### 1 Preface

This document describes the process of FLEXCUBE Screen Development using Enterprise Limits and Collateral Management Development Workbench.

### 1.1 Audience

This document is intended for FLEXCUBE Application developers/users that use ODT to develop various FLEXCUBE components.

To Use this manual, you need conceptual and working knowledge of the below:

Proficiency	Resources
FLEXCUBE Functional Architecture	Training programs from Oracle Financial Software Services.
FLEXCUBE Technical Architecture	Training programs from Oracle Financial Software Services.
FLEXCUBE Object Naming conventions	Development Overview Guide
Working knowledge of Web based applications	Self Acquired

Working knowledge of Oracle Database	Oracle Documentations
Working knowledge of PLSQL & SQL Language	Self Acquired
Working knowledge of XML files	Self Acquired
Essential knowledge on FLEXCUBE	02-ODT Administration.docx
ODT	03-ODT Getting Started.docx

### 1.2 Related Documents

05-ODT Generation, Deployment and Release of files.docx

<u>16-Development\_of\_Launch\_Forms\_and\_Others\_Screens.docx</u>

# 2 Overview of Customer Landing page Development for Oracle FLEXCUBE

Oracle FLEXCUBE ODT provides the developer with a user friendly console for designing and developing screens for Oracle FLEXCUBE.

ODT assist developers in designing screens with the capability of generating front end scripting files, PL/SQL Packages, Static data scripts, XSDs, Excel templates and html files. This generated code performs validations and does some processing which is common across screens in FLEXCUBE; only the Business logic specific to the screen has to be added by the Developer in back end and front end units.

#### **Example**

Release Name: FC 12.1

Release Type: KERNEL, CLUSTER, CUSTOM

ODT will generate all files and developers are supposed to add the business logic in designated units depending on the Release Type.

#### 2.1 Radxml

ODT saves all the activities carried out by the developer in an xml file hereby referred to as **radxml**. Persistence of the screens is achieved through radxml. All the units required for the working of a screen can be generated from its radxml.

If some changes are required on the screen in a future release, the same radxml can be loaded and changes can be done on this radxml. ODT can segregate the changes done on different releases and saves the radxml accordingly.

Radxml will adhere to following naming convention

Function Id name + \_RAD.xml

Example: STDCULND\_RAD

### 2.2 Extensible Development

In extensible framework, any development on FLEXCUBE is classified as on any of the following stage (also referred to as release type)

#### i) KERNEL

This refers to the core product.

Example: FC 12.1

#### ii) CLUSTER

This refers to any region specific enhancements /developments done on top of the kernel product. The changes done in a cluster pack will be non invasive to the kernel product. *Example:* FC 12.1 *India cluster* 

#### iii) CUSTOM

Any enhancements required by the customer/bank are done on this level. It will be non invasive of the changes done in kernel and cluster packs *Example: Customizations for MODEL bank on FC 12.1 India cluster* 

ODT can segregate the changes done on different releases and saves the radxml accordingly. It generates the files depending on the release type and developers can add the business logic to the release type specific files. Thus the code remains non invasive of the existing code.

### 2.3 Design Steps

Sequence of Steps to be followed while developing a screen in ODT is:

- 1. Identifying the data sources and their relations
- 2. Logically grouping the data sources into Data Blocks
- 3. Designing Screen Layout
- 4. Logically grouping the Block Fields into Field sets
- 5. Attaching Call forms and launch forms if any
- 6. Defining LOVs
- 7. Designing Summary
- 8. Defining Actions

Refer respective sections for detailed explanation of each step

#### Saving Radxml

While Development, save radxml at constant intervals. Click on save icon in the top right for having the work. Radxml would be saved in the user directory maintained

#### 2.3.1 Design Process:

Click on Customer Landing Page node in the browser tree found in the Landing page of ODT. Customer Landing Page window gets launched.

Oracle FLEXCUBE ODT Landing Page

While creating a new function in customer landing page in ODT, below information needs to be provided in the Header section

The Header portion of the Customer Landing Page screens consists of the following fields:

#### 2.3.2 Action

New and Load options are provided for this field.

For a new screen development, select the action as New; if an existing screen radxml has to be loaded for customization select Load option

If the action is load then corresponding radxml has to be loaded using browser option in Save Xml Path; all the header information will get populated.

#### 2.3.3 Function Id

If the Action is selected as New, the function Id name needs to be specified. Function Id is the unique name with which a screen is identified.

Function Id name should follow the FLEXCUBE standard naming convention.

- Function Id name to have maximum length of 8 characters
- For detail screens the third character should be 'D'
- For report screens the third character should be 'R'
- For call form function ids the third character should be 'C'
- First 2 characters should specify the module name for which the particular function id is used (recommended).

#### 2.3.4 Save Xml Path

The label description of the field will change depending on the action .If the action is load, ODT attaches a Browse button to it so that user can browse the radxml and load it.

