PID	NUMBER	Oracle process identifier
SERIAL#	NUMBER	Oracle process serial number
CATEGORY	VARCHAR2(15)	Category name. Categories include "SQL", "PL/SQL", "OLAP" and "JAVA". Special categories are "Freeable" and "Other". Freeable memory has been allocated to the process by the operating system, but has not been allocated to a category. "Other" memory has been allocated to a category, but not to one of the named categories.
ALLOCATED	NUMBER	Bytes of PGA memory allocated by the process for the category. For the "Freeable" category, it is the amount of free PGA memory eligible to be released to the operating system.
USED	NUMBER	Bytes of PGA memory used by the process for the category. For "Freeable", the value is zero. For "Other", the value is NULL for performance reasons.
MAX_ALLOCATED	NUMBER	Maximum bytes of PGA memory ever allocated by the process for the category.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.133 V$PROCESS_MEMORY_DETAIL

V$PROCESS_MEMORY_DETAIL provides detailed information on dynamic PGA memory usage for each automatically captured snapshot.

Column	Datatype	Description
PID	NUMBER	Oracle process identifier
SERIAL#	NUMBER	Oracle process serial number
TIMESTAMP	DATE	Time at which the snapshot was taken

Column	Datatype	Description
SQL_ID	VARCHAR2(13)	Identifier for the relevant SQL statement
TOTAL_MB	NUMBER	Total number of megabytes of PGA memory allocated at the time of the snapshot
CATEGORY	VARCHAR2(15)	Category name. Categories include: • SQL • PL/SQL • OLAP • JAVA • Freeable • Other
NAME	VARCHAR2(26)	PGA memory allocation comment. Small allocations may be grouped together with NAME set to Miscellaneous for performance reasons.
HEAP_NAME	VARCHAR2(15)	Name of heap or heaps (if same name) containing the allocations
BYTES	NUMBER	Bytes of PGA memory allocated in the process from heaps with the given heap name and with the given allocation comment
ALLOCATION_COUNT	NUMBER	Number of allocations with the comment found in the process inside heaps with the given heap name
HEAP_DESCRIPTOR	RAW(4 | 8)	If all the allocations are from one heap, then this is the address of the heap descriptor for that heap. Otherwise, this column is NULL.
PARENT_HEAP_DESCRIPTOR	RAW(4 | 8)	If all the allocations are from one heap, then this is the address of the parent heap descriptor for that heap. Otherwise, this column is NULL. If the heap has no parent, the value is zero.
MOST_RECENT	NUMBER	Oracle process identifier (PID) for most recent snapshot
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.134 V$PROCESS_POOL

V$PROCESS_POOL provides information about process pools.

Column	Datatype	Description
POOL_NAME	VARCHAR2(512)	Pool name
ENABLED	VARCHAR2(5)	Indicates whether the pool is active (TRUE) or not (FALSE)
MIN_COUNT	NUMBER	The default or configured minimum value
BATCH_COUNT	NUMBER	The default or configured batch count
INIT_COUNT	NUMBER	The default or configured initial count
CUR_COUNT	NUMBER	The number of spawned processes available in this pool

Column	Datatype	Description
MAX_COUNT	NUMBER	When INIT_COUNT is set, MAX_COUNT shows the number of processes yet to be spawned. Note that the current process count (CUR_COUNT) cannot reach INIT_COUNT in cases where processes are consumed during the spawn.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This row is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.135 V$PROPAGATION_RECEIVER

V$PROPAGATION_RECEIVER displays information about buffer queue propagation schedules on the receiving (destination) side. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when propagation migrates to another instance, or when an unscheduled propagation is attempted.

Column	Datatype	Description
SRC_QUEUE_SCHEMA	VARCHAR2(128)	Name of the source schema
SRC_QUEUE_NAME	VARCHAR2(128)	Name of the source queue
SRC_DBNAME	VARCHAR2(395)	Name of the source database
DST_QUEUE_SCHEMA	VARCHAR2(128)	Name of the destination schema
DST_QUEUE_NAME	VARCHAR2(128)	Name of the destination queue
STARTUP_TIME	DATE	Startup time of this schedule. This time changes when the source/ destination database gets restarted.
HIGH_WATER_MARK	NUMBER	High watermark of the messages received
ACKNOWLEDGEMENT	NUMBER	Acknowledgement of the messages received by the receiver
LAST_RECEIVED_MSG	NUMBER	Last received message
TOTAL_MSGS	NUMBER	Total number of messages
ELAPSED_UNPICKLE_TIME	NUMBER	Elapsed unpickle time
ELAPSED_RULE_TIME	NUMBER	Elapsed rule time
ELAPSED_ENQUEUE_TIME	NUMBER	Elapsed enqueue time
SESSION_ID	NUMBER	Session ID of the propagation receiver
SERIAL#	NUMBER	Serial number of the propagation receiver
SPID	VARCHAR2(24)	Process identification number of the propagation receiver
PROPAGATION_NAME	VARCHAR2(128)	Name of the propagation on the source database

Column	Datatype	Description
STATE	VARCHAR2(43)	State of the propagation receiver: • Initializing • Sending unapplied txns • Waiting for message from client • Receiving LCRs • Evaluating rules • Enqueueing LCRS • Waiting for memory • Waiting for apply to read • Waiting for message from propagation sender When the propagation schedule is not optimized, the state is Normal.
LAST_RECEIVED_MSG_POSITION	RAW(64)	Last received message position. Corresponds to LAST_RECEIVED_MSG, except the value is in position rather than SCN. Position is used by XStream to determine ordering.
ACKNOWLEDGEMENT_POSITION	RAW(64)	Acknowledgement position of the messages received by the receiver. Corresponds to ACKNOWLEDGEMENT, except the value is in position rather than SCN. Position is used by XStream to determine ordering.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.136 V$PROPAGATION_SENDER

V$PROPAGATION_SENDER displays information about buffer queue propagation schedules on the sending (source) side. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when propagation migrates to another instance, or when an unscheduled propagation is attempted.

Column	Datatype	Description
QUEUE_ID	NUMBER	Queue identifier of the queue
QUEUE_SCHEMA	VARCHAR2(128)	Schema of the queue
QUEUE_NAME	VARCHAR2(128)	Name of the queue
DST_QUEUE_SCHEMA	VARCHAR2(128)	Destination schema of the queue
DST_QUEUE_NAME	VARCHAR2(128)	Name of the destination queue
STARTUP_TIME	DATE	Time at which the propagation started
DBLINK	VARCHAR2(395)	Name of the destination database link
HIGH_WATER_MARK	NUMBER	High watermark of the messages sent
ACKNOWLEDGEMENT	NUMBER	Acknowledgement of the messages received by the receiver
SCHEDULE_STATUS	VARCHAR2(128)	Status of the propagation schedule
TOTAL_MSGS	NUMBER	Total messages propagated
TOTAL_BYTES	NUMBER	Total bytes propagated

Column	Datatype	Description
ELAPSED_DEQUEUE_TIME	NUMBER	Elapsed dequeue time (in hundredths of a second)
ELAPSED_PICKLE_TIME	NUMBER	Elapsed pickle time (time taken to linearize a logical change record (LCR) into a stream of bytes that can be sent over the network) (in hundredths of a second)
ELAPSED_PROPAGATION_TIME	NUMBER	Elapsed propagation time (in hundredths of a second)
ELAPSED_RULE_TIME	NUMBER	Elapsed rule time (in hundredths of a second)
MAX_NUM_PER_WIN	NUMBER	Maximum bytes per window
MAX_SIZE	NUMBER	Maximum bytes sent per window
LAST_MSG_LATENCY	NUMBER	Last propagated message latency
LAST_MSG_ENQUEUE_TIME	TIMESTAMP(6)	Last propagated message enqueue time
LAST_MSG_PROPAGATION_TIME	TIMESTAMP(6)	Last time when the message was propagated
LAST_LCR_LATENCY	NUMBER	Last propagated LCR latency
LAST_LCR_CREATION_TIME	DATE	Last propagated LCR timestamp
LAST_LCR_PROPAGATION_TIME	DATE	Last time when the LCR was propagated
DST_DATABASE_NAME	VARCHAR2(395)	Global name of the destination database
SESSION_ID	NUMBER	Session ID of the propagation sender process
SERIAL#	NUMBER	Serial number of the propagation sender process
SPID	VARCHAR2(24)	Process identification number of the propagation sender process
PROPAGATION_NAME	VARCHAR2(128)	Name of the propagation
STATE	VARCHAR2(128)	State of the propagation sender process: • Initializing • Initializing propagation receiver • Browsing LCRs • Evaluating rules • Dequeueing LCRs • Sending LCRs • Waiting for apply to be enabled • Waiting for apply database to start • Waiting for propagation to be enabled • Waiting for capture to terminate • Waiting for a subscriber to be added • Suspended due to a dropped subscriber • Suspended for auto split/merge • Waiting on empty queue When the SCHEDULE_STATUS column is not SCHEDULE OPTIMIZED, the state is the value of the SCHEDULE_STATUS column.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.137 V$PROXY_ARCHIVEDLOG

V$PROXY_ARCHIVEDLOG contains descriptions of archived log backups that were taken using the proxy copy functionality.

In a proxy copy, the media manager takes over the operations of backing up and restoring data. Each row represents a backup of one control file.

Column	Datatype	Description
RECID	NUMBER	Proxy copy record identifier
STAMP	NUMBER	Proxy copy stamp
DEVICE_TYPE	VARCHAR2(17)	Type of media device that stores the proxy copy
HANDLE	VARCHAR2(513)	Name or "handle" for the proxy copy
COMMENTS	VARCHAR2(81)	Comments about the proxy copy
MEDIA	VARCHAR2(65)	A comment that contains further information about the media manager that created this backup
MEDIA_POOL	NUMBER	Number of the media pool in which the proxy copy is stored
TAG	VARCHAR2(32)	Tag for the proxy copy
STATUS	VARCHAR2(1)	Status of the backup set: • A - Available • U - Unavailable • X - Expired • D - Deleted
DELETED	VARCHAR2(3)	Indicates whether this record has been deleted (YES) or not (NO)
THREAD#	NUMBER	Number of the redo thread
SEQUENCE#	NUMBER	Log sequence number
RESETLOGS_CHANGE#	NUMBER	RESETLOGS SCN of the database incarnation to which this archived log belongs
RESETLOGS_TIME	DATE	RESETLOGS time stamp of the database incarnation to which this archived log belongs
FIRST_CHANGE#	NUMBER	First SCN of this redo log
FIRST_TIME	DATE	Time when Oracle switched into the redo log
NEXT_CHANGE#	NUMBER	First SCN of the next redo log in the thread
NEXT_TIME	DATE	First time stamp of the next redo log in the thread
BLOCKS	NUMBER	Size of this archived redo log (in operating system blocks)
BLOCK_SIZE	NUMBER	Block size for the copy (in bytes)
START_TIME	DATE	Time when the proxy copy was initiated
COMPLETION_TIME	DATE	Time when the proxy copy was completed
ELAPSED_SECONDS	NUMBER	Duration of the proxy copy
RMAN_STATUS_RECID	NUMBER	Owning V$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V$RMAN_STATUS stamp
TERMINAL	VARCHAR2(3)	Indicates whether this record corresponds to a terminal archived redo log, as defined in V$ARCHIVED_LOG (YES) or not (NO)
KEEP	VARCHAR2(3)	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)

Column	Datatype	Description
KEEP_UNTIL	DATE	If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.
KEEP_OPTIONS	VARCHAR2(11)	Additional retention options for this backup set: • LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated • BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent • NOLOGS - Indicates a consistent backup made when the database was mounted • NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.138 V$PROXY_ARCHIVELOG_DETAILS

V$PROXY_ARCHIVELOG_DETAILS contains information about all available archive log proxy copies.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp
COPY_KEY	NUMBER	Copy identifier
THREAD#	NUMBER	Redo thread number
SEQUENCE#	NUMBER	Redo log sequence number
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the database when this log was written
RESETLOGS_TIME	DATE	Resetlogs time of the database when this log was written
HANDLE	VARCHAR2(513)	Proxy copy handle identifies the copy for restore
MEDIA	VARCHAR2(65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.
TAG	VARCHAR2(32)	Proxy copy tag
FIRST_CHANGE#	NUMBER	First change number in the archived log
NEXT_CHANGE#	NUMBER	First change number in the next log
FIRST_TIME	DATE	Timestamp of the first change
NEXT_TIME	DATE	Timestamp of the next change
OUTPUT_BYTES	NUMBER	Total output bytes written

Column	Datatype	Description
COMPLETION_TIME	DATE	Completion time
OUTPUT_BYTES_DISPLAY	VARCHAR2(3)	Displayable format for output bytes
KEEP	DATE	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)
KEEP_UNTIL	VARCHAR2(11)	If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.
KEEP_OPTIONS	VARCHAR2(4000)	Additional retention options for this backup set: • LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated • BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent • NOLOGS - Indicates a consistent backup made when the database was mounted • NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.139 V$PROXY_ARCHIVELOG_SUMMARY

V$PROXY_ARCHIVELOG_SUMMARY provides summary information about the output proxy archive log file.

Column	Datatype	Description
NUM_FILES_BACKED	NUMBER	Number of archived log files backed up
NUM_DISTINCT_FILES_BACKED	NUMBER	Number of distinct archived log files backed up
MIN_FIRST_CHANGE#	NUMBER	Minimum first change SCN
MAX_NEXT_CHANGE#	NUMBER	Maximum first change SCN
MIN_FIRST_TIME	DATE	Minimum first change time. Forms the redo range, along with MAX_NEXT_TIME.
MAX_NEXT_TIME	DATE	Maximum next change time
OUTPUT_BYTES	NUMBER	Total output size, in bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.140 V$PROXY_COPY_DETAILS

V$PROXY_COPY_DETAILS contains information about all available control file and datafile proxy copies.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session recid
SESSION_STAMP	NUMBER	Session stamp
COPY_KEY	NUMBER	Copy identifier
FILE#	NUMBER	Absolute datafile number, or 0 if this is a control file backup
HANDLE	VARCHAR2(513)	Proxy copy handle identifies the copy for restore
MEDIA	VARCHAR2(65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.
TAG	VARCHAR2(32)	Proxy copy tag
CREATION_CHANGE#	NUMBER	Datafile creation change number
CREATION_TIME	DATE	Datafile creation timestamp
CHECKPOINT_CHANGE#	NUMBER	Checkpoint change number of the datafile when the copy was made
CHECKPOINT_TIME	DATE	Checkpoint timestamp of the datafile when the copy was made
OUTPUT_BYTES	NUMBER	Total output bytes written
COMPLETION_TIME	DATE	Completion time
CONTROLFILE_TYPE	VARCHAR2(1)	Type of control file: • B - Normal control file • S - Standby control file
KEEP	VARCHAR2(3)	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)
KEEP_UNTIL	DATE	If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.
KEEP_OPTIONS	VARCHAR2(11)	Additional retention options for this backup set: • LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated • BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent • NOLOGS - Indicates a consistent backup made when the database was mounted. • NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.141 V$PROXY_COPY_SUMMARY

V$PROXY_COPY_SUMMARY provides summary information about the output proxy datafile and control file.

Column	Datatype	Description
NUM_COPIES	NUMBER	Number of copies created
NUM_DISTINCT_COPIES	NUMBER	Number of distinct copies (that contain datafiles with different checkpoints)
MIN_CHECKPOINT_CHANGE#	NUMBER	Minimum checkpoint change SCN
MAX_CHECKPOINT_CHANGE#	NUMBER	Maximum checkpoint change SCN
MIN_CHECKPOINT_TIME	DATE	Minimum checkpoint change time
MAX_CHECKPOINT_TIME	DATE	Maximum checkpoint change time
OUTPUT_BYTES	NUMBER	Total output bytes
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Displayable format for output bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.142 V$PROXY_DATAFILE

V$PROXY_DATAFILE contains descriptions of datafile and control file backups that are taken with Proxy Copy. Each row represents a backup of one database file.

Column	Datatype	Description
RECID	NUMBER	Proxy copy record ID
STAMP	NUMBER	Proxy copy record stamp
DEVICE_TYPE	VARCHAR2(17)	Type of the device on which the copy resides
HANDLE	VARCHAR2(513)	Proxy copy handle identifies the copy for restore
COMMENTS	VARCHAR2(81)	Comment returned by the operating system or storage subsystem. This value is informational only. It is not needed for restore.

Column	Datatype	Description
MEDIA	VARCHAR2(65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command
TAG	VARCHAR2(32)	Proxy copy tag
STATUS	VARCHAR2(1)	Status of the backup set: • A - Available • U - Unavailable • X - Expired • D - Deleted
DELETED	VARCHAR2(3)	Indicates whether this record has been deleted (YES) or not (NO)
FILE#	NUMBER	Absolute datafile number, or 0 if this is a control file backup
CREATION_CHANGE#	NUMBER	Datafile creation change number
CREATION_TIME	DATE	Datafile creation Timestamp
RESETLOGS_CHANGE#	NUMBER	Resetlogs change number of the datafile when the copy was made
RESETLOGS_TIME	DATE	Resetlogs timestamp of the datafile when the copy was made
CHECKPOINT_CHANGE#	NUMBER	Checkpoint change number of the datafile when the copy was made
CHECKPOINT_TIME	DATE	Checkpoint timestamp of the datafile when the copy was made
ABSOLUTE_FUZZY_CHANGE#	NUMBER	Highest change in any block of the file, if known
RECOVERY_FUZZY_CHANGE#	NUMBER	Highest change written to the file by media recovery
RECOVERY_FUZZY_TIME	DATE	Timestamp of the highest change written to the file by media recovery
INCREMENTAL_LEVEL	NUMBER	If this backup is part of an incremental backup strategy, then 0. Otherwise null.
ONLINE_FUZZY	VARCHAR2(3)	Indicates whether this copy was made after a crash or offline immediate (or is a copy of a copy which was taken improperly while the database was open) (YES) or not (NO). Recovery will need to apply all redo up to the next crash recovery marker to make the file consistent.
BACKUP_FUZZY	VARCHAR2(3)	Indicates whether this is a copy taken using the BEGIN BACKUP | END BACKUP technique (YES) or not (NO). The BEGIN BACKUP | END BACKUP technique is used internally when proxy copies of open files are created. Recovery will need to apply all redo up to the end backup marker to make this copy consistent.
BLOCKS	NUMBER	Size of the copy (in blocks). Also the size of the datafile when the copy was made.
BLOCK_SIZE	NUMBER	Block size of the datafile
OLDEST_OFFLINE_RANGE	NUMBER	If the file number is 0 (that is, this is a control file backup), the RECID of the oldest offline range record in this control file copy. 0 for datafile copies.
START_TIME	DATE	Starting time
COMPLETION_TIME	DATE	Completion time
ELAPSED_SECONDS	NUMBER	Number of elapsed seconds
CONTROLFILE_TYPE	VARCHAR2(1)	Type of control file: • B - Normal control file • S - Standby control file

Column	Datatype	Description
KEEP	VARCHAR2(3)	Indicates whether this backup set has a retention policy that is different than the value for the configure retention policy (YES) or not (NO)
KEEP_UNTIL	DATE	If specified, then this is the date after which the backup becomes obsolete. If this column is NULL, then the backup never expires.
KEEP_OPTIONS	VARCHAR2(11)	Additional retention options for this backup set: • LOGS - Indicates a long-term backup made with the LOGS keyword, which is now deprecated • BACKUP_LOGS - Indicates that the backup was made in open mode, so archived log backups must be applied to make it consistent • NOLOGS - Indicates a consistent backup made when the database was mounted. • NULL - Indicates that this backup has no KEEP options and becomes obsolete based on the retention policy
RMAN_STATUS_RECID	NUMBER	Owning V$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V$RMAN_STATUS stamp
FOREIGN_DBID	NUMBER	Foreign DBID of the database from which this datafile was transported. The value is 0 if the file backed up is not a foreign database file.
PLUGGED_READONLY	VARCHAR2(3)	Indicates whether this is a proxy copy of a transported read-only foreign file (YES) or not (NO)
PLUGIN_CHANGE#	NUMBER	SCN at which the foreign datafile was transported into the database. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_CHANGE#	NUMBER	SCN of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.
PLUGIN_RESETLOGS_TIME	DATE	Time of the RESETLOGS operation for the incarnation into which this foreign file was transported. The value is 0 if this file is not a foreign database file.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
BACKED_BY_PDB	VARCHAR2(3)	Recovery Manager (RMAN) allows a PDB to be backed up in two ways. The value in this column indicates how the PDB backup was taken: • YES: The backup was taken when connected to the PDB • NO: The backup was taken when connected to the root container
GUID	RAW(16)	The GUID of the PDB to which the backup belongs. This is useful after the PDB is dropped to identify which PDB the backup belongs to.

9.143 V$PROXY_PDB_TARGETS

V$PROXY_PDB_TARGETS provides information about the target of a proxy PDB.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: *n*: Where *n* is the container ID of a proxy PDB
TARGET_PORT	NUMBER	Port number that the target of the proxy PDB has registered with the listener, and which will be used by the proxy PDB to connect to the target
TARGET_HOST	VARCHAR2(128)	Host name where the target of the proxy PDB is running, and which will be used by the proxy PDB to connect to the target
TARGET_SERVICE	VARCHAR2(128)	Service name that the target of the proxy PDB has registered with the listener, and which will be used by the proxy PDB to connect to the target
TARGET_USER	VARCHAR2(128)	User name used by the proxy PDB to connect to the target of the proxy PDB. If null, the name of the connected user will be used.

See Also:

Oracle Multitenant Administrator's Guide for information about creating proxy PDBs

9.144 V$PWFILE_USERS

V$PWFILE_USERS lists all users in the password file, and indicates whether the user has been granted the SYSDBA, SYSOPER, SYSASM, SYSBACKUP, SYSDG, and SYSKM privileges.

Column	Datatype	Description
USERNAME	VARCHAR2(128)	Name of the user that is contained in the password file
SYSDBA	VARCHAR2(5)	Indicates whether the user can connect with SYSDBA privileges (TRUE) or not (FALSE)
SYSOPER	VARCHAR2(5)	Indicates whether the user can connect with SYSOPER privileges (TRUE) or not (FALSE)
SYSASM	VARCHAR2(5)	Indicates whether the user can connect with SYSASM privileges (TRUE) or not (FALSE)
SYSBACKUP	VARCHAR2(5)	Indicates whether the user can connect with SYSBACKUP privileges (TRUE) or not (FALSE)
SYSDG	VARCHAR2(5)	Indicates whether the user can connect with SYSDG privileges (TRUE) or not (FALSE)
SYSKM	VARCHAR2(5)	Indicates whether the user can connect with SYSKM privileges (TRUE) or not (FALSE)

Column	Datatype	Description
ACCOUNT_STATUS	VARCHAR2(30)	Account status: • OPEN • EXPIRED • EXPIRED (GRACE) • LOCKED (TIMED) • LOCKED • EXPIRED & LOCKED (TIMED) • EXPIRED & LOCKED • EXPIRED (GRACE) & LOCKED
PASSWORD_PROFILE	VARCHAR2(128)	Password profile name
LAST_LOGIN	TIMESTAMP(9) WITH TIME ZONE	The time of the last user login This column is not populated when a user connects to the database with administrative privileges, that is, AS { SYSASM | SYSBACKUP | SYSDBA | SYSDG | SYSOPER | SYSRAC | SYSKM }. The exception is as follows: If a user connects to the database with administrative privileges from a *remote* session, and the database password file format is 12.2 (V$PASSWORDFILE_INFO.FORMAT = 12.2), then this column is populated.
LOCK_DATE	DATE	Date the account was locked if account status was LOCKED
EXPIRY_DATE	DATE	Date of expiration of the account
EXTERNAL_NAME	VARCHAR2(1024)	Shows Certificate DN or Principal Name of externally authenticated users
AUTHENTICATION_TYPE	VARCHAR2(8)	Indicates the authentication mechanism for the user: • EXTERNAL - CREATE USER *user1* IDENTIFIED EXTERNALLY; • GLOBAL - CREATE USER *user2* IDENTIFIED GLOBALLY; • PASSWORD - CREATE USER *user3* IDENTIFIED BY *password*;
COMMON	VARCHAR2(3)	This column has a value of YES if an administrative privilege (for example, SYSDBA) was granted with CONTAINER=ALL. Otherwise, the column has a value of NO.
PASSWORD_VERSIONS	VARCHAR2(12)	Shows the list of versions of the password hashes (also known as "verifiers") existing for the account. The values for this column can include: • 11G: If a SHA-1 hash exists • 12C: If a de-optimized PBKDF2-based hash exists For more information about the 12C verifier, see *Oracle Database Concepts*. Note that any combination of these verifiers can exist for any given account.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.145 V$PX_INSTANCE_GROUP

V$PX_INSTANCE_GROUP provides information about the instance groups being used for parallel operations by the current session.

Column	Datatype	Description
QC_INSTANCE_GROUP	VARCHAR2(64)	The instance group being used by this session for parallel operations. This value repeats for every row returned.
WHY	VARCHAR2(23)	Where the current instance group name comes from, as follows: SERVICE - the instance group being used is from the session's service name PARALLEL_INSTANCE_GROUP - the instance group being used is being used because the PARALLEL_INSTANCE_GROUP initialization parameter has been set. The value repeats for every row returned.
INSTANCE_NUMBER	NUMBER	Instance number of the instance providing this instance group. There will be one row for each instance in the instance group that the Query Coordinator is using.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

"PARALLEL_INSTANCE_GROUP"

9.146 V$PX_PROCESS

V$PX_PROCESS contains information about the sessions running parallel execution.

Column	Datatype	Description
SERVER_NAME	VARCHAR2(4)	The name of the PX server (P000, P001, and so on)
STATUS	VARCHAR2(9)	The state of the PX server (IN USE or AVAILABLE)
PID	NUMBER	The process identifier
SPID	VARCHAR2(24)	Operating system process ID
SID	NUMBER	The session ID of the PX server, if in use
SERIAL#	NUMBER	The session serial number of the PX server, if in use

Column	Datatype	Description
IS_GV	VARCHAR2(5)	Indicates whether a PX server process in parallel is a normal process or a GV$ process. Possible values: • FALSE: The PX server process in parallel is a normal process • TRUE: The PX server process in parallel is a GV$ process
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.147 V$PX_PROCESS_DETAIL

V$PX_PROCESS_DETAIL lists statistics for each of the active PX (Parallel Execution) servers on an instance.

Column	Datatype	Description
SPID	VARCHAR2(24)	Operating system process ID
SERVER_NAME	VARCHAR2(7)	Name of the PX server (P000, P001, and so on)
STATISTIC	VARCHAR2(30)	Name of the statistic: • Start Time • Cleanup Start Time • Cleanup End Time
VALUE	VARCHAR2(64)	String representation of the value the statistic For example, if the value of the statistic is a timestamp, this column displays a string containing the timestamp information.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

9.148 V$PX_PROCESS_SYSSTAT

V$PX_PROCESS_SYSSTAT contains information about the sessions running parallel execution.

Column	Datatype	Description
STATISTIC	VARCHAR2(30)	Name of the statistic: • Buffers Allocated - Number of times a message buffer has been allocated • Buffers Current - Number of message buffers currently being used • Buffers Freed - Number of times a message buffer has been freed • Buffers HWM - Maximum number of concurrently allocated message buffers • Chunk Lists - Number of memory chunk lists • Memory Chunks Allocated - Number of large memory chunks allocated by PX servers • Memory Chunks Current - Number of large memory chunks currently being used • Memory Chunks Freed - Number of large memory chunks freed • Memory Chunks HWM - Maximum number of concurrently allocated chunks • Memory Chunks Permanent - Number of large memory chunks allocated permanently • Server Sessions - Total number of sessions created by all PX servers • Servers Available - Number of PX servers available to perform parallel operations • Servers Cleaned Up - Number of times PMON had to clean up a PX server. This should only happen during nonstandard termination of a parallel operation. If this number is large, then you should determine the cause. • Servers Highwater - Maximum number of concurrent PX server processes If this number is equal to the PARALLEL_MAX_SERVERS initialization parameter, then consider increasing the parameter. This could allow you to increase your throughput, especially if your system is under-utilized and the V$SYSSTAT statistic "Parallel operations downgraded to serial" is large. • Servers In Use - Number of PX servers currently performing parallel operations • Servers Shutdown - Number of times a PX server process has been shut down. A PX server process will be shut down if it has not been used recently. If this value is large, then consider increasing the parameter. This will improve performance by avoiding the latency of PX server process creation. • Servers Started - Number of times the system has had to create a PX server process
VALUE	NUMBER	Value of the statistic
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.149 V$PX_SERVER

V$PX_SERVER lists statistics for each of the active PX (Parallel Execution) servers on an instance.

Column	Datatype	Description
SERVER_NAME	VARCHAR2(4)	Name of the PX server
STATUS	VARCHAR2(4)	Current status of the PX server: • BUSY • IDLE
SESSIONS	NUMBER	Number of sessions that have used this PX server
IDLE_TIME_CUR	NUMBER	Amount of time spent idle while processing statements in the current session
BUSY_TIME_CUR	NUMBER	Amount of time spent busy while processing statements in the current session
CPU_SECS_CUR	NUMBER	Amount of CPU time (in seconds) spent on the current session
MSGS_SENT_CUR	NUMBER	Number of messages sent while processing statements for the current session
MSGS_RCVD_CUR	NUMBER	Number of messages received while processing statements for the current session
IDLE_TIME_TOTAL	NUMBER	Total amount of time (in minutes) this PX server has been idle
BUSY_TIME_TOTAL	NUMBER	Total amount of time (in minutes) this PX server has been active
CPU_SECS_TOTAL	NUMBER	Total amount of CPU time (in seconds) this PX server has used to process statements
MSGS_SENT_TOTAL	NUMBER	Total number of messages this PX server has sent
MSGS_RCVD_TOTAL	NUMBER	Total number of messages this PX server has received
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

Note:

This view is available starting with Oracle Database 23ai.

9.150 V$PX_SESSION

V$PX_SESSION contains information about the sessions running parallel execution.

Column	Datatype	Description
SADDR	RAW(4 | 8)	Session address
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Session serial number
QCSID	NUMBER	Session identifier of the parallel coordinator
QCSERIAL#	NUMBER	Session serial number of the parallel coordinator
QCINST_ID	NUMBER	Instance number on which the parallel coordinator is running
SERVER_GROUP	NUMBER	The logical group of PX servers to which this cluster database process belongs
SERVER_SET	NUMBER	The logical set of PX servers to which this cluster database process belongs. A single PX server group will have at most two PX server sets.
SERVER#	NUMBER	The logical number of the cluster database process within a PX server set
DEGREE	NUMBER	The degree of parallelism being used by the PX server set
REQ_DEGREE	NUMBER	The degree of parallelism that was requested by the user when the statement was issued and before any resource, multiuser, or load balancing reductions
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.151 V$PX_SESSTAT

V$PX_SESSTAT contains information about the sessions running parallel execution.

Column	Datatype	Description
SADDR	RAW(4 | 8)	Session address
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Session serial number
QCSID	NUMBER	Session identifier of the parallel coordinator
QCSERIAL#	NUMBER	Session serial number of the parallel coordinator
QCINST_ID	NUMBER	Instance number on which the parallel coordinator is running
SERVER_GROUP	NUMBER	The logical group of PX servers to which this cluster database process belongs
SERVER_SET	NUMBER	The logical set of PX servers that this cluster database process belongs to. A single PX server group will have at most two PX server sets.
SERVER#	NUMBER	The logical number of the cluster database process within a PX server set
DEGREE	NUMBER	The degree of parallelism being used by the PX server set

Column	Datatype	Description
REQ_DEGREE	NUMBER	The degree of parallelism that was requested by the user when the statement was issued and before any resource, multiuser, or load balancing reductions
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.152 V$QMON_COORDINATOR_STATS

V$QMON_COORDINATOR_STATS displays statistics of the non-sharded queue primary process. There is one row per instance. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
QMNC_PID	VARCHAR2(24)	Non-sharded queue primary process ID
STATUS	VARCHAR2(24)	Current status of the coordinator: • DEAD • INITIALIZING • RUNNING TASK COORDINATOR • WAITING • ADDING SERVER
NUM_SERVERS	NUMBER	Number of QMON servers currently running
LAST_SERVER_START_TIME	TIMESTAMP(3) WITH TIME ZONE	Last server startup time
LAST_SERVER_PID	VARCHAR2(24)	Process ID of the last server process (Qnnn) created
NEXT_WAKEUP_TIME	TIMESTAMP(3) WITH TIME ZONE	Next wakeup time of the coordinator
NEXT_READY_TIME	TIMESTAMP(3) WITH TIME ZONE	Ready time of the first delayed task
NEXT_EXPIRY_TIME	TIMESTAMP(3) WITH TIME ZONE	Expiry time of the next ready task
LAST_WAIT_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when the coordinator went to sleep
LAST_FAILURE	VARCHAR2(32)	Last failure encountered
LAST_FAILURE_TIME	TIMESTAMP(3) WITH TIME ZONE	Last failure time
MAX_TASK_LATENCY	VARCHAR2(40)	Maximum task latency across all the servers (in seconds)
MIN_TASK_LATENCY	VARCHAR2(40)	Minimum task latency across all the servers (in seconds)
TOTAL_TASK_LATENCY	NUMBER	Cumulative latency across all the tasks (in seconds)
TOTAL_TASKS_EXECUTED	NUMBER	Cumulative number of tasks serviced by all the servers

Column	Datatype	Description
MAX_SERVERS	NUMBER	Maximum number of servers present at any point of time
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

9.153 V$QMON_SERVER_STATS

V$QMON_SERVER_STATS displays information and statistics about the active queue monitor server processes. There is one row per live queue monitor server process. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
QMNC_PID	VARCHAR2(24)	Non-sharded queue primary process ID
SERVER_PID	VARCHAR2(24)	Process ID of the server
SERVER_NAME	VARCHAR2(48)	Name of the server
STATUS	VARCHAR2(40)	Current state of the server: • UNUSED • RUNNING • IDLE WAIT • EXITING • NOT ACTIVE
SERVER_START_TIME	TIMESTAMP(3) WITH TIME ZONE	Start time of the server
TASK_NAME	VARCHAR2(32)	Current executing task
TASK_NUMBER	NUMBER	Unique task number of the running task
TASK_START_TIME	TIMESTAMP(3) WITH TIME ZONE	Start time of the running task
LAST_WAIT_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when the server last waited
MAX_LATENCY	NUMBER	Maximum task latency for this server (in seconds)
MIN_LATENCY	NUMBER	Minimum task latency for this server (in seconds)
TOTAL_LATENCY	NUMBER	Cumulative task latency for this server (in seconds)
NUM_TASKS	NUMBER	Number of tasks processed by the server
LAST_FAILURE	VARCHAR2(128)	Last failure encountered by the server
LAST_FAILURE_TIME	TIMESTAMP(3) WITH TIME ZONE	Last failure time
LAST_FAILURE_TASK	VARCHAR2(32)	Task being run at the time of the last failure
LAST_FAILURE_TASKNUM	NUMBER	Unique task number of the failed task
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

9.154 V$QMON_TASK_STATS

V$QMON_TASK_STATS displays information and statistics based on different queue monitor tasks in the system (spilling, time manager activity, and so on). There is one row per kind of task. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
TASK_NAME	VARCHAR2(32)	Name of the task
TASK_TYPE	VARCHAR2(40)	Type of the task
LAST_CREATED_TASKNUM	NUMBER	Unique task number last created for this task
NUM_TASKS	NUMBER	Number of tasks currently present
TOTAL_TASK_RUN_TIME	NUMBER	Cumulative task run time
TOTAL_TASK_RUNS	NUMBER	Cumulative task runs
TOTAL_TASK_FAILURES	NUMBER	Cumulative failures
METRIC_TYPE	VARCHAR2(50)	Type of metric gathered for this task type
METRIC_VALUE	NUMBER	Value of this metric
LAST_FAILURE	VARCHAR2(32)	Last failure encountered while executing this type of task
LAST_FAILURE_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when the last failure occurred
LAST_FAILURE_TASKNUM	NUMBER	Task number of the last failed task for this task
REMARK	VARCHAR2(64)	Remarks about the task
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

9.155 V$QMON_TASKS

V$QMON_TASKS displays information and statistics about all queue background tasks in the system, which would be served by queue monitor servers. There is one row per task. The rows are deleted when the database (or instance in an Oracle RAC environment) restarts.

Column	Datatype	Description
TASK_NAME	VARCHAR2(32)	Task name
TASK_NUMBER	NUMBER	Unique task number
TASK_TYPE	VARCHAR2(40)	Task type
TASK_SUBMIT_TIME	TIMESTAMP(3) WITH TIME ZONE	Task submit time
TASK_READY_TIME	TIMESTAMP(3) WITH TIME ZONE	Task ready time
TASK_EXPIRY_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when this task expires
TASK_START_TIME	TIMESTAMP(3) WITH TIME ZONE	Last actual start time for the task
TASK_STATUS	VARCHAR2(32)	Status of the task
SERVER_NAME	VARCHAR2(48)	Name of the QMON server running this task

Column	Datatype	Description
MAX_RETRIES	NUMBER	Maximum retry count for the task
NUM_RUNS	NUMBER	Number of runs of the task if repeatable
NUM_FAILURES	NUMBER	Number of failures encountered while running the task
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

9.156 V$QUARANTINE

V$QUARANTINE provides information about quarantined objects.

Column	Datatype	Description
OBJECT	VARCHAR2(64)	Type of quarantined object (description of the memory)
ADDRESS	RAW(8)	Address of the object
BYTES	NUMBER	Amount of memory used by the object (this is the minimum amount; the actual amount may be unknown)
ERROR	VARCHAR2(128)	Oracle error causing quarantine
TIMESTAMP	TIMESTAMP(6) WITH TIME ZONE	Time the object was quarantined
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.157 V$QUARANTINE_SUMMARY

V$QUARANTINE_SUMMARY provides a summary of quarantine for each pluggable database (PDB).

Column	Datatype	Description
OBJECT_COUNT	NUMBER	Number of objects in quarantine
OBJECT_LIMIT	NUMBER	Limit on the number of objects that can be in quarantine before a termination will occur
MEMORY_TOTAL	NUMBER	Number of bytes in quarantine
MEMORY_LIMIT	NUMBER	Limit on the amount of memory that can be in quarantine before a termination will occur
RECENT_COUNT	NUMBER	Number of objects recently placed in quarantine (within the last hour)
RECENT_LIMIT	NUMBER	Limit on the number of recently quarantined objects before a termination will occur

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "V$QUARANTINE" for additional details on objects recently placed into quarantine

9.158 V$QUEUE

V$QUEUE contains information on the shared server message queues.

Column	Datatype	Description
PADDR	RAW(4 | 8)	Address of the process that owns the queue
TYPE	VARCHAR2(10)	Type of queue: • COMMON - Processed by servers • DISPATCHER
QUEUED	NUMBER	Number of items in the queue
WAIT	NUMBER	Total time that all items in this queue have waited (in hundredths of a second). Divide by TOTALQ for average wait per item.
TOTALQ	NUMBER	Total number of items that have ever been in the queue
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.159 V$QUEUEING_MTH

V$QUEUEING_MTH displays all available queuing resource allocation methods.

Column	Datatype	Description
NAME	VARCHAR2(40)	Name of the queuing resource allocation method

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.160 V$RAC_TWO_STAGE_ROLLING_UPDATES

V$RAC_TWO_STAGE_ROLLING_UPDATES displays information about Oracle RAC two-stage rolling updates.

Column	Datatype	Description
BUG_NUMBER	VARCHAR2(11)	Bug number for the two-stage rolling update
ENABLED	VARCHAR2(1)	Indicates whether the two-stage rolling update is enabled (Y) or disabled (N)
ONLINE_DISABLE	VARCHAR2(1)	Indicates whether the two-stage rolling update can be disabled while the database instance is running (Y) or not (N)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

9.161 V$RECOVER_FILE

V$RECOVER_FILE displays the status of files needing media recovery.

Column	Datatype	Description
FILE#	NUMBER	File identifier number
ONLINE	VARCHAR2(7)	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in ONLINE_STATUS.
ONLINE_STATUS	VARCHAR2(7)	Online status (ONLINE, OFFLINE)
ERROR	VARCHAR2(18)	Why the file must be recovered: NULL if reason unknown, or OFFLINE NORMAL if recovery not needed

Column	Datatype	Description
CHANGE#	NUMBER	SCN where recovery must start
TIME	DATE	Time of SCN when recovery must start
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.162 V$RECOVERY_AREA_USAGE

V$RECOVERY_AREA_USAGE displays usage information about recovery areas.

