_MONITOR are generally updated every second when the statement executes.

These statistics are recycled on the same basis as V\$SQL\_MONITOR.

To eliminate the overhead of SQL plan monitoring, statistics collected for each operation of the plan do not record timing information such as elapsed time, CPU time, or I/O time.

Instead, this timing information can be estimated quite accurately by joining V\$SQL\_PLAN\_MONITOR with V\$ACTIVE\_SESSION\_HISTORY on SQL\_ID, SQL\_EXEC\_START, SQL\_EXEC\_ID, and SQL\_PLAN\_LINE\_ID (simply named PLAN\_LINE\_ID in V\$SQL\_PLAN\_MONITOR). The result of that join is a sample of the activity performed by each operation in the plan, from which an estimate of CPU time and wait time can be derived. This can be achieved by breaking statement level monitoring time statistics found in V\$SQL\_MONITOR in proportion to the number of samples found in V\$ACTIVE\_SESSION\_HISTORY for the corresponding activity type.

| Column              | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID              | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| KEY                 | NUMBER         | Foreign key to efficiently join V\$SQL_PLAN_MONITOR with V\$SQL_MONITOR (see V\$SQL_MONITOR)                                                                                                                                                                                                                                                                                                                                                    |
| STATUS              | VARCHAR2 (19)  | SQL execution status: <ul style="list-style-type: none"> <li>EXECUTING - SQL statement is still executing</li> <li>DONE (ERROR) - Execution terminated with an error</li> <li>DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched</li> <li>DONE (ALL ROWS) - Execution terminated and all rows were fetched</li> <li>DONE - Execution terminated (parallel execution)</li> </ul>                         |
| FIRST_REFRESH_TIME  | DATE           | Time when monitoring of the SQL statement started                                                                                                                                                                                                                                                                                                                                                                                               |
| LAST_REFRESH_TIME   | DATE           | Time when statistics were last updated for the SQL statement                                                                                                                                                                                                                                                                                                                                                                                    |
| FIRST_CHANGE_TIME   | DATE           | First time a row was produced by this operation                                                                                                                                                                                                                                                                                                                                                                                                 |
| LAST_CHANGE_TIME    | DATE           | Last time a row was produced by this operation                                                                                                                                                                                                                                                                                                                                                                                                  |
| REFRESH_COUNT       | NUMBER         | Number of times statistics have been refreshed                                                                                                                                                                                                                                                                                                                                                                                                  |
| SID                 | NUMBER         | Session identifier executing (or having executed) the SQL statement being monitored                                                                                                                                                                                                                                                                                                                                                             |

| SQL_ID              | VARCHAR2 (13)  | SQL identifier                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| SQL_EXEC_START      | DATE           | Time when the execution started                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_EXEC_ID         | NUMBER         | Execution identifier                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SQL_PLAN_HASH_VALUE | NUMBER         | SQL plan hash value                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SQL_CHILD_ADDRESS   | RAW (4   8)    | Address of the child cursor                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PLAN_PARENT_ID      | NUMBER         | ID of the next execution step that operates on the output of the current step                                                                                                                                                                                                                                                                                                                                                                   |
| PLAN_LINE_ID        | NUMBER         | Plan line number for the entry                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PLAN_OPERATION      | VARCHAR2 (30)  | Plan operation name (from V\$SQL_PLAN)                                                                                                                                                                                                                                                                                                                                                                                                          |
| PLAN_OPTIONS        | VARCHAR2 (30)  | Plan option name (from V\$SQL_PLAN)                                                                                                                                                                                                                                                                                                                                                                                                             |
| PLAN_OBJECT_OWNER   | VARCHAR2 (128) | Name of the user who owns the schema containing the table or index                                                                                                                                                                                                                                                                                                                                                                              |
| PLAN_OBJECT_NAME    | VARCHAR2 (128) | Name of the table or index                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PLAN_OBJECT_TYPE    | VARCHAR2 (20)  | Type of the object                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PLAN_DEPTH          | NUMBER         | Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.                                                                                                                                                                                               |

| Column                  | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLAN_POSITION           | NUMBER        | Order of processing for all operations that have the same PARENT_ID                                                                                                                                                                                                                                                                                                                                                                                                |
| PLAN_COST               | NUMBER        | Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                                                   |
| PLAN_CARDINALITY        | NUMBER        | Estimate, by the cost-based optimizer, of the number of rows produced by the operation                                                                                                                                                                                                                                                                                                                                                                             |
| PLAN_BYTES              | NUMBER        | Estimate, by the cost-based optimizer, of the number of bytes produced by the operation                                                                                                                                                                                                                                                                                                                                                                            |
| PLAN_TIME               | NUMBER        | Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                              |
| PLAN_PARTITION_START    | VARCHAR2 (64) | Start partition of a range of accessed partitions                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PLAN_PARTITION_STOP     | VARCHAR2 (64) | Stop partition of a range of accessed partitions                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PLAN_CPU_COST           | NUMBER        | CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                                               |
| PLAN_IO_COST            | NUMBER        | I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                                                               |
| PLAN_TEMP_SPACE         | NUMBER        | Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.                                                                                                                                                                                                                                                                              |
| STARTS                  | NUMBER        | Number of times this operation was executed. For example, an operation is executed multiple times when it is on the right side of a nested-loop join (once for each row of the left input of that nested-loop join).                                                                                                                                                                                                                                               |
| OUTPUT_ROWS             | NUMBER        | Number of rows produced by this operation since the execution started. This number is cumulated for all executions of this operation. Divide by the value of the STARTS column to compute the average number of rows per execution of the operation. Note that the value in the STARTS column is equal to or higher than the value in the OUTPUT_ROWS column. The value will usually be equal, but depending on internal optimizations a higher value may be seen. |
| IO_INTERCONNECT_BYTES   | NUMBER        | Number of I/O bytes exchanged between Oracle Database and the storage system. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                        |
| PHYSICAL_READ_REQUESTS  | NUMBER        | Number of physical read I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                    |
| PHYSICAL_READ_BYTES     | NUMBER        | Number of bytes read from disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                                |
| PHYSICAL_WRITE_REQUESTS | NUMBER        | Number of physical write I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                   |
| PHYSICAL_WRITE_BYTES    | NUMBER        | Number of bytes written to disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.                                                                                                                                                                                                                                                                                                                                               |
| WORKAREA_MEM            | NUMBER        | Amount of memory (in bytes) used by the operation when the query is executing; NULL if the execution is done. This applies only to operations using a work area, such as sort, hash-join, group-by, and so on.                                                                                                                                                                                                                                                     |

| Column               | Datatype | Description                                                                                                                                                                                                                                    |
|----------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WORKAREA_MAX_MEM     | NUMBER   | Maximum value (in bytes) for WORKAREA_MEM; NULL if the operation is not using a work area. When the execution is finished, this value will hold the maximum amount of memory consumed by this operation during the execution of the statement. |
| WORKAREA_TEMPSEG     | NUMBER   | Amount of temporary space (in bytes) used by the operation when the query is executing; NULL if the operation has not spilled to disk or if the execution is finished                                                                          |
| WORKAREA_MAX_TEMPSEG | NUMBER   | Maximum value (in bytes) for WORKAREA_TEMPSEG; NULL if this operation never spilled to disk. When the execution is done, this value will hold the maximum amount of temporary space consumed by this operation during the entire execution.    |
| OTHERSTAT_GROUP_ID   | NUMBER   | Plan line statistic group identifier (see GROUP_ID column in V\$SQL_MONITOR_STATNAME)                                                                                                                                                          |
| OTHERSTAT_1_ID       | NUMBER   | Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 1 of that plan line                                                                                                                                       |
| OTHERSTAT_1_TYPE     | NUMBER   | Reserved for internal use                                                                                                                                                                                                                      |
| OTHERSTAT_1_VALUE    | NUMBER   | Value of statistic number 1 of that plan line                                                                                                                                                                                                  |
| OTHERSTAT_2_ID       | NUMBER   | Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 2 of that plan line                                                                                                                                       |
| OTHERSTAT_2_TYPE     | NUMBER   | Reserved for internal use                                                                                                                                                                                                                      |
| OTHERSTAT_2_VALUE    | NUMBER   | Value of statistic number 2 of that plan line                                                                                                                                                                                                  |

| OTHERSTAT_29_VALUE | NUMBER   | Value of statistic number 29 of that plan line                                                            |

| Column                  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OTHERSTAT_30_ID         | NUMBER   | Statistic identifier (see ID column in V\$SQL_MONITOR_STATNAME) for statistic number 30 of that plan line                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OTHERSTAT_30_TYPE       | NUMBER   | Reserved for internal use                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| OTHERSTAT_30_VALUE      | NUMBER   | Value of statistic number 30 of that plan line                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| OTHER_XML               | CLOB     | Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML because it allows multiple pieces of information to be stored, including the following: <ul style="list-style-type: none"> <li>Name of the schema against which the query was parsed</li> <li>Release number of the Oracle Database that produced the explain plan</li> <li>Hash value associated with the execution plan</li> <li>Name (if any) of the outline or the SQL profile used to build the execution plan</li> <li>Indication of whether or not dynamic statistics were used to produce the plan</li> <li>The outline data, a set of optimizer hints that can be used to regenerate the same plan</li> </ul> |
| PLAN_OPERATION_INACTIVE | NUMBER   | Indicates whether this plan operation was part of the final resolved plan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## 10.76 V\$SQL\_PLAN\_STATISTICS

V\$SQL\_PLAN\_STATISTICS provides execution statistics at the row source level for each child cursor.

| Column               | Datatype     | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS              | RAW(4   8)   | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                        |
| HASH_VALUE           | NUMBER       | Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V\$SQLAREA to locate the parent cursor.                                                                                                                                                                           |
| SQL_ID               | VARCHAR2(13) | SQL identifier of the parent statement in the library cache                                                                                                                                                                                                                                                                                |
| PLAN_HASH_VALUE      | NUMBER       | Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line)                                                                                                                      |
| FULL_PLAN_HASH_VALUE | NUMBER       | Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible. |

| Column              | Datatype   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CHILD_ADDRESS       | RAW(4   8) | Address of the child cursor                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CHILD_NUMBER        | NUMBER     | Number of the child cursor that uses this work area. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to locate the child cursor using this area.                                                                                                                                                                                                                                                              |
| OPERATION_ID        | NUMBER     | A number assigned to each step in the execution plan                                                                                                                                                                                                                                                                                                                                                                                            |
| EXECUTIONS          | NUMBER     | Number of times this cursor has been executed                                                                                                                                                                                                                                                                                                                                                                                                   |
| LAST_STARTS         | NUMBER     | Number of times this operation has been started, during the last execution                                                                                                                                                                                                                                                                                                                                                                      |
| STARTS              | NUMBER     | Number of times this operation has been started, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                                           |
| LAST_OUTPUT_ROWS    | NUMBER     | Number of rows produced by the row source, during the last execution                                                                                                                                                                                                                                                                                                                                                                            |
| OUTPUT_ROWS         | NUMBER     | Number of rows produced by the row source, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                                                 |
| LAST_CR_BUFFER_GETS | NUMBER     | Number of buffers retrieved in consistent mode, during the last execution. Buffers are usually retrieved in consistent mode for queries.                                                                                                                                                                                                                                                                                                        |
| CR_BUFFER_GETS      | NUMBER     | Number of buffers retrieved in consistent mode, accumulated over the past executions. Buffers are usually retrieved in consistent mode for queries.                                                                                                                                                                                                                                                                                             |
| LAST_CU_BUFFER_GETS | NUMBER     | Number of buffers retrieved in current mode, during the last execution. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.                                                                                                                                                                                                                                                                                |
| CU_BUFFER_GETS      | NUMBER     | Number of buffers retrieved in current mode, accumulated over the past executions. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.                                                                                                                                                                                                                                                                     |
| LAST_DISK_READS     | NUMBER     | Number of physical disk reads performed by the operation, during the last execution                                                                                                                                                                                                                                                                                                                                                             |
| DISK_READS          | NUMBER     | Number of physical disk reads performed by the operation, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                                  |
| LAST_DISK_WRITES    | NUMBER     | Number of physical disk writes performed by the operation, during the last execution                                                                                                                                                                                                                                                                                                                                                            |
| DISK_WRITES         | NUMBER     | Number of physical disk writes performed by the operation, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                                 |
| LAST_ELAPSED_TIME   | NUMBER     | Elapsed time (in microseconds) corresponding to this operation, during the last execution                                                                                                                                                                                                                                                                                                                                                       |
| ELAPSED_TIME        | NUMBER     | Elapsed time (in microseconds) corresponding to this operation, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                            |
| CON_ID              | NUMBER     | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.77 V\$SQL\_PLAN\_STATISTICS\_ALL

V\$SQL\_PLAN\_STATISTICS\_ALL contains memory usage statistics for row sources that use SQL memory (sort or hash-join). This view concatenates information in V\$SQL\_PLAN with execution statistics from V\$SQL\_PLAN\_STATISTICS and V\$SQL\_WORKAREA.

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                |
|----------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS              | RAW(4   8)    | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                        |
| HASH_VALUE           | NUMBER        | Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V\$SQLAREA to add the cursor-specific information.                                                                                                                                                                |
| SQL_ID               | VARCHAR2(13)  | SQL identifier of the parent statement in the library cache                                                                                                                                                                                                                                                                                |
| PLAN_HASH_VALUE      | NUMBER        | Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line)                                                                                                                      |
| FULL_PLAN_HASH_VALUE | NUMBER        | Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible. |
| CHILD_ADDRESS        | RAW(4   8)    | Address of the child cursor                                                                                                                                                                                                                                                                                                                |
| CHILD_NUMBER         | NUMBER        | Number of the child cursor that uses this execution plan. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V\$SQL to add the child cursor-specific information.                                                                                                                                                  |
| TIMESTAMP            | DATE          | Date and time when the execution plan was generated                                                                                                                                                                                                                                                                                        |
| OPERATION            | VARCHAR2(120) | Name of the internal operation performed in this step (for example, TABLE ACCESS)                                                                                                                                                                                                                                                          |
| OPTIONS              | VARCHAR2(120) | A variation on the operation described in the OPERATION column (for example, FULL)                                                                                                                                                                                                                                                         |
| OBJECT_NODE          | VARCHAR2(160) | Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed.                                                                                                                            |
| OBJECT#              | NUMBER        | Object number of the table or the index                                                                                                                                                                                                                                                                                                    |
| OBJECT_OWNER         | VARCHAR2(128) | Name of the user who owns the schema containing the table or index                                                                                                                                                                                                                                                                         |
| OBJECT_NAME          | VARCHAR2(128) | Name of the table or index                                                                                                                                                                                                                                                                                                                 |
| OBJECT_ALIAS         | VARCHAR2(261) | Alias for the object                                                                                                                                                                                                                                                                                                                       |
| OBJECT_TYPE          | VARCHAR2(80)  | Type of the object                                                                                                                                                                                                                                                                                                                         |

| Column            | Datatype        | Description                                                                                                                                                                                                                                       |
|-------------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPTIMIZER         | VARCHAR2 (80)   | Current mode of the optimizer for the first row in the plan (statement line), for example, CHOOSE. When the operation is a database access (for example, TABLE ACCESS), this column indicates whether or not the object is analyzed.              |
| ID                | NUMBER          | A number assigned to each step in the execution plan                                                                                                                                                                                              |
| PARENT_ID         | NUMBER          | ID of the next execution step that operates on the output of the current step                                                                                                                                                                     |
| DEPTH             | NUMBER          | Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0. |
| POSITION          | NUMBER          | Order of processing for all operations that have the same PARENT_ID                                                                                                                                                                               |
| SEARCH_COLUMNS    | NUMBER          | Number of index columns with start and stop keys (that is, the number of columns with matching predicates)                                                                                                                                        |
| COST              | NUMBER          | Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                  |
| CARDINALITY       | NUMBER          | Estimate, by the cost-based optimizer, of the number of rows produced by the operation                                                                                                                                                            |
| BYTES             | NUMBER          | Estimate, by the cost-based optimizer, of the number of bytes produced by the operation                                                                                                                                                           |
| OTHER_TAG         | VARCHAR2 (140)  | Describes the contents of the OTHER column. See EXPLAIN PLAN for values.                                                                                                                                                                          |
| PARTITION_START   | VARCHAR2 (256)  | Start partition of a range of accessed partitions                                                                                                                                                                                                 |
| PARTITION_STOP    | VARCHAR2 (256)  | Stop partition of a range of accessed partitions                                                                                                                                                                                                  |
| PARTITION_ID      | NUMBER          | Step that computes the pair of values of the PARTITION_START and PARTITION_STOP columns                                                                                                                                                           |
| OTHER             | VARCHAR2 (4000) | Other information specific to the execution step that users may find useful. See EXPLAIN PLAN for values.                                                                                                                                         |
| DISTRIBUTION      | VARCHAR2 (80)   | Stores the method used to distribute rows from producer query servers to consumer query servers                                                                                                                                                   |
| CPU_COST          | NUMBER          | CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                              |
| IO_COST           | NUMBER          | I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                              |
| TEMP_SPACE        | NUMBER          | Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                             |
| ACCESS_PREDICATES | VARCHAR2 (4000) | Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.                                                                                                                             |
| FILTER_PREDICATES | VARCHAR2 (4000) | Predicates used to filter rows before producing them                                                                                                                                                                                              |
| PROJECTION        | VARCHAR2 (4000) | Expressions produced by the operation                                                                                                                                                                                                             |

| Column              | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIME                | NUMBER          | Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| QBLOCK_NAME         | VARCHAR2 (128)  | Name of the query block                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| REMARKS             | VARCHAR2 (4000) | Remarks                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| OTHER_XML           | CLOB            | Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML since multiple pieces of information can be stored there. This includes: <ul style="list-style-type: none"> <li>Name of the schema against which the query was parsed</li> <li>Release number of the Oracle Database that produced the explain plan</li> <li>Hash value associated with the execution plan</li> <li>Name (if any) of the outline or the SQL profile used to build the execution plan</li> <li>Indication of whether or not dynamic statistics were used to produce the plan</li> <li>The outline data, a set of optimizer hints that can be used to regenerate the same plan</li> <li>Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans. Note that in Oracle Database 12c, there will be extra rows in the plan table and V\$SQL_PLAN.</li> </ul> |
| EXECUTIONS          | NUMBER          | Number of times this cursor has been executed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| LAST_ELAPSED_TIME      | NUMBER        | Elapsed time (in microseconds) corresponding to this operation, during the last execution                                                                                                                                                                                                                                                                                                                                                       |
| ELAPSED_TIME           | NUMBER        | Elapsed time (in microseconds) corresponding to this operation, accumulated over the past executions                                                                                                                                                                                                                                                                                                                                            |
| POLICY                 | VARCHAR2 (40) | Sizing policy for this work area: <ul style="list-style-type: none"> <li>MANUAL</li> <li>AUTO</li> </ul>                                                                                                                                                                                                                                                                                                                                        |
| ESTIMATED_OPTIMAL_SIZE | NUMBER        | Estimated size (in KB) required by this work area to execute the operation completely in memory (optimal execution). This is either derived from optimizer statistics or from previous executions.                                                                                                                                                                                                                                              |
| ESTIMATED_ONEPASS_SIZE | NUMBER        | Estimated size (in KB) required by this work area to execute the operation in a single pass. This is either derived from optimizer statistics or from previous executions.                                                                                                                                                                                                                                                                      |
| LAST_MEMORY_USED       | NUMBER        | Memory size (in KB) used by this work area during the last execution of the cursor                                                                                                                                                                                                                                                                                                                                                              |
| LAST_EXECUTION         | VARCHAR2 (40) | Indicates whether this work area ran using <code>OPTIMAL</code> , <code>ONE PASS</code> , or under <code>ONE PASS</code> memory requirement ( <code>MULTI-PASS</code> ), during the last execution of the cursor                                                                                                                                                                                                                                |
| LAST_DEGREE            | NUMBER        | Degree of parallelism used, during the last execution of the cursor                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_EXECUTIONS       | NUMBER        | Number of times this work area was active                                                                                                                                                                                                                                                                                                                                                                                                       |
| OPTIMAL_EXECUTIONS     | NUMBER        | Number of times this work area ran in optimal mode                                                                                                                                                                                                                                                                                                                                                                                              |
| ONEPASS_EXECUTIONS     | NUMBER        | Number of times this work area ran in one pass mode                                                                                                                                                                                                                                                                                                                                                                                             |
| MULTIPASSES_EXECUTIONS | NUMBER        | Number of times this work area ran below the one pass memory requirement                                                                                                                                                                                                                                                                                                                                                                        |
| ACTIVE_TIME            | NUMBER        | Average time this work area is active (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                               |
| MAX_TEMPSEG_SIZE       | NUMBER        | Maximum temporary segment size (in bytes) created by an instantiation of this work area. This column is null if this work area has never spilled to disk.                                                                                                                                                                                                                                                                                       |
| LAST_TEMPSEG_SIZE      | NUMBER        | Temporary segment size (in bytes) created in the last instantiation of this work area. This column is null if the last instantiation of this work area did not spill to disk.                                                                                                                                                                                                                                                                   |
| CON_ID                 | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CON_DBID               | NUMBER        | The database ID of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 10.78 V\$SQL\_REDIRECTION

V\$SQL\_REDIRECTION displays SQL statements that are redirected.

| Column            | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS           | RAW(4   8)     | Address of the cursor handle                                                                                                                                                                                                                                                                                                                                                                                                                          |
| PARENT_HANDLE     | RAW(4   8)     | Address of the parent cursor handle                                                                                                                                                                                                                                                                                                                                                                                                                   |
| HASH_VALUE        | NUMBER         | Hash value of the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SQL_ID            | VARCHAR2(13)   | SQL identifier of the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                   |
| CHILD_NUMBER      | NUMBER         | Number of the child (instance) for the hash                                                                                                                                                                                                                                                                                                                                                                                                           |
| PARSING_USER_ID   | NUMBER         | Parsing user ID                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| PARSING_SCHEMA_ID | NUMBER         | Parsing schema ID                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| COMMAND_TYPE      | NUMBER         | SELECT, UPDATE, INSERT, MERGE                                                                                                                                                                                                                                                                                                                                                                                                                         |
| REASON            | VARCHAR2(14)   | Reason for redirection ('INVALID OBJECT', 'ROWID', 'QUERY REWRITE', 'READ ONLY')                                                                                                                                                                                                                                                                                                                                                                      |
| ERROR_CODE        | NUMBER         | Error code for local parse                                                                                                                                                                                                                                                                                                                                                                                                                            |
| POSITION          | NUMBER         | Error position, 0 if unknown                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SQL_TEXT_PIECE    | VARCHAR2(1000) | SQL Text containing position, usually a (qualified) identifier                                                                                                                                                                                                                                                                                                                                                                                        |
| ERROR_MESSAGE     | VARCHAR2(1000) | Error code's corresponding error message resolved in the database language, no arguments resolved                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID            | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.79 V\$SQL\_SHARD

V\$SQL\_SHARD displays the shard information for a shard query's previous execution. This view uniquely maps a shard SQL fragment of a cross shard query to the target shard database.

| Column       | Datatype     | Description                                                   |
|--------------|--------------|---------------------------------------------------------------|
| SQL_ID       | VARCHAR2(13) | SQL identifier of a cross shard query on the coordinator      |
| CHILD_NUMBER | NUMBER       | Cursor child number of a cross shard query on the coordinator |

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPERATION_ID       | NUMBER        | Operation ID of a remote node for a shard SQL fragment of a cross shard query                                                                                                                                                                                                                                                                                                                                                     |
| SHARD_SQL_ID       | VARCHAR2 (13) | SQL ID of the SQL segment associated with a remote operation identified by the operation ID in the OPERATION_ID column                                                                                                                                                                                                                                                                                                            |
| SHARD_ID           | NUMBER        | IDs of shards where the shard SQL fragment was executed                                                                                                                                                                                                                                                                                                                                                                           |
| SHARD_CHILD_NUMBER | NUMBER        | Cursor child number of a shard SQL fragment on a shard. The default value is 0.                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID             | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 10.80 V\$SQL\_SHARED\_CURSOR

V\$SQL\_SHARED\_CURSOR explains why a particular child cursor is not shared with existing child cursors. Each column identifies a specific reason why the cursor cannot be shared.

| Column              | Datatype      | Description                                                                                |
|---------------------|---------------|--------------------------------------------------------------------------------------------|
| SQL_ID              | VARCHAR2 (13) | SQL identifier                                                                             |
| ADDRESS             | RAW (4   8)   | Address of the parent cursor                                                               |
| CHILD_ADDRESS       | RAW (4   8)   | Address of the child cursor                                                                |
| CHILD_NUMBER        | NUMBER        | Child number                                                                               |
| UNBOUND_CURSOR      | VARCHAR2 (1)  | (Y N) The existing child cursor was not fully built (in other words, it was not optimized) |
| SQL_TYPE_MISMATCH   | VARCHAR2 (1)  | (Y N) The SQL type does not match the existing child cursor                                |
| OPTIMIZER_MISMATCH  | VARCHAR2 (1)  | (Y N) The optimizer environment does not match the existing child cursor                   |
| OUTLINE_MISMATCH    | VARCHAR2 (1)  | (Y N) The outlines do not match the existing child cursor                                  |
| STATS_ROW_MISMATCH  | VARCHAR2 (1)  | (Y N) The existing statistics do not match the existing child cursor                       |
| LITERAL_MISMATCH    | VARCHAR2 (1)  | (Y N) Non-data literal values do not match the existing child cursor                       |
| FORCE_HARD_PARSE    | VARCHAR2 (1)  | (Y N) For internal use                                                                     |
| EXPLAIN_PLAN_CURSOR | VARCHAR2 (1)  | (Y N) The child cursor is an explain plan cursor and should not be shared                  |

| Column                    | Datatype     | Description                                                                                                                                                                                                                                   |
|---------------------------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BUFFERED_DML_MISMATCH     | VARCHAR2 (1) | (Y N) Buffered DML does not match the existing child cursor                                                                                                                                                                                   |
| PDML_ENV_MISMATCH         | VARCHAR2 (1) | (Y N) PDML environment does not match the existing child cursor                                                                                                                                                                               |
| INST_DRTLD_MISMATCH       | VARCHAR2 (1) | (Y N) Insert direct load does not match the existing child cursor                                                                                                                                                                             |
| SLAVE_QC_MISMATCH         | VARCHAR2 (1) | (Y N) The existing child cursor is a worker cursor and the new one was issued by the coordinator (or, the existing child cursor was issued by the coordinator and the new one is a worker cursor)                                             |
| TYPECHECK_MISMATCH        | VARCHAR2 (1) | (Y N) The existing child cursor is not fully optimized                                                                                                                                                                                        |
| AUTH_CHECK_MISMATCH       | VARCHAR2 (1) | (Y N) Authorization/translation check failed for the existing child cursor                                                                                                                                                                    |
| BIND_MISMATCH             | VARCHAR2 (1) | (Y N) The bind metadata does not match the existing child cursor                                                                                                                                                                              |
| DESCRIBE_MISMATCH         | VARCHAR2 (1) | (Y N) The typecheck heap is not present during the describe for the child cursor                                                                                                                                                              |
| LANGUAGE_MISMATCH         | VARCHAR2 (1) | (Y N) The language handle does not match the existing child cursor                                                                                                                                                                            |
| TRANSLATION_MISMATCH      | VARCHAR2 (1) | (Y N) The base objects of the existing child cursor do not match                                                                                                                                                                              |
| BIND_EQUIV_FAILURE        | VARCHAR2 (1) | (Y N) The bind value's selectivity does not match that used to optimize the existing child cursor                                                                                                                                             |
| INSUFF_PRIVS              | VARCHAR2 (1) | (Y N) Insufficient privileges on objects referenced by the existing child cursor                                                                                                                                                              |
| INSUFF_PRIVS_REM          | VARCHAR2 (1) | (Y N) Insufficient privileges on remote objects referenced by the existing child cursor                                                                                                                                                       |
| REMOTE_TRANS_MISMATCH     | VARCHAR2 (1) | (Y N) The remote base objects of the existing child cursor do not match                                                                                                                                                                       |
| LOGMINER_SESSION_MISMATCH | VARCHAR2 (1) | (Y N) LogMiner Session parameters mismatch                                                                                                                                                                                                    |
| INCOMP_LTRL_MISMATCH      | VARCHAR2 (1) | (Y N) Cursor might have some binds (literals) which may be unsafe/non-data. Value mismatch.                                                                                                                                                   |
| OVERLAP_TIME_MISMATCH     | VARCHAR2 (1) | (Y N) Mismatch caused by setting session parameter ERROR_ON_OVERLAP_TIME                                                                                                                                                                      |
| EDITION_MISMATCH          | VARCHAR2 (1) | (Y N) Cursor edition mismatch                                                                                                                                                                                                                 |
| MV_QUERY_GEN_MISMATCH     | VARCHAR2 (1) | (Y N) Internal, used to force a hard-parse when analyzing materialized view queries                                                                                                                                                           |
| USER_BIND_PEEK_MISMATCH   | VARCHAR2 (1) | (Y N) Cursor is not shared because value of one or more user binds is different and this has a potential to change the execution plan                                                                                                         |
| TYPCHK_DEP_MISMATCH       | VARCHAR2 (1) | (Y N) Cursor has typecheck dependencies                                                                                                                                                                                                       |
| NO_TRIGGER_MISMATCH       | VARCHAR2 (1) | (Y N) Cursor and child have no trigger mismatch                                                                                                                                                                                               |
| FLASHBACK_CURSOR          | VARCHAR2 (1) | (Y N) Cursor non-shareability due to flashback                                                                                                                                                                                                |
| ANYDATA_TRANSFORMATION    | VARCHAR2 (1) | (Y N) Is criteria for opaque type transformation and does not match                                                                                                                                                                           |
| PDDL_ENV_MISMATCH         | VARCHAR2 (1) | (Y N) Environment setting mismatch for parallel DDL cursor (that is, one or more of the following parameter values have changed: PARALLEL_EXECUTION_ENABLED, PARALLEL_DDL_MODE, PARALLEL_DDL_FORCED_DEGREE, or PARALLEL_DDL_FORCED_INSTANCES) |

| Column                        | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOP_LEVEL_RPI_CURSOR          | VARCHAR2 (1) | (Y N) Is top level RPI cursor                                                                                                                                                                                                                                                                                                                                                                                                              |
| DIFFERENT_LONG_LENGTH         | VARCHAR2 (1) | (Y N) Value of LONG does not match                                                                                                                                                                                                                                                                                                                                                                                                         |
| LOGICAL_STANDBY_APPLY         | VARCHAR2 (1) | (Y N) Logical standby apply context does not match                                                                                                                                                                                                                                                                                                                                                                                         |
| DIFF_CALL_DURN                | VARCHAR2 (1) | (Y N) If worker SQL cursor/single call                                                                                                                                                                                                                                                                                                                                                                                                     |
| BIND_UACS_DIFF                | VARCHAR2 (1) | (Y N) One cursor has bind UACs and one does not                                                                                                                                                                                                                                                                                                                                                                                            |
| PLSQL_CMP_SWITCHS_DIFF        | VARCHAR2 (1) | (Y N) PL/SQL anonymous block compiled with different PL/SQL compiler switches                                                                                                                                                                                                                                                                                                                                                              |
| CURSOR_PARTS_MISMATCH         | VARCHAR2 (1) | (Y N) Cursor was compiled with subexecution (cursor parts were executed)                                                                                                                                                                                                                                                                                                                                                                   |
| STB_OBJECT_MISMATCH           | VARCHAR2 (1) | (Y N) STB is an internal name for a SQL Management Object Mismatch. A SQL Management Object Mismatch means that either a SQL plan baseline, or a SQL profile, or a SQL patch has been created for your SQL statement between the executions. Because a cursor is a read-only entity, a hard parse is forced to be able to create a new cursor that contains information about the new SQL management object related to this SQL statement. |
| CROSSEDITION_TRIGGER_MISMATCH | VARCHAR2 (1) | (Y N) The set of crossedition triggers to execute might differ                                                                                                                                                                                                                                                                                                                                                                             |
| PQ_SLAVE_MISMATCH             | VARCHAR2 (1) | (Y N) Top-level worker decides not to share cursor                                                                                                                                                                                                                                                                                                                                                                                         |
| TOP_LEVEL_DDL_MISMATCH        | VARCHAR2 (1) | (Y N) Is top-level DDL cursor                                                                                                                                                                                                                                                                                                                                                                                                              |
| MULTI_PX_MISMATCH             | VARCHAR2 (1) | (Y N) Cursor has multiple parallelizers and is worker-compiled                                                                                                                                                                                                                                                                                                                                                                             |
| BIND_PEEKED_PQ_MISMATCH       | VARCHAR2 (1) | (Y N) Cursor based around bind peeked values                                                                                                                                                                                                                                                                                                                                                                                               |
| MV_REWRITE_MISMATCH           | VARCHAR2 (1) | (Y N) Cursor needs recompilation because an SCN was used during compile time due to being rewritten by materialized view                                                                                                                                                                                                                                                                                                                   |
| ROLL_INVALID_MISMATCH         | VARCHAR2 (1) | (Y N) Marked for rolling invalidation and invalidation window exceeded                                                                                                                                                                                                                                                                                                                                                                     |
| OPTIMIZER_MODE_MISMATCH       | VARCHAR2 (1) | (Y N) Parameter OPTIMIZER_MODE mismatch (for example, all_rows versus first_rows_1)                                                                                                                                                                                                                                                                                                                                                        |
| PX_MISMATCH                   | VARCHAR2 (1) | (Y N) Mismatch in one parameter affecting the parallelization of a SQL statement. For example, one cursor was compiled with parallel DML enabled while the other was not.                                                                                                                                                                                                                                                                  |
| MV_STALEOBJ_MISMATCH          | VARCHAR2 (1) | (Y N) Cursor cannot be shared because there is a mismatch in the list of materialized views which were stale when the cursor was built                                                                                                                                                                                                                                                                                                     |
| FLASHBACK_TABLE_MISMATCH      | VARCHAR2 (1) | (Y N) Cursor cannot be shared because there is a mismatch with triggers being enabled and/or referential integrity constraints being deferred                                                                                                                                                                                                                                                                                              |
| LITREP_COMP_MISMATCH          | VARCHAR2 (1) | (Y N) Mismatch in use of literal replacement                                                                                                                                                                                                                                                                                                                                                                                               |
| PLSQL_DEBUG                   | VARCHAR2 (1) | (Y N) Value of the PLSQL_DEBUG parameter for the current session does not match the value used to build the cursor                                                                                                                                                                                                                                                                                                                         |
| LOAD_OPTIMIZER_STATS          | VARCHAR2 (1) | (Y N) A hard parse is forced to initialize extended cursor sharing                                                                                                                                                                                                                                                                                                                                                                         |
| ACL_MISMATCH                  | VARCHAR2 (1) | (Y N) Cached ACL evaluation result stored in the child cursor is not valid for the current session or user                                                                                                                                                                                                                                                                                                                                 |

| Column                     | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FLASHBACK_ARCHIVE_MISMATCH | VARCHAR2(1) | (Y N) Value of the FLASHBACK_DATA_ARCHIVE_INTERNAL_CURSOR parameter for the current session does not match the value used to build the cursor                                                                                                                                                                                                                                                                                     |
| LOCK_USER_SCHEMA_FAILED    | VARCHAR2(1) | (Y N) User or schema used to build the cursor no longer exists<br><b>Note:</b> This sharing criterion is deprecated                                                                                                                                                                                                                                                                                                               |
| REMOTE_MAPPING_MISMATCH    | VARCHAR2(1) | (Y N) Reloaded cursor was previously remote-mapped and is currently not remote-mapped. Therefore, the cursor must be reparsed.                                                                                                                                                                                                                                                                                                    |
| LOAD_RUNTIME_HEAP_FAILED   | VARCHAR2(1) | (Y N) Loading of run-time heap for the new cursor (or reload of aged out cursor) failed                                                                                                                                                                                                                                                                                                                                           |
| HASH_MATCH_FAILED          | VARCHAR2(1) | (Y N) No existing child cursors have the unsafe literal bind hash values required by the current cursor                                                                                                                                                                                                                                                                                                                           |
| PURGED_CURSOR              | VARCHAR2(1) | (Y N) Child cursor is marked for purging                                                                                                                                                                                                                                                                                                                                                                                          |
| BIND_LENGTH_UPGRADEABLE    | VARCHAR2(1) | (Y N) Bind length(s) required for the current cursor are longer than the bind length(s) used to build the child cursor                                                                                                                                                                                                                                                                                                            |
| USE_FEEDBACK_STATS         | VARCHAR2(1) | (Y N) A hard parse is forced so that the optimizer can reoptimize the query with improved optimizer inputs (for example, cardinality estimates)                                                                                                                                                                                                                                                                                   |
| REASON                     | CLOB        | Child number, id, and reason the cursor is not shared. The content of this column is structured using XML.<br>If this column is null, the FORCE_HARD_PARSE, LOAD_RUNTIME_HEAP_FAILED, and HASH_MATCH_FAILED columns may enable you to determine why the child cursor is not shared.                                                                                                                                               |
| CON_ID                     | NUMBER      | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 10.81 V\$SQL\_SHARED\_MEMORY

V\$SQL\_SHARED\_MEMORY displays information about the cursor shared memory snapshot. Each SQL statement stored in the shared pool has one or more child objects associated with it. Each child object has several parts, one of which is the context heap, which holds, among other things, the query plan.

| Column       | Datatype       | Description                                                                                                                                                                                    |
|--------------|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TEXT     | VARCHAR2(1000) | SQL text of the shared cursor child object for which this row is displaying information                                                                                                        |
| SQL_FULLTEXT | CLOB           | Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the V\$SQLTEXT dynamic performance view. |
| HASH_VALUE   | NUMBER         | Hash value of the above SQL text in the shared pool                                                                                                                                            |
| SQL_ID       | VARCHAR2(13)   | SQL identifier of the above SQL text in the shared pool                                                                                                                                        |

| Column       | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HEAP_DESC    | RAW(4   8)   | Address of the descriptor for the context heap of the child cursor described in this row                                                                                                                                                                                                                                                                                                                                                        |
| STRUCTURE    | VARCHAR2(64) | If the memory chunk described in this row was allocated using a comment of the form "X : Y", then this is the "X" part of the comment                                                                                                                                                                                                                                                                                                           |
| FUNCTION     | VARCHAR2(64) | Similar to the STRUCTURE column, this is the "Y" field of the comment                                                                                                                                                                                                                                                                                                                                                                           |
| CHUNK_COM    | VARCHAR2(16) | Whole comment field that was supplied when this memory chunk was allocated                                                                                                                                                                                                                                                                                                                                                                      |
| CHUNK_PTR    | RAW(4   8)   | Starting address of the allocated memory chunk                                                                                                                                                                                                                                                                                                                                                                                                  |
| CHUNK_SIZE   | NUMBER       | Amount of memory allocated for this chunk                                                                                                                                                                                                                                                                                                                                                                                                       |
| ALLOC_CLASS  | VARCHAR2(8)  | Class of memory that this chunk of memory belongs to. It will usually be either FREEABLE or PERMANENT.                                                                                                                                                                                                                                                                                                                                          |
| CHUNK_TYPE   | NUMBER       | An index into a table of callback functions that tell the server how to re-create this chunk of memory should it need to be removed from the shared pool based on an LRU algorithm                                                                                                                                                                                                                                                              |
| SUBHEAP_DESC | RAW(4   8)   | If the parent heap of this context heap is itself a subheap, then this is the address of the descriptor of the parent heap                                                                                                                                                                                                                                                                                                                      |
| CON_ID       | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.82 V\$SQL\_TESTCASES

V\$SQL\_TESTCASES displays information about test cases exported by SQL Test Case Builder.

You can use this view in conjunction with the V\$DIAG\_INCIDENT view. Join the INCIDENT\_ID column in this view with the INCIDENT\_ID column in V\$DIAG\_INCIDENT to view information about the test case associated with a particular incident.

The V\$SQL\_TESTCASES view requires the existence of a TCB root directory named SQL\_TCB\_DIR. This view will not contain any rows if a TCB root directory does not exist, or if the TCB root directory exists with a name other than SQL\_TCB\_DIR. The operating system directory to which the TCB root directory refers must be writable by the owner of the Oracle Database binaries.

- In Oracle Autonomous Database environments, the TCB root directory is created automatically on each POD during provisioning.
- For on-premises databases, a user who has been granted the DBA role must explicitly create the TCB root directory. See *Oracle Database Administrator's Guide* for more information.

| Column        | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TESTCASE_NAME | VARCHAR2 (512)  | Test case name                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_ID        | VARCHAR2 (13)   | SQL identifier of the SQL statement in the test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SQL_TEXT      | VARCHAR2 (1000) | First 1000 characters of text for the SQL statement in the test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SQL_TEXT_FULL | CLOB            | Full text for the SQL statement in the test case, exposed as a CLOB column                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INCIDENT_ID   | NUMBER          | ID for the incident associated with the test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| PROBLEM_TYPE  | NUMBER          | Type of problem for the incident associated with the test case.<br>Possible values: <ul style="list-style-type: none"> <li>1: Performance problem (PROBLEM_TYPE_PERFORMANCE)</li> <li>2: Inconsistent results (PROBLEM_TYPE_WRONG_RESULTS)</li> <li>3: Crash in compilation (PROBLEM_TYPE_COMPILATION_ERROR)</li> <li>4: Crash in execution (PROBLEM_TYPE_EXECUTION_ERROR)</li> </ul> These numeric values, and their associated constant values shown in parentheses, correspond to the numeric and constant values for problem type constants in the DBMS_SQLDIAG package. See <i>Oracle Database PL/SQL Packages and Types Reference</i> for more information. |
| CREATION_DATE | TIMESTAMP (6)   | Creation time for the incident associated with the test case                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| STATUS        | VARCHAR2 (10)   | Current status for the incident associated with the test case.<br>Possible values: <ul style="list-style-type: none"> <li>COMPLETE: The test case export completed successfully</li> <li>INCOMPLETE: The test case export failed due to an error</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                       |
| CON_ID        | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                   |

## 10.83 V\$\$SQL\_WORKAREA

V\$\$SQL\_WORKAREA displays information about work areas used by SQL cursors. Each SQL statement stored in the shared pool has one or more child cursors that are listed in the V\$\$SQL view. V\$\$SQL\_WORKAREA lists all work areas needed by these child cursors; V\$\$SQL\_WORKAREA can be joined with V\$\$SQLAREA on (ADDRESS, HASH\_VALUE) and with V\$\$SQL on (ADDRESS, HASH\_VALUE, CHILD\_NUMBER).

You can use this view to find out answers to the following questions:

- What are the top 10 work areas that require the most cache area?

- For work areas allocated in `AUTO` mode, what percentage of work areas are running using maximum memory?

| Column                 | Datatype      | Description                                                                                                                                                                                                                                    |
|------------------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS                | RAW(4   8)    | Address of the parent cursor handle                                                                                                                                                                                                            |
| HASH_VALUE             | NUMBER        | Hash value of the parent statement in the library cache. Two columns <code>PARENT_HANDLE</code> and <code>HASH_VALUE</code> can be used to join with <code>V\$SQLAREA</code> to locate the parent cursor.                                      |
| SQL_ID                 | VARCHAR2(13)  | SQL identifier of the parent statement in the library cache                                                                                                                                                                                    |
| CHILD_NUMBER           | NUMBER        | Number of the child cursor that uses this work area. The columns <code>PARENT_HANDLE</code> , <code>HASH_VALUE</code> , and <code>CHILD_NUMBER</code> can be used to join with <code>V\$SQL</code> to locate the child cursor using this area. |
| WORKAREA_ADDRESS       | RAW(4   8)    | Address of the work area handle. This is the primary key for the view.                                                                                                                                                                         |
| OPERATION_TYPE         | VARCHAR2(160) | Type of operation using the work area. Can include values such as <code>SORT</code> , <code>HASH JOIN</code> , <code>GROUP BY</code> , <code>BUFFER</code> , <code>BITMAP MERGE</code> , and <code>BITMAP CONSTRUCTION</code> .                |
| OPERATION_ID           | NUMBER        | A unique number used to identify the operation in the execution plan. This identifier can be joined to <code>V\$SQL_PLAN</code> to locate the operation that uses this work area.                                                              |
| POLICY                 | VARCHAR2(40)  | Sizing policy for this work area ( <code>MANUAL</code> or <code>AUTO</code> )                                                                                                                                                                  |
| ESTIMATED_OPTIMAL_SIZE | NUMBER        | Estimated size (in bytes) required by this work area to execute the operation completely in memory (optimal execution). Derived from either optimizer statistics or previous executions.                                                       |
| ESTIMATED_ONEPASS_SIZE | NUMBER        | Estimated size (in bytes) required by this work area to execute the operation in a single pass. Derived from either optimizer statistics or previous executions.                                                                               |
| LAST_MEMORY_USED       | NUMBER        | Memory (in bytes) used by this work area during the last execution of the cursor                                                                                                                                                               |
| LAST_EXECUTION         | VARCHAR2(40)  | Indicates whether this work area runs using <code>OPTIMAL</code> , <code>ONE PASS</code> , or <code>ONE PASS</code> memory requirement (or <code>MULTI-PASS</code> ), during the last execution of the cursor                                  |
| LAST_DEGREE            | NUMBER        | Degree of parallelism used during the last execution of this operation                                                                                                                                                                         |
| TOTAL_EXECUTIONS       | NUMBER        | Number of times this work area was active                                                                                                                                                                                                      |
| OPTIMAL_EXECUTIONS     | NUMBER        | Number of times this work area ran in optimal mode                                                                                                                                                                                             |
| ONEPASS_EXECUTIONS     | NUMBER        | Number of times this work area ran in one-pass mode                                                                                                                                                                                            |
| MULTIPASSES_EXECUTIONS | NUMBER        | Number of times this work area ran below the one-pass memory requirement                                                                                                                                                                       |
| ACTIVE_TIME            | NUMBER        | Average time this work area is active (in hundredths of a second)                                                                                                                                                                              |
| MAX_TEMPSEG_SIZE       | NUMBER        | Maximum temporary segment size (in bytes) created by an instantiation of this work area. This column is <code>NULL</code> if this work area has never spilled to disk.                                                                         |
| LAST_TEMPSEG_SIZE      | NUMBER        | Temporary segment size (in bytes) created in the last instantiation of this work area. This column is <code>NULL</code> if the last instantiation of this work area did not spill to disk.                                                     |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.84 V\$SQL\_WORKAREA\_ACTIVE

V\$SQL\_WORKAREA\_ACTIVE contains an instantaneous view of the work areas currently allocated by the system. You can join this view against V\$SQL\_WORKAREA on WORKAREA\_ADDRESS to access the definition of that work area. If a work area spills to disk, then this view contains information for the temporary segment created on behalf of this work area. The last three columns are included to enable joining V\$SQL\_WORKAREA\_ACTIVE with V\$TEMPSEG\_USAGE to retrieve more information on this temporary segment.

You can use this view to answer the following:

- What are the top 10 largest work areas currently allocated in the system?
- What percentage of memory is over-allocated (EXPECTED\_SIZE < ACTUAL\_MEM\_USED) and under-allocated (EXPECTED\_SIZE > ACTUAL\_MEM\_USED)?
- What are the active work areas using more memory than what is expected by the memory manager?
- What are the active work areas that have spilled to disk?

| Column           | Datatype      | Description                                                                                                                                 |
|------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_HASH_VALUE   | NUMBER        | Hash value of the SQL statement that is currently being executed                                                                            |
| SQL_ID           | VARCHAR2(13)  | SQL identifier of the SQL statement that is currently being executed                                                                        |
| SQL_EXEC_START   | DATE          | Time when the execution of the SQL currently executed by this session started                                                               |
| SQL_EXEC_ID      | NUMBER        | SQL execution identifier (see V\$SQL_MONITOR)                                                                                               |
| WORKAREA_ADDRESS | RAW(4   8)    | Address of the work area handle. This is the primary key for the view.                                                                      |
| OPERATION_TYPE   | VARCHAR2(160) | Type of operation using the work area. Can include values such as SORT, HASH JOIN, GROUP BY, BUFFER, BITMAP MERGE, and BITMAP CONSTRUCTION. |

| Column          | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OPERATION_ID    | NUMBER         | A unique number used to identify the operation in the execution plan. This identifier can be joined to V\$SQL_PLAN to locate the operation that uses this work area.                                                                                                                                                                                                                                                              |
| POLICY          | VARCHAR2 (24)  | Sizing policy for this work area (MANUAL or AUTO)                                                                                                                                                                                                                                                                                                                                                                                 |
| SID             | NUMBER         | Session identifier                                                                                                                                                                                                                                                                                                                                                                                                                |
| QCINST_ID       | NUMBER         | Query coordinator instance identifier. Along with QCSID, enables you to uniquely identify the query coordinator.                                                                                                                                                                                                                                                                                                                  |
| QCSID           | NUMBER         | Query coordinator session identifier. This is the same as the SID if the work area is allocated by a serial cursor.                                                                                                                                                                                                                                                                                                               |
| ACTIVE_TIME     | NUMBER         | Average time this work area is active (in microseconds)                                                                                                                                                                                                                                                                                                                                                                           |
| WORK_AREA_SIZE  | NUMBER         | Maximum size (in bytes) of the work area as it is currently used by the operation                                                                                                                                                                                                                                                                                                                                                 |
| EXPECTED_SIZE   | NUMBER         | Expected size (in bytes) for this work area. EXPECTED_SIZE is set on behalf of the operation by the memory manager. Memory can be over-allocated when WORK_AREA_SIZE has a higher value than EXPECTED_SIZE. This can occur when the operation using this work area takes a long time to resize it.                                                                                                                                |
| ACTUAL_MEM_USED | NUMBER         | Amount of PGA memory (in bytes) currently allocated on behalf of this work area. This value should range between 0 and WORK_AREA_SIZE.                                                                                                                                                                                                                                                                                            |
| MAX_MEM_USED    | NUMBER         | Maximum memory amount (in bytes) used by this work area                                                                                                                                                                                                                                                                                                                                                                           |
| NUMBER_PASSES   | NUMBER         | Number of passes corresponding to this work area (0 if running in OPTIMAL mode)                                                                                                                                                                                                                                                                                                                                                   |
| TEMPSEG_SIZE    | NUMBER         | Size (in bytes) of the temporary segment used on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.                                                                                                                                                                                                                                                                                   |
| TABLESPACE      | VARCHAR2 (128) | Tablespace name for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.                                                                                                                                                                                                                                                                               |
| SEGRFNO#        | NUMBER         | Relative file number within the tablespace for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.                                                                                                                                                                                                                                                    |
| SEGBLK#         | NUMBER         | Block number for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.                                                                                                                                                                                                                                                                                  |
| CON_ID          | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 10.85 V\$SQL\_WORKAREA\_HISTOGRAM

V\$SQL\_WORKAREA\_HISTOGRAM displays the cumulative work area execution statistics (cumulated since instance startup) for different work area groups. The work areas are split into 33 groups based on their optimal memory requirements with the requirements increasing in powers of two. That is, work areas whose optimal requirement varies from 0 KB to 1 KB, 1 KB to 2 KB, 2 KB to 4 KB, ... and 2 TB to 4 TB.