					Control S	tring 🕂 🗧	
	Function Id	Mo	odule*	Mod	dule Description		~
		ST	×:	Static Maintenance			
							~

#### 3.1.1 Preferences

Function id level preferences like module, logging required, tanking modification Main menu, Sub-Menu1, Sub-Menu2 is maintained through Preferences screen in ODT.

The data maintained in Preferences Screen will be used for generating static data script for tables SMTB\_MENU, SMTB\_FUNCTION\_DESCRIPTION, SMTB\_ROLE\_DETAIL and SMTB\_FCC\_FCJ\_MAPPING

#### • Module

It captures the Module of the function id. Developer can choose module name from the list of values provided. List of values is populated based on the modules maintained in SMTB\_MODULE table of the business schema (current FLEXCUBE environment to which tool is mapped).

Module Code has to be provided mandatorily. Module name provided would be reflected in the script for SMTB\_MENU generated by ODT (in module column). This will also be considered while naming the packages generated by the tool. First two characters of the packages generated will be taken from the module code maintained.

#### • Module Description

Module description gets defaulted based on the module code selected.

#### • Head office Function

It captures whether the function is a head office function or not. It will be reflected in the static script for SMTB\_MENU in column HO\_FUNCTION.

If the function is a head office function, only query operation will be possible at all the other branches for the particular screen.

#### • Logging Required

It captures whether logging is required for the function or not. This will also be reflected in script generated for SMTB\_MENU (column LOGGING\_REQD).

If this option is selected, all the request and response for the functionId will be logged in CSTB\_MSG\_LOG. This is used for View Change option.

#### Auto Authorization

It captures whether Auto Authorization is allowed for the function or not. This will also be reflected in script generated for SMTB\_MENU (column AUTO\_AUTH).

Note that auto authorization is possible only if it is allowed at function id level, user level and the branch level.

#### • Tank Modification

It captures whether modification to be tanked for the function or not. This will be reflected in TANK\_MODIFICATIONS column of SMTB\_MENU table script.

If tank modification is enabled, then the record in that screen would be logged to logging tables and taken up for processing (*untanking*) in later stage during EOD operations. Currently this is applicable only for maintenance screens.

#### • Field Log Required

It captures whether field Logging is required for the function or not. This will be reflected in the FIELD\_LOG\_REQD column in SMTB\_MENU.

If field log required is enabled, then all operations on the screen will be logged to logging tables (STTB\_FIELD\_LOG.STTB\_RECORD\_LOG etc). Currently this is applicable only for maintenance screens.

#### • Excel Export Required

This field captures whether option to export records from summary screen to excel is required

#### • Multi Branch Access

It captures whether multi branch access is required for the function Id or not. This will be reflected in MULTIBRANCH\_ACCESS column of SMTB\_MENU table script generated.

If multi branch access is allowed, then records of different branches for the screen can be modified from a single branch.

#### • Txn Block Name

It captures the transaction Block Name. This is applicable only if multi branch access is allowed for the screen. Select the block from the select list which contains the field for branch code

#### Txn Field Name

•

It captures the transaction Field Name. This is applicable only if multi branch access is allowed for the screen. Select list provides all the block fields for the transaction block selected. Choose the field for branch code from the list.

Txn Block Name and Txn Field Name will be reflected in the system JavaScript file (SYS js) generated by ODT. Developer has to code for querying the records based on the branch code value of this field.

#### Branch Program ID

It captures branch program id for the function.

#### Process Code

This can be used to map which process needs to be initiated during screen launch. This is used for workflow screens.

#### • SVN Repository Url

This is applicable only if integration to SVN (version control tool) is required. Path of the SVN repository till the module needs to be provided in this field.

In the multiple entry block , developer needs to maintain all the related function Id names for the screen. ODT will default the name of the function Id to the first row of the multiple entry along with the module maintained earlier.

If any other function id is required for the particular screen, developer has to add the row.

*Example:* For FTDTRONL screen, developer designs a detail screen. He also wants to add one summary screen to the screen as well as gateway function Id for web services.

For this, he can add two new columns FTSTRONL (for summary) and FTGTRONL (for gateway operations) to the block as shown below.

#### 3.1.2 Screens

- Right click on screens and add.
- Give the name as CVS\_Master.
- Press OK.

ORACLE' FLEXCUBE Deve Browser .	opment Workbench for Universal Banking	P prasanth Windows Options Sign Out

Adding Tables and other information. Detail screen in customer Landing page is similar to developing others Screen. For reference please follow doc.

16-Development\_of\_Launch\_Forms\_and\_Others\_Screens.docx

### 5 Summary

Summary screen in Customer Landing Page is similar to Summary screen in normal Function Generation.

Please follow doc as 04-Development\_WorkBench\_Screen\_Development-I.docx

### 6 Tabs

Tabs screen is part of master screen, tabs screen contains group of screens in it.

Each screen is details under each tab.