Column	Datatype	Description
FILE_TYPE	VARCHAR2(23)	File type: • CONTROL FILE • REDO LOG • ARCHIVED LOG • BACKUP PIECE • IMAGE COPY • FLASHBACK LOG • REMOTE ARCHIVED LOG
PERCENT_SPACE_USED	NUMBER	Percent of the recovery area that is in use
PERCENT_SPACE_RECLAIMABLE	NUMBER	Percent of the recovery area that is reclaimable
NUMBER_OF_FILES	NUMBER	Number of files in the recovery area
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.163 V$RECOVERY_FILE_DEST

V$RECOVERY_FILE_DEST displays information about the disk quota and current disk usage in the fast recovery area.

Column	Datatype	Description
NAME	VARCHAR2(513)	Location name. This is the value specified in the DB_RECOVERY_FILE_DEST initialization parameter.

Column	Datatype	Description
SPACE_LIMIT	NUMBER	Maximum amount of disk space (in bytes) that the database can use for the fast recovery area. This is the value specified in the DB_RECOVERY_FILE_DEST_SIZE initialization parameter.
SPACE_USED	NUMBER	Amount of disk space (in bytes) used by fast recovery area files created in current and all previous fast recovery areas. Changing fast recovery areas does not reset SPACE_USED to 0.
SPACE_RECLAIMABLE	NUMBER	Total amount of disk space (in bytes) that can be created by deleting obsolete, redundant, and other low priority files from the fast recovery area
NUMBER_OF_FILES	NUMBER	Number of files in the fast recovery area
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- "DB_RECOVERY_FILE_DEST"
- "DB_RECOVERY_FILE_DEST_SIZE"

9.164 V$RECOVERY_FILE_STATUS

V$RECOVERY_FILE_STATUS contains one row for each datafile for each RECOVER statement. This view contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V$RECOVERY_FILE_STATUS will be empty to all other Oracle users.

Column	Datatype	Description
FILENUM	NUMBER	Number of the file being recovered
FILENAME	VARCHAR2(513)	Filename of the datafile being recovered
STATUS	VARCHAR2(13)	Status of the recovery: • IN RECOVERY • CURRENT • NOT RECOVERED

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> *Oracle Database Backup and Recovery User's Guide*

9.165 V$RECOVERY_LOG

V$RECOVERY_LOG lists information about archived logs that are needed to complete media recovery. This information is derived from the log history view, V$LOG_HISTORY.

V$RECOVERY_LOG contains useful information only for the Oracle process doing the recovery. When Recovery Manager directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V$RECOVERY_LOG will be empty to all other Oracle users.

Column	Datatype	Description
THREAD#	NUMBER	Thread number of the archived log
SEQUENCE#	NUMBER	Sequence number of the archived log
TIME	DATE	Time of the first entry (lowest SCN) in the log
ARCHIVE_NAME	VARCHAR2(513)	Name of the file when archived, using the naming convention specified by the LOG_ARCHIVE_FORMAT initialization parameter **See Also:** "LOG_ARCHIVE_FORMAT"
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "V$LOG_HISTORY" and *Oracle Database Backup and Recovery User's Guide*

9.166 V$RECOVERY_PROGRESS

V$RECOVERY_PROGRESS can be used to track database recovery operations to ensure that they are not stalled, and also to estimate the time required to complete the operation in progress.

On non-coordinator instances, V$RECOVERY_PROGRESS is not populated.

On the coordinator instance (the instance where MRP0 was started to start recovery), V$RECOVERY_PROGRESS has the same set of rows as before, except the following rows in the ITEM column are always 0 (not used) with Multi-Instance Redo Apply:

- Active Apply
- Maximum Apply Rate
- Apply Time per Log
- Checkpoint Time per Log
- Recovery ID

V$RECOVERY_PROGRESS is a subview of V$SESSION_LONGOPS.

> **Note:**
>
> This view is populated on the instance where the MRP0 process is started if recovery is running in Multi-Instance Redo Apply mode. Not all the columns will be populated.

Column	Datatype	Description
START_TIME	DATE	Start time of the recovery operation
TYPE	VARCHAR2(64)	Type of recovery operation being performed: • CRASH RECOVERY • INSTANCE RECOVERY • MEDIA RECOVERY
ITEM	VARCHAR2(32)	Item being measured. When TYPE is CRASH RECOVERY or INSTANCE RECOVERY, the possible values are: • Log Files • Redo Blocks When TYPE is MEDIA RECOVERY, the possible values are: • Active Apply Rate • Average Apply Rate • Maximum Apply Rate • Redo Applied • Log Files • Last Applied Redo • Active Time • Elapsed Time • Apply Time per Log • Checkpoint Time per Log • Standby Apply Lag • Recovery ID

Column	Datatype	Description
UNITS	VARCHAR2(32)	The units of measurement for each item
SOFAR	NUMBER	Amount of work done so far
TOTAL	NUMBER	Total amount of work expected
TIMESTAMP	DATE	Timestamp of the last redo record applied
COMMENTS	VARCHAR2(248)	Miscellaneous notes; currently displays the SCN for the last applied redo
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- "V$SESSION_LONGOPS"
- "Background Processes" for more information about the MRP0 process
- *Oracle Database Backup and Recovery User's Guide* for more information about performing database recovery

9.167 V$RECOVERY_SLAVE

V$RECOVERY_SLAVE is used to track database media recovery processes to monitor their performance statistics and analyze a media recovery session.

Note:

This view is deprecated. Oracle recommends that you instead use the V$RECOVERY_WORKER view.

See Also:

"V$RECOVERY_WORKER"

9.168 V$RECOVERY_STATUS

V$RECOVERY_STATUS contains statistics of the current recovery process. This view contains useful information only for the Oracle process doing the recovery. When Recovery Manager

directs a server process to perform recovery, only Recovery Manager can view the relevant information in this view. V$RECOVERY_STATUS will be empty to all other Oracle users.

Column	Datatype	Description
RECOVERY_CHECKPOINT	DATE	Point in time to which the recovery has occurred. If no logs have been applied, this is the point in time the recovery starts.
THREAD	NUMBER	Number of the redo thread currently being processed
SEQUENCE_NEEDED	NUMBER	Log sequence number of the log needed by the recovery process. The value is 0 if no log is needed.
SCN_NEEDED	VARCHAR2(16)	Low SCN of the log needed by recovery. The value is 0 if unknown or no log is needed.
TIME_NEEDED	DATE	Time when the log was created. The value is midnight on 1/1/88 if the time is unknown or if no log is needed.
PREVIOUS_LOG_NAME	VARCHAR2(513)	Filename of the log
PREVIOUS_LOG_STATUS	VARCHAR2(13)	Status of the previous log. Contains one of the following values: RELEASE; WRONG NAME; MISSING NAME; UNNEEDED NAME; NONE
REASON	VARCHAR2(13)	Reason recovery is returning control to the user (NEED LOG|LOG REUSED|THREAD DISABLED)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

Oracle Database Backup and Recovery User's Guide

9.169 V$RECOVERY_WORKER

V$RECOVERY_WORKER is used to track database media recovery processes to monitor their performance statistics and analyze a media recovery session.

Column	Datatype	Description
START_TIME	DATE	Start time of the recovery process
TYPE	VARCHAR2(64)	Type of recovery process being performed: • Media Recovery Applier # (where # represents the worker ID number) • Media Recovery Log Merger • Serial Media Recovery

Column	Datatype	Description
ITEM	VARCHAR2(32)	Item being measured. When TYPE is Media Recovery Applier #, the possible values are: • Recovery ID • Process ID • Number of Redo Cache Full • Number of Redo Cache Copy • Number of CV Cached • CV Applied OK • CV Applied Stuck • CV Applied Repair • CV Applied Corrupt • CV Applied Ckpt • CV Applied Reapplied • Total CV Processed Size • Total CV Applied • Number of Buffer Cache Full • Number of Buffer Retries • Number of Max Reads Issued • Number of Unrcv Condition • Number of Influx Buffer Flushed • Number of Reap Request • Number of Reap Wait IO • Number of Reap No Buffer • Number of Wait All Read • Number of Buffer Pinged • Buffer Ping Time • Read Issue Time • Number of Read Request Issued When TYPE is Media Recovery Log Merger, the possible values are: • Recovery ID • Process ID • Number of Redo Cache Full • Number of Redo Cache Copy • Number of CV Cached • Total Redo Read Bytes • Total CV Parsed When TYPE is Serial Media Recovery, the possible values include values from the other two TYPEs.
UNITS	VARCHAR2(32)	The units of measurement for each item
SOFAR	NUMBER	Amount of work done so far
TOTAL	NUMBER	Total amount of work expected
COMMENTS	VARCHAR2(248)	Miscellaneous notes, which may display the recovery ID and process ID for current recovery session

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.170 V$REDO_DEST_RESP_HISTOGRAM

V$REDO_DEST_RESP_HISTOGRAM provides statistical information for each redo transport destination.

Column	Datatype	Description
DEST_ID	NUMBER	A nonnegative integer value representing a SYNC standby destination
TIME	VARCHAR2(20)	A text string that shows the last wall-clock time that a bucket was hit
DURATION	NUMBER	A positive integer value that represents a bucket of seconds, 1, 2, 3, up to 300 seconds, followed by 5 additional buckets that represent 600, 1200, 2400, 4800, and 9600 (>= 4801) seconds
FREQUENCY	NUMBER	A nonnegative integer that shows the number of times a particular bucket was hit by the destination specified by DEST_ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.171 V$REQDIST

V$REQDIST lists statistics for the histogram of shared server dispatcher request times, divided into 12 buckets, or ranges of time. The time ranges grow exponentially as a function of the bucket number.

Column	Datatype	Description
BUCKET	NUMBER	Bucket number: 0 - 11; the maximum time for each bucket is (4 * 2^N)/100 seconds
COUNT	NUMBER	Count of requests whose total time to complete (excluding wait time) falls in this range
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.172 V$RESERVED_WORDS

V$RESERVED_WORDS displays a list of all SQL keywords. To determine whether a particular keyword is reserved in any way, check the RESERVED, RES_TYPE, RES_ATTR, and RES_SEMI columns.

Column	Datatype	Description
KEYWORD	VARCHAR2(128)	Name of the keyword
LENGTH	NUMBER	Length of the keyword
RESERVED	VARCHAR2(1)	Indicates whether the keyword cannot be used as an identifier (Y) or whether the keyword is not reserved (N)
RES_TYPE	VARCHAR2(1)	Indicates whether the keyword cannot be used as a type name (Y) or whether the keyword is not reserved (N)
RES_ATTR	VARCHAR2(1)	Indicates whether the keyword cannot be used as an attribute name (Y) or whether the keyword is not reserved (N)
RES_SEMI	VARCHAR2(1)	Indicates whether the keyword is not allowed as an identifier in certain situations, such as in DML (Y) or whether the keyword is not reserved (N)
DUPLICATE	VARCHAR2(1)	Indicates whether the keyword is a duplicate of another keyword (Y) or whether the keyword is not a duplicate (N)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.173 V$RESOURCE

V$RESOURCE contains resource name and address information.

Column	Datatype	Description
ADDR	RAW(4 | 8)	Address of the resource object
TYPE	VARCHAR2(2)	Resource type; the resource types are listed in Table 9-1
ID1	NUMBER	Resource identifier #1
ID2	NUMBER	Resource identifier #2
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.174 V$RESOURCE_LIMIT

V$RESOURCE_LIMIT displays information about global resource use for some of the system resources. Use this view to monitor the consumption of resources so that you can take corrective action, if necessary. Many of the resources correspond to initialization parameters listed in Table 9-5.
Some resources, those used by DLM for example, have an initial allocation (soft limit), and the hard limit, which is theoretically infinite (although in practice it is limited by SGA size). During SGA reservation/initialization, a place is reserved in SGA for the INITIAL_ALLOCATION of resources, but if this allocation is exceeded, additional resources are allocated up to the value indicated by LIMIT_VALUE. The CURRENT_UTILIZATION column indicates whether the initial allocation has been exceeded. When the initial allocation value is exceeded, the additional required resources are allocated from the shared pool, where they must compete for space with other resources.

A good choice for the value of INITIAL_ALLOCATION will avoid the contention for space. For most resources, the value for INITIAL_ALLOCATION is the same as the LIMIT_VALUE. Exceeding LIMIT_VALUE results in an error.

Column	Datatype	Description
RESOURCE_NAME	VARCHAR2(128)	Name of the resource (see Table 9-5)
CURRENT_UTILIZATION	NUMBER	Number of (resources, locks, or processes) currently being used
MAX_UTILIZATION	NUMBER	Maximum consumption of this resource since the last instance start-up
INITIAL_ALLOCATION	VARCHAR2(10)	Initial allocation. This will be equal to the value specified for the resource in the initialization parameter file (UNLIMITED for infinite allocation).
LIMIT_VALUE	VARCHAR2(10)	Unlimited for resources and locks. This can be greater than the initial allocation value (UNLIMITED for infinite limit).
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

Table 9-5 Values for the RESOURCE_NAME Column

Resource Name	Corresponds to
DML_LOCKS	See "DML_LOCKS"
ENQUEUE_LOCKS	This value is computed by the Oracle Database. See V$ENQUEUE_LOCK to obtain more information about the enqueue locks.
GES_LOCKS	Global Enqueue Service locks
GES_PROCS	Global Enqueue Service processes
GES_RESS	Global Enqueue Service resources
MAX_SHARED_SERVERS	See "MAX_SHARED_SERVERS"
PARALLEL_MAX_SERVERS	See "PARALLEL_MAX_SERVERS"
PROCESSES	See "PROCESSES"
SESSIONS	See "SESSIONS"
SORT_SEGMENT_LOCKS	This value is computed by the Oracle Database
TEMPORARY_LOCKS	This value is computed by the Oracle Database
TRANSACTIONS	See "TRANSACTIONS"

9.175 V$RESTORE_POINT

V$RESTORE_POINT displays information about restore points.

Column	Datatype	Description
SCN	NUMBER	Database SCN when the restore point was created
DATABASE_INCARNATION#	NUMBER	Database incarnation number when the restore point was created
GUARANTEE_FLASHBACK_DATABASE	VARCHAR2(3)	Indicates whether flashback log files will be kept to ensure a flashback to this point (YES) or not (NO)
STORAGE_SIZE	NUMBER	Approximate number of bytes of disk space currently tied up supporting this restore point, and which would no longer be tied up if this restore point is the oldest restore point and it is dropped. This will always be zero for non-guaranteed restore points.
TIME	TIMESTAMP(9)	Wall-clock time when the restore point was created
RESTORE_POINT_TIME	TIMESTAMP(9)	Time that was specified when the restore point was created. If a time was not specified, this value is NULL.
PRESERVED	VARCHAR2(3)	Indicates whether the restore point must be explicitly deleted (YES) or not (NO)
NAME	VARCHAR2(128)	Name of the restore point
PDB_RESTORE_POINT	VARCHAR2(3)	Indicates whether there is a PDB restore point for this PDB (YES) or not (NO)
CLEAN_PDB_RESTORE_POINT	VARCHAR2(3)	Indicates whether there is a clean PDB restore point for this PDB (YES) or not (NO)
PDB_INCARNATION#	NUMBER	Pluggable database (PDB) incarnation number. This value is meaningful only for PDB restore points.

Column	Datatype	Description
REPLICATED	VARCHAR2(3)	This column is useful in Oracle Data Guard environments. It indicates the method by which a restore point was created. Possible values: • YES - The restore point was automatically replicated from the primary database to this database when this database was a standby database. The string _PRIMARY is appended to the name of such a restore point. • NO - The restore point was created by a user and was not replicated from the primary database.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.176 V$RESULT_CACHE_DEPENDENCY

V$RESULT_CACHE_DEPENDENCY displays the depends-on relationship between cached results and dependencies.

Column	Datatype	Description
RESULT_ID	NUMBER	Cached result
DEPEND_ID	NUMBER	Dependency object
OBJECT_NO	NUMBER	Dictionary object number of the dependency object
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.177 V$RESULT_CACHE_MEMORY

V$RESULT_CACHE_MEMORY displays all the memory blocks and their status.

Column	Datatype	Description
ID	NUMBER	Unique block identifier (that is, the block number)
CHUNK	NUMBER	Chunk to which the block belongs, relative to the subcache in which the memory object resides (the upper 27 bits of the ID)
OFFSET	NUMBER	Offset of the block within its chunk, relative to the subcache in which the memory object resides (the lower 5 bits of the ID)
SUBCACHE_ID	NUMBER	Subcache ID
FREE	VARCHAR2(3)	Indicates whether the block is free (YES) or not (NO)

Column	Datatype	Description
OBJECT_ID	NUMBER	Cache object to which the memory block belongs; NULL if the memory block is not allocated to a cache object (FREE = YES)
POSITION	NUMBER	Position of the block in the cached object; NULL if the memory block is not allocated to a cache object (FREE = YES)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.178 V$RESULT_CACHE_OBJECTS

V$RESULT_CACHE_OBJECTS displays all the objects (both cached results and dependencies) and their attributes.

Column	Datatype	Description
ID	NUMBER	Identifier for the cache object (also the ID of the first block)
TYPE	VARCHAR2(10)	Type of the cache object: • Dependency • Result • Temp
STATUS	VARCHAR2(9)	Status of the object: • New - Result is still under construction • Published - Result is available for use • Bypass - Result will be bypassed from use • Expired - Result has exceeded expiration time • Invalid - Result is no longer available for use
BUCKET_NO	NUMBER	Internal hash bucket for the object
HASH	NUMBER	Hash value for the object
NAME	VARCHAR2(387)	Name (for example, SQL prefix or PL/SQL function name)
NAMESPACE	VARCHAR2(10)	Namespace: • SQL • PLSQL • KEY VECTOR
CREATION_TIMESTAMP	DATE	Time when the object was created
CREATOR_UID	NUMBER	UID that created the object
DEPEND_COUNT	NUMBER	Number of dependencies (TYPE = Result) or dependents (TYPE = Dependency)
BLOCK_COUNT	NUMBER	Total number of blocks in the cached object
SCN	NUMBER	Build SCN (TYPE = Result) or invalidation SCN (TYPE = Dependency)
COLUMN_COUNT[1]	NUMBER	Number of columns in the cached result
PIN_COUNT[1]	NUMBER	Number of active scans on this result

Column	Datatype	Description
SCAN_COUNT[1]	NUMBER	Total number of scans initiated on the cached result
ROW_COUNT[1]	NUMBER	Total number of rows in the cached result
ROW_SIZE_MAX[1]	NUMBER	Size of the largest row (in bytes)
ROW_SIZE_MIN[1]	NUMBER	Size of the smallest row (in bytes)
ROW_SIZE_AVG[1]	NUMBER	Average size of a row (in bytes)
BUILD_TIME[1]	NUMBER	Amount of time (in hundredths of a second) it took to build the cached result
LRU_NUMBER[1]	NUMBER	LRU list position (the larger the value, the more recent the usage)
OBJECT_NO[2]	NUMBER	Dictionary object number of the dependency object
INVALIDATIONS[2]	NUMBER	Number of times the object has invalidated its dependents
TIME_SAVED[2]	NUMBER	Amount of time (in microseconds) saved by reuse
INVALIDATION_COST[2]	NUMBER	Amount of time (in microseconds) spent on invalidation
SPACE_OVERHEAD[1]	NUMBER	Overhead (in bytes) for the result
SPACE_UNUSED[1]	NUMBER	Unused space (in bytes) for the result
CACHE_ID	VARCHAR2(387)	`CacheId` for the result (object name if it's a dependency)
CACHE_KEY	VARCHAR2(387)	`CacheKey` for the result (object name if it's a dependency)
CHECKSUM	NUMBER	Checksum for the result object. The checksum is computed over all the blocks in the result cache object minus the object header.
EDITION_ID	NUMBER	Shows the edition's object ID that was in use when the result was calculated
DB_LINK	VARCHAR2(3)	Possible values: • `YES`: The result cache object references a remote database object • `NO`: The result cache object does not reference a remote database object
GLOBAL	VARCHAR2(3)	Possible values: • `YES`: The object was fetched from the result cache of a remote database instance • `NO`: The object was recomputed on this instance, either because it was not available on a remote database instance or because the system deemed it was inefficient to fetch the object from a remote database instance
SUBCACHE_ID	NUMBER	Subcache ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • `0`: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • `1`: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

1 This column is valid only for `TYPE` = `Result`; otherwise, its value is 0.

2 This column is valid only for `TYPE` = `Dependency`; otherwise, its value is 0.

9.179 V$RESULT_CACHE_STATISTICS

V$RESULT_CACHE_STATISTICS displays various result cache settings and usage statistics.

Column	Datatype	Description
ID	NUMBER	Statistic number
NAME	VARCHAR2(128)	Name of the statistic (see Table 9-6)
VALUE	VARCHAR2(81)	Value of the statistic
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

Table 9-6 V$RESULT_CACHE_STATISTICS and V$RESULT_SUBCACHE_STATISTICS Statistics

Statistic Name	Description
Block Count Current	Number of memory blocks currently allocated
Block Count Maximum	Maximum number of memory blocks allowed
Block Size (Bytes)	Size of each memory block
Create Count Failure	Number of cache results that failed to create
Create Count Success	Number of cache results successfully created
Delete Count Invalid	Number of invalid cached results deleted
Delete Count Valid	Number of valid cached results deleted
Find Copy Count	Number of results copied directly out of the cache
Find Count	Number of cached results that were successfully found
Global Load Rate	Rate at which cached results were fetched from remote instances (in bytes per 10 milliseconds)
Global Prune By Self Count	Number of times this instance did not provide a cached result to a remote instance because this instance deemed it inefficient to do so
Global Prune Count	Number of times this instance did not fetch a cached result from a remote instance because it was deemed inefficient to do so
Hash Chain Length	Average length of items in the hash chain
Invalidation Count	Total number of invalidations
Result Size Maximum (Blocks)	Maximum number of blocks allowed for a single result
Subcache Count	Number of subcaches in the result cache

See Also:

"V$RESULT_SUBCACHE_STATISTICS"

9.180 V$RESULT_SUBCACHE_STATISTICS

V$RESULT_SUBCACHE_STATISTICS displays various result cache settings and usage statistics on a per subcache basis.

Column	Datatype	Description
ID	NUMBER	Statistic number
NAME	VARCHAR2(128)	Name of the statistic This view displays the same statistics as the V$RESULT_CACHE_STATISTICS view. See Table 9-6 in the documentation for V$RESULT_CACHE_STATISTICS.
VALUE	VARCHAR2(81)	Value of the statistic
SUBCACHE_ID	NUMBER	Subcache ID
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

"V$RESULT_CACHE_STATISTICS"

9.181 V$RMAN_BACKUP_JOB_DETAILS

V$RMAN_BACKUP_JOB_DETAILS displays details about backup jobs.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Together, with SESSION_KEY and SESSION_STAMP, used to uniquely identify job output from V$RMAN_OUTPUT
SESSION_STAMP	NUMBER	Together, with SESSION_KEY and SESSION_RECID, used to uniquely identify job output from V$RMAN_OUTPUT
COMMAND_ID	VARCHAR2(33)	Either a user-specified SET COMMAND ID or a unique command ID generated by RMAN
START_TIME	DATE	Start time of the first BACKUP command in the job
END_TIME	DATE	End time of the last BACKUP command in the job
INPUT_BYTES	NUMBER	Sum of all input file sizes backed up by this job
OUTPUT_BYTES	NUMBER	Output size of all pieces generated by this job
STATUS_WEIGHT	NUMBER	Used internally by Enterprise Manager
OPTIMIZED_WEIGHT	NUMBER	Used internally by Enterprise Manager

Column	Datatype	Description
OBJECT_TYPE_WEIGHT	NUMBER	Used internally by Enterprise Manager
OUTPUT_DEVICE_TYPE	VARCHAR2(17)	Can be DISK, SBT, or *. An * indicates more than one device (in most cases, it will be DISK or SBT).
AUTOBACKUP_COUNT	NUMBER	Number of autobackups performed by this job
BACKED_BY_OSB	VARCHAR2(3)	A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.
AUTOBACKUP_DONE	VARCHAR2(3)	YES or NO, depending upon whether or not a control file autobackup was done as part of this backup job
STATUS	VARCHAR2(23)	One of the following values: • RUNNING WITH WARNINGS • RUNNING WITH ERRORS • COMPLETED • COMPLETED WITH WARNINGS • COMPLETED WITH ERRORS • FAILED
INPUT_TYPE	VARCHAR2(13)	Contains one of the following values. If the user command does not satisfy one of them, then preference is given in order, from top to bottom of the list. • DB FULL • RECVR AREA • DB INCR • DATAFILE FULL • DATAFILE INCR • ARCHIVELOG • CONTROLFILE • SPFILE
OPTIMIZED	VARCHAR2(3)	YES or NO, depending on whether optimization was applied. Applicable to backup jobs only.
ELAPSED_SECONDS	NUMBER	Number of elapsed seconds
COMPRESSION_RATIO	NUMBER	Compression ratio
INPUT_BYTES_PER_SEC	NUMBER	Input read-rate-per-second
OUTPUT_BYTES_PER_SEC	NUMBER	Output write-rate-per-second
INPUT_BYTES_DISPLAY	VARCHAR2(4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on
INPUT_BYTES_PER_SEC_DISPLAY	VARCHAR2(4000)	Input read-rate-per-second. These values are in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
OUTPUT_BYTES_PER_SEC_DISPLAY	VARCHAR2(4000)	Output write-rate-per-second. These values are in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
TIME_TAKEN_DISPLAY	VARCHAR2(4000)	Time taken, shown in user-displayable format <nn>h:<nn>m:<nn>s

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.182 V$RMAN_BACKUP_SUBJOB_DETAILS

V$RMAN_BACKUP_SUBJOB_DETAILS merges similar operations within an RMAN session into a single row. For example, if there are four BACKUP DATAFILE <n> commands, three RECOVERY COPY OF DATAFILE commands, and one BACKUP RECOVERY AREA command, this view will contain three rows - one each for BACKUP, ROLLFORWARD, and COPY_DISK_TO_TAPE operation.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Together with SESSION_KEY and SESSION_STAMP, used to uniquely identify job output from V$RMAN_OUTPUT
SESSION_STAMP	NUMBER	Together with SESSION_KEY and SESSION_RECID, used to uniquely identify job output from V$RMAN_OUTPUT
OPERATION	VARCHAR2(33)	Can be BACKUP, ROLLFORWARD, VALIDATE, or COPY_DISK_TO_TAPE. A row for each suboperation type for the session will be in the output view.
COMMAND_ID	VARCHAR2(33)	Either a user-specified SET COMMAND ID or a unique command ID generated by RMAN
START_TIME	DATE	Start time of the first BACKUP command in the job
END_TIME	DATE	End time of the last BACKUP command in the job
INPUT_BYTES	NUMBER	Sum of all input file sizes backed up by this job
OUTPUT_BYTES	NUMBER	Output size of all pieces generated by this job
STATUS_WEIGHT	NUMBER	Used internally by Enterprise Manager
OBJECT_TYPE_WEIGHT	NUMBER	Used internally by Enterprise Manager
OPTIMIZED_WEIGHT	NUMBER	Used internally by Enterprise Manager
OUTPUT_DEVICE_TYPE	VARCHAR2(17)	Can be DISK, SBT, or *. An * indicates more than one device (in most cases, it will be DISK or SBT).
BACKED_BY_OSB	VARCHAR2(3)	A value of YES means the backup was done to Oracle Secure Backup. Otherwise, backed up by other third party tape library.
AUTOBACKUP_DONE	VARCHAR2(3)	YES or NO, depending upon whether or not a control file autobackup was done as part of this job

Column	Datatype	Description
STATUS	VARCHAR2(23)	One of the following values: • RUNNING WITH WARNINGS • RUNNING WITH ERRORS • COMPLETED • COMPLETED WITH WARNINGS • COMPLETED WITH ERRORS • FAILED
INPUT_TYPE	VARCHAR2(13)	Contains one of the following values. If the user command does not satisfy one of them, then preference is given in order, from top to bottom of the list. • DB FULL • RECVR AREA • DB INCR • DATAFILE FULL • DATAFILE INCR • ARCHIVELOG • CONTROLFILE • SPFILE
OPTIMIZED	VARCHAR2(3)	YES or NO, depending on whether optimization was applied. Applicable to backup jobs only.
AUTOBACKUP_COUNT	NUMBER	Number of autobackups performed by this job
COMPRESSION_RATIO	NUMBER	Compression ratio
INPUT_BYTES_DISPLAY	VARCHAR2(4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
OUTPUT_BYTES_DISPLAY	VARCHAR2(4000)	Values in user-displayable form. They will be converted to a format of nM, nG, nT, nP, and so on.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.183 V$RMAN_BACKUP_TYPE

V$RMAN_BACKUP_TYPE displays information about RMAN backup types.

Column	Datatype	Description
WEIGHT	NUMBER	Used to set precedence order of different backup types in reports.
INPUT_TYPE	VARCHAR2(13)	Used to represent possible filters used in creating various reporting screens.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.184 V$RMAN_COMPRESSION_ALGORITHM

V$RMAN_COMPRESSION_ALGORITHM provides descriptions of supported compression algorithms. It is used by the RMAN client.

Column	Datatype	Description
ALGORITHM_ID	NUMBER	Algorithm ID
ALGORITHM_NAME	VARCHAR2(64)	Name of the algorithm (for example, LOW, MEDIUM, DEFAULT, or HIGH)
INITIAL_RELEASE	VARCHAR2(18)	First Oracle Database release when this compression algorithm was available
TERMINAL_RELEASE	VARCHAR2(18)	Last Oracle Database release that supported using this compression algorithm to create new backups. Existing backups can always be restored, even if they use a deprecated compression algorithm.
ALGORITHM_DESCRIPTION	VARCHAR2(64)	Description of the algorithm
ALGORITHM_COMPATIBILITY	VARCHAR2(18)	Required database compatibility level for the algorithm (for example, 11.2.0 for DEFAULT)
IS_VALID	VARCHAR2(3)	Indicates whether the algorithm is valid with regard to the compatibility setting (YES) or not (NO). The value is YES if ALGORITHM_COMPATIBILITY <= DATABASE_COMPATIBILITY.
REQUIRES_ACO	VARCHAR2(3)	Indicates whether the algorithm requires the Advanced Compression Option (YES) or not (NO)
IS_DEFAULT	VARCHAR2(3)	Indicates whether the algorithm is the default compression algorithm that RMAN uses to create compressed backup sets (YES) or not (NO)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.185 V$RMAN_CONFIGURATION

V$RMAN_CONFIGURATION lists information about RMAN persistent configuration settings.

Column	Datatype	Description
CONF#	NUMBER	A unique key identifying this configuration record within the target database that owns it.
NAME	VARCHAR2(65)	The type of configuration. All options of the CONFIGURE command are valid types except: • CONFIGURE EXCLUDE (described in RC_TABLESPACE) • CONFIGURE AUXNAME (described in RC_DATAFILE) • CONFIGURE SNAPSHOT CONTROLFILE (stored only in control file)
VALUE	VARCHAR2(1025)	The CONFIGURE command setting. Example: RETENTION POLICY TO RECOVERY WINDOW OF 10 DAYS
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.186 V$RMAN_ENCRYPTION_ALGORITHMS

V$RMAN_ENCRYPTION_ALGORITHMS displays supported encryption algorithms. It is used by the RMAN client to validate user-requested algorithms.

This view lists AES128, AES192, and AES256 encryption algorithms for the current release. The default algorithm is AES256.

Column	Datatype	Description
ALGORITHM_ID	NUMBER	Number to identify the algorithm
ALGORITHM_NAME	VARCHAR2(64)	Name of the algorithm (for example, AES128, AES192, or AES256)
ALGORITHM_DESCRIPTION	VARCHAR2(64)	Description of the algorithm
IS_DEFAULT	VARCHAR2(3)	Indicates whether this is the default encryption algorithm for CFB encryption mode (YES) or not (NO). CFB encryption mode is used when the COMPATIBLE initialization parameter is set to a value less than 23.0.0.0. Otherwise, refer to the IS_DEFAULTXTS column. This value is set by Oracle Database and may vary for each Release (that is, it is not dependent on user-specified RMAN configuration).
RESTORE_ONLY	VARCHAR2(3)	Indicates whether this algorithm can be used for restore only (YES) or not (NO). If the value is NO, then the algorithm is also allowed for backup. This column is useful in determining whether an encryption algorithm is deprecated for backup purpose.
IS_DEFAULTXTS	VARCHAR2(3)	Indicates whether this is the default encryption algorithm for XTS encryption mode (YES) or not (NO). XTS encryption mode is used when the COMPATIBLE initialization parameter is set to a value greater than or equal to 23.0.0.0. Otherwise, refer to the IS_DEFAULT column. This value is set by Oracle Database and may vary for each Release (that is, it is not dependent on user-specified RMAN configuration).

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.187 V$RMAN_OUTPUT

V$RMAN_OUTPUT displays messages reported by RMAN.

This is an in-memory view and is not recorded in the controlfile. The view can hold 32768 rows.

Column	Datatype	Description
SID	NUMBER	Session ID of the session which is running this RMAN operation
RECID	NUMBER	Record ID of the corresponding V$RMAN_STATUS row
STAMP	NUMBER	Timestamp of the corresponding V$RMAN_STATUS row
SESSION_RECID	NUMBER	Record ID of the session (corresponding V$RMAN_STATUS row with ROW_LEVEL = 0)
SESSION_STAMP	NUMBER	Timestamp of the session (corresponding V$RMAN_STATUS row with ROW_LEVEL = 0)
OUTPUT	VARCHAR2(130)	Output text reported by RMAN
RMAN_STATUS_RECID	NUMBER	Owning V$RMAN_STATUS record ID
RMAN_STATUS_STAMP	NUMBER	Owning V$RMAN_STATUS record stamp
SESSION_KEY	NUMBER	Session identifier
GUID	NUMBER	The guid of the pluggable database (PDB) that did the RMAN operation. V$RMAN_OUTPUT captures the rman output. If a PDB sysdba did the backup, the guid of the PDB is displayed in V$RMAN_OUTPUT. If root did the backup, then guid of the root is displayed in V$RMAN_OUTPUT. Root A root user can see all of V$RMAN_OUTPUT rows (that is, the rows owned by all PDBs), but a PDB user can only see that PDB's V$RMAN_OUTPUT rows (that is, no rows from root or other PDBs).
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.188 V$RMAN_STATUS

V$RMAN_STATUS displays the finished and on-going RMAN jobs. For on-going jobs, this view displays progress and status. The jobs which are in progress are stored only in memory while the finished jobs are stored in the controlfile.

Column	Datatype	Description
SID	NUMBER	Session ID of the session which is running this RMAN operation
RECID	NUMBER	Record ID of the row in the controlfile
STAMP	NUMBER	Timestamp of the row (RECID + STAMP is unique)
PARENT_RECID	NUMBER	Record ID of the parent row of this row (corresponding V$RMAN_STATUS row with ROW_LEVEL = ROW_LEVEL - 1)
PARENT_STAMP	NUMBER	Timestamp of the parent row of this row (corresponding V$RMAN_STATUS row with ROW_LEVEL = ROW_LEVEL - 1)
SESSION_RECID	NUMBER	Record ID of the session (corresponding V$RMAN_STATUS row with ROW_LEVEL = 0)
SESSION_STAMP	NUMBER	Timestamp of the session (corresponding V$RMAN_STATUS row with ROW_LEVEL = 0)
ROW_LEVEL	NUMBER	Level of the row. The session has level 0.
ROW_TYPE	VARCHAR2(19)	Type of the row: • SESSION • COMMAND • RECURSIVE OPERATION
COMMAND_ID	VARCHAR2(33)	Command ID set by the RMAN SET COMMAND ID command. If not set, then RMAN will create a unique number.
OPERATION	VARCHAR2(33)	Name of the command in the execution explained by this row
STATUS	VARCHAR2(23)	Status of the operation: • RUNNING • RUNNING WITH WARNINGS • RUNNING WITH ERRORS • COMPLETED • COMPLETED WITH WARNINGS • COMPLETED WITH ERRORS • FAILED
MBYTES_PROCESSED	NUMBER	Percentage of the job completed; null if not applicable for the operation
START_TIME	DATE	Start time of the job
END_TIME	DATE	End time of the job
INPUT_BYTES	NUMBER	Number of input bytes read
OUTPUT_BYTES	NUMBER	Number of output bytes written
OPTIMIZED	VARCHAR2(3)	YES, if backup optimization was applied during the backup job. Otherwise, NO.
OBJECT_TYPE	VARCHAR2(13)	Identifies types of objects backed up
OUTPUT_DEVICE_TYPE	VARCHAR2(17)	DISK, SBT_TAPE, or *. An * indicates that output was written to more than one device type.
OSB_ALLOCATED	VARCHAR2(3)	A value of YES means an Oracle Secure Backup channel was allocated during the specified operation identified by the V$RMAN_STATUS view.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.189 V$RO_USER_ACCOUNT

V$RO_USER_ACCOUNT is populated only on Oracle databases that are open in read-only mode. When a database is read-only, security data cannot be stored in normal catalogue tables. Instead, the security data is stored in an in-memory table that is queried through this view. In an Oracle Data Guard environment, some of the security information for user accounts on the standby is inherited from the primary server. For example, if the account is locked out unlimited on the primary, then it will be locked on the standby database(s). The information stored on the standby is volatile information that user actions on the standby database(s) can affect, such as the number of failed logins, and the time the account was locked on the standby due to failed access attempts. Note that failed login attempts on standbys do not affect the account status on primaries.

If this view is queried from the root in a multitenent container database (CDB), then only common users and the SYS user are returned.

If this view is queried from a pluggable database (PDB), only rows that pertain to the current PDB are returned.

Column	Datatype	Description
USERID	NUMBER	User ID number
PASSW_EXPIRED	NUMBER	Indicates whether the password has expired (1) or not (0)
PASSW_IN_GRACE	NUMBER	Indicates whether the account is in grace (1) or not (0)
PASSW_LOCKED	NUMBER	Indicates whether the account is locked (1) or not (0)
PASSW_LOCK_UNLIM	NUMBER	Indicates whether the account is locked for an unlimited time (1) or not (0)
FAILED_LOGINS	NUMBER	The number of failed login attempts. The count is not cumulative; it is reset upon successful logon to the account
EXPIRATION_AFTER_GRACE	TIMESTAMP(3)	The expiration time after grace
PASSW_LOCK_TIME	TIMESTAMP(3)	The time the account was locked out

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container where the failed login occurred. For users that are not common users, the CON_IDis the PDB ID where the failed login attempt occurred. For common users, the CON_ID is 0. The login attempts that occurred on a PDB are not displayed when you query V$RO_USER_ACCOUNT from another PDB. You only see the failed login attempts of any users (that are not common users) if those failed login attempts occurred on the same PDB from which you are querying V$RO_USER_ACCOUNT. The failed login attempts of common users (and of the SYS user) are only displayed when V$RO_USER_ACCOUNT is queried from the root of a CDB, not when it is queried from a PDB. In a non-CDB, the value is always 0.
USERNAME	VARCHAR2(128)	User name

9.190 V$ROLLNAME

V$ROLLNAME lists the names of all online rollback segments. It can only be accessed when the database is open.

Column	Datatype	NULL	Description
USN	NUMBER		Rollback (undo) segment number
NAME	VARCHAR2(30)	NOT NULL	Rollback segment name
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.191 V$ROLLSTAT

V$ROLLSTAT contains rollback segment statistics.

Column	Datatype	Description
USN	NUMBER	Rollback segment number
LATCH	NUMBER	Latch for the rollback segment
EXTENTS	NUMBER	Number of extents in the rollback segment
RSSIZE	NUMBER	Size (in bytes) of the rollback segment. This value differs by the number of bytes in one database block from the value of the BYTES column of the *_SEGMENTS view. **See Also:** *Oracle Database Administrator's Guide* for more information about space management for rollback segments
WRITES	NUMBER	Number of bytes written to the rollback segment

Column	Datatype	Description
XACTS	NUMBER	Number of active transactions
GETS	NUMBER	Number of header gets
WAITS	NUMBER	Number of header waits
OPTSIZE	NUMBER	Optimal size of the rollback segment
HWMSIZE	NUMBER	High watermark of the rollback segment size
SHRINKS	NUMBER	Number of times the size of a rollback segment decreases
WRAPS	NUMBER	Number of times rollback segment is wrapped
EXTENDS	NUMBER	Number of times rollback segment size is extended
AVESHRINK	NUMBER	Average shrink size
AVEACTIVE	NUMBER	Current size of active extents, averaged over time.
STATUS	VARCHAR2(15)	Rollback segment status: • ONLINE • PENDING OFFLINE • OFFLINE • FULL
CUREXT	NUMBER	Current extent
CURBLK	NUMBER	Current block
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.192 V$ROWCACHE

V$ROWCACHE displays statistics for data dictionary activity. Each row contains statistics for one data dictionary cache.