For each work area group, the V\$SQL\_WORKAREA\_HISTOGRAM view shows how many work areas in that group were able to run in optimal mode, how many were able to run in one-pass mode, and finally how many ran in multi-pass mode. The DBA can take a snapshot at the beginning and the end of a desired time interval to derive the same statistics for that interval.

| Column                 | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOW_OPTIMAL_SIZE       | NUMBER   | Lower bound for the optimal memory requirement of work areas included in this row (bytes)                                                                                                                                                                                                                                                                                                                                                             |
| HIGH_OPTIMAL_SIZE      | NUMBER   | Upper bound for the optimal memory requirement of work areas included in this row (bytes)                                                                                                                                                                                                                                                                                                                                                             |
| OPTIMAL_EXECUTIONS     | NUMBER   | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in optimal mode since instance startup                                                                                                                                                                                                                                                                      |
| ONEPASS_EXECUTIONS     | NUMBER   | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in one-pass mode since instance startup                                                                                                                                                                                                                                                                     |
| MULTIPASSES_EXECUTIONS | NUMBER   | Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in multi-pass mode since instance startup                                                                                                                                                                                                                                                                   |
| TOTAL_EXECUTIONS       | NUMBER   | Sum of OPTIMAL_EXECUTIONS, ONEPASS_EXECUTIONS, and MULTIPASSES_EXECUTIONS                                                                                                                                                                                                                                                                                                                                                                             |
| CON_ID                 | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.86 V\$SQLAREA

V\$SQLAREA displays statistics on shared SQL areas and contains one row per SQL string. It provides statistics on SQL statements that are in memory, parsed, and ready for execution.

| Column                | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TEXT              | VARCHAR2(1000) | First thousand characters of the SQL text for the current cursor                                                                                                                                                                                                                                                                                                                                                                                                                    |
| SQL_FULLTEXT          | CLOB           | All characters of the SQL text for the current cursor                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SQL_ID                | VARCHAR2(13)   | SQL identifier of the parent cursor in the library cache                                                                                                                                                                                                                                                                                                                                                                                                                            |
| SHARABLE_MEM          | NUMBER         | Amount of shared memory used by a cursor. If multiple child cursors exist, then the sum of all shared memory used by all child cursors.                                                                                                                                                                                                                                                                                                                                             |
| PERSISTENT_MEM        | NUMBER         | Fixed amount of memory used for the lifetime of an open cursor. If multiple child cursors exist, then the fixed sum of memory used for the lifetime of all the child cursors.                                                                                                                                                                                                                                                                                                       |
| RUNTIME_MEM           | NUMBER         | Fixed amount of memory required during execution of a cursor. If multiple child cursors exist, then the fixed sum of all memory required during execution of all the child cursors.                                                                                                                                                                                                                                                                                                 |
| SORTS                 | NUMBER         | Sum of the number of sorts that were done for all the child cursors                                                                                                                                                                                                                                                                                                                                                                                                                 |
| VERSION_COUNT         | NUMBER         | Number of child cursors that are present in the cache under this parent                                                                                                                                                                                                                                                                                                                                                                                                             |
| LOADED_VERSIONS       | NUMBER         | Number of child cursors that are present in the cache and have their context heap loaded                                                                                                                                                                                                                                                                                                                                                                                            |
| OPEN_VERSIONS         | NUMBER         | Number of child cursors that are currently open under this current parent                                                                                                                                                                                                                                                                                                                                                                                                           |
| USERS_OPENING         | NUMBER         | Number of users that have any of the child cursors open                                                                                                                                                                                                                                                                                                                                                                                                                             |
| FETCHES               | NUMBER         | Number of fetches associated with the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| EXECUTIONS            | NUMBER         | Total number of executions, totalled over all the child cursors                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PX_SERVERS_EXECUTIONS | NUMBER         | Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)                                                                                                                                                                                                                                                                                                                                                       |
| END_OF_FETCH_COUNT    | NUMBER         | Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column. |
| USERS_EXECUTING       | NUMBER         | Total number of users executing the statement over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                |

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                |
|--------------------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LOADS                    | NUMBER         | Number of times the object was loaded or reloaded                                                                                                                                                                                                                                                                                          |
| FIRST_LOAD_TIME          | VARCHAR2 (76)  | Timestamp of the parent creation time                                                                                                                                                                                                                                                                                                      |
| INVALIDATIONS            | NUMBER         | Total number of invalidations over all the child cursors                                                                                                                                                                                                                                                                                   |
| PARSE_CALLS              | NUMBER         | Sum of all parse calls to all the child cursors under this parent                                                                                                                                                                                                                                                                          |
| DISK_READS               | NUMBER         | Sum of the number of disk reads over all child cursors                                                                                                                                                                                                                                                                                     |
| DIRECT_WRITES            | NUMBER         | Sum of the number of direct writes over all child cursors                                                                                                                                                                                                                                                                                  |
| DIRECT_READS             | NUMBER         | Sum of the number of direct reads over all child cursors                                                                                                                                                                                                                                                                                   |
| BUFFER_GETS              | NUMBER         | Sum of buffer gets over all child cursors                                                                                                                                                                                                                                                                                                  |
| APPLICATION_WAIT_TIME    | NUMBER         | Application wait time (in microseconds)                                                                                                                                                                                                                                                                                                    |
| CONCURRENCY_WAIT_TIME    | NUMBER         | Concurrency wait time (in microseconds)                                                                                                                                                                                                                                                                                                    |
| CLUSTER_WAIT_TIME        | NUMBER         | Cluster wait time (in microseconds)                                                                                                                                                                                                                                                                                                        |
| USER_IO_WAIT_TIME        | NUMBER         | User I/O Wait Time (in microseconds)                                                                                                                                                                                                                                                                                                       |
| PLSQL_EXEC_TIME          | NUMBER         | PL/SQL execution time (in microseconds)                                                                                                                                                                                                                                                                                                    |
| JAVA_EXEC_TIME           | NUMBER         | Java execution time (in microseconds)                                                                                                                                                                                                                                                                                                      |
| ROWS_PROCESSED           | NUMBER         | Total number of rows processed on behalf of this SQL statement                                                                                                                                                                                                                                                                             |
| COMMAND_TYPE             | NUMBER         | Oracle command type definition                                                                                                                                                                                                                                                                                                             |
| OPTIMIZER_MODE           | VARCHAR2 (10)  | Mode under which the SQL statement was executed                                                                                                                                                                                                                                                                                            |
| OPTIMIZER_COST           | NUMBER         | Cost of this query given by the optimizer                                                                                                                                                                                                                                                                                                  |
| OPTIMIZER_ENV            | RAW (2000)     | Optimizer environment                                                                                                                                                                                                                                                                                                                      |
| OPTIMIZER_ENV_HASH_VALUE | NUMBER         | Hash value for the optimizer environment                                                                                                                                                                                                                                                                                                   |
| PARSING_USER_ID          | NUMBER         | User ID of the user that has parsed the very first cursor under this parent                                                                                                                                                                                                                                                                |
| PARSING_SCHEMA_ID        | NUMBER         | Schema ID that was used to parse this child cursor                                                                                                                                                                                                                                                                                         |
| PARSING_SCHEMA_NAME      | VARCHAR2 (128) | Schema name that was used to parse this child cursor                                                                                                                                                                                                                                                                                       |
| KEPT_VERSIONS            | NUMBER         | Number of child cursors that have been marked to be kept using the DBMS_SHARED_POOL package                                                                                                                                                                                                                                                |
| ADDRESS                  | RAW (4   8)    | Address of the handle to the parent for this cursor                                                                                                                                                                                                                                                                                        |
| HASH_VALUE               | NUMBER         | Hash value of the parent statement in the library cache                                                                                                                                                                                                                                                                                    |
| OLD_HASH_VALUE           | NUMBER         | Old SQL hash value                                                                                                                                                                                                                                                                                                                         |
| PLAN_HASH_VALUE          | NUMBER         | Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).                                                                                                                       |
| FULL_PLAN_HASH_VALUE     | NUMBER         | Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible. |
| MODULE                   | VARCHAR2 (64)  | Contains the name of the module that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_MODULE                                                                                                                                                                                              |
| MODULE_HASH              | NUMBER         | Hash value of the module that is named in the MODULE column                                                                                                                                                                                                                                                                                |

| Column                    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACTION                    | VARCHAR2 (64) | Contains the name of the action that was executing when the SQL statement was first parsed as set by calling <code>DBMS_APPLICATION_INFO.SET_ACTION</code>                                                                                                                                                                                                                                                                    |
| ACTION_HASH               | NUMBER        | Hash value of the action that is named in the <code>ACTION</code> column                                                                                                                                                                                                                                                                                                                                                      |
| SERIALIZABLE_ABORTS       | NUMBER        | Number of times the transaction failed to serialize, producing <code>ORA-08177</code> errors, totalled over all the child cursors                                                                                                                                                                                                                                                                                             |
| OUTLINE_CATEGORY          | VARCHAR2 (64) | If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise the column is left blank.                                                                                                                                                                                                                                                                      |
| CPU_TIME                  | NUMBER        | CPU time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                                                                                                                                                                                                                                                                                           |
| ELAPSED_TIME              | NUMBER        | Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then <code>ELAPSED_TIME</code> is the cumulative time for the query coordinator, plus all parallel query worker processes.                                                                                                                                                                    |
| OUTLINE_SID               | VARCHAR2 (40) | Outline session identifier                                                                                                                                                                                                                                                                                                                                                                                                    |
| LAST_ACTIVE_CHILD_ADDRESS | RAW(4   8)    | Address (identifier) of the child cursor that was the last to be active in the group (that is, the child cursor on behalf of which statistics in <code>V\$SQL</code> were updated)                                                                                                                                                                                                                                            |
| REMOTE                    | VARCHAR2 (1)  | Indicates whether the cursor is remote mapped (Y) or not (N)                                                                                                                                                                                                                                                                                                                                                                  |
| OBJECT_STATUS             | VARCHAR2 (19) | Status of the cursor: <ul style="list-style-type: none"> <li>VALID - Valid, authorized without errors</li> <li>VALID_AUTH_ERROR - Valid, authorized with authorization errors</li> <li>VALID_COMPILE_ERROR - Valid, authorized with compilation errors</li> <li>VALID_UNAUTH - Valid, unauthorized</li> <li>INVALID_UNAUTH - Invalid, unauthorized</li> <li>INVALID - Invalid, unauthorized but keep the timestamp</li> </ul> |
| LITERAL_HASH_VALUE        | NUMBER        | Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when <code>CURSOR_SHARING</code> is used. This is not the hash value for the SQL statement. If <code>CURSOR_SHARING</code> is not used, then the value is 0.                                                                                                                                                        |
| LAST_LOAD_TIME            | DATE          | Time at which the query plan was loaded into the library cache                                                                                                                                                                                                                                                                                                                                                                |
| IS_OBSOLETE               | VARCHAR2 (1)  | Indicates whether the cursor has become obsolete (Y) or not (N). This can happen if the number of child cursors is too large.                                                                                                                                                                                                                                                                                                 |
| IS_BIND_SENSITIVE         | VARCHAR2 (1)  | Indicates whether the cursor is bind sensitive (Y) or not (N). A query is considered bind-sensitive if the optimizer peeked at one of its bind variable values when computing predicate selectivities and where a change in a bind variable value may cause the optimizer to generate a different plan.                                                                                                                       |
| IS_BIND_AWARE             | VARCHAR2 (1)  | Indicates whether the cursor is bind aware (Y) or not (N). A query is considered bind-aware if it has been marked to use extended cursor sharing. The query would already have been marked as bind-sensitive.                                                                                                                                                                                                                 |
| CHILD_LATCH               | NUMBER        | Child latch number that is protecting the cursor. This column is obsolete and maintained for backward compatibility.                                                                                                                                                                                                                                                                                                          |
| SQL_PROFILE               | VARCHAR2 (64) | SQL profile used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                   |

| Column                         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| PHYSICAL_READ_BYTES            | NUMBER        | Number of bytes read from disks by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                            |
| PHYSICAL_WRITE_REQUESTS        | NUMBER        | Number of physical write I/O requests issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                               |
| PHYSICAL_WRITE_BYTES           | NUMBER        | Number of bytes written to disks by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                           |
| OPTIMIZED_PHY_READ_REQUESTS    | NUMBER        | Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                |
| LOCKED_TOTAL                   | NUMBER        | Total number of times the child cursor has been locked                                                                                                                                                                                                                                                                                                                                                                                          |
| PINNED_TOTAL                   | NUMBER        | Total number of times the child cursor has been pinned                                                                                                                                                                                                                                                                                                                                                                                          |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER        | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                          |
| IO_CELL_OFFLOAD_RETURNED_BYTES | NUMBER        | Number of bytes that are returned by Exadata cell through the regular I/O path<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                                                                                                                                                                                                                                                    |
| CON_ID                         | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

| Column                    | Datatype    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IS_REOPTIMIZABLE          | VARCHAR2(1) | This column shows whether the next execution matching this child cursor will trigger a reoptimization. The values are: <ul style="list-style-type: none"> <li>Y: If the next execution will trigger a reoptimization</li> <li>R: If the child cursor contains reoptimization information, but will not trigger reoptimization because the cursor was compiled in reporting mode</li> <li>N: If the child cursor has no reoptimization information</li> </ul>                                                                                                                               |
| IS_RESOLVED_ADAPTIVE_PLAN | VARCHAR2(1) | This column shows whether all of the adaptive parts of a plan have been resolved to the final plan. Once the plan is resolved, the plan hash value and the plan displayed by DBMS_XPLAN will not change through the end of execution. The values for this column are: <ul style="list-style-type: none"> <li>NULL: If the plan is not adaptive</li> <li>Y: If the plan is fully resolved</li> <li>N: If the plan is not yet fully resolved</li> </ul> <p><b>See Also:</b> <i>Oracle Database PL/SQL Packages and Types Reference</i> for more information about the DBMS_XPLAN package</p> |

## 10.87 V\$SQLAREA\_PLAN\_HASH

V\$SQLAREA\_PLAN\_HASH displays statistics on shared SQL areas (V\$SQL) by grouping on the SQL\_ID and PLAN\_HASH\_VALUE columns. It can potentially create several rows for one parent cursor, one for each distinct value of the column PLAN\_HASH\_VALUE.

| Column       | Datatype       | Description                                                      |
|--------------|----------------|------------------------------------------------------------------|
| SQL_TEXT     | VARCHAR2(1000) | First thousand characters of the SQL text for the current cursor |
| SQL_FULLTEXT | CLOB           | All characters of the SQL text for the current cursor            |
| ADDRESS      | RAW(4   8)     | Address of the handle to the parent for this cursor              |
| HASH_VALUE   | NUMBER         | Hash value of the parent statement in the library cache          |
| SQL_ID       | VARCHAR2(13)   | SQL identifier of the parent cursor in the library cache         |

| Column                    | Datatype   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLAN_HASH_VALUE           | NUMBER     | Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).                                                                                                                                                                                                                                                                |
| VERSION_COUNT             | NUMBER     | Number of child cursors that are present in the cache under this parent                                                                                                                                                                                                                                                                                                                                                                                                             |
| LAST_ACTIVE_CHILD_ADDRESS | RAW(4   8) | Address (identifier) of the child cursor that was the last to be active in the group (that is, the child cursor on behalf of which statistics in V\$SQL were updated)                                                                                                                                                                                                                                                                                                               |
| SHARABLE_MEM              | NUMBER     | Amount of shared memory used by a cursor. If multiple child cursors exist, then it is the sum of all shared memory used by all child cursors.                                                                                                                                                                                                                                                                                                                                       |
| PERSISTENT_MEM            | NUMBER     | Fixed amount of memory used for the lifetime of an open cursor. If multiple child cursors exist, then it is the fixed sum of memory used for the lifetime of all the child cursors.                                                                                                                                                                                                                                                                                                 |
| RUNTIME_MEM               | NUMBER     | Fixed amount of memory required during execution of a cursor. If multiple child cursors exist, then the fixed sum of all memory required during execution of all the child cursors.                                                                                                                                                                                                                                                                                                 |
| SORTS                     | NUMBER     | Sum of the number of sorts that were done for all the child cursors                                                                                                                                                                                                                                                                                                                                                                                                                 |
| LOADED_VERSIONS           | NUMBER     | Number of child cursors that are present in the cache and that have their context heap loaded                                                                                                                                                                                                                                                                                                                                                                                       |
| OPEN_VERSIONS             | NUMBER     | Number of child cursors that are currently open under this parent                                                                                                                                                                                                                                                                                                                                                                                                                   |
| USERS_OPENING             | NUMBER     | Number of users that have any of the child cursors open                                                                                                                                                                                                                                                                                                                                                                                                                             |
| USERS_EXECUTING           | NUMBER     | Total number of users executing the statement over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                |
| FETCHES                   | NUMBER     | Number of fetches associated with the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| EXECUTIONS                | NUMBER     | Total number of executions, totalled over all the child cursors                                                                                                                                                                                                                                                                                                                                                                                                                     |
| PX_SERVERS_EXECUTIONS     | NUMBER     | Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)                                                                                                                                                                                                                                                                                                                                                       |
| END_OF_FETCH_COUNT        | NUMBER     | Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column. |
| LOADS                     | NUMBER     | Number of times the object was loaded or reloaded                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| FIRST_LOAD_TIME           | DATE       | Timestamp of the parent creation time                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LAST_LOAD_TIME            | DATE       | Time at which the query plan was loaded into the library cache                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LAST_ACTIVE_TIME          | DATE       | Time at which the query plan was last active                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| LAST_EXEC_START_TIME      | DATE       | Time at which the most recent execution of this SQL started                                                                                                                                                                                                                                                                                                                                                                                                                         |
| INVALIDATIONS             | NUMBER     | Total number of invalidations over all the child cursors                                                                                                                                                                                                                                                                                                                                                                                                                            |
| PARSE_CALLS               | NUMBER     | Sum of all parse calls to all the child cursors under this parent                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DISK_READS                | NUMBER     | Sum of the number of disk reads over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                              |
| DIRECT_WRITES             | NUMBER     | Sum of the number of direct writes over all child cursors                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Column                   | Datatype       | Description                                                                                                                                               |
|--------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| BUFFER_GETS              | NUMBER         | Sum of buffer gets over all child cursors                                                                                                                 |
| CPU_TIME                 | NUMBER         | CPU time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                       |
| ELAPSED_TIME             | NUMBER         | Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                   |
| APPLICATION_WAIT_TIME    | NUMBER         | Application wait time (in microseconds)                                                                                                                   |
| CONCURRENCY_WAIT_TIME    | NUMBER         | Concurrency wait time (in microseconds)                                                                                                                   |
| CLUSTER_WAIT_TIME        | NUMBER         | Cluster wait time (in microseconds)                                                                                                                       |
| USER_IO_WAIT_TIME        | NUMBER         | User I/O wait time (in microseconds)                                                                                                                      |
| PLSQL_EXEC_TIME          | NUMBER         | PL/SQL execution time (in microseconds)                                                                                                                   |
| JAVA_EXEC_TIME           | NUMBER         | Java execution time (in microseconds)                                                                                                                     |
| ROWS_PROCESSED           | NUMBER         | Total number of rows processed on behalf of this SQL statement                                                                                            |
| COMMAND_TYPE             | NUMBER         | Oracle command type definition                                                                                                                            |
| OPTIMIZER_MODE           | VARCHAR2 (10)  | Mode under which the SQL statement was executed                                                                                                           |
| OPTIMIZER_COST           | NUMBER         | Cost of this query given by the optimizer                                                                                                                 |
| OPTIMIZER_ENV            | RAW (2000)     | Optimizer environment                                                                                                                                     |
| OPTIMIZER_ENV_HASH_VALUE | NUMBER         | Hash value for the optimizer environment                                                                                                                  |
| PARSING_USER_ID          | NUMBER         | User ID of the user that has parsed the very first cursor under this parent                                                                               |
| PARSING_SCHEMA_ID        | NUMBER         | Schema ID that was used to parse this child cursor                                                                                                        |
| PARSING_SCHEMA_NAME      | VARCHAR2 (128) | Schema name that was used to parse this child cursor                                                                                                      |
| KEPT_VERSIONS            | NUMBER         | Number of child cursors that have been marked to be kept using the DBMS_SHARED_POOL package                                                               |
| MODULE                   | VARCHAR2 (64)  | Contains the name of the module that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_MODULE             |
| MODULE_HASH              | NUMBER         | Hash value of the module that is named in the MODULE column                                                                                               |
| ACTION                   | VARCHAR2 (64)  | Contains the name of the action that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_ACTION             |
| ACTION_HASH              | NUMBER         | Hash value of the action that is named in the ACTION column                                                                                               |
| SERIALIZABLE_ABORTS      | NUMBER         | Number of times the transaction failed to serialize, producing ORA-08177 errors, totalled over all the child cursors                                      |
| OUTLINE_CATEGORY         | VARCHAR2 (64)  | If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise, the column is left blank. |
| OUTLINE_SID              | VARCHAR2 (40)  | Outline session identifier                                                                                                                                |
| REMOTE                   | VARCHAR2 (1)   | Indicates whether the cursor is remote mapped (Y) or not (N)                                                                                              |

| Column                         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OBJECT_STATUS                  | VARCHAR2 (19) | <p>Status of the cursor:</p> <ul style="list-style-type: none"> <li>VALID - Valid, authorized without errors</li> <li>VALID_AUTH_ERROR - Valid, authorized with authorization errors</li> <li>VALID_COMPILE_ERROR - Valid, authorized with compilation errors</li> <li>VALID_UNAUTH - Valid, unauthorized</li> <li>INVALID_UNAUTH - Invalid, unauthorized</li> <li>INVALID - Invalid, unauthorized but keep the timestamp</li> </ul> |
| LITERAL_HASH_VALUE             | NUMBER        | Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when CURSOR_SHARING is used. This is not the hash value for the SQL statement. If CURSOR_SHARING is not used, then the value is 0.                                                                                                                                                                                         |
| SQL_PROFILE                    | VARCHAR2 (64) | SQL profile used for this statement, if any                                                                                                                                                                                                                                                                                                                                                                                          |
| PROGRAM_ID                     | NUMBER        | Program identifier                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PROGRAM_LINE#                  | NUMBER        | Program line number                                                                                                                                                                                                                                                                                                                                                                                                                  |
| EXACT_MATCHING_SIGNATURE       | NUMBER        | Signature used when the CURSOR_SHARING parameter is set to EXACT                                                                                                                                                                                                                                                                                                                                                                     |
| FORCE_MATCHING_SIGNATURE       | NUMBER        | Signature used when the CURSOR_SHARING parameter is set to FORCE                                                                                                                                                                                                                                                                                                                                                                     |
| BIND_DATA                      | RAW (2000)    | Bind data                                                                                                                                                                                                                                                                                                                                                                                                                            |
| TYPECHECK_MEM                  | NUMBER        | Typecheck memory                                                                                                                                                                                                                                                                                                                                                                                                                     |
| IO_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER        | <p>Number of I/O bytes which can be filtered by the Exadata storage system</p> <p><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information</p>                                                                                                                                                                                                                                                     |
| IO_INTERCONNECT_BYTES          | NUMBER        | Number of I/O bytes exchanged between Oracle Database and the storage system                                                                                                                                                                                                                                                                                                                                                         |
| PHYSICAL_READ_REQUESTS         | NUMBER        | Number of physical read I/O requests issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                     |
| PHYSICAL_READ_BYTES            | NUMBER        | Number of bytes read from disks by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                 |
| PHYSICAL_WRITE_REQUESTS        | NUMBER        | Number of physical write I/O requests issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                    |
| PHYSICAL_WRITE_BYTES           | NUMBER        | Number of bytes written to disks by the monitored SQL                                                                                                                                                                                                                                                                                                                                                                                |
| OPTIMIZED_PHY_READ_REQUESTS    | NUMBER        | Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL                                                                                                                                                                                                                                                                                                                                     |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER        | <p>Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells</p> <p><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information</p>                                                                                                                                                                                                                    |
| IO_CELL_OFFLOAD_RETURNED_BYTES | NUMBER        | <p>Number of bytes that are returned by Exadata cell through the regular I/O path</p> <p><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information</p>                                                                                                                                                                                                                                              |

| Column   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CON_DBID | NUMBER   | The database ID of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                      |

## 10.89 V\$SQLFN\_ARG\_METADATA

V\$SQLFN\_ARG\_METADATA contains metadata about function arguments. There is one row for each argument of every function found in V\$SQLFN\_METADATA. There are no rows for functions that do not have any arguments.

| Column   | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FUNC_ID  | NUMBER         | Internal function identification number. This column can be used to join with the V\$SQLFN_METADATA view.                                                                                                                                                                                                                                                                                                                                       |
| ARGNUM   | NUMBER         | Argument number                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DATATYPE | VARCHAR2 (8)   | Data type of the argument. The value is NULL if this argument is not used. Otherwise, it can take values of any Oracle data type, family data type, or EXPR data type.                                                                                                                                                                                                                                                                          |
| DESCR    | VARCHAR2 (128) | This column is reserved for future use.                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID   | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.90 V\$SQLFN\_METADATA

V\$SQLFN\_METADATA contains metadata about operators and built-in functions. Note that this view does not contain information about arguments because the number of arguments will be different for various functions. Information about arguments is contained in V\$SQLFN\_ARG\_METADATA, which can be joined with V\$SQLFN\_METADATA to get information about any function and its arguments.

| Column      | Datatype       | Description                                                                                                                                                                                                       |
|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FUNC_ID     | NUMBER         | Internal function identification number                                                                                                                                                                           |
| NAME        | VARCHAR2 (128) | Name of the built-in function                                                                                                                                                                                     |
| MINARGS     | NUMBER         | Minimum number of arguments for the function                                                                                                                                                                      |
| MAXARGS     | NUMBER         | Maximum number of arguments for the function                                                                                                                                                                      |
| DATATYPE    | VARCHAR2 (8)   | Return data type, which can take any Oracle data type values, data type family values, or ARG[n] data types                                                                                                       |
| VERSION     | VARCHAR2 (12)  | Minimum version of the database that has this function                                                                                                                                                            |
| ANALYTIC    | VARCHAR2 (3)   | Indicates whether the function is an analytic function (YES) or not (NO)                                                                                                                                          |
| AGGREGATE   | VARCHAR2 (3)   | Indicates whether the function is an aggregate function (YES) or not (NO)                                                                                                                                         |
| OFFLOADABLE | VARCHAR2 (3)   | Indicates whether execution of the function can be offloaded to the Oracle Exadata Storage Server (YES) or not (NO)<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information |

| Column    | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISP_TYPE | VARCHAR2 (13)   | Function display type: <ul style="list-style-type: none"> <li>• NORMAL</li> <li>• ARITHMETIC</li> <li>• PARENTHESIS</li> <li>• REL-OP</li> <li>• CASELIKE</li> <li>• NOPARENTHESIS</li> </ul>                                                                                                                                                                                                                                                         |
| USAGE     | VARCHAR2 (128)  | A text explanation of how to use this function. The text is based on the syntax diagram for the function in the <i>Oracle Database SQL Language Reference</i> .                                                                                                                                                                                                                                                                                       |
| DESCR     | VARCHAR2 (4000) | Description of the function                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID    | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.91 V\$SQLSTATS

V\$SQLSTATS displays basic performance statistics for SQL cursors and contains one row per SQL statement (that is, one row per unique value of SQL\_ID). The column definitions for columns in V\$SQLSTATS are identical to those in the V\$SQL and V\$SQLAREA views. However, the V\$SQLSTATS view differs from V\$SQL and V\$SQLAREA in that it is faster, more scalable, and has a greater data retention (the statistics may still appear in this view, even after the cursor has been aged out of the shared pool). Note that V\$SQLSTATS contains a subset of columns that appear in V\$SQL and V\$SQLAREA.

| Column                    | Datatype        | Description                                                                                                                                                                |
|---------------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SQL_TEXT                  | VARCHAR2 (1000) | First thousand characters of the SQL text for the current cursor                                                                                                           |
| SQL_FULLTEXT              | CLOB            | Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the V\$SQLTEXT view. |
| SQL_ID                    | VARCHAR2 (13)   | SQL identifier of the parent cursor in the library cache                                                                                                                   |
| LAST_ACTIVE_TIME          | DATE            | Last time the statistics of a contributing cursor were updated                                                                                                             |
| LAST_ACTIVE_CHILD_ADDRESS | RAW (4   8)     | Address of the contributing cursor that last updated these statistics                                                                                                      |

| Column                | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLAN_HASH_VALUE       | NUMBER   | Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).                                                                                                                                                                                                                                                                |
| PARSE_CALLS           | NUMBER   | Number of parse calls for all cursors with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                   |
| DISK_READS            | NUMBER   | Number of disk reads for all cursors with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                    |
| DIRECT_WRITES         | NUMBER   | Number of direct writes for all cursors with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DIRECT_READS          | NUMBER   | Number of direct reads for all cursors with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                  |
| BUFFER_GETS           | NUMBER   | Number of buffer gets for all cursors with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ROWS_PROCESSED        | NUMBER   | Total number of rows the parsed SQL statement returns                                                                                                                                                                                                                                                                                                                                                                                                                               |
| SERIALIZABLE_ABORTS   | NUMBER   | Number of times the transaction failed to serialize, producing ORA-08177 errors, per cursor                                                                                                                                                                                                                                                                                                                                                                                         |
| FETCHES               | NUMBER   | Number of fetches associated with the SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| EXECUTIONS            | NUMBER   | Number of executions that took place on this object since it was brought into the library cache                                                                                                                                                                                                                                                                                                                                                                                     |
| END_OF_FETCH_COUNT    | NUMBER   | Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column. |
| LOADS                 | NUMBER   | Number of times the object was either loaded or reloaded                                                                                                                                                                                                                                                                                                                                                                                                                            |
| VERSION_COUNT         | NUMBER   | number of cursors present in the cache with this SQL text and plan                                                                                                                                                                                                                                                                                                                                                                                                                  |
| INVALIDATIONS         | NUMBER   | Number of times this child cursor has been invalidated                                                                                                                                                                                                                                                                                                                                                                                                                              |
| PX_SERVERS_EXECUTIONS | NUMBER   | Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)                                                                                                                                                                                                                                                                                                                                                       |
| CPU_TIME              | NUMBER   | CPU time (in microseconds) used by this cursor for parsing, executing, and fetching                                                                                                                                                                                                                                                                                                                                                                                                 |
| ELAPSED_TIME          | NUMBER   | Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then ELAPSED_TIME is the cumulative time for the query coordinator, plus all parallel query worker processes.                                                                                                                                                                                                                                       |
| AVG_HARD_PARSE_TIME   | NUMBER   | Average hard parse time (in microseconds) used by this cursor                                                                                                                                                                                                                                                                                                                                                                                                                       |
| APPLICATION_WAIT_TIME | NUMBER   | Application wait time (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CONCURRENCY_WAIT_TIME | NUMBER   | Concurrency wait time (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CLUSTER_WAIT_TIME     | NUMBER   | Cluster wait time (in microseconds). This value is specific to Oracle RAC. It shows the total time spent waiting for all waits that are categorized under the cluster class of wait events. The value in this column is an accumulated wait time spent waiting for Oracle RAC cluster resources.                                                                                                                                                                                    |
| USER_IO_WAIT_TIME     | NUMBER   | User I/O wait time (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| PLSQL_EXEC_TIME       | NUMBER   | PL/SQL execution time (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| JAVA_EXEC_TIME        | NUMBER   | Java execution time (in microseconds)                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Column                         | Datatype | Description                                                                                                                                                                                            |
|--------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SORTS                          | NUMBER   | Number of sorts that were done for the child cursor                                                                                                                                                    |
| SHARABLE_MEM                   | NUMBER   | Total shared memory (in bytes) currently occupied by all cursors with this SQL text and plan                                                                                                           |
| TOTAL_SHARABLE_MEM             | NUMBER   | Total shared memory (in bytes) occupied by all cursors with this SQL text and plan if they were to be fully loaded in the shared pool (that is, cursor size)                                           |
| TYPECHECK_MEM                  | NUMBER   | Typecheck memory                                                                                                                                                                                       |
| IO_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER   | Number of I/O bytes which can be filtered by the Exadata storage system<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                                  |
| IO_INTERCONNECT_BYTES          | NUMBER   | Number of I/O bytes exchanged between Oracle Database and the storage system. Typically used for Cache Fusion or parallel queries.                                                                     |
| PHYSICAL_READ_REQUESTS         | NUMBER   | Number of physical read I/O requests issued by the monitored SQL. The requests may not be disk reads.                                                                                                  |
| PHYSICAL_READ_BYTES            | NUMBER   | Number of bytes read from disks by the monitored SQL                                                                                                                                                   |
| PHYSICAL_WRITE_REQUESTS        | NUMBER   | Number of physical write I/O requests issued by the monitored SQL                                                                                                                                      |
| PHYSICAL_WRITE_BYTES           | NUMBER   | Number of bytes written to disks by the monitored SQL                                                                                                                                                  |
| EXACT_MATCHING_SIGNATURE       | NUMBER   | Signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>EXACT</code>                                                                                                             |
| FORCE_MATCHING_SIGNATURE       | NUMBER   | Signature used when the <code>CURSOR_SHARING</code> parameter is set to <code>FORCE</code>                                                                                                             |
| IO_CELL_UNCOMPRESSED_BYTES     | NUMBER   | Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information |
| IO_CELL_OFFLOAD_RETURNED_BYTES | NUMBER   | Number of bytes that are returned by Exadata cell through the regular I/O path<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information                           |
| DELTA_PARSE_CALLS              | NUMBER   | Number of parse calls for the cursor since the last Automatic Workload Repository (AWR) snapshot<br><b>See Also:</b> <i>Oracle Database Performance Tuning Guide</i> for an introduction to AWR        |
| DELTA_DISK_READS               | NUMBER   | Number of disk reads for the cursor since the last AWR snapshot                                                                                                                                        |
| DELTA_DIRECT_WRITES            | NUMBER   | Number of direct writes for the cursor since the last AWR snapshot                                                                                                                                     |
| DELTA_DIRECT_READS             | NUMBER   | Number of direct reads for the cursor since the last AWR snapshot                                                                                                                                      |
| DELTA_BUFFER_GETS              | NUMBER   | Number of buffer gets for the cursor since the last AWR snapshot                                                                                                                                       |
| DELTA_ROWS_PROCESSED           | NUMBER   | Number of rows returned by the cursor since the last AWR snapshot                                                                                                                                      |
| DELTA_FETCH_COUNT              | NUMBER   | Number of fetches for the cursor since the last AWR snapshot                                                                                                                                           |
| DELTA_EXECUTION_COUNT          | NUMBER   | Number of executions for the cursor since the last AWR snapshot                                                                                                                                        |

| Column                            | Datatype | Description                                                                                                                                                                                                      |
|-----------------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DELTA_PX_SERVERS_EXECUTIONS       | NUMBER   | Number of executions performed by parallel execution servers since the last AWR snapshot                                                                                                                         |
| DELTA_END_OF_FETCH_COUNT          | NUMBER   | Number of times the cursor was fully executed since the last AWR snapshot                                                                                                                                        |
| DELTA_CPU_TIME                    | NUMBER   | CPU time (in microseconds) for the cursor since the last AWR snapshot                                                                                                                                            |
| DELTA_ELAPSED_TIME                | NUMBER   | Database time (in microseconds) for the cursor since the last AWR snapshot                                                                                                                                       |
| DELTA_APPLICATION_WAIT_TIME       | NUMBER   | Time spent by the cursor (in microseconds) in the Application wait class since the last AWR snapshot                                                                                                             |
| DELTA_CONCURRENCY_TIME            | NUMBER   | Time spent by the cursor (in microseconds) in the Concurrency wait class since the last AWR snapshot                                                                                                             |
| DELTA_CLUSTER_WAIT_TIME           | NUMBER   | Time spent by the cursor (in microseconds) in the Cluster wait class since the last AWR snapshot                                                                                                                 |
| DELTA_USER_IO_WAIT_TIME           | NUMBER   | Time spent by the cursor (in microseconds) in the User I/O wait class since the last AWR snapshot                                                                                                                |
| DELTA_PLSQL_EXEC_TIME             | NUMBER   | Time spent by the cursor (in microseconds) executing PL/SQL since the last AWR snapshot                                                                                                                          |
| DELTA_JAVA_EXEC_TIME              | NUMBER   | Time spent by the cursor (in microseconds) executing Java since the last AWR snapshot                                                                                                                            |
| DELTA_SORTS                       | NUMBER   | Number of sorts for the cursor since the last AWR snapshot                                                                                                                                                       |
| DELTA_LOADS                       | NUMBER   | Number of times the cursor was loaded since the last AWR snapshot                                                                                                                                                |
| DELTA_INVALIDATIONS               | NUMBER   | Number of times the cursor was invalidated since the last AWR snapshot                                                                                                                                           |
| DELTA_PHYSICAL_READ_REQUESTS      | NUMBER   | Number of physical read I/O requests for the cursor since the last AWR snapshot                                                                                                                                  |
| DELTA_PHYSICAL_READ_BYTES         | NUMBER   | Number of bytes read from disk for the cursor since the last AWR snapshot                                                                                                                                        |
| DELTA_PHYSICAL_WRITE_REQUESTS     | NUMBER   | Number of physical write I/O requests for the cursor since the last AWR snapshot                                                                                                                                 |
| DELTA_PHYSICAL_WRITE_BYTES        | NUMBER   | Number of bytes written to disk for the cursor since the last AWR snapshot                                                                                                                                       |
| DELTA_IO_INTERCONNECT_BYTES       | NUMBER   | Number of I/O bytes exchanged between the Oracle database and the storage system for the cursor since the last AWR snapshot                                                                                      |
| DELTA_CELL_OFFLOAD_ELIGIBLE_BYTES | NUMBER   | Number of I/O bytes which can be filtered by the Exadata storage system for the cursor since the last AWR snapshot<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information |
| DELTA_CELL_UNCOMPRESSED_BYTES     | NUMBER   | Number of uncompressed bytes that are offloaded to the Exadata cell for the cursor since the last AWR snapshot<br><b>See Also:</b> Oracle Exadata Storage Server Software documentation for more information     |

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID                   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CON_DBID                 | NUMBER   | The database ID of the PDB                                                                                                                                                                                                                                                                                                                                                                                                                      |
| OBSOLETE_COUNT           | NUMBER   | Number of times that a parent cursor became obsolete                                                                                                                                                                                                                                                                                                                                                                                            |
| AVOIDED_EXECUTIONS       | NUMBER   | Number of executions attempted on this object, but prevented due to the SQL statement being in quarantine                                                                                                                                                                                                                                                                                                                                       |
| DELTA_AVOIDED_EXECUTIONS | NUMBER   | Number of executions attempted on this object, but prevented due to the SQL statement being in quarantine, since the last AWR snapshot                                                                                                                                                                                                                                                                                                          |

## 10.92 V\$SQLSTATS\_PLAN\_HASH

V\$SQLSTATS\_PLAN\_HASH displays basic performance statistics for SQL cursors and contains one row per execution plan of a SQL statement (that is, one row per unique combination of SQL\_ID and PLAN\_HASH\_VALUE).

The columns for V\$SQLSTATS\_PLAN\_HASH are the same as those for V\$SQLSTATS.

## 10.93 V\$SQLTEXT

V\$SQLTEXT displays the text of SQL statements belonging to shared SQL cursors in the SGA.

| Column     | Datatype     | Description                                               |
|------------|--------------|-----------------------------------------------------------|
| ADDRESS    | RAW(4   8)   | Used with HASH_VALUE to uniquely identify a cached cursor |
| HASH_VALUE | NUMBER       | Used with ADDRESS to uniquely identify a cached cursor    |
| SQL_ID     | VARCHAR2(13) | SQL identifier of a cached cursor                         |

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMAND_TYPE | NUMBER        | Code for the type of SQL statement ( <code>SELECT</code> , <code>INSERT</code> , and so on)                                                                                                                                                                                                                                                                                                                                                     |
| PIECE        | NUMBER        | Number used to order the pieces of SQL text                                                                                                                                                                                                                                                                                                                                                                                                     |
| SQL_TEXT     | VARCHAR2 (64) | A column containing one piece of the SQL text                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.94 V\$SQLTEXT\_WITH\_NEWLINES

V\$SQLTEXT\_WITH\_NEWLINES is identical to the V\$SQLTEXT view except that, to improve legibility, V\$SQLTEXT\_WITH\_NEWLINES does not replace newlines and tabs in the SQL statement with spaces.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS      | RAW (4   8)   | Used with HASH_VALUE to uniquely identify a cached cursor                                                                                                                                                                                                                                                                                                                                                                                       |
| HASH_VALUE   | NUMBER        | Used with ADDRESS to uniquely identify a cached cursor                                                                                                                                                                                                                                                                                                                                                                                          |
| SQL_ID       | VARCHAR2 (13) | SQL identifier of a cached cursor                                                                                                                                                                                                                                                                                                                                                                                                               |
| COMMAND_TYPE | NUMBER        | Code for the type of SQL statement ( <code>SELECT</code> , <code>INSERT</code> , and so on)                                                                                                                                                                                                                                                                                                                                                     |
| PIECE        | NUMBER        | Number used to order the pieces of SQL text                                                                                                                                                                                                                                                                                                                                                                                                     |
| SQL_TEXT     | VARCHAR2 (64) | A column containing one piece of the SQL text                                                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

"V\$SQLTEXT"

## 10.95 V\$STANDBY\_EVENT\_HISTOGRAM

V\$STANDBY\_EVENT\_HISTOGRAM displays the histogram of apply lag on the physical standby. Each distinct value of apply lag has its own bucket and the count in the corresponding bucket represents the number of occurrences so far. The physical standby samples the apply lag every second and increments the corresponding bucket in the histogram.

| Column            | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NAME              | VARCHAR2 (64) | Name of the event (currently APPLY LAG is the only valid value)                                                                                                                                                                                                                                                                                                                                                                   |
| TIME              | NUMBER        | Time duration that the bucket represents                                                                                                                                                                                                                                                                                                                                                                                          |
| UNIT              | VARCHAR2 (16) | Time unit (seconds, minutes, hours, or days)                                                                                                                                                                                                                                                                                                                                                                                      |
| COUNT             | NUMBER        | Each row is a histogram bucket for apply lag. COUNT is the number of occurrences the apply lag falls into the histogram bucket.                                                                                                                                                                                                                                                                                                   |
| LAST_TIME_UPDATED | VARCHAR2 (20) | Last time the bucket was updated by an event falling into that time duration                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID            | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 10.96 V\$STANDBY\_LOG

V\$STANDBY\_LOG displays information about standby redo logs. Standby redo logs are similar to online redo logs, but standby redo logs are only used on a standby database that is receiving redo data from the primary database.

| Column        | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GROUP#        | NUMBER        | Log group number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| DBID          | VARCHAR2 (40) | Database ID of the primary database to which the standby redo logfile is assigned. If the standby redo logfile is unassigned, the value UNASSIGNED will be displayed.                                                                                                                                                                                                                                                                                                                                                                      |
| THREAD#       | NUMBER        | Log thread number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SEQUENCE#     | NUMBER        | Log sequence number                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| BYTES         | NUMBER        | Size of the log (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| BLOCKSIZE     | NUMBER        | Block size of the logfile (512 or 4096)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| USED          | NUMBER        | Number of bytes used in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ARCHIVED      | VARCHAR2 (3)  | Archive status (YES) or (NO). See the STATUS column for further details.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| STATUS        | VARCHAR2 (10) | Log status: <ul style="list-style-type: none"> <li>UNASSIGNED - If ARCHIVED is NO, then the standby redo log has been archived and is again available. If ARCHIVED is YES, then the standby redo log has never been used and is available.</li> <li>ACTIVE - If ARCHIVED is NO, then the standby redo log is complete and waiting to be archived. If ARCHIVED is YES, then the standby redo log is currently being written to and is therefore not ready to be archived. For a given thread, there should be only one such log.</li> </ul> |
| FIRST_CHANGE# | NUMBER        | Lowest SCN in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| FIRST_TIME    | DATE          | Time of the first SCN in the log                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Column       | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|--------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NEXT_CHANGE# | NUMBER   | All redo records contained within this log will have an SCN lower than NEXT_CHANGE#. Only filled in once the log is complete. Also the lowest SCN of any redo record in the next log.                                                                                                                                                                                                                                             |
| NEXT_TIME    | DATE     | All redo records contained within this log will have a timestamp lower than NEXT_TIME. Only filled in once the log is complete. Also the lowest timestamp of any redo record in the next log.                                                                                                                                                                                                                                     |
| LAST_CHANGE# | NUMBER   | All redo records contained within this log will have an SCN lower than LAST_CHANGE#. Only filled in once the log is complete. Also the lowest SCN of any redo record in the next log.<br>LAST_CHANGE# is deprecated. Use NEXT_CHANGE# instead.                                                                                                                                                                                    |
| LAST_TIME    | DATE     | All redo records contained within this log will have a timestamp lower than LAST_TIME. Only filled in once the log is complete. Also the lowest timestamp of any redo record in the next log.<br>LAST_TIME is deprecated. Use NEXT_TIME instead.                                                                                                                                                                                  |
| CON_ID       | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 10.97 V\$STATISTICS\_LEVEL

V\$STATISTICS\_LEVEL displays the status of the statistics/advisories controlled by STATISTICS\_LEVEL.

| Column               | Datatype        | Description                                                                                                                                                                                                                                                     |
|----------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTICS_NAME      | VARCHAR2 (64)   | Name of the statistic/advisory                                                                                                                                                                                                                                  |
| DESCRIPTION          | VARCHAR2 (4000) | Description of the statistic/advisory                                                                                                                                                                                                                           |
| SESSION_STATUS       | VARCHAR2 (8)    | Status of the statistic/advisory for the session: <ul style="list-style-type: none"> <li>ENABLED</li> <li>DISABLED</li> </ul>                                                                                                                                   |
| SYSTEM_STATUS        | VARCHAR2 (8)    | System-wide status of the statistic/advisory: <ul style="list-style-type: none"> <li>ENABLED</li> <li>DISABLED</li> </ul>                                                                                                                                       |
| ACTIVATION_LEVEL     | VARCHAR2 (7)    | Indicates the level of STATISTICS_LEVEL that enables the statistic/advisory: <ul style="list-style-type: none"> <li>BASIC</li> <li>TYPICAL</li> <li>ALL</li> </ul>                                                                                              |
| STATISTICS_VIEW_NAME | VARCHAR2 (64)   | If there is a single view externalizing the statistic/advisory, then this column contains the name of that view. If there is no such view, then this column is null. If there are multiple views involved, then the DESCRIPTION column mentions the view names. |

| Column           | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SESSION_SETTABLE | VARCHAR2 (3) | Indicates whether the statistic/advisory can be set at the session level (YES) or not (NO)                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID           | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

"STATISTICS\_LEVEL"

## 10.98 V\$STATNAME

V\$STATNAME displays decoded statistic names for the statistics shown in the V\$SESSTAT and V\$SYSSTAT tables.

On some platforms, the NAME and CLASS columns contain additional operating system-specific statistics.

| Column     | Datatype      | Description                                                                                                                                                                                                                                                                                                                                        |
|------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTIC# | NUMBER        | Statistic number<br><b>Note:</b> Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.                                                                                                                              |
| NAME       | VARCHAR2 (64) | Statistic name. Names that appear in this column remain stable across Oracle Database releases, and they can be relied on by customer scripts.                                                                                                                                                                                                     |
| CLASS      | NUMBER        | A number representing one or more statistics classes. The following class numbers are additive: <ul style="list-style-type: none"> <li>1 - User</li> <li>2 - Redo</li> <li>4 - Enqueue</li> <li>8 - Cache</li> <li>16 - OS</li> <li>32 - Real Application Clusters</li> <li>64 - SQL</li> <li>128 - Debug</li> <li>256 - Instance level</li> </ul> |
| STAT_ID    | NUMBER        | Identifier of the statistic                                                                                                                                                                                                                                                                                                                        |

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DISPLAY_NAME | VARCHAR2 (64) | A clearer and more descriptive name for the statistic that appears in the NAME column. Names that appear in the DISPLAY_NAME column can change across Oracle Database releases, therefore customer scripts should not rely on names that appear in the DISPLAY_NAME column across releases.                                                                                                                                                     |
| CON_ID       | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.99 V\$STATS\_ADVISOR\_RULES

V\$STATS\_ADVISOR\_RULES displays the rule definition information for each Optimizer Statistics Advisor rule.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RULE_ID     | NUMBER        | ID of the rule                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| NAME        | VARCHAR2 (64) | Name of the rule                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| RULE_TYPE   | VARCHAR2 (9)  | Type of the rule: <ul style="list-style-type: none"> <li>• OBJECT</li> <li>• OPERATION</li> <li>• SYSTEM</li> </ul>                                                                                                                                                                                                                                                                                                                                   |
| DESCRIPTION | VARCHAR2 (64) | Description of the rule                                                                                                                                                                                                                                                                                                                                                                                                                               |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.100 V\$STREAMS\_APPLY\_COORDINATOR

V\$STREAMS\_APPLY\_COORDINATOR displays information about each apply process coordinator. The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process, outbound server, or inbound server.

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SID                      | NUMBER         | Session ID of the coordinator's session                                                                                                                                                                                                                                                                                         |
| SERIAL#                  | NUMBER         | Serial number of the coordinator's session                                                                                                                                                                                                                                                                                      |
| STATE                    | VARCHAR2 (21)  | State of the coordinator: <ul style="list-style-type: none"> <li>• INITIALIZING - Starting up</li> <li>• IDLE - Performing no work</li> <li>• APPLYING - Passing transactions to apply servers</li> <li>• SHUTTING DOWN CLEANLY - Stopping without an error</li> <li>• ABORTING - Stopping because of an apply error</li> </ul> |
| APPLY#                   | NUMBER         | Apply process number. An apply process coordinator is an Oracle background process, prefixed by <code>ap</code> .                                                                                                                                                                                                               |
| APPLY_NAME               | VARCHAR2 (128) | Name of the apply process                                                                                                                                                                                                                                                                                                       |
| TOTAL_APPLIED            | NUMBER         | Total number of transactions applied by the apply process since the apply process was last started                                                                                                                                                                                                                              |
| TOTAL_WAIT_DEPS          | NUMBER         | Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions                                                                                  |
| TOTAL_WAIT_COMMITS       | NUMBER         | Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits                                                                                                                                            |
| TOTAL_ADMIN              | NUMBER         | Number of administrative jobs issued since the apply process was last started                                                                                                                                                                                                                                                   |
| TOTAL_ASSIGNED           | NUMBER         | Number of transactions assigned to apply servers since the apply process was last started                                                                                                                                                                                                                                       |
| TOTAL_RECEIVED           | NUMBER         | Total number of transactions received by the coordinator process since the apply process was last started                                                                                                                                                                                                                       |
| TOTAL_IGNORED            | NUMBER         | Number of transactions which were received by the coordinator but were ignored because they had been previously applied                                                                                                                                                                                                         |
| TOTAL_ROLLBACKS          | NUMBER         | Number of transactions which were rolled back due to unexpected contention                                                                                                                                                                                                                                                      |
| TOTAL_ERRORS             | NUMBER         | Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started                                                                                                                                                                                                    |
| UNASSIGNED_COMPLETE_TXNS | NUMBER         | Total number of complete transactions that the coordinator has not assigned to any apply servers                                                                                                                                                                                                                                |

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUTO_TXN_BUFFER_SIZE     | NUMBER   | Current value of transaction buffer size. Transaction buffer size refers to the number of transactions that the apply reader can assemble ahead of apply servers. The apply process periodically adjusts the transaction buffer size.                                                                                                                                                                                                           |
| LWM_TIME                 | DATE     | Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.                                                                                                                                                                                                                                                                              |
| LWM_MESSAGE_NUMBER       | NUMBER   | Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.                                                                                                                                                                              |
| LWM_MESSAGE_CREATE_TIME  | DATE     | For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.                                                                                                                                                                                          |
| HWM_TIME                 | DATE     | Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.                                                                                                                                                                                                                                                                            |
| HWM_MESSAGE_NUMBER       | NUMBER   | Number of the message corresponding to the high watermark. That is, no messages with a commit message number greater than this message number have been applied.                                                                                                                                                                                                                                                                                |
| HWM_MESSAGE_CREATE_TIME  | DATE     | For captured messages, creation time at the source database of the message corresponding to the high watermark. For user-enqueued messages, time when the message corresponding to the high watermark was enqueued into the queue at the local database.                                                                                                                                                                                        |
| STARTUP_TIME             | DATE     | Time when the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                    |
| ELAPSED_SCHEDULE_TIME    | NUMBER   | Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                           |
| ELAPSED_IDLE_TIME        | NUMBER   | Elapsed idle time                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LWM_POSITION             | RAW (64) | Position of the low-watermark LCR                                                                                                                                                                                                                                                                                                                                                                                                               |
| HWM_POSITION             | RAW (64) | Position of the high-watermark LCR                                                                                                                                                                                                                                                                                                                                                                                                              |
| PROCESSED_MESSAGE_NUMBER | NUMBER   | Message number currently processed by the apply coordinator                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| ACTIVE_SERVER_COUNT      | NUMBER   | Active server count                                                                                                                                                                                                                                                                                                                                                                                                                             |

 **Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

## 10.101 V\$STREAMS\_APPLY\_READER

`V$STREAMS_APPLY_READER` displays information about each apply reader. The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process, outbound server, or inbound server.

| Column                               | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OLDEST_POSITION       | RAW (64)       | The earliest position of the transactions currently being dequeued and applied. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                            |
| SPILL_LWM_POSITION    | RAW (64)       | Spill low-watermark position. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                                              |
| OLDEST_TRANSACTION_ID | VARCHAR2 (128) | Oldest transaction ID                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_LCRS_WITH_DEP   | NUMBER         | Total number of LCRs with row-level dependencies since the apply process last started                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_LCRS_WITH_WMDEP | NUMBER         | Total number of LCRs with watermark dependencies since the apply process last started.<br>A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.                                                                                                                                                                                                                 |
| TOTAL_IN_MEMORY_LCRS  | NUMBER         | Total number of LCRs currently in memory                                                                                                                                                                                                                                                                                                                                                                                                        |
| SGA_ALLOCATED         | NUMBER         | The total amount of shared memory (in bytes) allocated from the Streams pool for the apply process since the apply process last started                                                                                                                                                                                                                                                                                                         |
| CON_ID                | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

 **Note:**

The `ELAPSED_DEQUEUE_TIME` and `ELAPSED_SCHEDULE_TIME` columns are only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

 **See Also:**

- `"TIMED_STATISTICS"`
- `"STATISTICS_LEVEL"`

## 10.102 V\$STREAMS\_APPLY\_SERVER

`V$STREAMS_APPLY_SERVER` displays information about each apply server and its activities. An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the message to the appropriate apply handler. An apply server is a subcomponent of an apply process, outbound server, or inbound server.

| Column     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| APPLIED_MESSAGE_CREATE_TIME | DATE           | Creation time at the source database of the last captured message applied. No information about user-enqueued messages is recorded in this column.                                                                                                                                    |
| ELAPSED_DEQUEUE_TIME        | NUMBER         | Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started                                                                                                                                                                                  |
| ELAPSED_APPLY_TIME          | NUMBER         | Time elapsed (in hundredths of a second) applying messages since the apply process was last started                                                                                                                                                                                   |
| COMMIT_POSITION             | RAW (64)       | Commit position of the transaction. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.                                                                                                                           |
| DEP_COMMIT_POSITION         | RAW (64)       | Commit position of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                        |
| LAST_APPLY_POSITION         | RAW (64)       | For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server. |
| TRANSACTION_ID              | VARCHAR2 (128) | Transaction ID that the worker is applying. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                      |
| DEP_TRANSACTION_ID          | VARCHAR2 (128) | Transaction ID of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                         |

| Column              | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID              | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| TOTAL_LCRS_RETRIED  | NUMBER   | Total number of LCRs retried by this server                                                                                                                                                                                                                                                                                                                                                                                                     |
| LCR_RETRY_ITERATION | NUMBER   | Retry iteration for this transaction by this server                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_TXNS_RETRIED  | NUMBER   | Total transactions retried by this server                                                                                                                                                                                                                                                                                                                                                                                                       |
| TXN_RETRY_ITERATION | NUMBER   | Total retry iterations by this server                                                                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_TXNS_RECORDED | NUMBER   | Total transactions recorded in error queue by this server                                                                                                                                                                                                                                                                                                                                                                                       |

 **Note:**

The `ELAPSED_DEQUEUE_TIME` and `ELAPSED_APPLY_TIME` columns are only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

- "TIMED\_STATISTICS"
- "STATISTICS\_LEVEL"

## 10.103 V\$STREAMS\_POOL\_ADVICE

`V$STREAMS_POOL_ADVICE` displays information about the estimated count of spilled or unspilled messages and the associated time spent in the spill or unspill activity for different Streams pool sizes. The sizes range from 10% to 200% of the current Streams pool size, in equal intervals. The value of the interval depends on the current size of the Streams pool.

| Column                         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STREAMS_POOL_SIZE_FOR_ESTIMATE | NUMBER   | Streams pool size (in megabytes) for the estimate. The size ranges from values smaller than the current Streams pool size to values larger than the current Streams pool size, and there is a separate row for each increment. There is always an entry that shows the current Streams pool size, and there are always 20 increments. The range and the size of the increments depend on the current size of the Streams pool. |
| STREAMS_POOL_SIZE_FACTOR       | NUMBER   | Size factor with respect to the current Streams pool size                                                                                                                                                                                                                                                                                                                                                                      |

| Column             | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ESTD_SPILL_COUNT   | NUMBER   | Estimated count of messages spilled from the Streams pool                                                                                                                                                                                                                                                                                                                                                                                       |
| ESTD_SPILL_TIME    | NUMBER   | Estimated elapsed time (in seconds) to spill                                                                                                                                                                                                                                                                                                                                                                                                    |
| ESTD_UNSPILL_COUNT | NUMBER   | Estimated count of unspills (read back from disk)                                                                                                                                                                                                                                                                                                                                                                                               |
| ESTD_UNSPILL_TIME  | NUMBER   | Estimated elapsed time (in seconds) to unspill                                                                                                                                                                                                                                                                                                                                                                                                  |
| CON_ID             | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.104 V\$STREAMS\_POOL\_STATISTICS

V\$STREAMS\_POOL\_STATISTICS displays information about the current Streams pool usage percentage.

| Column                 | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_MEMORY_ALLOCATED | NUMBER   | Total memory allocated to the Streams pool (in bytes). It should always be less than the current size of the Streams pool. You can get the percentage of the Streams pool used by dividing TOTAL_MEMORY_ALLOCATED by CURRENT_SIZE.                                                                                                                                                                                                              |
| CURRENT_SIZE           | NUMBER   | Current size of the Streams pool (in bytes)                                                                                                                                                                                                                                                                                                                                                                                                     |
| SGA_TARGET_VALUE       | NUMBER   | Value of SGA_TARGET. Used to determine whether or not streams pool automatic tuning is enabled. This should be set even if MEMORY_TARGET is set and SGA_TARGET is not set.                                                                                                                                                                                                                                                                      |
| SHRINK_PHASE           | NUMBER   | This only pertains to the Streams pool in an automatic tuning environment (SGA_TARGET and MEMORY_TARGET set). In this case, this shows whether or not the Streams pool is being asked to shrink. During the shrink phase, enqueues are blocked, flow control is enabled for all components, and cached memory is returned to the SGA.                                                                                                           |
| ADVICE_DISABLED        | NUMBER   | This determines whether or not Streams pool advice in V\$STREAMS_POOL_ADVICE as well as all statistics gathering related to auto-tuning the Streams pool have been disabled.                                                                                                                                                                                                                                                                    |
| CON_ID                 | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.105 V\$\$SUBCACHE

V\$\$SUBCACHE displays information about the subordinate caches currently loaded into library cache memory. The view walks through the library cache, printing out a row for each loaded subordinate cache per library cache object.

| Column     | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OWNER_NAME | VARCHAR2 (64)   | Owner of the object containing these cache entries                                                                                                                                                                                                                                                                                                                                                                                              |
| NAME       | VARCHAR2 (1000) | Object Name                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| TYPE       | NUMBER          | Object Type                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| HEAP_NUM   | NUMBER          | Heap number containing this subordinate cache                                                                                                                                                                                                                                                                                                                                                                                                   |
| CACHE_ID   | NUMBER          | Subordinate cache ID                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CACHE_CNT  | NUMBER          | Number of entries for this cache in this object                                                                                                                                                                                                                                                                                                                                                                                                 |
| HEAP_SZ    | NUMBER          | Amount of extent space allocated to this heap                                                                                                                                                                                                                                                                                                                                                                                                   |
| HEAP_ALOC  | NUMBER          | Amount of extent space allocated from this heap                                                                                                                                                                                                                                                                                                                                                                                                 |
| HEAP_USED  | NUMBER          | Amount of space utilized in this heap                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID     | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.106 V\$\$SUBSCR\_REGISTRATION\_STATS

V\$\$SUBSCR\_REGISTRATION\_STATS displays information for diagnosability of notifications.

| Column                   | Datatype                        | Description                                                                 |
|--------------------------|---------------------------------|-----------------------------------------------------------------------------|
| REG_ID                   | NUMBER                          | Registration identifier                                                     |
| NUM_NTFNS                | NUMBER                          | Number of notifications                                                     |
| NUM_GROUPING_NTFNS       | NUMBER                          | Number of grouping notifications                                            |
| NUM_NTFNS_CURRENT_GROUP  | NUMBER                          | Number of events received in the current group                              |
| LAST_NTFN_START_TIME     | TIMESTAMP (3)<br>WITH TIME ZONE | Time when the last notification was started                                 |
| LAST_NTFN_SENT_TIME      | TIMESTAMP (3)<br>WITH TIME ZONE | Time when the last notification was sent                                    |
| TOTAL_EMON_LATENCY       | NUMBER                          | Total EMON latency (time taken by the EMON worker to process notifications) |
| EMON#                    | NUMBER                          | Active EMON worker serving the registration                                 |
| ALL_EMON_SERVERS         | RAW (2000)                      | EMON workers that served the registration                                   |
| TOTAL_PAYLOAD_BYTES_SENT | NUMBER                          | Total payload bytes sent                                                    |

| Column                   | Datatype                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SHARD_ID                 | NUMBER                          | Shard number for current registration used for Key Based Messaging                                                                                                                                                                                                                                                                                                                                                                                    |
| NUM_RETRIES              | NUMBER                          | Number of retries in sending notifications                                                                                                                                                                                                                                                                                                                                                                                                            |
| TOTAL_PLSQL_EXEC_TIME    | NUMBER                          | Total PL/SQL callback execution time (relevant only for PL/SQL notifications)                                                                                                                                                                                                                                                                                                                                                                         |

| TOTAL_PENDING_NTFN_BYTES | NUMBER                          | Total number of bytes for notifications pending to be sent                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID                   | NUMBER                          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.107 V\$SYS\_OPTIMIZER\_ENV

V\$SYS\_OPTIMIZER\_ENV displays the contents of the optimizer environment for the instance. The optimizer environment stores the value of the main parameters used by the Oracle optimizer when building the execution plan of a SQL statement. Hence, modifying the value of one or more of these parameters (for example, by issuing an ALTER SYSTEM statement) could lead to plan changes.