Column	Datatype	Description
CACHE#	NUMBER	Row cache ID number
TYPE	VARCHAR2(11)	Parent or subordinate row cache type
SUBORDINATE#	NUMBER	Subordinate set number
PARAMETER	VARCHAR2(32)	Name of the initialization parameter that determines the number of entries in the data dictionary cache
COUNT	NUMBER	Total number of entries in the cache
USAGE	NUMBER	Number of cache entries that contain valid data
FIXED	NUMBER	Number of fixed entries in the cache
GETS	NUMBER	Total number of requests for information on the data object
FASTGETS	NUMBER	Reserved for internal use
GETMISSES	NUMBER	Number of data requests resulting in cache misses
SCANS	NUMBER	Number of scan requests

Column	Datatype	Description
SCANMISSES	NUMBER	Number of times a scan failed to find the data in the cache
SCANCOMPLETES	NUMBER	For a list of subordinate entries, the number of times the list was scanned completely
MODIFICATIONS	NUMBER	Number of inserts, updates, and deletions
FLUSHES	NUMBER	Number of times flushed to disk
DLM_REQUESTS	NUMBER	Number of DLM requests
DLM_CONFLICTS	NUMBER	Number of DLM conflicts This column is obsolete and is maintained for backward compatibility.
DLM_RELEASES	NUMBER	Number of DLM releases This column is obsolete and is maintained for backward compatibility.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.193 V$ROWCACHE_PARENT

V$ROWCACHE_PARENT displays information for parent objects in the data dictionary. There is one row per lock owner, and one waiter for each object. This row shows the mode held or requested. For objects with no owners or waiters, a single row is displayed.

Column	Datatype	Description
INDX	NUMBER	Index of the row
HASH	NUMBER	Hash value
ADDRESS	RAW(4 | 8)	Address of the parent object
CACHE#	NUMBER	Parent cache ID
CACHE_NAME	VARCHAR2(64)	Parent cache name
EXISTENT	VARCHAR2(1)	Indicates whether the object is an existing object
LOCK_MODE	NUMBER	Mode the lock is held in
LOCK_REQUEST	NUMBER	Mode the lock is requested in
TXN	RAW(4 | 8)	Transaction currently locking the object
SADDR	RAW(4 | 8)	Address of the session
INST_LOCK_REQUEST	NUMBER	Mode in which instance lock is being requested. This column is only relevant for Real Application Clusters.
INST_LOCK_RELEASE	NUMBER	Whether the instance lock needs to be released. This column is only relevant for Real Application Clusters.
INST_LOCK_TYPE	VARCHAR2(2)	Type of instance lock. This column is only relevant for Real Application Clusters.
INST_LOCK_ID1	RAW(4)	ID associated with the instance lock. This column is only relevant for Real Application Clusters.

Column	Datatype	Description
INST_LOCK_ID2	RAW(4)	ID associated with the instance lock. This column is only relevant for Real Application Clusters.
KEY	RAW(100)	Contents of the key. This column is only relevant for Real Application Clusters.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.194 V$ROWCACHE_SUBORDINATE

V$ROWCACHE_SUBORDINATE displays information for subordinate objects in the data dictionary.

Column	Datatype	Description
INDX	NUMBER	The index
HASH	NUMBER	The hash value
ADDRESS	RAW(4 | 8)	Address of the subordinate object
CACHE#	NUMBER	The parent cache ID
SUBCACHE#	NUMBER	The subcache ID
SUBCACHE_NAME	VARCHAR2(64)	The subcache name
EXISTENT	VARCHAR2(1)	Whether the object is an existing object
PARENT	RAW(4 | 8)	Address of the parent object
KEY	RAW(100)	The contents of the key
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.195 V$RSRC_CONS_GROUP_HISTORY

V$RSRC_CONS_GROUP_HISTORY displays a history of consumer group statistics for each entry in V$RSRC_PLAN_HISTORY that has a non-NULL plan.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

A new window is created in V$RSRC_CON_GROUP_HISTORY when a pluggable database (PDB) changes its resource plan. The plan windows inside a PDB are not impacted by a multitenant container database (CDB) resource plan change.

Since PDB plans can be set independently across different PDBs, V$RSRC_CON_GROUP_HISTORY will not cover the same time period across different PDBs. Therefore, this view is not useful for comparing statistics across different PDBs.

Column	Datatype	Description
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.
ID	NUMBER	Consumer group object ID (a unique number, consistent across database shutdowns and startups)
NAME	VARCHAR2(30)	Name of the consumer group
REQUESTS	NUMBER	Cumulative number of requests that were executed in the consumer group
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU on the resmgr: cpu quantum wait event because of resource management (in milliseconds). This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU on the resmgr: cpu quantum wait event because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS	NUMBER	Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_EXCLUSIVE	NUMBER	Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_WON	NUMBER	Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero.
ACTIVE_SESS_LIMIT_HIT	NUMBER	Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit
UNDO_LIMIT_HIT	NUMBER	Number of times that queries in the consumer group were canceled because the consumer group reached its UNDO_POOL limit
SWITCHES_IN_CPU_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_TIME limit
SWITCHES_OUT_CPU_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_TIME limit
SWITCHES_IN_IO_MEGABYTES	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_OUT_IO_MEGABYTES	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_IN_IO_REQUESTS	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit

Column	Datatype	Description
SWITCHES_OUT_IO_REQUESTS	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit
SWITCHES_IN_IO_LOGICAL	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit
SWITCHES_OUT_IO_LOGICAL	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit
SWITCHES_IN_ELAPSED_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SWITCHES_OUT_ELAPSED_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SQL_CANCELED	NUMBER	Number of times that SQL queries running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and CANCEL_SQL was specified as the Resource Manager plan's SWITCH_GROUP
ACTIVE_SESS_KILLED	NUMBER	Number of times that sessions running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and KILL_SESSION was specified as the Resource Manager plan's SWITCH_GROUP
IDLE_SESS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because they were idle for too long (reached MAX_IDLE_TIME)
IDLE_BLKR_SESS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because they were idle too long (reached MAX_IDLE_BLOCKER_TIME) and were blocking other sessions
QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group have spent in the QUEUED state because of the active session limit (in milliseconds)
QUEUE_TIME_OUTS	NUMBER	Number of times that requests from sessions in the consumer group timed out because they were queued for too long (reached QUEUEING_P1)
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)

Column	Datatype	Description
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
PGA_LIMIT_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because their untunable PGA usage exceeded the SESSION_PGA_LIMIT limit
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.196 V$RSRC_CONSUMER_GROUP

V$RSRC_CONSUMER_GROUP displays data related to currently active resource consumer groups.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

Statistics in V$RSRC_CONSUMER_GROUP are reset when a pluggable database (PDB) changes its resource plan. They are not impacted by multitenant container database (CDB) resource plan changes.

Since PDB plans can be set independently across different PDBs, V$RSRC_CONSUMER_GROUP will not cover the same time period across different PDBs. Therefore, this view is not useful for comparing statistics across different PDBs.

Column	Datatype	Description
ID	NUMBER	Consumer group object ID (a unique number, consistent across database shutdowns and startups)
NAME	VARCHAR2(32)	Name of the consumer group
ACTIVE_SESSIONS	NUMBER	Number of currently active sessions in the consumer group
EXECUTION_WAITERS	NUMBER	Number of currently active sessions waiting for an execution time slice in which they will be able to use CPU

Column	Datatype	Description
REQUESTS	NUMBER	Cumulative number of requests that were executed in the consumer group
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU on the resmgr: cpu quantum wait event because of resource management (in milliseconds). This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU on the resmgr: cpu quantum wait event because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS	NUMBER	Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_EXCLUSIVE	NUMBER	Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero.
CPU_DECISIONS_WON	NUMBER	Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero.
QUEUE_LENGTH	NUMBER	Number of sessions waiting in the queue
CURRENT_UNDO_CONSUMPTION	NUMBER	Current amount (in KB) of undo consumed by the consumer group
ACTIVE_SESSION_LIMIT_HIT	NUMBER	Number of times that sessions in the consumer group were queued because the consumer group reached its active session limit
UNDO_LIMIT_HIT	NUMBER	Number of times that queries in the consumer group were canceled because the consumer group reached its UNDO_POOL limit
SWITCHES_IN_CPU_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_TIME limit
SWITCHES_OUT_CPU_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_TIME limit
SWITCHES_IN_IO_MEGABYTES	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_OUT_IO_MEGABYTES	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_MEGABYTES limit
SWITCHES_IN_IO_REQUESTS	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit
SWITCHES_OUT_IO_REQUESTS	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_REQS limit
SWITCHES_IN_IO_LOGICAL	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit
SWITCHES_OUT_IO_LOGICAL	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_IO_LOGICAL limit

Column	Datatype	Description
SWITCHES_IN_ELAPSED_TIME	NUMBER	Number of switches into the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SWITCHES_OUT_ELAPSED_TIME	NUMBER	Number of switches out of the consumer group because of the Resource Manager plan's SWITCH_ELAPSED_TIME limit
SQL_CANCELED	NUMBER	Number of times that SQL queries running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and CANCEL_SQL was specified as the Resource Manager plan's SWITCH_GROUP
ACTIVE_SESSIONS_KILLED	NUMBER	Number of times that sessions running in the consumer group were terminated because they exceeded one of the Resource Manager plan's SWITCH limits and KILL_SESSION was specified as the Resource Manager plan's SWITCH_GROUP
IDLE_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because they were idle for too long (reached MAX_IDLE_TIME)
IDLE_BLKR_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because they were idle too long (reached MAX_IDLE_BLOCKER_TIME) and were blocking other sessions
QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group have spent in the QUEUED state because of the active session limit (in milliseconds)
QUEUE_TIME_OUTS	NUMBER	Number of times that requests from sessions in the consumer group timed out because they were queued for too long (reached QUEUEING_P1)
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests
CURRENT_PQS_ACTIVE	NUMBER	Number of active parallel statements in the consumer group. This value does not include parallel statements that are never queued, such as GV$ queries.
CURRENT_PQ_SERVERS_ACTIVE	NUMBER	Number of active parallel servers in the consumer group. This value does not include servers running parallel statements that are never queued, such as GV$ queries.
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)
CURRENT_PQS_QUEUED	NUMBER	Number of sessions in the consumer group that are waiting in the parallel statement queue trying to run parallel statements

Column	Datatype	Description
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
PGA_LIMIT_SESSIONS_KILLED	NUMBER	Number of times that sessions in the consumer group were terminated because their untunable PGA usage exceeded the SESSION_PGA_LIMIT limit
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.197 V$RSRC_CONSUMER_GROUP_CPU_MTH

V$RSRC_CONSUMER_GROUP_CPU_MTH displays all resource allocation methods defined for resource consumer groups.

Column	Datatype	Description
NAME	VARCHAR2(40)	Name of the CPU resource allocation method
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.198 V$RSRC_PDB

`V$RSRC_PDB` displays data related to currently active resource consumer groups by pluggable database (PDB).

When the `STATISTICS_LEVEL` is set to `TYPICAL` or `ALL`, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

Statistics in `V$RSRC_PDB` are reset when a multitenant container database (CDB) changes its resource plan. They are not impacted by PDB resource plan changes.

`V$RSRC_PDB` covers the same time period for all PDBs. This view is specifically designed for comparing statistics across different PDBs.

Since `V$RSRC_PDB` does not contain information at the consumer group level, it is not useful for comparing consumer groups inside a PDB.

Column	Datatype	Description
PDB_NAME	VARCHAR2(32)	PDB name
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read

Column	Datatype	Description
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
CURRENT_PQS_ACTIVE	NUMBER	Number of active parallel statements in the consumer group. This value does not include parallel statements that are never queued, such as GV$ queries.
CURRENT_PQ_SERVERS_ACTIVE	NUMBER	Number of active parallel servers in the consumer group. This value does not include servers running parallel statements that are never queued, such as GV$ queries.
CURRENT_PQS_QUEUED	NUMBER	Number of sessions in the consumer group that are waiting in the parallel statement queue trying to run parallel statements
SGA_BYTES	NUMBER	The current SGA usage by this PDB in bytes
BUFFER_CACHE_BYTES	NUMBER	The current usage of buffer cache by this PDB in bytes
SHARED_POOL_BYTES	NUMBER	The current usage of shared pool by this PDB in bytes
PGA_BYTES	NUMBER	The current usage of PGA by this PDB in bytes
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.199 V$RSRC_PDB_HISTORY

V$RSRC_PDB_HISTORY displays a history of consumer group statistics for each entry in V$RSRC_PDB that has a non-NULL plan by pluggable database (PDB).

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources.

A new window is created in V$RSRC_PDB_HISTORY when a multitenant container database (CDB) changes its resource plan. The plan windows for the CDB are not impacted by a PDB resource plan change.

V$RSRC_PDB_HISTORY covers the same time period for all PDBs. This view is specifically designed for comparing statistics across different PDBs.

Since V$RSRC_PDB_HISTORY does not contain information at the consumer group level, it is not useful for comparing consumer groups inside a PDB.

Column	Datatype	Description
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V$RSRC_PDB entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.
PDB_NAME	VARCHAR2(32)	PBD name
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_WAITS	NUMBER	Cumulative number of times all sessions in the consumer group had to wait for CPU because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group (in milliseconds)
YIELDS	NUMBER	Cumulative number of times that sessions in the consumer group had to yield CPU to other sessions because of quantum expiration. When CPU resources are not being actively managed, this value is set to zero.
IO_SERVICE_TIME	NUMBER	Cumulative I/O wait time (in milliseconds)
IO_SERVICE_WAITS	NUMBER	Total number of wait requests
SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read
SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written
LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read
LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written
SMALL_READ_REQUESTS	NUMBER	Number of single block read requests
SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests
LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests
LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests
PQS_COMPLETED	NUMBER	Total number of completed parallel statements in the consumer group

Column	Datatype	Description
PQ_SERVERS_USED	NUMBER	Total number of parallel servers used by completed parallel statements in the consumer group
PQS_QUEUED	NUMBER	Number of times that sessions in the consumer group were queued when trying to run parallel statements
PQ_ACTIVE_TIME	NUMBER	Cumulative sum of the parallel active times for all completed parallel statements in the consumer group (in milliseconds)
PQ_QUEUED_TIME	NUMBER	Total amount of time that sessions in the consumer group were queued when trying to run parallel statements (in milliseconds)
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements from sessions in the consumer group timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

"V$RSRC_CONS_GROUP_HISTORY"

9.200 V$RSRC_PLAN

V$RSRC_PLAN displays the names of all currently active resource plans.

Column	Datatype	Description
ID	NUMBER	Resource plan ID (a unique number, consistent across database shutdowns and startups). This is also the data dictionary object ID.
NAME	VARCHAR2(32)	Name of the resource plan
IS_TOP_PLAN	VARCHAR2(5)	Indicates whether the resource plan is the current top plan (TRUE) or whether the resource plan is a subplan of the current top plan (FALSE)
CPU_MANAGED	VARCHAR2(3)	Indicates whether the resource plan has parameters that specify a policy for how the Resource Manager should schedule sessions to manage CPU usage (ON) or whether Resource Manager is not managing CPU usage (OFF)
CPU_SCOPE	VARCHAR2(13)	Scope of the policy for how the Resource Manager should schedule sessions to manage CPU usage. Possible values: • OFF - Resource Manager is not managing CPU usage (CPU_MANAGED = OFF) • INSTANCE_ONLY - Resource Manage is managing CPU usage only within the database instance • SERVER_WIDE - Resource Manager is using server-level inter-instance CPU resource management

Column	Datatype	Description
INSTANCE_CAGING	VARCHAR2(3)	Indicates whether instance caging is enabled (ON) or disabled (OFF). Instance caging is enabled if the CPU_COUNT initialization parameter is explicitly modified to a value other than 0 and Resource Manager is enabled.
PARALLEL_SERVERS_ACTIVE	NUMBER	Total number of active parallel servers on the instance
PARALLEL_SERVERS_TOTAL	NUMBER	The value of PARALLEL_SERVERS_TARGET for the instance. Parallel statements are queued if the total number of active parallel servers exceeds this value.
PARALLEL_EXECUTION_MANAGED	VARCHAR2(32)	State of parallel statement queuing: • OFF - Parallel statement queuing is disabled • STARTUP - Parallel statement queuing is enabled. This is a temporary state that can occur when an Oracle RAC database is undergoing configuration changes • FIFO - Parallel statement queuing is enabled. All parallel statements are managed in a single Oracle RAC FIFO queue • FULL - Parallel statement queuing is enabled. All parallel statements are managed in per-consumer group queues according to the current resource plan. This state is used when a resource plan that contains resource allocation directives (MGMT_P*) is enabled. • DISABLED - Parallel statement queuing is disabled. This state can occur when memory is unavailable for use by parallel statement queuing in the System Global Area (SGA). Restart the Oracle instance to re-enable parallel statement queuing. For an Oracle RAC database, only the instance running as primary Database Resource Manager (DBRM) shows the correct state of parallel statement queuing. All other instances default to the value FULL. A single instance database always shows the correct value for this field.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
DIRECTIVE_TYPE	VARCHAR2(32)	The type of directive used by this PDB: • DEFAULT_DIRECTIVE: The default plan directive • PDB: A PDB directive • PROFILE: A profile directive
SHARES	NUMBER	Resource allocation for this PDB, expressed in shares
UTILIZATION_LIMIT	NUMBER	Maximum percentage of the container's resources allowed for this PDB
PARALLEL_SERVER_LIMIT	NUMBER	Maximum percentage of the parallel target the PDB can use before queuing subsequent parallel queries
MEMORY_MIN	NUMBER	The percentage of Exadata Smart Flash Cache and Exadata PMEM cache that is guaranteed to the PDB This percentage is based on the total amount of space allocated to the CDB for Exadata Smart Flash Cache and Exadata PMEM cache. See *Oracle Exadata System Software User's Guide* for more information.

Column	Datatype	Description
MEMORY_LIMIT	NUMBER	The maximum percentage of Exadata Smart Flash Cache and Exadata PMEM cache that the PDB can use This percentage is based on the total amount of space allocated to the CDB for Exadata Smart Flash Cache and Exadata PMEM cache. See *Oracle Exadata System Software User's Guide* for more information.
PROFILE	VARCHAR2(32)	The value of the DB_PERFORMANCE_PROFILE initialization parameter for this PDB
CPU_COUNT	NUMBER	Value of the CPU_COUNT initialization parameter in the container to which the data pertains
CPU_MIN_COUNT	NUMBER	Value of the CPU_MIN_COUNT initialization parameter in the container to which the data pertains

The resource plan with CON_ID=ROOT is the CDB resource plan.

9.201 V$RSRC_PLAN_CPU_MTH

V$RSRC_PLAN_CPU_MTH displays all available CPU resource allocation methods defined for resource plans.

Column	Datatype	Description
NAME	VARCHAR2(40)	Name of the resource allocation method
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- *Oracle Database PL/SQL Packages and Types Reference* for information on defining resource allocation methods for consumer plans with the DBMS_RESOURCE_MANAGER package

9.202 V$RSRC_PLAN_HISTORY

V$RSRC_PLAN_HISTORY displays a history of when a resource plan was enabled, disabled, or modified on the instance. Up to 15 of the most recent entries are shown. Once the database is opened, this view shows at least one row. The row with the most recent START_TIME and with END_TIME equal to NULL gives information about the current resource plan.

Column	Datatype	Description
SEQUENCE#	NUMBER	A sequential counter that uniquely describes a row. When the instance is restarted, this value is reset to zero.
ID	NUMBER	Resource plan ID; NULL if the Resource Manager was disabled
NAME	VARCHAR2(30)	Resource plan name; NULL if the Resource Manager was disabled
START_TIME	DATE	Time that the resource plan was enabled
END_TIME	DATE	Time that the resource plan was disabled; NULL if the row contains the current resource plan information
ENABLED_BY_SCHEDULER	VARCHAR2(5)	Indicates whether the plan was enabled by a Job Scheduler window (TRUE) or not (FALSE)
WINDOW_NAME	VARCHAR2(128)	Job Scheduler window that triggered the resource plan event; NULL if a user triggered the resource plan event
ALLOWED_AUTOMATED_SWITCHES	VARCHAR2(5)	Indicates whether automated plan switches were allowed after this resource plan event (TRUE) or whether automated plan switches were disabled after this resource plan event (FALSE) **See Also:** the SWITCH_PLAN procedure
CPU_MANAGED	VARCHAR2(3)	Indicates whether the resource plan has parameters that specify a policy for how the Resource Manager should schedule sessions to manage CPU usage (ON) or whether Resource Manager is not managing CPU usage (OFF)
CPU_SCOPE	VARCHAR2(13)	Scope of the policy for how the Resource Manager should schedule sessions to manage CPU usage. Possible values: • OFF - Resource Manager is not managing CPU usage (CPU_MANAGED = OFF) • INSTANCE_ONLY - Resource Manage is managing CPU usage only within the database instance • SERVER_WIDE - Resource Manager is using server-level inter-instance CPU resource management
INSTANCE_CAGING	VARCHAR2(3)	Indicates whether instance caging is enabled (ON) or disabled (OFF). Instance caging is enabled if the CPU_COUNT initialization parameter is explicitly modified to a value other than 0 and Resource Manager is enabled.

Column	Datatype	Description
PARALLEL_EXECUTION_MANAGED	VARCHAR2(32)	State of parallel statement queuing: • OFF - Parallel statement queuing is disabled • STARTUP - Parallel statement queuing is enabled. This is a temporary state that can occur when an Oracle RAC database is undergoing configuration changes • FIFO - Parallel statement queuing is enabled. All parallel statements are managed in a single Oracle RAC FIFO queue • FULL - Parallel statement queuing is enabled. All parallel statements are managed in per-consumer group queues according to the current resource plan. This state is used when a resource plan that contains resource allocation directives (MGMT_P*) is enabled. • DISABLED - Parallel statement queuing is disabled. This state can occur when memory is unavailable for use by parallel statement queuing in the System Global Area (SGA). Restart the Oracle instance to re-enable parallel statement queuing. For an Oracle RAC database, only the instance running as primary Database Resource Manager (DBRM) shows the correct state of parallel statement queuing. All other instances default to the value FULL. A single instance database always shows the correct value for this field.
CPU_COUNT	NUMBER	Value of the CPU_COUNT initialization parameter in the container to which the data pertains
CPU_MIN_COUNT	NUMBER	Value of the CPU_MIN_COUNT initialization parameter in the container to which the data pertains
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.203 V$RSRC_SESSION_INFO

V$RSRC_SESSION_INFO displays Resource Manager statistics per session.

Column	Datatype	Description
SID	NUMBER	Session identifier
CURRENT_CONSUMER_GROUP_ID	NUMBER	Object ID of the consumer group in which the session currently belongs; NULL if the session has not yet logged in
CURRENT_CONSUMER_GROUP	VARCHAR2(32)	The name of the consumer group in which the session currently belongs
ORIG_CONSUMER_GROUP_ID	NUMBER	Object ID of the consumer group in which the session was placed by the consumer group mappings; NULL if the session has not yet logged in This group may not be the current group because the SWITCH_GROUP directive in the current plan may have changed the session's current group. This group may not equal the MAPPED_CONSUMER_GROUP because the MAPPED_CONSUMER_GROUP may not be part of the current plan.

Column	Datatype	Description
MAPPING_ATTRIBUTE	VARCHAR2(32)	Session attribute that was used to map the session into its original consumer group; NULL if no mapping was used **See Also:** "DBA_RSRC_GROUP_MAPPINGS" for more details
MAPPED_CONSUMER_GROUP	VARCHAR2(32)	Consumer group to which the session was originally mapped; NULL if no mapping was used This may not correspond to the original consumer group, because the mapped group may not be part of the current plan. **See Also:** "DBA_RSRC_GROUP_MAPPINGS" for more details
STATE	VARCHAR2(32)	Current state of the session: • NOT MANAGED - Session has not logged in or the current Resource Manager plan does not require the session to be managed at this point in time • RUNNING - Session is currently running on the CPU • WAITING FOR CPU - Session is ready to run. It is waiting for a CPU quantum to run. • QUEUED - Session is queued because the active session limit was reached • IDLE - Session is idle • IDLE BLKR - Session is idle and blocking another session • WAITING - Session is currently in a wait **See Also:** "V$SESSION_WAIT" for the wait type • WAITING_FOR_IO - Session is waiting to submit an I/O request • UNBOUND - Session is not bound to any process • EXITING - Session is about to terminate
ACTIVE	VARCHAR2(5)	Indicates whether the session is currently active (TRUE) or not (FALSE). This includes when one of the following conditions is true: • Session is in the top call • Session has a transaction in progress • Session is using temporary space objects • Session holds user enqueues
CURRENT_IDLE_TIME	NUMBER	Number of milliseconds the session has been idle (in states IDLE or IDLE BLKR) while in this consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This value is reset to zero when the session becomes active.
CURRENT_CPU_WAIT_TIME	NUMBER	Amount of time (in milliseconds) the session has waited for CPU because of resource management (in state WAIT FOR CPU) while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This does not include waits due to latch or enqueue contention, I/O waits, and so on. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.
CPU_WAIT_TIME	NUMBER	Cumulative amount of time (in milliseconds) the session has waited for CPU (in its lifetime) because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on.
CURRENT_CPU_WAITS	NUMBER	Number of times the session had to wait for CPU because of resource management while in this consumer group; NULL if the current Resource Manager plan does not require updating this statistic. This does not include waits due to latch or enqueue contention, I/O waits, and so on. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.

Column	Datatype	Description
CPU_WAITS	NUMBER	Cumulative number of times the session had to wait for CPU (in its lifetime) because of resource management. This does not include waits due to latch or enqueue contention, I/O waits, and so on.
CURRENT_CONSUMED_CPU_TIME	NUMBER	Amount of CPU time (in milliseconds) consumed by the session while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. If SWITCH_TIME_IN_CALL is used, then this will be reset at the end of every call.
CONSUMED_CPU_TIME	NUMBER	Cumulative amount of CPU time consumed by the session (in its lifetime) (in milliseconds)
CURRENT_ACTIVE_TIME	NUMBER	Amount of time (in milliseconds) the session has been active while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. Active time is time spent running and waiting while executing a call. It does not include the time a session waited for CPU resources. If SWITCH_TIME_IN_CALL is used, then this is reset at the end of every call.
ACTIVE_TIME	NUMBER	Cumulative amount of active time (in milliseconds) consumed by the session (in its lifetime)
CURRENT_QUEUED_TIME	NUMBER	Amount of time (in milliseconds) the current request from the session has been queued (in state QUEUED). If the session does not have a request currently queued up, then this number will be zero.
QUEUED_TIME	NUMBER	Total amount of time (in milliseconds) the session has spent in the QUEUED state (in its lifetime)
CURRENT_YIELDS	NUMBER	Number of times the session had to yield the CPU to other sessions (due to quantum expiration) while in the current consumer group; NULL if the current Resource Manager plan does not require updating this statistic. If SWITCH_TIME_IN_CALL is used, then this is reset at the end of every call.
YIELDS	NUMBER	Cumulative number of times the session had to yield CPU to other sessions due to quantum expiration (in its lifetime)
CURRENT_UNDO_CONSUMPTION	NUMBER	Current amount (in KB) of undo consumed by the session; NULL if the current Resource Manager plan does not have an UNDO_POOL directive
MAX_UNDO_CONSUMPTION	NUMBER	Maximum amount of undo consumed (in KB) during the session's lifetime. This value may not be updated because the current Resource Manager plan may not have an UNDO_POOL directive.
SQL_CANCELED	NUMBER	Number of times SQL queries running in the session were canceled due to exceeding the Resource Manager plan's SWITCH_TIME limit.
QUEUE_TIME_OUTS	NUMBER	Number of times requests from the session timed out because they queued longer than the Resource Manager plan's limit
ESTIMATED_EXECUTION_LIMIT_HIT	NUMBER	Number of times requests from the session were not run because the optimizer's estimated time to execute the query exceeded the MAX_EST_EXEC_TIME limit
CURRENT_IO_SERVICE_TIME	NUMBER	Current I/O wait time of the session (in milliseconds) for the current SQL operation
IO_SERVICE_TIME	NUMBER	Cumulative amount of I/O wait time by the session (in its lifetime) (in milliseconds)
CURRENT_IO_SERVICE_WAITS	NUMBER	Current I/O waits by session for the current SQL operation
IO_SERVICE_WAITS	NUMBER	Cumulative I/O waits by session (in its lifetime)
CURRENT_SMALL_READ_MEGABYTES	NUMBER	Number of single block megabytes read by the session for the current SQL operation

Column	Datatype	Description
SMALL_READ_MEGABYTES	NUMBER	Total number of single block megabytes read by the session (in its lifetime)
CURRENT_LARGE_READ_MEGABYTES	NUMBER	Number of multiblock megabytes read by the session for the current SQL operation
LARGE_READ_MEGABYTES	NUMBER	Total number of multiblock megabytes read by the session (in its lifetime)
CURRENT_SMALL_WRITE_MEGABYTES	NUMBER	Number of single block megabytes written by the session for the current SQL operation
SMALL_WRITE_MEGABYTES	NUMBER	Total number of single block megabytes written by the session (in its lifetime)
CURRENT_LARGE_WRITE_MEGABYTES	NUMBER	Number of multiblock megabytes written by the session for the current SQL operation
LARGE_WRITE_MEGABYTES	NUMBER	Total number of multiblock megabytes written by the session (in its lifetime)
CURRENT_SMALL_READ_REQUESTS	NUMBER	Number of single block read requests by the session for the current SQL operation
SMALL_READ_REQUESTS	NUMBER	Total number of single block read requests by the session (in its lifetime)
CURRENT_SMALL_WRITE_REQUESTS	NUMBER	Number of single block write requests by the session for the current SQL operation
SMALL_WRITE_REQUESTS	NUMBER	Total number of single block write requests by the session (in its lifetime)
CURRENT_LARGE_READ_REQUESTS	NUMBER	Number of multiblock read requests by the session for the current SQL operation
LARGE_READ_REQUESTS	NUMBER	Total number of multiblock read requests by the session (in its lifetime)
CURRENT_LARGE_WRITE_REQUESTS	NUMBER	Number of multiblock write requests by the session for the current SQL operation
LARGE_WRITE_REQUESTS	NUMBER	Total number of multiblock write requests by the session (in its lifetime)
CURRENT_PQ_ACTIVE_TIME	NUMBER	Amount of time that the current active parallel statement has been executing for the current SQL operation, not including the amount of time that the statement has been queued (in milliseconds). If the parallel statement is queued, then the value is 0.
PQ_ACTIVE_TIME	NUMBER	Cumulative amount of time that parallel statements have been executed over the lifetime of the session (in milliseconds)
DOP	NUMBER	Degree of parallelism for the active or queued parallel statement, if there are any in the session
PQ_SERVERS	NUMBER	The number of active parallel servers if the session is active and running the parallel query. If the query is queued, the number of parallel servers that this query is trying to run with is shown.
ESTIMATED_EXECUTION_TIME	NUMBER	Estimated execution time for the parallel statement, as estimated by the optimizer (in milliseconds). You can compare this value to CURRENT_PQ_ACTIVE_TIME to estimate how much longer the parallel statement will run.
CURRENT_PQ_QUEUED_TIME	NUMBER	Amount of time that the current parallel statement in the session has been queued (in milliseconds) for the current SQL operation. If the session does not have a queued parallel statement, then the value is 0.
PQ_QUEUED_TIME	NUMBER	Total amount of time that the session has spent in the PQ_QUEUED state in its lifetime (in milliseconds)

Column	Datatype	Description
PQ_QUEUED	NUMBER	Number of times that parallel statements in the session have been queued
PQ_QUEUE_TIME_OUTS	NUMBER	Number of times that parallel statements in the session timed out because their queue time exceeded the Resource Manager plan's PARALLEL_QUEUE_TIMEOUT limit
PQ_ACTIVE	VARCHAR2(5)	Indicates whether the session is actively running a parallel statement (TRUE) or not (FALSE).
PQ_STATUS	VARCHAR2(44)	The status of the parallel statement running in this session: • Active: The parallel statement is currently active and running • Queued: The parallel statement is queued and is not a possible candidate to be run next • Queue head: The parallel statement is queued due to the global systemwide limit and is the next parallel statement to be dequeued and run • Queue head - waiting on CG limit: The parallel statement is queued due to the consumer group limit and is the one to be run next from the session's consumer group • Queue head - waiting on service availability: The parallel statement is queued since there are not enough parallel servers available for the service this session is running on. This session is the one to be run next from the session's service • Queue head - waiting on PDB limit: The parallel statement is queued due to the PDB limit and is the one to be run next from the session's PDB • NULL: The session currently does not involve a parallel execution
CURRENT_LOGICAL_IOS	NUMBER	Number of logical I/O requests by the session for the current SQL operation
LOGICAL_IOS	NUMBER	Total number of logical I/O requests in this session's lifetime
CURRENT_ELAPSED_TIME	NUMBER	Elapsed time of the session's current SQL operation
ELAPSED_TIME	NUMBER	Total elapsed time for all of this session's SQL operations in its lifetime
LAST_ACTION	VARCHAR2(48)	The most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: • CANCEL_SQL • KILL_SESSION • LOG_ONLY • SWITCH TO <CG NAME> For the last value, <CG NAME> is the name of the consumer group that the SQL operation was switched to. If the Resource Plan has since been changed then <CG NAME> is the ID of the consumer group.
LAST_ACTION_REASON	VARCHAR2(30)	The reason for the most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: • SWITCH_CPU_TIME • SWITCH_IO_REQS • SWITCH_IO_MBS • SWITCH_ELAPSED_TIME • SWITCH_IO_LOGICAL
LAST_ACTION_TIME	DATE	The time of the most recent action that was taken on this SQL operation by Resource Manager
CURRENT_PGA	NUMBER	Amount of PGA memory (in bytes) used by the session for the current SQL operation

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.204 V$RSRCMGRMETRIC

V$RSRCMGRMETRIC displays information about resources consumed and wait times per consumer group.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources. Metrics are collected and stored every minute when CPU utilization is not being monitored.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V$RSRC_PLAN_HISTORY entry to which these consumer group statistics apply. When the instance is restarted, this value is reset to zero.
CONSUMER_GROUP_ID	NUMBER	Consumer group object ID (a unique number, consistent across database shutdowns and startups)
CONSUMER_GROUP_NAME	VARCHAR2(30)	Name of the consumer group
CPU_CONSUMED_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the consumer group, in milliseconds
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_EXHAUSTED	NUMBER	Percentage of time that CPUs are exhausted, out of the total number of checks in the consumer group
NUM_CPUS	NUMBER	Number of CPUs that the Resource Manager is utilizing. If instance caging is enabled, then this column is equal to the value of the CPU_COUNT initialization parameter. If instance caging is not enabled, then this column is equal to the total number of CPUs in the system.
RUNNING_SESSIONS_LIMIT	NUMBER	Maximum number of sessions in the consumer group that can run simultaneously. The value of this column is NUM_CPUS multiplied by the consumer group's MAX_UTILIZATION_LIMIT directive in the current Resource Manager plan.
AVG_RUNNING_SESSIONS	NUMBER	Average number of sessions in the consumer group that are currently running

Column	Datatype	Description
AVG_WAITING_SESSIONS	NUMBER	Average number of sessions in the consumer group that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.
CPU_UTILIZATION_LIMIT	NUMBER	Maximum percentage of CPU that the consumer group can use at any time, with respect to the total number of CPUs in the system. The value of this column is RUNNING_SESSIONS_LIMIT divided by the number of CPUs in the system. If instance caging is enabled, then this value is derived using the CPU_COUNT initialization parameter.
AVG_CPU_UTILIZATION	NUMBER	Average percentage of CPU consumed by the consumer group, with respect to the total number of CPUs in the system
CPU_DECISIONS	NUMBER	Percentage of CPU decisions for which the consumer group was present. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.
CPU_DECISIONS_EXCLUSIVE	NUMBER	Percentage of the CPU decisions for which the consumer group was present and was the only consumer group present. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.
CPU_DECISIONS_WON	NUMBER	Percentage of the CPU decisions that the consumer group won. When CPU resources are not being actively managed, this value is set to zero. This column is deprecated.
IO_REQUESTS	NUMBER	I/O requests
IO_MEGABYTES	NUMBER	I/O megabytes
AVG_ACTIVE_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were running during the 1-minute metric window
AVG_QUEUED_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were queued during the 1-minute metric window
AVG_ACTIVE_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window
AVG_QUEUED_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window
PARALLEL_SERVERS_LIMIT	NUMBER	The number of parallel servers allowed to be used by this consumer group during the 1-minute metric window
PLAN_NAME	VARCHAR2(30)	Resource Manager plan name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

"STATISTICS_LEVEL"

9.205 V$RSRCMGRMETRIC_HISTORY

V$RSRCMGRMETRIC_HISTORY displays a history (the last one hour) of resource manager metrics, taken from V$RSRCMGRMETRIC. When a resource plan is set, this history is cleared and restarted. This view provides information about resources consumed and wait times per consumer group. The columns for V$RSRCMGRMETRIC_HISTORY are the same as those for V$RSRCMGRMETRIC.

> **See Also:**
>
> "V$RSRCMGRMETRIC"

9.206 V$RSRCPDBMETRIC

V$RSRCPDBMETRIC displays information about resources consumed and wait times per PDB.

When the STATISTICS_LEVEL is set to TYPICAL or ALL, this view contains information about CPU utilization and wait times even when no Resource Manager plan is set or when the Resource Manager plan does not monitor CPU or session resources. Metrics are collected and stored every minute when CPU utilization is not being monitored.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
SEQUENCE#	NUMBER	A sequential counter that uniquely describes the V$RSRC_PLAN_HISTORY entry to which these PDB statistics apply. When the instance is restarted, this value is reset to zero.
CPU_CONSUMED_TIME	NUMBER	Cumulative amount of CPU time consumed by all sessions in the PDB, in milliseconds
CPU_WAIT_TIME	NUMBER	Cumulative amount of time that sessions waited for CPU because of resource management, in milliseconds. This does not include waits due to latch or enqueue contention, I/O waits, and so on. When CPU resources are not being actively managed, this value is set to zero.
CPU_EXHAUSTED	NUMBER	Percentage of time that CPUs are exhausted, out of the total number of checks in the PDB
NUM_CPUS	NUMBER	Number of CPUs that the Resource Manager is utilizing. If instance caging is enabled, then this column is equal to the value of the CPU_COUNT initialization parameter. If instance caging is not enabled, then this column is equal to the total number of CPUs in the system.
RUNNING_SESSIONS_LIMIT	NUMBER	Maximum number of sessions in the PDB that can run simultaneously. The value of this column is NUM_CPUS multiplied by the PDB's MAX_UTILIZATION_LIMIT directive in the current Resource Manager plan.
AVG_RUNNING_SESSIONS	NUMBER	Average number of sessions in the PDB that are currently running
AVG_WAITING_SESSIONS	NUMBER	Average number of sessions in the PDB that are waiting for CPU due to resource management. When CPU resources are not being actively managed, this value is set to zero.

Column	Datatype	Description
CPU_UTILIZATION_LIMIT	NUMBER	Maximum percentage of CPU that the PDB can use at any time, with respect to the total number of CPUs in the system. The value of this column is RUNNING_SESSIONS_LIMIT divided by the number of CPUs in the system. If instance caging is enabled, then this value is derived using the CPU_COUNT initialization parameter.
AVG_CPU_UTILIZATION	NUMBER	Average percentage of CPU consumed by the PDB, with respect to the total number of CPUs in the system
IOPS	NUMBER	I/O operations per second during the previous minute for this PDB
IOMBPS	NUMBER	I/O megabytes per second during the previous minute for this PDB
IOPS_THROTTLE_EXEMPT	NUMBER	Indicates how much of the I/O per second in the current PDB was exempted from throttling. For example, if the value in the IOPS column is 20 I/Os and the value in the IOPS_THROTTLE_EXEMPT column is 5 I/Os, then 5 I/Os of the 20 I/Os in that second were exempted from throttling. I/O throttling is defined by the MAX_IOPS database initialization parameter.
IOMBPS_THROTTLE_EXEMPT	NUMBER	Indicates how many megabytes of I/O executed per second in the current PDB were exempted from throttling. For example, if the value in the IOMBPS column is 200 megabytes and the value in the IOMBPS_THROTTLE_EXEMPT column is 50 megabytes, then 50 megabytes of the 200 megabytes were exempt from throttling. I/O megabytes per second throttling is defined by the MAX_MBPS database initialization parameter.
AVG_IO_THROTTLE	NUMBER	Average throttle time per I/O operation in milliseconds during the previous minute for this PDB
AVG_ACTIVE_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were running during the 1-minute metric window
AVG_QUEUED_PARALLEL_STMTS	NUMBER	The average number of parallel statements that were queued during the 1-minute metric window
AVG_ACTIVE_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were actively running as part of a parallel statement during the 1-minute metric window
AVG_QUEUED_PARALLEL_SERVERS	NUMBER	The average number of parallel servers that were requested by queued parallel statements during the 1-minute metric window
PARALLEL_SERVERS_LIMIT	NUMBER	The number of parallel servers allowed to be used by this PDB during the 1-minute metric window
SGA_BYTES	NUMBER	The current SGA usage by this PDB in bytes
BUFFER_CACHE_BYTES	NUMBER	The current usage of the buffer cache by this PDB in bytes
SHARED_POOL_BYTES	NUMBER	The current usage of the shared pool by this PDB in bytes
PGA_BYTES	NUMBER	The current PGA usage by this PDB in bytes
PLAN_NAME	VARCHAR2(30)	Resource Manager plan name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "STATISTICS_LEVEL"

9.207 V$RSRCPDBMETRIC_HISTORY

V$RSRCPDBMETRIC_HISTORY displays a history (the last one hour) of resource manager metrics for a PDB, taken from V$RSRCPDBMETRIC. When a resource plan is set, this history is cleared and restarted. This view provides information about resources consumed and wait times per consumer group.
The columns for V$RSRCPDBMETRIC_HISTORY are the same as those for V$RSRCPDBMETRIC.

> **See Also:**
>
> "V$RSRCPDBMETRIC"

9.208 V$RULE

V$RULE displays rule statistics. This view has a row for every rule loaded into shared memory.

Column	Datatype	Description
RULE_SET_OBJECT_ID	NUMBER	Rule set object ID
EVALUATION_CONTEXT_OBJECT_ID	NUMBER	Evaluation context object ID
RULE_OWNER	VARCHAR2(128)	Owner of the rule
RULE_NAME	VARCHAR2(128)	Name of the rule
RULE_CONDITION	VARCHAR2(200)	Rule condition
TRUE_HITS	NUMBER	Number of times the rule evaluated to TRUE
MAYBE_HITS	NUMBER	Number of times the rule evaluated to MAYBE
SQL_EVALUATIONS	NUMBER	Number of evaluations of the rule that were performed by issuing SQL
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

9.209 V$RULE_SET

V$RULE_SET displays rule set statistics. This view has a row for every rule set loaded into shared memory.

> **Note:**
>
> Querying the V$RULE_SET view may have a negative impact on performance if a database has a large library cache.

Column	Datatype	Description
OWNER	VARCHAR2(128)	Owner of the rule set
NAME	VARCHAR2(128)	Name of the rule set
CPU_TIME	NUMBER	Total CPU time (in hundredths of a second) spent in evaluation of the rule set
ELAPSED_TIME	NUMBER	Total elapsed time (in hundredths of a second) spent in evaluation of the rule set
FIRST_LOAD_TIME	DATE	First time the current cached copy of the rule set was loaded
LAST_LOAD_TIME	DATE	Last time the current cached copy of the rule set was loaded
LAST_LOADING_TIME	NUMBER	Total elapsed time (in hundredths of a second) spent to load the rule set the last time it was loaded
SHARABLE_MEM	NUMBER	Shared memory (in bytes) used by the rule set
RELOADS	NUMBER	Number of times the rule set object was reloaded in shared memory
INVALIDATIONS	NUMBER	Number of times the rule set object was invalidated
EVALUATIONS	NUMBER	Number of evaluations on the rule set
FIRST_HIT_EVALUATIONS	NUMBER	Number of evaluations on the rule set, with stop_on_first_hit set to TRUE
SIMPLE_RULES_ONLY_EVALUATIONS	NUMBER	Number of evaluations on the rule set, with simple_rules_only set to TRUE
SQL_FREE_EVALUATIONS	NUMBER	Number of evaluations on the rule set which did not internally issue SQL to evaluate rules
SQL_EXECUTIONS	NUMBER	Total number of SQL statements executed during evaluation of the rule set
CONDITIONS_PROCESSED	NUMBER	Total number of fast (indexed) conditions processed during evaluation of the rule set
TRUE_RULES	NUMBER	Total number of TRUE rules returned during evaluation of the rule set
MAYBE_RULES	NUMBER	Total number of MAYBE rules returned during evaluation of the rule set
VARIABLE_VALUE_FUNCTION_CALLS	NUMBER	Total number of calls made to user-defined functions to retrieve variable values (specified by the variable_value_function field in RE$VARIABLE_TYPE) made during evaluation of the rule set
VARIABLE_METHOD_FUNCTION_CALLS	NUMBER	Total number of calls made to user-defined functions to retrieve variable method values (specified by the variable_method_function field in RE$VARIABLE_TYPE) made during evaluation of the rule set

Column	Datatype	Description
EVALUATION_FUNCTION_CALLS	NUMBER	Total number of calls made to user-defined evaluation functions (specified as the evaluation_function argument to the DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT procedure) made during evaluation of the rule set
RESULT_CACHE_HITS	NUMBER	Number of result cache hits across all the sessions evaluating this rule set
IS_RESULT_CACHE	VARCHAR2(3)	Indicates whether this rule set result can be cached (YES) or not (NO)
RESULT_CACHE_ELEMENTS	NUMBER	Number of elements cached within the result cache
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

Oracle Database PL/SQL Packages and Types Reference for more information about the DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT procedure

9.210 V$RULE_SET_AGGREGATE_STATS

V$RULE_SET_AGGREGATE_STATS displays statistics aggregated over all evaluations on all rule sets. This view has a row for each type of statistic.

Column	Datatype	Description
NAME	VARCHAR2(80)	Name of the statistic: • rule set evaluations (all) - Total number of evaluations on all rule sets • rule set evaluations (first_hit) - Total number of evaluations on rule sets with stop_on_first_hit set to TRUE • rule set evaluations (simple_rules_only) - Total number of evaluations on rule sets with simple_rules_only set to TRUE • rule set evaluations (SQL free) - Total number of evaluations on rule sets which did not internally issue SQL to evaluate rules • rule set evaluation time (CPU) - Total CPU time (in hundredths of a second) spent in evaluations on rule sets • rule set evaluation time (elapsed) - Total elapsed time (in hundredths of a second) spent in evaluations on rule sets • rule set SQL executions - Total number of SQL statements executed during evaluations on rule sets • rule set conditions processed - Total number of fast (indexed) conditions processed during evaluations on rule sets • rule set true rules - Total number of TRUE rules returned during evaluations on rule sets • rule set maybe rules - Total number of MAYBE rules returned during evaluations on rule sets • rule set user function calls (variable value function) - Total number of calls made to user-defined functions to retrieve variable values (specified by the variable_value_function field in RE$VARIABLE_TYPE) made during evaluations on rule sets • rule set user function calls (variable method function) - Total number of calls made to user-defined functions to retrieve variable method values (specified by the variable_method_function field in RE$VARIABLE_TYPE) made during evaluations on rule sets • rule set user function calls (evaluation function) - Total number of calls made to user-defined evaluation functions (specified as the evaluation_function argument to the DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT procedure) made during evaluations on rule sets
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. The CON_ID value in this view is always 0. The rows pertain to the entire CDB or to the non-CDB.

See Also:

Dynamic Performance (V$) Views: V$SCHEDULER_IN_MEMORY_TRACE to V$ZONEMAP_USAGE_STATS

This chapter contains the dynamic performance views V$SCHEDULER_IN_MEMORY_TRACE to V$ZONEMAP_USAGE_STATS.

10.1 V$SCHEDULER_IN_MEMORY_TRACE

V$SCHEDULER_IN_MEMORY_TRACE displays in-memory trace and other information about all processes executing scheduler-related actions.

Column	Datatype	Description
SID	NUMBER	ID of the session generating scheduler trace
SERIAL#	NUMBER	Serial number of the session generating scheduler trace
USER#	NUMBER	Oracle identifier of the user generating scheduler trace
USERNAME	VARCHAR2(128)	Name of the user generating scheduler trace
PROCESSNAME	VARCHAR2(5)	Name of the process generating scheduler trace
PADDR	RAW(8)	Address of the process state object generating scheduler trace
SPID	VARCHAR2(24)	Operating system identifier of the process generating scheduler trace
PID	NUMBER	Oracle identifier of the process generating scheduler trace
TRACE_ST	CLOB	Scheduler trace generated by the process
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.2 V$SCHEDULER_RUNNING_JOBS

V$SCHEDULER_RUNNING_JOBS displays information about running Scheduler jobs.

Column	Datatype	Description
SESSION_ID	NUMBER	Identifier of the session running the Scheduler job
SESSION_SERIAL_NUM	NUMBER	Session serial number
JOB_ID	NUMBER	ID of the running Scheduler job
PADDR	RAW(4 | 8)	Process address
OS_PROCESS_ID	VARCHAR2(12)	Operating system process ID
SESSION_STAT_CPU	INTERVAL DAY(2) TO SECOND(3)	CPU statistics for the session
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire multitenant container database (CDB). This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.3 V$SECUREFILE_SHRINK

V$SECUREFILE_SHRINK displays information about SecureFiles Shrink tasks.

Column	Datatype	Description
LOB_OBJD	NUMBER	Database object number for the LOB segment
SHRINK_STATUS	VARCHAR2(40)	Status of the shrink task: • RUNNING • COMPLETE • ERROR
START_TIME	TIMESTAMP(3) WITH TIME ZONE	Date and time at which the shrink task started
END_TIME	TIMESTAMP(3) WITH TIME ZONE	Data and time at which the shrink task ended If SHRINK_STATUS = RUNNING, the value of this column is NULL.
BLOCKS_MOVED	NUMBER	Number of blocks relocated during the shrink task
BLOCKS_FREED	NUMBER	Number of blocks freed during the shrink task
BLOCKS_ALLOCATED	NUMBER	Number of blocks allocated from the tablespace during the shrink task This value includes only blocks allocated by the shrink process. Blocks allocated by other database processes are not included.
EXTENTS_ALLOCATED	NUMBER	Number of extents allocated from the tablespace during the shrink task This value includes only extents allocated by the shrink process. Extents allocated by other database processes are not included.
EXTENTS_FREED	NUMBER	Number of extents freed during the shrink task
EXTENTS_SEALED	NUMBER	Number of candidate extents selected and sealed during the shrink task
AUTOMATIC	NUMBER	Indicates whether the shrink task was started automatically (1) or manually (0)

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.4 V$SECUREFILE_TIMER

V$SECUREFILE_TIMER displays information about time taken (in microseconds) by functions of SecureFiles. These timer values are collected per session.

Column	Datatype	Description
NAME	VARCHAR2(50)	Name of the function
LAYER_ID	NUMBER	ID of the layer that the function belongs to: • 0 - Entire Subtree • 1 - Delta Updates • 2 - Write gather cache • 3 - Deduplication • 4 - Compression & Encryption • 5 - Inode • 6 - Space • 7 - Utilities • 8 - Row-Column Intersection
OWNTIME	NUMBER	Total time taken by the function
MAXTIME	NUMBER	Maximum time taken by a single call
MINTIME	NUMBER	Minimum time taken by a single call
INVOCATIONS	NUMBER	Number of times the function was invoked
LAYER_NAME	VARCHAR2(50)	Name of the layer to which the function belongs
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.5 V$SEGMENT_STATISTICS

V$SEGMENT_STATISTICS displays information about segment-level statistics.

Column	Datatype	Description
OWNER	VARCHAR2(128)	Owner of the object
OBJECT_NAME	VARCHAR2(128)	Name of the object
SUBOBJECT_NAME	VARCHAR2(128)	Name of the subobject
TABLESPACE_NAME	VARCHAR2(30)	Name of the table space to which the object belongs
TS#	NUMBER	Tablespace number
OBJ#	NUMBER	Dictionary object number of the object
DATAOBJ#	NUMBER	Data object number of the object
OBJECT_TYPE	VARCHAR2(18)	Type of the object
STATISTIC_NAME	VARCHAR2(64)	Name of the statistic
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.6 V$SEGSTAT

V$SEGSTAT displays information about segment-level statistics.

Column	Datatype	Description
TS#	NUMBER	Tablespace number
OBJ#	NUMBER	Dictionary object number
DATAOBJ#	NUMBER	Data object number
STATISTIC_NAME	VARCHAR2(64)	Name of the statistic
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Statistic value
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.7 V$SEGSTAT_NAME

V$SEGSTAT_NAME displays information about segment-level statistics properties.

Column	Datatype	Description
STATISTIC#	NUMBER	Statistic number
NAME	VARCHAR2(64)	Name of the statistic
SAMPLED	VARCHAR2(3)	Indicates whether the statistic was collected by sampling (YES) or not (NO)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.8 V$SERV_MOD_ACT_STATS

V$SERV_MOD_ACT_STATS displays the same set of performance statistics as V$SERVICE_STATS except for a specific combination of service/module/action names.

When aggregation is enabled for the service name, module, and action name, then this view provides the timing and work done for calls issued for the business transaction.

Column	Datatype	Description
AGGREGATION_TYPE	VARCHAR2(21)	Aggregation statistic type: • SERVICE_MODULE - Action value is NULL and the entry is an aggregate for all actions within a given module • SERVICE_MODULE_ACTION - Action value is NULL only for an empty action, and the aggregation is on the level of service/module/action
SERVICE_NAME	VARCHAR2(64)	Service name from V$SERVICES
MODULE	VARCHAR2(65)	Module name from DBA_ENABLED_AGGREGATIONS
ACTION	VARCHAR2(65)	Action name from DBA_ENABLED_AGGREGATIONS
STAT_ID	NUMBER	Statistic identifier
STAT_NAME	VARCHAR2(64)	Derived statistic name from V$STATNAME and V$SESS_TIME_MODEL
VALUE	NUMBER	Cumulative value (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

- "V$SERVICE_STATS"
- "V$STATNAME"
- "V$SESS_TIME_MODEL"

10.9 V$SERVICE_DRAIN_TIMEOUT_ADVICE

`V$SERVICE_DRAIN_TIMEOUT_ADVICE` displays information about connection draining.

This view allows you monitor the performance of the draining process, so you can make informed decisions about tuning the drain timeout configuration.

Column	Datatype	Description
SERVICE_ID	NUMBER	Service ID
DRAIN_ORIGIN	VARCHAR2(12)	Draining origin • DISCONNECT - Sessions are being drained by the ALTER SYSTEM DISCONNECT SESSION statement • LOAD BALANCE - Sessions are being drained by Oracle RAC load balancing • PDB - Sessions are being drained by a PDB close • SERVICE - Sessions are being drained by stopping a service
LAST_DRAIN_TIMEOUT	NUMBER	Number of seconds since the last drain timeout
MARKED_TO_DRAIN	NUMBER	Number of sessions marked to drain
DRAINED	NUMBER	Number of sessions drained (includes session that exited on error)
DRAINED_BY_CLIENT	NUMBER	Number of sessions closed by the client during draining
DRAINED_BY_DATABASE	NUMBER	Number of sessions closed by the database during draining
PLANNED_FAILED_OVER	NUMBER	Number of sessions that failed over during draining
DRAINED_INTERVAL01	NUMBER	Number of sessions drained in time interval 01 (Sessions drained in less than or equal to 1 second)
DRAINED_INTERVAL02	NUMBER	Number of sessions drained in time interval 02 (Sessions drained in less than or equal to 5 seconds)
DRAINED_INTERVAL03	NUMBER	Number of sessions drained in time interval 03 (Sessions drained in less than or equal to 10 seconds)
DRAINED_INTERVAL04	NUMBER	Number of sessions drained in time interval 04 (Sessions drained in less than or equal to 30 seconds)
DRAINED_INTERVAL05	NUMBER	Number of sessions drained in time interval 05 Sessions drained in less than or equal to 60 seconds)
DRAINED_INTERVAL06	NUMBER	Number of sessions drained in time interval 06 (Sessions drained in less than or equal to 120 seconds)
DRAINED_INTERVAL07	NUMBER	Number of sessions drained in time interval 07 (Sessions drained in less than or equal to 180 seconds)
DRAINED_INTERVAL08	NUMBER	Number of sessions drained in time interval 08 (Sessions drained in less than or equal to 300 seconds)

Column	Datatype	Description
DRAINED_INTERVAL09	NUMBER	Number of sessions drained in time interval 09 (Sessions drained in less than or equal to 600 seconds)
DRAINED_INTERVAL10	NUMBER	Number of sessions drained in time interval 10 (Sessions drained in less than or equal to 1200 seconds)
DRAINED_INTERVAL11	NUMBER	Number of sessions drained in time interval 11 (Sessions drained in less than or equal to 3600 seconds (1 hour))
DRAINED_INTERVAL12	NUMBER	Number of sessions drained in time interval 12 (Sessions drained in less than or equal to 7200 seconds (2 hours))
DRAINED_INTERVAL13	NUMBER	Number of sessions drained in time interval 13 (Sessions drained in less than or equal to 14400 seconds (4 hours))
DRAINED_INTERVAL14	NUMBER	Number of sessions drained in time interval 14 (Sessions drained in greater than 14400 seconds (4 hours))
DRAINED_INTERVAL15	NUMBER	Reserved for internal use
DRAINED_INTERVAL16	NUMBER	Reserved for internal use
TERMINATED_BY_DRAIN_TIMEOUT	NUMBER	Number of sessions terminated at drain timeout
IDLE_IN_DRAIN	NUMBER	Number of sessions idle throughout drain timeout
ESTD_DRAIN_TIMEOUT_ADVICE	VARCHAR2(128)	Estimated drain time advice. Possible values include: • Not enough sessions are draining to compute a drain timeout estimation • Waiting for 90% of drained sessions in order to compute a drain timeout advice. • Estimated drain timeout is <advice_in_seconds> seconds Where <advice_in_seconds> is determined by using the number of drained sessions in each time interval
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.10 V$SERVICE_EVENT

V$SERVICE_EVENT displays aggregated wait counts and wait times for each wait statistic.

Column	Datatype	Description
SERVICE_NAME	VARCHAR2(64)	Service name from V$SERVICES

Column	Datatype	Description
SERVICE_NAME_HASH	NUMBER	Service name hash from V$SERVICES
EVENT	VARCHAR2(64)	Name of the wait event; derived statistic name from V$EVENT_NAME **See Also:** " Oracle Wait Events"
EVENT_ID	NUMBER	Identifier of the wait event
TOTAL_WAITS	NUMBER	Total number of waits for the event by the service
TOTAL_TIMEOUTS	NUMBER	Total number of timeouts for the event by the service
TIME_WAITED	NUMBER	Total amount of time waited for the event by the service (in hundredths of a second)
AVERAGE_WAIT	NUMBER	Average amount of time waited for the event by the service (in hundredths of a second)
MAX_WAIT	NUMBER	Maximum amount of time waited for the event by the service (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time waited for the event by the service (in microseconds)
CPU	NUMBER	Total amount of CPU time consumed by the service while implementing the wait event itself (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.11 V$SERVICE_REGION_METRIC

V$SERVICE_REGION_METRIC displays the metric values captured for the most recent 30-second intervals for the workload against each service region available on the database.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
SERVICE_ID	NUMBER	Service number (internal)
SERVICE_NETWORK_NAME	VARCHAR2(512)	Network name for the service
REGION_NAME	VARCHAR2(30)	Region name
CALLSPERSEC	NUMBER	Number of user calls per second to the services
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> - "V$CHUNK_METRIC"

10.12 V$SERVICE_STATS

V$SERVICE_STATS displays a minimal set of performance statistics. These call rate statistics are used for making run-time routing decisions, for tracking service levels, and for per-instance diagnostics per call rate. The elapsed timing for each call provides a relative value across instances for how well a node is processing SQL calls issued under a service name. When aggregation is enabled for the Service Name, then this view provides the timing and work done for calls issued for the whole service.

Column	Datatype	Description
SERVICE_NAME_HASH	NUMBER	Service name hash from V$SERVICES
SERVICE_NAME	VARCHAR2(64)	Service name from V$SERVICES
STAT_ID	NUMBER	Statistic identifier
STAT_NAME	VARCHAR2(64)	Derived statistic name from V$STATNAME and V$SESS_TIME_MODEL
VALUE	NUMBER	For statistics that measure time (such as the DB CPU, background elapsed time, or parse time elapsed statistics), this column displays a cumulative value in microseconds. For other statistics that do not measure time (such as the db block changes, execute count, or logons cumulative statistics), this column displays the appropriate numeric value for the statistic.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> - "V$SERVICES"
> - "V$STATNAME"
> - "V$SESS_TIME_MODEL"
> - *Oracle Database Performance Tuning Guide* for more information about using database statistics to manage the performance of Oracle Database

10.13 V$SERVICE_WAIT_CLASS

V$SERVICE_WAIT_CLASS displays aggregated wait counts and wait times for each wait statistic.

An aggregation of these wait classes is used when thresholds are imported.

Column	Datatype	Description
SERVICE_NAME	VARCHAR2(64)	Service name from V$SERVICES
SERVICE_NAME_HASH	NUMBER	Service name hash from V$SERVICES
WAIT_CLASS_ID	NUMBER	Identifier of the wait class
WAIT_CLASS#	NUMBER	Number of the wait class
WAIT_CLASS	VARCHAR2(64)	Name of the wait class
TOTAL_WAITS	NUMBER	Total number waits from this wait class by the service
TIME_WAITED	NUMBER	Total amount of time spent in waits from this wait class by the service (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time spent in waits from this wait class by the service (in microseconds)
CPU	NUMBER	Total amount of CPU time consumed by the service while implementing waits from this wait class (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.14 V$SERVICEMETRIC

V$SERVICEMETRIC displays metric values measured on the most recent time interval period for services executing inside the database. Service metrics are measured in 5-second and 1-minute intervals.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin timestamp for the interval period
END_TIME	DATE	End timestamp for the interval period
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Group ID for the service metric group
SERVICE_NAME_HASH	NUMBER	Service name hash
SERVICE_NAME	VARCHAR2(64)	Service name
CTMHASH	NUMBER	Service create timestamp hash value
ELAPSEDPERCALL	NUMBER	Elapsed time per call (in microseconds). This column is deprecated in favor of the DBTIMEPERCALL column.
CPUPERCALL	NUMBER	CPU time per call (in microseconds)
DBTIMEPERCALL	NUMBER	Elapsed time per call (in microseconds)

Column	Datatype	Description
CALLSPERSEC	NUMBER	Number of user calls per second
DBTIMEPERSEC	NUMBER	Database time per second
GOODNESS	NUMBER	Indicates how attractive a given instance is with respect to processing the workload that is presented to the service. A lower number is better. This number is internally computed based on the GOAL (LONG or SHORT) that is specified for the particular service.
DELTA	NUMBER	Indicates the predicted increase in the goodness for every additional session that is routed to this instance
FLAGS	NUMBER	Flags that can be any of the following values: • 0x01 - Service is BLOCKED from accepting new connections • 0x02 - Service is VIOLATING the set threshold on some metric • 0x04 - Goodness is UNKNOWN
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.15 V$SERVICEMETRIC_HISTORY

V$SERVICEMETRIC_HISTORY displays a recent history of the metric values measured in predefined time interval periods for services executing inside the database. Service metrics are measured in 5-second and 1-minute intervals.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin timestamp for the interval period
END_TIME	DATE	End timestamp for the interval period
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Group ID for the service metric group
SERVICE_NAME_HASH	NUMBER	Service name hash
SERVICE_NAME	VARCHAR2(64)	Service name
CTMHASH	NUMBER	Service create timestamp hash value
ELAPSEDPERCALL	NUMBER	Elapsed time per call (in microseconds). This column is deprecated in favor of the DBTIMEPERCALL column.
CPUPERCALL	NUMBER	CPU time per call (in microseconds)
DBTIMEPERCALL	NUMBER	Elapsed time per call (in microseconds)
CALLSPERSEC	NUMBER	Number of user calls per second
DBTIMEPERSEC	NUMBER	Database time per second

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.16 V$SERVICES

V$SERVICES displays information about the services in the database.

Column	Datatype	Description
SERVICE_ID	NUMBER	Service ID
NAME	VARCHAR2(64)	Name of the service
NAME_HASH	NUMBER	Service name hash
NETWORK_NAME	VARCHAR2(512)	Network name
CREATION_DATE	DATE	Creation date
CREATION_DATE_HASH	NUMBER	Creation date hash
GOAL	VARCHAR2(12)	Runtime Load Balancing Goal being used to create run-time load balancing and connection load balancing advice: • NONE • SERVICE_TIME - Connections are balanced by response time • THROUGHPUT - Connections are balanced by throughput
DTP	VARCHAR2(1)	Indicates whether or not Distributed Transaction Processing is enabled for this service. When Distributed Transaction Processing is set to Y (YES), it means that the service is offered at exactly one instance at a time for XA affinity. Possible values: • Y - YES • N - NO
AQ_HA_NOTIFICATION	VARCHAR2(3)	Indicates whether FAN - Fast Application Notification for OCI connections is set (YES) or not (NO)
CLB_GOAL	VARCHAR2(5)	Connection load balancing goal used with statistics that are sent to the listeners to determine how new connections are distributed: • LONG - is using session count • SHORT - is using service time or throughput

Column	Datatype	Description
COMMIT_OUTCOME	VARCHAR2(3)	For Transaction Guard and Database Native Transaction Guard, indicates whether the database service associated with the user session has the COMMIT_OUTCOME service attribute enabled (YES) or not (NO). This attribute applies on a per session basis and is set at connect time. When the value of this column is YES, the commit status is managed for all supported transaction types and the outcome of a COMMIT transaction is preserved after the COMMIT has executed. Refer to the COMMIT_OUTCOME_FASTPATH column to view the preferred method for preserving the commit outcome. **See Also:** *Oracle Database Development Guide* for information about preserving the commit outcome
RETENTION_TIME	NUMBER	For Transaction Guard and Database Native Transaction Guard, when COMMIT_OUTCOME = YES, this value indicates the amount of time (in seconds) that the commit outcome is retained in the database.
REPLAY_INITIATION_TIMEOUT	NUMBER	For Application Continuity, this option specifies the difference between the time (in seconds) of original execution of the first operation of a request and the time that the replay is ready to start after a successful reconnect. Application Continuity will not replay after the specified amount of time has passed. This option is intended to avoid the unintentional execution of a request when a system is recovered after a long period of time. The default is 5 minutes (300 seconds).
SESSION_STATE_CONSISTENCY	VARCHAR2(128)	Describes how non-transactional is changed during a request. This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If non-transactional values change after the request starts, the default value of DYNAMIC should be set. Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode.
GLOBAL	VARCHAR2(3)	Indicates whether the service is global. A global service is managed by Global Service Manager (GSM) and can be provided by multiple databases that contain replicated data. Possible values: • YES: Indicates the service is global • NO: Indicates the service is not global
PDB	VARCHAR2(128)	Name of a pluggable database (PDB) associated with a given service. Will contain NULL if a database is a non-CDB or if the service is not associated with a PDB (that is, connecting to a CDB using this service will cause a user to connect to the root.)
SQL_TRANSLATION_PROFILE	VARCHAR2(261)	A non-NULL value specifies the initial SQL translation profile for subsequent database connections that use the service and do not specify a SQL translation profile. A NULL value has no effect.
MAX_LAG_TIME	VARCHAR2(128)	The maximum replication lag (in seconds) that is acceptable for a data replica to be used for providing the database service. Can only be specified for global services.
STOP_OPTION	VARCHAR2(128)	Stop option for sessions of this service for planned maintenance
FAILOVER_RESTORE	VARCHAR2(128)	Indicates whether sessions recover their commonly used session state (like NLS, schema) when they are failed over with TAF
DRAIN_TIMEOUT	NUMBER	Number of seconds to wait for sessions to be drained
TABLE_FAMILY_ID	NUMBER	Sharded table family ID associated with the service
PLACEMENT_TEMPLATE	VARCHAR2(64)	Reserved for future use

Column	Datatype	Description
COMMIT_OUTCOME_FASTPATH	VARCHAR2(3)	For Transaction Guard and Database Native Transaction Guard, when COMMIT_OUTCOME = YES, the value of this column indicates the preferred method for preserving the commit outcome. Possible values: • YES - Database Native Transaction Guard is used. Each transaction is assigned a unique transaction identifier (DB XID) in the database. The DB XID and status of the corresponding transaction are maintained persistently in a transaction table. Note that if COMMIT_OUTCOME = YES, then the value of COMMIT_OUTCOME_FASTPATH defaults to YES. • NO - Transaction Guard is used. A logical transaction ID (LTXID) is set for each user session at login and at each successful commit. LTXIDs are used only when the commit is not in the same round-trip to the database as the start of the transaction. Moreover, some transaction types, such as commit on success transactions, DDL transactions, and PL/SQL transactions, will continue to use LTXIDs in the same round-trip. When Transaction Guard is used, the outcome of a COMMIT transaction is known. If there is an outage, the application can use DBMS_APP_CONT.GET_LTXID_OUTCOME to return a reliable status for the last in-flight work. **See Also:** *Oracle Real Application Clusters Administration and Deployment Guide* for information about logical transaction IDs
TRUE_CACHE_SERVICE	VARCHAR2(64)	True Cache service associated with this database service
PARENT_SERVICE	VARCHAR2(64)	Name of the parent service
TEMPLATE_TIMEOUT	NUMBER	Maximum number of seconds that can pass before templates for the service expire If the value of this column is 0, then template timeout is turned off.
FAILOVER_TYPE	VARCHAR2(128)	AUTO for Transparent Application Continuity, TRANSACTION for Application Continuity, SESSION or SELECT for TAF.
FAILOVER_METHOD	VARCHAR2(128)	TAF only for compatibility - BASIC or NONE
FAILOVER_RETRIES	NUMBER	For Application Continuity and TAF, when reconnecting after a failure, number of attempts to re-connect per incident
FAILOVER_DELAY	NUMBER	For Application Continuity and TAF, when reconnecting after a failure, delay between each connection retry (in seconds)
RESET_STATE	VARCHAR2(6)	Reset state for the service. Possible values: • LEVEL1 • NONE
AUTO_CONNECTION_REBALANCE	VARCHAR2(7)	Drain setting for service load balancing. Possible values: • 0 - DEFAULT • 1 - NONE • 255 - AUTO
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.17 V$SES_OPTIMIZER_ENV

V$SES_OPTIMIZER_ENV displays the contents of the optimizer environment used by each session. When a new session is first created, it automatically inherits its optimizer environment from the optimizer environment defined at the instance level by V$SYS_OPTIMIZER_ENV. The value of certain parameters can be dynamically modified by issuing an ALTER SESSION statement.

Column	Datatype	Description
SID	NUMBER	Session identifier. This column can be used to join with V$SESSION on the SID column.
ID	NUMBER	Unique identifier of the parameter in the optimizer environment
NAME	VARCHAR2(40)	Name of the parameter
SQL_FEATURE	VARCHAR2(64)	Associated feature control ID
ISDEFAULT	VARCHAR2(3)	Indicates whether the parameter is set to the default value (YES) or not (NO)
VALUE	VARCHAR2(25)	Value of the parameter for the session
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

"V$SYS_OPTIMIZER_ENV"

10.18 V$SESS_IO

V$SESS_IO displays I/O statistics for each user session.

Column	Datatype	Description
SID	NUMBER	Session identifier
BLOCK_GETS	NUMBER	Block gets for this session
CONSISTENT_GETS	NUMBER	Consistent gets for this session
PHYSICAL_READS	NUMBER	Physical reads for this session
BLOCK_CHANGES	NUMBER	Block changes for this session
CONSISTENT_CHANGES	NUMBER	Consistent changes for this session
OPTIMIZED_PHYSICAL_READS	NUMBER	Number of physical reads from Database Smart Flash Cache for this session

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.19 V$SESS_TIME_MODEL

V$SESS_TIME_MODEL displays the session-accumulated time for various operations. The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation.
The time values are 8-byte integers and can therefore hold approximately 580,000 years of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

Column	Datatype	Description
SID	NUMBER	Session ID (same as in V$SESSION)
STAT_ID	NUMBER	Statistic identifier for the time statistic
STAT_NAME	VARCHAR2(64)	Name of the statistic (see Table 10-1)
VALUE	NUMBER	Amount of time (in microseconds) that the session has spent in this operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

Table 10-1 V$SESS_TIME_MODEL and V$SYS_TIME_MODEL Statistics

Statistic Name	Description
DB time	Amount of elapsed time (in microseconds) spent performing Database user-level calls. This does not include the elapsed time spent on instance background processes such as PMON.
DB CPU	Amount of CPU time (in microseconds) spent on database user-level calls. This does not include the CPU time spent on instance background processes such as PMON.
background elapsed time	Amount of elapsed time (in microseconds) consumed by database background processes.
background CPU time	Amount of CPU time (in microseconds) consumed by database background processes.

Table 10-1 (Cont.) V$SESS_TIME_MODEL and V$SYS_TIME_MODEL Statistics

Statistic Name	Description
sequence load elapsed time	Amount of elapsed time spent getting the next sequence number from the data dictionary. If a sequence is cached, then this is the amount of time spent replenishing the cache when it runs out. No time is charged when a sequence number is found in the cache. For non-cached sequences, some time will be charged for every nextval call.
parse time elapsed	Amount of elapsed time spent parsing SQL statements. It includes both soft and hard parse time.
hard parse elapsed time	Amount of elapsed time spent hard parsing SQL statements.
SQL execute elapsed time	Amount of elapsed time SQL statements are executing. Note that for select statements this also includes the amount of time spent performing fetches of query results.
connection management call elapsed time	Amount of elapsed time spent performing session connect and disconnect calls.
failed parse elapsed time	Amount of time spent performing SQL parses which ultimately fail with some parse error.
failed parse (out of shared memory) elapsed time	Amount of time spent performing SQL parses which ultimately fail with error `ORA-04031`.
hard parse (sharing criteria) elapsed time	Amount of elapsed time spent performing SQL hard parses when the hard parse resulted from not being able to share an existing cursor in the SQL cache.
hard parse (bind mismatch) elapsed time	Amount of elapsed time spent performing SQL hard parses when the hard parse resulted from bind type or bind size mismatch with an existing cursor in the SQL cache.
PL/SQL execution elapsed time	Amount of elapsed time spent running the PL/SQL interpreter. This does not include time spent recursively executing/parsing SQL statements or time spent recursively executing the Java VM.
PL/SQL compilation elapsed time	Amount of elapsed time spent running the PL/SQL compiler.
inbound PL/SQL rpc elapsed time	Time inbound PL/SQL remote procedure calls have spent executing. It includes all time spent recursively executing SQL and JAVA, and therefore is not easily related to "PL/SQL execution elapsed time".
Java execution elapsed time	Amount of elapsed time spent running the Java VM. This does not include time spent recursively executing/parsing SQL statements or time spent recursively executing PL/SQL.
RMAN cpu time (backup/restore)	Amount of CPU time (in microseconds) spent in RMAN backup and restore operations.
repeated bind elapsed time	Amount of elapsed time spent giving new values to bind variables (rebinding).
OLAP engine elapsed time	Amount of time spent performing OLAP session transactions. This includes time spent on database user-level calls, SQL statement execution, and PL/SQL execution within the OLAP transaction.
OLAP engine CPU time	Amount of CPU time spent on OLAP session transactions. This includes time spent on database user-level calls, SQL statement execution, and PL/SQL execution within the OLAP transaction.

The relationships between the statistics listed in Table 10-1 form two trees in which all the time reported by a child in the tree is contained within the parent in the tree. The following are the relationship trees; the number is the level in the given tree.

```
1) background elapsed time
    2) background cpu time
          3) RMAN cpu time (backup/restore)
```

```
1) DB time
    2) DB CPU
    2) connection management call elapsed time
    2) sequence load elapsed time
    2) sql execute elapsed time
    2) parse time elapsed
          3) hard parse elapsed time
                4) hard parse (sharing criteria) elapsed time
                    5) hard parse (bind mismatch) elapsed time
          3) failed parse elapsed time
                4) failed parse (out of shared memory) elapsed time
    2) PL/SQL execution elapsed time
    2) inbound PL/SQL rpc elapsed time
    2) PL/SQL compilation elapsed time
    2) Java execution elapsed time
    2) repeated bind elapsed time
```

The relationship between a parent and a child in the tree indicates containment only. Keep the following in mind regarding the tree:

- Children do not necessarily add up to the parent.
- Children are not necessarily exclusive (that is, they may overlap).
- The union of children does not necessarily cover the whole of the parent.

> **See Also:**

> "V$SYS_TIME_MODEL"

10.20 V$SESSION

`V$SESSION` displays session information for each current session.

Column	Datatype	Description
SADDR	RAW(4 | 8)	Session address
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Session serial number. Used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID.
AUDSID	NUMBER	Auditing session ID • If the database is configured for unified auditing, then this column displays the unified auditing session ID • If the database is configured for mixed mode auditing, then this column displays the traditional auditing session ID
PADDR	RAW(4 | 8)	Address of the process that owns the session
USER#	NUMBER	Oracle user identifier
USERNAME	VARCHAR2(128)	Oracle username

Column	Datatype	Description

COMMAND	NUMBER	Command in progress (last statement parsed).
		You can find the command name for any value *n* returned in this COMMAND column by running this SQL query:
		`SELECT command_name`
		`FROM v$sqlcommand`
		`WHERE command_type = n;`
		A value of 0 in this COMMAND column means the command is not recorded in V$SESSION.