The parameters displayed by this view are either regular initialization parameters (such as OPTIMIZER\_FEATURES\_ENABLE) or pseudo parameters (such as ACTIVE\_INSTANCE\_COUNT).

| Column        | Datatype      | Description                                                                   |
|---------------|---------------|-------------------------------------------------------------------------------|
| ID            | NUMBER        | Unique identifier of the parameter in the optimizer environment               |
| NAME          | VARCHAR2 (40) | Name of the parameter                                                         |
| SQL_FEATURE   | VARCHAR2 (64) | Associated feature control ID                                                 |
| ISDEFAULT     | VARCHAR2 (3)  | Indicates whether the parameter is set to the default value (YES) or not (NO) |
| VALUE         | VARCHAR2 (25) | Value of the parameter                                                        |
| DEFAULT_VALUE | VARCHAR2 (25) | Default value of the parameter                                                |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.108 V\$SYS\_TIME\_MODEL

V\$SYS\_TIME\_MODEL displays the system-wide accumulated times for various operations. The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation. The time values are 8-byte integers and can therefore hold approximately 580,000 years worth of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

| Column    | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STAT_ID   | NUMBER        | Statistic identifier for the time statistic                                                                                                                                                                                                                                                                                                                                                                                                     |
| STAT_NAME | VARCHAR2 (64) | Name of the statistic (see <a href="#">Table 10-1</a> )                                                                                                                                                                                                                                                                                                                                                                                         |
| VALUE     | NUMBER        | Amount of time (in microseconds) that the system has spent in this operation                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID    | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

 **Note:**

This view returns instance-wide data and a value of 0 in the CON\_ID column when queried from the root of a CDB.

## 10.109 V\$SYSAUX\_OCCUPANTS

V\$SYSAUX\_OCCUPANTS displays SYSAUX tablespace occupant information.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| SPACE_USAGE_KBYTES  | NUMBER        | Current space usage of the occupant (in KB)                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID              | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.110 V\$SYSMETRIC

V\$SYSMETRIC displays the system metric values captured for the most current time interval for both the long duration (60-second) and short duration (15-second) system metrics.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                               |
|--------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME   | DATE          | Begin time of the interval                                                                                                                                                                                                                                                                                                                                |

## 10.111 V\$SYSMETRIC\_HISTORY

V\$SYSMETRIC\_HISTORY displays all system metric values available in the database. Both long duration (60-second with 1 hour history) and short duration (15-second with one-interval only) metrics are displayed by this view.

| Column       | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                   |

## 10.112 V\$SYSMETRIC\_SUMMARY

V\$SYSMETRIC\_SUMMARY displays a summary of all system metric values for the long-duration system metrics. The average, maximum value, minimum value, and the value of one standard deviation for the last hour are displayed for each metric item.

| Column             | Datatype      | Description                                                                                                                                                                                                                                                                                                                                               |
|--------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 10.113 V\$SYSSTAT

V\$SYSSTAT displays system statistics. To find the name of the statistic associated with each statistic number (STATISTIC#), query the V\$STATNAME view.

| Column     | Datatype      | Description                                                                                                                                                                                                           |
|------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATISTIC# | NUMBER        | Statistic number<br><b>Note:</b> Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications. |
| NAME       | VARCHAR2 (64) | Statistic name. You can get a complete listing of statistic names by querying the V\$STATNAME view.                                                                                                                   |

| Column  | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLASS   | NUMBER   | A number representing one or more statistics class. The following class numbers are additive: <ul style="list-style-type: none"> <li>• 1 - User</li> <li>• 2 - Redo</li> <li>• 4 - Enqueue</li> <li>• 8 - Cache</li> <li>• 16 - OS</li> <li>• 32 - Real Application Clusters</li> <li>• 64 - SQL</li> <li>• 128 - Debug</li> <li>• 256 - Instance level</li> </ul>                                                                                    |
| VALUE   | NUMBER   | Statistic value                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| STAT_ID | NUMBER   | Identifier of the statistic                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID  | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note:**

This view returns instance-wide data and a value of 0 in the `CON_ID` column when queried from the root of a CDB.

## 10.114 V\$SYSTEM\_CURSOR\_CACHE

`V$SYSTEM_CURSOR_CACHE` displays system wide information on cursor usage.

**See Also:**

"[V\\$SESSION\\_CURSOR\\_CACHE](#)"

| Column | Datatype | Description                      |
|--------|----------|----------------------------------|
| OPENS  | NUMBER   | Cumulative total of cursor opens |

| Column    | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HITS      | NUMBER   | Cumulative total of cursor open hits                                                                                                                                                                                                                                                                                                                                                                                                            |
| HIT_RATIO | NUMBER   | Ratio of the number of times an open cursor was found divided by the number of times a cursor was sought                                                                                                                                                                                                                                                                                                                                        |
| CON_ID    | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.115 V\$SYSTEM\_EVENT

V\$SYSTEM\_EVENT displays information on total waits for an event. Note that the TIME\_WAITED and AVERAGE\_WAIT columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you want this column to reflect true wait times, then you must set TIMED\_STATISTICS to TRUE in the parameter file; doing this will have a small negative effect on system performance.

**See Also:**

"TIMED\_STATISTICS"

| Column            | Datatype      | Description                                                                                                                |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------|
| EVENT             | VARCHAR2 (64) | Name of the wait event; derived statistic name from V\$EVENT_NAME<br><b>See Also:</b> <a href="#">"Oracle Wait Events"</a> |
| TOTAL_WAITS       | NUMBER        | Total number of waits for the event                                                                                        |
| TOTAL_TIMEOUTS    | NUMBER        | Total number of timeouts for the event                                                                                     |
| TIME_WAITED       | NUMBER        | Total amount of time waited for the event (in hundredths of a second)                                                      |
| AVERAGE_WAIT      | NUMBER        | Average amount of time waited for the event (in hundredths of a second)                                                    |
| TIME_WAITED_MICRO | NUMBER        | Total amount of time waited for the event (in microseconds)                                                                |
| CPU               | NUMBER        | Total amount of CPU time consumed while implementing the wait event itself (in microseconds)                               |
| TOTAL_WAITS_FG    | NUMBER        | Total number of waits for the event, from foreground sessions                                                              |
| TOTAL_TIMEOUTS_FG | NUMBER        | Total number of timeouts for the event, from foreground sessions                                                           |
| TIME_WAITED_FG    | NUMBER        | Total amount of time waited for the event, from foreground sessions (in hundredths of a second)                            |
| AVERAGE_WAIT_FG   | NUMBER        | Average amount of time waited for the event, from foreground sessions (in hundredths of a second)                          |

| Column               | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIME_WAITED_MICRO_FG | NUMBER        | Total amount of time waited for the event, from foreground sessions (in microseconds)                                                                                                                                                                                                                                                                                                                                                           |
| CPU_FG               | NUMBER        | Total amount of CPU time consumed while implementing the wait event itself, from foreground sessions (in microseconds)                                                                                                                                                                                                                                                                                                                          |
| EVENT_ID             | NUMBER        | Identifier of the wait event                                                                                                                                                                                                                                                                                                                                                                                                                    |
| WAIT_CLASS_ID        | NUMBER        | Identifier of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                  |
| WAIT_CLASS#          | NUMBER        | Number of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                      |
| WAIT_CLASS           | VARCHAR2 (64) | Name of the wait class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID               | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

#### Note:

This view returns instance-wide data and a value of 0 in the `CON_ID` column when queried from the root of a CDB.

## 10.116 V\$SYSTEM\_FIX\_CONTROL

V\$SYSTEM\_FIX\_CONTROL displays information about Fix Control (enabled/disabled) at the system level.

| Column                    | Datatype      | Description                                                                   |
|---------------------------|---------------|-------------------------------------------------------------------------------|
| BUGNO                     | NUMBER        | Bug number (as fix control identifier)                                        |
| VALUE                     | NUMBER        | Current value set for the fix control                                         |
| SQL_FEATURE               | VARCHAR2 (64) | Feature control ID                                                            |
| DESCRIPTION               | VARCHAR2 (64) | Description of the fix control                                                |
| OPTIMIZER_FEATURE_ENABLED | VARCHAR2 (25) | Version on (and after) which the fix is enabled by default                    |
| EVENT                     | NUMBER        | Event formerly used to control this fix                                       |
| IS_DEFAULT                | NUMBER        | Indicates whether the current value is the same as the default (1) or not (0) |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.117 V\$SYSTEM\_PARAMETER

V\$SYSTEM\_PARAMETER displays information about the initialization parameters that are currently in effect for the instance. A new session inherits parameter values from the instance-wide values.

| Column           | Datatype        | Description                                                                                                                                                                                                                                                                                   |
|------------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NUM              | NUMBER          | Parameter number                                                                                                                                                                                                                                                                              |
| NAME             | VARCHAR2 (80)   | Name of the parameter                                                                                                                                                                                                                                                                         |
| TYPE             | NUMBER          | Parameter type: <ul style="list-style-type: none"> <li>1 - Boolean</li> <li>2 - String</li> <li>3 - Integer</li> <li>4 - Parameter file</li> <li>5 - Reserved</li> <li>6 - Big integer</li> </ul>                                                                                             |
| VALUE            | VARCHAR2 (4000) | Instance-wide parameter value                                                                                                                                                                                                                                                                 |
| DISPLAY_VALUE    | VARCHAR2 (4000) | Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.                                                                                                       |
| DEFAULT_VALUE    | VARCHAR2 (255)  | The default value for this parameter. This is the value of the parameter if a value is not explicitly specified for the parameter.                                                                                                                                                            |
| ISDEFAULT        | VARCHAR2 (9)    | Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE)<br>The database sets the value of the ISDEFAULT column to TRUE for parameters that are not specified in the init.ora or server parameter file (SPFILE). |
| ISSES_MODIFIABLE | VARCHAR2 (5)    | Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)                                                                                                                                                                                                       |

| Column                | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISSYS_MODIFIABLE      | VARCHAR2 (9)   | Indicates whether the parameter can be changed with <code>ALTER SYSTEM</code> and when the change takes effect: <ul style="list-style-type: none"> <li><code>IMMEDIATE</code> - Parameter can be changed with <code>ALTER SYSTEM</code> regardless of the type of parameter file used to start the instance. The change takes effect immediately.</li> <li><code>DEFERRED</code> - Parameter can be changed with <code>ALTER SYSTEM</code> regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions.</li> <li><code>FALSE</code> - Parameter cannot be changed with <code>ALTER SYSTEM</code> unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.</li> </ul> |
| ISPDB_MODIFIABLE      | VARCHAR2 (5)   | Indicates whether the parameter can be modified inside a PDB ( <code>TRUE</code> ) or not ( <code>FALSE</code> ).<br>In a non-CDB, the value of this column is <code>NULL</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ISINSTANCE_MODIFIABLE | VARCHAR2 (5)   | For parameters that can be changed with <code>ALTER SYSTEM</code> , indicates whether the value of the parameter can be different for every instance ( <code>TRUE</code> ) or whether the parameter must have the same value for all Real Application Clusters instances ( <code>FALSE</code> ). If the <code>ISSYS_MODIFIABLE</code> column is <code>FALSE</code> , then this column is always <code>FALSE</code> .                                                                                                                                                                                                                                                                                                                                                                |
| ISMODIFIED            | VARCHAR2 (8)   | Indicates how the parameter was modified. If an <code>ALTER SYSTEM</code> was performed, the value will be <code>MODIFIED</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ISADJUSTED            | VARCHAR2 (5)   | Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ISDEPRECATED          | VARCHAR2 (5)   | Indicates whether the parameter has been deprecated ( <code>TRUE</code> ) or not ( <code>FALSE</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ISBASIC               | VARCHAR2 (5)   | Indicates whether the parameter is a basic parameter ( <code>TRUE</code> ) or not ( <code>FALSE</code> )                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul>                                                                                                                                                                                                                                                                                                                                     |

 **See Also:**

"V\$PARAMETER" for information about initialization parameters that are currently in effect for a session

## 10.118 V\$SYSTEM\_PARAMETER2

V\$SYSTEM\_PARAMETER2 displays information about the initialization parameters that are currently in effect for the instance, with each list parameter value appearing as a row in the view. A new session inherits parameter values from the instance-wide values.

Presenting the list parameter values in this format enables you to quickly determine the values for a list parameter. For example, if a parameter value is a, b, then the V\$SYSTEM\_PARAMETER view does not tell you if the parameter has two values (both a and b) or one value (a, b). V\$SYSTEM\_PARAMETER2 makes the distinction between the list parameter values clear.

| VALUE            | VARCHAR2 (4000) | Parameter value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DISPLAY_VALUE    | VARCHAR2 (4000) | Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ISDEFAULT        | VARCHAR2 (6)    | Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ISSES_MODIFIABLE | VARCHAR2 (5)    | Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| ISSYS_MODIFIABLE | VARCHAR2 (9)    | Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: <ul style="list-style-type: none"> <li>• IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately.</li> <li>• DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions.</li> <li>• FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.</li> </ul> |
| ISPDB_MODIFIABLE | VARCHAR2 (5)    | Indicates whether the parameter can be modified on a per-PDB basis (TRUE) or not (FALSE).<br>In a non-CDB, the value of this column is NULL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Column                | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ISINSTANCE_MODIFIABLE | VARCHAR2 (5)   | For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.                                                                                                   |
| ISMODIFIED            | VARCHAR2 (8)   | Indicates how the parameter was modified. If an ALTER SYSTEM was performed, the value will be MODIFIED.                                                                                                                                                                                                                                                                                                                           |
| ISADJUSTED            | VARCHAR2 (5)   | Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)                                                                                                                                                                                                       |
| ISDEPRECATED          | VARCHAR2 (5)   | Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                         |
| ISBASIC               | VARCHAR2 (5)   | Indicates whether the parameter is a basic parameter (TRUE) or not (FALSE)                                                                                                                                                                                                                                                                                                                                                        |
| DESCRIPTION           | VARCHAR2 (255) | Description of the parameter                                                                                                                                                                                                                                                                                                                                                                                                      |
| ORDINAL               | NUMBER         | Position (ordinal number) of the parameter value. Useful only for parameters whose values are lists of strings.                                                                                                                                                                                                                                                                                                                   |
| UPDATE_COMMENT        | VARCHAR2 (255) | Comments associated with the most recent update                                                                                                                                                                                                                                                                                                                                                                                   |
| HASH                  | NUMBER         | Hash value for the parameter name                                                                                                                                                                                                                                                                                                                                                                                                 |
| CON_ID                | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

## 10.119 V\$SYSTEM\_WAIT\_CLASS

V\$SYSTEM\_WAIT\_CLASS displays the instance-wide time totals for each registered wait class.

| Column        | Datatype      | Description                                |
|---------------|---------------|--------------------------------------------|
| WAIT_CLASS_ID | NUMBER        | Identifier of the wait class               |
| WAIT_CLASS#   | NUMBER        | Number of the wait class                   |
| WAIT_CLASS    | VARCHAR2 (64) | Name of the wait class                     |
| TOTAL_WAITS   | NUMBER        | Total number of waits from this wait class |

| Column               | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TIME_WAITED          | NUMBER   | Total amount of time spent in waits from this wait class (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                            |
| TIME_WAITED_MICRO    | NUMBER   | Total amount of time spent in waits from this wait class (in microseconds)                                                                                                                                                                                                                                                                                                                                                                      |
| CPU                  | NUMBER   | Total amount of CPU time consumed while implementing waits from this wait class (in microseconds)                                                                                                                                                                                                                                                                                                                                               |
| TOTAL_WAITS_FG       | NUMBER   | Total number of waits for this wait class, from foreground sessions                                                                                                                                                                                                                                                                                                                                                                             |
| TIME_WAITED_FG       | NUMBER   | Total amount of time spent in waits from this wait class, from foreground sessions (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                  |
| TIME_WAITED_MICRO_FG | NUMBER   | Total amount of time spent in waits from this wait class, from foreground sessions (in microseconds)                                                                                                                                                                                                                                                                                                                                            |
| CPU_FG               | NUMBER   | Total amount of CPU time consumed while implementing waits from this wait class, from foreground sessions (in microseconds)                                                                                                                                                                                                                                                                                                                     |
| CON_ID               | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note:**

This view returns instance-wide data and a value of 0 in the `CON_ID` column when queried from the root of a CDB.

## 10.120 V\$TABLESPACE

V\$TABLESPACE displays tablespace information from the control file.

| Column                          | Datatype      | Description                                                                                                                                                                                                                          |
|---------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TS#                             | NUMBER        | Tablespace number                                                                                                                                                                                                                    |
| NAME                            | VARCHAR2 (30) | Tablespace name                                                                                                                                                                                                                      |
| INCLUDED_IN_DATABASE_B<br>ACKUP | VARCHAR2 (3)  | Indicates whether the tablespace is included in full database backups using the <code>BACKUP DATABASE RMAN</code> command (YES) or not (NO); NO only if the <code>CONFIGURE EXCLUDE RMAN</code> command was used for this tablespace |
| BIGFILE                         | VARCHAR2 (3)  | Indicates whether the tablespace is a bigfile tablespace (YES) or a smallfile tablespace (NO)                                                                                                                                        |
| FLASHBACK_ON                    | VARCHAR2 (3)  | Indicates whether the tablespace participates in <code>FLASHBACK DATABASE</code> operations (YES) or not (NO)                                                                                                                        |

| Column            | Datatype     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ENCRYPT_IN_BACKUP | VARCHAR2 (3) | Indicates whether encryption is turned ON or off at the tablespace level: <ul style="list-style-type: none"> <li>ON - Encryption is turned ON at the tablespace level</li> <li>OFF - Encryption is turned OFF at the tablespace level</li> <li>NULL - Encryption is neither explicitly turned on nor off at the tablespace level (default or when cleared)</li> </ul>                                                                           |
| CON_ID            | NUMBER       | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.121 V\$TDM\_STATS

V\$TDM\_STATS describes statistics for Oracle Connection Manager in Traffic Director Mode (CMAN-TDM).

| Column                        | Datatype                        | Description                                                                                                                                                        |
|-------------------------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CMAN_ID                       | VARCHAR2 (1024)                 | CMAN-TDM host name                                                                                                                                                 |
| GATEWAY_ID                    | NUMBER                          | Index of the gateway process of CMAN-TDM                                                                                                                           |
| SERVICE_NAME                  | VARCHAR2 (1024)                 | Reserved for future use                                                                                                                                            |
| PRCP_NUM_REQUESTS             | NUMBER                          | Number of client requests that resulted in acquire on the Proxy Resident Connection Pool (PRCP)                                                                    |
| PRCP_NUM_BUSY_CONNECTIONS     | NUMBER                          | Number of busy server connections in the PRCP                                                                                                                      |
| PRCP_NUM_OPEN_CONNECTIONS     | NUMBER                          | Number of busy and free server connections in the PRCP                                                                                                             |
| PRCP_HISTORIC_MAX_CONNECTIONS | NUMBER                          | Maximum size (number of connections) that the PRCP has ever reached                                                                                                |
| PRCP_NUM_WAITS                | NUMBER                          | Total number of client requests that waited due to unavailability of free server connections in the PRCP<br>This value accumulates since the start of the process. |
| PRCP_NUM_WAITS_ACTIVE         | NUMBER                          | Number of active client requests currently waiting due to unavailability of free server connections in the PRCP                                                    |
| PRCP_NUM_HITS                 | NUMBER                          | Total number of times that client requests found matches in the PRCP                                                                                               |
| PRCP_NUM_INBOUND_CONNECTIONS  | NUMBER                          | Total Number of active client connections for the PRCP                                                                                                             |
| EDITION                       | VARCHAR2 (1024)                 | Database edition name associated with the PRCP                                                                                                                     |
| UPDATED_TIME                  | TIMESTAMP (6)<br>WITH TIME ZONE | Date and time at which the statistics were uploaded to the PDB                                                                                                     |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.124 V\$TEMP\_EXTENT\_POOL

V\$TEMP\_EXTENT\_POOL displays the state of temporary space cached and used for the instance. Note that loading of the temporary space cache is lazy and that instances can be dormant.

| Column          | Datatype      | NULL        | Description                                    |
|-----------------|---------------|-------------|------------------------------------------------|
| TABLESPACE_NAME | VARCHAR2 (30) | NOT<br>NULL | Name of the tablespace                         |
| FILE_ID         | NUMBER        |             | Absolute file number                           |
| EXTENTS_CACHED  | NUMBER        |             | Number of extents that have been cached        |
| EXTENTS_USED    | NUMBER        |             | Number of extents that are actually being used |
| BLOCKS_CACHED   | NUMBER        |             | Number of blocks that are cached               |
| BLOCKS_USED     | NUMBER        |             | Number of blocks that are used                 |
| BYTES_CACHED    | NUMBER        |             | Number of bytes that are cached                |

| Column       | Datatype | NULL | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## 10.125 V\$TEMP\_SPACE\_HEADER

V\$TEMP\_SPACE\_HEADER displays aggregate information per file per LOCALLY MANAGED temporary tablespace regarding how much space is currently being used and how much is free as identified in the space header.

| Column          | Datatype      | NULL     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| CACHE_LOBS    | NUMBER   | Number of cache temp LOBs                                                                                                                                                                                                                                                                                                                                                                                                                       |
| NOCACHE_LOBS  | NUMBER   | Number of nocache temp LOBs                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ABSTRACT_LOBS | NUMBER   | Number of abstract LOBs                                                                                                                                                                                                                                                                                                                                                                                                                         |
| CON_ID        | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.128 V\$TEMPSEG\_USAGE

V\$TEMPSEG\_USAGE describes temporary segment usage.

| Column   | Datatype       | Description                        |
|----------|----------------|------------------------------------|
| USERNAME | VARCHAR2 (128) | User who requested temporary space |

| Column         | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USER           | VARCHAR2 (128) | This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in USERNAME.                                                                                                                                                                                                                                                                                                                 |
| SESSION_ADDR   | RAW (4   8)    | Session address                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SESSION_NUM    | NUMBER         | Serial number of session                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SQLADDR        | RAW (4   8)    | Address of SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                              |
| SQLHASH        | NUMBER         | Hash value of SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SQL_ID         | VARCHAR2 (13)  | SQL identifier of SQL statement                                                                                                                                                                                                                                                                                                                                                                                                                       |
| TABLESPACE     | VARCHAR2 (30)  | Tablespace in which space is allocated                                                                                                                                                                                                                                                                                                                                                                                                                |
| CONTENTS       | VARCHAR2 (9)   | Indicates whether tablespace is TEMPORARY or PERMANENT                                                                                                                                                                                                                                                                                                                                                                                                |

| BLOCKS         | NUMBER         | Extents in blocks allocated to the sort                                                                                                                                                                                                                                                                                                                                                                                                               |
| SEGRFNO#       | NUMBER         | Relative file number of initial extent                                                                                                                                                                                                                                                                                                                                                                                                                |
| TS#            | NUMBER         | Tablespace number                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID         | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| SQL_ID_TEMPSEG | VARCHAR2 (13)  | SQL identifier of the SQL statement that created the temporary segment                                                                                                                                                                                                                                                                                                                                                                                |

## 10.129 V\$TEMPSTAT

V\$TEMPSTAT displays information about file read/write statistics.

| Column   | Datatype | Description                               |
|----------|----------|-------------------------------------------|
| FILE#    | NUMBER   | Number of the file                        |
| PHYRDS   | NUMBER   | Number of physical reads done             |
| PHYWRTS  | NUMBER   | Number of times DBWR is required to write |
| PHYBLKRD | NUMBER   | Number of physical blocks read            |

| Column         | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PHYBLKWRT      | NUMBER   | Number of blocks written to disk, which may be the same as PHYWRTS if all writes are single blocks                                                                                                                                                                                                                                                                                                                                              |
| SINGLEBLKRDS   | NUMBER   | Number of single block reads                                                                                                                                                                                                                                                                                                                                                                                                                    |
| READTIM        | NUMBER   | Time (in hundredths of a second) spent doing reads if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                                        |
| WRITETIM       | NUMBER   | Time (in hundredths of a second) spent doing writes if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                                       |
| SINGLEBLKRDTIM | NUMBER   | Cumulative single block read time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                   |
| AVGIOTIM       | NUMBER   | Average time (in hundredths of a second) spent on I/O, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                                    |
| LSTIOTIM       | NUMBER   | Time (in hundredths of a second) spent doing the last I/O, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                                |
| MINIOTIM       | NUMBER   | Minimum time (in hundredths of a second) spent on a single I/O, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                           |
| MAXIORTM       | NUMBER   | Maximum time (in hundredths of a second) spent doing a single read, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                       |
| MAXIOWTM       | NUMBER   | Maximum time (in hundredths of a second) spent doing a single write, if the TIMED_STATISTICS parameter is true; 0 if false                                                                                                                                                                                                                                                                                                                      |
| CON_ID         | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.130 V\$TEMPUNDOSTAT

V\$TEMPUNDOSTAT shows various statistics related to the temporary undo log for this database instance. It displays a histogram of statistical data to show how the system is working. Each row in the view keeps statistics collected in the instance for a 10-minute interval. The rows are in the descending order of the BEGIN\_TIME column value. This view contains a total of 576 rows, spanning a 4-day cycle. This view is similar to the V\$UNDOSTAT view.

| Column     | Datatype | Description                                   |
|------------|----------|-----------------------------------------------|
| BEGIN_TIME | DATE     | Identifies the beginning of the time interval |
| END_TIME   | DATE     | Identifies the end of the time interval       |

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UNDOTSN        | NUMBER        | Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.                                                                                                                                                    |
| TXNCOUNT       | NUMBER        | Total number of transaction that have bound to the temp undo segment contained in above tablespace within the interval period                                                                                                                                                                                                                                                                                                                   |
| MAXCONCURRENCY | NUMBER        | Highest number of transactions executed concurrently which modified temporary objects within the interval period                                                                                                                                                                                                                                                                                                                                |
| MAXQUERYLEN    | NUMBER        | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                         |
| MAXQUERYID     | VARCHAR2 (13) | Reserved for future use                                                                                                                                                                                                                                                                                                                                                                                                                         |
| UNDOBLKCNT     | NUMBER        | Total number of temporary undo blocks consumed                                                                                                                                                                                                                                                                                                                                                                                                  |
| EXTCNT         | NUMBER        | Total number of extents consumed                                                                                                                                                                                                                                                                                                                                                                                                                |
| USCOUNT        | NUMBER        | Temp undo segments created in this period                                                                                                                                                                                                                                                                                                                                                                                                       |
| SSOLDERRCNT    | NUMBER        | Identifies the number of times the error <code>ORA-01555</code> occurred. You can use this statistic to decide whether or not the <code>UNDO_RETENTION</code> initialization parameter is set properly given the size of the undo tablespace. Increasing the value of <code>UNDO_RETENTION</code> can reduce the occurrence of this error.                                                                                                      |
| NOSPACEERRCNT  | NUMBER        | Total number of times the error 'no space left for temporary undo' was raised                                                                                                                                                                                                                                                                                                                                                                   |
| CON_ID         | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.132 V\$THREAD

`V$THREAD` displays thread information from the control file. This view does not return meaningful results on a physical standby database.

| Column  | Datatype     | Description                  |
|---------|--------------|------------------------------|
| THREAD# | NUMBER       | Thread number                |
| STATUS  | VARCHAR2 (6) | Thread status (OPEN  CLOSED) |

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| OBJECT_TYPE       | VARCHAR2 (64) | Object type: <ul style="list-style-type: none"> <li>• SYSTEM</li> <li>• FILE</li> <li>• SERVICE</li> <li>• EVENT_CLASS</li> <li>• TABLESPACE</li> <li>• SESSION</li> </ul> |
| ALERT_REASON_ID   | NUMBER        | ID of the alert reason                                                                                                                                                     |
| METRIC_VALUE_TYPE | NUMBER        | Metric value type                                                                                                                                                          |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.134 V\$TIMER

V\$TIMER displays the elapsed time in hundredths of a second. Time is measured since the beginning of the epoch, which is operating system specific, and wraps around to 0 again whenever the value overflows four bytes (roughly 497 days).

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HSECS  | NUMBER   | Elapsed time (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.135 V\$TIMEZONE\_FILE

V\$TIMEZONE\_FILE describes the time zone file that is currently in use by the database.

| Column   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILENAME | VARCHAR2 (20) | Time zone file name                                                                                                                                                                                                                                                                                                                                                                                                                             |
| VERSION  | NUMBER        | Time zone file version                                                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID   | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.136 V\$TIMEZONE\_NAMES

V\$TIMEZONE\_NAMES displays valid time zone names.

| Column   | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TZNAME   | VARCHAR2 (64) | Time zone region (for example, US/Pacific)                                                                                                                                                                                                                                                                                                                                                                                                      |
| TZABBREV | VARCHAR2 (64) | Corresponding daylight abbreviation (for example, PDT)                                                                                                                                                                                                                                                                                                                                                                                          |
| CON_ID   | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.137 V\$TOPLEVELCALL

V\$TOPLEVELCALL displays the mapping between Oracle top level calls and names.

| Column              | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOP_LEVEL_CALL#     | NUMBER        | Oracle top level call number                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TOP_LEVEL_CALL_NAME | VARCHAR2 (64) | Oracle top level call name                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID              | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.138 V\$TRANSACTION

V\$TRANSACTION lists the active transactions in the system.

| Column     | Datatype      | Description                             |
|------------|---------------|-----------------------------------------|
| ADDR       | RAW (4   8)   | Address of the transaction state object |
| XIDUSN     | NUMBER        | Undo segment number                     |
| XIDSLOT    | NUMBER        | Slot number                             |
| XIDSQN     | NUMBER        | Sequence number                         |
| UBAFIL     | NUMBER        | Undo block address (UBA) filenum        |
| UBABLK     | NUMBER        | UBA block number                        |
| UBASQN     | NUMBER        | UBA sequence number                     |
| UBAREC     | NUMBER        | UBA record number                       |
| STATUS     | VARCHAR2 (16) | Status                                  |
| START_TIME | VARCHAR2 (20) | Start time (wall clock)                 |
| START_SCNB | NUMBER        | Start system change number (SCN) base   |

| Column                    | Datatype       | Description                                                                                                                            |
|---------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| START_SCNW                | NUMBER         | Start SCN wrap                                                                                                                         |
| START_UEXT                | NUMBER         | Start extent number                                                                                                                    |
| START_UBAFIL              | NUMBER         | Start UBA file number                                                                                                                  |
| START_UBABLK              | NUMBER         | Start UBA block number                                                                                                                 |
| START_UBASQN              | NUMBER         | Start UBA sequence number                                                                                                              |

| TXN_PRIORITY <sup>1</sup> | VARCHAR2 (7)   | Automatic Transaction Rollback priority of the transaction (HIGH, MEDIUM, or LOW)                                                      |

| Column                                | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TXN_PRIORITY_WAIT_TARGET <sup>1</sup> | NUMBER   | If the Automatic Transaction Rollback priority of the transaction is HIGH or MEDIUM, the maximum number of seconds the transaction will wait for a row lock before the database rolls back a lower priority transaction holding the lock<br>If the priority is LOW, the value of this column is 0.                                                                                                                                |
| CON_ID                                | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul> |

<sup>1</sup> This column is available starting with Oracle Database 23c.

## 10.139 V\$TRANSACTION\_ENQUEUE

V\$TRANSACTION\_ENQUEUE displays locks owned by transaction state objects.

| Column  | Datatype     | Description                                                                                                                                                                                                                                                        |
|---------|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDR    | RAW (4   8)  | Address of lock state object                                                                                                                                                                                                                                       |
| KADDR   | RAW (4   8)  | Address of lock                                                                                                                                                                                                                                                    |
| SID     | NUMBER       | Identifier for session holding or acquiring the lock                                                                                                                                                                                                               |
| TYPE    | VARCHAR2 (2) | Type of lock. TX indicates transaction enqueue.                                                                                                                                                                                                                    |

| LMODE   | NUMBER       | Lock mode in which the session holds the lock: <ul style="list-style-type: none"> <li>0 - none</li> <li>1 - null (NULL)</li> <li>2 - row-S (SS)</li> <li>3 - row-X (SX)</li> <li>4 - share (S)</li> <li>5 - S/Row-X (SSX)</li> <li>6 - exclusive (X)</li> </ul>    |
| REQUEST | NUMBER       | Lock mode in which the process requests the lock: <ul style="list-style-type: none"> <li>0 - none</li> <li>1 - null (NULL)</li> <li>2 - row-S (SS)</li> <li>3 - row-X (SX)</li> <li>4 - share (S)</li> <li>5 - S/Row-X (SSX)</li> <li>6 - exclusive (X)</li> </ul> |
| CTIME   | NUMBER       | Time since current mode was granted                                                                                                                                                                                                                                |
| BLOCK   | NUMBER       | The lock is blocking another lock                                                                                                                                                                                                                                  |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.140 V\$TRANSPORTABLE\_PLATFORM

V\$TRANSPORTABLE\_PLATFORM displays all platforms that support cross-platform tablespace transport. Specifically, it lists all platforms supported by the RMAN CONVERT TABLESPACE command, along with the endianness of each platform.

| Column        | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PLATFORM_ID   | NUMBER         | Platform identification number                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PLATFORM_NAME | VARCHAR2 (101) | Platform name                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| ENDIAN_FORMAT | VARCHAR2 (14)  | Platform endian format: <ul style="list-style-type: none"> <li>Big</li> <li>Little</li> <li>UNKNOWN FORMAT</li> </ul>                                                                                                                                                                                                                                                                                                                           |
| CON_ID        | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.141 V\$TSDP\_SUPPORTED\_FEATURE

V\$TSDP\_SUPPORTED\_FEATURE displays information about the features supported by Transparent Sensitive Data Protection (TSDP).

| Column        | Datatype        | Description                                                                                                                                                                                                    |
|---------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FEATURE_NAME  | VARCHAR2 (200)  | The name of the supported feature                                                                                                                                                                              |
| FUNCTIONALITY | VARCHAR2 (200)  | The functionality that is supported within the feature. If all of the functionality of the feature is supported, the value is ALL, otherwise the value will show the specific functionality that is supported. |
| COMMENT\$\$   | VARCHAR2 (4000) | More information regarding the support for the feature and the specific functionality                                                                                                                          |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.142 V\$type\_size

V\$type\_size displays the sizes of various database components for use in estimating data block capacity.

| Column      | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMPONENT   | VARCHAR2 (8)  | Component name, such as segment or buffer header                                                                                                                                                                                                                                                                                                                                                                                                |
| TYPE        | VARCHAR2 (8)  | Component type                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DESCRIPTION | VARCHAR2 (32) | Description of the component                                                                                                                                                                                                                                                                                                                                                                                                                    |
| TYPE_SIZE   | NUMBER        | Size of the component                                                                                                                                                                                                                                                                                                                                                                                                                           |
| CON_ID      | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.143 V\$undostat

V\$undostat displays a histogram of statistical data to show how well the system is working. The available statistics include undo space consumption, transaction concurrency, and length of queries executed in the instance. You can use this view to estimate the amount of undo space required for the current workload. Oracle uses this view to tune undo usage in the system. The view returns NULL values if the system is in manual undo management mode.

Each row in the view keeps statistics collected in the instance for a 10-minute interval. The rows are in descending order by the BEGIN\_TIME column value. Each row belongs to the time interval marked by (BEGIN\_TIME, END\_TIME). Each column represents the data collected for the particular statistic in that time interval. The first row of the view

contains statistics for the (partial) current time period. The view contains a total of 576 rows, spanning a 4 day cycle.

| Column         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME     | DATE          | Identifies the beginning of the time interval                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_TIME       | DATE          | Identifies the end of the time interval                                                                                                                                                                                                                                                                                                                                                                                                            |
| UNDOTSN        | NUMBER        | Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.                                                                                                                                                       |
| UNDOBLKS       | NUMBER        | Represents the total number of undo blocks consumed. You can use this column to obtain the consumption rate of undo blocks, and thereby estimate the size of the undo tablespace needed to handle the workload on your system.                                                                                                                                                                                                                     |
| TXNCOUNT       | NUMBER        | Identifies the total number of transactions executed within the period                                                                                                                                                                                                                                                                                                                                                                             |
| MAXQUERYLEN    | NUMBER        | Identifies the length of the longest query (in seconds) executed in the instance during the period. You can use this statistic to estimate the proper setting of the <code>UNDO_RETENTION</code> initialization parameter. The length of a query is measured from the cursor open time to the last fetch/execute time of the cursor. Only the length of those cursors that have been fetched/executed during the period are reflected in the view. |
| MAXQUERYID     | VARCHAR2 (13) | SQL identifier of the longest running SQL statement in the period                                                                                                                                                                                                                                                                                                                                                                                  |
| MAXCONCURRENCY | NUMBER        | Identifies the highest number of transactions executed concurrently within the period                                                                                                                                                                                                                                                                                                                                                              |
| UNXPSTEALCNT   | NUMBER        | Number of attempts to obtain undo space by stealing unexpired extents from other transactions                                                                                                                                                                                                                                                                                                                                                      |
| UNXPBLKRELCNT  | NUMBER        | Number of unexpired blocks removed from certain undo segments so they can be used by other transactions                                                                                                                                                                                                                                                                                                                                            |
| UNXPBLKREUCNT  | NUMBER        | Number of unexpired undo blocks reused by transactions                                                                                                                                                                                                                                                                                                                                                                                             |
| EXPSTEALCNT    | NUMBER        | Number of attempts to steal expired undo blocks from other undo segments                                                                                                                                                                                                                                                                                                                                                                           |
| EXPBLKRELCNT   | NUMBER        | Number of expired undo blocks stolen from other undo segments                                                                                                                                                                                                                                                                                                                                                                                      |
| EXPBLKREUCNT   | NUMBER        | Number of expired undo blocks reused within the same undo segments                                                                                                                                                                                                                                                                                                                                                                                 |
| SSOLDERRCNT    | NUMBER        | Identifies the number of times the error <code>ORA-01555</code> occurred. You can use this statistic to decide whether or not the <code>UNDO_RETENTION</code> initialization parameter is set properly given the size of the undo tablespace. Increasing the value of <code>UNDO_RETENTION</code> can reduce the occurrence of this error.                                                                                                         |
| NOSPACEERRCNT  | NUMBER        | Identifies the number of times space was requested in the undo tablespace and there was no free space available. That is, all of the space in the undo tablespace was in use by active transactions. The corrective action is to add more space to the undo tablespace.                                                                                                                                                                            |
| ACTIVEBLKS     | NUMBER        | Total number of blocks in the active extents of the undo tablespace for the instance at the sampled time in the period                                                                                                                                                                                                                                                                                                                             |
| UNEXPIREDBLKS  | NUMBER        | Total number of blocks in the unexpired extents of the undo tablespace for the instance at the sampled time in the period                                                                                                                                                                                                                                                                                                                          |

| Column              | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EXPIREDBLKS         | NUMBER   | Total number of blocks in the expired extents of the undo tablespace for the instance at the sampled time in the period                                                                                                                                                                                                                                                                                                            |
| TUNED_UNDORETENTION | NUMBER   | Amount of time (in seconds) for which undo will not be recycled from the time it was committed. At any point in time, the latest value of TUNED_UNDORETENTION is used to determine whether data committed at a particular time in the past can be recycled.<br>The value of this column is not meaningful on an Oracle Active Data Guard standby database instance, because the system does not tune this value on such instances. |
| CON_ID              | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li>n: Where n is the applicable container ID for the rows containing data</li> </ul>  |

"UNDO\_RETENTION"

## 10.144 V\$UNUSABLE\_BACKUPFILE\_DETAILS

V\$UNUSABLE\_BACKUPFILE\_DETAILS displays information about all backup files (backup pieces, proxy copies, or copies) that are marked unavailable and expired. You can select one of the rows and use BTYPE\_KEY or FILETYPE\_KEY to change the status of a backup file set or a specific file to available.

| Column            | Datatype     | Description                                                                                           |
|-------------------|--------------|-------------------------------------------------------------------------------------------------------|
| SESSION_KEY       | NUMBER       | Session identifier                                                                                    |
| SESSION_RECID     | NUMBER       | Session record ID                                                                                     |
| SESSION_STAMP     | NUMBER       | Session stamp                                                                                         |
| RMAN_STATUS_RECID | NUMBER       | Record ID of the corresponding row in the control file                                                |
| RMAN_STATUS_STAMP | NUMBER       | Timestamp of the row in the controlfile                                                               |
| BTYPE             | CHAR(9)      | Backup type container. Possible values are: BACKUPSET, IMAGECOPY, PROXYCOPY.                          |
| BTYPE_KEY         | NUMBER       | Unique identifier for the backup type, either BS_KEY or COPY_KEY.                                     |
| ID1               | NUMBER       | If BACKUPSET, it contains SET_STAMP.<br>If IMAGECOPY or PROXYCOPY, it is RECID from the control file. |
| ID2               | NUMBER       | If BACKUPSET, it contains SET_COUNT.<br>If IMAGECOPY or PROXYCOPY, it is STAMP.                       |
| FILETYPE          | VARCHAR2(15) | Type of file. Possible values are: BACKUPPIECE, COPY, PROXYCOPY.                                      |

| Column       | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FILETYPE_KEY | NUMBER         | Backup piece key if the file is a backup piece; otherwise <code>COPY_KEY</code> .                                                                                                                                                                                                                                                                                                                                                               |
| STATUS       | VARCHAR2 (1)   | Status of the backup file, either U (unavailable) or X (expired)                                                                                                                                                                                                                                                                                                                                                                                |
| FILESIZE     | NUMBER         | Size of the file                                                                                                                                                                                                                                                                                                                                                                                                                                |
| DEVICE_TYPE  | VARCHAR2 (17)  | Type of device on which the file resides                                                                                                                                                                                                                                                                                                                                                                                                        |
| FILENAME     | VARCHAR2 (513) | Name of the file                                                                                                                                                                                                                                                                                                                                                                                                                                |
| MEDIA        | VARCHAR2 (65)  | Name of the media on which the copy resides. This value is informational only. It is not needed for restore.                                                                                                                                                                                                                                                                                                                                    |
| MEDIA_POOL   | NUMBER         | Media pool in which the copy resides. This is the same value that was entered in the <code>POOL</code> operand of the Recovery Manager <code>BACKUP</code> command.                                                                                                                                                                                                                                                                             |
| CON_ID       | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.145 V\$VERSION

`V$VERSION` displays the version number of Oracle Database. The database components have the same version number as the database, so the version number is returned only once.

| Column        | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BANNER        | VARCHAR2 (80)  | Component name and version number                                                                                                                                                                                                                                                                                                                                                                                                               |
| BANNER_FULL   | VARCHAR2 (160) | The new 2 line banner format introduced in Oracle Database 18c. The banner displays the database release and version number.                                                                                                                                                                                                                                                                                                                    |
| BANNER_LEGACY | VARCHAR2 (80)  | The legacy 1 line banner used before Oracle Database 18c. This column displays the same value as the <code>BANNER</code> column.                                                                                                                                                                                                                                                                                                                |
| CON_ID        | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.146 V\$VPD\_POLICY

`V$VPD_POLICY` displays all the fine-grained security policies and predicates associated with the cursors currently in the library cache.

| Column                | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ADDRESS               | RAW(4   8)     | Cursor address                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| PARADDR               | RAW(4   8)     | Parent cursor address                                                                                                                                                                                                                                                                                                                                                                                                                           |
| SQL_HASH              | NUMBER         | SQL hash number                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| SQL_ID                | VARCHAR2(13)   | SQL identifier                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| CHILD_NUMBER          | NUMBER         | Cursor's child number under the parent                                                                                                                                                                                                                                                                                                                                                                                                          |

| POLICY                | VARCHAR2(128)  | Name of the policy                                                                                                                                                                                                                                                                                                                                                                                                                              |
| POLICY_FUNCTION_OWNER | VARCHAR2(128)  | Owner of the policy function                                                                                                                                                                                                                                                                                                                                                                                                                    |
| PREDICATE             | VARCHAR2(4000) | Predicate for the policy (truncated to 4000 bytes in length)                                                                                                                                                                                                                                                                                                                                                                                    |
| CON_ID                | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.147 V\$WAIT\_CHAINS

V\$WAIT\_CHAINS displays information about blocked sessions. A wait chain is composed of sessions that are blocked by one another. Each row represents a blocked and blocker session pair. If a wait chain is not a cyclical wait chain, then the last row for the chain does not have a blocker.

| Column               | Datatype      | Description                                                                                                                   |
|----------------------|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| CHAIN_ID             | NUMBER        | A number identifying the wait chain                                                                                           |
| CHAIN_IS_CYCLE       | VARCHAR2(5)   | Indicates whether the final blocked session in the wait chain is blocked by the initial blocked session (TRUE) or not (FALSE) |
| CHAIN_SIGNATURE      | VARCHAR2(801) | An Oracle-specific text signature of the wait chain. This signature can be used to identify similar wait chains.              |
| CHAIN_SIGNATURE_HASH | NUMBER        | A numeric representation of CHAIN_SIGNATURE                                                                                   |
| INSTANCE             | NUMBER        | Blocked session's instance identifier                                                                                         |
| OSID                 | VARCHAR2(25)  | Blocked session's operating system process identifier                                                                         |
| PID                  | NUMBER        | Blocked session's Oracle process identifier                                                                                   |
| SID                  | NUMBER        | Blocked session's Oracle session identifier                                                                                   |
| SESS_SERIAL#         | NUMBER        | Blocked session's Oracle session serial number                                                                                |
| PDB_ID               | NUMBER        | Blocked session's PDB identifier                                                                                              |
| PDB_NAME             | VARCHAR2(31)  | Blocked session's PDB name                                                                                                    |
| BLOCKER_IS_VALID     | VARCHAR2(5)   | Indicates whether the blocked session has a blocker (TRUE) or not (FALSE)                                                     |

| TIME_REMAINING_SECS       | NUMBER        | Seconds remaining until the blocked session ends its wait (-1 if the blocked session can indefinitely wait); NULL if IN_WAIT is FALSE                                                                                                                   |
| NUM_WAITERS               | NUMBER        | Number of sessions waiting for the blocked session                                                                                                                                                                                                      |
| ROW_WAIT_OBJ#             | NUMBER        | Object ID for the table containing the row specified in ROW_WAIT_ROW#; NULL if IN_WAIT is FALSE                                                                                                                                                         |
| ROW_WAIT_FILE#            | NUMBER        | Identifier for the data file containing the row specified in ROW_WAIT_ROW#; NULL if IN_WAIT is FALSE. This column is valid only if the blocked session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1. |

| Column          | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ROW_WAIT_BLOCK# | NUMBER   | Identifier for the block containing the row specified in ROW_WAIT_ROW#; NULL if IN_WAIT is FALSE. This column is valid only if the blocked session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.                                                                                                                                                                                             |
| ROW_WAIT_ROW#   | NUMBER   | Current row being locked; NULL if IN_WAIT is FALSE. This column is valid only if the blocked session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.                                                                                                                                                                                                                                           |
| CON_ID          | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.148 V\$WAITCLASSMETRIC

V\$WAITCLASSMETRIC displays metric values of wait classes for the most recent 60-second interval. A history of the last one hour will be kept in the system.

| Column               | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BEGIN_TIME           | DATE     | Begin time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                      |
| END_TIME             | DATE     | End time of the interval                                                                                                                                                                                                                                                                                                                                                                                                                        |
| INTSIZE_CSEC         | NUMBER   | Interval size (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                                       |
| WAIT_CLASS#          | NUMBER   | Number of the class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                           |
| WAIT_CLASS_ID        | NUMBER   | Identifier of the class of the wait event                                                                                                                                                                                                                                                                                                                                                                                                       |
| AVERAGE_WAITER_COUNT | NUMBER   | Average waiter count                                                                                                                                                                                                                                                                                                                                                                                                                            |
| DBTIME_IN_WAIT       | NUMBER   | Percent of database time spent in the wait                                                                                                                                                                                                                                                                                                                                                                                                      |
| TIME_WAITED          | NUMBER   | Time waited during the interval (in hundredths of a second)                                                                                                                                                                                                                                                                                                                                                                                     |
| WAIT_COUNT           | NUMBER   | Number of times waited                                                                                                                                                                                                                                                                                                                                                                                                                          |
| TIME_WAITED_FG       | NUMBER   | Amount of time (in hundredths of a second) spent in waits from this wait class in foreground sessions                                                                                                                                                                                                                                                                                                                                           |
| WAIT_COUNT_FG        | NUMBER   | Number of times foreground processes waited                                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID               | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.149 V\$WAITCLASSMETRIC\_HISTORY

V\$WAITCLASSMETRIC\_HISTORY displays metric values of wait classes for all intervals in the last one hour.

The columns for V\$WAITCLASSMETRIC\_HISTORY are the same as those for V\$WAITCLASSMETRIC.

### See Also:

"V\$WAITCLASSMETRIC"

## 10.150 V\$WAITSTAT

V\$WAITSTAT displays block contention statistics. This table is only updated when timed statistics are enabled.

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLASS  | VARCHAR2 (18) | Class of the block                                                                                                                                                                                                                                                                                                                                                                                                                              |
| COUNT  | NUMBER        | Number of waits by this OPERATION for this CLASS of block                                                                                                                                                                                                                                                                                                                                                                                       |
| TIME   | NUMBER        | Sum of all wait times for all the waits by this OPERATION for this CLASS of block (in centiseconds)                                                                                                                                                                                                                                                                                                                                             |
| CON_ID | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.151 V\$WALLET

V\$WALLET displays metadata of certificates that may be used as a master key for Transparent Data Encryption.

### Note:

The use of PKI encryption with Transparent Data Encryption is deprecated. To configure Transparent Data Encryption, use the ADMINISTER KEY MANAGEMENT SQL statement. See *Oracle Database Advanced Security Guide* for more information.

| Column  | Datatype      | Description                                                                                                  |
|---------|---------------|--------------------------------------------------------------------------------------------------------------|
| CERT_ID | VARCHAR2 (52) | A unique certificate identifier value used to specify a particular PKI certificate for use as the master key |

| Column     | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DN         | VARCHAR2 (255) | Distinguished name of a particular PKI certificate                                                                                                                                                                                                                                                                                                                                                                                                    |
| SERIAL_NUM | VARCHAR2 (40)  | Unique serial number assigned to a certificate by the issuer or signer                                                                                                                                                                                                                                                                                                                                                                                |
| ISSUER     | VARCHAR2 (255) | Distinguished name of the Certificate Authority or issuer that issued and signed the certificate                                                                                                                                                                                                                                                                                                                                                      |
| KEYSIZE    | NUMBER         | Size of the PKI key associated with the certificate                                                                                                                                                                                                                                                                                                                                                                                                   |
| STATUS     | VARCHAR2 (16)  | Current status of the certificate: <ul style="list-style-type: none"> <li>• UNUSED</li> <li>• IN USE</li> <li>• USED</li> </ul> This column allows the user to identify whether a certificate is currently in use or has already been used for Transparent Data Encryption.                                                                                                                                                                           |
| CON_ID     | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.152 V\$WORKLOAD\_REPLAY\_THREAD

V\$WORKLOAD\_REPLAY\_THREAD displays information for all the different types of replay sessions.

| Column      | Datatype       | Description                                                        |
|-------------|----------------|--------------------------------------------------------------------|
| CLOCK       | NUMBER         | Current simulated SCN based on the SCN recorded at capture time    |
| NEXT_TICKER | NUMBER         | Next stream ID that will increment the CLOCK after a commit action |
| SID         | NUMBER         | Session ID of the replay session                                   |
| SERIAL#     | NUMBER         | Session serial number of the replay session                        |
| SPID        | VARCHAR2 (24)  | The server process ID of the replay session                        |
| LOGON_USER  | VARCHAR2 (128) | Logon username of the replay session                               |
| LOGON_TIME  | DATE           | Logon time of the replay session                                   |
| EVENT       | VARCHAR2 (64)  | Event name                                                         |
| EVENT_ID    | NUMBER         | Event identifier                                                   |
| EVENT#      | NUMBER         | Event operation code                                               |
| P1TEXT      | VARCHAR2 (64)  | Text for event parameter 1                                         |
| P1          | NUMBER         | Value of event parameter 1                                         |
| P2TEXT      | VARCHAR2 (64)  | Text for event parameter 2                                         |
| P2          | NUMBER         | Value of event parameter 2                                         |
| P3TEXT      | VARCHAR2 (64)  | Text for event parameter 3                                         |

| Column               | Datatype      | Description                                                                                                                                 |
|----------------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| P3                   | NUMBER        | Value of event parameter 3                                                                                                                  |
| WAIT_FOR_SCN         | NUMBER        | The captured SCN for which the current user call should wait                                                                                |
| FILE_ID              | NUMBER        | The stream ID that is being replayed                                                                                                        |
| CALL_COUNTER         | NUMBER        | The call counter of the user call that is being replayed                                                                                    |
| DEPENDENT_SCN        | NUMBER        | The dependent SCN, captured to order the commit actions using block-level dependencies                                                      |
| STATEMENT_SCN        | NUMBER        | Statement SCN                                                                                                                               |
| COMMIT_WAIT_SCN      | NUMBER        | The (maximum) SCN that the current commit should wait for                                                                                   |
| POST_COMMIT_SCN      | NUMBER        | The next SCN after the current commit                                                                                                       |
| ACTION_TYPE          | NUMBER        | The type of commits. The possible values are: COMMIT, ROLLBACK, FAKED_COMMIT, and NULL. A value of NULL means it is not a commit operation. |
| SESSION_TYPE         | VARCHAR2 (13) | The type of replay session:<br>LOGON<br>ADMIN<br>DISPATCHER<br>REPLAY                                                                       |
| WRC_ID               | NUMBER        | Unique replay client ID assigned by the server to all participating replay clients when replay starts                                       |
| SCHEDULE_CAP_ID      | NUMBER        | An unique identifier for a workload capture added to a replay schedule. A value of 0 is used for a non-consolidated replay.                 |
| FILE_NAME            | VARCHAR2 (51) | File name of the captured stream                                                                                                            |
| SKIP_IT              | VARCHAR2 (1)  | Whether or not the current replayed user call is skipped or not                                                                             |
| DIRTY_BUFFERS        | VARCHAR2 (1)  | Reserved for internal use                                                                                                                   |
| DBTIME               | NUMBER        | Accumulated database time for the replay session                                                                                            |
| NETWORK_TIME         | NUMBER        | Accumulated network time for the replay session                                                                                             |
| THINK_TIME           | NUMBER        | Accumulated think time for the replay session                                                                                               |
| TIME_GAIN            | NUMBER        | If nonzero, the accumulated time in macro seconds indicating how fast the replay is                                                         |
| TIME_LOSS            | NUMBER        | If nonzero, the accumulated time in macro seconds indicating how slow the replay is                                                         |
| USER_CALLS           | NUMBER        | Total number of user calls                                                                                                                  |
| PLSQL_CALLS          | NUMBER        | Total number of PL/SQL calls recorded in the workload capture                                                                               |
| PLSQL_SUBCALLS       | NUMBER        | Total number of calls recorded in the workload capture for SQL executed from PL/SQL                                                         |
| PLSQL_DBTIME         | NUMBER        | Total amount of database time in microseconds from PL/SQL calls that have been recorded in the workload capture                             |
| CLIENT_OS_USER       | VARCHAR2 (15) | Operating system username of the replay client                                                                                              |
| CLIENT_HOST          | VARCHAR2 (64) | Host name of the replay client                                                                                                              |
| CLIENT_PID           | VARCHAR2 (24) | Process ID of the replay client                                                                                                             |
| PROGRAM              | VARCHAR2 (84) | Program name of the replay client                                                                                                           |
| CAPTURE_ELAPSED_TIME | NUMBER        | Total amount of elapsed time of a session since capture starts (in seconds)                                                                 |

| Column              | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| REPLAY_ELAPSED_TIME | NUMBER   | Total amount of elapsed time of a session since replay starts (in seconds)                                                                                                                                                                                                                                                                                                                                                                      |
| CON_ID              | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.153 V\$XML\_AUDIT\_TRAIL

V\$XML\_AUDIT\_TRAIL shows standard, fine-grained, SYS, and mandatory audit records written in XML format files.