OWNERID	NUMBER	Identifier of the user who owns the migratable session; the column contents are invalid if the value is 2147483644 For operations using parallel worker processes, interpret this value as a 4-byte value. The low-order 2 bytes represent the session number and the high-order bytes represent the instance ID of the query coordinator.
TADDR	VARCHAR2(16)	Address of the transaction state object
LOCKWAIT	VARCHAR2(16)	Address of the lock the session is waiting for; NULL if none
STATUS	VARCHAR2(8)	Status of the session: • ACTIVE - Session currently executing SQL • INACTIVE - Session which is inactive and either has no configured limits or has not yet exceeded the configured limits • KILLED - Session marked to be terminated • CACHED - Session temporarily cached for use by Oracle*XA • SNIPED - An inactive session that has exceeded some configured limits (for example, resource limits specified for the resource manager consumer group or idle_time specified in the user's profile). Such sessions will not be allowed to become active again.
SERVER	VARCHAR2(9)	Server type: • DEDICATED • SHARED • PSEUDO • POOLED • NONE
SCHEMA#	NUMBER	Schema user identifier
SCHEMANAME	VARCHAR2(128)	Schema user name
OSUSER	VARCHAR2(128)	Operating system client user name
PROCESS	VARCHAR2(24)	Operating system client process ID
MACHINE	VARCHAR2(64)	Operating system machine name
PORT	NUMBER	Client port number
TERMINAL	VARCHAR2(30)	Operating system terminal name
PROGRAM	VARCHAR2(84)	Operating system program name
TYPE	VARCHAR2(10)	Session type
SQL_ADDRESS	RAW(4 | 8)	Used with SQL_HASH_VALUE to identify the SQL statement that is currently being executed
SQL_HASH_VALUE	NUMBER	Used with SQL_ADDRESS to identify the SQL statement that is currently being executed
SQL_ID	VARCHAR2(13)	SQL identifier of the SQL statement that is currently being executed
SQL_CHILD_NUMBER	NUMBER	Child number of the SQL statement that is currently being executed

Column	Datatype	Description
SQL_EXEC_START	DATE	Time when the execution of the SQL currently executed by this session started; NULL if SQL_ID is NULL
SQL_EXEC_ID	NUMBER	SQL execution identifier; NULL if SQL_ID is NULL or if the execution of that SQL has not yet started (see V$SQL_MONITOR)
PREV_SQL_ADDR	RAW(4 | 8)	Used with PREV_HASH_VALUE to identify the last SQL statement executed
PREV_HASH_VALUE	NUMBER	Used with SQL_HASH_VALUE to identify the last SQL statement executed
PREV_SQL_ID	VARCHAR2(13)	SQL identifier of the last SQL statement executed
PREV_CHILD_NUMBER	NUMBER	Child number of the last SQL statement executed
PREV_EXEC_START	DATE	SQL execution start of the last executed SQL statement
PREV_EXEC_ID	NUMBER	SQL execution identifier of the last executed SQL statement
PLSQL_ENTRY_OBJECT_ID	NUMBER	Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack
PLSQL_ENTRY_SUBPROGRAM_ID	NUMBER	Subprogram ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack
PLSQL_OBJECT_ID	NUMBER	Object ID of the currently executing PL/SQL subprogram; NULL if executing SQL
PLSQL_SUBPROGRAM_ID	NUMBER	Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL
MODULE	VARCHAR2(64)	Name of the currently executing module as set by calling the DBMS_APPLICATION_INFO.SET_MODULE procedure
MODULE_HASH	NUMBER	Hash value of the MODULE column
ACTION	VARCHAR2(64)	Name of the currently executing action as set by calling the DBMS_APPLICATION_INFO.SET_ACTION procedure
ACTION_HASH	NUMBER	Hash value of the ACTION column
CLIENT_INFO	VARCHAR2(64)	Information set by the DBMS_APPLICATION_INFO.SET_CLIENT_INFO procedure
FIXED_TABLE_SEQUENCE	NUMBER	This contains a number that increases every time the session completes a call to the database and there has been an intervening select from a dynamic performance table. This column can be used by performance monitors to monitor statistics in the database. Each time the performance monitor looks at the database, it only needs to look at sessions that are currently active or have a higher value in this column than the highest value that the performance monitor saw the last time. All the other sessions have been idle since the last time the performance monitor looked at the database.
ROW_WAIT_OBJ#	NUMBER	Object ID for the table containing the row specified in ROW_WAIT_ROW#
ROW_WAIT_FILE#	NUMBER	Identifier for the data file containing the row specified in ROW_WAIT_ROW#. This column is valid only if the session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
ROW_WAIT_BLOCK#	NUMBER	Identifier for the block containing the row specified in ROW_WAIT_ROW#. This column is valid only if the session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
ROW_WAIT_ROW#	NUMBER	Current row being locked. This column is valid only if the session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
TOP_LEVEL_CALL#	NUMBER	Oracle top level call number
LOGON_TIME	DATE	Time of logon

Column	Datatype	Description
LAST_CALL_ET	NUMBER	If the session STATUS is currently ACTIVE, then the value represents the elapsed time (in seconds) since the session has become active. If the session STATUS is currently INACTIVE, then the value represents the elapsed time (in seconds) since the session has become inactive.
PDML_ENABLED	VARCHAR2(3)	This column has been replaced by the PDML_STATUS column
FAILOVER_TYPE	VARCHAR2(13)	Indicates whether failover is enabled for this session: • NONE - Failover is disabled for this session. • SESSION - Transparent application failover (TAF) is enabled for this session and the client can fail over its session following a disconnect. • SELECT - TAF is enabled for this session and the client can fail over queries. The application must not set session state after the initial setup. (Transactions are not included at failover.) • TRANSACTION - Application Continuity (AC) is enabled for this session. This feature is available with the Oracle Real Application Clusters (RAC), Oracle RAC One Node, and Oracle Active Data Guard options. AC hides outages from end users and applications by recovering the database sessions following recoverable outages and planned maintenance. • AUTO - Transparent Application Continuity (TAC) is enabled for this session. This feature is the automated version of Application Continuity (AC) that makes decisions on your behalf. TAC is on by default for Oracle Autonomous Database Cloud and can also be on by default for your applications. **See Also:** • *Oracle Database Net Services Administrator's Guide* for more information on TAF • *Oracle Real Application Clusters Administration and Deployment Guide* for more information on AC • *Oracle Real Application Clusters Administration and Deployment Guide* for more information on TAC
FAILOVER_METHOD	VARCHAR2(10)	Indicates the transparent application failover method for the session: • NONE - Failover is disabled for this session • BASIC - Client itself reconnects following a disconnect • PRECONNECT - Backup instance can support all connections from every instance for which it is backed up
FAILED_OVER	VARCHAR2(3)	Indicates whether the session is running in failover mode and failover has occurred (YES) or not (NO)
RESOURCE_CONSUMER_GROUP	VARCHAR2(32)	Name of the session's current resource consumer group
PDML_STATUS	VARCHAR2(8)	If ENABLED, the session is in a PARALLEL DML enabled mode. If DISABLED, PARALLEL DML enabled mode is not supported for the session. If FORCED, the session has been altered to force PARALLEL DML.
PDDL_STATUS	VARCHAR2(8)	If ENABLED, the session is in a PARALLEL DDL enabled mode. If DISABLED, PARALLEL DDL enabled mode is not supported for the session. If FORCED, the session has been altered to force PARALLEL DDL.
PQ_STATUS	VARCHAR2(8)	If ENABLED, the session is in a PARALLEL QUERY enabled mode. If DISABLED, PARALLEL QUERY enabled mode is not supported for the session. If FORCED, the session has been altered to force PARALLEL QUERY.
CURRENT_QUEUE_DURATION	NUMBER	If queued (1), the current amount of time the session has been queued. If not currently queued, the value is 0.

Column	Datatype	Description
CLIENT_IDENTIFIER	VARCHAR2(64)	Client identifier of the session
BLOCKING_SESSION_STATUS	VARCHAR2(11)	This column provides details on whether there is a blocking session: • VALID - there is a blocking session, and it is identified in the BLOCKING_INSTANCE and BLOCKING_SESSION columns • NO HOLDER - there is no session blocking this session • NOT IN WAIT - this session is not in a wait • UNKNOWN - the blocking session is unknown
BLOCKING_INSTANCE	NUMBER	Instance identifier of the blocking session. This column is valid only if BLOCKING_SESSION_STATUS has the value VALID.
BLOCKING_SESSION	NUMBER	Session identifier of the blocking session. This column is valid only if BLOCKING_SESSION_STATUS has the value VALID.
FINAL_BLOCKING_SESSION_STATUS	VARCHAR2(11)	The final blocking session is the final element in the wait chain constructed by following the sessions that are blocked by one another starting with this session. In the case of a cyclical wait chain, one of the sessions in the wait chain will be chosen as the final blocker. This column provides details on whether there is a final blocking session: • VALID - there is a final blocking session and it is identified in the FINAL_BLOCKING_INSTANCE and FINAL_BLOCKING_SESSION columns • NO HOLDER - there is no session blocking this session • NOT IN WAIT - this session is not in a wait • UNKNOWN - the final blocking session is unknown
FINAL_BLOCKING_INSTANCE	NUMBER	Instance identifier of the final blocking session. This column is valid only if FINAL_BLOCKING_SESSION_STATUS has the value VALID.
FINAL_BLOCKING_SESSION	NUMBER	Session identifier of the blocking session. This column is valid only if FINAL_BLOCKING_SESSION_STATUS has the value VALID.
SEQ#	NUMBER	A number that uniquely identifies the current or last wait (incremented for each wait)
EVENT#	NUMBER	If the session is currently waiting, then the number of the resource or event for which the session is waiting. If the session is not in a wait, then the number of the resource or event for which the session most recently waited.
EVENT	VARCHAR2(64)	If the session is currently waiting, then the resource or event for which the session is waiting. If the session is not in a wait, then the resource or event for which the session most recently waited. **See Also:** " Oracle Wait Events"
P1TEXT	VARCHAR2(64)	Description of the first wait event parameter
P1	NUMBER	First wait event parameter (in decimal)
P1RAW	RAW(8)	First wait event parameter (in hexadecimal)[1]
P2TEXT	VARCHAR2(64)	Description of the second wait event parameter
P2	NUMBER	Second wait event parameter (in decimal)
P2RAW	RAW(8)	Second wait event parameter (in hexadecimal)[1]
P3TEXT	VARCHAR2(64)	Description of the third wait event parameter
P3	NUMBER	Third wait event parameter (in decimal)
P3RAW	RAW(8)	Third wait event parameter (in hexadecimal)[1]
WAIT_CLASS_ID	NUMBER	Identifier of the class of the wait event
WAIT_CLASS#	NUMBER	Number of the class of the wait event

Column	Datatype	Description
WAIT_CLASS	VARCHAR2(64)	Name of the class of the wait event
WAIT_TIME	NUMBER	If the session is currently waiting, then the value is 0. If the session is not in a wait, then the value is as follows: • > 0 - Value is the duration of the last wait in hundredths of a second • -1 - Duration of the last wait was less than a hundredth of a second • -2 - Parameter TIMED_STATISTICS was set to false This column has been deprecated in favor of the columns WAIT_TIME_MICRO and STATE.
SECONDS_IN_WAIT	NUMBER	If the session is currently waiting, then the value is the amount of time waited for the current wait. If the session is not in a wait, then the value is the amount of time since the start of the last wait. This column has been deprecated in favor of the columns WAIT_TIME_MICRO and TIME_SINCE_LAST_WAIT_MICRO.
STATE	VARCHAR2(19)	Wait state: • WAITING - Session is currently waiting • WAITED UNKNOWN TIME - Duration of the last wait is unknown; this is the value when the parameter TIMED_STATISTICS is set to false • WAITED SHORT TIME - Last wait was less than a hundredth of a second • WAITED KNOWN TIME - Duration of the last wait is specified in the WAIT_TIME column
WAIT_TIME_MICRO	NUMBER	Amount of time waited (in microseconds). If the session is currently waiting, then the value is the time spent in the current wait. If the session is currently not in a wait, then the value is the amount of time waited in the last wait.
TIME_REMAINING_MICRO	NUMBER	Value is interpreted as follows: • > 0 - Amount of time remaining for the current wait (in microseconds) • 0 - Current wait has timed out • -1 - Session can indefinitely wait in the current wait • NULL - Session is not currently waiting
TOTAL_TIME_WAITED_MICRO	NUMBER	Total time for the current wait (in microseconds) A wait includes code within its beginning and end that can encounter other waits as part of its implementation. For example, a wait might need to acquire a latch to check state to determine when the wait is satisfied, and the latch itself might enter a wait. In this case, when the latch wait ends and returns to the outer wait, the latch time is included in the value of this column, while the value of WAIT_TIME_MICRO is reset to start after the latch wait.
HEUR_TIME_WAITED_MICRO	NUMBER	Heuristic wait time (in microseconds) This value is calculated by attempting to group sequential waits that appear to be the same.
TIME_SINCE_LAST_WAIT_MICRO	NUMBER	Time elapsed since the end of the last wait (in microseconds). If the session is currently in a wait, then the value is 0.
SERVICE_NAME	VARCHAR2(64)	Service name of the session
SQL_TRACE	VARCHAR2(8)	Indicates whether SQL tracing is enabled (ENABLED) or disabled (DISABLED)
SQL_TRACE_WAITS	VARCHAR2(5)	Indicates whether wait tracing is enabled (TRUE) or not (FALSE)
SQL_TRACE_BINDS	VARCHAR2(5)	Indicates whether bind tracing is enabled (TRUE) or not (FALSE)

Column	Datatype	Description
SQL_TRACE_PLAN_STATS	VARCHAR2(10)	Frequency at which row source statistics are dumped in the trace files for each cursor: • never • first_execution • all_executions
SESSION_EDITION_ID	NUMBER	Shows the value that, in the session, would be reported by sys_context('USERENV', 'SESSION_EDITION_ID')
CREATOR_ADDR	RAW(4 | 8)	Address of the creating process or circuit
CREATOR_SERIAL#	NUMBER	Serial number of the creating process or circuit
ECID	VARCHAR2(64)	Execution context identifier (sent by Application Server)
SQL_TRANSLATION_PROFILE_ID	NUMBER	Object number of the SQL translation profile
PGA_TUNABLE_MEM	NUMBER	The amount of tunable PGA memory (in bytes). Untunable memory is PGA_ALLOC_MEM from V$PROCESS minus PGA_TUNABLE_MEM from V$SESSION.
SHARD_DDL_STATUS	VARCHAR2(8)	Indicates whether shard DDL is enabled in the current session (ENABLED) or not (DISABLED). This value is only relevant for the shard catalog database.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
EXTERNAL_NAME	VARCHAR2(1024)	External name of the database user. For enterprise users, returns the Oracle Internet Directory DN.
PLSQL_DEBUGGER_CONNECTED	VARCHAR2(5)	Indicates whether the session is connected to a PL/SQL debugger (TRUE) or not (FALSE)
DRAIN_STATUS	VARCHAR2(8)	Draining status • DRAINING • NONE
DRAIN_DEADLINE	TIMESTAMP(6) WITH TIME ZONE	Drain deadline for the session
DRAIN_ORIGIN	VARCHAR2(12)	Draining origin • DISCONNECT - The session is being drained by the ALTER SYSTEM DISCONNECT SESSION statement • LOAD BALANCE - The session is being drained by Oracle RAC load balancing • PDB - The session is being drained by a PDB close • SERVICE - The session is being drained by stopping a service • NONE - The session is not being drained (DRAIN_STATUS = NONE)

[1] The P1RAW, P2RAW, and P3RAW columns display the same values as the P1, P2, and P3 columns, except that the numbers are displayed in hexadecimal.

10.21 V$SESSION_BLOCKERS

V$SESSION_BLOCKERS displays the blocker sessions for each blocked session. Each row represents a blocked and blocker session pair. If a session is blocked by multiple sessions there will be multiple rows for that blocked session. The maximum number of blocker sessions displayed for a single blocked session is 30. If a session is not blocked by other sessions, then there will be no row in this view for that session.

Column	Datatype	Description
SID	NUMBER	Blocked session's Oracle session identifier
SESS_SERIAL#	NUMBER	Blocked session's Oracle session serial number
WAIT_ID	NUMBER	A number identifying the wait for the blocked session
WAIT_EVENT	NUMBER	Resource or event number for which the blocked session is waiting
WAIT_EVENT_TEXT	VARCHAR2(64)	Resource or event for which the blocked session is waiting
BLOCKER_INSTANCE_ID	NUMBER	Blocker session's instance identifier
BLOCKER_SID	NUMBER	Blocker session's Oracle session identifier
BLOCKER_SESS_SERIAL#	NUMBER	Blocker session's Oracle session serial number
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.22 V$SESSION_CONNECT_INFO

V$SESSION_CONNECT_INFO displays information about network connections for all currently logged in sessions.

Column	Datatype	Description
SID	NUMBER	Session identifier (can be used to join this view with V$SESSION)

Column	Datatype	Description
SERIAL#	NUMBER	Session serial number. Used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID. (Can be used to join this view with V$SESSION.)
AUTHENTICATION_TYPE	VARCHAR2(26)	How the user was authenticated: • DATABASE - Username/password authentication • OS - Operating system external user authentication • NETWORK - Network protocol or ANO authentication • PROXY - OCI proxy connection authentication • SERVER • PASSWORD • EXTERNAL ADAPTERS • INTERNAL • GLOBAL • EXTERNAL • PASSWORD BASED GLOBAL USER
OSUSER	VARCHAR2(128)	External username for this database user
NETWORK_SERVICE_BANNER	VARCHAR2(4000)	Product banners for each Oracle Net service used for this connection (one row per banner)
CLIENT_CHARSET	VARCHAR2(40)	Client character set as specified in the NLS_LANG environment variable or in the OCIEnvNlsCreate() call; Unknown if the Oracle client is older than release 11.1 or the connection is through the JDBC thin driver
CLIENT_CONNECTION	VARCHAR2(13)	Client server connection flags: • Heterogeneous • Homogeneous
CLIENT_OCI_LIBRARY	VARCHAR2(27)	OCI client library: • Home-based • Full Instant Client • Light Weight Instant Client • OCI • Unknown
CLIENT_VERSION	VARCHAR2(40)	Client library version number
CLIENT_DRIVER	VARCHAR2(30)	Client driver name
CLIENT_LOBATTR	VARCHAR2(23)	Client LOB flags: • Client Temp Lob Rfc On • Client Temp Lob Rfc Off
CLIENT_REGID	NUMBER	Query cache registration ID sent by the client
CLIENT_CONNECTION_STRING	VARCHAR2(4000)	Connection string used to establish the connection
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "V$SESSION"

10.23 V$SESSION_CURSOR_CACHE

V$SESSION_CURSOR_CACHE displays information on cursor usage for the current session.

> **Note:**
>
> The V$SESSION_CURSOR_CACHE view is not a measure of the effectiveness of the SESSION_CACHED_CURSORS initialization parameter.

Column	Datatype	Description
MAXIMUM	NUMBER	Maximum number of cursors to cache. Once you hit this number, some cursors will need to be closed in order to open more. The value in this column is derived from the initialization parameter SESSION_CACHED_CURSORS.
COUNT	NUMBER	Current number of cursors (whether they are in use or not)
OPENS	NUMBER	Cumulative total of cursor opens minus one. This is because the cursor that is currently open and being used for this query is not counted in the OPENS statistic.
HITS	NUMBER	Cumulative total of cursor open hits
HIT_RATIO	NUMBER	Ratio of the number of times an open cursor was found divided by the number of times a cursor was sought
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "SESSION_CACHED_CURSORS"

10.24 V$SESSION_EVENT

V$SESSION_EVENT displays information on waits for an event by a session. Note that the TIME_WAITED and AVERAGE_WAIT columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you

want this column to reflect true wait times, then you must set `TIMED_STATISTICS` to `true` in the parameter file; doing this will have a small negative effect on system performance.

> **See Also:**
>
> "TIMED_STATISTICS"

Column	Datatype	Description
SID	NUMBER	Session identifier
EVENT	VARCHAR2(64)	Name of the wait event; derived statistic name from `V$EVENT_NAME` **See Also:** " Oracle Wait Events"
TOTAL_WAITS	NUMBER	Total number of waits for the event by the session
TOTAL_TIMEOUTS	NUMBER	Total number of timeouts for the event by the session
TIME_WAITED	NUMBER	Total amount of time waited for the event by the session (in hundredths of a second)
AVERAGE_WAIT	NUMBER	Average amount of time waited for the event by the session (in hundredths of a second)
MAX_WAIT	NUMBER	Maximum amount of time waited for the event by the session (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time waited for the event by the session (in microseconds)
CPU	NUMBER	Total amount of CPU time consumed by the session while implementing the wait event itself (in microseconds)
EVENT_ID	NUMBER	Identifier of the wait event
WAIT_CLASS_ID	NUMBER	Identifier of the wait class of the wait event
WAIT_CLASS#	NUMBER	Number of the wait class of the wait event
WAIT_CLASS	VARCHAR2(64)	Name of the wait class of the wait event
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • `0`: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • `1`: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.25 V$SESSION_FIX_CONTROL

`V$SESSION_FIX_CONTROL` displays information about Fix Control (enabled/disabled) for the current session.

Column	Datatype	Description
SESSION_ID	NUMBER	Session identifier (can be used to join this view with `V$SESSION`)
BUGNO	NUMBER	Bug number (as fix control identifier)
VALUE	NUMBER	Current value set for the fix control
SQL_FEATURE	VARCHAR2(64)	Feature control ID

Column	Datatype	Description
DESCRIPTION	VARCHAR2(64)	Description of the fix control
OPTIMIZER_FEATURE_ENABLE	VARCHAR2(25)	Version on (and after) which the fix is enabled by default
EVENT	NUMBER	Event formerly used to control the fix
IS_DEFAULT	NUMBER	Indicates whether the current value is the same as the default (1) or not (0)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.26 V$SESSION_LONGOPS

V$SESSION_LONGOPS displays the status of various operations that run for longer than 6 seconds (in absolute time). These operations currently include many backup and recovery functions, statistics gathering, and query execution, and more operations are added for every Oracle release.
To monitor query execution progress, you must be using the cost-based optimizer and you must:

- Set the TIMED_STATISTICS or SQL_TRACE parameters to true
- Gather statistics for your objects with the DBMS_STATS package

You can add information to this view about application-specific long-running operations by using the DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS procedure.

Column	Datatype	Description
SID	NUMBER	Identifier of the session processing the long-running operation. If multiple sessions are cooperating in the long-running operation, then SID corresponds to the main session.
SERIAL#	NUMBER	Serial number of the session processing the long-running operation. If multiple sessions are cooperating in the long-running operation, then SERIAL# corresponds to the main session. SERIAL# is used to uniquely identify a session's objects. Guarantees that session-level commands are applied to the correct session objects if the session ends and another session begins with the same session ID.
OPNAME	VARCHAR2(64)	Brief description of the operation
TARGET	VARCHAR2(64)	Object on which the operation is carried out
TARGET_DESC	VARCHAR2(32)	Description of the target
SOFAR	NUMBER	Units of work done so far for the operation specified in the OPNAME column
TOTALWORK	NUMBER	Total units of work for the operation specified in the OPNAME column
UNITS	VARCHAR2(32)	Units of measurement
START_TIME	DATE	Starting time of the operation
LAST_UPDATE_TIME	DATE	Time when statistics were last updated for the operation

Column	Datatype	Description
TIMESTAMP	DATE	Timestamp specific to the operation
TIME_REMAINING	NUMBER	Estimate (in seconds) of time remaining for the operation to complete
ELAPSED_SECONDS	NUMBER	Number of elapsed seconds from the start of the operations
CONTEXT	NUMBER	Context
MESSAGE	VARCHAR2(512)	Statistics summary message
USERNAME	VARCHAR2(30)	User ID of the user performing the operation
SQL_ADDRESS	RAW(4 | 8)	Used with the value of the SQL_HASH_VALUE column to identify the SQL statement associated with the operation
SQL_HASH_VALUE	NUMBER	Used with the value of the SQL_ADDRESS column to identify the SQL statement associated with the operation
SQL_ID	VARCHAR2(13)	SQL identifier of the SQL statement associated with the long operation, if any
SQL_PLAN_HASH_VALUE	NUMBER	SQL plan hash value; NULL if SQL_ID is NULL
SQL_EXEC_START	DATE	Time when the execution of the SQL started; NULL if SQL_ID is NULL
SQL_EXEC_ID	NUMBER	SQL execution identifier (see V$SQL_MONITOR)
SQL_PLAN_LINE_ID	NUMBER	SQL plan line ID corresponding to the long operation; NULL if the long operation is not associated with a line of the execution plan
SQL_PLAN_OPERATION	VARCHAR2(30)	Plan operation name; NULL if SQL_PLAN_LINE_ID is NULL
SQL_PLAN_OPTIONS	VARCHAR2(30)	Plan operation options; NULL if SQL_PLAN_LINE_ID is NULL
QCSID	NUMBER	Session identifier of the parallel coordinator
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_STATS package

10.27 V$SESSION_OBJECT_CACHE

V$SESSION_OBJECT_CACHE displays object cache statistics for the current user session on the local server (instance).

Column	Datatype	Description
PINS	NUMBER	Number of object pins or look-ups in the cache
HITS	NUMBER	Number of object pins that found the object already in the cache
TRUE_HITS	NUMBER	Number of object pins that found the object already in the cache and in the desired state (thus, not requiring refresh from the database)
HIT_RATIO	NUMBER	Ratio of HITS / PINS
TRUE_HIT_RATIO	NUMBER	Ratio of TRUE_HITS/PINS
OBJECT_REFRESHES	NUMBER	Number of objects in the cache that were refreshed with a new value from the database
CACHE_REFRESHES	NUMBER	Number of times the whole cache (all objects) were refreshed
OBJECT_FLUSHES	NUMBER	Number of objects in the cache that were flushed to the database
CACHE_FLUSHES	NUMBER	Number of times the whole cache (all objects) were flushed to the database
CACHE_SHRINKS	NUMBER	Number of times the cache was shrunk to the optimal size
CACHED_OBJECTS	NUMBER	Number of objects currently cached
PINNED_OBJECTS	NUMBER	Number of objects currently pinned
CACHE_SIZE	NUMBER	Current size of the cache (in bytes)
OPTIMAL_SIZE	NUMBER	Optimal size of the cache (in bytes)
MAXIMUM_SIZE	NUMBER	Maximum size of the cache (in bytes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.28 V$SESSION_WAIT

V$SESSION_WAIT displays the current or last wait for each session.

Column	Datatype	Description
SID	NUMBER	Session identifier; maps to V$SESSION.SID
SEQ#	NUMBER	A number that uniquely identifies the current or last wait (incremented for each wait)
EVENT	VARCHAR2(64)	If the session is currently waiting, then the resource or event for which the session is waiting. If the session is not in a wait, then the resource or event for which the session most recently waited. **See Also:** " Oracle Wait Events"
P1TEXT	VARCHAR2(64)	Description of the first wait event parameter
P1	NUMBER	First wait event parameter (in decimal)
P1RAW	RAW(8)	First wait event parameter (in hexadecimal)[1]
P2TEXT	VARCHAR2(64)	Description of the second wait event parameter
P2	NUMBER	Second wait event parameter (in decimal)

Column	Datatype	Description
P2RAW	RAW(8)	Second wait event parameter (in hexadecimal)[1]
P3TEXT	VARCHAR2(64)	Description of the third wait event parameter
P3	NUMBER	Third wait event parameter (in decimal)
P3RAW	RAW(8)	Third wait event parameter (in hexadecimal)[1]
WAIT_CLASS_ID	NUMBER	Identifier of the class of the wait event
WAIT_CLASS#	NUMBER	Number of the class of the wait event
WAIT_CLASS	VARCHAR2(64)	Name of the class of the wait event
WAIT_TIME	NUMBER	If the session is currently waiting, then the value is 0. If the session is not in a wait, then the value is as follows: • > 0 - Value is the duration of the last wait in hundredths of a second • -1 - Duration of the last wait was less than a hundredth of a second • -2 - Parameter TIMED_STATISTICS was set to false This column has been deprecated in favor of the columns WAIT_TIME_MICRO and STATE.
SECONDS_IN_WAIT	NUMBER	If the session is currently waiting, then the value is the amount of time waited for the current wait. If the session is not in a wait, then the value is the amount of time since the start of the last wait. This column has been deprecated in favor of the columns WAIT_TIME_MICRO and TIME_SINCE_LAST_WAIT_MICRO.
STATE	VARCHAR2(19)	Wait state: • WAITING - Session is currently waiting • WAITED UNKNOWN TIME - Duration of the last wait is unknown; this is the value when the parameter TIMED_STATISTICS is set to false • WAITED SHORT TIME - Last wait was less than a hundredth of a second • WAITED KNOWN TIME - Duration of the last wait is specified in the WAIT_TIME column
WAIT_TIME_MICRO	NUMBER	Amount of time waited (in microseconds). If the session is currently waiting, then the value is the time spent in the current wait. If the session is currently not in a wait, then the value is the amount of time waited in the last wait.
TIME_REMAINING_MICRO	NUMBER	Value is interpreted as follows: • > 0 - Amount of time remaining for the current wait (in microseconds) • 0 - Current wait has timed out • -1 - Session can indefinitely wait in the current wait • NULL - Session is not currently waiting
TOTAL_TIME_WAITED_MICRO	NUMBER	Total time for the current wait (in microseconds) A wait includes code within its beginning and end that can encounter other waits as part of its implementation. For example, a wait might need to acquire a latch to check state to determine when the wait is satisfied, and the latch itself might enter a wait. In this case, when the latch wait ends and returns to the outer wait, the latch time is included in the value of this column, while the value of WAIT_TIME_MICRO is reset to start after the latch wait.
HEUR_TIME_WAITED_MICRO	NUMBER	Heuristic wait time (in microseconds) This value is calculated by attempting to group sequential waits that appear to be the same.

Column	Datatype	Description
TIME_SINCE_LAST_WAIT_MICRO	NUMBER	Time elapsed since the end of the last wait (in microseconds). If the session is currently in a wait, then the value is 0.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

[1] The P1RAW, P2RAW, and P3RAW columns display the same values as the P1, P2, and P3 columns, except that the numbers are displayed in hexadecimal.

> **See Also:**
>
> "TIMED_STATISTICS" and " Oracle Wait Events"

10.29 V$SESSION_WAIT_CLASS

V$SESSION_WAIT_CLASS displays the time spent in various wait event operations on a per-session basis.

Column	Datatype	Description
SID	NUMBER	Session identifier
SERIAL#	NUMBER	Serial number
WAIT_CLASS_ID	NUMBER	Identifier of the wait class
WAIT_CLASS#	NUMBER	Number of the wait class
WAIT_CLASS	VARCHAR2(64)	Name of the wait class
TOTAL_WAITS	NUMBER	Total number waits from this wait class by the session
TIME_WAITED	NUMBER	Total amount of time spent in waits from this wait class by the session (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time spent in waits from this wait class by the session (in microseconds)
CPU	NUMBER	Total amount of CPU time consumed by the session while implementing waits from this wait class (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.30 V$SESSION_WAIT_HISTORY

V$SESSION_WAIT_HISTORY displays the last 10 wait events for each active session.

Column	Datatype	Description
SID	NUMBER	Session identifier
SEQ#	NUMBER	Sequence of wait events; 1 is the most recent
EVENT#	NUMBER	Event number
EVENT	VARCHAR2(64)	Resource or event for which the session is waiting
P1TEXT	VARCHAR2(64)	Description of the first wait event parameter
P1	NUMBER	First wait event parameter (in decimal)
P2TEXT	VARCHAR2(64)	Description of the second wait event parameter
P2	NUMBER	Second wait event parameter (in decimal)
P3TEXT	VARCHAR2(64)	Description of the third wait event parameter
P3	NUMBER	Third wait event parameter (in decimal)
WAIT_TIME	NUMBER	Amount of time waited (in hundredths of a second)
WAIT_TIME_MICRO	NUMBER	Amount of time waited (in microseconds)
TIME_SINCE_LAST_WAIT_MICRO	NUMBER	Time elapsed (in microseconds) since the end of the previous wait in the wait history
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.31 V$SESSIONS_COUNT

V$SESSIONS_COUNT displays the current number of sessions for each PDB.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
USER_SESSION_COUNT	NUMBER	Displays the current number of user sessions for the PDB
RECURSIVE_SESSION_COUNT	NUMBER	Displays the current number of recursive sessions for the PDB

10.32 V$SESSMETRIC

V$SESSMETRIC displays the metric values for all sessions.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
SESSION_ID	NUMBER	Session ID
SESSION_SERIAL_NUM	NUMBER	Session serial number
CPU	NUMBER	CPU usage
PHYSICAL_READS	NUMBER	Number of physical reads
LOGICAL_READS	NUMBER	Number of logical reads
PGA_MEMORY	NUMBER	PGA size at the end of the interval
HARD_PARSES	NUMBER	Number of hard parses
SOFT_PARSES	NUMBER	Number of soft parses
PHYSICAL_READ_PCT	NUMBER	Physical read ratio
LOGICAL_READ_PCT	NUMBER	Logical read ratio
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.33 V$SESSTAT

V$SESSTAT displays user session statistics. To find the name of the statistic associated with each statistic number (STATISTIC#), query the V$STATNAME view.

Column	Datatype	Description
SID	NUMBER	Session identifier
STATISTIC#	NUMBER	Statistic number **Note:** Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.
VALUE	NUMBER	Statistic value

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "V$STATNAME" and " Statistics Descriptions"

10.34 V$SGA

V$SGA displays summary information about the system global area (SGA).

Column	Datatype	Description
NAME	VARCHAR2(20)	SGA component group
VALUE	NUMBER	Memory size (in bytes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.35 V$SGA_CURRENT_RESIZE_OPS

V$SGA_CURRENT_RESIZE_OPS displays information about SGA resize operations which are currently in progress. An operation can be a grow or a shrink of a dynamic SGA component. All sizes are expressed in bytes.

Column	Datatype	Description
COMPONENT	VARCHAR2(64)	Component name
OPER_TYPE	VARCHAR2(13)	Operation type: • STATIC • INITIALIZING • DISABLED • GROW • SHRINK • SHRINK_CANCEL

Column	Datatype	Description
OPER_MODE	VARCHAR2(9)	Operation mode: • MANUAL • DEFERRED • IMMEDIATE
PARAMETER	VARCHAR2(80)	Name of the parameter for the resize operation
INITIAL_SIZE	NUMBER	Parameter value at the start of the operation
TARGET_SIZE	NUMBER	Desired value of the parameter after the resize
CURRENT_SIZE	NUMBER	Current value of the parameter
START_TIME	DATE	Start time of the operation
LAST_UPDATE_TIME	DATE	Last time progress was made for the operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.36 V$SGA_DYNAMIC_COMPONENTS

V$SGA_DYNAMIC_COMPONENTS displays information about the dynamic SGA components. This view summarizes information based on all completed SGA resize operations since instance startup. All sizes are expressed in bytes.

Column	Datatype	Description
COMPONENT	VARCHAR2(64)	Component name
CURRENT_SIZE	NUMBER	Current size of the component
MIN_SIZE	NUMBER	Minimum size of the component since instance startup
MAX_SIZE	NUMBER	Maximum size of the component since instance startup
USER_SPECIFIED_SIZE	NUMBER	Value of the user parameter for the component
OPER_COUNT	NUMBER	Number of operations since instance startup
LAST_OPER_TYPE	VARCHAR2(13)	Last completed operation for the component: • STATIC • INITIALIZING • DISABLED • GROW • SHRINK • SHRINK_CANCEL
LAST_OPER_MODE	VARCHAR2(9)	Mode of the last completed operation: • MANUAL • DEFERRED • IMMEDIATE
LAST_OPER_TIME	DATE	Start time of the last completed operation
GRANULE_SIZE	NUMBER	Granularity of the grow or the shrink operation

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.37 V$SGA_DYNAMIC_FREE_MEMORY

V$SGA_DYNAMIC_FREE_MEMORY displays information about the amount of SGA memory available for future dynamic SGA resize operations.

Column	Datatype	Description
CURRENT_SIZE	NUMBER	Amount of available memory (in bytes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.38 V$SGA_RESIZE_OPS

V$SGA_RESIZE_OPS displays information about the last 800 completed SGA resize operations. This does not include in-progress operations. All sizes are expressed in bytes.

Column	Datatype	Description
COMPONENT	VARCHAR2(64)	Component name
OPER_TYPE	VARCHAR2(13)	Operation type: • STATIC • INITIALIZING • DISABLED • GROW • SHRINK • SHRINK_CANCEL
OPER_MODE	VARCHAR2(9)	Operation mode: • MANUAL • DEFERRED • IMMEDIATE
PARAMETER	VARCHAR2(80)	Name of the parameter for the resize operation
INITIAL_SIZE	NUMBER	Parameter value at the start of the operation
TARGET_SIZE	NUMBER	Requested value of the parameter after the resize
FINAL_SIZE	NUMBER	Real value of the parameter after the resize

Column	Datatype	Description
STATUS	VARCHAR2(9)	Completion status of the operation: • INACTIVE • PENDING • COMPLETE • CANCELLED • ERROR
START_TIME	DATE	Start time of the operation
END_TIME	DATE	End time of the operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.39 V$SGA_TARGET_ADVICE

V$SGA_TARGET_ADVICE displays information about the SGA_TARGET initialization parameter.

Column	Datatype	Description
SGA_SIZE	NUMBER	Size of the SGA
SGA_SIZE_FACTOR	NUMBER	Ratio between the SGA_SIZE and the current size of the SGA
ESTD_DB_TIME	NUMBER	Estimated DB_TIME for this SGA_SIZE
ESTD_DB_TIME_FACTOR	NUMBER	Ratio between ESTD_DB_TIME and DB_TIME for the current size of the SGA
ESTD_PHYSICAL_READS	NUMBER	Estimated number of physical reads
ESTD_BUFFER_CACHE_SIZE	NUMBER	Estimated size of the buffer cache
ESTD_SHARED_POOL_SIZE	NUMBER	Estimated size of the shared pool
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

"SGA_TARGET"

10.40 V$SGAINFO

V$SGAINFO displays size information about the SGA, including the sizes of different SGA items, the granule size, and free memory.

Column	Datatype	Description
NAME	VARCHAR2(32)	Name of the SGA size item
BYTES	NUMBER	Size of the item (in bytes)
RESIZEABLE	VARCHAR2(3)	Indicates whether the item is resizeable (Yes) or not (No)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.41 V$SGASTAT

V$SGASTAT displays detailed information on the system global area (SGA).

Column	Datatype	Description
POOL	VARCHAR2(14)	Designates the pool in which the memory in NAME resides: • in-memory pool - Memory is allocated from the In-Memory pool • java pool - Memory is allocated from the Java pool • large pool - Memory is allocated from the large pool • numa pool - Memory is allocated from the NUMA pool • shared pool - Memory is allocated from the shared pool • streams pool - Memory is allocated from the Streams pool
NAME	VARCHAR2(26)	SGA component name
BYTES	NUMBER	Memory size (in bytes)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.42 V$SHARD_ACK_RECEIVER

V$SHARD_ACK_RECEIVER displays information about ACK receiver processes.

Column	Datatype	Description
SID	NUMBER	Session identifier of the ACK receiver process
SERIAL#	NUMBER	Session serial number of the ACK receiver process
RU_ID	NUMBER	Replication unit (RU) identifier
STARTUP_TIME	DATE	ACK receiver start time
STATE	VARCHAR2(27)	State of the ACK receiver: • ACTIVE • INITIALIZING • POSTING USER TRANSACTION • WAITING FOR ACK FROM SENDER • WAITING FOR EOS FROM SENDER
STATE_CHANGED_TIME	DATE	Time at which the ACK receiver state last changed
ACK_SENDER_PEER_ID	NUMBER	ACK sender's database identifier of the follower
TOTAL_ACKS_RECEIVED	NUMBER	Total number of ACKs received
ACK_RECEIVED_TIME	DATE	Time at which ACK was last received
LAST_ACK_LOG_INDEX_RECEIVED	NUMBER	Last received ACK log index
SPID	VARCHAR2(12)	OS process identifier
LCR_CREATE_TIME	DATE	Commit LCR creation time
DB_ID	NUMBER	Database identifier
IO_SYNC_READ_TIME	NUMBER	Time spent on synchronous reads on Raft logs (in microseconds)
IO_ASYNC_CNT_LK_AHD_READS	NUMBER	Number of asynchronous reads on Raft logs
IO_CNT_BLK_ASYNC_READ	NUMBER	Number of times blocking was required while waiting for asynchronous look-ahead reads
IO_TIME_BLK_ASYNC_READ	NUMBER	Time spent waiting for asynchronous look-ahead reads (in microseconds)
IO_ASYNC_BLOCKS_READ	NUMBER	Total number of file blocks read asynchronously
IO_ASYNC_CACHE_HITS	NUMBER	Number of file blocks used from the look-ahead buffer
IO_BSRCH_SYNC_RDS	NUMBER	Number of times binary search was invoked to find a specific LCR
IO_CNT_CACHE_INVALID	NUMBER	Number of look-ahead read blocks that were stale
IO_BLKS_REQUIRED	NUMBER	Number of look-ahead blocks that were required
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

Note:

This view is available starting with Oracle Database 23ai.

10.43 V$SHARD_ACK_SENDER

V$SHARD_ACK_SENDER displays information about ACK sender processes.

Column	Datatype	Description
SID	NUMBER	Session identifier of the ACK sender process
SERIAL#	NUMBER	Session serial number of the ACK sender process
RU_ID	NUMBER	Replication unit (RU) identifier
STARTUP_TIME	DATE	ACK sender start time
STATE	VARCHAR2(25)	State of the ACK sender: • ACTIVE • CONNECTING TO LEADER • INITIALIZING • SENDING ACK • WAITING FOR LCR PERSISTER
STATE_CHANGED_TIME	DATE	Time at which the ACK sender state last changed
LEADER_ID	NUMBER	Database identifier of the leader of the RU
TOTAL_ACKS_SENT	NUMBER	Total number of ACKs sent
ACK_TIME	DATE	Time at which ACK was last sent
LAST_ACK_LOG_INDEX_SENT	NUMBER	Last sent ACK log index
SPID	VARCHAR2(12)	OS process identifier
DB_ID	NUMBER	Database identifier
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.44 V$SHARD_APPLY_COORDINATOR

V$SHARD_APPLY_COORDINATOR displays information about apply coordinator processes.

Column	Datatype	Description
SID	NUMBER	Session identifier of the apply coordinator process
SERIAL#	NUMBER	Session serial number of the apply coordinator process

Column	Datatype	Description
STATE	VARCHAR2(21)	Apply coordinator state: • ABORTING - Stopping because of an apply error • APPLYING - Passing transactions to apply servers • IDLE - Performing no work • INITIALIZING - Initializing • SHUTTING DOWN CLEANLY - Stopping without an error
APPLY#	NUMBER	Apply process number An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
TOTAL_APPLIED	NUMBER	Number of transactions applied by the apply process since the apply process was last started
TOTAL_WAIT_DEPS	NUMBER	Number of times, since the apply process was last started, that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction, because of a dependency between the transactions
TOTAL_WAIT_COMMITS	NUMBER	Number of times, since the apply process was last started, that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits
TOTAL_ADMIN	NUMBER	Number of administrative jobs issued since the apply process was last started
TOTAL_ASSIGNED	NUMBER	Number of transactions assigned to apply servers since the apply process was last started
TOTAL_RECEIVED	NUMBER	Number of transactions received by the coordinator process since the apply process was last started
TOTAL_IGNORED	NUMBER	Number of transactions that were received by the coordinator, but were ignored because they had been previously applied
TOTAL_ROLLBACKS	NUMBER	Number of transactions that were rolled back due to unexpected contention
TOTAL_ERRORS	NUMBER	Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started
UNASSIGNED_COMPLETE_TXNS	NUMBER	Number of unassigned complete transactions
AUTO_TXN_BUFFER_SIZE	NUMBER	Auto-tuned transaction buffer size
LWM_TIME	DATE	Time at which the LCR with the lowest log index was recorded The creation time of the LCR with the lowest LCR log index was also recorded at this time.
LWM_LCR_LOG_INDEX	NUMBER	LCRs with a commit log index less than or equal to this number have definitely been applied, but some LCRs with a higher commit log index also may have been applied.
LWM_LCR_CREATE_TIME	DATE	Time at which the LCR corresponding to the low watermark was created
HWM_TIME	DATE	Time at which the LCR with the highest log index was recorded The creation time of the LCR with the highest LCR log index was also recorded at this time.
HWM_LCR_LOG_INDEX	NUMBER	No LCR with a commit log index greater than this LCR log index has been applied
HWM_LCR_CREATE_TIME	DATE	Time at which the LCR corresponding to the high watermark was created
STARTUP_TIME	DATE	Apply coordinator process start time

Column	Datatype	Description
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) spent scheduling transactions since the apply process was last started
ELAPSED_IDLE_TIME	NUMBER	Elapsed idle time (in hundredths of a second) since the apply process was last started
PROCESSED_LCR_LOG_INDEX	NUMBER	LCR log index currently processed by the apply coordinator
ACTIVE_SERVER_COUNT	NUMBER	Number of active servers
RU_ID	NUMBER	Replication unit (RU) identifier
DB_ID	NUMBER	Database identifier
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.45 V$SHARD_APPLY_LCR_READER

V$SHARD_APPLY_LCR_READER displays information about apply LCR reader processes.

Column	Datatype	Description
SID	NUMBER	Session identifier of the apply LCR reader process
SERIAL#	NUMBER	Session serial number of the apply LCR reader process
APPLY#	NUMBER	Apply process number An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process group
STATE	VARCHAR2(36)	State of the apply LCR reader: • DEQUEUING LCR • ENQUEUING LCR • GENERATING HASH VALUES • IDLE • INITIALIZING • READ ON DISK LCRS • WAITING ON EMPTY INBOUND QUEUE • WAITING ON FULL INBOUND QUEUE
TOTAL_LCRS_DEQUEUED	NUMBER	Total number of LCRs read
DEQUEUE_TIME	DATE	Last read LCR time
DEQUEUED_LCR_LOG_INDEX	NUMBER	Last read LCR log index

Column	Datatype	Description
DEQUEUED_LCR_CREATE_TIME	DATE	Last read LCR create time
RU_ID	NUMBER	Replication unit (RU) identifier
DB_ID	NUMBER	Database identifier
TOTAL_ON_DISK_LCRS_READ	NUMBER	Number of LCRs read from disk
LAST_ON_DISK_LCR_LOG_INDEX	NUMBER	Last LCR log index read from disk
STARTUP_TIME	DATE	Apply LCR reader start time
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.46 V$SHARD_APPLY_READER

V$SHARD_APPLY_READER displays information about apply reader processes.

Column	Datatype	Description
SID	NUMBER	Session identifier of the apply reader process
SERIAL#	NUMBER	Session serial number of the apply reader process
APPLY#	NUMBER	Apply process number An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
STATE	VARCHAR2(36)	State of the apply reader: • DEQUEUE LCRS • IDLE • INITIALIZING • PAUSED – WAITING FOR DDL TO COMPLETE • SCHEDULE TRANSACTIONS • SPILLING
TOTAL_LCRS_DEQUEUED	NUMBER	Total number of LCRs read
TOTAL_LCRS_SPILLED	NUMBER	Total number of LCRs spilled
DEQUEUE_TIME	DATE	Last read LCR time
DEQUEUED_LCR_LOG_INDEX	NUMBER	Last read LCR log index
DEQUEUED_LCR_CREATE_TIME	DATE	Last read LCR create time

Column	Datatype	Description
SGA_USED	NUMBER	Amount of SGA memory (in bytes) used by the apply process since it was last started
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) while dequeuing the last LCR
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) spent scheduling transactions since the apply process was last started
ELAPSED_SPILL_TIME	NUMBER	Time elapsed (in hundredths of a second) while spilling LCRs
LAST_BROWSE_LOG_INDEX	NUMBER	Last browsed LCR log index
OLDEST_LOG_INDEX	NUMBER	Oldest log index
OLDEST_XIDUSN	NUMBER	Transaction ID undo segment number of the oldest transaction
OLDEST_XIDSLT	NUMBER	Transaction ID slot number of the oldest transaction
OLDEST_XIDSQN	NUMBER	Transaction ID sequence number of the oldest transaction
SPILL_LWM_LOG_INDEX	NUMBER	Spill low-watermark log index
OLDEST_TRANSACTION_ID	VARCHAR2(128)	Oldest transaction ID
TOTAL_LCRS_WITH_DEP	NUMBER	Number of LCRs with row-level dependencies since the apply process last started
TOTAL_LCRS_WITH_WMDEP	NUMBER	Number of LCRs with watermark dependencies since the apply process last started A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.
TOTAL_IN_MEMORY_LCRS	NUMBER	Total number of LCRs currently in memory
SGA_ALLOCATED	NUMBER	Total amount of shared memory (in bytes) allocated from the SGA for the apply process since the apply process last started
RU_ID	NUMBER	Replication unit (RU) identifier
DB_ID	NUMBER	Database identifier
TOTAL_ON_DISK_LCRS_READ	NUMBER	Number of LCRs read from disk
LAST_ON_DISK_LCR_LOG_INDEX	NUMBER	Last LCR log index read from disk
STARTUP_TIME	DATE	Apply reader process start time
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

Note:

This view is available starting with Oracle Database 23ai.

10.47 V$SHARD_APPLY_SERVER

V$SHARD_APPLY_SERVER displays information about apply server components.

Column	Datatype	Description
SID	NUMBER	Session identifier of the apply server component
SERIAL#	NUMBER	Session serial number of the apply server component
APPLY#	NUMBER	Apply process number An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
SERVER_ID	NUMBER	Parallel execution server number of the apply server
STATE	VARCHAR2(20)	State of the apply server: • ADD PARTITION • DROP PARTITION • EXECUTE TRANSACTION • GET TRANSACTIONS • IDLE • INACTIVE • INITIALIZING • POLL SHUTDOWN • RECORD LOW-WATERMARK • REQUEST UA SESSION • ROLLBACK TRANSACTIONS • SPILL • TRANSACTION CLEANUP • WAIT COMMIT • WAIT DEPENDENCY • WAIT FOR CLIENT • WAIT FOR NEXT CHUNK • WAIT POST COMMIT
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction currently being applied
XIDSLT	NUMBER	Transaction ID slot number of the transaction currently being applied
XIDSQN	NUMBER	Transaction ID undo sequence number of the transaction currently being applied
COMMIT_LOG_INDEX	NUMBER	Commit log index of the transaction currently being applied
DEP_XIDUSN	NUMBER	Transaction ID undo segment number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSLT	NUMBER	Transaction ID slot number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSQN	NUMBER	Transaction ID sequence number of a transaction on which the transaction being applied by this apply server depends
DEP_COMMIT_LOG_INDEX	NUMBER	Commit log index of the transaction on which this apply server depends
CURRENT_LOG_INDEX	NUMBER	Current LCR log index being applied by the apply server. This value is reset to 1 at the beginning of each transaction.
TOTAL_ASSIGNED	NUMBER	Number of transactions assigned to the apply server since the apply process was last started

Column	Datatype	Description
TOTAL_ADMIN	NUMBER	Number of administrative jobs performed by the apply server since the apply process was last started. See the STATE information in this view for the types of administrative jobs.
TOTAL_ROLLBACKS	NUMBER	Number of transactions assigned to this server that were rolled back
TOTAL_LCRS_APPLIED	NUMBER	Total number of LCRs applied by this apply server since the apply process was last started
APPLY_TIME	DATE	Time the last LCR was applied
APPLIED_LCR_LOG_INDEX	NUMBER	Last applied LCR log index
APPLIED_LCR_CREATE_TIME	DATE	Last applied LCR create time
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) while dequeuing LCRs
ELAPSED_APPLY_TIME	NUMBER	Time elapsed (in hundredths of a second) applying LCRs since the apply process was last started
TRANSACTION_ID	VARCHAR2(128)	ID of the transaction that the worker process is applying
TOTAL_LCRS_RETRIED	NUMBER	Total number of LCRs retried by this server
LCR_RETRY_ITERATION	NUMBER	Retry iteration for this transaction by this server
TOTAL_TXNS_RETRIED	NUMBER	Total number of LCRs retried by this server
TXN_RETRY_ITERATION	NUMBER	Retry iteration for this transaction by this server
TOTAL_TXNS_RECORDED	NUMBER	Total transactions recorded in error queue by this server
RU_ID	NUMBER	Replication unit (RU) identifier
DB_ID	NUMBER	Database identifier
STARTUP_TIME	DATE	Apply server process start time
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.48 V$SHARD_LCR_LOGS

V$SHARD_LCR_LOGS displays information about LCR logs.

Column	Datatype	Description
INST_ID	NUMBER	Instance ID
RU_ID	NUMBER	Replication unit (RU) ID
NAME	VARCHAR2(257)	Name and path of the log file

Column	Datatype	Description
SIZE_GB	NUMBER	Size of the log file (in gigabytes)
ROTD_IDX	NUMBER	Rotated index
CURR_FILE	VARCHAR2(1)	Indicates whether the file is current (Y) or not (N)
STIDX_HIGH	NUMBER	High 4 bytes of the starting log index in the log file
STIDX_LOW	NUMBER	Low 4 bytes of the starting log index in the log file
ENDIDX_HIGH	NUMBER	High 4 bytes of the ending log index in the log file
ENDIDX_LOW	NUMBER	Low 4 bytes of the ending logindex in the log file
START_SEC	NUMBER	Time when this log file was first written to, measured in seconds from the epoch
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.49 V$SHARD_LCR_PERSISTER

V$SHARD_LCR_PERSISTER displays information about LCR persister processes.

This view displays one row for each LCR persister for a replication unit (RU).

Column	Datatype	Description
SID	NUMBER	Session identifier of the LCR persister process
SERIAL#	NUMBER	Session serial number of the LCR persister process
RU_ID	NUMBER	Replication unit (RU) identifier
STARTUP_TIME	DATE	LCR persister process start time
STATE	VARCHAR2(30)	State of the LCR persister: • ACTIVE • INITIALIZING • READING FROM IO • WAITING FOR BUFFERS TO PERSIST • WAITING ON EMPTY QUEUE • WRITING TO IO
STATE_CHANGED_TIME	DATE	Time at which the LCR persister state last changed
PERSISTED_LOG_INDEX	NUMBER	Last persisted LCR log index
PERSISTED_TIMESTAMP	DATE	Timestamp of the last persisted LCR

Column	Datatype	Description
IOBUF_INIT_US	NUMBER	Write buffer initialization time (in microseconds)
LEAD_IO_ISSUED_COUNT	NUMBER	Number of times I/O was issued on the leader
LEAD_IO_ISSUED_US	NUMBER	Time spent (in microseconds) during I/O on the leader
LEAD_IO_ISSUED_BLKS	NUMBER	Number of blocks written on the leader
LEAD_IO_FETCHED_COUNT	NUMBER	Number of times LCR persister issued fetch on the leader
LEAD_IO_FETCHED_US	NUMBER	Time (in microseconds) to fetch blocks
LEAD_IO_FETCHED_SUCCESS	NUMBER	Number of times the LCR persister actually fetched
LEAD_IO_BLOCKED_COUNT	NUMBER	Number of times I/O blocked on the leader
LEAD_IO_BLOCKED_US	NUMBER	Time (in microseconds) spent while the I/O was blocked
LEAD_IO_COMMITS_COUNT	NUMBER	Number of times commit processed on the leader
FOLL_IO_ISSUED_COUNT	NUMBER	Number of times I/O was issued on the follower
FOLL_IO_ISSUED_US	NUMBER	Time spent during I/O on the follower (in microseconds)
FOLL_IO_ISSUED_BLKS	NUMBER	Number of blocks written on the follower
FOLL_IO_COMMITS_COUNT	NUMBER	Number of times commit processed on the follower
SPID	VARCHAR2(12)	OS process identifier
DB_ID	NUMBER	Database identifier
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.50 V$SHARD_LCR_PRODUCER

V$SHARD_LCR_PRODUCER displays information about LCR producer processes.

Column	Datatype	Description
SID	NUMBER	Session identifier of the LCR producer process
SERIAL#	NUMBER	Session serial number of the LCR producer process
RU_ID	NUMBER	Replication unit (RU) identifier
STARTUP_TIME	DATE	LCR producer process start time

Column	Datatype	Description
STATE	VARCHAR2(33)	State of the LCR producer: • ACTIVE • BROWSING LCR • DEQUEUING LCR • ENQUEUING LCR • INITIALIZING • WAITING FOR MEMORY • WAITING ON EMPTY INBOUND QUEUE • WAITING ON SUBSCRIBERS TO DEQUEUE
STATE_CHANGED_TIME	DATE	Time at which the LCR producer state last changed
OUTBOUND_QUEUE_SIZE	NUMBER	Outbound queue size
TOTAL_AVAILABLE_LCRS_IN_OUTBOUND_QUEUE	NUMBER	Total number of LCRs available in the outbound queue
NEXT_LOG_INDEX	NUMBER	Next LCR log index
TOTAL_LCRS_DEQUEUED	NUMBER	Total number of LCRs dequeued from the foreground queue
LAST_DEQUEUED_LCR_LOG_INDEX	NUMBER	Last dequeued LCR log index
TOTAL_LCRS_ENQUEUED	NUMBER	Total number of LCRs enqueued into the outbound queue
LAST_ENQUEUED_TIME	DATE	Last LCR enqueued time
LAST_ENQUEUED_LCR_TIME	DATE	Creation time of the last LCR enqueued
LAST_ENQUEUED_LCR_LOG_INDEX	NUMBER	Last enqueued LCR log index
SPID	VARCHAR2(12)	OS process identifier
DB_ID	NUMBER	Database identifier
FLWCTRL_PEERS	VARCHAR2(64)	Flow control state
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**

10.51 V$SHARD_NETWORK_RECEIVER

V$SHARD_NETWORK_RECEIVER displays information about network receiver processes.

Column	Datatype	Description
SID	NUMBER	Session identifier of the network receiver process
SERIAL#	NUMBER	Session serial number of the network receiver process
APPLY_NAME	VARCHAR2(128)	Name of the apply process
STARTUP_TIME	DATE	Network receiver start time
RU_ID	NUMBER	Replication unit (RU) identifier
SPILL_LWM	NUMBER	Highest log index of LCRs that an apply has persisted to its spilled tables
LAST_RECEIVED_LOG_INDEX	NUMBER	Log index of the last received LCR
TOTAL_LCRS_RECEIVED	NUMBER	Total number of LCRs received
TOTAL_AVAILABLE_LCRS	NUMBER	Total number of LCRs available in knlbm
STATE	VARCHAR2(38)	State of the network receiver: • Enqueueing LCRs • Initializing • Receiving LCRs • Sending unapplied txns • Waiting for apply error to be resolved • Waiting for apply to be unsuspended • Waiting for apply to dequeue • Waiting for flush request to complete • Waiting for memory • Waiting for message from peer
SPID	VARCHAR2(12)	OS process identifier
LAST_RECEIVED_LCR_TIME	DATE	Time last LCR was received
LAST_RECEIVED_LCR_CREATE_TIME	DATE	Creation time of last received LCR
REMOTE_PEER_ID	NUMBER	Database ID of the leader of this RU
TOTAL_SKIPPED_ENQUEUE_LCRS	NUMBER	Total number of LCRs skipped for enqueueing to apply queue
LAST_SKIPPED_ENQUEUE_LCR_LOG_INDEX	NUMBER	LCR log index of the last skipped enqueue to the apply queue
DB_ID	NUMBER	Database identifier
TOTAL_BYTES_RECEIVED	NUMBER	Total number of bytes received
IO_SYNC_READ_TIME	NUMBER	Time spent on synchronous reads on Raft logs (in microseconds)
IO_ASYNC_CNT_LK_AHD_READS	NUMBER	Number of asynchronous reads on Raft logs
IO_CNT_BLK_ASYNC_READ	NUMBER	Number of times blocking was required while waiting for asynchronous look-ahead reads
IO_TIME_BLK_ASYNC_READ	NUMBER	Time spent waiting for asynchronous look-ahead reads (in microseconds)
IO_ASYNC_BLOCKS_READ	NUMBER	Total number of file blocks read asynchronously
IO_ASYNC_CACHE_HITS	NUMBER	Number of file blocks used from the look-ahead buffer
IO_BSRCH_SYNC_RDS	NUMBER	Number of times binary search was invoked to find a specific LCR
IO_CNT_CACHE_INVALID	NUMBER	Number of look-ahead read blocks that were stale
IO_BLKS_REQUIRED	NUMBER	Number of look-ahead blocks that were required

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.52 V$SHARD_NETWORK_SENDER

V$SHARD_NETWORK_SENDER displays information about network sender processes.

Column	Datatype	Description
SID	NUMBER	Session identifier of the network sender process
SERIAL#	NUMBER	Session serial number of the network sender process
RU_ID	NUMBER	Replication unit (RU) identifier
REMOTE_PEER_ID	NUMBER	Remote follower's database identifier of this RU
STARTUP_TIME	DATE	Network sender process start time
STATE	VARCHAR2(22)	State of the network sender: • ACTIVE • BROWSING LCR • CONNECTING TO FOLLOWER • DEQUEUING LCR SENDING LCR • INITIALIZING • WAITING ON EMPTY QUEUE
STATE_CHANGED_TIME	DATE	Time at which the network sender state last changed
TOTAL_LCRS_SENT	NUMBER	Number of LCRs sent
BROWSED_TIME	DATE	Last browsed LCR time
LAST_BROWSED_LCR_LOG_INDEX	NUMBER	Last browsed LCR log index
SEND_TIME	DATE	Time at which last LCR was sent
LAST_SENT_LCR_LOG_INDEX	NUMBER	Last sent LCR log index
LAST_SENT_LCR_TIME	DATE	Creation time of the last sent LCR
ELAPSED_PROPAGATION_TIME	NUMBER	Amount of time taken to propogate LCRs (in what unit of time?)
AVAILABLE_LCRS	NUMBER	Number of LCRs available in outbound queue
SPID	VARCHAR2(12)	OS process identifier
CONNECT_ERROR_COUNT	NUMBER	Number of network sender connection errors

Column	Datatype	Description
DB_ID	NUMBER	Database identifier
TOTAL_BYTES_SENT	NUMBER	Total number of bytes sent
IO_SYNC_READ_TIME	NUMBER	Time spent on synchronous reads on Raft logs (in microseconds)
IO_ASYNC_CNT_LK_AHD_READS	NUMBER	Number of asynchronous reads on Raft logs
IO_CNT_BLK_ASYNC_REA	NUMBER	Number of times blocking was required while waiting for asynchronous look-ahead reads
IO_TIME_BLK_ASYNC_READ	NUMBER	Time spent waiting for asynchronous look-ahead reads (in microseconds)
IO_ASYNC_BLOCKS_READ	NUMBER	Total number of file blocks read asynchronously
IO_ASYNC_CACHE_HITS	NUMBER	Number of file blocks used from the look-ahead buffer
IO_BSRCH_SYNC_RDS	NUMBER	Number of times binary search was invoked to find a specific LCR
IO_CNT_CACHE_INVALID	NUMBER	Number of look-ahead read blocks that were stale
IO_BLKS_REQUIRED	NUMBER	Number of look-ahead blocks that were required
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.53 V$SHARD_REPLICATION_UNIT

V$SHARD_REPLICATION_UNIT displays information about replication units (RUs) that are present in a shard.

This view displays one row for each RU.

Column	Datatype	Description
SHARD_ID	NUMBER	Shard database identifier
RU_ID	NUMBER	Replication unit (RU) identifier
LEADER_ID	NUMBER	Leader's SHARD_ID for the corresponding RU
ROLE	NUMBER	Role of the shard for the RU: • 1 - The shard is the leader • 2 - The shard is the follower • 3 - The shard is a candidate for leader election
TERM	NUMBER	Term number This value is incremented each time a new leader is elected.

Column	Datatype	Description
COMMITIDX	NUMBER	LCRs with a log index of COMMITIDX or lower have consensus
OLDAPPIDX	NUMBER	Oldest log index that an apply process group may need
APPLYLWMIDX	NUMBER	Position of apply low watermark on the follower
ONDISKIDX	NUMBER	Persisted log index
FLAGS	NUMBER	State of the shard with respect to the RU: • 0x00000001 - PRE-SHUTDOWN • 0x00000002 - IN MOVE • 0x00000004 - IN COPY • 0x00000008 - LEADER NOT RECOVERED • 0x00000010 - OPEN LEADER • 0x00000020 - ELECTION REQUEST • 0x00000040 - AFTER VOTE • 0x00000080 - DRAIN KNLBM LEADER TO FOLLOWER When a shard becomes follower, the knlb buffer should be drained. • 0x00000100 - BARRIER DDL SUSPEND • 0x00000200 - BARRIER DDL RESUME • 0x00000400 - RESUME NOTIFICATION • 0x00000800 - RU LOADED • 0x00001000 - SUSPEND APPLY KNLB ENQ • 0x00002000 - NETWORK RECEIVER RAISED • 0x00004000 - ERROR CHECK HINT Set by foreground using DBMS_APPLY_ADM.DELETE_ALL_ERRORS. When this flag is set, the network receiver can immediately check the number of apply errors without waiting for a timeout. • 0x00008000 - SUSPEND CHECK HINT Set by foreground using DBMS_APPLY_ADM.DELETE_ALL_ERRORS. When this flag is set, the network receiver can immediately check the apply suspend status without waiting for a timeout. • 0x00010000 - ERRORS When this flag is set, the RU has active errors. The flag will be unset upon successful recovery. • 0x00020000 - GP AUTO RESTART • 0x00040000 - FOLLOWER CATCHUP • 0x00100000 - DELETE LOG STOP ENQ • 0x00200000 - OPTIMISE APPLY STOP DELETE LOG TAIL
ROLE_CHANGED_TIME	TIMESTAMP(6)	Time at which the role for the RU in the shard last changed
RECOVERY_TIME	TIMESTAMP(6)	Amount of time taken for recovery
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.54 V$SHARED_POOL_ADVICE

V$SHARED_POOL_ADVICE displays information about estimated parse time in the shared pool for different pool sizes. The sizes range from 10% of the current shared pool size or the amount of pinned library cache memory (whichever is higher) to 200% of the current shared pool size, in equal intervals. The value of the interval depends on the current size of the shared pool.

Column	Datatype	Description
SHARED_POOL_SIZE_FOR_ESTIMATE	NUMBER	Shared pool size for the estimate (in megabytes)
SHARED_POOL_SIZE_FACTOR	NUMBER	Size factor with respect to the current shared pool size
ESTD_LC_SIZE	NUMBER	Estimated memory in use by the library cache (in megabytes)
ESTD_LC_MEMORY_OBJECTS	NUMBER	Estimated number of library cache memory objects in the shared pool of the specified size
ESTD_LC_TIME_SAVED	NUMBER	Estimated elapsed parse time saved (in seconds), owing to library cache memory objects being found in a shared pool of the specified size. This is the time that would have been spent in reloading the required objects in the shared pool had they been aged out due to insufficient amount of available free memory.
ESTD_LC_TIME_SAVED_FACTOR	NUMBER	Estimated parse time saved factor with respect to the current shared pool size
ESTD_LC_LOAD_TIME	NUMBER	Estimated elapsed time (in seconds) for parsing in a shared pool of the specified size
ESTD_LC_LOAD_TIME_FACTOR	NUMBER	Estimated load time factor with respect to the current shared pool size
ESTD_LC_MEMORY_OBJECT_HITS	NUMBER	Estimated number of times a library cache memory object was found in a shared pool of the specified size
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.55 V$SHARED_POOL_LRU_EFFORT

V$SHARED_POOL_LRU_EFFORT displays information about shared pool LRU scans.

This view allows you to determine the amount of time spent scanning the shared pool LRU in an effort to free up space.

Column	Datatype	Description
DSIDX	NUMBER	Shared pool subpool to which this data pertains

Column	Datatype	Description
SECONDS_AGO	NUMBER	Number of seconds that have elapsed since this scan row was performed
MS_SPENT	NUMBER	Number of milliseconds spent performing the scan
REQUEST_SIZE	NUMBER	Size of the memory request
REQ_COMMENT	VARCHAR2(20)	Comment for the chunk being requested
BYTES_FREED	NUMBER	Number of bytes freed to satisfy this request
OBJECTS_FREED	NUMBER	Number of objects evicted to satisfy this request
RETURN_ZERO	NUMBER	Number of times an eviction request was rejected
RETURN_ZERO_COMMENT	VARCHAR2(20)	Comment for the first RETURN_ZERO object
LATCH_SKIPPED	NUMBER	Number of times an object was skipped because of an incompatible latch
TIMESTAMP	NUMBER	Time at which the scan was performed
SID	NUMBER	ID of the session that requested the scan
REPORT_TIME	NUMBER	Time at which the report was run You can compare to this column to the TIMESTAMP column.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.56 V$SHARED_POOL_RESERVED

V$SHARED_POOL_RESERVED displays statistics that help you tune the reserved pool and space within the shared pool.

Column	Datatype	Description
FREE_SPACE	NUMBER	Total amount of free space on the reserved list in bytes[1]
AVG_FREE_SIZE	NUMBER	Average size of the free memory on the reserved list in bytes[1]
FREE_COUNT	NUMBER	Number of free pieces of memory on the reserved list[1]
MAX_FREE_SIZE	NUMBER	Size of the largest free piece of memory on the reserved list in bytes[1]
USED_SPACE	NUMBER	Total amount of used memory on the reserved list in bytes[1]
AVG_USED_SIZE	NUMBER	Average size of the used memory on the reserved list in bytes[1]
USED_COUNT	NUMBER	Number of used pieces of memory on the reserved list[1]
MAX_USED_SIZE	NUMBER	Size of the largest used piece of memory on the reserved list in bytes[1]

Column	Datatype	Description
REQUESTS	NUMBER	Number of times that the reserved list was searched for a free piece of memory[1]
REQUEST_MISSES	NUMBER	Number of times the reserved list did not have a free piece of memory to satisfy the request, and started flushing objects from the LRU list[1]
LAST_MISS_SIZE	NUMBER	Request size of the last request miss in bytes, when the reserved list did not have a free piece of memory to satisfy the request and started flushing objects from the LRU list[1]
MAX_MISS_SIZE	NUMBER	Request size of the largest request miss in bytes, when the reserved list did not have a free piece of memory to satisfy the request and started flushing objects from the LRU list[1]
REQUEST_FAILURES	NUMBER	Number of times that no memory was found to satisfy a request. If an internal flush (used to free up memory) does not meet a memory need, then the error ORA-04031 occurs.[2]
LAST_FAILURE_SIZE	NUMBER	Request size of the last failed request in bytes. If an internal flush (used to free up memory) does not meet a memory need, then the error ORA-04031 occurs.[2]
ABORTED_REQUEST_THRESHOLD	NUMBER	Minimum size of a request in bytes which signals an ORA-04031 error without flushing objects[2]
ABORTED_REQUESTS	NUMBER	Number of requests that signalled an ORA-04031 error without flushing objects[2]
LAST_ABORTED_SIZE	NUMBER	Last size of the request in bytes that returned an ORA-04031 error without flushing objects from the LRU list[2]
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

1 These columns are valid only if the initialization parameter SHARED_POOL_RESERVED_SIZE is set to a valid value.

2 These columns contain values which are valid even if SHARED_POOL_RESERVED_SIZE is not set.

10.57 V$SHARED_SERVER

V$SHARED_SERVER displays information on the shared server processes.

Column	Datatype	Description
NAME	VARCHAR2(4)	Name of the server
PADDR	RAW(4 | 8)	Server's process address

Column	Datatype	Description
STATUS	VARCHAR2(16)	Server status: • EXEC - Executing SQL • WAIT (ENQ) - Waiting for a lock • WAIT (SEND) - Waiting to send data to user • WAIT (COMMON) - Idle; waiting for a user request • WAIT (RECEIVE) - Waiting for records to be shown in the client application • WAIT (RESET) - Waiting for a circuit to reset after a break • QUIT - Terminating
MESSAGES	NUMBER	Number of messages processed
BYTES	NUMBER	Total number of bytes in all messages
BREAKS	NUMBER	Number of breaks
CIRCUIT	RAW(4 | 8)	Address of the circuit currently being serviced
IDLE	NUMBER	Total idle time (in hundredths of a second)
BUSY	NUMBER	Total busy time (in hundredths of a second)
IN_NET	NUMBER	Total incoming network wait time (in hundredths of a second)
OUT_NET	NUMBER	Total outgoing network wait time (in hundredths of a second)
REQUESTS	NUMBER	Total number of requests taken from the common queue in this server's lifetime
BOUND_TIME	NUMBER	Time that a circuit and shared server have been bound (in centiseconds)
BOUND_REASON	VARCHAR2(32)	Provides a reason (a short explanation) for why a shared server and circuit could not be unbound. This column is empty when a circuit is not bound to a server. When the server starts serving a circuit, BOUND_REASON is empty and remains empty unless the server tries unsuccessfully to unbind the circuit (after it finishes serving the current request). When this column is not empty, it will be cleared once the server and circuit are unbound (that is, once the resources preventing the session migration to another shared server are released).
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.58 V$SHARED_SERVER_MONITOR

V$SHARED_SERVER_MONITOR displays information for tuning the shared server.

Column	Datatype	Description
MAXIMUM_CONNECTIONS	NUMBER	Highest number of virtual circuits in use at one time since the instance started. If this value reaches the value set for the CIRCUITS initialization parameter, then consider raising the value of CIRCUITS. **See Also:** "CIRCUITS"
MAXIMUM_SESSIONS	NUMBER	Highest number of shared server sessions in use at one time since the instance started. If this reaches the value set for the SHARED_SERVER_SESSIONS initialization parameter, then consider raising the value of SHARED_SERVER_SESSIONS. **See Also:** "SHARED_SERVER_SESSIONS"
SERVERS_STARTED	NUMBER	Total number of shared servers started since the instance started (but not including those started during startup)
SERVERS_TERMINATED	NUMBER	Total number of shared servers stopped by Oracle since the instance started
SERVERS_HIGHWATER	NUMBER	Highest number of servers running at one time since the instance started. If this value reaches the value set for the MAX_SHARED_SERVERS initialization parameter, then consider raising the value of SHARED_SERVERS. **See Also:** "SHARED_SERVERS"
DISPATCHERS_CPU	NUMBER	Total CPU time of all dispatchers since the instance started (in millionths of a second)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.59 V$SHARED_SERVER_STAT

V$SHARED_SERVER_STAT displays statistics for all shared server processes. The statistics are cumulative from the start of the instance.

Column	Datatype	Description
MESSAGES	NUMBER	Number of messages processed
BYTES	NUMBER	Total number of bytes in all messages
IDLE	NUMBER	Total idle time (in hundredths of a second)
BUSY	NUMBER	Total busy time (in hundredths of a second)
IN_NET	NUMBER	Total incoming network wait time (in hundredths of a second)
OUT_NET	NUMBER	Total outgoing network wait time (in hundredths of a second)
REQUESTS	NUMBER	Total number of requests taken from the common queue

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.60 V$SORT_SEGMENT

V$SORT_SEGMENT displays information about every sort segment in a given instance. The view is only updated when the tablespace is of the TEMPORARY type.

Column	Datatype	Description
TABLESPACE_NAME	VARCHAR2(30)	Name of the tablespace
SEGMENT_FILE	NUMBER	File number of the first extent
SEGMENT_BLOCK	NUMBER	Block number of the first extent
EXTENT_SIZE	NUMBER	Extent size
CURRENT_USERS	NUMBER	Number of active users of the segment
TOTAL_EXTENTS	NUMBER	Total number of extents in the segment
TOTAL_BLOCKS	NUMBER	Total number of blocks in the segment
USED_EXTENTS	NUMBER	Extents allocated to active sorts
USED_BLOCKS	NUMBER	Blocks allocated to active sorts
FREE_EXTENTS	NUMBER	Extents not allocated to any sort
FREE_BLOCKS	NUMBER	Blocks not allocated to any sort
ADDED_EXTENTS	NUMBER	Number of extent allocations
EXTENT_HITS	NUMBER	Number of times an unused extent was found in the pool
FREED_EXTENTS	NUMBER	Number of deallocated extents
FREE_REQUESTS	NUMBER	Number of requests to deallocate
MAX_SIZE	NUMBER	Maximum number of extents ever used
MAX_BLOCKS	NUMBER	Maximum number of blocks ever used
MAX_USED_SIZE	NUMBER	Maximum number of extents used by all sorts
MAX_USED_BLOCKS	NUMBER	Maximum number of blocks used by all sorts
MAX_SORT_SIZE	NUMBER	Maximum number of extents used by an individual sort
MAX_SORT_BLOCKS	NUMBER	Maximum number of blocks used by an individual sort
RELATIVE_FNO	NUMBER	Relative file number of the sort segment header
TS#	NUMBER	Tablespace number

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
IS_LOCAL_TEMP	NUMBER	Indicates whether the sort segment is allocated from a local temporary tablespace (1) or not (0).

10.61 V$SPPARAMETER

V$SPPARAMETER displays information about the contents of the server parameter file. If a server parameter file was not used to start the instance, then each row of the view will contain FALSE in the ISSPECIFIED column.

Column	Datatype	Description
FAMILY	VARCHAR2(80)	For internal use only
SID	VARCHAR2(80)	SID for which the parameter is defined.
NAME	VARCHAR2(80)	Name of the parameter
TYPE	VARCHAR2(11)	Parameter type
VALUE	VARCHAR2(255)	Parameter value (null if a server parameter file was not used to start the instance)
DISPLAY_VALUE	VARCHAR2(255)	Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.
ISSPECIFIED	VARCHAR2(6)	Indicates whether the parameter was specified in the server parameter file (TRUE) or not (FALSE)
ORDINAL	NUMBER	Position (ordinal number) of the parameter value (0 if a server parameter file was not used to start the instance). Useful only for parameters whose values are lists of strings.
UPDATE_COMMENT	VARCHAR2(255)	Comments associated with the most recent update (null if a server parameter file was not used to start the instance)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.62 V$SQL

V$SQL lists statistics on shared SQL areas without the GROUP BY clause and contains one row for each child of the original SQL text entered. Statistics displayed in V$SQL are normally updated at the end of query execution. However, for long running queries, they are updated

every 5 seconds. This makes it easy to see the impact of long running SQL statements while they are still in progress.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	First thousand characters of the SQL text for the current cursor
SQL_FULLTEXT	CLOB	Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the V$SQLTEXT dynamic performance view.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
SHARABLE_MEM	NUMBER	Amount of shared memory used by the child cursor (in bytes)
PERSISTENT_MEM	NUMBER	Fixed amount of memory used for the lifetime of the child cursor (in bytes)
RUNTIME_MEM	NUMBER	Fixed amount of memory required during the execution of the child cursor
SORTS	NUMBER	Number of sorts that were done for the child cursor
LOADED_VERSIONS	NUMBER	Indicates whether the context heap is loaded (1) or not (0)
OPEN_VERSIONS	NUMBER	Indicates whether the child cursor is locked (1) or not (0)
USERS_OPENING	NUMBER	Number of users that have any of the child cursors open
FETCHES	NUMBER	Number of fetches associated with the SQL statement
EXECUTIONS	NUMBER	Number of executions that took place on this object since it was brought into the library cache
PX_SERVERS_EXECUTIONS	NUMBER	Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)
END_OF_FETCH_COUNT	NUMBER	Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column.
USERS_EXECUTING	NUMBER	Number of users executing the statement
LOADS	NUMBER	Number of times the object was either loaded or reloaded
FIRST_LOAD_TIME	VARCHAR2(19)	Timestamp of the parent creation time
INVALIDATIONS	NUMBER	Number of times this child cursor has been invalidated
PARSE_CALLS	NUMBER	Number of parse calls for this child cursor
DISK_READS	NUMBER	Number of disk reads for this child cursor
DIRECT_WRITES	NUMBER	Number of direct writes for this child cursor
DIRECT_READS	NUMBER	Number of direct reads for this child cursor
BUFFER_GETS	NUMBER	Number of buffer gets for this child cursor
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds)
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds)
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds)
USER_IO_WAIT_TIME	NUMBER	User I/O Wait Time (in microseconds)
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds)
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds)
ROWS_PROCESSED	NUMBER	Total number of rows the parsed SQL statement returns

Column	Datatype	Description
COMMAND_TYPE	NUMBER	Oracle command type definition
OPTIMIZER_MODE	VARCHAR2(10)	Mode under which the SQL statement was executed
OPTIMIZER_COST	NUMBER	Cost of this query given by the optimizer
OPTIMIZER_ENV	RAW(2000)	Optimizer environment
OPTIMIZER_ENV_HASH_VALUE	NUMBER	Hash value for the optimizer environment
PARSING_USER_ID	NUMBER	User ID of the user who originally built this child cursor
PARSING_SCHEMA_ID	NUMBER	Schema ID that was used to originally build this child cursor
PARSING_SCHEMA_NAME	VARCHAR2(128)	Schema name that was used to originally build this child cursor
KEPT_VERSIONS	NUMBER	Indicates whether this child cursor has been marked to be kept pinned in the cache using the DBMS_SHARED_POOL package
ADDRESS	RAW(4 | 8)	Address of the handle to the parent for this cursor
TYPE_CHK_HEAP	RAW(4 | 8)	Descriptor of the type check heap for this child cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
OLD_HASH_VALUE	NUMBER	Old SQL hash value
PLAN_HASH_VALUE	NUMBER	Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).
FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
CHILD_NUMBER	NUMBER	Number of this child cursor
SERVICE	VARCHAR2(64)	Service name
SERVICE_HASH	NUMBER	Hash value for the name listed in the SERVICE column
MODULE	VARCHAR2(64)	Contains the name of the module that was executing when the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_MODULE
MODULE_HASH	NUMBER	Hash value of the module listed in the MODULE column
ACTION	VARCHAR2(64)	Contains the name of the action that was executing when the SQL statement was first parsed, which is set by calling DBMS_APPLICATION_INFO.SET_ACTION
ACTION_HASH	NUMBER	Hash value of the action listed in the ACTION column
SERIALIZABLE_ABORTS	NUMBER	Number of times the transaction failed to serialize, producing ORA-08177 errors, per cursor
OUTLINE_CATEGORY	VARCHAR2(64)	If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise the column is left blank.
CPU_TIME	NUMBER	CPU time (in microseconds) used by this cursor for parsing, executing, and fetching