### Note:

This view is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23c. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored and are viewable with this view. See *Oracle Database Security Guide* for more information about how this desupport works.

| Column             | Datatype                        | Description                                                                                                                                                                                 |
|--------------------|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AUDIT_TYPE         | NUMBER                          | Type of audit row: <ul style="list-style-type: none"> <li>1 = Standard XML Audit</li> <li>2 = Fine Grained XML Audit</li> <li>4 = SYS XML Audit</li> <li>8 = Mandatory XML Audit</li> </ul> |
| SESSION_ID         | NUMBER                          | Numeric ID for the Oracle session                                                                                                                                                           |
| PROXY_SESSIONID    | NUMBER                          | Proxy session serial number, if an enterprise user has logged in through a proxy mechanism                                                                                                  |
| STATEMENTID        | NUMBER                          | Numeric ID for the statement run (a statement may cause multiple audit records)                                                                                                             |
| ENTRYID            | NUMBER                          | Numeric ID for the audit trail entry in the session                                                                                                                                         |
| EXTENDED_TIMESTAMP | TIMESTAMP (6)<br>WITH TIME ZONE | Timestamp of the audited operation (the timestamp of the user's logon for entries is created by AUDIT SESSION)                                                                              |
| GLOBAL_UID         | VARCHAR2 (32)                   | Global user identifier for the user, if the user has logged in as an enterprise user                                                                                                        |
| DB_USER            | VARCHAR2 (128)                  | Database username of the user whose actions were audited                                                                                                                                    |
| CLIENTIDENTIFIER   | VARCHAR2 (64)                   | Client identifier in the Oracle session                                                                                                                                                     |
| EXT_NAME           | VARCHAR2 (1024)                 | User's external name                                                                                                                                                                        |
| OS_USER            | VARCHAR2 (128)                  | Operating system logon user name of the user whose actions were audited                                                                                                                     |

| Column           | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| OS_HOST          | VARCHAR2 (128)  | Client host system name                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| OS_PROCESS       | VARCHAR2 (16)   | Operating system process identifier of the Oracle server process                                                                                                                                                                                                                                                                                                                                                                                               |
| TERMINAL         | VARCHAR2 (30)   | Identifier for the user's terminal                                                                                                                                                                                                                                                                                                                                                                                                                             |
| INSTANCE_NUMBER  | NUMBER          | Instance number as specified by the <code>INSTANCE_NUMBER</code> initialization parameter                                                                                                                                                                                                                                                                                                                                                                      |
| OBJECT_SCHEMA    | VARCHAR2 (128)  | Owner of the audited object                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| OBJECT_NAME      | VARCHAR2 (128)  | Name of the object affected by the action                                                                                                                                                                                                                                                                                                                                                                                                                      |
| POLICY_NAME      | VARCHAR2 (128)  | Name of the fine-grained auditing policy                                                                                                                                                                                                                                                                                                                                                                                                                       |
| NEW_OWNER        | VARCHAR2 (128)  | Owner of the object named in the <code>NEW_NAME</code> column                                                                                                                                                                                                                                                                                                                                                                                                  |
| NEW_NAME         | VARCHAR2 (128)  | New name of object after renaming, or the name of an underlying object (for example, <code>CREATE INDEX owner.obj_name ON new_owner.new_name</code> )                                                                                                                                                                                                                                                                                                          |
| ACTION           | NUMBER          | Numeric code for the action type                                                                                                                                                                                                                                                                                                                                                                                                                               |
| STATEMENT_TYPE   | NUMBER          | Description of the action                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| TRANSACTIONID    | RAW (8)         | Identifier of the transaction in which the object is accessed or modified                                                                                                                                                                                                                                                                                                                                                                                      |
| RETURNCODE       | NUMBER          | Oracle error code generated by the action. Zero if the action succeeded.                                                                                                                                                                                                                                                                                                                                                                                       |
| SCN              | NUMBER          | System change number (SCN) of the query                                                                                                                                                                                                                                                                                                                                                                                                                        |
| COMMENT_TEXT     | VARCHAR2 (4000) | Text comments on standard audit entries. Also indicates how the user was authenticated - the method can be one of the following: <ul style="list-style-type: none"> <li>• DATABASE - authentication was done by password</li> <li>• NETWORK - authentication was done by Oracle Net Services or the Advanced Networking Option</li> <li>• PROXY - the client was authenticated by another user. The name of the proxy user follows the method type.</li> </ul> |
| AUTH_PRIVILEGES  | VARCHAR2 (32)   | Privileges granted and revoked in <code>GRANT</code> and <code>REVOKE</code> statements recorded for standard audit trail entry                                                                                                                                                                                                                                                                                                                                |
| GRANTEE          | VARCHAR2 (128)  | User who granted or revoked the privilege                                                                                                                                                                                                                                                                                                                                                                                                                      |
| PRIV_USED        | NUMBER          | Numerical code of privileges, if any, used in the action                                                                                                                                                                                                                                                                                                                                                                                                       |
| SES_ACTIONS      | VARCHAR2 (16)   | Session summary for standard audit records. A string of 12 characters, one for each action type, in the following order: Alter, Audit, Comment, Delete, Grant, Index, Insert, Lock, Rename, Select, Update, Flashback.<br>Values: - = None, S=Success, F=Failure, B=Both                                                                                                                                                                                       |
| OS_PRIVILEGE     | VARCHAR2 (7)    | This column is populated only for administrative authentication audit records. It contains the administrative privilege used (for example, <code>SYSDBA</code> , <code>SYSOPER</code> , <code>NONE</code> ).<br>For all other types of audit records, the value of this column is null.                                                                                                                                                                        |
| ECONTEXT_ID      | VARCHAR2 (64)   | Application execution context identifier                                                                                                                                                                                                                                                                                                                                                                                                                       |
| SQL_BIND         | VARCHAR2 (4000) | List of bind variables used in the statement                                                                                                                                                                                                                                                                                                                                                                                                                   |
| SQL_TEXT         | VARCHAR2 (4000) | The statement or command that triggered the audit event                                                                                                                                                                                                                                                                                                                                                                                                        |
| OBJ_EDITION_NAME | VARCHAR2 (128)  | Name of the edition containing the audited object                                                                                                                                                                                                                                                                                                                                                                                                              |
| DBID             | NUMBER          | Database identifier of the audited database                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Column       | Datatype        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RLS_INFO     | VARCHAR2 (4000) | Stores virtual private database (VPD) policy names and predicates separated by delimiter.<br>To format the output into individual rows, use the <code>DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML</code> function.                                                                                                                                                                                                                                     |
| CURRENT_USER | VARCHAR2 (128)  | Effective user for the statement execution                                                                                                                                                                                                                                                                                                                                                                                                            |
| CON_ID       | NUMBER          | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>• 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>• 1: This value is used for rows containing data that pertain to only the root</li> <li>• <i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

**Note:**

The `SQL_BIND` and `SQL_TEXT` columns are only populated if the `AUDIT_TRAIL` initialization parameter is set to `xml`, `extended` or if the `AUDIT_SYS_OPERATIONS` initialization parameter is set to `TRUE`.

## 10.154 V\$XSTREAM\_APPLY\_COORDINATOR

`V$XSTREAM_APPLY_COORDINATOR` displays information about each XStream apply process coordinator. The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process, outbound server, or inbound server.

| Column  | Datatype | Description                                |
|---------|----------|--------------------------------------------|
| SID     | NUMBER   | Session ID of the coordinator's session    |
| SERIAL# | NUMBER   | Serial number of the coordinator's session |

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                                           |
|--------------------------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE                    | VARCHAR2 (21)  | State of the coordinator: <ul style="list-style-type: none"> <li>INITIALIZING - Starting up</li> <li>IDLE - Performing no work</li> <li>APPLYING - Passing transactions to apply servers</li> <li>SHUTTING DOWN CLEANLY - Stopping without an error</li> <li>ABORTING - Stopping because of an apply error</li> </ul> |
| APPLY#                   | NUMBER         | Apply process number. An apply process coordinator is an Oracle background process, prefixed by <code>ap</code> .                                                                                                                                                                                                     |
| APPLY_NAME               | VARCHAR2 (128) | Name of the apply process                                                                                                                                                                                                                                                                                             |
| TOTAL_APPLIED            | NUMBER         | Total number of transactions applied by the apply process since the apply process was last started                                                                                                                                                                                                                    |
| TOTAL_WAIT_DEPS          | NUMBER         | Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions                                                                        |
| TOTAL_WAIT_COMMITS       | NUMBER         | Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits                                                                                                                                  |
| TOTAL_ADMIN              | NUMBER         | Number of administrative jobs issued since the apply process was last started                                                                                                                                                                                                                                         |
| TOTAL_ASSIGNED           | NUMBER         | Number of transactions assigned to apply servers since the apply process was last started                                                                                                                                                                                                                             |
| TOTAL_RECEIVED           | NUMBER         | Total number of transactions received by the coordinator process since the apply process was last started                                                                                                                                                                                                             |
| TOTAL_IGNORED            | NUMBER         | Number of transactions which were received by the coordinator but were ignored because they had been previously applied                                                                                                                                                                                               |
| TOTAL_ROLLBACKS          | NUMBER         | Number of transactions which were rolled back due to unexpected contention                                                                                                                                                                                                                                            |
| TOTAL_ERRORS             | NUMBER         | Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started                                                                                                                                                                                          |
| UNASSIGNED_COMPLETE_TXNS | NUMBER         | Total number of complete transactions that the coordinator has not assigned to any apply servers                                                                                                                                                                                                                      |
| LWM_TIME                 | DATE           | Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.                                                                                                                                                    |
| LWM_MESSAGE_NUMBER       | NUMBER         | Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.                                                    |
| LWM_MESSAGE_CREATE_TIME  | DATE           | For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.                                                                |
| HWM_TIME                 | DATE           | Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.                                                                                                                                                  |

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| HWM_MESSAGE_NUMBER       | NUMBER   | Number of the message corresponding to the high watermark. That is, no messages with a commit message number greater than this message number have been applied.                                                                                                                                                                                                                                                                                |
| HWM_MESSAGE_CREATE_TIME  | DATE     | For captured messages, creation time at the source database of the message corresponding to the high watermark. For user-enqueued messages, time when the message corresponding to the high watermark was enqueued into the queue at the local database.                                                                                                                                                                                        |
| STARTUP_TIME             | DATE     | Time when the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                    |
| ELAPSED_SCHEDULE_TIME    | NUMBER   | Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                           |
| ELAPSED_IDLE_TIME        | NUMBER   | Elapsed idle time                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LWM_POSITION             | RAW (64) | Position of the low-watermark LCR                                                                                                                                                                                                                                                                                                                                                                                                               |
| HWM_POSITION             | RAW (64) | Position of the high-watermark LCR                                                                                                                                                                                                                                                                                                                                                                                                              |
| PROCESSED_MESSAGE_NUMBER | NUMBER   | Message number currently processed by the apply coordinator                                                                                                                                                                                                                                                                                                                                                                                     |
| CON_ID                   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| ACTIVE_SERVER_COUNT      | NUMBER   | Active server count                                                                                                                                                                                                                                                                                                                                                                                                                             |

 **Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

## 10.155 V\$XSTREAM\_APPLY\_READER

`V$XSTREAM_APPLY_READER` displays information about each XStream apply reader. The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions

on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process, outbound server, or inbound server.

| Column                         | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| APPLY#                         | NUMBER        | Apply process number. An apply process is an Oracle background process, prefixed by <code>ap</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| APPLY_NAME                     | VARCHAR2(128) | Name of the apply process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| STATE                          | VARCHAR2(36)  | Shows the state of the apply reader and the hash server. The possible values include: <ul style="list-style-type: none"> <li>INITIALIZING - Starting up</li> <li>IDLE - Performing no work</li> <li>DEQUEUE MESSAGES - Dequeuing messages from the queue</li> <li>SCHEDULE MESSAGES - Computing dependencies between messages and assembling messages into transactions</li> <li>SPELLING - Spilling unapplied messages from memory to hard disk</li> <li>PAUSED - WAITING FOR DDL TO COMPLETE - Waiting for a data definition language (DDL) logical change record (LCR) to be applied</li> </ul> The state of the apply reader is displayed first, followed by the state of the hash server. A semicolon separates the apply reader state from the hash server state. |
| TOTAL_MESSAGES_DEQUEUED        | NUMBER        | Total number of messages dequeued since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| TOTAL_MESSAGES_SPILLED         | NUMBER        | Number of messages spilled by the reader since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DEQUEUE_TIME                   | DATE          | Time when the last message was received                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DEQUEUED_MESSAGE_NUMBER        | NUMBER        | Number of the last message received                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| DEQUEUED_MESSAGE_CREATION_TIME | DATE          | For captured messages, creation time at the source database of the last message received. For user-enqueued messages, time when the message was enqueued into the queue at the local database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| SGA_USED                       | NUMBER        | Amount (in bytes) of SGA memory used by the apply process since it was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ELAPSED_DEQUEUE_TIME           | NUMBER        | Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ELAPSED_SCHEDULE_TIME          | NUMBER        | Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started. Scheduling includes computing dependencies between messages and assembling messages into transactions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ELAPSED_SPILL_TIME             | NUMBER        | Elapsed time (in hundredths of a second) spent spilling messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| TOTAL_LCRS_WITH_WMDEP | NUMBER        | Total number of LCRs with watermark dependencies since the apply process last started.<br>A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.                                                                                                                                                                                                                 |
| TOTAL_IN_MEMORY_LCRS  | NUMBER        | Total number of LCRs currently in memory                                                                                                                                                                                                                                                                                                                                                                                                        |
| SGA_ALLOCATED         | NUMBER        | The total amount of shared memory (in bytes) allocated from the XStreams pool for the apply process since the apply process last started                                                                                                                                                                                                                                                                                                        |
| CON_ID                | NUMBER        | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

 **Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

## 10.156 V\$XSTREAM\_APPLY\_RECEIVER

`V$XSTREAM_APPLY_RECEIVER` displays information about the message receiver of the apply process. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when apply migrates to another instance, or when the XStream process is stopped.

| Column                                  | Datatype                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Column                   | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ACKNOWLEDGEMENT_POSITION | RAW(64)  | Acknowledgement position of the messages received by the receiver. Corresponds to <code>ACKNOWLEDGEMENT</code> , except the value is in position rather than SCN.                                                                                                                                                                                                                                                                               |
| CON_ID                   | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.157 V\$XSTREAM\_APPLY\_SERVER

`V$XSTREAM_APPLY_SERVER` displays information about each XStream apply server and its activities. An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the message to the appropriate apply handler. An apply server is a subcomponent of an apply process, outbound server, or inbound server.

| Column     | Datatype      | Description                                                                                           |
|------------|---------------|-------------------------------------------------------------------------------------------------------|
| SID        | NUMBER        | Session ID of the apply server's session                                                              |
| SERIAL#    | NUMBER        | Serial number of the apply server's session                                                           |
| APPLY#     | NUMBER        | Apply process number. An apply process is an Oracle background process, prefixed by <code>ap</code> . |
| APPLY_NAME | VARCHAR2(128) | Name of the apply process                                                                             |
| SERVER_ID  | NUMBER        | Parallel execution server number of the apply server                                                  |

| Column           | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| MESSAGE_SEQUENCE | NUMBER        | Number of the current message being applied by the apply server. This value is reset to 1 at the beginning of each transaction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Column                      | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TOTAL_ASSIGNED              | NUMBER         | Total number of transactions assigned to the apply server since the apply process was last started                                                                                                                                                                                                                                                                                                                                              |
| TOTAL_ADMIN                 | NUMBER         | Total number of administrative jobs done by the apply server since the apply process was last started. See the <code>STATE</code> information in this view for the types of administrative jobs.                                                                                                                                                                                                                                                |
| TOTAL_ROLLBACKS             | NUMBER         | Number of transactions assigned to this server which were rolled back                                                                                                                                                                                                                                                                                                                                                                           |
| TOTAL_MESSAGES_APPLIED      | NUMBER         | Total number of messages applied by this apply server since the apply process was last started                                                                                                                                                                                                                                                                                                                                                  |
| APPLY_TIME                  | DATE           | Time the last message was applied                                                                                                                                                                                                                                                                                                                                                                                                               |
| APPLIED_MESSAGE_NUMBER      | NUMBER         | Number of the last message applied                                                                                                                                                                                                                                                                                                                                                                                                              |
| APPLIED_MESSAGE_CREATE_TIME | DATE           | Creation time at the source database of the last captured message applied. No information about user-enqueued messages is recorded in this column.                                                                                                                                                                                                                                                                                              |
| ELAPSED_DEQUEUE_TIME        | NUMBER         | Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                            |
| ELAPSED_APPLY_TIME          | NUMBER         | Time elapsed (in hundredths of a second) applying messages since the apply process was last started                                                                                                                                                                                                                                                                                                                                             |
| COMMIT_POSITION             | RAW (64)       | Commit position of the transaction. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                                        |
| DEP_COMMIT_POSITION         | RAW (64)       | Commit position of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                  |
| LAST_APPLY_POSITION         | RAW (64)       | For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.                                                                                                                                                           |
| TRANSACTION_ID              | VARCHAR2 (128) | Transaction ID that the worker is applying. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                                |
| DEP_TRANSACTION_ID          | VARCHAR2 (128) | Transaction ID of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                                                                                                                                                                   |
| CON_ID                      | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| TOTAL_LCRS_RETRIED          | NUMBER         | Total number of LCRs retried by this server                                                                                                                                                                                                                                                                                                                                                                                                     |
| LCR_RETRY_ITERATION         | NUMBER         | Retry iteration for this transaction by this server                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_TXNS_RETRIED          | NUMBER         | Total transactions retried by this server                                                                                                                                                                                                                                                                                                                                                                                                       |
| TXN_RETRY_ITERATION         | NUMBER         | Retry iteration for this transaction by this server                                                                                                                                                                                                                                                                                                                                                                                             |
| TOTAL_TXNS_RECORDED         | NUMBER         | Total transactions recorded in error queue by this server                                                                                                                                                                                                                                                                                                                                                                                       |

 **Note:**

The `ELAPSED_SCHEDULE_TIME` column is only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

## 10.158 V\$XSTREAM\_CAPTURE

`V$XSTREAM_CAPTURE` displays information about each capture process that sends LCRs to an XStream outbound server.

| Column                    | Datatype                   | Description                                                                                           |
|---------------------------|----------------------------|-------------------------------------------------------------------------------------------------------|
| <code>SID</code>          | <code>NUMBER</code>        | Session identifier of the capture process                                                             |
| <code>SERIAL#</code>      | <code>NUMBER</code>        | Session serial number of the capture process session                                                  |
| <code>CAPTURE#</code>     | <code>NUMBER</code>        | Capture process number. A capture process is an Oracle background process prefixed by <code>cp</code> |
| <code>CAPTURE_NAME</code> | <code>VARCHAR2(128)</code> | Name of the capture process                                                                           |
| <code>LOGMINER_ID</code>  | <code>NUMBER</code>        | Session ID of the Oracle LogMiner session associated with the capture process                         |
| <code>STARTUP_TIME</code> | <code>DATE</code>          | Time when the capture process was last started                                                        |

| Column                    | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE                     | VARCHAR2 (551) | <p>State of the capture process:</p> <ul style="list-style-type: none"> <li>INITIALIZING - Starting up.</li> <li>WAITING FOR DICTIONARY REDO - Waiting for redo log files containing the dictionary build related to the first SCN to be added to the capture process session. A capture process cannot begin to scan the redo log files until all of the log files containing the dictionary build have been added.</li> <li>DICTIONARY INITIALIZATION - Processing a dictionary build.</li> <li>MINING (PROCESSED SCN = <i>scn_value</i>) - Mining a dictionary build at the SCN <i>scn_value</i>.</li> <li>LOADING (step <i>X</i> of <i>Y</i>) - Processing information from a dictionary build and currently at step <i>X</i> in a process that involves <i>Y</i> steps, where <i>X</i> and <i>Y</i> are numbers.</li> <li>CAPTURING CHANGES - Scanning the redo log for changes that satisfy the capture process rule sets.</li> <li>WAITING FOR REDO - Waiting for new redo log files to be added to the capture process session. The capture process has finished processing all of the redo log files added to its session. This state is possible if there is no activity at a source database. For a downstream capture process, this state is possible if the capture process is waiting for new log files to be added to its session.</li> <li>EVALUATING RULE - Evaluating a change against a capture process rule set.</li> <li>CREATING LCR - Converting a change into an LCR.</li> <li>ENQUEUEING MESSAGE - Enqueueing an LCR that satisfies the capture process rule sets into the capture process queue.</li> <li>PAUSED FOR FLOW CONTROL - Unable to enqueue LCRs either because of low memory or because propagations and outbound servers are consuming messages slower than the capture process is creating them. This state indicates flow control that is used to reduce spilling of captured LCRs when propagation or apply has fallen behind or is unavailable.</li> <li>WAITING FOR THE BUFFERED QUEUE TO SHRINK - Waiting for the buffered queue to change to a smaller size. The buffered queue shrinks when there is a memory limitation or when an administrator reduces its size.</li> <li>WAITING FOR <i>n</i> SUBSCRIBER(S) INITIALIZING - Waiting for outbound servers that receive LCRs from the capture process to start, where <i>n</i> is the number of apply processes.</li> <li>WAITING FOR TRANSACTION - Waiting for LogMiner to provide more transactions.</li> <li>WAITING FOR INACTIVE DEQUEUEERS - Waiting for the capture process's queue subscribers to start. The capture process stops enqueueing LCRs if there are no active subscribers to the queue.</li> <li>SUSPENDED FOR AUTO SPLIT/MERGE - Waiting for a merge operation to complete.</li> <li>SHUTTING DOWN - Stopping.</li> <li>ABORTING - Terminating.</li> </ul> |
| TOTAL_PREFILTER_DISCARDED | NUMBER         | Total number of prefiltered messages discarded                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| TOTAL_PREFILTER_EVALUATIONS   | NUMBER        | Total number of prefilter evaluations                                                                                                                                                                                                                                                                                |
| TOTAL_MESSAGES_CAPTURED       | NUMBER        | Total number of redo entries passed by LogMiner to the capture process for detailed rule evaluation since the capture process last started. A capture process converts a redo entry into a message and performs detailed rule evaluation on the message when capture process prefiltering cannot discard the change. |
| CAPTURE_TIME                  | DATE          | Time when the most recent message was captured                                                                                                                                                                                                                                                                       |

| TOTAL_MESSAGES_CREATED        | NUMBER        | Count associated with ELAPSED_LCR_TIME to calculate rate                                                                                                                                                                                                                                                             |
| TOTAL_FULL_EVALUATIONS        | NUMBER        | Count associated with ELAPSED_RULE_TIME to calculate rate                                                                                                                                                                                                                                                            |
| TOTAL_MESSAGES_ENQUEUE_D      | NUMBER        | Total number of messages enqueued since the capture process was last started                                                                                                                                                                                                                                         |
| ENQUEUE_TIME                  | DATE          | Time when the last message was enqueued                                                                                                                                                                                                                                                                              |
| ENQUEUE_MESSAGE_NUMBER        | NUMBER        | Number of the last enqueued message                                                                                                                                                                                                                                                                                  |
| ENQUEUE_MESSAGE_CREATE_TIME   | DATE          | Creation time of the last enqueued message                                                                                                                                                                                                                                                                           |
| AVAILABLE_MESSAGE_NUMBER      | NUMBER        | For local capture, the last redo SCN flushed to the log files. For downstream capture, the last SCN added to LogMiner through the archived redo log files.                                                                                                                                                           |
| AVAILABLE_MESSAGE_CREATE_TIME | DATE          | For local capture, the time the SCN was written to the log file. For downstream capture, the time the most recent archived redo log file (containing the most recent SCN) was added to LogMiner.                                                                                                                     |
| ELAPSED_CAPTURE_TIME          | NUMBER        | Elapsed time (in hundredths of a second) scanning for changes in the redo log since the capture process was last started                                                                                                                                                                                             |
| ELAPSED_RULE_TIME             | NUMBER        | Elapsed time (in hundredths of a second) evaluating rules since the capture process was last started                                                                                                                                                                                                                 |
| ELAPSED_ENQUEUE_TIME          | NUMBER        | Elapsed time (in hundredths of a second) enqueueing messages since the capture process was last started                                                                                                                                                                                                              |
| ELAPSED_LCR_TIME              | NUMBER        | Elapsed time (in hundredths of a second) creating LCRs since the capture process was last started                                                                                                                                                                                                                    |
| ELAPSED_REDO_WAIT_TIME        | NUMBER        | Elapsed time (in hundredths of a second) spent by the capture process in the WAITING FOR REDO state                                                                                                                                                                                                                  |
| ELAPSED_PAUSE_TIME            | NUMBER        | Elapsed flow control pause time (in hundredths of a second)                                                                                                                                                                                                                                                          |
| STATE_CHANGED_TIME            | DATE          | Time at which the state of the capture process changed                                                                                                                                                                                                                                                               |
| SGA_USED                      | NUMBER        | The total amount of shared memory (in bytes) currently used by the capture process out of the amount allocated (SGA_ALLOCATED)                                                                                                                                                                                       |
| SGA_ALLOCATED                 | NUMBER        | The total amount of shared memory (in bytes) allocated from the Streams pool for the capture process                                                                                                                                                                                                                 |
| BYTES_OF_REDO_MINED           | VARCHAR2 (64) | The total amount of redo data mined (in bytes) since the capture process last started                                                                                                                                                                                                                                |
| SESSION_RESTART_SCN           | VARCHAR2 (64) | The SCN from which the capture process started mining redo data when it was last started                                                                                                                                                                                                                             |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

 **Note:**

The `ELAPSED_CAPTURE_TIME`, `ELAPSED_RULE_TIME`, `ELAPSED_ENQUEUE_TIME`, `ELAPSED_LCR_TIME`, and `ELAPSED_REDO_WAIT_TIME` columns are only populated if the `TIMED_STATISTICS` initialization parameter is set to `true`, or if the `STATISTICS_LEVEL` initialization parameter is set to `TYPICAL` or `ALL`.

 **See Also:**

- "TIMED\_STATISTICS"
- "STATISTICS\_LEVEL"

## 10.159 V\$XSTREAM\_MESSAGE\_TRACKING

`V$XSTREAM_MESSAGE_TRACKING` displays information about LCRs tracked through the stream that are processed by XStream components.

You can track an LCR through a stream using one of the following methods:

- Set the `message_tracking_frequency capture process` parameter to 1 or another relatively low value for XStream Outbound processes.
- Set the `message_tracking_frequency apply process` parameter to 1 or another relatively low value for XStream Inbound processes.
- Use the `DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING` procedure to specify a tracking label that becomes part of each LCR generated by the current session.

When the `actions` parameter in the `DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING` procedure is set to `DBMS_XSTREAM_ADM.ACTION_MEMORY`, information about the LCRs is tracked in memory, and this view is populated with information about the LCRs. Currently, `DBMS_XSTREAM_ADM.ACTION_MEMORY` is the only valid setting for the `actions` parameter in the procedure.

 **Note:**

This view does not display information about messages flowing in an Oracle GoldenGate configuration. To view information about such message streams, query the `V$GOLDENGATE_MESSAGE_TRACKING` view.

| Column                | Datatype                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TRACKING_LABEL        | VARCHAR2 (128)                  | User-specified tracking label                                                                                                                                                                                                                                                                                                                                                                                                                   |
| TAG                   | RAW (30)                        | First 30 bytes of the tag of the LCR                                                                                                                                                                                                                                                                                                                                                                                                            |
| COMPONENT_NAME        | VARCHAR2 (128)                  | Name of the component that processed the LCR                                                                                                                                                                                                                                                                                                                                                                                                    |
| COMPONENT_TYPE        | VARCHAR2 (128)                  | Type of the component that processed the LCR                                                                                                                                                                                                                                                                                                                                                                                                    |

## 10.160 V\$XSTREAM\_OUTBOUND\_SERVER

V\$XSTREAM\_OUTBOUND\_SERVER displays statistics about an outbound server. An outbound server sends LCRs to the XStream client application.

 **Note:**

When the COMMITTED\_DATA\_ONLY column is YES in the V\$XSTREAM\_OUTBOUND\_SERVER view, the V\$STREAMS\_APPLY\_SERVER view provides additional information about the outbound server process, and information about the apply server background processes used by the outbound server.

| Column       | Datatype       | Description                                                                                             |
|--------------|----------------|---------------------------------------------------------------------------------------------------------|
| SID          | NUMBER         | Session ID of the outbound server's session                                                             |
| SERIAL#      | NUMBER         | Serial number of the outbound server's session                                                          |
| SPID         | VARCHAR2 (12)  | Process identification number of the operating-system process that sends LCRs to the client application |
| SERVER_NAME  | VARCHAR2 (128) | Name of the outbound server                                                                             |
| STARTUP_TIME | DATE           | Time when the client application attached to the outbound server                                        |

| Column | Datatype      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| STATE  | VARCHAR2 (19) | <p>State of the outbound server</p> <p>When the <code>COMMITTED_DATA_ONLY</code> column shows YES, the following states are possible:</p> <ul style="list-style-type: none"> <li>INITIALIZING - Starting up the outbound server.</li> <li>IDLE - Performing no work because there are no LCRs to send to the XStream client application.</li> <li>GET TRANSACTIONS - Receiving transactions from the outbound server's apply coordinator.</li> <li>SEND TRANSACTION - Sending a transaction to an XStream client application.</li> <li>WAIT FOR NEXT CHUNK - Waiting for the next set of LCRs for a large transaction.</li> <li>TRANSACTION CLEANUP - Cleaning up an applied transaction, which includes removing LCRs from the outbound server's queue.</li> <li>WAIT FOR CLIENT - Waiting for an XStream client application to request more LCRs.</li> </ul> <p>When the <code>COMMITTED_DATA_ONLY</code> column shows NO, the following states are possible:</p> <ul style="list-style-type: none"> <li>INITIALIZING - Starting up the outbound server.</li> <li>INITIALIZING RULE EVALUATION CONTEXT - Initializing the context to evaluate the outbound server's rules.</li> <li>IDLE - Performing no work because there is no LCR to send to the XStream client application.</li> <li>BROWSING LCR - Browsing the outbound server's queue for next LCR.</li> <li>EVALUATING RULES - Evaluating an LCR against a rule set.</li> <li>DEQUEUEING LCR - Dequeueing an LCR from the outbound server's queue.</li> <li>SENDING LCR - Sending an LCR to an XStream client application.</li> <li>WAITING FOR CAPTURE TO TERMINATE - Waiting for the capture process to become disabled.</li> <li>SUSPENDED DUE TO A DROPPED SUBSCRIBER - Suspended because a connected subscriber was dropped. For example, a subscriber can be dropped during a split or merge operation.</li> <li>SUSPENDED FOR AUTO SPLIT/MERGE - Suspended because an automatic split or merge operation is being performed.</li> <li>WAITING ON EMPTY QUEUE - Waiting for more LCRs from the capture process.</li> <li>WAITING FOR CLIENT - Waiting for the XStream client application to request more LCRs.</li> <li>WAITING FOR CAPTURE TO INITIALIZE - Waiting for the capture process to finish the data dictionary build.</li> <li>WAITING TO ATTACH TO CAPTURE - Waiting for the outbound server to attach to the capture process.</li> </ul> <p>When a state refers to a capture process, it is the capture process that captures changes for the outbound server. When a state refers to a propagation, it is the outbound server that sends LCRs to the XStream client application.</p> |

| Column                          | Datatype | Description                                                                                                                                                                                                                                                                                                          |
|---------------------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XIDUSN                          | NUMBER   | Transaction ID undo segment number of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.                                                                                       |
| XIDSLT                          | NUMBER   | Transaction ID slot number of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.                                                                                               |
| XIDSQN                          | NUMBER   | Transaction ID sequence number of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.                                                                                           |
| COMMITSCN                       | NUMBER   | Commit SCN of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.                                                                                                               |
| TOTAL_TRANSACTIONS_SENT         | NUMBER   | Total number of transactions sent by the outbound server to the XStream client application since the last time the client application attached to the outbound server. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL. |
| MESSAGE_SEQUENCE                | NUMBER   | Number of the current LCR being processed by the outbound server. This value is reset to 1 at the beginning of each transaction. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.                                       |
| TOTAL_MESSAGES_SENT             | NUMBER   | Total number of LCRs sent by the outbound server to the XStream client application since the last time the client application attached to the outbound server                                                                                                                                                        |
| SEND_TIME                       | DATE     | Time the last LCR was sent by the outbound server to the XStream client application                                                                                                                                                                                                                                  |
| LAST_SENT_MESSAGE_NUMBER        | NUMBER   | Message number of the last LCR sent by the outbound server to the XStream client application                                                                                                                                                                                                                         |
| LAST_SENT_MESSAGE_CREATION_TIME | DATE     | Creation time at the source database of the last LCR sent by the outbound server to the client application                                                                                                                                                                                                           |
| ELAPSED_SEND_TIME               | NUMBER   | Time elapsed (in hundredths of a second) sending LCRs to the XStream client application since the last time the client application attached to the outbound server                                                                                                                                                   |
| COMMIT_POSITION                 | RAW (64) | Commit position of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.                                                                                                          |
| LAST_SENT_POSITION              | RAW (64) | Position of the last LCR sent to the XStream client application. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.                                                                                                       |
| BYTES_SENT                      | NUMBER   | Total number of bytes sent by the outbound server to the XStream client application since the last time the client application attached to the outbound server                                                                                                                                                       |

| Column              | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| COMMITTED_DATA_ONLY | CHAR (3) | <p>YES if the outbound server can send only LCRs in committed transactions to the XStream client application. A committed transaction is an assembled, noninterleaving transaction with no rollbacks.</p> <p>NO if the outbound server can send LCRs in transactions that have not yet committed to the XStream client application. This mode is for internal Oracle use only.</p>                                                                     |
| CON_ID              | NUMBER   | <p>The ID of the container to which the data pertains. Possible values include:</p> <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.161 V\$XSTREAM\_TABLE\_STATS

V\$XSTREAM\_TABLE\_STATS shows the statistics for all the tables processed by each apply server for the XStream session.

| Column                  | Datatype       | Description                                                                                                                                                                      |
|-------------------------|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| APPLY_NAME              | VARCHAR2 (128) | Name of XStream Out or XStream In process                                                                                                                                        |
| SERVER_ID               | NUMBER         | Parallel apply server worker ID. If the server ID is 0, then this is an aggregate of statistics for servers that may have been automatically shutdown due to session inactivity. |
| SOURCE_TABLE_OWNER      | VARCHAR2 (128) | Source owner of the captured or replicated table                                                                                                                                 |
| SOURCE_TABLE_NAME       | VARCHAR2 (128) | Source name of the captured or replicated table                                                                                                                                  |
| DESTINATION_TABLE_OWNER | VARCHAR2 (128) | Target owner of the captured or replicated table                                                                                                                                 |
| DESTINATION_TABLE_NAME  | VARCHAR2 (128) | Target name of the captured or replicated table                                                                                                                                  |
| LAST_UPDATE             | DATE           | Time of last update                                                                                                                                                              |
| TOTAL_INSERTS           | NUMBER         | Number of insert operations on this table processed by this apply server for the current session                                                                                 |
| TOTAL_UPDATES           | NUMBER         | Number of update operations on this table processed by this apply server for the current session                                                                                 |
| TOTAL_DELETES           | NUMBER         | Number of delete operations on this table processed by this apply server for the current session                                                                                 |
| INSERT_COLLISIONS       | NUMBER         | Number of insert collisions on this table encountered by this apply server for the current session                                                                               |

| Column                     | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UPDATE_COLLISIONS          | NUMBER   | Number of update collisions on this table encountered by this apply server for the current session                                                                                                                                                                                                                                                                                                                                              |
| DELETE_COLLISIONS          | NUMBER   | Number of delete collisions on this table encountered by this apply server for the current session                                                                                                                                                                                                                                                                                                                                              |
| REPERROR_RECORDS           | NUMBER   | Number of change records that were recorded on this table by this apply server for the current session                                                                                                                                                                                                                                                                                                                                          |
| REPERROR_IGNORES           | NUMBER   | Number of ignored change records on this table by this apply server for the current session                                                                                                                                                                                                                                                                                                                                                     |
| WAIT_DEPENDENCIES          | NUMBER   | Number of waits for this table due to dependency for the current session                                                                                                                                                                                                                                                                                                                                                                        |
| CON_ID                     | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |
| CDR_INSERT_ROW_EXISTS      | NUMBER   | Number of conflicts where an insert gets an ORA-00001 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_UPDATE_ROW_EXISTS      | NUMBER   | Number of conflicts where an update gets an ORA-26786 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_UPDATE_ROW_MISSING     | NUMBER   | Number of conflicts where an update gets an ORA-26787 error                                                                                                                                                                                                                                                                                                                                                                                     |
| CDR_DELETE_ROW_EXISTS      | NUMBER   | Number of conflicts where a delete gets an ORA-26786 error                                                                                                                                                                                                                                                                                                                                                                                      |
| CDR_DELETE_ROW_MISSING     | NUMBER   | Number of conflicts where a delete gets an ORA-26787 error                                                                                                                                                                                                                                                                                                                                                                                      |
| CDR_SUCCESSFUL_RESOLUTIONS | NUMBER   | Number of successfully resolved conflicts                                                                                                                                                                                                                                                                                                                                                                                                       |
| CDR_FAILED_RESOLUTIONS     | NUMBER   | Number of conflicts that could not be resolved due to an error during resolution                                                                                                                                                                                                                                                                                                                                                                |
| LOB_OPERATIONS             | NUMBER   | The number of LOB updates (LOB writes, LOB trims, and LOB erases) applied by the inbound server.                                                                                                                                                                                                                                                                                                                                                |

## 10.162 V\$XSTREAM\_TRANSACTION

V\$XSTREAM\_TRANSACTION displays information about transactions that are being processed by capture processes, outbound servers, and inbound servers. This view can identify long running transactions and to display how many LCRs are being processed in each transaction. This view only contains information about captured LCRs. It does not contain information about user-enqueued LCRs or user messages. This view only shows information about LCRs that are being processed because they satisfied the rule sets for the component at the time of the query. For capture processes, this view only shows information about changes in transactions that the

capture process has converted into LCRs. It does not show information about all the active transactions present in the redo log.

For outbound servers, this view only shows information about LCRs that the outbound server has dequeued. It does not show information about LCRs in the outbound server's queue. For outbound servers, information about a transaction remains in the view until the transaction is sent to the XStream client application.

For inbound servers, information about a transaction remains in the view until the transaction commits or until the entire transaction is rolled back.

| Column                   | Datatype       | Description                                                                                                                                                                                                                                                                                    |

| COMPONENT_NAME           | VARCHAR2 (128) | Name of the component                                                                                                                                                                                                                                                                          |
| COMPONENT_TYPE           | VARCHAR2 (20)  | Type of component <ul style="list-style-type: none"> <li>CAPTURE - Capture process</li> <li>APPLY - Apply reader subcomponent in an outbound server or inbound server</li> <li>PROPAGATION_SENDER - Propagation sender that sends LCRs from a capture process to an outbound server</li> </ul> |
| XIDUSN                   | NUMBER         | Transaction ID undo segment number of the transaction                                                                                                                                                                                                                                          |
| XIDSLT                   | NUMBER         | Transaction ID slot number of the transaction                                                                                                                                                                                                                                                  |
| XIDSQN                   | NUMBER         | Transaction ID sequence number of the transaction                                                                                                                                                                                                                                              |
| CUMULATIVE_MESSAGE_COUNT | NUMBER         | Number of LCRs processed in the transaction. If a component is restarted while the transaction is being processed, then this column shows the number of LCRs processed in the transaction since the component was started.                                                                     |
| TOTAL_MESSAGE_COUNT      | NUMBER         | Total number of LCRs processed in the transaction by an outbound server or inbound server. This column does not pertain to capture processes.                                                                                                                                                  |
| FIRST_MESSAGE_TIME       | DATE           | Time stamp of the first LCR processed in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the time stamp of the first LCR processed after the capture process was started.                                                  |
| FIRST_MESSAGE_NUMBER     | NUMBER         | SCN of the first message in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the SCN of the first message processed after the capture process was started.                                                                  |
| LAST_MESSAGE_TIME        | DATE           | Time stamp of the last LCR processed in the transaction                                                                                                                                                                                                                                        |
| LAST_MESSAGE_NUMBER      | NUMBER         | SCN of the most recent message encountered for the transaction                                                                                                                                                                                                                                 |
| FIRST_MESSAGE_POSITION   | RAW (64)       | Position of the first message seen by an XStream inbound server<br>This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                        |
| LAST_MESSAGE_POSITION    | RAW (64)       | Position of the last message seen by an XStream inbound server.<br>This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                        |
| TRANSACTION_ID           | VARCHAR2 (128) | Transaction ID for an XStream inbound server. This column is populated only for an apply process that is functioning as an XStream inbound server.                                                                                                                                             |

| Column | Datatype | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CON_ID | NUMBER   | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

## 10.163 V\$ZONEMAP\_USAGE\_STATS

V\$ZONEMAP\_USAGE\_STATS displays zone map usage statistics.

| Column       | Datatype       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ZONEMAP      | VARCHAR2 (257) | Name of the zone map in the form of <i>owner.name</i>                                                                                                                                                                                                                                                                                                                                                                                           |
| PRUNING_TYPE | VARCHAR2 (11)  | Type of data pruning performed using the zone map                                                                                                                                                                                                                                                                                                                                                                                               |
| EXECUTIONS   | NUMBER         | Number of executions, including parallel worker executions                                                                                                                                                                                                                                                                                                                                                                                      |
| BASE_COUNT   | NUMBER         | Base count accumulated over number of executions                                                                                                                                                                                                                                                                                                                                                                                                |
| PRUNED_COUNT | NUMBER         | Pruned count accumulated over number of executions                                                                                                                                                                                                                                                                                                                                                                                              |
| CON_ID       | NUMBER         | The ID of the container to which the data pertains. Possible values include: <ul style="list-style-type: none"> <li>0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs.</li> <li>1: This value is used for rows containing data that pertain to only the root</li> <li><i>n</i>: Where <i>n</i> is the applicable container ID for the rows containing data</li> </ul> |

The ratio ( $\text{PRUNED\_COUNT} / \text{BASE\_COUNT}$ ) shows the fraction of data pruned by the zone map.

# Part IV

## Appendixes

This part includes the following appendixes:

- [Database Limits](#)
- [SQL Scripts](#)
- [Oracle Wait Events](#)
- [Oracle Enqueue Names](#)
- [Statistics Descriptions](#)
- [Background Processes](#)

# A

## Database Limits

This appendix lists the limits of values associated with database functions and objects. Limits exist on several levels in the database. There is usually a hard-coded limit in the database that cannot be exceeded. This value may be further restricted for any given operating system. Database limits are divided into four categories:

- [Datatype Limits](#)
- [Physical Database Limits](#)
- [Logical Database Limits](#)
- [Process and Runtime Limits](#)

### A.1 Datatype Limits

This table documents the limits for datatypes, and includes comments about the datatypes.

| Datatypes | Limit                                                                                                                                                           | Comments                                                                                                                                                                                                                                                                                                             |
|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BFILE     | Maximum size: 4 GB<br>Maximum size of a file name: 255 characters<br>Maximum size of a directory name: 128 bytes<br>Maximum number of open BFILES: see Comments | The maximum number of BFILES is limited by the value of the <code>SESSION_MAX_OPEN_FILES</code> initialization parameter, which is itself limited by the maximum number of open files the operating system will allow.                                                                                               |
| BLOB      | Maximum size: (4 GB - 1) *<br><code>DB_BLOCK_SIZE</code> initialization parameter (8 TB to 128 TB)                                                              | The number of LOB columns per table is limited only by the maximum number of columns per table (that is, 1000 if <code>MAX_COLUMNS = STANDARD</code> and 4096 if <code>MAX_COLUMNS = EXTENDED<sup>1</sup></code> ).<br><b>See Also:</b> " <code>MAX_COLUMNS</code> " initialization parameter for additional details |

<sup>1</sup> The absolute maximum number of columns in a table is 1000 or 4096, depending on the value of the MAX\_COLUMNS initialization parameter. However, when you create an object table (or a relational table with columns of object, nested table, varray, or REF type), Oracle maps the columns of the user-defined types to relational columns, creating in effect hidden columns that count toward the maximum column limit. For details on how Oracle calculates the total number of columns in such a table, refer to *Oracle Database Administrator's Guide*.

<sup>2</sup> All forms of LONG data types (LONG, LONG RAW, LONG VARCHAR, LONG VARRAW) were deprecated in Oracle8i Release 8.1.6. For succeeding releases, the LONG data type was provided for backward compatibility with existing applications. In new applications developed with later releases, Oracle strongly recommends that you use the CLOB or NCLOB data type for storing large amounts of character data.

## A.2 Physical Database Limits

This table describes limit types and limit values for physical database items.

| Item                | Type of Limit                                    | Limit Value                                                                                                                                                                                                                                                |
|---------------------|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Database Block Size | Minimum                                          | 2048 bytes; must be a multiple of operating system physical block size                                                                                                                                                                                     |
| Database Block Size | Maximum                                          | Operating system dependent; never more than 32 KB                                                                                                                                                                                                          |
| Database Blocks     | Minimum in initial extent of a segment           | 2 blocks                                                                                                                                                                                                                                                   |
| Database Blocks     | Maximum per datafile                             | Platform dependent; typically $2^{22} - 1$ blocks                                                                                                                                                                                                          |
| Controlfiles        | Number of control files                          | 1 minimum; 2 or more (on separate devices) strongly recommended                                                                                                                                                                                            |
| Controlfiles        | Size of a control file                           | Maximum of 201031680 logical blocks                                                                                                                                                                                                                        |

| Database files      | Maximum per database                             | 65533<br>May be less on some operating systems<br>Limited also by size of database blocks and by the <code>DB_FILES</code> initialization parameter for a particular instance                                                                              |
| Database extents    | Maximum per dictionary managed tablespace        | 4 GB * physical block size (with K/M modifier); 4 GB (without K/M modifier)                                                                                                                                                                                |
| Database extents    | Maximum per locally managed (uniform) tablespace | 2 GB * physical block size (with K/M modifier); 2 GB (without K/M modifier)                                                                                                                                                                                |
| Database file size  | Maximum                                          | Operating system dependent. Limited by maximum operating system file size. See the <b>Bigfile Tablespaces</b> and <b>Smallfile (traditional) Tablespaces</b> rows for more information about the maximum database file size in these types of tablespaces. |
| MAXEXTENTS          | Default value                                    | Derived from tablespace default storage or <code>DB_BLOCK_SIZE</code> initialization parameter                                                                                                                                                             |
| MAXEXTENTS          | Maximum                                          | Unlimited                                                                                                                                                                                                                                                  |
| Redo Log Files      | Maximum number of logfiles                       | Limited by value of <code>MAXLOGFILES</code> parameter in the <code>CREATE DATABASE</code> statement<br>Control file can be resized to allow more entries; ultimately an operating system limit                                                            |
| Redo Log Files      | Maximum number of logfiles per group             | Unlimited                                                                                                                                                                                                                                                  |

| Item                                | Type of Limit               | Limit Value                                                                                                                                                                                                                                                                               |
|-------------------------------------|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Redo Log File Size                  | Minimum size                | 4 MB                                                                                                                                                                                                                                                                                      |
| Redo Log File Size                  | Maximum Size                | Operating system limit; typically 2 TB                                                                                                                                                                                                                                                    |
| Tablespaces                         | Maximum number per database | 64 K<br>Number of tablespaces cannot exceed the number of database files because each tablespace must include at least one file                                                                                                                                                           |
| Bigfile Tablespaces                 | Number of blocks            | A bigfile tablespace contains only one datafile or tempfile, which can contain up to approximately 4 billion ( $2^{32}$ ) blocks. The maximum size of the single datafile or tempfile is 128 terabytes (TB) for a tablespace with 32 K blocks and 32 TB for a tablespace with 8 K blocks. |
| Smallfile (traditional) Tablespaces | Number of blocks            | A smallfile tablespace is a traditional Oracle tablespace, which can contain 1023 datafiles or tempfiles, each of which can contain up to approximately 4 million ( $2^{22}$ ) blocks.                                                                                                    |
| External Tables file                | Maximum size                | Dependent on the operating system.<br>An external table can be composed of multiple files.                                                                                                                                                                                                |

## A.3 Logical Database Limits

This table describes limit types and limit values for logical database items.

| Item                                | Type of Limit                          | Limit Value                                                                                                                                                                                                                                                                      |
|-------------------------------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Columns                             | Maximum per table                      | If <code>MAX_COLUMNS = STANDARD</code> : 1000<br>If <code>MAX_COLUMNS = EXTENDED</code> : 4096 (available starting with Oracle Database 23c)<br><b>See Also:</b> " <a href="#">MAX_COLUMNS</a> " initialization parameter for additional details                                 |
| Columns                             | Maximum per index (or clustered index) | 32                                                                                                                                                                                                                                                                               |
| Columns                             | Maximum per bitmapped index            | 30                                                                                                                                                                                                                                                                               |
| Constraints                         | Maximum per column                     | Unlimited<br>Oracle does not define a limit on the number of constraints per column. However, constraints are subject to the limit on the maximum number of constraints in the database. See the entry for " <a href="#">Constraints - Maximum per database</a> " in this table. |
| Constraints                         | Maximum per database                   | 4,294,967,293                                                                                                                                                                                                                                                                    |
| Database users                      | Maximum per database                   | 4,294,967,293                                                                                                                                                                                                                                                                    |
| Dictionary-managed database objects | Maximum per database                   | 4,254,950,911 - overhead                                                                                                                                                                                                                                                         |

| Item                         | Type of Limit                                                    | Limit Value                                                                                                                                                                                                                                                                                            |
|------------------------------|------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Indexes                      | Maximum per table                                                | Unlimited<br>Oracle does not define a limit on the number of indexes per table. However, indexes are subject to the limit on the maximum number of dictionary-managed database objects allowed per database. See the entry for " <a href="#">Dictionary-managed database objects</a> " in this table.  |
| Indexes                      | Total size of indexed column(s)                                  | Approximately 75% of the database block size minus some overhead                                                                                                                                                                                                                                       |
| Partitions                   | Maximum length of linear partitioning key                        | 4 KB - overhead                                                                                                                                                                                                                                                                                        |
| Partitions                   | Maximum number of columns in partition key                       | 16 columns                                                                                                                                                                                                                                                                                             |
| Partitions                   | Maximum number of partitions allowed per table or index          | 1024K - 1                                                                                                                                                                                                                                                                                              |
| Rows                         | Maximum number per table                                         | Unlimited                                                                                                                                                                                                                                                                                              |
| Stored Packages              | Maximum size                                                     | Approximately 6,000,000 lines of code.<br><b>See Also:</b> <i>Oracle Database PL/SQL Language Reference</i> for details                                                                                                                                                                                |
| Subpartitions                | Maximum number of subpartitions in a composite partitioned table | 1024K - 1                                                                                                                                                                                                                                                                                              |
| Subqueries                   | Maximum levels of subqueries in a SQL statement                  | Unlimited in the FROM clause of the top-level query<br>255 subqueries in the WHERE clause                                                                                                                                                                                                              |
| System Change Numbers (SCNs) | Maximum                                                          | $2^{63} - 2^{48} = 9,223,090,561,878,065,152$ SCNs                                                                                                                                                                                                                                                     |
| Tables                       | Maximum per clustered table                                      | 32 tables                                                                                                                                                                                                                                                                                              |
| Tables                       | Maximum per database                                             | Unlimited<br>Oracle does not define a limit on the number of tables per database. However, tables are subject to the limit on the maximum number of dictionary-managed database objects allowed per database. See the entry for " <a href="#">Dictionary-managed database objects</a> " in this table. |
| Trigger Cascade Limit        | Maximum value                                                    | Operating system-dependent, typically 32                                                                                                                                                                                                                                                               |
| Users and Roles              | Maximum                                                          | 2,147,483,638                                                                                                                                                                                                                                                                                          |

**Note:**

The limit on how long a SQL statement can be depends on many factors, including database configuration, disk space, and memory

 **Note:**

When an object instance exists in memory, there is no fixed limit on the number of attributes in the object. But the maximum total amount of memory consumed by an object instance is 4 GB. When an object instance is inserted into a table, the attributes are exploded into separate columns in the table, and these columns count toward the limit on the maximum number of columns per table.

## A.4 Process and Runtime Limits

This table describes limit types and limit values for process and runtime items.

| Item                           | Type of Limit                                             | Limit Value                                                                                                           |
|--------------------------------|-----------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Instances per database         | Maximum number of cluster database instances per database | Operating system-dependent                                                                                            |
| Locks                          | Row-level                                                 | Unlimited                                                                                                             |
| Locks                          | Distributed Lock Manager                                  | Operating system dependent                                                                                            |
| SGA size                       | Maximum value                                             | Operating system-dependent; typically 2 to 4 GB for 32-bit operating systems, and > 4 GB for 64-bit operating systems |
| Advanced Queuing Processes     | Maximum per instance                                      | 10                                                                                                                    |
| Job Queue Processes            | Maximum per instance                                      | 1000                                                                                                                  |
| I/O Worker Processes           | Maximum per background process (DBWR, LGWR, and so on)    | 15                                                                                                                    |
| I/O Worker Processes           | Maximum per Backup session                                | 15                                                                                                                    |
| Sessions                       | Maximum per instance                                      | 2 <sup>16</sup> ; limited by the PROCESSES and SESSIONS initialization parameters. 2 <sup>16</sup> is 65536.          |
| Global Cache Service Processes | Maximum per instance                                      | 10                                                                                                                    |
| Shared Servers                 | Maximum per instance                                      | Unlimited within constraints set by the PROCESSES and SESSIONS initialization parameters, for instance                |
| Dispatchers                    | Maximum per instance                                      | Unlimited within constraints set by PROCESSES and SESSIONS initialization parameters, for instance                    |
| Parallel Execution Workers     | Maximum per instance                                      | Unlimited within constraints set by PROCESSES and SESSIONS initialization parameters, for instance                    |
| Backup Sessions                | Maximum per instance                                      | Unlimited within constraints set by PROCESSES and SESSIONS initialization parameters, for instance                    |
| Services                       | Maximum per instance                                      | 8200                                                                                                                  |

# B

## SQL Scripts

This appendix describes SQL scripts that are required for optimal operation of the Oracle Database.

The SQL scripts are described in the following sections:

- [Creating the Data Dictionary](#)
- [Creating Additional Data Dictionary Structures](#)
- [The "NO" Scripts](#)
- [Upgrade Scripts](#)
- [Java Scripts](#)

### Note:

Comments within the SQL scripts themselves contain more detailed information and examples.

### Note:

To run scripts in a pluggable database (PDB), connect to the PDB before running the script. For more information about running scripts in a multitenant container database (CDB), see *Oracle Multitenant Administrator's Guide*.

## B.1 Creating the Data Dictionary

When you use the Database Configuration Assistant to create a database, Oracle automatically creates the data dictionary. Thereafter, whenever the database is in operation, Oracle updates the data dictionary in response to every DDL statement. The data dictionary base tables are the first objects created in any Oracle database. They are created in the `SYSTEM` tablespace and must remain there. The data dictionary base tables store information about all user-defined objects in the database.

[Table B-1](#) lists required scripts, which are run automatically when you create a database using the Database Configuration Assistant. They are described here because you might need to run them if you create a database manually. To run these scripts, you must be connected to Oracle as a user with `SYSDBA` privileges.