Column	Datatype	Description
ELAPSED_TIME	NUMBER	Elapsed database time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then ELAPSED_TIME is the cumulative time for the query coordinator, plus all parallel query worker processes. Note that this column displays database time, not wall clock time. In some cases, ELAPSED_TIME can exceed the duration of the query. For example, this can occur for parallel queries.
OUTLINE_SID	NUMBER	Outline session identifier
CHILD_ADDRESS	RAW(4 | 8)	Address of the child cursor
SQLTYPE	NUMBER	Denotes the version of the SQL language used for this statement
REMOTE	VARCHAR2(1)	Indicates whether the cursor is remote mapped (Y) or not (N)
OBJECT_STATUS	VARCHAR2(19)	Status of the cursor: • VALID - Valid, authorized without errors • VALID_AUTH_ERROR - Valid, authorized with authorization errors • VALID_COMPILE_ERROR - Valid, authorized with compilation errors • VALID_UNAUTH - Valid, unauthorized • INVALID_UNAUTH - Invalid, unauthorized • INVALID - Invalid, unauthorized but keep the timestamp
LITERAL_HASH_VALUE	NUMBER	Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when CURSOR_SHARING is used. This is not the hash value for the SQL statement. If CURSOR_SHARING is not used, then the value is 0.
LAST_LOAD_TIME	VARCHAR2(19)	Time at which the query plan was loaded into the library cache
IS_OBSOLETE	VARCHAR2(1)	Indicates whether the cursor has become obsolete (Y) or not (N). This can happen if the number of child cursors is too large.
IS_BIND_SENSITIVE	VARCHAR2(1)	Indicates whether the cursor is bind sensitive (Y) or not (N). A query is considered bind-sensitive if the optimizer peeked at one of its bind variable values when computing predicate selectivities and where a change in a bind variable value may cause the optimizer to generate a different plan.
IS_BIND_AWARE	VARCHAR2(1)	Indicates whether the cursor is bind aware (Y) or not (N). A query is considered bind-aware if it has been marked to use extended cursor sharing. The query would already have been marked as bind-sensitive.
IS_SHAREABLE	VARCHAR2(1)	Indicates whether the cursor can be shared (Y) or not (N)
CHILD_LATCH	NUMBER	Child latch number that is protecting the cursor. This column is obsolete and maintained for backward compatibility.
SQL_PROFILE	VARCHAR2(64)	SQL profile used for this statement, if any
SQL_PATCH	VARCHAR2(128)	SQL patch used for this statement, if any
SQL_PLAN_BASELINE	VARCHAR2(128)	SQL plan baseline used for this statement, if any
PROGRAM_ID	NUMBER	Program identifier
PROGRAM_LINE#	NUMBER	Program line number
EXACT_MATCHING_SIGNATURE	NUMBER	Signature calculated on the normalized SQL text. The normalization includes the removal of white space and the uppercasing of all non-literal strings.
FORCE_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to FORCE
LAST_ACTIVE_TIME	DATE	Time at which the query plan was last active
BIND_DATA	RAW(2000)	Bind data

Column	Datatype	Description
TYPECHECK_MEM	NUMBER	Typecheck memory
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system **See Also:** Oracle Exadata Storage Server Software documentation for more information
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
OPTIMIZED_PHY_READ_REQUESTS	NUMBER	Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL
LOCKED_TOTAL	NUMBER	Total number of times the child cursor has been locked
PINNED_TOTAL	NUMBER	Total number of times the child cursor has been pinned
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells **See Also:** Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_RETURNED_BYTES	NUMBER	Number of filtered bytes returned by Exadata cells (that is, the number of bytes returned after processing has been offloaded on the Exadata cells) **See Also:** Oracle Exadata Storage Server Software documentation for more information
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • `0`: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • `1`: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
IS_REOPTIMIZABLE	VARCHAR2(1)	This column shows whether the next execution matching this child cursor will trigger a reoptimization. The values are: • `Y`: If the next execution will trigger a reoptimization • `R`: If the child cursor contains reoptimization information, but will not trigger reoptimization because the cursor was compiled in reporting mode • `N`: If the child cursor has no reoptimization information
IS_RESOLVED_ADAPTIVE_PLAN	VARCHAR2(1)	This column shows whether all of the adaptive parts of a plan have been resolved to the final plan. Once the plan is resolved, the plan hash value and the plan displayed by `DBMS_XPLAN` will not change through the end of execution. The values for this column are: • `NULL`: If the plan is not adaptive • `Y`: If the plan is fully resolved • `N`: If the plan is not yet fully resolved **See Also:** *Oracle Database PL/SQL Packages and Types Reference* for more information about the `DBMS_XPLAN` package
IM_SCANS	NUMBER	Number of In-Memory Column Store (IM column store) segment scans

Column	Datatype	Description
IM_SCAN_BYTES_UNCOMPRESSED	NUMBER	Uncompressed size of data scanned from the IM column store
IM_SCAN_BYTES_INMEMORY	NUMBER	In-memory size of data scanned from the IM column store
DDL_NO_INVALIDATE	VARCHAR2(1)	Indicates if a DDL statement updated a dependent object and did not invalidate this cursor. The values are: • N: There has not been a DDL statement that updated a dependent object without invalidating this cursor. • Y: A DDL statement updated a dependent object and did not invalidate this cursor, but the cursor has not executed since this happened. • X: A DDL statement updated a dependent object and did not invalidate this cursor, and the cursor has executed since this happened.
IS_ROLLING_INVALID	VARCHAR2(1)	Indicates if this cursor is rolling invalidated. The values are: • N: This cursor is not rolling invalidated. • Y: This cursor is rolling invalidated, but the cursor has not executed in this state. • X: This cursor is rolling invalidated, and the cursor has executed in this state.
IS_ROLLING_REFRESH_INVALID	VARCHAR2(1)	Indicates if this cursor is rolling invalidated and requires execution time refresh. The values are: • N: This cursor is not a cursor that is rolling invalidated and requires execution time refresh. • Y: This cursor is rolling invalidated and requires execution time refresh, but the cursor has not executed in this state. • X: This cursor is rolling invalidated and requires execution time refresh, and the cursor has executed in this state.
RESULT_CACHE	VARCHAR2(1)	Indicates whether the SQL statement used the result cache (Y) or not (N)
SQL_QUARANTINE	VARCHAR2(128)	If the execution plan for this cursor is quarantined, then this column contains the name of the SQL quarantine configuration (corresponds to the NAME column in the DBA_SQL_QUARANTINE view). Otherwise, this column is null.
AVOIDED_EXECUTIONS	NUMBER	Number of times this cursor was prevented from being used due to the plan being quarantined
HEAP0_LOAD_TIME	DATE	Time at which heap0 of the library cache object was loaded
HEAP6_LOAD_TIME	DATE	Time at which heap6 of the library cache object was loaded A time difference of more than one minute between HEAP0_LOAD_TIME and HEAP6_LOAD_TIME indicates that heap6 has been partially reloaded. For example, the database might have aged out heap6 due to shared pool space pressure and reloaded it at a later time.
RESULT_CACHE_REJECTION_REASON	NUMBER	Numeric code representing the reason for a result cache rejection This column is populated when the query contains a result cache row source (RESULT_CACHE=Y), but fails to create or finish writing a result object. The reason for this failure is recorded as a numeric code in this column. See Block Listing Reasons for a list of rejection codes and recommended remedial actions. If the query does not contain a result cache row source (RESULT_CACHE=N) or the query reused an existing result, then the value of this column is null.

Block Listing Reasons

Table 10-2 Result Cache Rejection Reason Codes

Code	Reason for Result Cache Rejection	Recommended Remedial Action
0	Success	N/A
1000	Result size exceeds per-result limit for in-memory	Increase the value of one or both of the RESULT_CACHE_MAX_SIZE and RESULT_CACHE_MAX_RESULT initialization parameters, or enable spilling results to disk.
1001	Result size exceeds per-result limit on disk	Increase the value of one or both of the RESULT_CACHE_MAX_TEMP_SIZE and RESULT_CACHE_MAX_TEMP_RESULT initialization parameters.
2000	Unable to acquire enqueues	The system is busy; try again later.
2001	Unable to acquire a DML locks on a referenced object	The system is busy; try again later.
2002	Unable to acquire a row cache lock on referenced objects	The system is busy; try again later.
2003	Unable to allocate memory	The system is busy; try again later.
3000	Result cache ID for the query is blocklisted	Remove the cache ID from the blocklist by using the DBMS_RESULT_CACHE package. Exercise caution because the query may have been intentionally blocklisted.
3001	An object referenced in the query is blocklisted	Remove the object ID from the blocklist by using the DBMS_RESULT_CACHE package. Exercise caution because the object may have been intentionally blocklisted.
4001	Result cache is bypassed	The result cache was bypassed with DBMS_RESULT_CACHE.BYPASS or by setting the RESULT_CACHE_MAX_SIZE initialization parameter to 0. Exercise caution because the bypass may have been intentional.
4002	Result cache is corrupt	Reset the result cache by using DBMS_RESULT_CACHE.FLUSH. If that does not resolve the problem, then restart the PDB or instance.
4003	RCBG process is down in Oracle RAC	Restart the Oracle RAC instance
4004	The query was only partially executed	The cursor should be fully executed. If the cursor is being executed as part of PL/SQL, then it should be fetched from until the NO_DATA_FOUND error is returned. If the cursor is being executed as part of a SQL query, then do not cancel it by terminating the process (such as typing CTRL+C).
4005	Temporary space cannot be allocated because the RCBG process is down	Restart the Oracle RAC instance
9999	Unknown reason	Unknown

10.63 V$SQL_BIND_CAPTURE

V$SQL_BIND_CAPTURE displays information on bind variables used by SQL cursors. Each row in the view contains information for one bind variable defined in a cursor. This includes:

- Reference to the cursor defining the bind variable

  (hash_value, address) for the parent cursor and (hash_value, child_address) for the child cursor.

- Bind metadata

  Name, position, data type, character set ID, precision, scale, and maximum length of the bind variable.

- Bind data

  One of the bind values used for the bind variable during a past execution of its associated SQL statement. Bind values are not always captured for this view. Bind values are displayed by this view only when the type of the bind variable is simple (this excludes LONG, LOB, and ADT data types) and when the bind variable is used in the WHERE or HAVING clauses of the SQL statement.

Bind capture is disabled when the STATISTICS_LEVEL initialization parameter is set to BASIC. This view can be joined with V$SQLAREA on (HASH_VALUE, ADDRESS) and with V$SQL on (HASH_VALUE, CHILD_ADDRESS).

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Address of the parent cursor
HASH_VALUE	NUMBER	Hash value of the parent cursor in the library cache. The hash value is a fixed index for the view and should always be used to speed up access to the view.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
CHILD_ADDRESS	RAW(4 | 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Child cursor number
NAME	VARCHAR2(128)	Name of the bind variable

Column	Datatype	Description
POSITION	NUMBER	Position of the bind variable in the SQL statement
DUP_POSITION	NUMBER	If the binding is performed by name and the bind variable is duplicated, then this column gives the position of the primary bind variable.
DATATYPE	NUMBER	Internal identifier for the bind data type. Beginning in Oracle Database 12*c*, a number representing a PL/SQL data type can appear in this column.
DATATYPE_STRING	VARCHAR2(15)	Textual representation of the bind data type. Beginning in Oracle Database 12*c*, a text representation of a PL/SQL-only data type can appear in this column. If the actual data type is a PL/SQL sub type, the name of the data type, not the sub type will be displayed.
CHARACTER_SID	NUMBER	National character set identifier
PRECISION	NUMBER	Precision (for numeric binds)
SCALE	NUMBER	Scale (for numeric binds)
MAX_LENGTH	NUMBER	Maximum bind length
WAS_CAPTURED	VARCHAR2(3)	Indicates whether the bind value was captured (YES) or not (NO)
LAST_CAPTURED	DATE	Date when the bind value was captured. Bind values are captured when SQL statements are executed. To limit the overhead, binds are captured at most every 15 minutes for a given cursor.
VALUE_STRING	VARCHAR2(4000)	Value of the bind represented as a string
VALUE_ANYDATA	ANYDATA	Value of the bind represented using the ANYDATA data type. This representation is useful to programmatically decode the value of the bind variable. This column is NULL if a PL/SQL-only data type appears in the DATATYPE column.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

- "V$ALL_SQL_BIND_CAPTURE"

10.64 V$SQL_BIND_DATA

V$SQL_BIND_DATA describes information related to bind variables.

V$SQL_BIND_DATA describes, for each distinct bind variable in each cursor owned by the session querying this view:

- Actual bind data, if the bind variable is user defined
- The underlying literal, if the `CURSOR_SHARING` parameter is set to `FORCE` and the bind variable is system generated. (System-generated binds have a value of `256` in the `SHARED_FLAG2` column.)

Column	Datatype	Description
CURSOR_NUM	NUMBER	Cursor number for this bind
POSITION	NUMBER	Bind position
DATATYPE	NUMBER	Internal identifier for the bind data type. Beginning in Oracle Database 12*c*, a number representing a PL/SQL data type can appear in this column.
SHARED_MAX_LEN	NUMBER	Shared maximum length for this bind from the shared cursor object associated with this bind
PRIVATE_MAX_LEN	NUMBER	Private maximum length for this bind sent from the client
ARRAY_SIZE	NUMBER	Maximum number of array elements (for array binds only)
PRECISION	NUMBER	Precision (for numeric binds)
SCALE	NUMBER	Scale (for numeric binds)
SHARED_FLAG	NUMBER	Shared bind data flags
SHARED_FLAG2	NUMBER	Shared bind data flags (continued)
BUF_ADDRESS	RAW(4 | 8)	Bind buffer memory address
BUF_LENGTH	NUMBER	Bind buffer length
VAL_LENGTH	NUMBER	Actual bind value length
BUF_FLAG	NUMBER	Bind buffer flags
INDICATOR	NUMBER	Bind indicator
VALUE	VARCHAR2(4000)	Contents of the bind buffer
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • `0`: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • `1`: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "CURSOR_SHARING"

10.65 V$SQL_BIND_METADATA

`V$SQL_BIND_METADATA` describes metadata related to bind variables.

`V$SQL_BIND_METADATA` describes, for each distinct bind variable in each cursor owned by the session querying this view:

- Bind metadata provided by the client, if the bind variable is user defined

- Metadata based on the underlying literal, if the `CURSOR_SHARING` parameter is set to `FORCE` and the bind variable is system-generated.

Column	Datatype	Description
`ADDRESS`	`RAW(4 | 8)`	Memory address of the child cursor that owns this bind variable
`POSITION`	`NUMBER`	Bind position
`DATATYPE`	`NUMBER`	Internal identifier for the bind data type. Beginning in Oracle Database 12*c*, a number representing a PL/SQL data type can appear in this column.
`MAX_LENGTH`	`NUMBER`	Maximum length of the bind value
`ARRAY_LEN`	`NUMBER`	Maximum number of array elements (for array binds only)
`BIND_NAME`	`VARCHAR2(128)`	User-defined or system-generated bind variable name (if used)
`CON_ID`	`NUMBER`	The ID of the container to which the data pertains. Possible values include: • `0`: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • `1`: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "CURSOR_SHARING"

10.66 V$SQL_CS_HISTOGRAM

`V$SQL_CS_HISTOGRAM` summarizes the monitoring information stored by adaptive cursor sharing. This information is used to decide whether to enable extended cursor sharing for a query. It is stored in a histogram, whose bucket's contents are exposed by this view.

Column	Datatype	Description
`ADDRESS`	`RAW(4 | 8)`	Address of the handle to the parent for this cursor
`HASH_VALUE`	`NUMBER`	Hash value of the parent statement in the library cache
`SQL_ID`	`VARCHAR2(13)`	SQL identifier of the parent cursor in the library cache
`CHILD_NUMBER`	`NUMBER`	Number of the child cursor being monitored
`BUCKET_ID`	`NUMBER`	Bucket number of the monitoring histogram
`COUNT`	`NUMBER`	Value in this bucket of the histogram
`CON_ID`	`NUMBER`	The ID of the container to which the data pertains. Possible values include: • `0`: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • `1`: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.67 V$SQL_CS_SELECTIVITY

V$SQL_CS_SELECTIVITY exposes the valid selectivity ranges for a child cursor in extended cursor sharing mode. A valid range consists of a low and high value for each predicate containing binds. Each predicate's selectivity (with the current bind value) must fall between the corresponding low and high values in order for the child cursor to be shared.

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
CHILD_NUMBER	NUMBER	Number of the child cursor
PREDICATE	VARCHAR2(40)	Predicate whose selectivity must fall between low and high values
RANGE_ID	NUMBER	Identifier for the range used to match up the low and high values for multiple predicates
LOW	VARCHAR2(10)	Lower bound for allowable selectivity
HIGH	VARCHAR2(10)	Upper bound for allowable selectivity
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.68 V$SQL_CS_STATISTICS

V$SQL_CS_STATISTICS contains the raw execution statistics used by the monitoring component of adaptive cursor sharing. A sample of the executions is monitored. This view exposes which executions were sampled, and what the statistics were for those executions. The statistics are cumulative for each distinct set of bind values.

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
CHILD_NUMBER	NUMBER	Number of the child cursor being monitored
BIND_SET_HASH_VALUE	NUMBER	Hash of the values of the binds
PEEKED	VARCHAR2(1)	Indicates if this is the bind set used to build the cursor (Y) or not (N)
EXECUTIONS	NUMBER	Number of times this bind set has been executed and monitored
ROWS_PROCESSED	NUMBER	Cumulative number of rows processed by all row sources in the plan over all monitored executions with this bind set
BUFFER_GETS	NUMBER	Cumulative number of buffer gets over all monitored executions with this bind set

Column	Datatype	Description
CPU_TIME	NUMBER	Cumulative CPU time (in microseconds) used by this cursor for monitored executions with this bind set
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.69 V$SQL_CURSOR

V$SQL_CURSOR displays debugging information for each cursor associated with the session querying this view.

Column	Datatype	Description
CURNO	NUMBER	Cursor number
FLAG	NUMBER	Flags set in the cursor
STATUS	VARCHAR2(9)	Status of the cursor; that is, what state the cursor is in
PARENT_HANDLE	RAW(4 | 8)	Pointer to the parent cursor handle
PARENT_LOCK	RAW(4 | 8)	Pointer to the parent cursor lock
CHILD_LOCK	RAW(4 | 8)	Pointer to the child cursor lock
CHILD_PIN	RAW(4 | 8)	Pointer to the child cursor pin
PERS_HEAP_MEM	NUMBER	Total amount of memory allocated from persistent heap for this cursor
WORK_HEAP_MEM	NUMBER	Total amount of memory allocated from the work heap for this cursor
BIND_VARS	NUMBER	Total number of bind positions in the query currently parsed into this cursor
DEFINE_VARS	NUMBER	Total number of define variables in the query currently parsed into this cursor
BIND_MEM_LOC	VARCHAR2(64)	Which memory heap the bind variables are stored in: either the UGA or the CGA
INST_FLAG	VARCHAR2(64)	Instantiation object flags
INST_FLAG2	VARCHAR2(64)	Instantiation object flags (continued)
CHILD_HANDLE	RAW(4 | 8)	Pointer to the child cursor handle
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.70 V$SQL_HISTORY

V$SQL_HISTORY displays SQL statements tracked by SQL history monitoring.

This view is populated only when the SQL_HISTORY_ENABLED initialization parameter is set to true.

Column	Datatype	Description
KEY	NUMBER	Artificial key to efficiently read a specific SQL history data entry For internal use only.
SQL_ID	VARCHAR2(13)	SQL identifier of the SQL statement
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) for the SQL statement
CPU_TIME	NUMBER	CPU time (in microseconds) for the SQL statement
BUFFER_GETS	NUMBER	Number of buffer get operations for the SQL statement
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system for the SQL statement
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the SQL statement
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disk by the SQL statement
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the SQL statement
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disk by the SQL statement
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds) for the SQL statement
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds) for the SQL statement
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds) for the SQL statement
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds) for the SQL statement
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds) for the SQL statement
USER_IO_WAIT_TIME	NUMBER	User I/O Wait Time (in microseconds) for the SQL statement
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells for the SQL statement **See Also:** Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes that can be filtered by the Exadata storage system for the SQL statement **See Also:** Oracle Exadata Storage Server Software documentation for more information
SQL_TEXT	VARCHAR2(100)	Up to the first 100 characters of the text of the SQL statement
PLAN_HASH_VALUE	NUMBER	SQL plan hash value
SQL_EXEC_ID	NUMBER	SQL execution identifier
SQL_EXEC_START	DATE	Time at which the SQL statement execution started
LAST_ACTIVE_TIME	DATE	Time at which the SQL statement execution was last active
SESSION_USER#	NUMBER	Unique ID number for the session user who issued the SQL statement
CURRENT_USER#	NUMBER	Unique number identifying the current user
CHILD_NUMBER	NUMBER	Child number of the SQL statement
SID	NUMBER	Session ID for the SQL statement's session
SESSION_SERIAL#	NUMBER	Session serial number for the SQL statement's session

Column	Datatype	Description
MODULE_HASH	NUMBER	Hash value for the module name corresponding to the executing session
ACTION_HASH	NUMBER	Hash value for the action name corresponding to the executing session
SERVICE_HASH	NUMBER	Hash value for the service name corresponding to the executing session
IS_FULL_SQLTEXT	VARCHAR2(1)	Indicates whether the SQL_TEXT column displays the entire SQL text (Y) or not (N)
ERROR_SIGNALLED	VARCHAR2(1)	Indicates whether the SQL statement generated an error (Y) or not (N)
ERROR_NUMBER	NUMBER	If the SQL statement failed to execute, the error number (for example, 932 for error ORA-00932)
ERROR_FACILITY	VARCHAR2(4)	If the SQL statement failed to execute, the error facility (for example, ORA for error ORA-00932)
STATEMENT_TYPE	VARCHAR2(5)	Type of SQL statement: • DDL • DML • PLSQL • QUERY • OTHER
IS_PARALLEL	VARCHAR2(1)	Indicates whether the SQL ran as a parallel execution (Y) or not (N)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

> **See Also:**
>
> "SQL_HISTORY_ENABLED"

10.71 V$SQL_JOIN_FILTER

V$SQL_JOIN_FILTER displays performance information about the characteristics of join filters when they are used for a parallel cursor. (A join filter is a bitmap filter applied to table rows before a join operation in order to avoid parallel communication.)

Column	Datatype	Description
QC_SESSION_ID	NUMBER	QC (Query Coordinator) session ID of the given cursor for the given parallel query
QC_INSTANCE_ID	NUMBER	QC (Query Coordinator) instance ID of the given cursor for the given parallel query
SQL_PLAN_HASH_VALUE	NUMBER	SQL plan hash value of the given cursor for the given parallel query
FILTER_ID	NUMBER	An ID that identifies the join filter in the given cursor and corresponds to the filter ID in the execution plan
LENGTH	NUMBER	Total size of the join filter field
BITS_SET	NUMBER	Number of bits set in this filter
FILTERED	NUMBER	Number of rows seen by the join filter
PROBED	NUMBER	Number of rows of the right table that have been tested against the bitmap filter. This is the sum of the filtered rows plus the non-filtered rows.
ACTIVE	NUMBER	Whether the filter is active (Yes) or not (No)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.72 V$SQL_MONITOR

V$SQL_MONITOR displays SQL statements whose execution have been (or are being) monitored by Oracle.

This view contains global, high-level information about simple and composite database operations.

Oracle Database monitors simple database operations, which are top SQL statements and PL/SQL subprograms, when any of the following conditions is true:

- The operations run in parallel.
- The operations have consumed at least 5 seconds of CPU or I/O time in a single execution.
- Tracking for the operations is forced by the /*+ MONITOR */ hint.

For simple database operations, monitoring statistics are not cumulative over several executions. In this case, one entry in V$SQL_MONITOR is dedicated to a single execution of a SQL statement. If the database monitors two executions of the same SQL statement, then each execution has a separate entry in V$SQL_MONITOR.

For simple database operations, V$SQL_MONITOR has one entry for the parallel execution coordinator process and one entry for each parallel execution server process. Each entry has corresponding entries in V$SQL_PLAN_MONITOR. Because the processes allocated for the parallel execution of a SQL statement are cooperating for the same execution, these entries share the same execution key (the combination of SQL_ID, SQL_EXEC_START, and SQL_EXEC_ID).

Oracle Database monitors composite database operations when either of the following conditions is true:

- A database operation was started with `DBMS_SQL_MONITOR.BEGIN_OPERATION` and the operation has consumed at least 5 seconds of CPU or I/O time.
- Tracking for the operation is forced by setting `FORCE_TRACKING` to `Y` in `DBMS_SQL_MONITOR.BEGIN_OPERATION`.

For composite database operations, each row contains an operation whose statistics are accumulated over the SQL statements and PL/SQL subprograms that run in the same session as part of the operation.

The `V$SQL_MONITOR` view contains a subset of the statistics available in `V$SQL`. However, unlike `V$SQL`, monitoring statistics are not cumulative over several executions. Instead, one entry in `V$SQL_MONITOR` is dedicated to a single execution of a SQL statement. If the database monitors two executions of the same SQL statement, then each execution has a separate entry in `V$SQL_MONITOR`.

The primary key is the combination of the columns `SQL_ID`, `SQL_EXEC_START`, and `SQL_EXEC_ID`.

`V$SQL_MONITOR` has one entry for the parallel execution coordinator process, and one entry for each parallel execution server process. Each entry has corresponding entries in `V$SQL_PLAN_MONITOR`. Because the processes allocated for the parallel execution of a SQL statement are cooperating for the same execution, these entries share the same execution key (the composite `SQL_ID`, `SQL_EXEC_START`, and `SQL_EXEC_ID`). You can aggregate the execution key to determine the overall statistics for a parallel execution.

When the SQL statement being monitored is executing, statistics in `V$SQL_MONITOR` are generally refreshed in near real time, once every second. Once the execution ends, monitoring information is not deleted immediately. Instead, it is kept in `V$SQL_MONITOR` for at least one minute. The entry will eventually be deleted to reclaim its space as new statements are monitored.

Column	Datatype	Description
KEY	NUMBER	Artificial join key to efficiently join `V$SQL_MONITOR` with its corresponding plan level monitoring statistics stored in `V$SQL_PLAN_MONITOR`
REPORT_ID	NUMBER	Unique ID of the XML report stored in Automatic Workload Repository (AWR) for this monitored entity
STATUS	VARCHAR2(19)	SQL execution status: • `QUEUED` - SQL statement is queued • `EXECUTING` - SQL statement is still executing • `DONE (ERROR)` - Execution terminated with an error • `DONE (FIRST N ROWS)` - Execution terminated by the application before all rows were fetched • `DONE (ALL ROWS)` - Execution terminated and all rows were fetched • `DONE` - Execution terminated (parallel execution)
USER#	NUMBER	User ID of the database user who issued the SQL being monitored
USERNAME	VARCHAR2(128)	User name of the database user who issued the SQL being monitored
MODULE	VARCHAR2(64)	Name of the executing module when sampled, as set by the `DBMS_APPLICATION_INFO.SET_MODULE` procedure
ACTION	VARCHAR2(64)	Name of the executing action when sampled, as set by the `DBMS_APPLICATION_INFO.SET_ACTION` procedure
SERVICE_NAME	VARCHAR2(64)	Service name of the user session

Column	Datatype	Description
CLIENT_IDENTIFIER	VARCHAR2(64)	Client identifier from the user session
CLIENT_INFO	VARCHAR2(64)	Client information for the user session
PROGRAM	VARCHAR2(84)	Name of the operating system program that issued the monitored SQL
PLSQL_ENTRY_OBJECT_ID	NUMBER	Object ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack
PLSQL_ENTRY_SUBPROGRAM_ID	NUMBER	Subprogram ID of the top-most PL/SQL subprogram on the stack; NULL if there is no PL/SQL subprogram on the stack
PLSQL_OBJECT_ID	NUMBER	Object ID of the currently executing PL/SQL subprogram; NULL if executing SQL
PLSQL_SUBPROGRAM_ID	NUMBER	Subprogram ID of the currently executing PL/SQL object; NULL if executing SQL
FIRST_REFRESH_TIME	DATE	Time when monitoring of the SQL statement started, generally a few seconds after execution start time
LAST_REFRESH_TIME	DATE	Time when statistics in V$SQL_MONITOR were last updated for the SQL statement. Statistics are generally refreshed every second when the statement executes.
REFRESH_COUNT	NUMBER	Number of times V$SQL_MONITOR statistics have been refreshed (generally once every second when the SQL statement executes)
DBOP_EXEC_ID	NUMBER	Database operation execution identifier for the current execution. If the type is SQL, the DBOP_EXEC_ID will be NULL.
DBOP_NAME	VARCHAR2(30)	Database operation name. If the type is SQL, the DBOP_NAME will be NULL.
SID	NUMBER	Session identifier executing (or having executed) the SQL statement being monitored
PROCESS_NAME	VARCHAR2(5)	Process name identifier executing (or having executed)the statement; ora if the process is foreground, else the background process name (for example, p001 for PX server p001)
SQL_ID	VARCHAR2(13)	SQL identifier of the statement being monitored
SQL_TEXT	VARCHAR2(2000)	Up to the first 2000 characters of the text of the SQL being monitored
IS_FULL_SQLTEXT	VARCHAR2(1)	Indicates whether the SQL_TEXT column has the entire SQL text (Y) or not (N)
SQL_EXEC_START	DATE	Time when the execution started
SQL_EXEC_ID	NUMBER	Execution identifier. Together, the three columns SQL_ID, SQL_EXEC_START, and SQL_EXEC_ID represent the execution key. The execution key is used to uniquely identify one execution of the SQL statement.
SQL_PLAN_HASH_VALUE	NUMBER	SQL plan hash value
SQL_FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one SQL_FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the SQL_FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
EXACT_MATCHING_SIGNATURE	NUMBER	Signature calculated on the normalized SQL text. The normalization includes the removal of white space and the uppercasing of all non-literal strings.
FORCE_MATCHING_SIGNATURE	NUMBER	Same as EXACT_MATCHING_SIGNATURE but literals in the SQL text are replaced by binds

Column	Datatype	Description
SQL_CHILD_ADDRESS	RAW(4 | 8)	Address of the child cursor (can be used with SQL_ID to join with V$SQL)
SESSION_SERIAL#	NUMBER	Session serial number executing the statement being monitored
PX_IS_CROSS_INSTANCE	VARCHAR2(1)	Indicates whether the SQL statement ran parallel across multiple instances (Y) or not (N)
PX_MAXDOP	NUMBER	Maximum degree of parallelism for any plan operation executed on behalf of the monitored SQL
PX_MAXDOP_INSTANCES	NUMBER	Number of database instances touched at the maximum degree of parallelism
PX_SERVERS_REQUESTED	NUMBER	Total number of parallel execution servers requested to execute the monitored SQL
PX_SERVERS_ALLOCATED	NUMBER	Actual number of parallel execution servers allocated to execute the query
PX_SERVER#	NUMBER	Logical parallel execution server process number executing (or having executed) the statement being monitored; NULL if this monitoring entry is not associated with an execution server. This is a logical number within the parallel server set (see SERVER# in V$PX_SESSION).
PX_SERVER_GROUP	NUMBER	Logical parallel execution server group number to which PX_SERVER# belongs (see SERVER_GROUP in V$PX_SESSION); NULL if this monitoring entry is not associated with a parallel execution server. This value is generally 1 unless the SQL statement has one or more parallel sub-queries.
PX_SERVER_SET	NUMBER	Number (1 or 2) of the logical set of parallel execution servers to which PX_SERVER# belongs (see SERVER_SET in V$PX_SESSION); NULL if this monitoring entry is not associated with a parallel execution server
PX_QCINST_ID	NUMBER	Instance identifier where the parallel execution coordinator runs; NULL if PX_SERVER# is NULL
PX_QCSID	NUMBER	Session identifier for the parallel execution coordinator; NULL if PX_SERVER# is NULL
ERROR_NUMBER	VARCHAR2(40)	Error number encountered in case a SQL fails to execute successfully (for example, 932 in case of ORA-00932)
ERROR_FACILITY	VARCHAR2(4)	Error facility in case a SQL fails to execute successfully (for example, ORA in case of ORA-00932)
ERROR_MESSAGE	VARCHAR2(256)	Detailed error message displayed corresponding to the error number and error facility when a SQL fails to execute successfully
BINDS_XML	CLOB	Information about bind variables used with the SQL, such as name, position, value, data type, and so on (stored in XML format)

Column	Datatype	Description
OTHER_XML	CLOB	Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML, which allows multiple pieces of information to be stored, including the following: • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan • Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds); updated as the statement executes
QUEUING_TIME	NUMBER	Duration of time (in microseconds) spent by SQL in the statement queue
CPU_TIME	NUMBER	CPU time (in microseconds); updated as the statement executes
FETCHES	NUMBER	Number of fetches associated with the SQL statement; updated as the statement executes
BUFFER_GETS	NUMBER	Number of buffer get operations; updated as the statement executes
DISK_READS	NUMBER	Number of disk reads; updated as the statement executes
DIRECT_WRITES	NUMBER	Number of direct writes; updated as the statement executes
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds); updated as the statement executes
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds); updated as the statement executes
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds); updated as the statement executes
USER_IO_WAIT_TIME	NUMBER	User I/O Wait Time (in microseconds); updated as the statement executes
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds); updated as the statement executes
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds); updated as the statement executes

Column	Datatype	Description
RM_LAST_ACTION	VARCHAR2(48)	The most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: • CANCEL_SQL • KILL_SESSION • LOG_ONLY • SWITCH TO <CG NAME> For the last value, <CG NAME> is the name of the consumer group that the SQL operation was switched to. If the Resource Plan has since been changed then <CG NAME> is the ID of the consumer group.
RM_LAST_ACTION_REASON	VARCHAR2(128)	The reason for the most recent action that was taken on this SQL operation by Resource Manager. Its value is one of the following: • SWITCH_CPU_TIME • SWITCH_IO_REQS • SWITCH_IO_MBS • SWITCH_ELAPSED_TIME • SWITCH_IO_LOGICAL
RM_LAST_ACTION_TIME	DATE	The time of the most recent action that was taken on this SQL operation by Resource Manager
RM_CONSUMER_GROUP	VARCHAR2(128)	The current consumer group for this SQL operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
CON_NAME	VARCHAR2(128)	Container name of the object. The value of this column is NULL in non-CDBs.
ECID	VARCHAR2(64)	Execution context identifier (sent by Application Server)
IS_ADAPTIVE_PLAN	VARCHAR2(1)	Indicates whether the statistics are from an adaptive plan (Y) or not (N).
IS_FINAL_PLAN	VARCHAR2(1)	Indicates whether the statistics are from the final plan (Y) or not (N).
IN_DBOP_NAME	VARCHAR2(30)	If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the name of that DBOP
IN_DBOP_EXEC_ID	NUMBER	If the SQL that is monitored was executed by a session that was also monitored by a database operation (DBOP), then this column specifies the execution ID of that DBO
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells **See Also:** Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system **See Also:** Oracle Exadata Storage Server Software documentation for more information

Column	Datatype	Description
IO_CELL_OFFLOAD_RETURNED_BYTES	NUMBER	Number of filtered bytes returned by Exadata cells (that is, the number of bytes returned after processing has been offloaded on the Exadata cells) **See Also:** Oracle Exadata Storage Server Software documentation for more information
CURRENT_USER#	NUMBER	Unique number identifying the current user
CURRENT_USERNAME	VARCHAR2(128)	Username for the current user
PDB_REPORT_ID	NUMBER	Unique ID of the XML report of a PDB monitored entity that is stored in the CDB's Automatic Workload Repository (AWR) tables
PDB_ID	NUMBER	Container ID of the PDB
PARSING_SCHEMA#	NUMBER	Identifier of the parsing schema
PARSING_SCHEMA_NAME	VARCHAR2(128)	Name of the parsing schema

10.73 V$SQL_MONITOR_SESSTAT

V$SQL_MONITOR_SESSTAT displays information about statistics that are exposed in V$SESSTAT.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
KEY	NUMBER	Artificial join key to efficiently join with other database operation views
STATISTIC#	NUMBER	Statistic number
VALUE	NUMBER	Value associated with the statistic

> **See Also:**
>
> "V$SESSTAT"

10.74 V$SQL_MONITOR_STATNAME

V$SQL_MONITOR_STATNAME provides information about the plan line statistics exposed in V$SQL_PLAN_MONITOR. A plan line statistic is identified by its group ID (column GROUP_ID) and its ID (column ID).

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
ID	NUMBER	Plan line statistic ID
GROUP_ID	NUMBER	Plan line statistic group ID
NAME	VARCHAR2(40)	Short name for the statistic
DESCRIPTION	VARCHAR2(200)	Short description for the statistic
TYPE	NUMBER	Reserved for internal use
FLAGS	NUMBER	Reserved for internal use

> **See Also:**
>
> "V$SQL_PLAN_MONITOR"

10.75 V$SQL_OPTIMIZER_ENV

V$SQL_OPTIMIZER_ENV displays the contents of the optimizer environment used to build the execution plan of a SQL cursor. This view can be joined with V$SQLAREA on (HASH_VALUE, ADDRESS) and with V$SQL on (HASH_VALUE, CHILD_ADDRESS).

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Address of the parent cursor
HASH_VALUE	NUMBER	Hash value of the parent cursor in the library cache. The hash value is the fixed index for the view and should be used when querying V$SQL_OPTIMIZER_ENV to avoid scanning the entire library cache.
SQL_ID	VARCHAR2(13)	SQL identifier
CHILD_ADDRESS	RAW(4 | 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Child cursor number

Column	Datatype	Description
ID	NUMBER	Unique identifier of the parameter in the optimizer environment
NAME	VARCHAR2(40)	Name of the parameter
ISDEFAULT	VARCHAR2(3)	Indicates whether the parameter is set to the default value (YES) or not (NO)
VALUE	VARCHAR2(25)	Value of the parameter
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.76 V$SQL_PLAN

V$SQL_PLAN contains the execution plan information for each child cursor loaded in the library cache.

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V$SQLAREA to add the cursor-specific information.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
PLAN_HASH_VALUE	NUMBER	Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).
FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
CHILD_ADDRESS	RAW(4 | 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Number of the child cursor that uses this execution plan. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V$SQL to add the child cursor-specific information.
TIMESTAMP	DATE	Date and time when the execution plan was generated
OPERATION	VARCHAR2(30)	Name of the internal operation performed in this step (for example, TABLE ACCESS)
OPTIONS	VARCHAR2(30)	A variation on the operation described in the OPERATION column (for example, FULL)
OBJECT_NODE	VARCHAR2(40)	Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed.
OBJECT#	NUMBER	Object number of the table or the index

Column	Datatype	Description
OBJECT_OWNER	VARCHAR2(128)	Name of the user who owns the schema containing the table or index
OBJECT_NAME	VARCHAR2(128)	Name of the table or index
OBJECT_ALIAS	VARCHAR2(261)	Alias for the object
OBJECT_TYPE	VARCHAR2(20)	Type of the object
OPTIMIZER	VARCHAR2(20)	Current mode of the optimizer for the first row in the plan (statement line), for example, ALL_ROWS. When the operation is a database access (for example, TABLE ACCESS), this column indicates whether or not the object is analyzed.
ID	NUMBER	A number assigned to each step in the execution plan
PARENT_ID	NUMBER	ID of the next execution step that operates on the output of the current step
DEPTH	NUMBER	Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.
POSITION	NUMBER	Order of processing for all operations that have the same PARENT_ID
SEARCH_COLUMNS	NUMBER	Number of index columns with start and stop keys (that is, the number of columns with matching predicates)
COST	NUMBER	Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
CARDINALITY	NUMBER	Estimate, by the cost-based optimizer, of the number of rows produced by the operation
BYTES	NUMBER	Estimate, by the cost-based optimizer, of the number of bytes produced by the operation
OTHER_TAG	VARCHAR2(35)	Describes the contents of the OTHER column. See EXPLAIN PLAN for values.
PARTITION_START	VARCHAR2(64)	Start partition of a range of accessed partitions
PARTITION_STOP	VARCHAR2(64)	Stop partition of a range of accessed partitions
PARTITION_ID	NUMBER	Step that computes the pair of values of the PARTITION_START and PARTITION_STOP columns
OTHER	VARCHAR2(4000)	Other information specific to the execution step that users may find useful. See EXPLAIN PLAN for values.
DISTRIBUTION	VARCHAR2(20)	Stores the method used to distribute rows from producer query servers to consumer query servers
CPU_COST	NUMBER	CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
IO_COST	NUMBER	I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
TEMP_SPACE	NUMBER	Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
ACCESS_PREDICATES	VARCHAR2(4000)	Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.
FILTER_PREDICATES	VARCHAR2(4000)	Predicates used to filter rows before producing them

Column	Datatype	Description
PROJECTION	VARCHAR2(4000)	Expressions produced by the operation
TIME	NUMBER	Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
QBLOCK_NAME	VARCHAR2(128)	Name of the query block
REMARKS	VARCHAR2(4000)	Remarks
OTHER_XML	CLOB	Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML, which allows multiple pieces of information to be stored, including the following: • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan • Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.77 V$SQL_PLAN_MONITOR

V$SQL_PLAN_MONITOR displays plan level monitoring statistics for each SQL statement found in V$SQL_MONITOR. Each row in V$SQL_PLAN_MONITOR corresponds to an operation of the execution plan being monitored. As with V$SQL_MONITOR, statistics exposed in V$SQL_PLAN_MONITOR are generally updated every second when the statement executes. These statistics are recycled on the same basis as V$SQL_MONITOR.