**Table B-1 Creating the Data Dictionary Scripts**

| Script Name  | Needed For                       | Description                                                                                                                                                                                                                                              |
|--------------|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| catalog.sql  | All databases                    | Creates the data dictionary and public synonyms for many of its views<br>Grants PUBLIC access to the synonyms                                                                                                                                            |
| catproc.sql  | All databases                    | Runs all scripts required for, or used with, PL/SQL                                                                                                                                                                                                      |
| catpcat.sql  | All databases                    | Runs the catalog.sql and catproc.sql scripts as parallel processes, which can speed up database creation<br><b>Note:</b> You must run catpcat.sql by using the catctl.pl program. See <i>Oracle Database Administrator's Guide</i> for more information. |
| catclust.sql | Oracle Real Application Clusters | Creates Oracle Real Application Clusters data dictionary views                                                                                                                                                                                           |

 **See Also:**

- Your operating system-specific Oracle documentation for the exact names and locations of these scripts on your operating system
- *Oracle Database Administrator's Guide* for more information about creating a database
- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about creating Oracle Real Application Cluster views

## B.2 Creating Additional Data Dictionary Structures

Oracle Database supplies other scripts that create additional structures you can use in managing your database and creating database applications. These scripts are listed in [Table B-2](#).

 **See Also:**

Your operating system-specific Oracle documentation for the exact names and locations of these scripts on your operating system

Table B-2 Creating Additional Data Dictionary Structures

| Script Name                    | Needed For             | Run By        | Description                                                                                                                                                                                                                                |
|--------------------------------|------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| catblock.sql                   | Performance management | SYS           | Creates views that can dynamically display lock dependency graphs<br><b>See Also:</b> <i>Oracle Database Administrator's Guide</i>                                                                                                         |
| caths.sql                      | Heterogeneous Services | SYS           | Installs packages for administering heterogeneous services<br><b>See Also:</b> <i>Oracle Database Gateway for APCC Installation and Configuration Guide for Microsoft Windows</i>                                                          |
| catio.sql                      | Performance management | SYS           | Allows I/O to be traced on a table-by-table basis                                                                                                                                                                                          |
| catqueue.sql                   | Advanced Queuing       |               | Creates the dictionary objects required for Advanced Queuing                                                                                                                                                                               |
| catrep.sql                     | Oracle Replication     | SYS           | Runs all SQL scripts for enabling database replication                                                                                                                                                                                     |
| catwrr.sql                     | Database Replay        | SYS           | Main script that creates the entire schema related to Database Replay - calls the create schema scripts for Workload Capture, Database Replay, Workload Replay, and Workload Intelligence                                                  |
| catwrrwitb.sql                 | Database Replay        | SYS           | Creates the schema for Workload Intelligence                                                                                                                                                                                               |
| dbmsiotc.sql                   | Storage management     | Any user      | Analyzes chained rows in index-organized tables                                                                                                                                                                                            |
| dbmspool.sql                   | Performance management | SYS or SYSDBA | Enables DBA to lock PL/SQL packages, SQL statements, and triggers into the shared pool<br><b>See Also:</b> <i>Oracle Database PL/SQL Packages and Types Reference</i>                                                                      |
| userlock.sql                   | Concurrency control    | SYS or SYSDBA | Provides a facility for user-named locks that can be used in a local or clustered environment to aid in sequencing application actions                                                                                                     |
| utlstat.sql and utleststat.sql | Performance monitoring | SYS           | Respectively start and stop collecting performance tuning statistics                                                                                                                                                                       |
| utlchnl.sql                    | Storage management     | Any user      | For use with the Oracle Database. Creates tables for storing the output of the ANALYZE command with the CHAINED ROWS option. Can handle both physical and logical rowids.<br><b>See Also:</b> <i>Oracle Database Administrator's Guide</i> |
| utlconst.sql                   | Year 2000 compliance   | Any user      | Provides functions to validate that CHECK constraints on date columns are year 2000 compliant                                                                                                                                              |

**Table B-2 (Cont.) Creating Additional Data Dictionary Structures**

| Script Name    | Needed For                             | Run By        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|----------------|----------------------------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| utldtree.sql   | Metadata management                    | Any user      | Creates tables and views that show dependencies between objects<br><b>See Also:</b> <i>Oracle Database SecureFiles and Large Objects Developer's Guide</i>                                                                                                                                                                                                                                                                                                                                               |
| utlexpt1.sql   | Constraints                            | Any user      | For use with the Oracle Database. Creates the default table (EXCEPTIONS) for storing exceptions from enabling constraints. Can handle both physical and logical rowids.<br><b>See Also:</b> <i>Oracle Database Administrator's Guide</i>                                                                                                                                                                                                                                                                 |
| utlfixdirs.sql | Moving a database to a new Oracle home | SYS           | Used after moving a database to a new Oracle home. Updates directory objects to use the new path names for the Oracle home and Oracle base directories, as defined by the new values for the ORACLE_HOME and ORACLE_BASE environment variables.<br>When you run this script in the root container of a CDB, it updates directory objects in the root, as well as any Oracle-maintained directory objects in the PDBs; you must manually update any PDB directory objects that are not Oracle-maintained. |
| utlip.sql      | PL/SQL                                 | SYS           | Used primarily for upgrade and downgrade operations. It invalidates all existing PL/SQL modules by altering certain dictionary tables so that subsequent recompilations will occur in the format required by the database. It also reloads the packages STANDARD and DBMS_STANDARD, which are necessary for any PL/SQL compilations.                                                                                                                                                                     |
| utlirp.sql     | PL/SQL                                 | SYS           | Used to change from 32-bit to 64-bit word size or vice versa. This script recompiles existing PL/SQL modules in the format required by the new database. It first alters some data dictionary tables. Then it reloads the packages STANDARD and DBMS_STANDARD, which are necessary for using PL/SQL. Finally, it triggers a recompilation of all PL/SQL modules, such as packages, procedures, and types.                                                                                                |
| utllockt.sql   | Performance monitoring                 | SYS or SYSDBA | Displays a lock wait-for graph, in tree structure format<br><b>See Also:</b> <i>Oracle Database Administrator's Guide</i>                                                                                                                                                                                                                                                                                                                                                                                |

**Table B-2 (Cont.) Creating Additional Data Dictionary Structures**

| Script Name  | Needed For             | Run By                        | Description                                                                                                                                                                                                                 |
|--------------|------------------------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| utlpwdmg.sql | Security               | SYS or SYSDBA                 | Creates PL/SQL functions for default password complexity verification. Sets the default password profile parameters and enables password management features.<br><br><b>See Also:</b> <i>Oracle Database Security Guide</i> |
| utlrp.sql    | PL/SQL                 | SYS                           | Recompiles all existing PL/SQL modules that were previously in an <code>INVALID</code> state, such as packages, procedures, and types.                                                                                      |
| utlsampl.sql | Examples               | SYS or any user with DBA role | Creates sample tables, such as <code>emp</code> and <code>dept</code> , and users, such as <code>scott</code>                                                                                                               |
| utlscln.sql  | Oracle Replication     | Any user                      | Copies a snapshot schema from another snapshot site                                                                                                                                                                         |
| utltkprf.sql | Performance management | SYS                           | Creates the <code>TKPROFER</code> role to allow the <code>TKPROF</code> profiling utility to be run by non-DBA users                                                                                                        |
| utlvalid.sql | Partitioned tables     | Any user                      | Creates tables required for storing output of <code>ANALYZE TABLE ...VALIDATE STRUCTURE</code> of a partitioned table                                                                                                       |
| utlxplan.sql | Performance management | Any user                      | Creates the table <code>PLAN_TABLE</code> , which holds output from the <code>EXPLAIN PLAN</code> statement<br><br><b>See Also:</b> <i>Oracle Database Data Warehousing Guide</i>                                           |

## B.3 The "NO" Scripts

These scripts are used to remove dictionary information for various optional services or components.

**Table B-3 The NO Scripts**

| Script Name     | Needed For                | Run By | Description                                                                    |
|-----------------|---------------------------|--------|--------------------------------------------------------------------------------|
| catnoadt.sql    | Objects                   | SYS    | Drops views and synonyms on dictionary metadata that relate to object types    |
| catnoaud.sql    | Security                  | SYS    | Drops views and synonyms on auditing metadata                                  |
| catnoclust.sql  | Real Application Clusters | SYS    | Drops views that are specific to Oracle Real Application Clusters (Oracle RAC) |
| catnodrdaas.sql | DRDA Application Server   | SYS    | Drops all DRDA Application Server objects from the database                    |
| catnogwm.sql    | Global Data Services      | SYS    | Drops users, roles, and other objects created for Global Data Services.        |
| catnohs.sql     | Heterogeneous Services    | SYS    | Removes Heterogeneous Services dictionary metadata                             |

**Table B-3 (Cont.) The NO Scripts**

| Script Name      | Needed For             | Run By | Description                                                                                                                                                                           |
|------------------|------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| catnojav.sql     | Java                   | SYS    | Drops the RDBMS Java classes and system triggers created by the <code>catjava.sql</code> script.                                                                                      |
| catnoprt.sql     | Partitioning           | SYS    | Drops views and synonyms on dictionary metadata that relate to partitioned tables and indexes                                                                                         |
| catnosvm.sql     | Server Manager         | SYS    | Removes Oracle7 Server Manager views and synonyms                                                                                                                                     |
| catnowrr.sql     | Database Replay        | SYS    | Main script that drops the entire schema related to Database Replay - calls the drop schema scripts for Workload Capture, Database Replay, Workload Replay, and Workload Intelligence |
| catnowrrc.sql    | Database Replay        | SYS    | Drops the schema related to Workload Capture                                                                                                                                          |
| catnowrrp.sql    | Database Replay        | SYS    | Drops the schema related to Workload Replay                                                                                                                                           |
| catnowrrwitb.sql | Database Replay        | SYS    | Drops the schema related to Workload Intelligence                                                                                                                                     |
| catnsnmp.sql     | Distributed management | SYS    | Drops the DBSNMP user and SNMPAGENT role                                                                                                                                              |

## B.4 Upgrade Scripts

Upgrade scripts are used when upgrading to another release of Oracle.

### See Also:

*Oracle Database Upgrade Guide* for information about upgrade scripts

## B.5 Java Scripts

The Java scripts are useful only if the JServer option is installed.

**Table B-4 Java Scripts**

| Script Name | Description                                                                                           |
|-------------|-------------------------------------------------------------------------------------------------------|
| initjvm.sql | Initializes JServer by installing core Java class libraries and Oracle-specific Java classes          |
| rmjvm.sql   | Removes all elements of the JServer<br><b>See Also:</b> <i>Oracle Database Java Developer's Guide</i> |
| catjava.sql | Installs Java-related packages and classes                                                            |

# C

## Oracle Wait Events

This appendix describes Oracle wait events.

It includes these topics:

- [Classes of Wait Events](#)
- [Descriptions of Common Wait Event Parameters](#)
- [Descriptions of Wait Events](#)

Information about wait events is displayed in three dynamic performance views:

- `V$SESSION_WAIT` displays the events for which sessions have just completed waiting or are currently waiting.
- `V$SYSTEM_EVENT` displays the total number of times all the sessions have waited for the events in that view.
- `V$SESSION_EVENT` is similar to `V$SYSTEM_EVENT`, but displays all waits for each session.

### See Also:

["V\\$SESSION\\_WAIT"](#), ["V\\$SYSTEM\\_EVENT"](#), and ["V\\$SESSION\\_EVENT"](#)

Many of these wait events are tied to the internal implementation of Oracle and therefore are subject to change or deletion without notice. Application developers should be aware of this and write their code to tolerate missing or extra wait events.

The following SQL statement displays an alphabetical list of all Oracle wait events and the wait class to which they belong:

```
SQL> SELECT name, wait_class FROM V$EVENT_NAME ORDER BY name;
```

### C.1 Classes of Wait Events

Every wait event belongs to a class of wait event.

The following list describes each of the wait classes.

#### Administrative

Waits resulting from DBA commands that cause users to wait (for example, an index rebuild)

#### Application

Waits resulting from user application code (for example, lock waits caused by row level locking or explicit lock commands)

### **Cluster**

Waits related to Oracle Real Application Clusters resources (for example, global cache resources such as 'gc cr block busy')

### **Commit**

This wait class only comprises one wait event - wait for redo log write confirmation after a commit (that is, 'log file sync')

### **Concurrency**

Waits for internal database resources (for example, latches)

### **Configuration**

Waits caused by inadequate configuration of database or instance resources (for example, undersized log file sizes, shared pool size)

### **Idle**

Waits that signify the session is inactive, waiting for work (for example, 'SQL\*Net message from client')

### **Network**

Waits related to network messaging (for example, 'SQL\*Net more data to dblink')

### **Other**

Waits which should not typically occur on a system (for example, 'wait for EMON to spawn')

### **Queueing**

Contains events that signify delays in obtaining additional data in a pipelined environment. The time spent on these wait events indicates inefficiency or other problems in the pipeline. It affects features such as parallel queries or `DBMS_PIPE` PL/SQL packages.

### **Scheduler**

Resource Manager related waits (for example, 'resmgr: become active')

### **System I/O**

Waits for background process I/O (for example, DBWR wait for 'db file parallel write')

### **User I/O**

Waits for user I/O (for example 'db file sequential read')

## C.2 Descriptions of Common Wait Event Parameters

This section describes some of the common wait event parameters.

### **block#**

This is the block number of the block for which Oracle needs to wait. The block number is relative to the start of the file. To find the object to which this block belongs, issue the following SQL statement:

```
select segment_name, segment_type, owner, tablespace_name
from dba_extents
where file_id = file#
 and block#
 between block_id and block_id + blocks - 1;
```

### **blocks**

The number of blocks that is being either read from or written to the file. The block size depends on the file type:

- Database files have a block size of `DB_BLOCK_SIZE`
- Logfiles and control files have a block size that is equivalent to the physical block size of the platform

### **break?**

If the value for this parameter equals 0, a reset was sent to the client. A nonzero value indicates that a break was sent to the client.

### **class**

The class of the block describes how the contents of the block are used. For example, class 1 represents data block, and class 2 represents sort block. Use this SQL query to see the block classes:

```
select view_definition
from v$fixed_view_definition
where view_name='GV$WAITSTAT';
```

### **dba**

The initials "dba" represents the data block address, which consists of a file number and a block number.

### **driver id**

The address of the disconnect function of the driver that is currently being used.

### **file#**

The following query returns the name of the database file:

```
select *
from v$datafile
where file# = file#;
```

**id1**

The first identifier (*id1*) of the enqueue or global lock takes its value from P2 or P2RAW. The meaning of the identifier depends on the name (P1).

**id2**

The second identifier (*id2*) of the enqueue or global lock takes its value from P3 or P3RAW. The meaning of the identifier depends on the name (P1).

**mode**

The *mode* is usually stored in the low order bytes of P1 or P1RAW and indicates the mode of the enqueue or global lock request. This parameter has one of the following values:

**Table C-1 Lock Mode Values**

| Mode Value | Description         |
|------------|---------------------|
| 1          | Null mode           |
| 2          | Sub-Share           |
| 3          | Sub-Exclusive       |
| 4          | Share               |
| 5          | Share/Sub-Exclusive |
| 6          | Exclusive           |

Use the following SQL statement to retrieve the name of the lock and the mode of the lock request:

```
select chr(bitand(p1,-16777216)/16777215)||
 chr(bitand(p1, 16711680)/65535) "Lock",
 bitand(p1, 65535) "Mode"
from v$session_wait
where event = 'DFS enqueue lock acquisition';
```

**name and type**

The name or "type" of the enqueue or global lock can be determined by looking at the two high order bytes of P1 or P1RAW. The name is always two characters. Use the following SQL statement to retrieve the lock name.

```
select chr(bitand(p1,-16777216)/16777215)||
 chr(bitand(p1,16711680)/65535) "Lock"
from v$session_wait
where event = 'DFS enqueue lock acquisition';
```

**namespace**

The name of the object namespace as it is displayed in V\$DB\_OBJECT\_CACHE view.

**requests**

The number of I/Os that are "requested." This differs from the number of blocks in that one request could potentially contain multiple blocks.

**session#**

The number of the inactive session. Use the following SQL statement to find more information about the session:

```
select *
from v$session
where sid = session#;
```

**waited**

This is the total amount of time the session has waited for this session to terminate.

## C.3 Descriptions of Wait Events

This section provides detailed descriptions for those wait events of greatest interest.

Where appropriate, pointers are provided to further information elsewhere in Oracle Database documentation. For a complete listing of wait events, in alphabetical order, you can issue the following SQL statement:

```
SQL> SELECT name FROM V$EVENT_NAME ORDER BY name;
```

### C.3.1 alter system set dispatcher

A session has issued a statement `ALTER SYSTEM SET DISPATCHER = string` and is waiting for the dispatchers to get started.

**Wait Time:** The session will wait 1 / 100 of a second and verify if the new dispatchers have started, else the session will wait again

| Parameter     | Description                                                     |
|---------------|-----------------------------------------------------------------|
| <i>waited</i> | Number of times that the session has waited 1 / 100 of a second |

### C.3.2 ARCH Remote Write

Used to track the time (in centiseconds) that `ARCn` background processes spend blocked waiting for network write operations to complete.

### C.3.3 ASYNC Remote Write

Used to track the time (in centiseconds) for asynchronous streaming `RFSWRITE` operations. This includes stall reaps and streaming network submission time. This time is accumulated by `TTnn` (Redo Transport Worker) background processes.

 **See Also:**

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

### C.3.4 BFILE check if exists

The session waits to check if an external large object (LOB) exists.

**Wait Time:** The total elapsed time for the **exists** call

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

### C.3.5 BFILE check if open

The session waits for an external large object (LOB) to open.

**Wait Time:** The total elapsed time for the **isopen** call

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

### C.3.6 BFILE closure

The session waits for an external large object (LOB) to close.

**Wait Time:** The total elapsed time for the **close** call

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

### C.3.7 BFILE get length

The session waits on a call to check the size of an external large object (LOB).

**Wait Time:** The total elapsed time for the call to check the LOB size

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

### C.3.8 BFILE get name object

The session waits on a call to find or generate the external name of a external large object.

**Wait Time:** The total elapsed time for **make external file name** to complete

---

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

---

### C.3.9 BFILE get path object

The session is waiting on a call to find or generate the external path name of an external large object (LOB).

**Wait Time:** The total elapsed time for **make external path** to complete

---

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

---

### C.3.10 BFILE internal seek

The session waits for a positioning call within the external large object (LOB) to complete.

**Wait Time:** The total elapsed time for the **seek** to complete

---

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

---

### C.3.11 BFILE open

The session waits for an external large object (LOB) to open.

**Wait Time:** The total elapsed time for the **isopen** call

---

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

---

### C.3.12 BFILE read

The session waits for a read from a external large object (LOB) to complete.

**Wait Time:** The total elapsed time for the **read** to complete

---

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

---

### C.3.13 broadcast mesg queue transition

Processes enter "wait for broadcast mesg queue transition" when cleaning up a publisher channel handle to a RELIABLE broadcast channel. The publisher is responsible for moving the message to the free queue, but it cannot do so until the message is in the done queue. If the message is still not in the done queue, process enters this wait. This wait event will most likely appear when an Oracle process is about to exit normally, or when PMON cleans up a terminated process.

**Wait Time:** Varies

| Parameter             | Description                                                          |
|-----------------------|----------------------------------------------------------------------|
| <i>channel handle</i> | publisher channel handle pointer                                     |
| <i>message</i>        | broadcast message pointer                                            |
| <i>location</i>       | A number indicating the function in KSR where the process is waiting |

### C.3.14 broadcast mesg recovery queue transition

Processes enter "wait for broadcast mesg recovery queue transition" when cleaning up a publisher channel handle to a RELIABLE broadcast channel. The broadcasted message is in the recovery queue of another channel handle (for example, ch2). Process enters this wait, if the message is yet to be removed from the recovery queue of the ch2 channel handle. This wait event will most likely appear when an Oracle process is about to exit normally, or when PMON cleans up a terminated process.

**Wait Time:** Varies

| Parameter             | Description                                                          |
|-----------------------|----------------------------------------------------------------------|
| <i>channel handle</i> | Publisher channel handle pointer                                     |
| <i>message</i>        | Broadcast message pointer                                            |
| <i>location</i>       | A number indicating the function in KSR where the process is waiting |

### C.3.15 buffer busy waits

Wait until a buffer becomes available.

There are four reasons that a session cannot pin a buffer in the buffer cache, and a separate wait event exists for each reason:

1. "buffer busy waits": A session cannot pin the buffer in the buffer cache because another session has the buffer pinned.
2. "read by other session": A session cannot pin the buffer in the buffer cache because another session is reading the buffer from disk.
3. "gc buffer busy acquire": A session cannot pin the buffer in the buffer cache because another session is reading the buffer from the cache of another instance.
4. "gc buffer busy release": A session cannot pin the buffer in the buffer cache because another session on another instance is taking the buffer from this cache into its own cache so it can pin it.

Prior to release 10.1, all four reasons were covered by "buffer busy waits." In release 10.1, the "gc buffer busy" wait event covered both the "gc buffer busy acquire" and "gc buffer busy release" wait events.

**Wait Time:** Normal wait time is 1 second. If the session was waiting for a buffer during the last wait, then the next wait will be 3 seconds.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about the potential causes of the buffer busy waits wait event

## C.3.16 buffer deadlock

Oracle does not really wait on this event; the foreground only yields the CPU. Thus, the chances of catching this event are very low. This is not an application induced deadlock, but an assumed deadlock by the cache layer. The cache layer cannot get a buffer in a certain mode within a certain amount of time.

**Wait Time:** 0 seconds. The foreground process only yields the CPU and will usually be placed at the end of the CPU run queue.

| Parameter    | Description                                                                 |
|--------------|-----------------------------------------------------------------------------|
| <i>class</i> | See " <a href="#">class</a> "                                               |
| <i>mode</i>  | See " <a href="#">mode</a> "                                                |
| <i>flag</i>  | The flag points to the internal flags used by the session to get this block |
| <i>dba</i>   | See " <a href="#">dba</a> "                                                 |

## C.3.17 buffer latch

The session waits on the buffer hash chain latch. Primarily used in the dump routines.

**Wait Time:** 1 second

| Parameter         | Description                                                                                                                                                                                                                  |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>latch addr</i> | The virtual address in the SGA where this latch is located. Use the following statement to find the name of this latch: <pre>select * from v\$latch a, v\$latchname b where addr = latch addr and a.latch# = b.latch#;</pre> |

| Parameter     | Description                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------|
| <i>chain#</i> | The index into array of buffer hash chains. When the chain is 0xffffffff, the foreground waits on the LRU latch. |

### C.3.18 buffer read retry

This event occurs only if the instance is mounted in shared mode (Oracle Real Application Cluster).

During the read of the buffer, the contents changed. This means that either:

- The version number, dba, or the incarnation and sequence number stored in the block no longer match
- The checksum on the block does not match the checksum in the block

The block will be reread (this may fail up to 3 times), then corruption is assumed and the corrupt block is dumped in the trace file.

**Wait Time:** The wait time is the elapsed time of the read

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |

### C.3.19 checkpoint completed

A session waits for a checkpoint to complete. This could happen, for example, during a close database or a local checkpoint.

**Wait Time:** 5 seconds

**Parameters:** None

### C.3.20 cleanup of aborted process

When a process spawn is terminated while the process spawning background is in the middle of spawning, the current session must wait until the pid of the new process is filled in. Once the pid is filled in, then the process spawn can be actually terminated.

**Wait Time:** Usually 3 seconds

| Parameter       | Description          |
|-----------------|----------------------|
| <i>location</i> | Location of the wait |

### C.3.21 control file parallel write

This event occurs while the session is writing physical blocks to all control files. This happens when:

- The session starts a control file transaction (to ensure the control files are up to date in case the session crashes before committing the control file transaction)

- The session commits a transaction to a control file
- Changing a generic entry in the control file, the new value is being written to all control files

**Wait Time:** The wait time is the time it takes to finish all writes to all control files

| Parameter       | Description                                                          |
|-----------------|----------------------------------------------------------------------|
| <i>files</i>    | The number of control files to which the session is writing          |
| <i>blocks</i>   | The number of blocks that the session is writing to the control file |
| <i>requests</i> | The number of I/O requests which the session wants to write          |

### C.3.22 control file sequential read

Reading from the control file. This happens often. For example, while:

- Making a backup of the control files
- Sharing information (between instances) from the control file
- Reading other blocks from the control files
- Reading the header block

**Wait Time:** The wait time is the elapsed time of the read

| Parameter     | Description                                                                                                                                                                               |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>file#</i>  | The control file from which the session is reading                                                                                                                                        |
| <i>block#</i> | Block number in the control file from where the session starts to read. The block size is the physical block size of the port (usually 512 bytes, some UNIX ports have 1 or 2 Kilobytes). |
| <i>blocks</i> | The number of blocks that the session is trying to read                                                                                                                                   |

### C.3.23 control file single write

This wait is signaled while the control file's shared information is written to disk. This is an atomic operation protected by an enqueue (CF), so that only one session at a time can write to the entire database.

**Wait Time:** The wait time is the elapsed time of the write

| Parameter     | Description                                                                                                                                                                       |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>file#</i>  | This identifies the control file to which the session is currently writing                                                                                                        |
| <i>block#</i> | Block number in the control file where the write begins. The block size is the as the physical block size of the port (usually 512 bytes, some UNIX ports have 1 or 2 Kilobytes). |
| <i>blocks</i> | The number of blocks that the session is trying to write                                                                                                                          |

### C.3.24 cursor: mutex S

A session waits on this event when it is requesting a mutex in shared mode, when another session is currently holding a this mutex in exclusive mode on the same cursor object.

| Parameter | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Hash value of cursor                                                                                                 |
| <i>P2</i> | Mutex value (top 2 bytes contain SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0) |
| <i>P3</i> | Mutex where (an internal code locator) OR'd with Mutex Sleeps                                                        |

### C.3.25 cursor: mutex X

The session requests the mutex for a cursor object in exclusive mode, and it must wait because the resource is busy. The mutex is busy because either the mutex is being held in exclusive mode by another session or the mutex is being held shared by one or more sessions. The existing mutex holder(s) must release the mutex before the mutex can be granted exclusively.

| Parameter | Description                                                                                                          |
|-----------|----------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Hash value of cursor                                                                                                 |
| <i>P2</i> | Mutex value (top 2 bytes contain SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0) |
| <i>P3</i> | Mutex where (an internal code locator) OR'd with Mutex Sleeps                                                        |

### C.3.26 cursor: pin S

A session waits on this event when it wants to update a shared mutex pin and another session is currently in the process of updating a shared mutex pin for the same cursor object. This wait event should rarely be seen because a shared mutex pin update is very fast.

**Wait Time:** Microseconds

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Hash value of cursor                                                                                                  |
| <i>P2</i> | Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0) |
| <i>P3</i> | Mutex where (an internal code locator) OR'd with Mutex Sleeps                                                         |

### C.3.27 cursor: pin S wait on X

A session waits for this event when it is requesting a shared mutex pin and another session is holding an exclusive mutex pin on the same cursor object.

**Wait Time:** Microseconds

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Hash value of cursor                                                                                                  |
| <i>P2</i> | Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0) |

| Parameter | Description                                                   |
|-----------|---------------------------------------------------------------|
| <i>P3</i> | Mutex where (an internal code locator) OR'd with Mutex Sleeps |

### C.3.28 cursor: pin X

A session waits on this event when it is requesting an exclusive mutex pin for a cursor object and it must wait because the resource is busy. The mutex pin for a cursor object can be busy either because a session is already holding it exclusive, or there are one or more sessions which are holding shared mutex pin(s). The exclusive waiter must wait until all holders of the pin for that cursor object have released it, before it can be granted.

**Wait Time:** Microseconds

| Parameter | Description                                                                                                           |
|-----------|-----------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Hash value of cursor                                                                                                  |
| <i>P2</i> | Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0) |
| <i>P3</i> | Mutex where (an internal code locator) OR'd with Mutex Sleeps                                                         |

### C.3.29 db file async I/O submit

When asynchronous I/O is available, this wait event captures any time spent in submitting I/Os to the underlying storage.

**See Also:**

"db file parallel write"

### C.3.30 db file parallel read

This happens during recovery. It can also happen during buffer prefetching, as an optimization (rather than performing multiple single-block reads). Database blocks that must be changed as part of recovery are read in parallel from the database.

**Wait Time:** Wait until all of the I/Os are completed

| Parameter       | Description                                                                       |
|-----------------|-----------------------------------------------------------------------------------|
| <i>files</i>    | This indicates the number of files to which the session is reading                |
| <i>blocks</i>   | This indicates the total number of blocks to be read                              |
| <i>requests</i> | This indicates the total number of I/O requests, which will be the same as blocks |

### C.3.31 db file parallel write

This event occurs in the DBWR. It indicates the time that DBWR spends waiting for I/O completion.

If asynchronous I/O is available, then the db file async I/O submit wait event captures any time spent in submitting I/Os to the underlying storage.

When asynchronous I/O is not available, db file parallel write captures the time spent during submit and reap.

**Wait Time:** While there are outstanding I/Os, DBWR waits for some of the writes to complete. DBWR does not wait for all of the outstanding I/Os to complete.

| Parameter        | Description                                                                                |
|------------------|--------------------------------------------------------------------------------------------|
| <i>requests</i>  | This indicates the total number of I/O requests, which will be the same as blocks          |
| <i>interrupt</i> |                                                                                            |
| <i>timeout</i>   | This indicates the timeout value in hundredths of a second to wait for the I/O completion. |

#### See Also:

- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems
- "[db file async I/O submit](#)"

### C.3.32 db file scattered read

Similar to the "db file sequential read" wait event, except that the session is reading multiple data blocks.

**Wait Time:** The wait time is the actual time it takes to do all of the I/Os

| Parameter     | Description                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                                                                           |
| <i>block#</i> | See " <a href="#">block#</a> "                                                                          |
| <i>blocks</i> | The number of blocks that the session is trying to read from the <i>file#</i> starting at <i>block#</i> |

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems
- *Oracle Database Performance Tuning Guide* about potential causes for this wait event

### C.3.33 db file sequential read

The session waits while a sequential read from the database is performed. This event is also used for rebuilding the control file, dumping data file headers, and getting the database file headers.

**Wait Time:** The wait time is the actual time it takes to do the I/O

| Parameter     | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                                                 |
| <i>block#</i> | See " <a href="#">block#</a> "                                                |
| <i>blocks</i> | This is the number of blocks that the session is trying to read (should be 1) |

 **See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about how this wait event can help identify I/O problems
- *Oracle Database Performance Tuning Guide* about potential causes for this wait event

### C.3.34 db file single write

This event is used to wait for the writing of the file headers.

**Wait Time:** The wait time is the actual time it takes to do the I/O

| Parameter     | Description                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                                                                              |
| <i>block#</i> | See " <a href="#">block#</a> "                                                                             |
| <i>blocks</i> | This is the number of blocks that the session is trying to write in <i>file#</i> starting at <i>block#</i> |

 **See Also:**

- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems

## C.3.35 DFS lock handle

The session waits for the lock handle of a global lock request. The lock handle identifies a global lock. With this lock handle, other operations can be performed on this global lock (to identify the global lock in future operations such as conversions or release). The global lock is maintained by the DLM.

**Wait Time:** The session waits in a loop until it has obtained the lock handle from the DLM. Inside the loop there is a wait of 0.5 seconds.

| Parameter   | Description                           |
|-------------|---------------------------------------|
| <i>name</i> | See " <a href="#">name and type</a> " |
| <i>mode</i> | See " <a href="#">mode</a> "          |
| <i>id1</i>  | See " <a href="#">id1</a> "           |
| <i>id2</i>  | See " <a href="#">id2</a> "           |

## C.3.36 direct path read

During Direct Path operations the data is asynchronously read from the database files. At some stage the session needs to make sure that all outstanding asynchronous I/O have been completed to disk. This can also happen if during a direct read no more slots are available to store outstanding load requests (a load request could consist of multiple I/Os).

**Wait Time:** 10 seconds. The session will be posted by the completing asynchronous I/O. It will never wait the entire 10 seconds. The session waits in a tight loop until all outstanding I/Os have completed.

| Parameter                 | Description                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------|
| <i>descriptor address</i> | This is a pointer to the I/O context of outstanding direct I/Os on which the session is currently waiting |
| <i>first dba</i>          | The dba of the oldest I/O in the context referenced by the descriptor address                             |
| <i>block cnt</i>          | Number of valid buffers in the context referenced by the descriptor address                               |

 **See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.37 direct path sync

During Direct Path write operations the data is asynchronously written to the database files. At some point the session needs to ensure that all outstanding asynchronous I/O have been completed to disk. On UNIX the `fsync` command, which synchronizes data to disk, is issued to confirm that all the writes have completed and the data is all on disk.

**Wait Time:** The time taken for the `fsync` operation to complete, which normally is the time taken to complete the outstanding I/Os.

| Parameters   | Description                       |
|--------------|-----------------------------------|
| <i>file#</i> | See "file#"                       |
| <i>flags</i> | Flags used for debugging purposes |

### C.3.38 direct path write

During Direct Path operations, the data is asynchronously written to the database files. At some stage the session needs to make sure that all outstanding asynchronous I/O have been completed to disk. This can also happen if, during a direct write, no more slots are available to store outstanding load requests (a load request could consist of multiple I/Os).

**Wait Time:** 10 seconds. The session will be posted by the completing asynchronous I/O. It will never wait the entire 10 seconds. The session waits in a tight loop until all outstanding I/Os have completed.

| Parameter                 | Description                                                                                               |
|---------------------------|-----------------------------------------------------------------------------------------------------------|
| <i>descriptor address</i> | This is a pointer to the I/O context of outstanding direct I/Os on which the session is currently waiting |
| <i>first dba</i>          | The dba of the oldest I/O in the context referenced by the descriptor address                             |
| <i>block cnt</i>          | Number of valid buffers in the context referenced by the descriptor address                               |

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about this parameter

### C.3.39 Disk file operations I/O

This event is used to wait for disk file operations (for example, open, close, seek, and resize). It is also used for miscellaneous I/O operations such as block dumps and password file accesses.

**Wait Time:** The wait time is the actual time it takes to do the I/O

| Parameter            | Description            |
|----------------------|------------------------|
| <i>FileOperation</i> | Type of file operation |

| Parameter       | Description                                                |
|-----------------|------------------------------------------------------------|
| <i>fileno</i>   | File identification number                                 |
| <i>filetype</i> | Type of file (for example, log file, data file, and so on) |

### C.3.40 dispatcher shutdown

During shutdown immediate or normal, the shutdown process must wait for all the dispatchers to shutdown. As each dispatcher is signaled, the session that causes the shutdown waits on this event until the requested dispatcher is no longer running.

**Wait Time:** 1 second

| Parameter     | Description                                                                                                                                     |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>waited</i> | Indicates the cumulative wait time. After 5 minutes, the session writes to the alert and trace files to indicate that there might be a problem. |

#### See Also:

*Oracle Database SQL Language Reference* for information about shutting down a dispatcher using `SHUTDOWN` clause of the `SQL ALTER SYSTEM` statement

### C.3.41 dispatcher timer

This basically means that the dispatcher is idle and waiting for some work to arrive.

**Wait Time:** 60 seconds

| Parameter         | Description                                                                                                                                                                                          |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>sleep time</i> | The intended sleep time. The dispatcher will return to work sooner if it is posted by either data arriving on the network or by a post from a shared server process to send data back to the client. |

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.42 dupl. cluster key

It is possible for a race condition to occur when creating a new cluster key. If it is found that another process has put the cluster key into the data/index block, then the session waits and retries. The retry should then find a valid cluster key.

**Wait Time:** 0.01 seconds

| Parameter  | Description                                                                   |
|------------|-------------------------------------------------------------------------------|
| <i>dba</i> | The dba of the block into which the session is trying to insert a cluster key |

### C.3.43 enq: OW - initialization

A session will wait on this event if it is trying to initialize the database wallet, and another session has already begun an initialization.

**Wait Time:** Total time necessary to initialize the wallet context

**Parameters:** None

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about the potential causes of an enqueue wait event

### C.3.44 enq: OW - termination

A session will wait on this event if it is trying to terminate the database wallet, and another session has already begun a termination.

**Wait Time:** Total time necessary to deallocate memory used by the wallet context and terminate the context.

**Parameters:** None

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about the potential causes of an enqueue wait event

### C.3.45 enq: SV - contention

A session is accessing a sequence number from an ordered sequence object.

**Wait Time:** The wait time is the actual time waited until the requested sequence number is acquired.

| Parameter  | Description      |
|------------|------------------|
| <i>id1</i> | Sequence object# |

 **See Also:**

*Oracle Database SQL Language Reference* for more information about sequences

### C.3.46 enq: TX - index contention

Occurs when a transaction inserting a row in an index has to wait for the end of an index block split being done by another transaction.

### C.3.47 enq: TX - row lock (HIGH priority)

This wait event occurs when a transaction with the Automatic Transaction Rollback priority of `HIGH` is waiting for a row lock being held by another transaction.

This wait event is useful when configuring Automatic Transaction Rollback. You can observe the statistics for this wait event to determine whether the wait time for `HIGH` priority transactions is appropriate for your environment.

**Wait Time:** The amount of time specified by the `TXN_AUTO_ROLLBACK_HIGH_PRIORITY_WAIT_TARGET` initialization parameter.

| Parameter       | Description                           |
|-----------------|---------------------------------------|
| <i>name</i>     | See " <a href="#">name and type</a> " |
| <i>mode</i>     | See " <a href="#">mode</a> "          |
| <i>usn</i> <<16 | Undo segment number                   |
| <i>slot</i>     | Slot number                           |
| <i>sequence</i> | Sequence number                       |

 **See Also:**

- *Oracle Database Administrator's Guide* for information about configuring Automatic Transaction Rollback
- "[TXN\\_AUTO\\_ROLLBACK\\_HIGH\\_PRIORITY\\_WAIT\\_TARGET](#)"

### C.3.48 enq: TX - row lock (LOW priority)

This wait event occurs when a transaction with the Automatic Transaction Rollback priority of `LOW` is waiting for a row lock being held by another transaction.

This wait event is useful when configuring Automatic Transaction Rollback. You can observe the statistics for this wait event to determine how long `LOW` priority transactions are waiting for row locks.

**Wait Time:** Total time necessary to obtain the row lock

| Parameter       | Description                           |
|-----------------|---------------------------------------|
| <i>name</i>     | See " <a href="#">name and type</a> " |
| <i>mode</i>     | See " <a href="#">mode</a> "          |
| <i>usn</i> <<16 | Undo segment number                   |
| <i>slot</i>     | Slot number                           |
| <i>sequence</i> | Sequence number                       |

 **See Also:**

- *Oracle Database Administrator's Guide* for information about configuring Automatic Transaction Rollback

### C.3.49 enq: TX - row lock (MEDIUM priority)

This wait event occurs when a transaction with the Automatic Transaction Rollback priority of `MEDIUM` is waiting for a row lock being held by another transaction.

This wait event is useful when configuring Automatic Transaction Rollback. You can observe the statistics for this wait event to determine whether the wait time for `MEDIUM` priority transactions is appropriate for your environment.

**Wait Time:** The amount of time specified by the `TXN_AUTO_ROLLBACK_MEDIUM_PRIORITY_WAIT_TARGET` initialization parameter.

| Parameter       | Description                           |
|-----------------|---------------------------------------|
| <i>name</i>     | See " <a href="#">name and type</a> " |
| <i>mode</i>     | See " <a href="#">mode</a> "          |
| <i>usn</i> <<16 | Undo segment number                   |
| <i>slot</i>     | Slot number                           |
| <i>sequence</i> | Sequence number                       |

 **See Also:**

- *Oracle Database Administrator's Guide* for information about configuring Automatic Transaction Rollback
- "[TXN\\_AUTO\\_ROLLBACK\\_MEDIUM\\_PRIORITY\\_WAIT\\_TARGET](#)"

## C.3.50 enq: TX - row lock contention

This wait event can occur for several reasons.

- If one user is wanting to update or delete a row or rows that another session is modifying. The session holding the lock will release it when it performs a COMMIT or ROLLBACK.
- If a session is waiting due to potential duplicates in a UNIQUE index. If two sessions try to insert the same key value, the second session has to wait to see if an ORA-0001 should be raised or not. The session holding the lock will release it when it performs a COMMIT or ROLLBACK.
- If a session is waiting due to a shared bitmap index fragment. Bitmap indexes index key values and a range of rowids. Each entry in a bitmap index can cover many rows in the actual table. If two sessions want to update rows covered by the same bitmap index fragment, then the second session waits for the first transaction to either COMMIT or ROLLBACK by waiting for the TX lock.

## C.3.51 enqueue

The session is waiting for a local enqueue.

The wait depends on the name of the enqueue (see [Oracle Enqueue Names](#)).

**Wait Time:** Depends on the enqueue name

| Parameter   | Description                           |
|-------------|---------------------------------------|
| <i>name</i> | See " <a href="#">name and type</a> " |
| <i>mode</i> | See " <a href="#">mode</a> "          |

### See Also:

*Oracle Database Performance Tuning Guide* for more information about the potential causes of an enqueue wait event

## C.3.52 flashback buf free by RVWR

This wait event only occurs when Flashback Database is turned on. A session waits for recovery writer (RVWR) to write flashback data to the flashback logs on disk because the buffers are full. Until RVWR can free up the buffers, the session may need to wait.

If this event becomes a top wait event for the database, it is typically because the file system or storage system for the Fast Recovery Area does not support enough bandwidth for Oracle to write the flashback database logs. Refer to the Flashback Database section in *Oracle Database Backup and Recovery User's Guide* for tuning considerations.

**Wait Time:** 1 second

**Parameters:** None

### C.3.53 flashback log file sync

Waits for flashback database data to be written to disk.

**Wait Time:** Includes RVWR writing the flashback database data and posting this process

**Parameters:** None

### C.3.54 free buffer waits

This wait event can occur for several reasons.

- All buffer gets have been suspended. This could happen when a file was read-only and is now read/write. All the existing buffers must be invalidated since they are not linked to lock elements (needed when mounted parallel (shared)). So cache buffers are not assigned to data block addresses until the invalidation is finished.
- The session moved some dirty buffers to the dirty queue and now this dirty queue is full. The dirty queue must be written first. The session will wait on this event and try again to find a free buffer
- This also happens after inspecting **free buffer inspected** buffers. If no free buffer is found, Oracle waits for one second, and then tries to get the buffer again (depends on the context). For more information, see [free buffer inspected](#).

**Wait Time:** 1 second

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |

#### See Also:

### C.3.55 free global transaction table entry

The session is waiting for a free slot in the global transaction table (used by the Distributed Database option). It will wait for 1 second and try again.

**Wait Time:** 1 second

| Parameter    | Description                                                                               |
|--------------|-------------------------------------------------------------------------------------------|
| <i>tries</i> | The number of times the session tried to find a free slot in the global transaction table |

### C.3.56 free process state object

Used during the creation of a process. The session will scan the process table and look for a free process slot. If none can be found, PMON is posted to check if all the processes currently in the process table are still running. If there are terminated processes, then PMON will clean them and make the process slot available to new processes. The waiting process will then rescan the process table to find the new slot.

**Wait Time:** 1 second

**Parameters:** None

### C.3.57 gc buffer busy acquire

This event indicates that the requested buffer was globally busy in the cluster, because it had already been requested from a remote instance by another local client.

**Wait Time:** The wait time is the actual time it took to resolve the buffer contention.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.58 gc buffer busy release

This event indicates that the requested buffer was globally busy in the cluster, because the requested buffer had been transferred away by a remote instance and needed to be requested again.

**Wait Time:** The wait time is the actual time it took to resolve the buffer contention.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.59 gc cr block 2-way

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and 2 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |

| Parameter     | Description                   |
|---------------|-------------------------------|
| <i>class#</i> | See " <a href="#">class</a> " |

### C.3.60 gc cr block 3-way

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and 3 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.61 gc cr block busy

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, but the request had to be put on hold at the serving instance.

This could happen when a dirty buffer had to be transferred, in which case REDO needs to be flushed before the Cache Fusion transfer could be processed. This could also happen if the requested buffer was being held by another process on the remote instance. The serving instance would transfer the requested buffer once the REDO flush is complete, or once the buffer is released by the holding process.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.62 gc cr block congested

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, but the request was queued at the serving instance for too long.

This could happen when the GCS server processes (LMS*n* and LM*nn*) are very busy due to having a high volume of incoming Cache Fusion requests. Increasing the GCS server processes (GCS\_SERVER\_PROCESSES) is usually the remedy to alleviate congestion for the GCS server processes.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

#### See Also:

"[GCS\\_SERVER\\_PROCESSES](#)"

### C.3.63 gc cr block direct read

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and the buffer was directly read from the remote cache utilizing the RDMA protocol.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.64 gc cr block lost

This event indicates that a Cache Fusion consistent read (CR) buffer request resulted in a potentially lost block. The request will be re-tried automatically.

This is typically caused by unreliable interconnect network protocols, usually when the network is congested and packets are dropped. It can also be the result of interconnect hardware errors or simply the result of an overloaded system, or a sign that a public network path is used for Cache Fusion instead of a private network.

**Wait Time:** The wait time is the actual time it took to detect the potentially lost block.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.65 gc cr grant read-mostly invalidation

The client is performing a DML on a read-mostly object, which requires a read lock invalidation on all other instances.

**Wait Time:** The wait time is the actual time it takes to complete the invalidation on all other instances.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.66 gc cr multi block grant

This event indicates that a client requested multiple consistent read (CR) buffers from another instance in the cluster, and the request resulted in multiple lock grants from the remote instance.

**Wait Time:** The wait time is the actual time waited for the multi-block request to complete.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.67 gc cr multi block mixed

This event indicates that a client requested multiple consistent read (CR) buffers from another instance in the cluster, and the remote instance returned a mixture of blocks and grants.

**Wait Time:** The wait time is the actual time waited for the multi-block request to complete.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.68 gc cr request

This event is used for ongoing Cache Fusion consistent read (CR) buffer requests. The event is renamed to reflect the actual outcome of the request (example: "gc cr block 2-way") upon completion of the wait. Therefore, these events will not be reported in AWR reports, but may appear in ASH data.

**Wait Time:** The wait time is the actual time waited for the request.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.69 gc current block 2-way

This event indicates that the requested current buffer was transferred from another instance in the cluster, and 2 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

### C.3.70 gc current block 3-way

This event indicates that the requested current buffer was transferred from another instance in the cluster, and 3 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

### C.3.71 gc current block busy

This event indicates that the requested current buffer was transferred from another instance in the cluster, but the request had to be put on hold at the serving instance.

This could happen when a dirty buffer had to be transferred, in which case REDO needs to be flushed before the Cache Fusion transfer could be processed. This could also happen if the requested buffer was being held by another process on the remote instance. The serving instance would transfer the requested buffer once the REDO flush is complete, or once the buffer is released by the holding process.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

## C.3.72 gc current block congested

This event indicates that the requested current buffer was transferred from another instance in the cluster, but the request was queued at the serving instance for too long.

This could happen when the GCS server processes (LMS) are very busy due to having a high volume of incoming Cache Fusion requests. Increasing the GCS server processes (`GCS_SERVER_PROCESSES`) is usually the remedy to alleviate congestion for the GCS server processes.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

**See Also:**

["GCS\\_SERVER\\_PROCESSES"](#)

## C.3.73 gc current block direct read

This event indicates that the requested current buffer was transferred from another instance in the cluster, and the buffer was directly read from the remote cache utilizing the RDMA protocol.

**Wait Time:** The wait time is the actual time it took to receive the requested buffer.

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

## C.3.74 gc current block lost

This event indicates that a Cache Fusion current buffer request resulted in a potentially lost block. The request will be re-tried automatically.

This is typically caused by unreliable interconnect network protocols, usually when the network is congested and packets are dropped. It can also be the result of interconnect hardware errors or simply the result of an overloaded system, or a sign that a public network path is used for Cache Fusion instead of a private network.

**Wait Time:** The wait time is the actual time it took to detect the potentially lost block.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

### C.3.75 gc current request

This event is used for ongoing Cache Fusion current buffer requests. The event is renamed to reflect the actual outcome of the request (example: "gc current block 2-way") upon completion of the wait. Therefore, these events will not be reported in AWR reports, but may appear in ASH data.

**Wait Time:** The wait time is the actual time waited for the request.

| Parameter     | Description                                           |
|---------------|-------------------------------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "                         |
| <i>block#</i> | See " <a href="#">block#</a> "                        |
| <i>id#</i>    | Block class and global access mode held and requested |

### C.3.76 inactive session

This event is used for switching and terminating sessions.

- Switching sessions
 

If a timeout period has been specified, then wait that amount of time for the session to be detached.
- Terminating sessions
 

From either `KILL SESSION` or internal request. Having posted a session that it should terminate itself, wait for up to 1 minute for the session to terminate.

**Wait Time:** 1 second

| Parameter       | Description                      |
|-----------------|----------------------------------|
| <i>session#</i> | See " <a href="#">session#</a> " |
| <i>waited</i>   | See " <a href="#">waited</a> "   |

### C.3.77 inactive transaction branch

The session waits for a transaction branch that is currently used by another session.

**Wait Time:** 1 second

| Parameter      | Description                                                           |
|----------------|-----------------------------------------------------------------------|
| <i>branch#</i> | The serial number of the transaction for which the session is waiting |
| <i>waited</i>  | See " <a href="#">waited</a> "                                        |

### C.3.78 index split completion

This event occurs when a transaction inserting a row into an index must wait for the end of an index block split being performed by another transaction. In an Oracle RAC database, some index split waits will use this wait event in lieu of the "enq: TX - index contention" wait event.

**Wait Time:** The wait time is the actual time waited for the split to complete.

| Parameter        | Description                                                         |
|------------------|---------------------------------------------------------------------|
| <i>undo seg#</i> | The rollback segment ID                                             |
| <i>slot#</i>     | The slot ID inside the rollback segment                             |
| <i>wrap#</i>     | The sequence number that is incremented for each transaction        |
| <i>count</i>     | The number of times that the session has waited on this transaction |

### C.3.79 instance state change

The session waits for SMON to enable or disable cache or transaction recovery. This usually happens during `ALTER DATABASE OPEN OR CLOSE`.

**Wait Time:** Wait time depends on the amount of time the action takes (that is, the amount of recovery needed)

| Parameter     | Description                                                                                                                                                           |
|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>layer</i>  | This value can be 1 or 2. If 1, it means that the transaction layer wants transaction recovery to be performed. If 2, it means that cache recovery will be performed. |
| <i>value</i>  | This value can be 0 (disable) or 1 (enable)                                                                                                                           |
| <i>waited</i> | The number of seconds waited so far                                                                                                                                   |

### C.3.80 io done

The session waits for an I/O to complete or it waits for a worker process to become available to submit the I/O request. This event occurs on platforms that do not support asynchronous I/O.

**Wait Time:** 50 milliseconds

| Parameter      | Description                  |
|----------------|------------------------------|
| <i>msg ptr</i> | A pointer to the I/O request |

### C.3.81 ksxr wait for mount shared

The cross instance broadcast facility of this Oracle instance is waiting for the database mount in shared mode to complete.

**Wait Time:** The time taken for the instance to mount. An indefinite wait on this event implies that the instance startup is hanging.

## C.3.82 ktm: instance recovery

The session waits for SMON to finish the instance, transaction recovery, or sort segment cleanup.

**Wait Time:** The wait time can vary and depends on the amount of recovery needed

| Parameter            | Description                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>undo segment#</i> | <p>If the value is 0, SMON is probably performing instance recovery. If P1 &gt; 0, use this query to find the undo segment:</p> <pre>select * from v\$rollstat where usn = undo segment#;</pre> |

## C.3.83 latch activity

This event is used as part of the process of determining whether a latch must be cleaned.

**Wait Time:** 0.05 to 0.1 seconds

| Parameter       | Description                                                                                                                                                                                  |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>address</i>  | The address of the latch that is being checked                                                                                                                                               |
| <i>number</i>   | <p>The latch number of the latch that has activity. To find more information on the latch, use the following SQL statement:</p> <pre>select * from v\$latchname where latch# = number;</pre> |
| <i>process#</i> | If this is 0, it is the first phase of the in-flux tests                                                                                                                                     |

### See Also:

*Oracle Database Performance Tuning Guide* for more information about latch wait events

## C.3.84 latch free

The process waits for a latch that is currently busy (held by another process).

**Wait Time:** The wait time increases exponentially and does not include spinning on the latch (active waiting). The maximum wait time also depends on the number of latches that the process is holding. There is an incremental wait of up to 2 seconds.

| Parameter      | Description                                               |
|----------------|-----------------------------------------------------------|
| <i>address</i> | The address of the latch for which the process is waiting |

| Parameter     | Description                                                                                                                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>number</i> | The latch number that indexes in the <code>V\$LATCHNAME</code> view. To find more information on the latch, use the following SQL statement:<br><br><pre>select * from v\$latchname where latch# = number;</pre> |
| <i>tries</i>  | A count of the number of times the process tried to get the latch (slow with spinning) and the process has to sleep                                                                                              |

 **See Also:**

*Oracle Database Performance Tuning Guide* for more information about latch wait events

### C.3.85 latch: redo copy

Redo copy latches are acquired by sessions in order to write changes into the redo log buffer and by the LGWR process to ensure that there are no current writers before it copies data from the buffer to the redo log.

### C.3.86 library cache load lock

The session tries to find the load lock for the database object so that it can load the object. The load lock is always obtained in Exclusive mode, so that no other process can load the same object. If the load lock is busy the session will wait on this event until the lock becomes available.

**Wait Time:** 3 seconds (1 second for PMON)

| Parameter             | Description                                                |
|-----------------------|------------------------------------------------------------|
| <i>object address</i> | Address of the object being loaded                         |
| <i>lock address</i>   | Address of load lock being used                            |
| <i>mask</i>           | Indicates which data pieces of the object that must loaded |

### C.3.87 library cache lock

This event controls the concurrency between clients of the library cache. It acquires a lock on the object handle so that either:

- One client can prevent other clients from accessing the same object
- The client can maintain a dependency for a long time (for example, no other client can change the object)

This lock is also obtained to locate an object in the library cache.

**Wait Time:** 3 seconds (1 second for PMON)

| Parameter             | Description                                                                                                     |
|-----------------------|-----------------------------------------------------------------------------------------------------------------|
| <i>handle address</i> | Address of the object being loaded                                                                              |
| <i>lock address</i>   | Address of the load lock being used. This is not the same thing as a latch or an enqueue, it is a State Object. |
| <i>mode</i>           | Indicates the data pieces of the object which must be loaded                                                    |
| <i>namespace</i>      | See " <a href="#">namespace</a> "                                                                               |

**See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

### C.3.88 library cache pin

This event manages library cache concurrency. Pinning an object causes the heaps to be loaded into memory. If a client wants to modify or examine the object, the client must acquire a pin after the lock.

**Wait Time:** 3 seconds (1 second for PMON)

| Parameter             | Description                                                                                                               |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------|
| <i>handle address</i> | Address of the object being loaded                                                                                        |
| <i>pin address</i>    | Address of the load lock being used. This is not the same thing as a latch or an enqueue, it is basically a State Object. |
| <i>mode</i>           | Indicates which data pieces of the object that must be loaded                                                             |
| <i>namespace</i>      | See " <a href="#">namespace</a> "                                                                                         |

**See Also:**

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

### C.3.89 library cache shutdown

The process shutting down the instance waits for sessions to complete before proceeding with library cache shutdown.

### C.3.90 library cache: mutex X

Library cache mutexes protect hash buckets within the shared pool. Each hash bucket contains a number of cursors. The mutex must be held in exclusive mode before any of the structures that it protects can be changed. This wait event is often associated with high parse activity.

### C.3.91 Log archive I/O

Used local archiving of online redo logs (for a production database) or standby redo logs (for a standby database). When the archiving process exhausts its I/O buffers because all of them are being used for on-going I/O's, the wait for an available I/O buffer is captured in this system wait event.

**Wait Time:** Depends on the speed of the disks

**Parameters:** None

### C.3.92 log buffer space

Waiting for space in the log buffer because the session is writing data into the log buffer faster than LGWR can write it out. Consider making the log buffer bigger if it is small, or moving the log files to faster disks such as striped disks.

**Wait Time:** Usually 1 second, but 5 seconds if it is waiting for a Switch Logfile to complete

**Parameters:** None

#### See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

### C.3.93 log file parallel write

Writing redo records to the redo log files from the log buffer.

**Wait Time:** Time it takes for the I/Os to complete. Even though redo records are written in parallel, the parallel write is not complete until the last I/O is on disk.

| Parameter       | Description                    |
|-----------------|--------------------------------|
| <i>files</i>    | Number of files to be written  |
| <i>blocks</i>   | Number of blocks to be written |
| <i>requests</i> | Number of I/O requests         |

 **See Also:**

*Oracle Database Performance Tuning Guide* for information about how this wait event can help identify I/O problems

### C.3.94 log file sequential read

Waiting for the read from this logfile to return. This is used to read redo records from the log file.

**Wait Time:** Time it takes to complete the physical I/O (read)

| Parameter     | Description                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------|
| <i>log#</i>   | The relative sequence number of the logfiles within a log group (used only when dumping the logfiles) |
| <i>block#</i> | See " <a href="#">block#</a> "                                                                        |
| <i>blocks</i> | The number of blocks to read                                                                          |

### C.3.95 log file single write

Waiting for the write to this logfile to complete. This event is used while updating the header of the logfile. It is signaled when adding a log file member and when incrementing sequence numbers.

**Wait Time:** Time it takes for the physical I/O (write) to complete

| Parameter     | Description                                                                   |
|---------------|-------------------------------------------------------------------------------|
| <i>log#</i>   | This is the number of the group/log to which the session is currently writing |
| <i>block#</i> | See " <a href="#">block#</a> "                                                |
| <i>blocks</i> | The number of blocks to write                                                 |

### C.3.96 log file switch (archiving needed)

Waiting for a log switch because the log that the LGWR will be switching into has not been archived yet. Check the alert log to ensure that archiving has not stopped due to a failed archive write. To speed archiving, consider adding more archive processes or putting the archive files on striped disks.

**Wait Time:** 1 second

**Parameters:** None

### C.3.97 log file switch (checkpoint incomplete)

Waiting for a log switch because the session cannot wrap into the next log. Wrapping cannot be performed because the checkpoint for that log has not completed.

**Wait Time:** 1 second

**Parameters:** None

### C.3.98 log file switch (clearing log file)

Waiting for a log switch because the log is being cleared due to a `CLEAR LOGFILE` command or implicit clear logfile executed by recovery.

**Wait Time:** 1 second

**Parameters:** None

### C.3.99 log file switch (private strand flush incomplete)

User sessions trying to generate redo, wait on this event when LGWR waits for DBWR to complete flushing redo from IMU buffers into the log buffer; when DBWR is complete LGWR can then finish writing the current log, and then switch log files.

**Wait Time:** 1 second

**Parameters:** None

### C.3.100 log file switch completion

Waiting for a log switch to complete.

**Wait Time:** 1 second

**Parameters:** None

### C.3.101 log file sync

When a user session commits, the session's redo information must be flushed to the redo logfile. The user session will post the LGWR to write the log buffer to the redo log file. When the LGWR has finished writing, it will post the user session.

**Wait Time:** The wait time includes the writing of the log buffer and the post.

| Parameter      | Description                                                                        |
|----------------|------------------------------------------------------------------------------------|
| <i>buffer#</i> | The number of the physical buffer in the redo log buffer that must be synchronized |

#### See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for information about potential causes of this wait event

## C.3.102 log switch/archive

Used as part of the `ALTER SYSTEM ARCHIVE LOG CHANGE scn` statement. The session waits for the current log from all open threads to be archived.

**Wait Time:** Wait for up to 10 seconds

| Parameter      | Description                                                                 |
|----------------|-----------------------------------------------------------------------------|
| <i>thread#</i> | The thread number of the thread that is currently archiving its current log |

## C.3.103 optimizer stats update retry

When concurrent sessions try to update optimizer statistics for the same object, all of them except the one that successfully acquired all necessary locks/pins on the library/row cache entries, wait on this wait event and then retry locking after a short period of time. In addition to explicit statistics gathering and maintenance operations using the `DBMS_STATS` package, Oracle database itself may try to update statistics for some objects, either on behalf of the user or for its own maintenance purposes.

**Wait Time:** 10 ms

**Parameters:** None

## C.3.104 parallel recovery change buffer free

The parallel recovery coordinator is waiting for a change mapping buffer to be released by one of the recovery workers.

**Wait Time:** 100ms

**Parameters:** None

## C.3.105 parallel recovery control message reply

The parallel recovery coordinator is waiting for all recovery workers to respond to a synchronous control message.

**Wait Time:** 100ms

**Parameters:** None

## C.3.106 parallel recovery coord send blocked

The parallel recovery coordinator cannot send a redo change message because the recovery worker is still actively applying redo that it has already received and has not yet released the channel.

**Wait Time:** 100ms

**Parameters:** None

### C.3.107 parallel recovery coord wait for reply

The parallel recovery coordinator is waiting for all recovery workers to exit.

**Wait Time:** 100ms

**Parameters:** None

### C.3.108 parallel recovery coordinator waits for slave cleanup

The parallel recovery coordinator is waiting for all recovery workers to exit gracefully.

**Wait Time:** 10ms

**Parameters:** None

### C.3.109 parallel recovery read buffer free

The parallel recovery coordinator is waiting for a log read buffer to be released by all recovery workers. Only after every recovery worker finishes applying redo from a log read buffer, can the buffer be used by the coordinator to issue the next log read.

**Wait Time:** 100ms

**Parameters:** None

### C.3.110 parallel recovery slave next change

A parallel recovery worker is idle and waiting for the next change message from the coordinator.

**Wait Time:** 100ms

**Parameters:** None

### C.3.111 pending global transaction(s)

This event should happen only during testing. The session waits for pending transactions to clear.

**Wait Time:** 30 seconds

| Parameter    | Description                                                                  |
|--------------|------------------------------------------------------------------------------|
| <i>scans</i> | Number of times the session has scanned the <code>PENDING_TRANS</code> table |

### C.3.112 pipe get

The session waits for a message to be received on the pipe or for the pipe timer to expire.

**Wait Time:** There is a 5 second wake up (check) and the pipe timer set by the user

| Parameter             | Description                                   |
|-----------------------|-----------------------------------------------|
| <i>handle address</i> | The library cache object handle for this pipe |
| <i>buffer length</i>  | The length of the buffer                      |
| <i>timeout</i>        | The pipe timer set by the user                |

 **See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.113 pipe put

The session waits for the pipe send timer to expire or for space to be made available in the pipe.

**Wait Time:** There is the 5 second wakeup (check) and the user-supplied timeout value

| Parameter             | Description                                                        |
|-----------------------|--------------------------------------------------------------------|
| <i>handle address</i> | The library cache object handle for this pipe                      |
| <i>record length</i>  | The length of the record or buffer that has been put into the pipe |
| <i>timeout</i>        | The pipe timer set by the user                                     |

### C.3.114 PL/SQL lock timer

This event is called through the `DBMS_LOCK.SLEEP` procedure. This event will most likely originate from procedures written by a user.

**Wait Time:** The wait time is in hundredths of seconds and depends on the user context

| Parameter       | Description                                                                        |
|-----------------|------------------------------------------------------------------------------------|
| <i>duration</i> | The duration that the user specified in the <code>DBMS_LOCK.SLEEP</code> procedure |

### C.3.115 pmon timer

This is the main wait event for PMON. When PMON is idle, it is waiting on this event.

**Wait Time:** Up to 3 seconds, if not posted before

| Parameter       | Description                                                |
|-----------------|------------------------------------------------------------|
| <i>duration</i> | The actual amount of time that the PMON is trying to sleep |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.116 prior spawner clean up

When a prior process has died while spawning a background, the current process which is trying to spawn new a background must wait until the prior process state is cleaned up.

**Wait Time:** Usually 3 - 10 seconds

| Parameter          | Description                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------|
| <i>process_pid</i> | process identifier (see <code>V\$PROCESS.PID</code> ) of the process whose state must be cleaned up.        |
| <i>process_sno</i> | process serial number (see <code>V\$PROCESS.SERIAL#</code> ) of the process whose state must be cleaned up. |

### C.3.117 process startup

Wait for a shared server, Dispatcher, or other background process to start.

**Wait Time:** Wait up to 1 second for a background process to start. If timed out, then re-wait until 5 minutes have passed and signal an error. If the process has started, the event will acknowledge this.

| Parameter       | Description                                     |
|-----------------|-------------------------------------------------|
| <i>type</i>     | The process type that was started               |
| <i>process#</i> | The process number of the process being started |
| <i>waited</i>   | Cumulative time waited for the process to start |

### C.3.118 PX Deque wait

The process is waiting for a message during a parallel execute.

**Wait Time:** The wait time depends on how quickly the message arrives. Wait times can vary, but it will normally be a short period of time.

| Parameter        | Description                                          |
|------------------|------------------------------------------------------|
| <i>reason</i>    | The reason for dequeuing                             |
| <i>sleeptime</i> | The amount of time that the session slept            |
| <i>loop</i>      | The total number of times that the session has slept |

### C.3.119 PX qref latch

Each parallel execution process has a parallel execution qref latch, which must be acquired before the queue buffers can be manipulated.

**Wait Time:** Wait up to 1 second

| Parameter        | Description                                                           |
|------------------|-----------------------------------------------------------------------|
| <i>function</i>  | Indicates the type of wait that the session is doing                  |
| <i>sleeptime</i> | The amount of time that the session waits (in hundredths of a second) |
| <i>qref</i>      | The address of the process queue for which the session is waiting     |

### C.3.120 PX server shutdown

During normal or immediate shutdown the parallel execution servers are posted to shutdown cleanly. If any parallel execution servers are still running after 10 seconds, they are terminated.

**Wait Time:** Wait up to 0.5 seconds

| Parameter        | Description                                                         |
|------------------|---------------------------------------------------------------------|
| <i>nalive</i>    | The number of parallel execution servers that are still running     |
| <i>sleeptime</i> | The total sleeptime since the session started to wait on this event |
| <i>loop</i>      | The number of times the session waited for this event               |

### C.3.121 PX signal server

This event occurs only in Exclusive mode. The query coordinator is signaling the Query Workers that an error has occurred.

**Wait Time:** 0.5 seconds

| Parameter     | Description                                        |
|---------------|----------------------------------------------------|
| <i>serial</i> | The serial number of the worker process queue      |
| <i>error</i>  | The error that has occurred                        |
| <i>nbusy</i>  | The number of worker processes that are still busy |

### C.3.122 rdbms ipc message

The background processes (LGWR, DBWR, LMSO) use this event to indicate that they are idle and are waiting for the foreground processes to send them an IPC message to do some work.

**Wait Time:** Up to 3 seconds. The parameter *timeout* shows the true sleep time.

| Parameter      | Description                                                  |
|----------------|--------------------------------------------------------------|
| <i>timeout</i> | The amount of time that the session waits for an IPC message |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.123 rdbms ipc message block

This event indicates that all message blocks are in use and that the session had to wait for a message block to become available.

**Wait Time:** Wait up to 60 seconds

**Parameters:** None

### C.3.124 rdbms ipc reply

This event is used to wait for a reply from one of the background processes.

**Wait Time:** The wait time is specified by the user and is indicated by the parameter *timeout*.

| Parameter           | Description                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------|
| <i>from_process</i> | The background process for which the session is waiting. The wait is for a reply to an IPC message sent by the session. |
| <i>timeout</i>      | The amount of time in seconds that this process will wait for a reply                                                   |

### C.3.125 read by other session

This event occurs when a session requests a buffer that is currently being read into the buffer cache by another session. Prior to release 10.1, waits for this event were grouped with the other reasons for waiting for buffers under the 'buffer busy waits' event.

**Wait Time:** Time waited for the buffer to be read by the other session (in microseconds)

| Parameter     | Description                    |
|---------------|--------------------------------|
| <i>file#</i>  | See " <a href="#">file#</a> "  |
| <i>block#</i> | See " <a href="#">block#</a> " |
| <i>class#</i> | See " <a href="#">class</a> "  |

### C.3.126 recovery active instance mapping setup

This event is used to track the time taken (in centiseconds) to set up recovery context on remote instances.

### C.3.127 recovery apply pending

This event tracks the time the logmerger process waited (in centiseconds) for apply workers to apply all pending changes up to a certain SCN.

### C.3.128 recovery cancel

This wait event is used to track the time taken (in centiseconds) to cancel multi instance media recovery.

### C.3.129 recovery checkpoint

This wait event tracks the time (in centiseconds) spent waiting for DBWR processes on all instances to write dirty buffers to disk up to a certain SCN.

### C.3.130 recovery file header update for checkpoint

This wait event tracks the time (in centiseconds) spent by MRP0 process waiting on logmerger to update file headers to record the latest checkpoint.

### C.3.131 recovery file header update for fuzziness

This wait event tracks the time taken (in centiseconds) to update file headers to record media recovery fuzziness.

### C.3.132 recovery marker apply

This wait event is used to track the time (in centiseconds) taken to process a recovery marker.

### C.3.133 recovery merge pending

This wait event is used to track the time spent (in centiseconds) by the MRP0 process waiting for remote logmergers to merge changes up to a certain SCN.

### C.3.134 recovery metadata latch

This wait event tracks the time taken (in centiseconds) to get the active DataGuard metadata update latch to advance a query SCN.

### C.3.135 recovery move influx buffers

This wait event is used to track the time spent (in centiseconds) waiting for all apply workers to move their influx buffers to the dirty queue.

### C.3.136 recovery read

A parallel recovery worker (or serial recovery process) is waiting for a batch of data block reads to complete.

**Wait Time:** Time it takes to complete the physical I/O (read)

**Parameters:** None

### C.3.137 recovery receive buffer free

This wait event is used to track the time (in centiseconds) spent by the receiver process on instance waiting for apply workers to apply changes from received buffers so that they can be freed for the next change.

### C.3.138 recovery remote file verification

This wait event tracks the time spent (in centiseconds) by the MRP0 process waiting for remote logmergers to finish file verification on remote instances.

### C.3.139 recovery send buffer free

This wait event is used to track the time spent (in centiseconds) by the sender process waiting for apply workers to apply changes from the local instance so that the buffer can be reused for new changes.

### C.3.140 recovery shutdown

This wait event is used to track the time (in centiseconds) taken for remote logmergers to shut down.

### C.3.141 Redo Transport Attach

Used to track the time spent (in centiseconds) doing Connect, Logon, and RFSATTACH for *any* network process.

 **See Also:**

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

## C.3.142 Redo Transport Close

Used to track the time spent (in centiseconds) by *ARCn*, *NSSn*, and *TTnn* processes doing *RFSCLOSE* and *RFSRGSTR* operations.

 **See Also:**

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

## C.3.143 Redo Transport Detach

Used to track the time spent (in centiseconds) doing *RFSDETACH* and *Disconnect* for *any* network process.

 **See Also:**

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

## C.3.144 Redo Transport Open

Used to track the time spent (in centiseconds) by *ARCn*, *NSSn*, and *TTnn* background processes doing *RFSCREAT* and *RFSANNCE* operations.

 **See Also:**

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

## C.3.145 Redo Transport Ping

Used to track the time spent (in centiseconds) by *ARCn* background processes doing *RFSPING* operations.

 **See Also:**

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

### C.3.146 Redo Transport Slave Startup

Used to track the time spent (in centiseconds) by LGWR doing NSSn and TTnn process startup and initialization.

### C.3.147 Redo Writer Remote Sync Complete

Used to track the time spent (in centiseconds) by LGWR reaping completed network writes to remote destinations.

### C.3.148 Redo Writer Remote Sync Notify

Used to track the time spent (in centiseconds) by LGWR issuing network writes to remote destinations.

### C.3.149 resmgr:become active

The session is waiting for a resource manager active session slot. This event occurs when the resource manager is enabled and the number of active sessions in the session's current consumer group exceeds the current resource plan's active session limit for the consumer group. To reduce the occurrence of this wait event, increase the active session limit for the session's current consumer group.

**Wait Time:** The time the session waited to be allocated an active session slot

| Parameter       | Description          |
|-----------------|----------------------|
| <i>location</i> | location of the wait |

### C.3.150 resmgr:cpu quantum

The session is waiting to be allocated a quantum of CPU. This event occurs when the resource manager is enabled and is throttling CPU consumption. To reduce the occurrence of this wait event, increase the CPU allocation for the sessions's current consumer group.

**Wait Time:** The time the session waited to acquire a CPU quantum

| Parameter                | Description                                                                                                                     |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| <i>location</i>          | Location of the wait                                                                                                            |
| <i>Consumer Group ID</i> | Consumer group ID of the session waiting. This value is from the CONSUMER_GROUP_ID column in the DBA_RSRC_CONSUMER_GROUPS view. |

#### See Also:

["DBA\\_RSRC\\_CONSUMER\\_GROUPS"](#)

### C.3.151 resmgr: I/O rate limit

The session is waiting for I/O bandwidth to be available to issue I/Os. This event occurs when PDB I/O rate limits are enabled by setting the `MAX_IOPS` and/or `MAX_MBPS` parameters.

To reduce the occurrence of this wait event, the PDB I/O rate limit values need to be increased. This can be achieved by increasing the values of `MAX_IOPS` and `MAX_MBPS` or by removing the limits altogether by setting the parameter value to 0.

**Wait Time:** The time the session waited for the I/O bandwidth to become available.

| Parameter         | Description                                                                                                                                |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <i>P1: PDB_ID</i> | This the PDB ID of the PDB that has its I/O throttled because the <code>MAX_IOPS</code> or <code>MAX_MBPS</code> parameter was set for it. |

#### See Also:

- ["MAX\\_IOPS"](#)
- ["MAX\\_MBPS"](#)

### C.3.152 resmgr:pq queued

The session is waiting in the parallel statement queue.

**Wait Time:** The time the session waited for sufficient parallel query processes to become available to run this session with the requested degree of parallelism

| Parameter       | Description          |
|-----------------|----------------------|
| <i>location</i> | Location of the wait |

#### See Also:

*Oracle Database VLDB and Partitioning Guide* for more information about this wait event

### C.3.153 rolling migration: cluster quiesce

This is the wait event that instances wait on when cluster is about to start a rolling migration. The instances are waiting for any privileged operations that blocks rolling migration to complete before allowing rolling migration.

**Wait Time:** 1 second

| Parameter       | Description                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>location</i> | Its value will be 1 if the wait is for completion of the privileged operations so that a rolling upgrade/downgrade can start. Its value will be 2 if the wait is for completion of the rolling upgrade/downgrade on all the nodes in the cluster. |
| <i>waits</i>    | The number of seconds spent waiting at the current location.                                                                                                                                                                                      |

### C.3.154 row cache lock

The session is trying to get a data dictionary lock.

**Wait Time:** Wait up to 60 seconds.

| Parameter       | Description                                     |
|-----------------|-------------------------------------------------|
| <i>cache id</i> | The CACHE# column value in the V\$ROWCACHE view |
| <i>mode</i>     | See " <a href="#">mode</a> "                    |
| <i>request</i>  | The pipe timer set by the user                  |

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.155 RVWR wait for flashback copy

Waits for a process to copy flashback database data into the flashback buffer, in order to write out the requested flashback data.

**Wait Time:** 10 milliseconds

| Parameter           | Description                                           |
|---------------------|-------------------------------------------------------|
| <i>copy latch #</i> | The number of flashback copy latch RVWR is waiting on |

### C.3.156 sbtbufinfo

This function is called when Oracle needs to discover the size, and number, of I/O buffers that have been allocated by the SBT layer. It should be very fast and never block.

**Wait Time:** Less than one millisecond

**Parameters:** None

### C.3.157 sbtgetbuf

This function obtains one I/O buffer that Oracle will use for I/O during a backup job.

**Wait Time:** Less than one millisecond

**Parameters:** None

### C.3.158 sbtmapbuf

This is an internal function used to facilitate multi-process buffer management. It should be very fast and never block.

**Wait Time:** Less than one millisecond

**Parameters:** None

### C.3.159 sbtrelbuf

This function releases an I/O buffer that has been already processed during a restore job, so that the SBT layer can fill it with more data. It should be very fast and never block.

**Wait Time:** Less than one millisecond

**Parameters:** None

### C.3.160 scging AST call

Called by the session to find the highest lock mode that is held on a resource.

**Wait Time:** Wait up to 0.2 seconds, but the wait will continue until the NULL mode Acquisition AST has fired.

**Parameters:** None

### C.3.161 SGA: allocation forcing component growth

Process waiting on an immediate mode memory transfer with auto-tune SGA after a 4031 for MMAN to get the memory and post it.

**Wait Time:** 10 msec

**Parameters:** None

### C.3.162 SGA: MMAN sleep for component shrink

MMAN to wait and post itself for satisfying an auto-tuned memory request while trying to fully free a component's quiesced granules. In Release 10.1, the name of this event was 'wait for SGA component shrink'.

**Wait Time:** 10 msec

| Parameter | Description                                     |
|-----------|-------------------------------------------------|
| <i>P1</i> | component_id (corresponding to the memory pool) |
| <i>P2</i> | Current size in granules                        |
| <i>P3</i> | Target size in granules                         |

### C.3.163 SGA: sga\_target resize

Memory resize requests wait while sga target is being resized. In Release 10.1, the name of this event was 'wait for sga\_target resize'.

**Wait Time:** 10 msec

**Parameters:** None

### C.3.164 Shared IO Pool Memory

Wait until a shared I/O pool buffer becomes available. This happens when processes are using these buffers for I/O and the current process needs to wait for the release of any one of the buffers to the shared I/O pool.

**Wait Time:** 10msec

**Parameters:** None

### C.3.165 shared server idle wait

Idle wait event for a shared server.

The server waits on the common queue for a virtual circuit. (See also "[virtual circuit wait](#)".)

**Wait Time:** 30 seconds

**Parameters:** None

#### See Also:

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.166 single-task message

When running single task, this event indicates that the session waits for the client side of the executable.

**Wait Time:** Total elapsed time that this session spent in the user application

**Parameters:** None

### C.3.167 smon timer

This is the main idle event for SMON. SMON will be waiting on this event most of the time until it times out or is posted by another process.

**Wait Time:** 5 minutes (300 seconds)

| Parameter        | Description                                                         |
|------------------|---------------------------------------------------------------------|
| <i>sleeptime</i> | The amount of time that SMON tries to wait on this event in seconds |
| <i>failed</i>    | The number of times SMON was posted when there some kind of error   |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.168 SQL\*Net break/reset to client

The server sends a break or reset message to the client. The session running on the server waits for a reply from the client.

**Wait Time:** The actual time it takes for the break or reset message to return from the client

| Parameter        | Description                       |
|------------------|-----------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> " |
| <i>break?</i>    | See " <a href="#">break?</a> "    |

### C.3.169 SQL\*Net break/reset to dblink

Same as **SQL\*Net break/reset to client**, but in this case, the break/reset message is sent to another server process over a database link.

**Wait Time:** The actual time it takes for the break or reset message to return from the other server process

| Parameter        | Description                       |
|------------------|-----------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> " |
| <i>break?</i>    | See " <a href="#">break?</a> "    |

### C.3.170 SQL\*Net message from client

The server process (foreground process) waits for a message from the client process to arrive.

**Wait Time:** The time it took for a message to arrive from the client since the last message was sent to the client

| Parameter        | Description                                                                      |
|------------------|----------------------------------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                                                |
| <i>#bytes</i>    | The number of bytes received by the server (foreground process) from the client. |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.171 SQL\*Net message from dblink

The session waits while the server process (foreground process) receives messages over a database link from another server process.

**Wait Time:** The time it took for a message to arrive from another server (foreground process) since a message was sent to the other foreground process.

| Parameter        | Description                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                                                                                     |
| <i>#bytes</i>    | The number of bytes received by the server (foreground process) from another foreground process over a database link. |

**See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.172 SQL\*Net message to client

The server (foreground process) is sending a message to the client.

**Wait Time:** The actual time the **send** takes

| Parameter        | Description                                                  |
|------------------|--------------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                            |
| <i>#bytes</i>    | The number of bytes sent by the server process to the client |

### C.3.173 SQL\*Net message to dblink

The server process (foreground process) is sending a message over a database link to another server process.

**Wait Time:** The actual time the **send** takes

| Parameter        | Description                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                                                             |
| <i>#bytes</i>    | The number of bytes sent by the server process to another server process over a database link |

 **See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.174 SQL\*Net more data from client

The server is waiting on the client to send more data to its client shadow process, in an already initiated operation.

**Wait Time:** The time waited depends on the time it took to receive the data (including the waiting time)

| Parameter        | Description                                  |
|------------------|----------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "            |
| <i>#bytes</i>    | The number of bytes received from the client |

### C.3.175 SQL\*Net more data from dblink

The foreground process is expecting more data from a data base link.

**Wait Time:** The total time it takes to read the data from the database link (including the waiting time for the data to arrive)

| Parameter        | Description                       |
|------------------|-----------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> " |
| <i>#bytes</i>    | The number of bytes received      |

### C.3.176 SQL\*Net more data to client

The server process is sending more data/messages to the client. The previous operation to the client was also a **send**.

**Wait Time:** The actual time it took for the **send** to complete

| Parameter        | Description                                           |
|------------------|-------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                     |
| <i>#bytes</i>    | The number of bytes that are being sent to the client |

 **See Also:**

*Oracle Database Performance Tuning Guide* for more information about this wait event

### C.3.177 SQL\*Net more data to dblink

The event indicates that the server is sending data over a database link again. The previous operation over this database link was also a **send**.

**Wait Time:** The actual time it takes to send the data to the other server

| Parameter        | Description                                                                          |
|------------------|--------------------------------------------------------------------------------------|
| <i>driver id</i> | See " <a href="#">driver id</a> "                                                    |
| <i>#bytes</i>    | The number of bytes that are sent over the database link to the other server process |

### C.3.178 Streams AQ: waiting for messages in the queue

The session is waiting on an empty OLTP queue (Advanced Queuing) for a message to arrive so that the session can dequeue that message.

**Wait Time:** The amount of time that the session wants to wait is determined by the parameter *wait time*

| Parameter        | Description                                                  |
|------------------|--------------------------------------------------------------|
| <i>queue id</i>  | The ID of the OLTP queue for which this session is waiting   |
| <i>process#</i>  | The process number of the process in which this session runs |
| <i>wait time</i> | The intended wait time for this session                      |

### C.3.179 switch logfile command

The session waits on the user command `SWITCH LOGFILE` to complete.

**Wait Time:** 5 seconds

**Parameters:** None

### C.3.180 SYNC Remote Write

Used to track the time spent by LGWR doing SYNC RFSWRITE operations.

**See Also:**

*Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

### C.3.181 TCP Socket (KGAS)

A session is waiting for an external host to provide requested data over a network socket. The time that this wait event tracks does not indicate a problem, and even a long wait time is not a reason to contact Oracle Support. It naturally takes time for data to flow between hosts

over a network, and for the remote aspect of an application to process any request made to it.

An application that communicates with a remote host must wait until the data it will read has arrived. In addition, on Microsoft Windows, a separate thread monitors the arrival of traffic. This thread spends most of its life in waits tracked by the TCP Socket (KGAS) wait event.

**Wait Time:** The total elapsed time for the network connection to be established or for data to arrive from over the network

| Parameter | Description                                                                                                                                                    |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>P0</i> | For Oracle internal use only. Values 8, 9, and 10 occur within the special thread present on Microsoft Windows; other P0 values occur in normal user sessions. |
| <i>P1</i> | For Oracle internal use only                                                                                                                                   |

### C.3.182 timer in sksawat

The session waits for the Archiver (ARC*n*) asynchronous I/O to complete.

**Wait Time:** 0.01 seconds

**Parameters:** None

### C.3.183 transaction

Wait for a blocking transaction to be rolled back. Continue waiting until the transaction has been rolled back.

**Wait Time:** 1 second

| Parameter        | Description                                                         |
|------------------|---------------------------------------------------------------------|
| <i>undo seg#</i> | The rollback segment ID                                             |
| <i>slot#</i>     | The slot ID inside the rollback segment                             |
| <i>wrap#</i>     | The sequence number that is incremented for each transaction        |
| <i>count</i>     | The number of times that the session has waited on this transaction |

### C.3.184 unbound tx

The session waits to see if there are any transactions that have been started but do not have a Rollback Segment associated with them.

**Wait Time:** 1 second

**Parameters:** None

### C.3.185 undo\_retention publish retry

This wait can occur for two reasons. A session issuing an `ALTER SYSTEM SET UNDO_RETENTION` may wait on this event wait while a cluster reconfiguration takes

place. Or the background process MMNL may wait for cluster reconfiguration while attempting to determine the max UNDO\_RETENTION.

**Wait time:** 1 second

| Parameter | Description                                                                                                                                                                           |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>P1</i> | Identifies where the retry is happening. Id = 1 retry while publishing into the max undo_retention namespace. Id = 2 retry while iterator accessing the max undo_retention namespace. |
| <i>P2</i> | Retry count (maximum number of retries is 5)                                                                                                                                          |

### C.3.186 undo segment extension

The undo segment is being extended or shrunk. The session must wait until the operation on the undo segment has finished.

**Wait Time:** 0.01 seconds

| Parameter       | Description                                                     |
|-----------------|-----------------------------------------------------------------|
| <i>segment#</i> | The ID of the rollback segment that is being extended or shrunk |

### C.3.187 undo segment recovery

PMON is rolling back a terminated transaction. The wait continues until rollback finishes.

**Wait Time:** 3 seconds

| Parameter       | Description                                                                            |
|-----------------|----------------------------------------------------------------------------------------|
| <i>segment#</i> | The ID of the rollback segment that contains the transaction that is being rolled back |
| <i>tx flags</i> | The transaction flags (options) set for the transaction that is being rolled back      |

### C.3.188 undo segment tx slot

Wait for a transaction slot to become available within the selected rollback segment. Continue waiting until the slot is available.

**Wait Time:** 1 second

| Parameter       | Description                                                                            |
|-----------------|----------------------------------------------------------------------------------------|
| <i>segment#</i> | The ID of the rollback segment that contains the transaction that is being rolled back |

### C.3.189 utl\_file I/O

Waits associated with operations performed using the UTL\_FILE package.

### C.3.190 virtual circuit wait

The session waits for a virtual circuit operation to complete.

**Wait Time:** 30 seconds

| Parameter       | Description                                                |
|-----------------|------------------------------------------------------------|
| <i>circuit#</i> | Indicates the virtual circuit# being waited on             |
| <i>type</i>     | Indicates the type of operation the session is waiting for |

### C.3.191 WCR: replay client notify

During replay, the Workload Replay Client always keeps an open connection to the database to detect some special errors. This session will normally be in the wait state until some specific replay-related exception occurs.

**Wait Time:** Waits until notified. Times out every 30 seconds.

| Parameter       | Description                                                                                                                                                                              |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>who am I</i> | Identifies the reason for wait for the admin thread.<br>1 - waiting for REPLAY.START() to be issued.<br>2 - waiting for the replay to run to completion or REPLAY.CANCEL() to be issued. |

### C.3.192 WCR: replay clock

A session will wait on this event during replay if it has some logical dependencies on another session that has not yet committed its work.

**Wait Time:** Depends upon the amount of row lock contention in the original capture

| Parameter                        | Description                                                          |
|----------------------------------|----------------------------------------------------------------------|
| <i>wait for scn's hi 4 bytes</i> | High 4 bytes of the 8-byte replay SCN that the session is waiting on |
| <i>wait for scn's lo 4 bytes</i> | Low 4 bytes of the 8-byte replay SCN that the session is waiting on  |

### C.3.193 WCR: replay lock order

A session will wait on this event during replay if it saw some lock contention during capture.

**Wait Time:** Depends upon the amount of row lock contention in the original capture

| Parameter                        | Description                                                          |
|----------------------------------|----------------------------------------------------------------------|
| <i>wait for scn's hi 4 bytes</i> | High 4 bytes of the 8-byte replay SCN that the session is waiting on |

| Parameter                        | Description                                                         |
|----------------------------------|---------------------------------------------------------------------|
| <i>wait for scn's lo 4 bytes</i> | Low 4 bytes of the 8-byte replay SCN that the session is waiting on |

### C.3.194 WCR: replay paused

When the user issues a `DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY` command, all the replayed sessions are waiting on this wait event until replay is resumed.

**Parameters:** None

### C.3.195 WCR: Sync context busy

In the default replay mode, commits during replay are synchronized to follow the same order as capture. All commits are serialized using the Sync context. A replayed session will wait on this event if it is trying to commit at the same time as another replayed session.

**Parameters:** None

### C.3.196 write complete waits

The session waits for a buffer to be written. The write is caused by normal aging or by a cross-instance call.

**Wait Time:** 1 second

| Parameter     | Description                                                                       |
|---------------|-----------------------------------------------------------------------------------|
| <i>file#</i>  | The rollback segment id that contains the transaction that is being rolled back   |
| <i>block#</i> | The transaction flags (options) set for the transaction that is being rolled back |
| <i>id</i>     | Identifies the reason for waiting                                                 |

# D

## Oracle Enqueue Names

This appendix lists Oracle enqueues. **Enqueues** are shared memory structures (locks) that serialize access to database resources. They can be associated with a session or transaction. Enqueue names are displayed in the `LOCK_TYPE` column of the `DBA_LOCK` and `DBA_LOCK_INTERNAL` data dictionary views.

A **resource** uniquely identifies an object that can be locked by different sessions within an instance (local resource) or between instances (global resource). Each session that tries to lock the resource will have an **enqueue** on the resource.

### Note:

The names of enqueues and their definitions may change from release to release.

### See Also:

["DBA\\_LOCK\\_INTERNAL"](#) and ["DBA\\_LOCK"](#)

The Oracle enqueues are:

- BL, Buffer Cache Management
- BR, Backup/Restore
- CF, Controlfile Transaction
- CI, Cross-instance Call Invocation
- CU, Bind Enqueue
- DF, Datafile
- DL, Direct Loader Index Creation
- DM, Database Mount
- DR, Distributed Recovery Process
- DW, SecureFiles
- DX, Distributed Transaction
- FP, File Object
- FS, File Set
- HW, High-Water Lock
- IN, Instance Number
- IR, Instance Recovery
- IS, Instance State

- IV, Library Cache Invalidation
- JI, Enqueue used during AJV snapshot refresh
- JQ, Job Queue
- KK, Redo Log "Kick"
- KP, contention in Oracle Data Pump startup and shutdown processes
- KO, Multiple Object Checkpoint
- L[A-P], Library Cache Lock
- LS, Log Start or Switch
- MM, Mount Definition
- MR, Media Recovery
- N[A-Z], Library Cache Pin
- PE, ALTER SYSTEM SET PARAMETER = VALUE
- PF, Password File
- PI, Parallel Slaves
- PR, Process Startup
- PS, Parallel Slave Synchronization
- Q[A-Z], Row Cache
- RO, Object Reuse
- RT, Redo Thread
- RW, Row Wait
- SC, System Change Number
- SM, SMON
- SN, Sequence Number
- SQ, Sequence Number Enqueue
- SR, Synchronized Replication
- SS, Sort Segment
- ST, Space Management Transaction
- SV, Sequence Number Value
- TA, Transaction Recovery
- TC, Thread Checkpoint
- TE, Extend Table
- TM, DML Enqueue
- TO, Temporary Table Object Enqueue
- TS, Temporary Segment (also TableSpace)
- TT, Temporary Table
- TX, Transaction
- UL, User-defined Locks

- UN, User Name
- US, Undo Segment, Serialization
- WL, Being Written Redo Log
- XA, Instance Attribute Lock
- XI, Instance Registration Lock
- ZA, Exclusive Lock When Moving Audit Table

## Statistics Descriptions

This appendix describes the statistics stored in the `V$SESSTAT` and `V$SYSSTAT` dynamic performance tables. These statistics are useful in identifying and correcting performance problems.

This appendix contains the following topics:

- [Displaying Statistics](#)
- [Statistics Descriptions](#)

### E.1 Displaying Statistics

The `V$SESSTAT` view displays statistics on a per-session basis and is valid only for the session currently connected. When a session disconnects, all statistics for the session are updated in `V$SYSSTAT`. The values for the statistics are cleared until the next session uses them.

The `V$STATNAME` view contains all of the statistics for an Oracle release.

Many of these statistics are tied to the internal implementation of Oracle and therefore are subject to change or deletion without notice, even between patch releases. Application developers should be aware of this and write their code to tolerate missing or extra statistics.

#### See Also:

"`V$SESSTAT`", "`V$STATNAME`", and "`V$SYSSTAT`" for more information on these views

### E.2 Statistics Descriptions

This section describes some of the statistics stored in the `V$SESSTAT` and `V$SYSSTAT` views. The statistics are listed in alphabetical order.

The `CLASS` column contains a number representing one or more statistics classes. The following class numbers are additive:

- 1, User
- 2, Redo
- 4, Enqueue
- 8, Cache
- 16, OS
- 32, Real Application Clusters
- 64, SQL
- 128, Debug

- 256, Instance level

For example, a class value of 72 represents a statistic that relates to SQL statements and caching.

Some statistics are populated only if the `TIMED_STATISTICS` initialization parameter is set to `true`. Those statistics are flagged with a `Y` in the right-hand column.

**Table E-1 Database Statistics Descriptions**

| Name                                   | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | TIMED_STATISTICS |
|----------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| application wait time                  | 1     | The total wait time (in centiseconds) for waits that belong to the Application wait class                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                  |
| background checkpoints completed       | 8     | Number of checkpoints completed by the background process. This statistic is incremented when the background process successfully advances the thread checkpoint.                                                                                                                                                                                                                                                                                                                                                                                                                     |                  |
| background checkpoints started         | 8     | Number of checkpoints started by the background process. This statistic can be larger than "background checkpoints completed" if a new checkpoint overrides an incomplete checkpoint or if a checkpoint is currently under way. This statistic includes only checkpoints of the redo thread. It does not include: <ul style="list-style-type: none"> <li>• Individual file checkpoints for operations such as offline or begin backup</li> <li>• Foreground (user-requested) checkpoints (for example, performed by <code>ALTER SYSTEM CHECKPOINT LOCAL</code> statements)</li> </ul> |                  |
| background timeouts                    | 128   | This is a count of the times where a background process has set an alarm for itself and the alarm has timed out rather than the background process being posted by another process to do some work.                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| branch node splits                     | 128   | Number of times an index branch block was split because of the insertion of an additional value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                  |
| buffer is not pinned count             | 72    | Number of times a buffer was free when visited. Useful only for internal debugging purposes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| buffer is pinned count                 | 72    | Number of times a buffer was pinned when visited. Useful only for internal debugging purposes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                  |
| bytes received via SQL*Net from client | 1     | Total number of bytes received from the client over Oracle Net Services                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| bytes received via SQL*Net from dblink | 1     | Total number of bytes received from a database link over Oracle Net Services                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| bytes sent via SQL*Net to client       | 1     | Total number of bytes sent to the client from the foreground processes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |

| cell physical IO bytes saved by storage index                   | 8     | Number of bytes saved by the storage index                                                                                                                                               |                  |
| cell physical IO bytes saved during optimized file creation     | 64    | Number of I/O bytes saved by the database host by offloading the file creation operation to the cells<br>This statistic shows the benefit of optimized file creation operations.         |                  |
| cell physical IO bytes saved during optimized RMAN file restore | 64    | Number of I/O bytes saved by the database host by offloading the RMAN file restore operation to the cells<br>This statistic shows the benefit of optimized RMAN file restore operations. |                  |
| cell physical IO bytes sent directly to DB node to balance CPU  | 64    | Number of I/O bytes sent back to the database server for processing due to high storage server CPU usage                                                                                 |                  |
| cell physical IO interconnect bytes                             | 64    | Number of I/O bytes exchanged over the interconnect between the database host and the cells                                                                                              |                  |
| cell physical IO interconnect bytes returned by smart scan      | 64    | Number of I/O bytes that are returned by the cell for Smart Scan operations<br>This value does not include bytes for other database I/O.                                                 |                  |
| cell pmem cache read hits                                       | 8     | Number of non-RDMA read requests processed by <code>cellsrv</code> resulting in a PMEM cache hit                                                                                         |                  |
| cell pmem cache writes                                          | 264   | Number of non-RDMA write requests processed by <code>cellsrv</code> resulting in a PMEM cache write                                                                                      |                  |
| cell pmem log writes                                            | 258   | Number of redo log write requests that used PMEM log                                                                                                                                     |                  |
| cell ram cache read hits                                        | 8     | Number of read requests that hit the RAM cache on the cell                                                                                                                               |                  |
| cell RDMA reads                                                 | 8     | Number of PMEM cache read requests using RDMA                                                                                                                                            |                  |
| cell RDMA writes                                                | 264   | Number of PMEM cache write requests using RDMA                                                                                                                                           |                  |
| cell writes to flash cache                                      | 8     | Total number of write requests written entirely to Exadata Smart Flash Cache<br>This statistic is incremented once per mirror write.                                                     |                  |
| cell writes to flash cache for temp IO                          | 8     | Number of write requests for temporary segments that were absorbed by Exadata Smart Flash Cache                                                                                          |                  |
| change write time                                               | 8     | Elapsed redo write time for changes made to <code>CURRENT</code> blocks in 10s of milliseconds.                                                                                          | Y                |
| cleanouts and rollbacks - consistent read gets                  | 128   | Number of consistent gets that require both block rollbacks and block cleanouts.<br><b>See Also:</b> " <a href="#">consistent gets</a> "                                                 |                  |
| cleanouts only - consistent read gets                           | 128   | Number of consistent gets that require only block cleanouts, no rollbacks.<br><b>See Also:</b> " <a href="#">consistent gets</a> "                                                       |                  |
| cluster key scan block gets                                     | 64    | Number of blocks obtained in a cluster scan                                                                                                                                              |                  |
| cluster key scans                                               | 64    | Number of cluster scans that were started                                                                                                                                                |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                             | Class | Description                                                                                                                                                            | TIMED_STATISTICS |
|--------------------------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| cluster wait time                                | 1     | The total wait time (in centiseconds) for waits that belong to the Cluster wait class                                                                                  |                  |
| cold recycle reads                               | 8     | Number of buffers that were read through the least recently used end of the recycle cache with fast aging strategy                                                     |                  |
| commit cleanout failures: block lost             | 8     | Number of times Oracle attempted a cleanout at commit but could not find the correct block due to forced write, replacement, or switch <code>CURRENT</code>            |                  |
| commit cleanout failures: buffer being written   | 8     | Number of times Oracle attempted a cleanout at commit, but the buffer was currently being written                                                                      |                  |
| commit cleanout failures: callback failure       | 8     | Number of times the cleanout callback function returns <code>FALSE</code>                                                                                              |                  |
| commit cleanout failures: cannot pin             | 8     | Total number of times a commit cleanout was performed but failed because the block could not be pinned                                                                 |                  |
| commit cleanout failures: hot backup in progress | 8     | Number of times Oracle attempted block cleanout at commit during hot backup. The image of the block must be logged before the buffer can be made dirty.                |                  |
| commit cleanout failures: pmem only              | 264   | Number of time Oracle attempted a cleanout at commit, but could not modify PMEM buffers directly without a DRAM version                                                |                  |
| commit cleanout failures: write disabled         | 8     | Number of times a cleanout block at commit was performed but the writes to the database had been temporarily disabled                                                  |                  |
| commit cleanouts                                 | 8     | Total number of times the cleanout block at commit function was performed                                                                                              |                  |
| commit cleanouts successfully completed          | 8     | Number of times the cleanout block at commit function completed successfully                                                                                           |                  |
| commit nowait performed                          | 1     | The number of asynchronous commits that were actually performed. These commits did not wait for the commit redo to be flushed and be present on disk before returning. |                  |
| commit nowait requested                          | 1     | The number of no-wait commit or asynchronous commit requests that were made either using SQL or the OCI transaction control API                                        |                  |
| Commit SCN cached                                | 128   | Number of times the system change number of a commit operation was cached                                                                                              |                  |
| commit wait/nowait performed                     | 1     | The number of asynchronous/synchronous commits that were actually performed                                                                                            |                  |
| commit wait/nowait requested                     | 1     | The number of no-wait or wait commits that were made either using SQL or the OCI transaction control API                                                               |                  |
| commit wait performed                            | 1     | The number of synchronous commits that were actually performed. These commits waited for the commit redo to be flushed and be present on disk before returning.        |                  |
| commit wait requested                            | 1     | The number of waiting or synchronous commit requests that were made either using SQL or the OCI transaction control API                                                |                  |

| Name                                        | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                            | TIMED_STATISTICS |
|---------------------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| concurrency wait time                       | 1     | The total wait time (in centiseconds) for waits that belong to the Concurrency wait class                                                                                                                                                                                                                                                                                                                              |                  |
| consistent changes                          | 8     | Number of times a user process has applied rollback entries to perform a consistent read on the block<br>Work loads that produce a great deal of consistent changes can consume a great deal of resources. The value of this statistic should be small in relation to the "consistent gets" statistic.                                                                                                                 |                  |
| consistent gets                             | 8     | Number of times a consistent read was requested for a block.<br><b>See Also:</b> "consistent changes" and "session logical reads" statistics                                                                                                                                                                                                                                                                           |                  |
| consistent gets direct                      | 8     | Number of times a consistent read was requested for a block bypassing the buffer cache (for example, direct load operation). This is a subset of "consistent gets" statistics value.                                                                                                                                                                                                                                   |                  |
| consistent gets from cache                  | 8     | Number of times a consistent read was requested for a block from buffer cache. This is a subset of "consistent gets" statistics value.                                                                                                                                                                                                                                                                                 |                  |
| consistent gets from pmem                   | 8     | Number of direct-mapped blocks accessed in CR (consistent read) mode from PMEM. This is a subset of "consistent gets" statistics value.                                                                                                                                                                                                                                                                                |                  |
| consistent gets pmem direct                 | 8     | Number of CR gets from pmem in direct read (e.g. tablescan) code path. This is a subset of "consistent gets from pmem" statistics value.                                                                                                                                                                                                                                                                               |                  |
| consistent gets pmem examination            | 8     | Number of direct-mapped blocks accessed and examined in CR mode from PMEM, via regular path. This is a subset of "consistent gets from pmem" statistics value.                                                                                                                                                                                                                                                         |                  |
| consistent gets pmem examination (fastpath) | 8     | Number of direct-mapped blocks accessed and examined in CR mode from PMEM, via fast path. This is a subset of both "consistent gets from pmem" and "consistent gets pmem examination" statistics values.                                                                                                                                                                                                               |                  |
| consistent gets pmem pin                    | 8     | Number of direct-mapped blocks accessed and pinned in CR mode from PMEM, via regular path. This is a subset of "consistent gets from pmem" statistics value.                                                                                                                                                                                                                                                           |                  |
| consistent gets pmem pin (fastpath)         | 8     | Number of direct-mapped blocks accessed and pinned in CR mode from PMEM, via fast path. This is a subset of both "consistent gets from pmem" and "consistent gets pmem pin" statistics values.                                                                                                                                                                                                                         |                  |
| CPU used by this session                    | 1     | Amount of CPU time (in 10s of milliseconds) used by a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistics, and 0 milliseconds are added.<br><br>A similar problem can exist in the reporting by the operating system, especially on systems that suffer from many context switches. | Y                |

| cursor authentications                                    | 128   | Number of privilege checks conducted during execution of an operation                                                                                                                                                                                                                                                                                                                                                                                                                              |                  |
| data blocks consistent reads - undo records applied       | 128   | Number of undo records applied to data blocks that have been rolled back for consistent read purposes                                                                                                                                                                                                                                                                                                                                                                                              |                  |
| data warehousing cooling action                           | 8     | Number of times that cooling occurred on this instance                                                                                                                                                                                                                                                                                                                                                                                                                                             |                  |
| data warehousing evicted objects                          | 8     | Number of times that objects got evicted by automatic big table caching on this instance                                                                                                                                                                                                                                                                                                                                                                                                           |                  |
| data warehousing evicted objects - cooling                | 8     | Number of times that objects got evicted on this instance due to a cooling action                                                                                                                                                                                                                                                                                                                                                                                                                  |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                       | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | TIMED_STATISTICS |
|--------------------------------------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| data warehousing evicted objects - replace | 8     | Number of times that objects got evicted due to caching replacement, that is, when an object is evicted because a hotter object forces it to be evicted from the cache                                                                                                                                                                                                                                                                                                                                       |                  |
| data warehousing scanned blocks            | 8     | Number of blocks scanned by automatic big table caching on this instance using parallel query                                                                                                                                                                                                                                                                                                                                                                                                                |                  |
| data warehousing scanned blocks - disk     | 8     | Number of blocks scanned by automatic big table caching on this instance by direct read from disk                                                                                                                                                                                                                                                                                                                                                                                                            |                  |
| data warehousing scanned blocks - memory   | 8     | Number of blocks scanned by automatic big table caching on this instance by cache read from memory                                                                                                                                                                                                                                                                                                                                                                                                           |                  |
| data warehousing scanned blocks - offload  | 8     | Number of blocks scanned by automatic big table caching on this instance by Exadata offloading                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| data warehousing scanned objects           | 8     | Number of times the objects in automatic big table caching are scanned using parallel query                                                                                                                                                                                                                                                                                                                                                                                                                  |                  |
| db block changes                           | 8     | Closely related to " <a href="#">consistent changes</a> ", this statistic counts the total number of changes that were part of an update or delete operation that were made to all blocks in the SGA. Such changes generate redo log entries and hence become permanent changes to the database if the transaction is committed.<br><br>This approximates total database work. This statistic indicates the rate at which buffers are being dirtied (on a per-transaction or per-second basis, for example). |                  |
| db block gets                              | 8     | Number of times a CURRENT block was requested<br><b>See Also:</b> " <a href="#">consistent gets</a> "                                                                                                                                                                                                                                                                                                                                                                                                        |                  |
| db block gets direct                       | 8     | Number of times a CURRENT block was requested bypassing the buffer cache (for example, a direct load operation). This is a subset of "db block gets" statistics value.                                                                                                                                                                                                                                                                                                                                       |                  |
| db block gets from cache                   | 8     | Number of times a CURRENT block was requested from the buffer cache. This is a subset of "db block gets" statistics value.                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| db block gets from pmem                    | 8     | Number of direct-mapped blocks accessed in CURRENT mode from PMEM, via regular path                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| db block gets from pmem (fastpath)         | 8     | Number of direct-mapped blocks accessed in CURRENT mode from PMEM, via fast path                                                                                                                                                                                                                                                                                                                                                                                                                             |                  |
| DBWR checkpoint buffers written            | 8     | Number of buffers that were written for checkpoints                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| DBWR checkpoints                           | 8     | Number of times the DBWR was asked to scan the cache and write all blocks marked for a checkpoint or the end of recovery. This statistic is always larger than " <a href="#">background checkpoints completed</a> ".                                                                                                                                                                                                                                                                                         |                  |
| DBWR lru scans                             | 8     | Number of times that DBWR scans the LRU queue looking for buffers to write. This count includes scans to fill a batch being written for another purpose (such as a checkpoint).                                                                                                                                                                                                                                                                                                                              |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                           | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | TIMED_STATISTICS |
|------------------------------------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| DBWR revisited being-written buffer            | 8     | Number of times that DBWR tried to save a buffer for writing and found that it was already in the write batch. This statistic measures the amount of "useless" work that DBWR had to do in trying to fill the batch.<br><br>Many sources contribute to a write batch. If the same buffer from different sources is considered for adding to the write batch, then all but the first attempt will be "useless" because the buffer is already marked as being written.                                                                                                                                                                                                                   |                  |
| DBWR transaction table writes                  | 8     | Number of rollback segment headers written by DBWR. This statistic indicates how many "hot" buffers were written, causing a user process to wait while the write completed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                  |
| DBWR undo block writes                         | 8     | Number of rollback segment blocks written by DBWR                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |
| DDL statements parallelized                    | 32    | Number of DDL statements that were executed in parallel                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |
| deferred (CURRENT) block cleanout applications | 128   | Number of times cleanout records are deferred, piggyback with changes, always current get                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                  |
| DFO trees parallelized                         | 32    | Number of times a serial execution plan was converted to a parallel plan                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| dirty buffers inspected                        | 8     | Number of dirty buffers found by the user process while it is looking for a buffer to reuse                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                  |
| DML statements parallelized                    | 32    | Number of DML statements that were executed in parallel                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |
| DML statements retried                         | 64    | When a long-running DML is executing, the cursor may get invalidated due to some concurrent DDL on one of the cursor's dependencies. In this case, an internal ORA-14403 error is thrown and is caught and cleared in one of the calling functions. The current work is rolled back and the DML is restarted without the user being notified of this.<br><br>The statistic counts the number of times that the thrown, caught, and cleared (ORA-14403) sequence occurred for DML statements. Should a DML vary widely in execution time, check this statistic to see if it increments during the DML execution. If so, then concurrent DDL may be the cause of the extra elapsed time. |                  |
| enqueue conversions                            | 4     | Total number of conversions of the state of table or row lock                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| enqueue deadlocks                              | 4     | Total number of deadlocks between table or row locks in different sessions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                  |
| enqueue releases                               | 4     | Total number of table or row locks released                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                  |
| enqueue requests                               | 4     | Total number of table or row locks acquired                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                  |
| enqueue timeouts                               | 4     | Total number of table and row locks (acquired and converted) that timed out before they could complete                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                  |
| enqueue waits                                  | 4     | Total number of waits that occurred during an enqueue convert or get because the enqueue get was deferred                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                     | Class | Description                                                                                                                                                                                                                                                                                                                                                                     | TIMED_STATISTICS |
|------------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| exchange deadlocks                       | 8     | Number of times that a process detected a potential deadlock when exchanging two buffers and raised an internal, restartable error. Index scans are the only operations that perform exchanges.                                                                                                                                                                                 |                  |
| execute count                            | 64    | Total number of calls (user and recursive) that executed SQL statements                                                                                                                                                                                                                                                                                                         |                  |
| fbda woken up                            | 128   | Number of times the flashback data archive background process was woken up to do archiving                                                                                                                                                                                                                                                                                      |                  |
| file io wait time                        | 1     | Total time spent in wait (in microseconds) for I/O to datafiles, excluding the service time for such I/O. This is cumulative for all I/Os for all datafiles. The service time for one I/O operation is estimated as the minimum time spent in the I/O call seen so far. This service time is subtracted from the time spent in each I/O call to get the wait time for that I/O. |                  |
| flash cache eviction: aged out           | 8     | Flash cache buffer is aged out of the Database Smart Flash Cache                                                                                                                                                                                                                                                                                                                |                  |
| flash cache eviction: buffer pinned      | 8     | Database Smart Flash Cache buffer is invalidated due to object or range reuse, and so on. The Database Flash Cache Buffer was in use at the time of eviction.                                                                                                                                                                                                                   |                  |
| flash cache eviction: invalidated        | 8     | Database Smart Flash Cache buffer is invalidated due to object or range reuse, and so on. The Database Smart Flash Cache buffer was not in use at the time of eviction.                                                                                                                                                                                                         |                  |
| flash cache insert skip: corrupt         | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because the buffer was corrupted                                                                                                                                                                                                                                                                 |                  |
| flash cache insert skip: DBWR overloaded | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because DBWR was busy writing other buffers                                                                                                                                                                                                                                                      |                  |
| flash cache insert skip: exists          | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was already in the flash cache                                                                                                                                                                                                                                                        |                  |
| flash cache insert skip: modification    | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was being modified                                                                                                                                                                                                                                                                    |                  |
| flash cache insert skip: not current     | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was not current                                                                                                                                                                                                                                                                       |                  |
| flash cache insert skip: not useful      | 8     | In-memory buffer was skipped for insertion into the Database Smart Flash Cache because the type of buffer was not useful to keep                                                                                                                                                                                                                                                |                  |
| flash cache inserts                      | 8     | Total number of in-memory buffers inserted into the Database Smart Flash Cache                                                                                                                                                                                                                                                                                                  |                  |
| flashback log write bytes                | 2     | Total size in bytes of flashback database data written by RVWR to flashback database logs                                                                                                                                                                                                                                                                                       |                  |
| flashback log writes                     | 2     | Total number of writes by RVWR to flashback database logs                                                                                                                                                                                                                                                                                                                       |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                       | Class | Description                                                                                                                                                                                                                                                                                                                                           | TIMED_STATISTICS |
|--------------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| foreground propagated tracked transactions | 128   | Number of transactions modifying tables enabled for flashback data archive which were archived by a foreground process                                                                                                                                                                                                                                |                  |
| free buffer inspected                      | 8     | Number of buffers skipped over from the end of an LRU queue to find a reusable buffer. The difference between this statistic and "dirty buffers inspected" is the number of buffers that could not be used because they had a user, a waiter, or were being read or written, or because they were busy or needed to be written after rapid aging out. |                  |
| free buffer inspected for pmem             | 8     | Number of PMEM buffers skipped over from the end of an LRU queue to find a reusable PMEM buffer                                                                                                                                                                                                                                                       |                  |
| free buffer requested                      | 8     | Number of times a reusable buffer or a free buffer was requested to create or load a block                                                                                                                                                                                                                                                            |                  |
| free buffer requested for pmem             | 8     | Number of times a reusable PMEM buffer or a free PMEM buffer was requested to directly access a block                                                                                                                                                                                                                                                 |                  |
| gc read wait failures                      | 40    | A read wait is when a CR server waits for a disk read to complete before serving a block to another instance. This statistic displays the number of times a read wait ended in failure, that is, after waiting it was unable to serve a block.                                                                                                        |                  |
| gc read wait timeouts                      | 40    | A read wait is when a CR server waits for a disk read to complete before serving a block to another instance. This statistic displays the number of times a read wait timed out, that is, the disk read did not complete in time, so the wait was terminated.                                                                                         |                  |
| gc read waits                              | 40    | The number of times a CR server waited for a disk read, and then successfully served a block                                                                                                                                                                                                                                                          |                  |
| global enqueue CPU used by this session    | 32    | Amount of CPU time (in 10s of milliseconds) used by synchronous and asynchronous global enqueue activity in a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistics, and 0 milliseconds are added.                   |                  |
| global enqueue get time                    | 32    | Total elapsed time in 10s of milliseconds of all synchronous and asynchronous global enqueue gets and converts                                                                                                                                                                                                                                        |                  |
| global enqueue gets async                  | 32    | Total number of asynchronous global enqueue gets and converts                                                                                                                                                                                                                                                                                         |                  |
| global enqueue gets sync                   | 32    | Total number of synchronous global enqueue gets and converts                                                                                                                                                                                                                                                                                          |                  |
| global enqueue releases                    | 32    | Total number of synchronous global enqueue releases                                                                                                                                                                                                                                                                                                   |                  |
| HCC analyze table CUs                      | 128   | Number of Compression Units that were decompressed for ANALYZE TABLE                                                                                                                                                                                                                                                                                  |                  |
| HCC analyzer calls                         | 128   | Number of times ANALYZE TABLE has been run on Hybrid Columnar Compression (HCC) compressed tables                                                                                                                                                                                                                                                     |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                      | Class | Description                                                                                                                                                                                                 | TIMED_STATISTICS |
|-------------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| HCC block compressions attempted          | 128   | Number of times the system failed to recompress an OLTP compressed block in HCC format                                                                                                                      |                  |
| HCC block compressions completed          | 128   | Number of times an OLTP compressed block was successfully recompressed in HCC format                                                                                                                        |                  |
| HCC DML conventional                      | 128   | Number of searched DML statements ( <code>UPDATE</code> and <code>DELETE</code> ) issued against HCC compressed tables                                                                                      |                  |
| HCC DML CUs                               | 128   | Number of Compression Units that were decompressed for searched DMLs ( <code>UPDATE</code> and <code>DELETE</code> )                                                                                        |                  |
| HCC fetch by rowid CUs                    | 128   | Number of Compression Units that were decompressed by single row fetch                                                                                                                                      |                  |
| HCC load conventional bytes compressed    | 128   | Length of the data after compression stored in Compression Units by conventional loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.  |                  |
| HCC load conventional bytes uncompressed  | 128   | Length of the data before compression stored in Compression Units by conventional loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data. |                  |
| HCC load conventional CUs                 | 128   | Number of Compression Units that were successfully compressed in any format from conventional loads                                                                                                         |                  |
| HCC load conventional CUs archive high    | 128   | Number of Compression Units that were successfully compressed in HCC <code>ARCHIVE HIGH</code> format from conventional loads                                                                               |                  |
| HCC load conventional CUs archive low     | 128   | Number of Compression Units that were successfully compressed in HCC <code>ARCHIVE LOW</code> format from conventional loads                                                                                |                  |
| HCC load conventional CUs query high      | 128   | Number of Compression Units that were successfully compressed in HCC <code>QUERY HIGH</code> format from conventional loads                                                                                 |                  |
| HCC load conventional CUs query low       | 128   | Number of Compression Units that were successfully compressed in HCC <code>QUERY LOW</code> format from conventional loads                                                                                  |                  |
| HCC load conventional rows                | 128   | Number of rows that were successfully compressed in HCC format from conventional loads                                                                                                                      |                  |
| HCC load conventional rows not compressed | 128   | Number of rows that were unable to be compressed in HCC format from conventional loads because the compression resulted in taking more space, not less                                                      |                  |
| HCC load direct bytes compressed          | 128   | Length of the data after compression stored in Compression Units by Direct Path Loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.   |                  |
| HCC load direct bytes uncompressed        | 128   | Length of the data before compression stored in Compression Units by Direct Path Loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.  |                  |

| Name                                 | Class | Description                                                                                                                                         | TIMED_STATISTICS |
|--------------------------------------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| HCC load direct CUs                  | 128   | Number of Compression Units that were successfully HCC compressed by Direct Path Loads                                                              |                  |
| HCC load direct CUs archive high     | 128   | Number of rows from Direct Path Loads that were HCC compressed with ARCHIVE HIGH successfully                                                       |                  |
| HCC load direct CUs archive low      | 128   | Number of rows from Direct Path Loads that were HCC compressed with ARCHIVE LOW successfully                                                        |                  |
| HCC load direct CUs query high       | 128   | Number of rows from Direct Path Loads that were HCC compressed with QUERY HIGH successfully                                                         |                  |
| HCC load direct CUs query low        | 128   | Number of rows from Direct Path Loads that were HCC compressed with QUERY LOW successfully                                                          |                  |
| HCC load direct rows                 | 128   | Number of rows from Direct Path Loads that were HCC compressed successfully                                                                         |                  |
| HCC load direct rows not compressed  | 128   | Number of rows from Direct Path Loads that were OLTP compressed instead of HCC compressed due to negative compression                               |                  |
| HCC scan cell bytes compressed       | 128   | Length of the compressed data stored in Compression Units prior to decompression. This is the length of all columns, not just the columns accessed. |                  |
| HCC scan cell bytes decompressed     | 128   | Length of the data after decompression stored in Compression Units. This is the length of all columns, not just the columns accessed.               |                  |
| HCC scan cell CUs archive high       | 128   | Number of Compression Units scanned that had been compressed with ARCHIVE HIGH                                                                      |                  |
| HCC scan cell CUs archive low        | 128   | Number of Compression Units scanned that had been compressed with ARCHIVE LOW                                                                       |                  |
| HCC scan cell CUs columns accessed   | 128   | Number of columns that needed to be decompressed on the storage server to process the Compression Unit                                              |                  |
| HCC scan cell CUs decompressed       | 128   | Number of Compression Units that needed to be decompressed on the storage server                                                                    |                  |
| HCC scan cell CUs decompression time | 128   | Total time spent decompressing the columns that were needed on the storage server                                                                   |                  |
| HCC scan cell CUs optimized read     | 128   | Number of Compression Units where all the rows were within the stored Min/Max values. Evaluation of those predicates was optimized out.             |                  |
| HCC scan cell CUs pruned             | 128   | Number of Compression Units that were pruned based on the Min/Max value checks                                                                      |                  |
| HCC scan cell CUs query high         | 128   | Number of Compression Units scanned that had been compressed with QUERY HIGH                                                                        |                  |
| HCC scan cell CUs query low          | 128   | Number of Compression Units scanned that had been compressed with QUERY LOW                                                                         |                  |
| HCC scan cell CUs sent compressed    | 64    | Number of Compression Units that the storage server returned to the RDBMS still compressed after predicate evaluation was done                      |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                         | Class | Description                                                                                                                                                                                                                                      | TIMED_STATISTICS |
|----------------------------------------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| HCC scan cell CUs sent head piece            | 64    | Number of Compression Units that the storage server was unable to process and the block header was returned to the RDBMS to be processed                                                                                                         |                  |
| HCC scan cell CUs sent uncompressed          | 64    | Number of Compression Units that the storage server returned to the RDBMS in uncompressed columnar format                                                                                                                                        |                  |
| HCC scan cell rows                           | 128   | Number of rows from columnar formatted data that were returned by the storage server to the RDBMS                                                                                                                                                |                  |
| HCC scan CUs pcode aggregation pushdown      | 128   | Number of Compression Units that were aggregated on the cell using P(ortable)-byte code                                                                                                                                                          |                  |
| HCC scan CUs pcode pred evaled               | 128   | Number of predicates that were evaluated using P(ortable)-byte code                                                                                                                                                                              |                  |
| HCC scan CUs pcode pred evaled using rowsets | 128   | Number of predicates that were evaluated using P(ortable)-byte code using vectorized data                                                                                                                                                        |                  |
| HCC scan CUs predicates applied              | 128   | Number of predicates where at least some value passed the Min/Max check                                                                                                                                                                          |                  |
| HCC scan CUs predicates optimized            | 128   | Number of predicates that could be evaluated directly against columnar data                                                                                                                                                                      |                  |
| HCC scan CUs predicates received             | 128   | Number of predicates sent to the storage server that could be evaluated directly against HCC format data after decompression                                                                                                                     |                  |
| HCC scan rdbms bytes compressed              | 128   | Length of the compressed data stored in Compression Units prior to decompression. This is the length of all columns, not just the columns accessed.                                                                                              |                  |
| HCC scan rdbms bytes decompressed            | 128   | Length of the data after decompression stored in Compression Units. This is the length of all columns, not just the columns accessed.                                                                                                            |                  |
| HCC scan rdbms CUs archive high              | 128   | Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with ARCHIVE HIGH                                                                                                                                  |                  |
| HCC scan rdbms CUs archive low               | 128   | Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with ARCHIVE LOW                                                                                                                                   |                  |
| HCC scan rdbms CUs columns accessed          | 128   | Number of columns that were decompressed                                                                                                                                                                                                         |                  |
| HCC scan rdbms CUs decompressed              | 128   | Number of Compression Units that were decompressed on the RDBMS server                                                                                                                                                                           |                  |
| HCC scan rdbms CUs decompression time        | 128   | Total time spent decompressing the columns that were needed on the RDBMS server                                                                                                                                                                  |                  |
| HCC scan rdbms CUs normal                    | 128   | Number of HCC Compression Units decompressed by the RDBMS regular table scan, i.e., 'Table Access Full' in a query plan. This is typically used in specialized scans that, for example, use row versions, row SCN, or use the LONG RAW datatype. |                  |

| Name                                        | Class | Description                                                                                                                                                                                                                              | TIMED_STATISTICS |
|---------------------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| HCC scan rdbms CUs pruned                   | 128   | Number of Compression Units that were eliminated by comparing the predicates to the stored Min and Max values for that Comprssion Unit                                                                                                   |                  |
| HCC scan rdbms CUs query high               | 128   | Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with QUERY HIGH (which is the default)                                                                                                     |                  |
| HCC scan rdbms CUs query low                | 128   | Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with QUERY LOW                                                                                                                             |                  |
| HCC scan rdbms CUs turbo                    | 128   | Number of HCC Compression Units decompressed by the RDBMS fast table scan (TurboScan). This is separate to decompression that happens on an Exadata cell.                                                                                |                  |
| HCC scan rdbms rows                         | 128   | Number of rows returned from HCC blocks or that were returned from an Exadata cell in columnar format that passed the predicates on that table                                                                                           |                  |
| HCC scan rows pcode aggregated              | 128   | Number of rows from HCC blocks or from columnar format blocks returned by an Exadata cell that could be aggregated using the P(ortable)-code style of query compilation                                                                  |                  |
| HCC usage cloud                             | 128   | Internal count of how often TurboScan is invoked for HCC data stored in an Oracle Cloud environment. It does not include Oracle on other vendor's clouds. This may or may not correspond with the number of queries or granules scanned. |                  |
| HCC usage pillar                            | 128   | Internal count of how often TurboScan is invoked for HCC data stored on Pillar storage. This may or may not correspond with the number of queries or granules scanned.                                                                   |                  |
| HCC usage ZFS                               | 128   | Internal count of how often TurboScan is invoked for HCC data stored on ZFS storage. This may or may not correspond with the number of queries or granules scanned.                                                                      |                  |
| hot buffers moved to head of LRU            | 8     | When a hot buffer reaches the tail of its replacement list, Oracle moves it back to the head of the list to keep it from being reused. This statistic counts such moves.                                                                 |                  |
| hot buffers moved to head of LRU for pmem   | 8     | When a hot PMEM buffer reaches the tail of its replacement list, Oracle moves it back to the head of the list to keep it from being reused. This statistic counts such moves.                                                            |                  |
| hot pmem block exchange with dram attempts  | 264   | Number of hot PMEM buffers that were attempted to be exchanged with colder DRAM buffers, to ensure both blocks are still cached                                                                                                          |                  |
| hot pmem block exchange with dram successes | 264   | Number of hot PMEM buffers that were successfully exchanged with colder DRAM buffers, with both blocks still cached                                                                                                                      |                  |
| hot pmem block migration to dram attempts   | 8     | Number of hot PMEM buffer cache blocks that were attempted to be migrated to DREM to reduce access latency                                                                                                                               |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                            | Class | Description                                                                                                                                                                  | TIMED_STATISTICS |
|-------------------------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| hot pmem block migration to dram successes      | 264   | Number of hot PMEM buffer cache blocks that were successfully migrated to DRAM to reduce access latency                                                                      |                  |
| immediate (CR) block cleanout applications      | 128   | Number of times cleanout records are applied immediately during consistent-read requests                                                                                     |                  |
| immediate (CURRENT) block cleanout applications | 128   | Number of times cleanout records are applied immediately during current gets. Compare this statistic with " <a href="#">deferred (CURRENT) block cleanout applications</a> " |                  |
| IM (HPK4SQL) hash joins attempted               | 384   | Number of in-memory vectorized hash joins attempted                                                                                                                          |                  |
| IM (HPK4SQL) hash joins completed               | 384   | Number of in-memory vectorized hash joins completed                                                                                                                          |                  |
| IM (hybrid) scan blocks on hybrid list          | 384   | Number of blocks on the hybrid In-Memory scan list                                                                                                                           |                  |
| IM (hybrid) scan rows on hybrid list            | 384   | Number of rows on the hybrid In-Memory scan list                                                                                                                             |                  |
| IM default area resized                         | 128   | The amount of memory by which the column store got resized                                                                                                                   |                  |
| IM populate accumulated time (ms)               | 128   | Total amount of DB time (in milliseconds) spent populating CUs into the IM column store due to segment scans                                                                 |                  |
| IM populate bytes in-memory EU data             | 128   | Size in bytes of in-memory EU data populated due to segment scans                                                                                                            |                  |
| IM populate bytes uncompressed EU data          | 128   | Uncompressed size in bytes of in-memory EU data populated due to segment scans                                                                                               |                  |
| IM populate CUs                                 | 128   | Number of CUs populated in the IM column store due to segment scans                                                                                                          |                  |
| IM populate CUs memcompress for capacity high   | 128   | Number of CUs populated in the IM column store due to segment scans using memcompress for capacity high                                                                      |                  |
| IM populate CUs memcompress for capacity low    | 128   | Number of CUs populated in the IM column store due to segment scans using memcompress for capacity low                                                                       |                  |
| IM populate CUs memcompress for dml             | 128   | Number of CUs populated in the IM column store due to segment scans using memcompress for DML                                                                                |                  |
| IM populate CUs memcompress for query high      | 128   | Number of CUs populated in the IM column store due to segment scans using memcompress for query high                                                                         |                  |
| IM populate CUs memcompress for query low       | 128   | Number of CUs populated in the IM column store due to segment scans using memcompress for query low                                                                          |                  |
| IM populate CUs no memcompress                  | 128   | Number of CUs populated in the IM column store due to segment scans without compression                                                                                      |                  |
| IM populate CUs requested                       | 128   | Number of CUs requested to be populated due to segment scans                                                                                                                 |                  |
| IM populate EUs                                 | 128   | Number of EUs populated in the IM column store due to segment scans                                                                                                          |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                             | Class | Description                                                                                                          | TIMED_STATISTICS |
|--------------------------------------------------|-------|----------------------------------------------------------------------------------------------------------------------|------------------|
| IM populate EUs accumulated time (ms)            | 128   | Total amount of DB time (in milliseconds) spent populating EUs into the IM column store due to segment scans         |                  |
| IM populate EUs columns                          | 128   | Number of columns populated in EUs due to segment scans                                                              |                  |
| IM populate EUs memcompress for capacity high    | 128   | Number of EUs populated in the IM column store due to segment scans at memcompress for capacity high                 |                  |
| IM populate EUs memcompress for capacity low     | 128   | Number of EUs populated in the IM column store due to segment scans at memcompress for capacity low                  |                  |
| IM populate EUs memcompress for dml              | 128   | Number of EUs populated in the IM column store due to segment scans at memcompress for dml                           |                  |
| IM populate EUs memcompress for query high       | 128   | Number of EUs populated in the IM column store due to segment scans at memcompress for query high                    |                  |
| IM populate EUs memcompress for query low        | 128   | Number of EUs populated in the IM column store due to segment scans at memcompress for query low                     |                  |
| IM populate EUs no memcompress                   | 128   | Number of EUs populated in the IM column store without compression due to segment scans                              |                  |
| IM populate EUs requested                        | 128   | Number of EUs requested to be populated in the IM column store due to segment scans                                  |                  |
| IM populate no contiguous inmemory space         | 128   | Number of CUs that fail to populate due to lack of contiguous space in In-Memory area                                |                  |
| IM populate segments                             | 128   | Number of segments populated due to segment scan                                                                     |                  |
| IM populate segments requested                   | 128   | Number of segments requested to be populated due to segment scan                                                     |                  |
| IM populate segments wall clock time (ms)        | 128   | Total amount of wall clock time (in milliseconds) spent populating CUs into the IM column store due to segment scans |                  |
| IM prepopulate accumulated time (ms)             | 128   | Total amount of DB time (in milliseconds) spent prepopulating CUs into the IM column store priority                  |                  |
| IM prepopulate bytes in-memory EU data           | 128   | Size in bytes of in-memory EU data populated due to priority                                                         |                  |
| IM prepopulate bytes uncompressed EU data        | 128   | Uncompressed size in bytes of in-memory EU data populated due to priority                                            |                  |
| IM prepopulate CUs                               | 128   | Number of CUs prepopulated in the IM column store due to priority                                                    |                  |
| IM prepopulate CUs memcompress for capacity high | 128   | Number of CUs prepopulated in the IM column store due to priority using memcompress for capacity high                |                  |
| IM prepopulate CUs memcompress for capacity low  | 128   | Number of CUs prepopulated in the IM column store due to priority using memcompress for capacity low                 |                  |
| IM prepopulate CUs memcompress for dml           | 128   | Number of CUs prepopulated in the IM column store due to priority using memcompress for DML                          |                  |

| IM repopulate (trickle) EUs accumulated time (ms)         | 128   | Total amount of DB time (in milliseconds) spent trickle repopulating EUs into the IM column store due to DML changes    |                  |
| IM repopulate (trickle) EUs columns                       | 128   | Number of columns repopulated in EUs due to DML changes                                                                 |                  |
| IM repopulate (trickle) EUs memcompress for capacity high | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for capacity high            |                  |
| IM repopulate (trickle) EUs memcompress for capacity low  | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for capacity low             |                  |
| IM repopulate (trickle) EUs memcompress for dml           | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for dml                      |                  |
| IM repopulate (trickle) EUs memcompress for query high    | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for query high               |                  |
| IM repopulate (trickle) EUs memcompress for query low     | 128   | Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for query low                |                  |
| IM repopulate (trickle) EUs no memcompress                | 128   | Number of EUs trickle repopulated in the IM column store without compression due to DML changes                         |                  |
| IM repopulate (trickle) EUs requested                     | 128   | Number of EUs requested to be trickle repopulated in the IM column store due to DML changes                             |                  |
| IM scan CUs column not in memory                          | 128   | Number of extents that could not be read from the IM column store because one of the columns required was not in memory |                  |
| IM scan CUs invalid or missing revert to on disk extent   | 128   | Number of extents where no IMCU exists                                                                                  |                  |
| IM scan CUs memcompress for query low                     | 128   | Number of memcompress for query high CUs scanned in the IM column store                                                 |                  |
| IM scan CUs memcompress for query high                    | 128   | Number of memcompress for query high CUs scanned in the IM column store                                                 |                  |
| IM scan CUs memcompress for capacity low                  | 128   | Number of memcompress for capacity low CUs scanned in the IM column store                                               |                  |
| IM scan CUs memcompress for capacity high                 | 128   | Number of memcompress for capacity high CUs scanned in the IM column store                                              |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                        | Class | Description                                                                                                                                                                    | TIMED_STATISTICS |
|---------------------------------------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| IM scan CUs memcompress for dml             | 128   | Number of memcompress for DML CUs scanned in the IM column store                                                                                                               |                  |
| IM scan CUs predicates applied              | 128   | Number of where clause predicates applied to the In-Memory storage index                                                                                                       |                  |
| IM scan CUs predicates optimized            | 128   | Number of where clause predicates applied to the IM column store for which either all rows pass min/max pruning via an In-Memory storage index or no rows pass min/max pruning |                  |
| IM scan CUs pruned                          | 128   | Number of CUs pruned by the storage index                                                                                                                                      |                  |
| IM scan (dynamic) multi-threaded scans      | 128   | Number of In-Memory table scans which benefited from In-Memory dynamic scans                                                                                                   |                  |
| IM scan (dynamic) tasks processed by parent | 128   | Number of IMCUs processed normally because of Resource Manager limit                                                                                                           |                  |
| IM scan (dynamic) tasks processed by thread | 128   | Number of IMCUs processed in parallel by a worker thread                                                                                                                       |                  |
| IM scan (dynamic) rows                      | 128   | Number of rows processed by In-Memory dynamic scans                                                                                                                            |                  |
| IM scan EU bytes in-memory                  | 128   | Size in bytes of in-memory EU data accessed by scans                                                                                                                           |                  |
| IM scan EU bytes uncompressed               | 128   | Uncompressed size in bytes of in-memory EU data accessed by scans                                                                                                              |                  |
| IM scan EU rows                             | 128   | Number of rows scanned from EUs in the IM column store before where clause predicate applied                                                                                   |                  |
| IM scan EUs columns accessed                | 128   | Number of columns in the EUs accessed by scans                                                                                                                                 |                  |
| IM scan EUs columns decompressed            | 128   | Number of columns in the EUs decompressed by scans                                                                                                                             |                  |
| IM scan EUs columns theoretical max         | 128   | Number of columns that would have been accessed from the EU if the scans looked at all columns                                                                                 |                  |
| IM scan EUs memcompress for capacity high   | 128   | Number of memcompress for capacity high EUs scanned in the IM column store                                                                                                     |                  |
| IM scan EUs memcompress for capacity low    | 128   | Number of memcompress for capacity low EUs scanned in the IM column store                                                                                                      |                  |
| IM scan EUs memcompress for dml             | 128   | Number of memcompress for DML EUs scanned in the IM column store                                                                                                               |                  |
| IM scan EUs memcompress for query high      | 128   | Number of memcompress for query high EUs scanned in the IM column store                                                                                                        |                  |
| IM scan EUs memcompress for query low       | 128   | Number of memcompress for query low EUs scanned in the IM column store                                                                                                         |                  |
| IM scan EUs no memcompress                  | 128   | Number of uncompressed EUs scanned in the IM column store                                                                                                                      |                  |
| IM scan EUs split pieces                    | 128   | Number of split EU pieces among all IM EUs                                                                                                                                     |                  |
| IM scan rows                                | 128   | Number of rows in scanned In-Memory Compression Units (IMCUs)                                                                                                                  |                  |

| index fast full scans (full)              | 64    | Number of fast full scans initiated for full segments                                                                                                                                                                                                                                                            |                  |
| index fast full scans (rowid ranges)      | 64    | Number of fast full scans initiated with rowid endpoints specified                                                                                                                                                                                                                                               |                  |
| large tracked transactions                | 128   | For tables tracked by flashback data archive, the number of transactions modifying rows in those tables which are large in terms of size or number of changes                                                                                                                                                    |                  |
| leaf node splits                          | 128   | Number of times an index leaf node was split because of the insertion of an additional value                                                                                                                                                                                                                     |                  |
| lob reads                                 | 8     | Number of LOB API read operations performed in the session/system. A single LOB API read may correspond to multiple physical/logical disk block reads.                                                                                                                                                           |                  |
| lob writes                                | 8     | Number of LOB API write operations performed in the session/system. A single LOB API write may correspond to multiple physical/logical disk block writes.                                                                                                                                                        |                  |
| lob writes unaligned                      | 8     | Number of LOB API write operations whose start offset or buffer size is not aligned to the internal chunk size of the LOB. Writes aligned to chunk boundaries are the most efficient write operations. The internal chunk size of a LOB is available through the LOB API (for example, DBMS_LOB.GETCHUNKSIZE()). |                  |
| logons cumulative                         | 1     | Total number of logons since the instance started. Useful only in V\$SYSSTAT. It gives an instance overview of all processes that logged on.                                                                                                                                                                     |                  |
| logons current                            | 1     | Total number of current logons. Useful only in V\$SYSSTAT.                                                                                                                                                                                                                                                       |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                               | Class | Description                                                                                                                                                                                                                                                 | TIMED_STATISTICS |
|------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| memopt r failed puts               | 128   | Total failed puts on hash index                                                                                                                                                                                                                             |                  |
| memopt r failed reads on blocks    | 128   | Total lookup failures due to read failure on blocks because of concurrent changes                                                                                                                                                                           |                  |
| memopt r failed reads on buckets   | 128   | Total lookup failures due to concurrent hash bucket changes                                                                                                                                                                                                 |                  |
| memopt r hits                      | 128   | Total hits on hash index – primary key found                                                                                                                                                                                                                |                  |
| memopt r lookup detected CR buffer | 128   | Total lookup failures due to block pointed to by hash index being no longer the current version                                                                                                                                                             |                  |
| memopt r lookups                   | 128   | Total number of lookups on hash index                                                                                                                                                                                                                       |                  |
| memopt r misses                    | 128   | Total misses on hash index due to primary key not found                                                                                                                                                                                                     |                  |
| memopt r puts                      | 128   | Total puts on hash index                                                                                                                                                                                                                                    |                  |
| memopt r successful puts           | 128   | Total successful puts on hash index                                                                                                                                                                                                                         |                  |
| messages received                  | 128   | Number of messages sent and received between background processes                                                                                                                                                                                           |                  |
| messages sent                      | 128   | Number of messages sent and received between background processes                                                                                                                                                                                           |                  |
| no buffer to keep pinned count     | 72    | Number of times a visit to a buffer attempted, but the buffer was not found where expected. Like <a href="#">"buffer is not pinned count"</a> and <a href="#">"buffer is pinned count"</a> , this statistic is useful only for internal debugging purposes. |                  |
| no work - consistent read gets     | 128   | Number consistent gets that require neither block cleanouts nor rollbacks.<br><b>See Also:</b> <a href="#">"consistent gets"</a>                                                                                                                            |                  |
| non-idle wait count                | 1     | The total number of waits performed with wait events that were not part of the Idle wait class.<br><b>See Also:</b> <a href="#">"in call idle wait time"</a> and <a href="#">"non-idle wait time"</a>                                                       |                  |
| non-idle wait time                 | 1     | The total wait time (in microseconds) for waits that do not belong to the Idle wait class.<br><b>See Also:</b> <a href="#">"in call idle wait time"</a> and <a href="#">"non-idle wait count"</a>                                                           |                  |
| OLAP Aggregate Function Calc       | 64    | The number of times the AGGREGATE function computes a parent value based on the values of its children.                                                                                                                                                     |                  |
| OLAP Aggregate Function Logical NA | 64    | The number of times an AGGREGATE function evaluates to a logical NA value. This could be because the AGGINDEX is on and the composite tuple does not exist.                                                                                                 |                  |
| OLAP Aggregate Function Precompute | 64    | The number of times the AGGREGATE function is to compute a value and finds it precomputed in the cube.                                                                                                                                                      |                  |
| OLAP Custom Member Limit           | 64    | The number of times an OLAP table function issues a custom member limit                                                                                                                                                                                     |                  |
| OLAP Engine Calls                  | 64    | The total number of OLAP transactions executed within the session. This value provides a general indication of the level of OLAP activity in the session.                                                                                                   |                  |
| OLAP Fast Limit                    | 64    | The number of times an OLAP table function issues a fast limit                                                                                                                                                                                              |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                   | Class | Description                                                                                                                                                                                                                                                                              | TIMED_STATISTICS |
|----------------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| OLAP Full Limit                        | 64    | The number of times an OLAP table function issues a full limit                                                                                                                                                                                                                           |                  |
| OLAP GID Limit                         | 64    | The number of times an OLAP table function issues a Cube Grouping ID (CGID) limit. Typically, this type of limit occurs for query rewrite transformations that resolve to a cube organized materialized view.                                                                            |                  |
| OLAP Import Rows Loaded                | 64    | The number of OLAP import rows loaded. This statistic provides the number of rows of the source cursor that are actually loaded into an Analytic Workspace (AW).<br>The difference between the OLAP Import Rows Pushed and OLAP Import Rows Loaded provides the number of rejected rows. |                  |
| OLAP Import Rows Pushed                | 64    | The number of OLAP import rows pushed. This statistic refers to the number of rows encountered from a source cursor and is useful during cube build operations.                                                                                                                          |                  |
| OLAP INHIER Limit                      | 64    | The number of times an OLAP table function issues an in-hierarchy limit. This type of limit can occur when you use cube dimension hierarchy views.                                                                                                                                       |                  |
| OLAP Limit Time                        | 64    | The total time taken by all the OLAP Limit operations that were performed during the last call to the OLAP table function                                                                                                                                                                |                  |
| OLAP Paging Manager Cache Changed Page | 64    | The number of times the OLAP page pool is changed for any attached AW.                                                                                                                                                                                                                   |                  |
| OLAP Paging Manager Cache Hit          | 64    | The number of times a requested page is found in the OLAP page pool. Use this statistic in conjunction with <a href="#">OLAP Paging Manager Cache Miss</a> to determine the OLAP page pool efficiency ratio.                                                                             |                  |
| OLAP Paging Manager Cache Miss         | 64    | The number of times a requested page is not found in the OLAP page pool. Use this statistic in conjunction with OLAP Paging Manager Cache Hit to determine the OLAP page pool efficiency ratio.                                                                                          |                  |
| OLAP Paging Manager Cache Write        | 64    | The number of times the OLAP paging manager writes to a page in the OLAP page pool.                                                                                                                                                                                                      |                  |
| OLAP Paging Manager New Page           | 64    | The number of newly-created pages in the OLAP page pool that have not yet been written to the workspace LOB                                                                                                                                                                              |                  |
| OLAP Paging Manager Pool Size          | 64    | Size, in bytes, of the OLAP page pool allocated to a session and the sum of all OLAP page pools in the system.                                                                                                                                                                           |                  |
| OLAP Perm LOB Read                     | 64    | The number of times data was read from the table where the AW is stored. These are permanent LOB reads.                                                                                                                                                                                  |                  |
| OLAP Row Id Limit                      | 64    | The number of times an OLAP table function issues a row Id limit.                                                                                                                                                                                                                        |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                            | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | TIMED_STATISTICS |
|---------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| OLAP Row Load Time              | 64    | <p>The total time spent loading rows into an AW during cube build and OLAP SQL import operations.</p> <p>Use this statistic along with the <a href="#">OLAP engine elapsed time</a> to measure time spent running OLAP engine routines that involve loading data into AWs from a SQL source.</p> <p>This statistic has the following levels of precision:</p> <ul style="list-style-type: none"> <li>• Low precision timer<br/>This captures the elapsed time of the entire fetch phase of the SQL cursor that is being loaded into AWs. It includes the SQL execution time that occurs during a fetch operation from a source cursor and time taken by the OLAP engine to populate AWs.</li> <li>• High precision timer<br/>This captures the elapsed time, excluding the SQL processing of the cursor being loaded. It records the time spent in the OLAP engine only.</li> <li>• Default timer precision:<br/>This is based on the <code>STATISTIC_LEVEL</code> parameter. If the low precision is used, then <code>STATISTICS_LEVEL</code> is <code>TYPICAL</code>. The high precision timer is used when <code>STATISTIC_LEVEL</code> is set to <code>ALL</code>. No timing is captured when <code>STATISTICS_LEVEL</code> is <code>BASIC</code>.</li> </ul> |                  |
| OLAP Row Source Rows Processed  | 64    | The number of rows processed by the OLAP row source                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| OLAP Session Cache Hit          | 64    | The number of times the requested, dynamically-aggregated value of an AW object, was found in the OLAP session cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                  |
| OLAP Session Cache Miss         | 64    | The number of times the requested, dynamically-aggregated value of an AW object, was not found in the OLAP session cache.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                  |

| OS CPU Qt wait time             | 1     | The time a session spends on the CPU run queue (in microseconds), waiting to get the CPU to run                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| OS Involuntary context switches | 16    | Number of context switches that were enforced by the operating system                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                        | Class | Description                                                                                                                                                                                                              | TIMED_STATISTICS |
|---------------------------------------------|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| OS Signals received                         | 16    | Number of signals received                                                                                                                                                                                               |                  |
| OS Swaps                                    | 16    | Number of swap pages                                                                                                                                                                                                     |                  |
| OS Voluntary context switches               | 16    | Number of voluntary context switches (for example, when a process gives up the CPU by a SLEEP() system call)                                                                                                             |                  |
| Parallel operations downgraded 1 to 25 pct  | 32    | Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers                                                                            |                  |
| Parallel operations downgraded 25 to 50 pct | 32    | Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers                                                                            |                  |
| Parallel operations downgraded 50 to 75 pct | 32    | Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers                                                                            |                  |
| Parallel operations downgraded 75 to 99 pct | 32    | Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers                                                                            |                  |
| Parallel operations downgraded to serial    | 32    | Number of times parallel execution was requested but execution was serial because of insufficient parallel execution servers                                                                                             |                  |
| Parallel operations not downgraded          | 32    | Number of times parallel execution was executed at the requested degree of parallelism                                                                                                                                   |                  |
| parse count (describe)                      | 64    | Total number of parse calls on a describe cursor. This operation is a less expensive than a hard parse and more expensive than a soft parse.                                                                             |                  |
| parse count (hard)                          | 64    | Total number of parse calls (real parses). A hard parse is a very expensive operation in terms of memory use, because it requires Oracle to allocate a workheap and other memory structures and then build a parse tree. |                  |
| parse count (total)                         | 64    | Total number of parse calls (hard, soft, and describe). A soft parse is a check on an object already in the shared pool, to verify that the permissions on the underlying object have not changed.                       |                  |
| parse time cpu                              | 64    | Total CPU time used for parsing (hard and soft) in 10s of milliseconds                                                                                                                                                   | Y                |
| parse time elapsed                          | 64    | Total elapsed time for parsing, in 10s of milliseconds. Subtract " <a href="#">parse time cpu</a> " from this statistic to determine the total waiting time for parse resources.                                         | Y                |
| physical maps pmem                          | 264   | Number of direct-mapped references acquired from FsDirect. Note that in steady state this is approximately the same as the number of unmaps, because each map requires an unmap (e.g. reuses a PMEM buffer).             |                  |
| physical read bytes                         | 8     | Total size in bytes of all disk reads by application activity (and not other instance activity) only.                                                                                                                    |                  |
| physical read flash cache hits              | 8     | Total number of reads from flash cache instead of disk                                                                                                                                                                   |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                       | Class | Description                                                                                                                                                                                                                                                                                                                                                   | TIMED_STATISTICS |
|--------------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| physical read IO requests                  | 8     | Number of read requests for application activity (mainly buffer cache and direct load operation) which read one or more database blocks per request. This is a subset of "physical read total IO requests" statistic.                                                                                                                                         |                  |
| physical read requests optimized           | 8     | Number of read requests that read one or more database blocks from the Database Smart Flash Cache or the Exadata Smart Flash Cache.                                                                                                                                                                                                                           |                  |
| physical read total bytes                  | 8     | Total size in bytes of disk reads by all database instance activity including application reads, backup and recovery, and other utilities. The difference between this value and "physical read bytes" gives the total read size in bytes by non-application workload.                                                                                        |                  |
| physical read total IO requests            | 8     | Number of read requests which read one or more database blocks for all instance activity including application, backup and recovery, and other utilities. The difference between this value and "physical read total multi block requests" gives the total number of small I/O requests which are less than 128 kilobytes down to single block read requests. |                  |
| physical read total multi block requests   | 8     | Total number of Oracle instance read requests which read 128 kilobytes or more in two or more database blocks per request for all instance activity including application, backup and recovery, and other utilities.                                                                                                                                          |                  |
| physical reads                             | 8     | Total number of data blocks read from disk. This value can be greater than the value of "physical reads direct" plus "physical reads cache" as reads into process private buffers also included in this statistic.                                                                                                                                            |                  |
| physical reads cache                       | 8     | Total number of data blocks read from disk into the buffer cache. This is a subset of "physical reads" statistic.                                                                                                                                                                                                                                             |                  |
| physical reads cache prefetch              | 8     | Number of contiguous and noncontiguous blocks that were prefetched.                                                                                                                                                                                                                                                                                           |                  |
| physical reads direct                      | 8     | Number of reads directly from disk, bypassing the buffer cache. For example, in high bandwidth, data-intensive operations such as parallel query, reads of disk blocks bypass the buffer cache to maximize transfer rates and to prevent the premature aging of shared data blocks resident in the buffer cache.                                              |                  |
| physical reads direct (lob)                | 8     | Number of buffers that were read directly for LOBs                                                                                                                                                                                                                                                                                                            |                  |
| physical reads direct temporary tablespace | 8     | Number of buffers that were read directly from temporary tablespaces                                                                                                                                                                                                                                                                                          |                  |
| physical reads for flashback new           | 8     | Number of blocks read for newing (that is, preparing a data block for a completely new change) blocks while flashback database is enabled                                                                                                                                                                                                                     |                  |
| physical reads pmem                        | 8     | Number of blocks read/copied from PMEM into DRAM cache                                                                                                                                                                                                                                                                                                        |                  |
| physical reads pmem decrypt                | 8     | Number of blocks read/copied from PMEM into DRAM cache due to the need for decryption. This is a subset of "physical reads pmem" statistics value.                                                                                                                                                                                                            |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                      | Class | Description                                                                                                                                                                                                                                                                                             | TIMED_STATISTICS |
|-------------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| physical reads pmem direct path           | 8     | Number of blocks read from PMEM into PGA memory due to direct path access. This is a subset of "physical reads pmem" statistics value.                                                                                                                                                                  |                  |
| physical reads pmem exclusive             | 8     | Number of blocks read/copied from PMEM into DRAM cache due to exclusive access requests, which prevents other processes from accessing the block on PMEM directly. This is a subset of "physical reads pmem" statistics value.                                                                          |                  |
| physical reads pmem modification          | 8     | Number of blocks read/copied from PMEM into DRAM cache due to modification. This is a subset of "physical reads pmem" statistics value.                                                                                                                                                                 |                  |
| physical reads pmem promote               | 8     | Number of blocks read/copied from PMEM into DRAM cache due to hot block promotion. This is a subset of "physical reads pmem" statistics value. This statistic is further categorized into "hot pmem block migration to dram successes" and "hot pmem block exchange with dram successes" statistics.    |                  |
| physical reads pmem rollback              | 8     | Number of blocks read/copied from PMEM into DRAM cache due to CR rollback. This is a subset of "physical reads pmem" statistics value.                                                                                                                                                                  |                  |
| physical reads prefetch warmup            | 8     | Number of data blocks that were read from the disk during the automatic prewarming of the buffer cache.                                                                                                                                                                                                 |                  |
| physical unmaps pmem forced               | 264   | Number of forfeited direct-mapped references requested by FsDirect due to PMEM memory pressure                                                                                                                                                                                                          |                  |
| physical write bytes                      | 8     | Total size in bytes of all disk writes from the database application activity (and not other kinds of instance activity).                                                                                                                                                                               |                  |
| physical write IO requests                | 8     | Number of write requests for application activity (mainly buffer cache and direct load operation) which wrote one or more database blocks per request.                                                                                                                                                  |                  |
| physical write total bytes                | 8     | Total size in bytes of all disk writes for the database instance including application activity, backup and recovery, and other utilities. The difference between this value and "physical write bytes" gives the total write size in bytes by non-application workload.                                |                  |
| physical write total IO requests          | 8     | Number of write requests which wrote one or more database blocks from all instance activity including application activity, backup and recovery, and other utilities. The difference between this stat and "physical write total multi block requests" gives the number of single block write requests. |                  |
| physical write total multi block requests | 8     | Total number of Oracle instance write requests which wrote two or more blocks per request to the disk for all instance activity including application activity, recovery and backup, and other utilities.                                                                                               |                  |
| physical writes                           | 8     | Total number of data blocks written to disk. This statistics value equals the sum of "physical writes direct" and "physical writes from cache" values.                                                                                                                                                  |                  |

| Name                                          | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | TIMED_STATISTICS |
|-----------------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| physical writes direct                        | 8     | Number of writes directly to disk, bypassing the buffer cache (as in a direct load operation)                                                                                                                                                                                                                                                                                                                                                                                                                           |                  |
| physical writes direct (lob)                  | 8     | Number of buffers that were directly written for LOBs                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| physical writes direct temporary tablespace   | 8     | Number of buffers that were directly written for temporary tablespaces                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                  |
| physical writes from cache                    | 8     | Total number of data blocks written to disk from the buffer cache. This is a subset of "physical writes" statistic.                                                                                                                                                                                                                                                                                                                                                                                                     |                  |
| physical writes non checkpoint                | 8     | Number of times a buffer is written for reasons other than advancement of the checkpoint. Used as a metric for determining the I/O overhead imposed by setting the <code>FAST_START_IO_TARGET</code> parameter to limit recovery I/Os. (Note that <code>FAST_START_IO_TARGET</code> is a deprecated parameter.) Essentially this statistic measures the number of writes that would have occurred had there been no checkpointing. Subtracting this value from "physical writes" gives the extra I/O for checkpointing. |                  |
| pinned buffers inspected                      | 8     | Number of times a user process, when scanning the tail of the replacement list looking for a buffer to reuse, encountered a cold buffer that was pinned or had a waiter that was about to pin it. This occurrence is uncommon, because a cold buffer should not be pinned very often.                                                                                                                                                                                                                                   |                  |
| pinned buffers inspected for pmem             | 8     | Number of times a user process, when scanning the tail of the replacement list looking for a PMEM buffer to reuse in DRAM, encountered a cold buffer that was pinned or had a waiter that was about to pin it. This occurrence is uncommon, because a cold buffer should not be pinned very often.                                                                                                                                                                                                                      |                  |
| prefetched blocks aged out before use         | 8     | Number of contiguous and noncontiguous blocks that were prefetched but aged out before use                                                                                                                                                                                                                                                                                                                                                                                                                              |                  |
| process last non-idle time                    | 128   | The last time this process executed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Y                |

| recovery blocks skipped lost write checks | 8     | Number of Block Read Records that skipped the lost write check during recovery.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                  |
| recursive calls                           | 1     | Number of recursive calls generated at both the user and system level. Oracle maintains tables used for internal processing. When Oracle needs to make a change to these tables, it internally generates an internal SQL statement, which in turn generates a recursive call.                                                                                                                                                                                                                                                                                                                                                                                                                                          |                  |
| recursive cpu usage                       | 1     | Total CPU time used by non-user calls (recursive calls). Subtract this value from "CPU used by this session" to determine how much CPU time was used by the user calls.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |
| redo blocks checksummed by FG (exclusive) | 2     | Number of exclusive redo blocks that were checksummed by the generating foreground processes. An exclusive redo block is the one whose entire redo content belongs to a single redo entry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                  |
| redo blocks checksummed by LGWR           | 2     | Number of redo blocks that were checksummed by the LGWR.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| redo blocks written                       | 2     | Total number of redo blocks written. This statistic divided by "redo writes" equals number of blocks per write.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                  |
| redo buffer allocation retries            | 2     | Total number of retries necessary to allocate space in the redo buffer. Retries are needed either because the redo writer has fallen behind or because an event such as a log switch is occurring.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                  |
| redo entries                              | 2     | Number of times a redo entry is copied into the redo log buffer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                  |
| redo entries for lost write detection     | 2     | Number of times a Block Read Record is copied into the log buffer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                  |
| redo log space requests                   | 2     | Number of times the active log file is full and Oracle must wait for disk space to be allocated for the redo log entries. Such space is created by performing a log switch.<br><br>Log files that are small in relation to the size of the SGA or the commit rate of the work load can cause problems. When the log switch occurs, Oracle must ensure that all committed dirty buffers are written to disk before switching to a new log file. If you have a large SGA full of dirty buffers and small redo log files, a log switch must wait for DBWR to write dirty buffers to disk before continuing.<br><br>Also examine the <b>log file space</b> and <b>log file space switch</b> wait events in V\$SESSION_WAIT |                  |
| redo log space wait time                  | 2     | Total time waited in centiseconds for available space in the redo log buffer. See also "redo log space requests"                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Y                |
| redo ordering marks                       | 2     | Number of times that a system change number was allocated to force a redo record to have a higher SCN than a record generated in another thread using the same block                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                  |
| redo size                                 | 2     | Total amount of redo generated in bytes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                    | Class | Description                                                                                                                                                                                                                                                                                                       | TIMED_STATISTICS |
|-----------------------------------------|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| redo size for lost write detection      | 2     | Total amount of Block Read Records generated in bytes.                                                                                                                                                                                                                                                            |                  |
| redo synch time                         | 8     | Elapsed time of all "redo synch writes" calls in 10s of milliseconds                                                                                                                                                                                                                                              | Y                |
| redo synch writes                       | 8     | Number of times the redo is forced to disk, usually for a transaction commit. The log buffer is a circular buffer that LGWR periodically flushes. Usually, redo that is generated and copied into the log buffer need not be flushed out to disk immediately.                                                     |                  |
| redo wastage                            | 2     | Number of bytes wasted because redo blocks needed to be written before they are completely full. Early writing may be needed to commit transactions, to be able to write a database buffer, or to switch logs.                                                                                                    |                  |
| redo write broadcast ack count          | 2     | Number of times a commit broadcast acknowledgment has not been received by the time when the corresponding log write is completed. This is only for Oracle RAC.                                                                                                                                                   |                  |
| redo write broadcast ack time           | 2     | Total amount of the latency associated with broadcast on commit beyond the latency of the log write (in microseconds). This is only for Oracle RAC.                                                                                                                                                               | Y                |
| redo write time                         | 2     | Total elapsed time of the write from the redo log buffer to the current redo log file in 10s of milliseconds                                                                                                                                                                                                      | Y                |
| redo writes                             | 2     | Total number of writes by LGWR to the redo log files. "redo blocks written" divided by this statistic equals the number of blocks per write                                                                                                                                                                       |                  |
| rollback changes - undo records applied | 128   | Number of undo records applied to user-requested rollback changes (not consistent-read rollbacks)                                                                                                                                                                                                                 |                  |
| rollbacks only - consistent read gets   | 128   | Number of consistent gets that require only block rollbacks, no block cleanouts.<br><b>See Also:</b> "consistent gets"                                                                                                                                                                                            |                  |
| rows fetched via callback               | 64    | Rows fetched via callback. Useful primarily for internal debugging purposes.                                                                                                                                                                                                                                      |                  |
| scheduler wait time                     | 1     | The total wait time (in microseconds) for waits that belong to the Scheduler wait class                                                                                                                                                                                                                           |                  |
| SCN increments due to another database  | 128   | SCN increments due to communication with another database                                                                                                                                                                                                                                                         |                  |
| serializable aborts                     | 1     | Number of times a SQL statement in a serializable isolation level had to terminate                                                                                                                                                                                                                                |                  |
| session connect time                    | 1     | The connect time for the session in 10s of milliseconds. This value is useful only in V\$SESSTAT. It is the wall clock time since the logon to this session occurred.                                                                                                                                             | Y                |
| session cursor cache count              | 64    | Total number of cursors cached. This statistic is incremented only if SESSION_CACHED_CURSORS > 0. This statistic is the most useful in V\$SESSTAT. If the value for this statistic in V\$SESSTAT is close to the setting of the SESSION_CACHED_CURSORS parameter, the value of the parameter should be increased. |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                                  | Class | Description                                                                                                                                                                                                                                              | TIMED_STATISTICS |
|---------------------------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| session cursor cache hits             | 64    | Number of hits in the session cursor cache. A hit means that the SQL (including recursive SQL) or PL/SQL statement did not have to be reparsed. Subtract this statistic from "parse count (total)" to determine the real number of parses that occurred. |                  |
| session logical reads                 | 1     | The sum of "db block gets" plus "consistent gets". This includes logical reads of database blocks from either the buffer cache or process private memory.                                                                                                |                  |
| session logical reads - IM            | 128   | Number of database blocks read from the IM column store (number of blocks in IMCU - number of blocks with invalid rows)                                                                                                                                  |                  |
| session pga memory                    | 1     | Current PGA size for the session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.                                                                                                                                                            |                  |
| session pga memory max                | 1     | Peak PGA size for the session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.                                                                                                                                                               |                  |
| session stored procedure space        | 1     | Amount of memory this session is using for stored procedures                                                                                                                                                                                             |                  |
| session uga memory                    | 1     | Current UGA size for the session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.                                                                                                                                                            |                  |
| session uga memory max                | 1     | Peak UGA size for a session. Useful only in V\$SESSTAT; it has no meaning in V\$SYSSTAT.                                                                                                                                                                 |                  |
| shared hash latch upgrades - no wait  | 8     | A shared hash latch upgrade is when a hash latch is upgraded from shared mode to exclusive mode. This statistic displays the number of times the upgrade completed immediately.                                                                          |                  |
| shared hash latch upgrades - wait     | 8     | A shared hash latch upgrade is when a hash latch is upgraded from shared mode to exclusive mode. This statistics displays the number of times the upgrade did not complete immediately.                                                                  |                  |
| shared io pool buffer get failure     | 128   | Number of unsuccessful buffer gets from the shared I/O pool from instance startup time.                                                                                                                                                                  |                  |
| shared io pool buffer get success     | 128   | Number of successful buffer gets from the shared I/O pool from instance startup time.                                                                                                                                                                    |                  |
| slave propagated tracked transactions | 128   | Number of transactions modifying tables enabled for flashback data archive which were archived by a worker process                                                                                                                                       |                  |
| sorts (disk)                          | 64    | Number of sort operations that required at least one disk write<br><br>Sorts that require I/O to disk are quite resource intensive. Try increasing the size of the initialization parameter SORT_AREA_SIZE. For more information, see "SORT_AREA_SIZE".  |                  |

**Table E-1 (Cont.) Database Statistics Descriptions**

| Name                              | Class | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | TIMED_STATISTICS |
|-----------------------------------|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| sorts (memory)                    | 64    | Number of sort operations that were performed completely in memory and did not require any disk writes<br>You cannot do much better than memory sorts, except maybe no sorts at all. Sorting is usually caused by selection criteria specifications within table join SQL operations.                                                                                                                                                                                                                                  |                  |
| sorts (rows)                      | 64    | Total number of rows sorted                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                  |
| SQL*Net roundtrips to/from client | 1     | Total number of Oracle Net Services messages sent to and received from the client                                                                                                                                                                                                                                                                                                                                                                                                                                      |                  |
| SQL*Net roundtrips to/from dblink | 1     | Total number of Oracle Net Services messages sent over and received from a database link                                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| summed dirty queue length         | 8     | The sum of the dirty LRU queue length after every write request. Divide by <b>write requests</b> to get the average queue length after write completion.                                                                                                                                                                                                                                                                                                                                                               |                  |
| switch current from pmem          | 8     | Number of times the CURRENT PMEM block moved to a DRAM buffer, leaving a CR block in the original PMEM buffer. This happens when one Oracle process pins a CURRENT PMEM buffer for read, and another Oracle process wants to pin the same buffer for modification. The latter process clones the PMEM buffer into a new DRAM buffer for modification, while converting the original PMEM current buffer into a PMEM CR buffer.                                                                                         |                  |
| switch current to new buffer      | 8     | Number of times the CURRENT block moved to a different buffer, leaving a CR block in the original buffer                                                                                                                                                                                                                                                                                                                                                                                                               |                  |
| table fetch by rowid              | 64    | Number of rows that are fetched using a ROWID (usually recovered from an index)<br><br>This occurrence of table scans usually indicates either non-optimal queries or tables without indexes. Therefore, this statistic should increase as you optimize queries and provide indexes in the application.                                                                                                                                                                                                                |                  |
| table fetch continued row         | 64    | Number of times a chained or migrated row is encountered during a fetch<br><br>Retrieving rows that span more than one block increases the logical I/O by a factor that corresponds to the number of blocks that need to be accessed. Exporting and re-importing may eliminate this problem. Evaluate the settings for the storage parameters PCTFREE and PCTUSED. This problem cannot be fixed if rows are larger than database blocks (for example, if the LONG data type is used and the rows are extremely large). |                  |
| table scan blocks gotten          | 64    | During scanning operations, each row is retrieved sequentially by Oracle. This statistic counts the number of blocks encountered during the scan.<br><br>This statistic tells you the number of database blocks that you had to get from the buffer cache for the purpose of scanning. Compare this value with the value of " <a href="#">consistent gets</a> " to determine how much of the consistent read activity can be attributed to scanning.                                                                   |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                                                       | Class | Description                                                                                                                                                           | TIMED_STATISTICS |
|------------------------------------------------------------|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| table scan disk IMC fallback                               | 128   | Number of rows fetched from the buffer cache because they were not present in the IM column store (in a scan that was otherwise performed in memory)                  |                  |
| table scan disk non-IMC rows gotten                        | 128   | Number of rows fetched during non-In-Memory scan                                                                                                                      |                  |
| table scan rows gotten                                     | 64    | Number of rows that are processed during scanning operations                                                                                                          |                  |
| table scans (cache partitions)                             | 64    | Number of range scans performed on tables that have the CACHE option enabled                                                                                          |                  |
| table scans (direct read)                                  | 64    | Number of table scans performed with direct read (bypassing the buffer cache)                                                                                         |                  |
| table scans (IM)                                           | 128   | Number of segments / granules scanned using In-Memory                                                                                                                 |                  |
| table scans (long tables)                                  | 64    | Long (or conversely short) tables can be defined as tables that do not meet the short table criteria as described in <a href="#">"table scans (short tables)"</a>     |                  |
| table scans (rowid ranges)                                 | 64    | During parallel query, the number of table scans conducted with specified ROWID ranges                                                                                |                  |
| table scans (short tables)                                 | 64    | Long (or conversely short) tables can be defined by optimizer hints coming down into the row source access layer of Oracle. The table must have the CACHE option set. |                  |
| tracked rows                                               | 128   | Number of rows modified in tables enabled for flashback data archive                                                                                                  |                  |
| tracked transactions                                       | 128   | Number of transactions which modified a table enabled for flashback data archive                                                                                      |                  |
| transaction lock background get time                       | 128   | Useful only for internal debugging purposes                                                                                                                           |                  |
| transaction lock background gets                           | 128   | Useful only for internal debugging purposes                                                                                                                           |                  |
| transaction lock foreground requests                       | 128   | Useful only for internal debugging purposes                                                                                                                           |                  |
| transaction lock foreground wait time                      | 128   | Useful only for internal debugging purposes                                                                                                                           |                  |
| transaction rollbacks                                      | 128   | Number of transactions being successfully rolled back                                                                                                                 |                  |
| transaction tables consistent read rollbacks               | 128   | Number of times rollback segment headers are rolled back to create consistent read blocks                                                                             |                  |
| transaction tables consistent reads - undo records applied | 128   | Number of undo records applied to transaction tables that have been rolled back for consistent read purposes                                                          |                  |

Table E-1 (Cont.) Database Statistics Descriptions

| Name                               | Class | Description                                                                                                                                                                                                                                        | TIMED_STATISTICS |
|------------------------------------|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| user commits                       | 1     | Number of user commits. When a user commits a transaction, the redo generated that reflects the changes made to database blocks must be written to disk. Commits often represent the closest thing to a user transaction rate.                     |                  |
| user I/O wait time                 | 1     | The total wait time (in centiseconds) for waits that belong to the User I/O wait class                                                                                                                                                             |                  |
| user rollbacks                     | 1     | Number of times users manually issue the <code>ROLLBACK</code> statement or an error occurs during a user's transactions                                                                                                                           |                  |
| very large tracked transactions    | 128   | For tables tracked by flashback data archive, number of transactions modifying those tables which are very large in terms of size or number of changes                                                                                             |                  |
| write clones created in background | 8     | Number of times a background or foreground process clones a <code>CURRENT</code> buffer that is being written. The clone becomes the new, accessible <code>CURRENT</code> buffer, leaving the original buffer (now the clone) to complete writing. |                  |
| write clones created in foreground | 8     | Number of times a background or foreground process clones a <code>CURRENT</code> buffer that is being written. The clone becomes the new, accessible <code>CURRENT</code> buffer, leaving the original buffer (now the clone) to complete writing. |                  |

# F

## Background Processes

An Oracle Database **background process** is defined as any process that is listed in `V$PROCESS` and has a non-null value in the `PNAME` column.

[Table F-1](#) describes Oracle Database background processes.

The External Properties column lists the type of instance in which the process runs. If the process is specific to a particular feature, then the column names the feature.

### Note:

When the `THREADED_EXECUTION` initialization parameter is set to `TRUE` on Linux and UNIX, the `DBW`, `PMON`, `PSP`, and `VKTM` background processes run as operating system processes, and the other background processes run as operating system threads.

See "[THREADED\\_EXECUTION](#)" for more information about the `THREADED_EXECUTION` initialization parameter.

**Table F-1 Background Processes**

| Name             | Expanded Name                                                     | Short Description                                                                                                                | Long Description                                                                                                                                                                                                                                                                                                                                                                          | External Properties              |
|------------------|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| ABMR             | Auto BMR Background Process                                       | Coordinates execution of tasks such as filtering duplicate block media recovery requests and performing flood control            | When a process submits a block media recovery request to ABMR, it dynamically spawns worker processes ( <code>BMR<sub>n</sub></code> ) to perform the recovery. ABMR and <code>BMR<sub>n</sub></code> terminate after being idle for a long time.<br><b>See Also:</b> <i>Oracle Database Backup and Recovery User's Guide</i>                                                             | Database instances               |
| ACFS             | Oracle Advanced Cluster File System (Oracle ACFS) CSS Process     | Tracks the cluster membership in CSS and informs the file system driver of membership changes                                    | The ACFS process delivers CSS membership changes to the cluster file system. These membership changes are required for the file system to maintain file system consistency within the cluster.                                                                                                                                                                                            | Oracle ASM instances, Oracle RAC |
| ACMS             | Atomic Control File to Memory Service Process                     | Coordinates consistent updates to a control file resource with its SGA counterpart on all instances in an Oracle RAC environment | The ACMS process works with a coordinating caller to ensure that an operation is executed on every instance in Oracle RAC despite failures. ACMS is the process in which a distributed operation is called. As a result, this process can exhibit a variety of behaviors. In general, ACMS is limited to small, nonblocking state changes for a limited set of cross-instance operations. | Database instances, Oracle RAC   |

| ASMB,<br>AMB $n$ | ASM<br>Background<br>Process                      | Communicates with an Oracle ASM instance, managing storage and providing statistics                                                                                                                                                                     | <p>In a database instance, the ASMB and AMB<math>n</math> processes enable the database instance to connect to an Oracle ASM instance in order to access Oracle ASM disk groups. Possible processes are ASMB and AMB1-AMB3.</p> <p>In an Oracle ASM instance, the ASMB process runs when the ASMCMD <code>cp</code> command runs, or when a database instance first starts if the server parameter file is stored in Oracle ASM. ASMB also runs with Oracle Cluster Registry on Oracle ASM. The only possible process is ASMB; AMB<math>n</math> processes do not run in Oracle ASM instances.</p> <p>In an Oracle IO Server (IOS) instance, the ASMB process enables the IOS instance to connect to an Oracle ASM instance in order to access Oracle ASM disk groups. The only possible process is ASMB; AMB<math>n</math> processes do not run in IOS instances.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Database instances, Oracle ASM instances, Oracle IO Server (IOS) instances                            |
| AS $nn$          | Replication<br>Apply Reader<br>or Apply<br>Server | <p>Computes dependencies between logical change records (LCRs) and assembles messages into transactions (Reader Server)</p> <p>Applies LCRs to database objects or passes LCRs and user messages to their appropriate apply handlers (Apply Server)</p> | <p>When the reader server finishes computing dependencies between LCRs and assembling transactions, it returns the assembled transactions to the coordinator process. Query <code>V\$STREAMS_APPLY_READER</code>, <code>V\$XSTREAM_APPLY_READER</code>, and <code>V\$GG_APPLY_READER</code> for information about the reader server background process.</p> <p>An apply server receives the transactions from the coordinator background process, and either applies database changes in LCRs or sends LCRs or messages to apply handlers. Apply servers can also enqueue a queue. If an apply server encounters an error, then it then tries to resolve the error with a user-specified conflict handler or error handler. If an apply server cannot resolve an error, then it rolls back the transaction and places the entire transaction, including all of its messages, in the error queue. When an apply server commits a completed transaction, this transaction has been applied. When an apply server places a transaction in the error queue and commits, this transaction also has been applied. Query <code>V\$STREAMS_APPLY_SERVER</code> for information about the apply server background process. For XStream Inbound servers, query <code>V\$XSTREAM_APPLY_SERVER</code>. For GoldenGate Integrated Replicat, query <code>V\$GG_APPLY_SERVER</code>.</p> <p>The coordinator process name is AS<math>nn</math>, where <math>nn</math> can include letters and numbers.</p> | Database instances, XStream Outbound servers, XStream Inbound servers, GoldenGate Integrated Replicat |

Table F-1 (Cont.) Background Processes

| Name    | Expanded Name                                      | Short Description                                                                                                                      | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | External Properties                      |
|---------|----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| BMR $n$ | Automatic Block Media Recovery Worker Pool Process | Fetches blocks from a real-time readable standby database                                                                              | When a process submits a block media recovery request to ABMR, it dynamically spawns worker processes (BMR $n$ ) to perform the recovery. BMR $n$ processes fetch blocks from a real-time readable standby database. ABMR and BMR $n$ terminate after being idle for a long time.<br><br><b>See Also:</b> <i>Oracle Database Backup and Recovery User's Guide</i>                                                                                                                                                                       | Database instances                       |
| B $nnn$ | ASM Blocking Worker Process for GMON               | Performs maintenance actions on Oracle ASM disk groups                                                                                 | B $nnn$ performs actions that require waiting for resources on behalf of GMON. GMON must be highly available and cannot wait.<br><br>A B $nnn$ worker is spawned when a disk is taken offline in an Oracle ASM disk group. Offline timer processing and drop of the disk are performed in this worker. Up to five process (B000 to B004) can exist depending on the load.                                                                                                                                                               | Oracle ASM instances                     |
| BW $nn$ | Database Writer Process                            | Writes modified blocks from the database buffer cache to the data files                                                                | See the <b>Long Description</b> for the DBW $n$ process in this table for more information about the BW $nn$ process.                                                                                                                                                                                                                                                                                                                                                                                                                   | Database instances                       |
| CJQ0    | Job Queue Coordinator Process                      | Selects jobs that need to be run from the data dictionary and spawns job queue worker processes (J $nnn$ ) to run the jobs             | CJQ0 is automatically started and stopped as needed by Oracle Scheduler.<br><br>The JOB_QUEUE_PROCESSES initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. CJQ0 starts only as many job queue processes as required by the number of jobs to run and available resources.<br><br><b>See Also:</b> <i>Oracle Database Concepts</i> and <i>Oracle Database Administrator's Guide</i>                                                                                       | Database instances                       |
| CKPT    | Checkpoint Process                                 | Signals DBW $n$ at checkpoints and updates all the data files and control files of the database to indicate the most recent checkpoint | At specific times CKPT starts a checkpoint request by messaging DBW $n$ to begin writing dirty buffers. On completion of individual checkpoint requests, CKPT updates data file headers and control files to record most recent checkpoint.<br><br>CKPT checks every three seconds to see whether the amount of memory exceeds the value of the PGA_AGGREGATE_LIMIT initialization parameter, and if so, takes the action described in " <a href="#">PGA_AGGREGATE_LIMIT</a> ".<br><br><b>See Also:</b> <i>Oracle Database Concepts</i> | Database instances, Oracle ASM instances |
| CL $nn$ | Cleanup Worker Process                             | Performs cleanup of terminated processes                                                                                               | Cleanup workers assist in the cleanup of terminated processes and terminated sessions. The number of workers will be proportional to the amount of cleanup work to be done and the current efficiency of cleanup.                                                                                                                                                                                                                                                                                                                       | Database instances, Oracle ASM instances |

Table F-1 (Cont.) Background Processes

|---------|---------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| CLG     | Persistent Cluster Flash Cache Background Process | For Oracle Data Appliance only, this process performs actions related to recovery of a terminated instance's database flash cache                                                | For Oracle Data Appliance only, in the event of an instance crash, the running instance will recover the crashed instance's database flash cache. The CLG process will perform actions related to scanning the crashed instance's database flash cache and claim flash blocks mastered by the crashed instance.                                                                                                                                                                                                                                                                                                                                                | Database instances, Oracle RAC               |
| CLMN    | Cleanup Main Process                              | Performs cleanup of terminated processes, terminated sessions, terminated transactions, and terminated network connections                                                       | CLMN periodically performs cleanup of all the following: terminated processes, terminated sessions, transactions, network connections, idle sessions, detached transactions, and detached network connections that have exceeded their idle timeout.                                                                                                                                                                                                                                                                                                                                                                                                           | Database instances, Oracle ASM instances     |
| CP $nn$ | Replication Capture Process                       | Captures database changes from the redo log by using the infrastructure of LogMiner                                                                                              | The capture process name is CP $nn$ , where $nn$ can include letters and numbers. The underlying LogMiner process name is MS $nn$ , where $nn$ can include letters and numbers. The capture process includes one reader server that reads the redo log and divides it into regions, one or more preparer servers that scan the redo log, and one builder server that merges redo records from the preparer servers. Each reader server, preparer server, and builder server is a process. Query the V\$XSTREAM_CAPTURE and V\$GOLDENGATE_CAPTURE views for information about this background process.<br><b>See Also:</b> <i>Oracle Database XStream Guide</i> | Database instances, XStream Outbound Servers |
| CR $nn$ | LMS CR Worker Process                             | Offloads the work from LMS so that blocks that require lots of UNDO to be applied do not block the LMS. Such requests are passed on to the worker so that the LMS is not stalled | There can be a maximum of eight CR processes per LMS process, with names from CR00 to CR07. Each LMS has its own set with similar name. The CR $nn$ processes are threads and the process ID part will be the same as the owning LMS's process ID.<br>The names for CR $nn$ processes will have the format CR0 $n$ _ $\langle$ spawning process id $\rangle$ _ $\langle$ thread id $\rangle$ .                                                                                                                                                                                                                                                                 | Oracle RAC                                   |
| CS $nn$ | I/O Calibration Process                           | Issues I/Os to storage as part of storage calibration.                                                                                                                           | CS $nn$ worker processes are started on execution of the DBMS_RESOURCE_MANAGER.CALIBRATE_IO() procedure. There is one worker process per CPU on each node of the database.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Database instances, Oracle RAC               |
| CTWR    | Change Tracking Writer Process                    | Tracks changed data blocks as part of the Recovery Manager block change tracking feature                                                                                         | CTWR tracks changed blocks as redo is generated at a primary database and as redo is applied at a standby database. The process is slightly different depending on the type of database.<br><b>See Also:</b> <i>Oracle Database Backup and Recovery User's Guide</i>                                                                                                                                                                                                                                                                                                                                                                                           | Database instances                           |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                      | Short Description                                                                                           | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | External Properties                         |
|------|------------------------------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| CXnn | Replication Capture Worker Process | Sends captured LCRs to a receiver, such as an XStream Outbound Server                                       | The capture worker process name is CXnn, where nn can include letters and numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Database instances, XStream Outbound Server |
| DBRM | Database Resource Manager Process  | Sets resource plans and performs other tasks related to the Database Resource Manager                       | If a resource plan is not enabled, then this process is idle.<br><b>See Also:</b> <i>Oracle Database Administrator's Guide</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Database instances                          |
| DBWn | Database Writer Process            | Writes modified blocks from the database buffer cache to the data files                                     | The primary responsibility of the Database Writer Process is to write data blocks to disk. It also handles checkpoints, file open synchronization, and logging of Block Written records.<br><br>In many cases the blocks that the Database Writer Process writes are scattered throughout the disk. Thus, the writes tend to be slower than the sequential writes performed by LGWR. The Database Writer Process performs multiblock writes when possible to improve efficiency. The number of blocks written in a multiblock write varies by operating system.<br><br>The DB_WRITER_PROCESSES initialization parameter specifies the number of Database Writer Processes. There can be 1 to 100 Database Writer Processes. The names of the first 36 Database Writer Processes are DBW0-DBW9 and DBWa-DBWz. The names of the 37th through 100th Database Writer Processes are BW36-BW99. The database selects an appropriate default setting for the DB_WRITER_PROCESSES parameter or adjusts a user-specified setting based on the number of CPUs and processor groups.<br><b>See Also:</b> " <a href="#">DB_WRITER_PROCESSES</a> " | Database instances                          |
| DIA0 | Diagnostic Process                 | Detects and resolves hangs and deadlocks                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Database instances, Oracle ASM instances    |
| DIAG | Diagnostic Capture Process         | Performs diagnostic dumps                                                                                   | DIAG performs diagnostic dumps requested by other processes and dumps triggered by process or instance termination. In Oracle RAC, DIAG performs global diagnostic dumps requested by remote instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Database instances, Oracle ASM instances    |
| DMnn | Data Pump Control Job Process      | Coordinates the Data Pump job tasks performed by Data Pump worker processes and handles client interactions | The Data Pump control job process is started during job creation and coordinates all tasks performed by the Data Pump job. It handles all client interactions and communication, establishes all job contexts, and coordinates all worker process activities on behalf of the job.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Database instances, Data Pump               |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                     | Short Description                                                                                                                            | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | External Properties                |
|------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| DMON | Data Guard Broker Monitor Process | Manages and monitors a database that is part of a Data Guard broker configuration                                                            | <p>When you start the Data Guard broker, a DMON process is created. DMON runs for every database instance that is managed by the broker. DMON interacts with the local database and the DMON processes of the other databases to perform the requested function. DMON also monitors the health of the broker configuration and ensures that every database has a consistent description of the configuration.</p> <p>DMON maintains profiles about all database objects in the broker configuration in a binary configuration file. A copy of this file is maintained by the DMON process for each of the databases that belong to the broker configuration. The process is created when the <code>DG_BROKER_START</code> initialization parameter is set to <code>true</code>.</p> <p><b>See Also:</b> <i>Oracle Data Guard Broker</i></p>                                                                                                                                                                                                                                                                   | Database instances, Data Guard     |
| Dnnn | Dispatcher Process                | Performs network communication in the shared server architecture                                                                             | <p>In the shared server architecture, clients connect to a dispatcher process, which creates a virtual circuit for each connection. When the client sends data to the server, the dispatcher receives the data into the virtual circuit and places the active circuit on the common queue to be picked up by an idle shared server. The shared server then reads the data from the virtual circuit and performs the database work necessary to complete the request. When the shared server must send data to the client, the server writes the data back into the virtual circuit and the dispatcher sends the data to the client. After the shared server completes the client request, the server releases the virtual circuit back to the dispatcher and is free to handle other clients.</p> <p>Several initialization parameters relate to shared servers. The principal parameters are: <code>DISPATCHERS</code>, <code>SHARED_SERVERS</code>, <code>MAX_SHARED_SERVERS</code>, <code>LOCAL_LISTENER</code>, <code>REMOTE_LISTENER</code>.</p> <p><b>See Also:</b> <i>Oracle Database Concepts</i></p> | Database instances, shared servers |
| DSKM | Worker Diskmon Process            | Acts as the conduit between the database, Oracle ASM instances, and the Primary Diskmon daemon to communicate information to Exadata storage | This process is active only if Exadata Storage is used. DSKM performs operations related to Exadata I/O fencing and Exadata cell failure handling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Oracle ASM instances, Exadata      |
| DWnn | Data Pump Worker Process          | Performs Data Pump tasks as assigned by the Data Pump control job process                                                                    | The Data Pump worker process is responsible for performing tasks that are assigned by the Data Pump control job process, such as the loading and unloading of metadata and data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Database instances                 |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                                        | Short Description                                                                                                               | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | External Properties                      |
|------|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| EMNC | EMON Coordinator Process                             | Coordinates database event management and notifications                                                                         | EMNC is a primary background process that coordinates event management and notification activity in the database, including Streams Event Notifications, Continuous Query Notifications, and Fast Application Notifications.                                                                                                                                                                                                                                                                                             | Database instances                       |
| Ennn | EMON Worker Process                                  | Performs database event management and notifications                                                                            | The database event management and notification load is distributed among the EMON worker processes. These processes work on the system notifications in parallel, offering a capability to process a larger volume of notifications, a faster response time, and a lower shared memory use for staging notifications.                                                                                                                                                                                                    | Database instances                       |
| FBDA | Flashback Data Archiver Process                      | Archives historical rows for tracked tables into flashback data archives and manages archive space, organization, and retention | When a transaction that modifies a tracked table commits, FBDA stores the pre-image of the rows in the archive. FBDA maintains metadata on the current rows and tracks how much data has been archived.<br><br>FBDA is also responsible for automatically managing the flashback data archive for space, organization (partitioning tablespaces), and retention. FBDA also keeps track of how far the archiving of tracked transactions has progressed.<br><br><b>See Also:</b> <i>Oracle Database Development Guide</i> | Database instances                       |
| FDnn | Oracle ASM Stale FD Cleanup Worker Process           | Cleans up Oracle ASM stale file descriptors on foreground processes                                                             | This process cleans up Oracle ASM stale file descriptors on foreground processes if an Oracle ASM disk is globally closed.                                                                                                                                                                                                                                                                                                                                                                                               | Database and Oracle ASM instances        |
| FENC | Fence Monitor Process                                | Processes fence requests for RDBMS instances which are using Oracle ASM instances                                               | CSS monitors RDBMS instances which are connected to the Oracle ASM instance and constantly doing I/Os. When the RDBMS instance terminates due to a failure, all the outstanding I/O's from the RDBMS instance should be drained and any new I/O's rejected. FENC receives and processes the fence request from CSSD.                                                                                                                                                                                                     | Oracle ASM instances                     |
| FMON | File Mapping Monitor Process                         | Manages mapping information for the Oracle Database file mapping interface                                                      | The <code>DBMS_STORAGE_MAP</code> package enables you to control the mapping operations. When instructed by the user, FMON builds mapping information and stores it in the SGA, refreshes the information when a change occurs, saves the information to the data dictionary, and restores it to the SGA at instance startup.<br><br>FMON is started by the database whenever the <code>FILE_MAPPING</code> initialization parameter is set to <code>true</code> .                                                       | Database instances, Oracle ASM instances |
| FSFP | Data Guard Broker Fast Start Failover Pinger Process | Maintains fast-start failover state between the primary and target standby databases                                            | FSFP is created when fast-start failover is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Database instances, Data Guard           |

Table F-1 (Cont.) Background Processes

| Name    | Expanded Name                             | Short Description                                                                    | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | External Properties                                                                                |
|---------|-------------------------------------------|--------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| GCR $n$ | Global Conflict Resolution Worker Process | Performs synchronous tasks on behalf of LMHB                                         | GCR $n$ processes are transient workers that are started and stopped as required by LMHB to perform synchronous or resource intensive tasks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Database instances, Oracle ASM instances, Oracle RAC                                               |
| GCW $n$ | GCR Monitor processes (LMHB)              | GCR(DRF) monitor processes (LMHB)                                                    | Infrastructure helper processes for LMHB. Monitors the LMHB process for stalls, and restarts if necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Database instances, Oracle ASM instances, Oracle RAC instances (prior to Oracle Database 23c only) |
| GEN0    | General Task Execution Process            | Performs required tasks including SQL and DML                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Database instances, Oracle ASM instances, Oracle ASM Proxy instances                               |
| GMON    | ASM Disk Group Monitor Process            | Monitors all mounted Oracle ASM disk groups                                          | GMON monitors all the disk groups mounted in an Oracle ASM instance and is responsible for maintaining consistent disk membership and status information. Membership changes result from adding and dropping disks, whereas disk status changes result from taking disks offline or bringing them online.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Oracle ASM instances                                                                               |
| GTX $n$ | Global Transaction Process                | Provides transparent support for XA global transactions in an Oracle RAC environment | <p>These processes help maintain the global information about XA global transactions throughout the cluster. Also, the processes help perform two-phase commit for global transactions anywhere in the cluster so that an Oracle RAC database behaves as a single system to the externally coordinated distributed transactions.</p> <p>The GLOBAL_TXN_PROCESSES initialization parameter specifies the number of GTX<math>n</math> processes, where <math>n</math> is 0-9 or a-j. The database automatically tunes the number of these processes based on the workload of XA global transactions. You can disable these processes by setting the parameter to 0. If you try to run XA global transactions with these processes disabled, an error is returned.</p> <p><b>See Also:</b> <i>Oracle Real Application Clusters Administration and Deployment Guide</i></p> | Database instances, Oracle RAC                                                                     |

Table F-1 (Cont.) Background Processes

| Name        | Expanded Name                               | Short Description                                                                                                    | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | External Properties                                  |
|-------------|---------------------------------------------|----------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| <i>Innn</i> | Disk and Tape I/O Worker Process            | Serves as an I/O worker process spawned on behalf of DBWR, LGWR, or an RMAN backup session                           | I/O worker process can be configured on platforms where asynchronous I/O support is not available. These workers are started by setting the corresponding worker enable parameter in the server parameter file. The I/O workers simulate the asynchronous I/O behavior when the underlying platform does not have native support for asynchronous I/O.                                                                                                                                                                                                                        | Database instances                                   |
| IMCO        | In-Memory Coordinator                       | Initiates background population and repopulation of in-memory enabled objects                                        | The IMCO background process initiates population (prepopulation) of in-memory enabled objects with priority LOW/MEDIUM/HIGH/CRITICAL. In-memory enabled objects with priority NONE will not be prepopulated but will be populated on demand via <i>Wnnn</i> processes when queried. The IMCO background process can also initiate repopulation of in-memory objects.<br><br>Starting with Oracle Database 19c, IMXT (In-Memory External Table) segments are dropped by the IMCO background process. In previous releases, IMXT segments were dropped by foreground processes. | Database instances                                   |
| IMR0        | Instance Membership Recovery Worker Process | Performs synchronous tasks on behalf of LMON                                                                         | The IMR0 background process performs the Instance Member Recovery synchronous operations on behalf of LMON                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Oracle RAC, Database instances, Oracle ASM instances |
| INSV        | Data Guard Broker Instance Worker Process   | Performs Data Guard broker communication among instances in an Oracle RAC environment                                | INSV is created when the <code>DG_BROKER_START</code> initialization parameter is set to <code>true</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Database instances, Data Guard                       |
| IPC0        | IPC Service Background Process              | Common background server for basic messaging and RDMA primitives based on IPC (Inter-process communication) methods. | IPC0 handles very high rates of incoming connect requests, as well as, completing reconfigurations to support basic messaging and RDMA primitives over several transports such as UDP, RDS, InfiniBand and RC.                                                                                                                                                                                                                                                                                                                                                                | Oracle RAC                                           |
| <i>Jnnn</i> | Job Queue Worker Process                    | Executes jobs assigned by the job coordinator                                                                        | Job worker processes are created or awakened by the job coordinator when it is time for a job to be executed.<br><br>Job workers gather all the metadata required to run the job from the data dictionary. The worker processes start a database session as the owner of the job, execute triggers, and then execute the job. After the job is complete, the worker processes commit and then execute appropriate triggers and close the session. The worker can repeat this operation in case additional jobs need to be run.                                                | Database instances                                   |

Table F-1 (Cont.) Background Processes

| Name    | Expanded Name                               | Short Description                                              | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                 | External Properties                                  |
|---------|---------------------------------------------|----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| JP $n$  | Java Patching Worker Process                | Patches and updates the Java in the database classes           | JP $n$ patches and updates the Java in the database classes. It is only started for Oracle Real Application Clusters (Oracle RAC) databases, and one of the database instances is responsible for patching the Java in the database objects. For multitenant container databases (CDBs), the process updates each pluggable database (PDB) individually. JP $n$ is started automatically and does not require user intervention. | Oracle RAC                                           |
| LCK $n$ | Lock Process                                | Manages global enqueue requests and cross-instance broadcasts  | The process handles all requests for resources other than data blocks. For examples, LCK $n$ manages library and row cache requests. Possible processes are LCK0 and LCK1.                                                                                                                                                                                                                                                       | Database instances, Oracle ASM instances, Oracle RAC |
| LDD $n$ | Global Enqueue Service Daemon Helper Worker | Helps the LMD $n$ processes with various tasks                 | LDD $n$ processes are worker processes spawned on demand by LMD $n$ processes. They are spawned to help the dedicated LMD $n$ processes with various tasks when certain workloads start creating performance bottlenecks. These worker processes are transient as they are started on demand and they can be shutdown when no longer needed. There can be up to 36 of these worker processes (LDD0-LDDz).                        | Database instances, Oracle ASM instances, Oracle RAC |
| LG $n$  | Log Writer Worker                           | Writes redo log                                                | On multiprocessor systems, LGWR creates worker processes to improve the performance of writing to the redo log. LGWR workers are not used when there is a SYNC standby destination. Possible processes are LG00-LG99.                                                                                                                                                                                                            | Database instances                                   |
| LGWR    | Log Writer Process                          | Writes redo entries to the online redo log                     | Redo log entries are generated in the redo log buffer of the system global area (SGA). LGWR writes the redo log entries sequentially into a redo log file. If the database has a multiplexed redo log, then LGWR writes the redo log entries to a group of redo log files.<br><b>See Also:</b> <i>Oracle Database Concepts</i> and <i>Oracle Database Administrator's Guide</i>                                                  | Database instances, Oracle ASM instances             |
| LM $n$  | <b>See</b> LMS $n$ , LM $n$                 |                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                      |
| LMD $n$ | Global Enqueue Service Daemon Process       | Manages incoming remote resource requests from other instances | LMD $n$ processes enqueue resources managed under Global Enqueue Service. In particular, they process incoming enqueue request messages and control access to global enqueues. They also perform distributed deadlock detections. There can be up to 36 of these processes (LMD0-LMDz).                                                                                                                                          | Database instances, Oracle ASM instances, Oracle RAC |

| LMFC       | Lock Manager Flash Cache Process                | For Oracle Database Appliance only, performs actions related to recovery of a terminated instance's database flash cache. | For Oracle Database Appliance only, in the event of a instance crash, the running instance will recover the crashed instance's database flash cache. The LMFC process will perform actions related to scanning the crashed instance's database flash cache and claim flash blocks mastered by the crashed instance.                                                                                                                                                      | Database instances, Oracle RAC                       |
| LMHB       | Global Cache/ Enqueue Service Heartbeat Monitor | Monitor the heartbeat of several processes                                                                                | LMHB monitors the CKPT, DIAn, LCKn, LGnn, LGWR, LMDn, LMON, LMSn , and RMSn processes to ensure they are running normally without blocking or spinning.                                                                                                                                                                                                                                                                                                                  | Database instances, Oracle ASM instances, Oracle RAC |
| LMON       | Global Enqueue Service Monitor Process          | Monitors an Oracle RAC cluster to manage global resources                                                                 | LMON maintains instance membership within Oracle RAC. The process detects instance transitions and performs reconfiguration of GES and GCS resources.<br><b>See Also:</b> <i>Oracle Real Application Clusters Administration and Deployment Guide</i>                                                                                                                                                                                                                    | Database instances, Oracle ASM instances, Oracle RAC |
| LMSn, LMnn | Global Cache Service Process                    | Manages resources and provides resource control among Oracle RAC instances                                                | LMSn and LMnn processes maintain a lock database for Global Cache Service (GCS) and buffer cache resources. These processes receive, process, and send GCS requests, block transfers, and other GCS-related messages. There can be up to 100 of these processes, named as follows:<br><br>LMS0-LMS9<br>LMSA-LMSZ<br>LM10-LM19<br>LM1A-LM1Z<br>LM20-LM29<br>LM2A-LM2R<br><br><b>See Also:</b> <i>Oracle Real Application Clusters Administration and Deployment Guide</i> | Database instances, Oracle ASM instances, Oracle RAC |
| LREG       | Listener Registration Process                   | Registers the instance with the listeners                                                                                 | LREG notifies the listeners about instances, services, handlers, and endpoint.                                                                                                                                                                                                                                                                                                                                                                                           | Database instances, Oracle ASM instances, Oracle RAC |
| LSP0       | Logical Standby Coordinator Process             | Schedules transactions for Data Guard SQL Apply                                                                           | LSP0 is the initial process created upon startup of Data Guard SQL Apply. In addition to managing LogMiner and Apply processes, LSP0 is responsible for maintaining inter-transaction dependencies and appropriately scheduling transactions with applier processes. LSP0 is also responsible for detecting and enabling run-time parameter changes for the SQL Apply product as a whole.                                                                                | Database instances, Data Guard                       |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                                     | Short Description                                                                                           | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | External Properties                                      |
|------|---------------------------------------------------|-------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------|
| LSP1 | Logical Standby Dictionary Build Process          | Performs a logical standby dictionary build on a primary database                                           | The LSP1 process is spawned on a logical standby database that is intended to become the new primary database. A logical standby database becomes a primary database because of switchover or failover. The dictionary is necessary for logical standby databases to interpret the redo of the new primary database.                                                                                                                                                                                                                                             | Database instances, Data Guard                           |
| LSP2 | Logical Standby Set Guard Process                 | Determines which database objects will be protected by the database guard                                   | The LSP2 process is created as needed during startup of SQL Apply to update the list of objects that are protected by the database guard.                                                                                                                                                                                                                                                                                                                                                                                                                        | Database instances, Data Guard                           |
| Lnnn | Pooled Server Process                             | Handles client requests in Database Resident Connection Pooling                                             | In Database Resident Connection Pooling, clients connect to a connection broker process. When a connection becomes active, the connection broker hands off the connection to a compatible pooled server process. The pooled server process performs network communication directly on the client connection and processes requests until the client releases the server. After being released, the connection is returned to the broker for monitoring, leaving the server free to handle other clients.<br><br><b>See Also:</b> <i>Oracle Database Concepts</i> | Database instances, Database Resident Connection Pooling |
| MARK | Mark AU for Resynchronization Coordinator Process | Marks ASM allocation units as stale following a missed write to an offline disk                             | MARK essentially tracks which extents require resynchronization for offline disks. This process runs in the database instance and is started when the database instance first begins using the Oracle ASM instance. If required, MARK can also be started on demand when disks go offline in the Oracle ASM redundancy disk group.                                                                                                                                                                                                                               | Database instances, Oracle ASM instances                 |
| MMAN | Memory Manager Process                            | Serves as the instance memory manager                                                                       | This process performs the resizing of memory components on the instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Database instances, Oracle ASM instances                 |
| MMNL | Manageability Monitor Lite Process                | Performs tasks relating to manageability, including active session history sampling and metrics computation | MMNL performs many tasks relating to manageability, including session history capture and metrics computation.                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Database instances, Oracle ASM instances                 |
| MMON | Manageability Monitor Process                     | Performs or schedules many manageability tasks                                                              | MMON performs many tasks related to manageability, including taking Automatic Workload Repository snapshots and performing Automatic Database Diagnostic Monitor analysis.                                                                                                                                                                                                                                                                                                                                                                                       | Database instances, Oracle ASM instances                 |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                           | Short Description                                                                                  | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | External Properties                                                              |
|------|-----------------------------------------|----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Mnnn | Shared MMON Worker Process              | Performs manageability tasks on behalf of MMON                                                     | The Mnnn processes are a pool of worker processes that can be shared by multiple MZnn processes.<br><br>See the <b>Long Description</b> for MZnn in this table for more information about the MZnn processes.                                                                                                                                                                                                                                                                                                                                                    | Database instances, Oracle ASM instances                                         |
| MRP0 | Managed Standby Recovery Process        | Coordinates the application of redo on a physical standby database                                 | MRP0 is spawned at the start of redo apply on a physical standby database. This process handles the extraction of redo and coordinates the application of that redo on a physical standby database.<br><br><b>See Also:</b> <i>Oracle Data Guard Concepts and Administration</i>                                                                                                                                                                                                                                                                                 | Database instances, Data Guard                                                   |
| MSnn | LogMiner Worker Process                 | Reads redo log files and translates and assembles into transactions                                | Multiple MSnn processes can exist, where <i>n</i> is 0-9 or a-z. A minimum of three MSnn processes work as a group to provide transactions to a LogMiner client, for example, a logical standby database or a database capture. There may be more than one such group, for example, multiple capture processes configured for either local or downstream capture in a database.                                                                                                                                                                                  | Database instances, Logical Standby, XStream Outbound servers, Oracle GoldenGate |
| MZnn | Dedicated MMON Worker Process           | Performs manageability tasks on behalf of MMON                                                     | MZnn is a dedicated process for a single MMON worker action. It performs manageability tasks dispatched by MMON, which include taking Automatic Workload Repository snapshots and performing Automatic Database Diagnostic Monitor analysis.                                                                                                                                                                                                                                                                                                                     | Database instances, Oracle ASM instances                                         |
| Nnnn | Connection Broker Process               | Monitors idle connections and hands off active connections in Database Resident Connection Pooling | In Database Resident Connection Pooling, clients connect to a connection broker process. When a connection becomes active, the connection broker hands off the connection to a compatible pooled server process. The pooled server process performs network communication directly on the client connection and processes requests until the client releases the server. After being released, the connection is returned to the broker for monitoring, leaving the server free to handle other clients.<br><br><b>See Also:</b> <i>Oracle Database Concepts</i> | Database instances, Database Resident Connection Pooling                         |
| NFSn | Direct NFS Dispatcher IO Worker Process | Performs direct NFS I/O for database processes                                                     | The dispatcher worker processes enable scaling of Direct NFS connections to a clustered NAS storage. These dedicated set of workers will be used to perform Direct NFS I/Os on behalf of database processes. The dispatcher processes are enabled by the <code>ENABLE_DNFS_DISPATCHER</code> initialization parameter. NFSn is spawned only if Direct NFS library is enabled for I/O to NFS servers. The number of worker processes spawned is based on the <code>CPU_COUNT</code> value.<br><br><b>See Also:</b> <a href="#">"ENABLE_DNFS_DISPATCHER"</a>       | Database instances                                                               |

Table F-1 (Cont.) Background Processes

| NSS $n$ | Network Server SYNC Process                  | Transfers redo from current online redo logs to remote standby destinations configured for SYNC transport | NSS $n$ can run as multiple processes, where $n$ is 1-9 or A.<br><b>See Also:</b> <i>Oracle Data Guard Concepts and Administration</i>                                                                                                                                                                                          | Database instances, Data Guard                                       |
| NSV $n$ | Data Guard Broker NetSlave Process           | Performs broker network communications between databases in a Data Guard environment                      | NSV $n$ is created when a Data Guard broker configuration is enabled. There can be as many NSV $n$ processes (where $n$ is 0- 9 and A-U) created as there are databases in the Data Guard broker configuration.                                                                                                                 | Database instances, Data Guard                                       |
| OCF $n$ | ASM CF Connection Pool Process               | Maintains a connection to the Oracle ASM instance for metadata operations                                 |                                                                                                                                                                                                                                                                                                                                 | Database instances, Oracle ASM instances                             |
| OFSD    | Oracle File Server Background Process        | Serves file system requests submitted to an Oracle instance                                               | This background process listens for new file system requests, both management (like mount, unmount, and export) and I/O requests, and executes them using Oracle threads.                                                                                                                                                       | Database instances, Oracle RAC                                       |
| OF $nn$ | Oracle File Server Background Process Thread | Serves file system requests submitted to an Oracle instance                                               | This is a thread for the OFSD background process<br>This background process thread is available only on Linux systems.                                                                                                                                                                                                          | Database instances, Oracle RAC                                       |
| Onnn    | ASM Connection Pool Process                  | Maintains a connection to the Oracle ASM instance for metadata operations                                 | Onnn worker processes are spawned on demand. These processes communicate with the Oracle ASM instance.                                                                                                                                                                                                                          | Database instances, Oracle ASM instances                             |
| PING    | Interconnect Latency Measurement Process     | Assesses latencies associated with communications for each pair of cluster instances                      | Every few seconds, the process in one instance sends messages to each instance. The message is received by PING on the target instance. The time for the round trip is measured and collected.                                                                                                                                  | Database instances, Oracle ASM instances, Oracle RAC                 |
| PMAN    | Process Manager                              | Manages several background processes including shared servers, pooled servers, and job queue processes    | PMAN monitors, spawns, and stops the following as needed: <ul style="list-style-type: none"> <li>• dispatcher and shared server processes</li> <li>• connection broker and pooled server processes for database resident connection pools</li> <li>• job queue processes</li> <li>• restartable background processes</li> </ul> | Database instances, Oracle ASM instances, Oracle ASM Proxy instances |

Table F-1 (Cont.) Background Processes

| Name    | Expanded Name                     | Short Description                                                                                                           | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | External Properties                                                  |
|---------|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| PMON    | Process Monitor                   | Scans for terminated processes and coordinates cleanup                                                                      | PMON periodically scans all processes to find any that have died in a nonstandard way. PMON is then responsible for coordinating cleanup performed by the CLMN process and the CL $nn$ workers.<br><br><b>See Also:</b> <i>Oracle Database Concepts</i> and <i>Oracle Database Net Services Administrator's Guide</i>                                                                                                                                                                                                                                                                                                                   | Database instances, Oracle ASM instances, Oracle ASM Proxy instances |
| P $nnn$ | Parallel Query Worker Process     | Perform parallel execution of a SQL statement (query, DML, or DDL)                                                          | Parallel Query has two components: a foreground process that acts as query coordinator and a set of parallel workers (P $nnn$ ) that are background processes. These background processes are spawned or reused during the start of a parallel statement. They receive and perform units of work sent from the query coordinator.<br><br>The maximum number of P $nnn$ processes is controlled by the initialization parameter PARALLEL_MAX_SERVERS. Worker processes are numbered from 0 to the PARALLEL_MAX_SERVERS setting. If the query is a GV\$ query, then these background processes are numbered backward, starting from PPA7. | Database instances, Oracle ASM instances                             |
| PR $nn$ | Parallel Recovery Process         | Performs tasks assigned by the coordinator process performing parallel recovery                                             | PR $nn$ serves as a worker process for the coordinator process performing parallel media recovery and carries out tasks assigned by the coordinator. The default number of these processes is based on number of CPUs.                                                                                                                                                                                                                                                                                                                                                                                                                  | Database instances                                                   |
| PSP0    | Process Spawner Process           | Spawns Oracle background processes after initial instance startup                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Database instances, Oracle ASM instances                             |
| PXMN    | Parallel Execution Monitor        | Spawns parallel server processes on local instances in an Oracle RAC environment for Query Coordinator in remote instances. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Database instances                                                   |
| QMNC    | Non-sharded queue primary process | Monitors AQ                                                                                                                 | QMNC is the non-sharded queue primary process responsible for facilitating various background activities required by AQ: time management of messages, management of nonpersistent queues, cleanup of resources, and so on. QMNC dynamically spawns Q $nnn$ processes as needed for performing these tasks.<br><br>Note that if the AQ_TM_PROCESSES initialization parameter is set to 0, this process will not start. The database writes the following message to the alert log: WARNING: AQ_TM_PROCESSES is set to 0. System might be adversely affected.                                                                             | Database instances<br>Advanced Queueing                              |

| QMnn | AQ Primary Class Process          | Per instance per AQ Primary Class Process                                                                           | Each of this type of process represents a single class of work item such as AQ notification, queue monitors, and cross process.                                                                                                                                                                                                                                                                                                                                                                                              | Database instances<br>Advanced Queueing     |
| Qnnn | AQ Server Class Process           | Per AQ Primary Class server process                                                                                 | Each server class process acts on behalf of an AQ primary class process. This relationship is maintained until the primary requires services of a particular service process. Once released, the server class processes are moved to a free server pool.                                                                                                                                                                                                                                                                     | Database instances<br>Advanced Queueing     |
| Rnnn | ASM Block Remap Worker Process    | Remaps a block with a read error                                                                                    | A database instance reading from an Oracle ASM disk group can encounter an error during a read. If possible, Oracle ASM asynchronously schedules a Rnnn worker process to remap this bad block from a mirror copy.                                                                                                                                                                                                                                                                                                           | Oracle ASM instances                        |
| RBAL | ASM Rebalance Primary Process     | Coordinates rebalance activity                                                                                      | In an Oracle ASM instance, it coordinates rebalance activity for disk groups. In a database instance, it manages Oracle ASM disk groups.                                                                                                                                                                                                                                                                                                                                                                                     | Database instances,<br>Oracle ASM instances |
| RCBG | Result Cache Background Process   | Handles result cache messages                                                                                       | This process is used for handling invalidation and other messages generated by server processes attached to other instances in Oracle RAC.                                                                                                                                                                                                                                                                                                                                                                                   | Database instances,<br>Oracle RAC           |
| RECO | Recoverer Process                 | Resolves distributed transactions that are pending because of a network or system failure in a distributed database | RECO uses the information in the pending transaction table to finalize the status of in-doubt transactions. At timed intervals, the local RECO attempts to connect to remote databases and automatically complete the commit or rollback of the local portion of any pending distributed transactions. All transactions automatically resolved by RECO are removed from the pending transaction table.<br><br><b>See Also:</b> <i>Oracle Database Concepts</i> and <i>Oracle Database Net Services Administrator's Guide</i> | Database instances                          |
| RLnn | ResetLogs Process                 | Clear online redo logs when performing open resetlogs and converting to physical standby                            | RLnn processes are spawned to clear online redo logs. These workers are terminated after the online redo logs are cleared, and the session does not persist.<br><br>Possible processes are RL00-RL31.                                                                                                                                                                                                                                                                                                                        | Database instances                          |
| RM   | RAT Masking Worker Process        | Extracts and masks bind values from workloads like SQL tuning sets and DB Replay capture files                      | This background process is used with Data Masking and Real Application Testing.                                                                                                                                                                                                                                                                                                                                                                                                                                              | Database instances                          |
| RMON | Rolling Migration Monitor Process | Manages the rolling migration procedure for an Oracle ASM cluster                                                   | The RMON process is spawned on demand to run the protocol for transitioning an ASM cluster in and out of rolling migration mode.                                                                                                                                                                                                                                                                                                                                                                                             | Oracle ASM instance,<br>Oracle RAC          |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                         | Short Description                                                                               | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | External Properties            |
|------|---------------------------------------|-------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| RMSn | Oracle RAC Management Process         | Performs manageability tasks for Oracle RAC                                                     | RMSn performs a variety of tasks, including creating resources related to Oracle RAC when new instances are added to a cluster.<br><br><b>See Also:</b> <i>Oracle Real Application Clusters Administration and Deployment Guide</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Database instances, Oracle RAC |
| RPnn | Capture Processing Worker Process     | Processes a set of workload capture files                                                       | RPnn are worker processes spawned by calling <code>DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE (capture_dir, parallel_level)</code> . Each worker process is assigned a set of workload capture files to process.<br><br>Worker processes execute in parallel without needing to communicate with each other. After each process is finished processing its assigned files, it exits and informs its parent process.<br><br>The number of worker processes is controlled by the <code>parallel_level</code> parameter of <code>DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE</code> . By default, <code>parallel_level</code> is null. Then, the number of worker processes is computed as follows:<br><br><pre>SELECT VALUE FROM   V\$PARAMETER WHERE  NAME='cpu_count';</pre><br>When <code>parallel_level</code> is 1, no worker processes are spawned. | Database instances             |
| RPOP | Instant Recovery Repopulation Daemon  | Responsible for re-creating and/or repopulating data files from snapshot files and backup files | The RPOP process is responsible for re-creating and repopulating data files from snapshots files. It works with the instant recovery feature to ensure immediate data file access. The local instance has immediate access to the remote snapshot file's data, while repopulation of the recovered primary data files happens concurrently. Any changes in the data are managed between the instance's DBW processes and RPOP to ensure the latest copy of the data is returned to the user.                                                                                                                                                                                                                                                                                                                                               | Database instances             |
| RSnn | Global Cache Service Remaster Process | Performs remastering for cluster reconfiguration and dynamic remastering                        | Each RSnn process is a worker process for LMSn to handle remastering work. They are also helper processes for LMS to handle non-critical work from global cache service.<br><br>The RSnn processes were named RMVn in Oracle Database 12c and earlier releases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Database instances, Oracle RAC |
| RSM0 | Data Guard Broker Worker Process      | Performs monitoring management tasks related to Data Guard on behalf of DMON                    | The process is created when a Data Guard broker configuration is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Database instances, Data Guard |

| RSMN | Remote Worker Monitor Process                   | Manages background worker process creation and communication on remote instances in Oracle RAC         | This background process manages the creation of worker processes and the communication with their coordinators and peers. These background worker processes perform tasks on behalf of a coordinating process running in another cluster instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Database instances, Oracle RAC         |
| RVWR | Recovery Writer Process                         | Writes flashback data to the flashback logs in the fast recovery area                                  | RVWR writes flashback data from the flashback buffer in the SGA to the flashback logs. RVWR also creates flashback logs and performs some tasks for flashback log automatic management.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Database instances, Flashback Database |
| Snnn | Shared Server Process                           | Handles client requests in the shared server architecture                                              | <p>In the shared server architecture, clients connect to a dispatcher process, which creates a virtual circuit for each connection. When the client sends data to the server, the dispatcher receives the data into the virtual circuit and places the active circuit on the common queue to be picked up by an idle shared server. The shared server then reads the data from the virtual circuit and performs the database work necessary to complete the request. When the shared server must send data to the client, the server writes the data back into the virtual circuit and the dispatcher sends the data to the client. After the shared server completes the client request, the server releases the virtual circuit back to the dispatcher and is free to handle other clients.</p> <p>Several initialization parameters relate to shared servers. The principal parameters are:<br/>DISPATCHERS, SHARED_SERVERS,<br/>MAX_SHARED_SERVERS, LOCAL_LISTENER,<br/>REMOTE_LISTENER.</p> <p><b>See Also:</b> <i>Oracle Database Concepts</i></p> | Database instances, shared servers     |
| SAnn | SGA Allocator                                   | Allocates SGA                                                                                          | <p>A small fraction of SGA is allocated during instance startup. The SAnn process allocates the rest of SGA in small chunks. The process exits upon completion of SGA allocation.</p> <p>Possible processes are SA00-SAzz.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Database instances                     |
| SCCn | ASM Disk Scrubbing Worker Check Process         | Performs Oracle ASM disk scrubbing check operation                                                     | <p>SCCn acts as a worker process for SCRIB and performs the checking operations.</p> <p>Possible processes are SCC0-SCC9.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Oracle ASM instances                   |
| SCM0 | DLM Statistics Collection and Management Worker | Collects and manages statistics related to global enqueue service (GES) and global cache service (GCS) | The DLM Statistics Collection and Management worker (SCM0) is responsible for collecting and managing the statistics related to global enqueue service (GES) and global cache service (GCS). This worker exists only if DLM statistics collection is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Database instances                     |

Table F-1 (Cont.) Background Processes

| Name    | Expanded Name                            | Short Description                                                                                                                                                                                         | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | External Properties  |
|---------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| SCMN    | Statistics Collection and Management     | Main thread for a multithreaded process in a threaded Oracle RAC architecture                                                                                                                             | All other threads are spawned within the processes through SCMN, based on the requests in the instance. SCMN is an idle main thread, which waits for any requests, especially spawn threads, and takes care of them, along with performing periodic maintenance operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Oracle RAC           |
| SCRB    | ASM Disk Scrubbing Primary Process       | Coordinates Oracle ASM disk scrubbing operations                                                                                                                                                          | SCRB runs in an Oracle ASM instance and coordinates Oracle ASM disk scrubbing operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Oracle ASM instances |
| SCR $n$ | ASM Disk Scrubbing Worker Repair Process | Performs Oracle ASM disk scrubbing repair operation                                                                                                                                                       | SCR $n$ acts as a worker process for SCRB and performs the repairing operations.<br>Possible processes are SCR0-SCR9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Oracle ASM instances |
| SCV $n$ | ASM Disk Scrubbing Worker Verify Process | Performs Oracle ASM disk scrubbing verify operation                                                                                                                                                       | SCV $n$ acts as a worker process for SCRB and performs the verifying operations.<br>Possible processes are SCV0-SCV9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Oracle ASM instances |
| SMCO    | Space Management Coordinator Process     | Coordinates the execution of various space management tasks                                                                                                                                               | This background process coordinates the execution of various space management tasks, including proactive space allocation and space reclamation. SMCO dynamically spawns worker processes ( $Wnnn$ ) to implement these tasks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Database instances   |
| SMON    | System Monitor Process                   | Performs critical tasks such as instance recovery and terminated transaction recovery, and maintenance tasks such as temporary space reclamation, data dictionary cleanup, and undo tablespace management | SMON performs many database maintenance tasks, including the following: <ul style="list-style-type: none"> <li>Reclaims space used by orphaned temporary segments</li> <li>Maintains the undo tablespace by online, offline, and shrinking the undo segments based on undo space usage statistics</li> <li>Cleans up the data dictionary when it is in a transient and inconsistent state</li> <li>Maintains the SCN to time mapping table used to support Oracle Flashback features</li> </ul> <p>In an Oracle RAC database, the SMON process of one instance can perform instance recovery for other instances that have failed.</p> <p>SMON is resilient to internal and external errors raised during background activities.</p> <p><b>See Also:</b> <i>Oracle Database Concepts</i></p> | Database instances   |
| SP      | SPA Exec Worker                          | Analyzes single SQL statements sent from SQL Performance Analyzer (SPA)                                                                                                                                   | Executions of SPA tasks created from a SQL tuning set use this worker to analyze the SQL statements of the SQL tuning set concurrently.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Database instances   |
| SVCB    | Service Background Process               | Provides database service run-time load balancing and topology information to clients.                                                                                                                    | Every 30 seconds the process processes and publishes run-time load-balancing information and keeps the topology information current. This process is started only if Oracle Real Application Clusters (Oracle RAC) is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Oracle RAC           |

Table F-1 (Cont.) Background Processes

| Name    | Expanded Name                         | Short Description                                                                                                  | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | External Properties                              |
|---------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------|
| TEM $n$ | ASM disk Test Error Emulation Process | Emulates I/O errors on Oracle ASM disks through named events                                                       | I/O errors can be emulated on Oracle ASM disk I/O through named events. The scope can be the process, instance, or even cluster. Optionally, a set of AUs can be chosen for error emulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Oracle ASM instances                             |
| TT $nn$ | Redo Transport Worker Process         | Ships redo from current online and standby redo logs to remote standby destinations configured for ASYNC transport | TT $nn$ can run as multiple processes, where $nn$ is 00 to ZZ.<br><b>See Also:</b> <i>Oracle Data Guard Concepts and Administration</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Database instances, Data Guard                   |
| Un $nn$ | Container process for threads         | Host processes where database processes execute as threads.                                                        | Un $nn$ processes are database container operating system processes where database background processes like SMON, CJQ0, and database foreground processes run. The V\$PROCESS view lists database processes running in these container processes. These container processes are created only when the <code>THREADED_EXECUTION</code> initialization parameter is set to <code>TRUE</code> . The number of these processes vary depending on the active database processes. On a host with multiple NUMA nodes, there will be at least one Un $nn$ process per NUMA node.<br><br>These processes are irrecoverable processes; if any of them is terminated, it will result in instance termination. These processes exit when the instance is shut down or terminated. | Database instances                               |
| VBG $n$ | Volume Background Process             | Communicates between the Oracle ASM instance and the operating system volume driver                                | VBG $n$ handles messages originating from the volume driver in the operating system and sends them to the Oracle ASM instance.<br><br>VBG $n$ can run as multiple processes, where $n$ is 0-9.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Oracle ASM instances, Oracle ASM Proxy instances |
| VDBG    | Volume Driver Process                 | Forwards Oracle ASM requests to perform various volume-related tasks                                               | VDBG handles requests to lock or unlock an extent for rebalancing, volume resize, disk offline, add or drop a disk, force and dismount disk group to the Dynamic Volume Manager driver.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Oracle ASM instances, Oracle ASM Proxy instances |
| VI $nn$ | Volume I/O                            | Route ADVN volume I/O for ASM instances on compute nodes within an Exadata                                         | These processes handle requests for I/Os targeted at storage not locally accessible. They are used for Exadata targeted storage as well. These background processes only start when an ASM Volume is created and set up to be used. One process will start for each NUMA node on target machines. Under normal operation on non-Exadata hardware and on Exadata hardware that is not utilizing ASM volumes, these processes will not be started.<br><br>There can be up to 32 VI processes, and they are named sequentially from VI00 to VI31.                                                                                                                                                                                                                          | Oracle ASM Proxy instances                       |

Table F-1 (Cont.) Background Processes

| Name | Expanded Name                                  | Short Description                                                                                         | Long Description                                                                                                                                                                                                                                                                                                                | External Properties                                  |
|------|------------------------------------------------|-----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------|
| VKRM | Virtual Scheduler for Resource Manager Process | Serves as centralized scheduler for Resource Manager activity                                             | VKRM manages the CPU scheduling for all managed Oracle processes. The process schedules managed processes in accordance with an active resource plan.                                                                                                                                                                           | Database instances                                   |
| VKTM | Virtual Keeper of Time Process                 | Provides a wall clock time and reference time for time interval measurements                              | VKTM acts as a time publisher for an Oracle instance. VKTM publishes two sets of time: a wall clock time using a seconds interval and a higher resolution time (which is not wall clock time) for interval measurements. The VKTM timer service centralizes time tracking and offloads multiple timer calls from other clients. | Database instances, Oracle ASM instances             |
| VMB0 | Volume Membership Process                      | Maintains cluster membership on behalf of the Oracle ASM volume driver                                    | This process membership in the cluster as an I/O-capable client on behalf of the Oracle ASM volume driver.                                                                                                                                                                                                                      | Oracle ASM instances, Oracle ASM Proxy instances     |
| VOSD | Virtual Operating System Daemon                | Executes time-bound Oracle database service actions                                                       | This process is spawned on instance startup and is responsible for executing system service actions critical for the database.                                                                                                                                                                                                  | Database instances, Oracle ASM instances, Oracle RAC |
| VUBG | Volume drive Umbilicus Background              | Relays messages between Oracle ASM instance and Oracle ASM Proxy instance that is used by ADVN (for ACFS) |                                                                                                                                                                                                                                                                                                                                 | Oracle ASM instances, Oracle ASM Proxy instances     |

Table F-1 (Cont.) Background Processes

| Name        | Expanded Name                   | Short Description                                                                                              | Long Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | External Properties           |
|-------------|---------------------------------|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|
| <i>Wnnn</i> | Space Management Worker Process | Performs various background space management tasks, including proactive space allocation and space reclamation | <p><i>Wnnn</i> worker processes perform work on behalf of Space Management and on behalf of the Oracle Database In-Memory option.</p> <ul style="list-style-type: none"> <li>When performing work on behalf of Space Management, <i>Wnnn</i> processes are worker processes dynamically spawned by SMCO to perform space management tasks in the background. These tasks include preallocating space into locally managed tablespace and SecureFiles segments based on space usage growth analysis, and reclaiming space from dropped segments. After being started, the worker acts as an autonomous agent. After it finishes task execution, it automatically picks up another task from the queue. The process terminates itself after being idle for a long time.</li> <li>When performing work on behalf of the Oracle Database In-Memory option, <i>Wnnn</i> processes execute tasks for population or repopulation of objects that are enabled for the In-Memory column store (IM columns store), and tasks that drop in-memory segments when an object is disabled for the IM columns store.</li> </ul> <p>For in-memory population and repopulation, both the IMCO background process and foreground processes will utilize <i>Wnnn</i> workers. <i>Wnnn</i> processes are utilized by the IMCO background process for prepopulation of in-memory enabled objects with priority LOW/MEDIUM/HIGH/CRITICAL, and for repopulation of in-memory objects. In-memory populate and repopulate tasks running on <i>Wnnn</i> workers are also initiated from foreground processes in response to queries and DMLs that reference in-memory enabled objects.</p> | Database instances            |
| XDMG        | Exadata Automation Manager      | Initiates automation tasks involved in managing Exadata storage                                                | XDMG monitors all configured Exadata cells for state changes, such as a bad disk getting replaced, and performs the required tasks for such events. Its primary tasks are to watch for when inaccessible disks and cells become accessible again, and to initiate the ASM ONLINE operation. The ONLINE operation is handled by XDWK.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Oracle ASM instances, Exadata |
| XDWK        | Exadata Automation Manager      | Performs automation tasks requested by XDMG                                                                    | XDWK gets started when asynchronous actions such as ONLINE, DROP, and ADD an Oracle ASM disk are requested by XDMG. After a 5 minute period of inactivity, this process will shut itself down.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Oracle ASM instances, Exadata |
| <i>Xnnn</i> | ASM Disk Expel Worker Process   | Performs Oracle ASM post-rebalance activities                                                                  | This process expels dropped disks after an Oracle ASM rebalance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Oracle ASM instances          |