To eliminate the overhead of SQL plan monitoring, statistics collected for each operation of the plan do not record timing information such as elapsed time, CPU time, or I/O time. Instead, this timing information can be estimated quite accurately by joining V$SQL_PLAN_MONITOR with V$ACTIVE_SESSION_HISTORY on SQL_ID, SQL_EXEC_START, SQL_EXEC_ID, and SQL_PLAN_LINE_ID (simply named PLAN_LINE_ID in V$SQL_PLAN_MONITOR). The result of that join is a sample of the activity performed by each operation in the plan, from which an estimate of CPU time and wait time can be derived. This can be achieved by breaking statement level monitoring time statistics found in V$SQL_MONITOR in proportion to the number of samples found in V$ACTIVE_SESSION_HISTORY for the corresponding activity type.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
KEY	NUMBER	Foreign key to efficiently join V$SQL_PLAN_MONITOR with V$SQL_MONITOR (see V$SQL_MONITOR)
STATUS	VARCHAR2(19)	SQL execution status: • EXECUTING - SQL statement is still executing • DONE (ERROR) - Execution terminated with an error • DONE (FIRST N ROWS) - Execution terminated by the application before all rows were fetched • DONE (ALL ROWS) - Execution terminated and all rows were fetched • DONE - Execution terminated (parallel execution)
FIRST_REFRESH_TIME	DATE	Time when monitoring of the SQL statement started
LAST_REFRESH_TIME	DATE	Time when statistics were last updated for the SQL statement
FIRST_CHANGE_TIME	DATE	First time a row was produced by this operation
LAST_CHANGE_TIME	DATE	Last time a row was produced by this operation
REFRESH_COUNT	NUMBER	Number of times statistics have been refreshed
SID	NUMBER	Session identifier executing (or having executed) the SQL statement being monitored
PROCESS_NAME	VARCHAR2(5)	Process name identifier
SQL_ID	VARCHAR2(13)	SQL identifier
SQL_EXEC_START	DATE	Time when the execution started
SQL_EXEC_ID	NUMBER	Execution identifier
SQL_PLAN_HASH_VALUE	NUMBER	SQL plan hash value
SQL_CHILD_ADDRESS	RAW(4 | 8)	Address of the child cursor
PLAN_PARENT_ID	NUMBER	ID of the next execution step that operates on the output of the current step
PLAN_LINE_ID	NUMBER	Plan line number for the entry
PLAN_OPERATION	VARCHAR2(30)	Plan operation name (from V$SQL_PLAN)
PLAN_OPTIONS	VARCHAR2(30)	Plan option name (from V$SQL_PLAN)
PLAN_OBJECT_OWNER	VARCHAR2(128)	Name of the user who owns the schema containing the table or index
PLAN_OBJECT_NAME	VARCHAR2(128)	Name of the table or index
PLAN_OBJECT_TYPE	VARCHAR2(20)	Type of the object
PLAN_DEPTH	NUMBER	Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.
PLAN_POSITION	NUMBER	Order of processing for all operations that have the same PARENT_ID
PLAN_COST	NUMBER	Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.

Column	Datatype	Description
PLAN_CARDINALITY	NUMBER	Estimate, by the cost-based optimizer, of the number of rows produced by the operation
PLAN_BYTES	NUMBER	Estimate, by the cost-based optimizer, of the number of bytes produced by the operation
PLAN_TIME	NUMBER	Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_PARTITION_START	VARCHAR2(64)	Start partition of a range of accessed partitions
PLAN_PARTITION_STOP	VARCHAR2(64)	Stop partition of a range of accessed partitions
PLAN_CPU_COST	NUMBER	CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_IO_COST	NUMBER	I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
PLAN_TEMP_SPACE	NUMBER	Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is NULL.
STARTS	NUMBER	Number of times this operation was executed. For example, an operation is executed multiple times when it is on the right side of a nested-loop join (once for each row of the left input of that nested-loop join).
OUTPUT_ROWS	NUMBER	Number of rows produced by this operation since the execution started. This number is cumulated for all executions of this operation. Divide by the value of the STARTS column to compute the average number of rows per execution of the operation. Note that the value in the STARTS column is equal to or higher than the value in the OUTPUT_ROWS column. The value will usually be equal, but depending on internal optimizations a higher value may be seen.
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL. Maintained only after Oracle starts to monitor the execution.
WORKAREA_MEM	NUMBER	Amount of memory (in bytes) used by the operation when the query is executing; NULL if the execution is done. This applies only to operations using a work area, such as sort, hash-join, group-by, and so on.
WORKAREA_MAX_MEM	NUMBER	Maximum value (in bytes) for WORKAREA_MEM; NULL if the operation is not using a work area. When the execution is finished, this value will hold the maximum amount of memory consumed by this operation during the execution of the statement.
WORKAREA_TEMPSEG	NUMBER	Amount of temporary space (in bytes) used by the operation when the query is executing; NULL if the operation has not spilled to disk or if the execution is finished

Column	Datatype	Description
WORKAREA_MAX_TEMPSEG	NUMBER	Maximum value (in bytes) for WORKAREA_TEMPSEG; NULL if this operation never spilled to disk. When the execution is done, this value will hold the maximum amount of temporary space consumed by this operation during the entire execution.
OTHERSTAT_GROUP_ID	NUMBER	Plan line statistic group identifier (see GROUP_ID column in V$SQL_MONITOR_STATNAME)
OTHERSTAT_1_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 1 of that plan line
OTHERSTAT_1_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_1_VALUE	NUMBER	Value of statistic number 1 of that plan line
OTHERSTAT_2_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 2 of that plan line
OTHERSTAT_2_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_2_VALUE	NUMBER	Value of statistic number 2 of that plan line
OTHERSTAT_3_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 3 of that plan line
OTHERSTAT_3_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_3_VALUE	NUMBER	Value of statistic number 3 of that plan line
OTHERSTAT_4_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 4 of that plan line
OTHERSTAT_4_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_4_VALUE	NUMBER	Value of statistic number 4 of that plan line
OTHERSTAT_5_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 5 of that plan line
OTHERSTAT_5_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_5_VALUE	NUMBER	Value of statistic number 5 of that plan line
OTHERSTAT_6_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 6 of that plan line
OTHERSTAT_6_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_6_VALUE	NUMBER	Value of statistic number 6 of that plan line
OTHERSTAT_7_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 7 of that plan line
OTHERSTAT_7_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_7_VALUE	NUMBER	Value of statistic number 7 of that plan line
OTHERSTAT_8_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 8 of that plan line
OTHERSTAT_8_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_8_VALUE	NUMBER	Value of statistic number 8 of that plan line
OTHERSTAT_9_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 9 of that plan line
OTHERSTAT_9_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_9_VALUE	NUMBER	Value of statistic number 9 of that plan line
OTHERSTAT_10_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 10 of that plan line

Column	Datatype	Description
OTHERSTAT_10_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_10_VALUE	NUMBER	Value of statistic number 10 of that plan line
OTHERSTAT_11_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 11 of that plan line
OTHERSTAT_11_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_11_VALUE	NUMBER	Value of statistic number 11 of that plan line
OTHERSTAT_12_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 12 of that plan line
OTHERSTAT_12_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_12_VALUE	NUMBER	Value of statistic number 12 of that plan line
OTHERSTAT_13_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 13 of that plan line
OTHERSTAT_13_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_13_VALUE	NUMBER	Value of statistic number 13 of that plan line
OTHERSTAT_14_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 14 of that plan line
OTHERSTAT_14_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_14_VALUE	NUMBER	Value of statistic number 14 of that plan line
OTHERSTAT_15_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 15 of that plan line
OTHERSTAT_15_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_15_VALUE	NUMBER	Value of statistic number 15 of that plan line
OTHERSTAT_16_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 16 of that plan line
OTHERSTAT_16_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_16_VALUE	NUMBER	Value of statistic number 16 of that plan line
OTHERSTAT_17_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 17 of that plan line
OTHERSTAT_17_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_17_VALUE	NUMBER	Value of statistic number 17 of that plan line
OTHERSTAT_18_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 18 of that plan line
OTHERSTAT_18_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_18_VALUE	NUMBER	Value of statistic number 18 of that plan line
OTHERSTAT_19_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 19 of that plan line
OTHERSTAT_19_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_19_VALUE	NUMBER	Value of statistic number 19 of that plan line
OTHERSTAT_20_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 20 of that plan line
OTHERSTAT_20_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_20_VALUE	NUMBER	Value of statistic number 20 of that plan line

Column	Datatype	Description
OTHERSTAT_21_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 21 of that plan line
OTHERSTAT_21_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_21_VALUE	NUMBER	Value of statistic number 21 of that plan line
OTHERSTAT_22_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 22 of that plan line
OTHERSTAT_22_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_22_VALUE	NUMBER	Value of statistic number 22 of that plan line
OTHERSTAT_23_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 23 of that plan line
OTHERSTAT_23_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_23_VALUE	NUMBER	Value of statistic number 23 of that plan line
OTHERSTAT_24_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 24 of that plan line
OTHERSTAT_24_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_24_VALUE	NUMBER	Value of statistic number 24 of that plan line
OTHERSTAT_25_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 25 of that plan line
OTHERSTAT_25_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_25_VALUE	NUMBER	Value of statistic number 25 of that plan line
OTHERSTAT_26_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 26 of that plan line
OTHERSTAT_26_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_26_VALUE	NUMBER	Value of statistic number 26 of that plan line
OTHERSTAT_27_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 27 of that plan line
OTHERSTAT_27_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_27_VALUE	NUMBER	Value of statistic number 27 of that plan line
OTHERSTAT_28_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 28 of that plan line
OTHERSTAT_28_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_28_VALUE	NUMBER	Value of statistic number 28 of that plan line
OTHERSTAT_29_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 29 of that plan line
OTHERSTAT_29_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_29_VALUE	NUMBER	Value of statistic number 29 of that plan line
OTHERSTAT_30_ID	NUMBER	Statistic identifier (see ID column in V$SQL_MONITOR_STATNAME) for statistic number 30 of that plan line
OTHERSTAT_30_TYPE	NUMBER	Reserved for internal use
OTHERSTAT_30_VALUE	NUMBER	Value of statistic number 30 of that plan line

Column	Datatype	Description
OTHER_XML	CLOB	Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML, which allows multiple pieces of information to be stored, including the following: • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan • Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans
PLAN_OPERATION_INACTIVE	NUMBER	Indicates whether this plan operation was part of the final resolved plan
PDB_ID	NUMBER	Container ID of the PDB

10.78 V$SQL_PLAN_STATISTICS

V$SQL_PLAN_STATISTICS provides execution statistics at the row source level for each child cursor.

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V$SQLAREA to locate the parent cursor.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent statement in the library cache
PLAN_HASH_VALUE	NUMBER	Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line)
FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
CHILD_ADDRESS	RAW(4 | 8)	Address of the child cursor

Column	Datatype	Description
CHILD_NUMBER	NUMBER	Number of the child cursor that uses this work area. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V$SQL to locate the child cursor using this area.
OPERATION_ID	NUMBER	A number assigned to each step in the execution plan
EXECUTIONS	NUMBER	Number of times this cursor has been executed
LAST_STARTS	NUMBER	Number of times this operation has been started, during the last execution
STARTS	NUMBER	Number of times this operation has been started, accumulated over the past executions
LAST_OUTPUT_ROWS	NUMBER	Number of rows produced by the row source, during the last execution
OUTPUT_ROWS	NUMBER	Number of rows produced by the row source, accumulated over the past executions
LAST_CR_BUFFER_GETS	NUMBER	Number of buffers retrieved in consistent mode, during the last execution. Buffers are usually retrieved in consistent mode for queries.
CR_BUFFER_GETS	NUMBER	Number of buffers retrieved in consistent mode, accumulated over the past executions. Buffers are usually retrieved in consistent mode for queries.
LAST_CU_BUFFER_GETS	NUMBER	Number of buffers retrieved in current mode, during the last execution. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.
CU_BUFFER_GETS	NUMBER	Number of buffers retrieved in current mode, accumulated over the past executions. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.
LAST_DISK_READS	NUMBER	Number of physical disk reads performed by the operation, during the last execution
DISK_READS	NUMBER	Number of physical disk reads performed by the operation, accumulated over the past executions
LAST_DISK_WRITES	NUMBER	Number of physical disk writes performed by the operation, during the last execution
DISK_WRITES	NUMBER	Number of physical disk writes performed by the operation, accumulated over the past executions
LAST_ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) corresponding to this operation, during the last execution
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) corresponding to this operation, accumulated over the past executions
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.79 V$SQL_PLAN_STATISTICS_ALL

V$SQL_PLAN_STATISTICS_ALL contains memory usage statistics for row sources that use SQL memory (sort or hash-join). This view concatenates information in V$SQL_PLAN with execution statistics from V$SQL_PLAN_STATISTICS and V$SQL_WORKAREA.

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache. The two columns ADDRESS and HASH_VALUE can be used to join with V$SQLAREA to add the cursor-specific information.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent statement in the library cache
PLAN_HASH_VALUE	NUMBER	Numerical representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line)
FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
CHILD_ADDRESS	RAW(4 | 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Number of the child cursor that uses this execution plan. The columns ADDRESS, HASH_VALUE, and CHILD_NUMBER can be used to join with V$SQL to add the child cursor-specific information.
TIMESTAMP	DATE	Date and time when the execution plan was generated
OPERATION	VARCHAR2(30)	Name of the internal operation performed in this step (for example, TABLE ACCESS)
OPTIONS	VARCHAR2(30)	A variation on the operation described in the OPERATION column (for example, FULL)
OBJECT_NODE	VARCHAR2(40)	Name of the database link used to reference the object (a table name or view name). For local queries that use parallel execution, this column describes the order in which output from operations is consumed.
OBJECT#	NUMBER	Object number of the table or the index
OBJECT_OWNER	VARCHAR2(128)	Name of the user who owns the schema containing the table or index
OBJECT_NAME	VARCHAR2(128)	Name of the table or index
OBJECT_ALIAS	VARCHAR2(261)	Alias for the object
OBJECT_TYPE	VARCHAR2(20)	Type of the object
OPTIMIZER	VARCHAR2(20)	Current mode of the optimizer for the first row in the plan (statement line), for example, CHOOSE. When the operation is a database access (for example, TABLE ACCESS), this column indicates whether or not the object is analyzed.
ID	NUMBER	A number assigned to each step in the execution plan
PARENT_ID	NUMBER	ID of the next execution step that operates on the output of the current step
DEPTH	NUMBER	Depth (or level) of the operation in the tree. It is not necessary to issue a CONNECT BY statement to get the level information, which is generally used to indent the rows from the PLAN_TABLE table. The root operation (statement) is level 0.

Column	Datatype	Description
POSITION	NUMBER	Order of processing for all operations that have the same PARENT_ID
SEARCH_COLUMNS	NUMBER	Number of index columns with start and stop keys (that is, the number of columns with matching predicates)
COST	NUMBER	Cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
CARDINALITY	NUMBER	Estimate, by the cost-based optimizer, of the number of rows produced by the operation
BYTES	NUMBER	Estimate, by the cost-based optimizer, of the number of bytes produced by the operation
OTHER_TAG	VARCHAR2(35)	Describes the contents of the OTHER column. See EXPLAIN PLAN for values.
PARTITION_START	VARCHAR2(64)	Start partition of a range of accessed partitions
PARTITION_STOP	VARCHAR2(64)	Stop partition of a range of accessed partitions
PARTITION_ID	NUMBER	Step that computes the pair of values of the PARTITION_START and PARTITION_STOP columns
OTHER	VARCHAR2(4000)	Other information specific to the execution step that users may find useful. See EXPLAIN PLAN for values.
DISTRIBUTION	VARCHAR2(20)	Stores the method used to distribute rows from producer query servers to consumer query servers
CPU_COST	NUMBER	CPU cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
IO_COST	NUMBER	I/O cost of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
TEMP_SPACE	NUMBER	Temporary space usage of the operation (sort or hash-join) as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
ACCESS_PREDICATES	VARCHAR2(4000)	Predicates used to locate rows in an access structure. For example, start or stop predicates for an index range scan.
FILTER_PREDICATES	VARCHAR2(4000)	Predicates used to filter rows before producing them
PROJECTION	VARCHAR2(4000)	Expressions produced by the operation
TIME	NUMBER	Elapsed time (in seconds) of the operation as estimated by the optimizer's cost-based approach. For statements that use the rule-based approach, this column is null.
QBLOCK_NAME	VARCHAR2(128)	Name of the query block
REMARKS	VARCHAR2(4000)	Remarks

Column	Datatype	Description
OTHER_XML	CLOB	Provides extra information specific to an execution step of the execution plan. The content of this column is structured using XML, which allows multiple pieces of information to be stored, including the following: • Name of the schema against which the query was parsed • Release number of the Oracle Database that produced the explain plan • Hash value associated with the execution plan • Name (if any) of the outline or the SQL profile used to build the execution plan • Indication of whether or not dynamic statistics were used to produce the plan • The outline data, a set of optimizer hints that can be used to regenerate the same plan • Additional data that describes the relationship between rows in the plan table and subplans of adaptive plans
EXECUTIONS	NUMBER	Number of times this cursor has been executed
LAST_STARTS	NUMBER	Number of times this operation has been started, during the last execution
STARTS	NUMBER	Number of times this operation has been started, accumulated over the past executions
LAST_OUTPUT_ROWS	NUMBER	Number of rows produced by the row source, during the last execution
OUTPUT_ROWS	NUMBER	Number of rows produced by the row source, accumulated over the past executions
LAST_CR_BUFFER_GETS	NUMBER	Number of buffers retrieved in consistent mode, during the last execution. Buffers are usually retrieved in consistent mode for queries.
CR_BUFFER_GETS	NUMBER	Number of buffers retrieved in consistent mode, accumulated over the past executions. Buffers are usually retrieved in consistent mode for queries.
LAST_CU_BUFFER_GETS	NUMBER	Number of buffers retrieved in current mode, during the last execution. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.
CU_BUFFER_GETS	NUMBER	Number of buffers retrieved in current mode, accumulated over the past executions. Buffers are retrieved in current mode for statements such as INSERT, UPDATE, and DELETE.
LAST_DISK_READS	NUMBER	Number of physical disk reads performed by the operation, during the last execution
DISK_READS	NUMBER	Number of physical disk reads performed by the operation, accumulated over the past executions
LAST_DISK_WRITES	NUMBER	Number of physical disk writes performed by the operation, during the last execution
DISK_WRITES	NUMBER	Number of physical disk writes performed by the operation, accumulated over the past executions
LAST_ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) corresponding to this operation, during the last execution
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) corresponding to this operation, accumulated over the past executions
POLICY	VARCHAR2(10)	Sizing policy for this work area: • MANUAL • AUTO

Column	Datatype	Description
ESTIMATED_OPTIMAL_SIZE	NUMBER	Estimated size (in KB) required by this work area to execute the operation completely in memory (optimal execution). This is either derived from optimizer statistics or from previous executions.
ESTIMATED_ONEPASS_SIZE	NUMBER	Estimated size (in KB) required by this work area to execute the operation in a single pass. This is either derived from optimizer statistics or from previous executions.
LAST_MEMORY_USED	NUMBER	Memory size (in KB) used by this work area during the last execution of the cursor
LAST_EXECUTION	VARCHAR2(10)	Indicates whether this work area ran using OPTIMAL, ONE PASS, or under ONE PASS memory requirement (MULTI-PASS), during the last execution of the cursor
LAST_DEGREE	NUMBER	Degree of parallelism used, during the last execution of the cursor
TOTAL_EXECUTIONS	NUMBER	Number of times this work area was active
OPTIMAL_EXECUTIONS	NUMBER	Number of times this work area ran in optimal mode
ONEPASS_EXECUTIONS	NUMBER	Number of times this work area ran in one pass mode
MULTIPASSES_EXECUTIONS	NUMBER	Number of times this work area ran below the one pass memory requirement
ACTIVE_TIME	NUMBER	Average time this work area is active (in hundredths of a second)
MAX_TEMPSEG_SIZE	NUMBER	Maximum temporary segment size (in bytes) created by an instantiation of this work area. This column is null if this work area has never spilled to disk.
LAST_TEMPSEG_SIZE	NUMBER	Temporary segment size (in bytes) created in the last instantiation of this work area. This column is null if the last instantiation of this work area did not spill to disk.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
CON_DBID	NUMBER	The database ID of the PDB

10.80 V$SQL_REDIRECTION

V$SQL_REDIRECTION displays SQL statements that are redirected.

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Address of the cursor handle

Column	Datatype	Description
PARENT_HANDLE	RAW(4 | 8)	Address of the parent cursor handle
HASH_VALUE	NUMBER	Hash value of the SQL statement
SQL_ID	VARCHAR2(13)	SQL identifier of the SQL statement
CHILD_NUMBER	NUMBER	Number of the child (instance) for the hash
PARSING_USER_ID	NUMBER	Parsing user ID
PARSING_SCHEMA_ID	NUMBER	Parsing schema ID
COMMAND_TYPE	NUMBER	SELECT, UPDATE, INSERT, MERGE
REASON	VARCHAR2(14)	Reason for redirection ('INVALID OBJECT', 'ROWID', 'QUERY REWRITE', 'READ ONLY')
ERROR_CODE	NUMBER	Error code for local parse
POSITION	NUMBER	Error position, 0 if unknown
SQL_TEXT_PIECE	VARCHAR2(1000)	SQL Text containing position, usually a (qualified) identifier
ERROR_MESSAGE	VARCHAR2(1000)	Error code's corresponding error message resolved in the database language, no arguments resolved
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.81 V$SQL_SHARD

V$SQL_SHARD displays the shard information for a shard query's previous execution. This view uniquely maps a shard SQL fragment of a cross shard query to the target shard database.

Column	Datatype	Description
SQL_ID	VARCHAR2(13)	SQL identifier of a cross shard query on the coordinator
CHILD_NUMBER	NUMBER	Cursor child number of a cross shard query on the coordinator
OPERATION_ID	NUMBER	Operation ID of a remote node for a shard SQL fragment of a cross shard query
SHARD_SQL_ID	VARCHAR2(13)	SQL ID of the SQL segment associated with a remote operation identified by the operation ID in the OPERATION_ID column
SHARD_ID	NUMBER	IDs of shards where the shard SQL fragment was executed
SHARD_CHILD_NUMBER	NUMBER	Cursor child number of a shard SQL fragment on a shard. The default value is 0.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> *Oracle Globally Distributed Database Guide* for more information about the V$SQL_SHARD view

10.82 V$SQL_SHARED_CURSOR

V$SQL_SHARED_CURSOR explains why a particular child cursor is not shared with existing child cursors.

Each column identifies a specific reason why the cursor cannot be shared.

You can find additional diagnostic information about the cursors displayed in this view by querying the V$SQL_SHARED_CURSOR_DIAG view. Join this view with V$SQL_SHARED_CURSOR_DIAG on the SQL_ID and CHILD_NUMBER columns.

Column	Datatype	Description
SQL_ID	VARCHAR2(13)	SQL identifier
ADDRESS	RAW(4 | 8)	Address of the parent cursor
CHILD_ADDRESS	RAW(4 | 8)	Address of the child cursor
CHILD_NUMBER	NUMBER	Child number
UNBOUND_CURSOR	VARCHAR2(1)	(Y|N) The existing child cursor was not fully built (in other words, it was not optimized)
SQL_TYPE_MISMATCH	VARCHAR2(1)	(Y|N) The SQL type does not match the existing child cursor
OPTIMIZER_MISMATCH	VARCHAR2(1)	(Y|N) The optimizer environment does not match the existing child cursor
OUTLINE_MISMATCH	VARCHAR2(1)	(Y|N) The outlines do not match the existing child cursor
STATS_ROW_MISMATCH	VARCHAR2(1)	(Y|N) The existing statistics do not match the existing child cursor
LITERAL_MISMATCH	VARCHAR2(1)	(Y|N) Non-data literal values do not match the existing child cursor
FORCE_HARD_PARSE	VARCHAR2(1)	(Y|N) For internal use
EXPLAIN_PLAN_CURSOR	VARCHAR2(1)	(Y|N) The child cursor is an explain plan cursor and should not be shared
BUFFERED_DML_MISMATCH	VARCHAR2(1)	(Y|N) Buffered DML does not match the existing child cursor
PDML_ENV_MISMATCH	VARCHAR2(1)	(Y|N) PDML environment does not match the existing child cursor
INST_DRTLD_MISMATCH	VARCHAR2(1)	(Y|N) Insert direct load does not match the existing child cursor

Column	Datatype	Description
SLAVE_QC_MISMATCH	VARCHAR2(1)	(Y|N) The existing child cursor is a worker cursor and the new one was issued by the coordinator (or, the existing child cursor was issued by the coordinator and the new one is a worker cursor)
TYPECHECK_MISMATCH	VARCHAR2(1)	(Y|N) The existing child cursor is not fully optimized
AUTH_CHECK_MISMATCH	VARCHAR2(1)	(Y|N) Authorization/translation check failed for the existing child cursor
BIND_MISMATCH	VARCHAR2(1)	(Y|N) The bind metadata does not match the existing child cursor
DESCRIBE_MISMATCH	VARCHAR2(1)	(Y|N) The typecheck heap is not present during the describe for the child cursor
LANGUAGE_MISMATCH	VARCHAR2(1)	(Y|N) The language handle does not match the existing child cursor
TRANSLATION_MISMATCH	VARCHAR2(1)	(Y|N) The base objects of the existing child cursor do not match
BIND_EQUIV_FAILURE	VARCHAR2(1)	(Y|N) The bind value's selectivity does not match that used to optimize the existing child cursor
INSUFF_PRIVS	VARCHAR2(1)	(Y|N) Insufficient privileges on objects referenced by the existing child cursor
INSUFF_PRIVS_REM	VARCHAR2(1)	(Y|N) Insufficient privileges on remote objects referenced by the existing child cursor
REMOTE_TRANS_MISMATCH	VARCHAR2(1)	(Y|N) The remote base objects of the existing child cursor do not match
LOGMINER_SESSION_MISMATCH	VARCHAR2(1)	(Y|N) LogMiner Session parameters mismatch
INCOMP_LTRL_MISMATCH	VARCHAR2(1)	(Y|N) Cursor might have some binds (literals) which may be unsafe/non-data. Value mismatch.
OVERLAP_TIME_MISMATCH	VARCHAR2(1)	(Y|N) Mismatch caused by setting session parameter ERROR_ON_OVERLAP_TIME
EDITION_MISMATCH	VARCHAR2(1)	(Y|N) Cursor edition mismatch
MV_QUERY_GEN_MISMATCH	VARCHAR2(1)	(Y|N) Internal, used to force a hard-parse when analyzing materialized view queries
USER_BIND_PEEK_MISMATCH	VARCHAR2(1)	(Y|N) Cursor is not shared because value of one or more user binds is different and this has a potential to change the execution plan
TYPCHK_DEP_MISMATCH	VARCHAR2(1)	(Y|N) Cursor has typecheck dependencies
NO_TRIGGER_MISMATCH	VARCHAR2(1)	(Y|N) Cursor and child have no trigger mismatch
FLASHBACK_CURSOR	VARCHAR2(1)	(Y|N) Cursor non-shareability due to flashback
ANYDATA_TRANSFORMATION	VARCHAR2(1)	(Y|N) Is criteria for opaque type transformation and does not match
PDDL_ENV_MISMATCH	VARCHAR2(1)	(Y|N) Environment setting mismatch for parallel DDL cursor (that is, one or more of the following parameter values have changed: PARALLEL_EXECUTION_ENABLED, PARALLEL_DDL_MODE, PARALLEL_DDL_FORCED_DEGREE, or PARALLEL_DDL_FORCED_INSTANCES)
TOP_LEVEL_RPI_CURSOR	VARCHAR2(1)	(Y|N) Is top level RPI cursor
DIFFERENT_LONG_LENGTH	VARCHAR2(1)	(Y|N) Value of LONG does not match
LOGICAL_STANDBY_APPLY	VARCHAR2(1)	(Y|N) Logical standby apply context does not match
DIFF_CALL_DURN	VARCHAR2(1)	(Y|N) If worker SQL cursor/single call
BIND_UACS_DIFF	VARCHAR2(1)	(Y|N) One cursor has bind UACs and one does not
PLSQL_CMP_SWITCHS_DIFF	VARCHAR2(1)	(Y|N) PL/SQL anonymous block compiled with different PL/SQL compiler switches

Column	Datatype	Description
CURSOR_PARTS_MISMATCH	VARCHAR2(1)	(Y|N) Cursor was compiled with subexecution (cursor parts were executed)
STB_OBJECT_MISMATCH	VARCHAR2(1)	(Y|N) STB is an internal name for a SQL Management Object Mismatch. A SQL Management Object Mismatch means that either a SQL plan baseline, or a SQL profile, or a SQL patch has been created for your SQL statement between the executions. Because a cursor is a read-only entity, a hard parse is forced to be able to create a new cursor that contains information about the new SQL management object related to this SQL statement.
CROSSEDITION_TRIGGER_MISMATCH	VARCHAR2(1)	(Y|N) The set of crossedition triggers to execute might differ
PQ_SLAVE_MISMATCH	VARCHAR2(1)	(Y|N) Top-level worker decides not to share cursor
TOP_LEVEL_DDL_MISMATCH	VARCHAR2(1)	(Y|N) Is top-level DDL cursor
MULTI_PX_MISMATCH	VARCHAR2(1)	(Y|N) Cursor has multiple parallelizers and is worker-compiled
BIND_PEEKED_PQ_MISMATCH	VARCHAR2(1)	(Y|N) Cursor based around bind peeked values
MV_REWRITE_MISMATCH	VARCHAR2(1)	(Y|N) Cursor needs recompilation because an SCN was used during compile time due to being rewritten by materialized view
ROLL_INVALID_MISMATCH	VARCHAR2(1)	(Y|N) Marked for rolling invalidation and invalidation window exceeded
OPTIMIZER_MODE_MISMATCH	VARCHAR2(1)	(Y|N) Parameter OPTIMIZER_MODE mismatch (for example, all_rows versus first_rows_1)
PX_MISMATCH	VARCHAR2(1)	(Y|N) Mismatch in one parameter affecting the parallelization of a SQL statement. For example, one cursor was compiled with parallel DML enabled while the other was not.
MV_STALEOBJ_MISMATCH	VARCHAR2(1)	(Y|N) Cursor cannot be shared because there is a mismatch in the list of materialized views which were stale when the cursor was built
FLASHBACK_TABLE_MISMATCH	VARCHAR2(1)	(Y|N) Cursor cannot be shared because there is a mismatch with triggers being enabled and/or referential integrity constraints being deferred
LITREP_COMP_MISMATCH	VARCHAR2(1)	(Y|N) Mismatch in use of literal replacement
PLSQL_DEBUG	VARCHAR2(1)	(Y|N) Value of the PLSQL_DEBUG parameter for the current session does not match the value used to build the cursor
LOAD_OPTIMIZER_STATS	VARCHAR2(1)	(Y|N) A hard parse is forced to initialize extended cursor sharing
ACL_MISMATCH	VARCHAR2(1)	(Y|N) Cached ACL evaluation result stored in the child cursor is not valid for the current session or user
FLASHBACK_ARCHIVE_MISMATCH	VARCHAR2(1)	(Y|N) Value of the FLASHBACK_DATA_ARCHIVE_INTERNAL_CURSOR parameter for the current session does not match the value used to build the cursor
LOCK_USER_SCHEMA_FAILED	VARCHAR2(1)	(Y|N) User or schema used to build the cursor no longer exists **Note:** This sharing criterion is deprecated
REMOTE_MAPPING_MISMATCH	VARCHAR2(1)	(Y|N) Reloaded cursor was previously remote-mapped and is currently not remote-mapped. Therefore, the cursor must be reparsed.
LOAD_RUNTIME_HEAP_FAILED	VARCHAR2(1)	(Y|N) Loading of run-time heap for the new cursor (or reload of aged out cursor) failed
HASH_MATCH_FAILED	VARCHAR2(1)	(Y|N) No existing child cursors have the unsafe literal bind hash values required by the current cursor
PURGED_CURSOR	VARCHAR2(1)	(Y|N) Child cursor is marked for purging

Column	Datatype	Description
BIND_LENGTH_UPGRADEABLE	VARCHAR2(1)	(Y|N) Bind length(s) required for the current cursor are longer than the bind length(s) used to build the child cursor
USE_FEEDBACK_STATS	VARCHAR2(1)	(Y|N) A hard parse is forced so that the optimizer can reoptimize the query with improved optimizer inputs (for example, cardinality estimates)
REASON	CLOB	Child number, id, and reason the cursor is not shared. The content of this column is structured using XML. If this column is null, the FORCE_HARD_PARSE, LOAD_RUNTIME_HEAP_FAILED, and HASH_MATCH_FAILED columns may enable you to determine why the child cursor is not shared.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

"V$SQL_SHARED_CURSOR_DIAG"

10.83 V$SQL_SHARED_CURSOR_DIAG

V$SQL_SHARED_CURSOR_DIAG displays diagnostic information about child cursors that cannot be shared with existing child cursors.

You can find additional information about the cursors displayed in this view by querying the V$SQL_SHARED_CURSOR view. Join this view with V$SQL_SHARED_CURSOR on the SQL_ID and CHILD_NUMBER columns.

Column	Datatype	Description
SQL_ID	VARCHAR2(13)	SQL identifier
CHILD_NUMBER	NUMBER	Child number
FAILING_CRITERIA	VARCHAR2(4000)	Reason the child cursor failed to share, in JSON format
DIAG_DATA	CLOB	Diagnostic information, in JSON format
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**

> "V$SQL_SHARED_CURSOR"

10.84 V$SQL_SHARED_MEMORY

V$SQL_SHARED_MEMORY displays information about the cursor shared memory snapshot. Each SQL statement stored in the shared pool has one or more child objects associated with it. Each child object has several parts, one of which is the context heap, which holds, among other things, the query plan.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	SQL text of the shared cursor child object for which this row is displaying information
SQL_FULLTEXT	CLOB	Full text for the SQL statement exposed as a CLOB column. The full text of a SQL statement can be retrieved using this column instead of joining with the V$SQLTEXT dynamic performance view.
HASH_VALUE	NUMBER	Hash value of the above SQL text in the shared pool
SQL_ID	VARCHAR2(13)	SQL identifier of the above SQL text in the shared pool
HEAP_DESC	RAW(4 | 8)	Address of the descriptor for the context heap of the child cursor described in this row
STRUCTURE	VARCHAR2(16)	If the memory chunk described in this row was allocated using a comment of the form "X : Y", then this is the "X" part of the comment
FUNCTION	VARCHAR2(16)	Similar to the STRUCTURE column, this is the "Y" field of the comment
CHUNK_COM	VARCHAR2(16)	Whole comment field that was supplied when this memory chunk was allocated
CHUNK_PTR	RAW(4 | 8)	Starting address of the allocated memory chunk
CHUNK_SIZE	NUMBER	Amount of memory allocated for this chunk
ALLOC_CLASS	VARCHAR2(8)	Class of memory that this chunk of memory belongs to. It will usually be either FREEABLE or PERMANENT.
CHUNK_TYPE	NUMBER	An index into a table of callback functions that tell the server how to re-create this chunk of memory should it need to be removed from the shared pool based on an LRU algorithm
SUBHEAP_DESC	RAW(4 | 8)	If the parent heap of this context heap is itself a subheap, then this is the address of the descriptor of the parent heap

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.85 V$SQL_TESTCASES

V$SQL_TESTCASES displays information about test cases exported by SQL Test Case Builder.

You can use this view in conjunction with the V$DIAG_INCIDENT view. Join the INCIDENT_ID column in this view with the INCIDENT_ID column in V$DIAG_INCIDENT to view information about the test case associated with a particular incident.

The V$SQL_TESTCASES view requires the existence of a TCB root directory named SQL_TCB_DIR. This view will not contain any rows if a TCB root directory does not exist, or if the TCB root directory exists with a name other than SQL_TCB_DIR. The operating system directory to which the TCB root directory refers must be writable by the owner of the Oracle Database binaries.

- In Oracle Autonomous Database environments, the TCB root directory is created automatically on each POD during provisioning.
- For on-premises databases, a user who has been granted the DBA role must explicitly create the TCB root directory. See *Oracle Database Administrator's Guide* for more information.

Column	Datatype	Description
TESTCASE_NAME	VARCHAR2(512)	Test case name
SQL_ID	VARCHAR2(13)	SQL identifier of the SQL statement in the test case
SQL_TEXT	VARCHAR2(1000)	First 1000 characters of text for the SQL statement in the test case
SQL_TEXT_FULL	CLOB	Full text for the SQL statement in the test case, exposed as a CLOB column
INCIDENT_ID	NUMBER	ID for the incident associated with the test case
PROBLEM_TYPE	NUMBER	Type of problem for the incident associated with the test case. Possible values: • 1: Performance problem (PROBLEM_TYPE_PERFORMANCE) • 2: Inconsistent results (PROBLEM_TYPE_WRONG_RESULTS) • 3: Crash in compilation (PROBLEM_TYPE_COMPILATION_ERROR) • 4: Crash in execution (PROBLEM_TYPE_EXECUTION_ERROR) These numeric values, and their associated constant values shown in parentheses, correspond to the numeric and constant values for problem type constants in the DBMS_SQLDIAG package. See *Oracle Database PL/SQL Packages and Types Reference* for more information.
CREATION_DATE	TIMESTAMP(6)	Creation time for the incident associated with the test case

Column	Datatype	Description
STATUS	VARCHAR2(10)	Current status for the incident associated with the test case. Possible values: • COMPLETE: The test case export completed successfully • INCOMPLETE: The test case export failed due to an error
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

"V$DIAG_INCIDENT"

10.86 V$SQL_WORKAREA

V$SQL_WORKAREA displays information about work areas used by SQL cursors. Each SQL statement stored in the shared pool has one or more child cursors that are listed in the V$SQL view. V$SQL_WORKAREA lists all work areas needed by these child cursors; V$SQL_WORKAREA can be joined with V$SQLAREA on (ADDRESS, HASH_VALUE) and with V$SQL on (ADDRESS, HASH_VALUE, CHILD_NUMBER).
You can use this view to find out answers to the following questions:

- What are the top 10 work areas that require the most cache area?
- For work areas allocated in AUTO mode, what percentage of work areas are running using maximum memory?

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Address of the parent cursor handle
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache. Two columns PARENT_HANDLE and HASH_VALUE can be used to join with V$SQLAREA to locate the parent cursor.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent statement in the library cache
CHILD_NUMBER	NUMBER	Number of the child cursor that uses this work area. The columns PARENT_HANDLE, HASH_VALUE, and CHILD_NUMBER can be used to join with V$SQL to locate the child cursor using this area.
WORKAREA_ADDRESS	RAW(4 | 8)	Address of the work area handle. This is the primary key for the view.
OPERATION_TYPE	VARCHAR2(40)	Type of operation using the work area. Can include values such as SORT, HASH JOIN, GROUP BY, BUFFER, BITMAP MERGE, and BITMAP CONSTRUCTION.
OPERATION_ID	NUMBER	A unique number used to identify the operation in the execution plan. This identifier can be joined to V$SQL_PLAN to locate the operation that uses this work area.

Column	Datatype	Description
POLICY	VARCHAR2(10)	Sizing policy for this work area (MANUAL or AUTO)
ESTIMATED_OPTIMAL_SIZE	NUMBER	Estimated size (in bytes) required by this work area to execute the operation completely in memory (optimal execution). Derived from either optimizer statistics or previous executions.
ESTIMATED_ONEPASS_SIZE	NUMBER	Estimated size (in bytes) required by this work area to execute the operation in a single pass. Derived from either optimizer statistics or previous executions.
LAST_MEMORY_USED	NUMBER	Memory (in bytes) used by this work area during the last execution of the cursor
LAST_EXECUTION	VARCHAR2(10)	Indicates whether this work area runs using OPTIMAL, ONE PASS, or ONE PASS memory requirement (or MULTI-PASS), during the last execution of the cursor
LAST_DEGREE	NUMBER	Degree of parallelism used during the last execution of this operation
TOTAL_EXECUTIONS	NUMBER	Number of times this work area was active
OPTIMAL_EXECUTIONS	NUMBER	Number of times this work area ran in optimal mode
ONEPASS_EXECUTIONS	NUMBER	Number of times this work area ran in one-pass mode
MULTIPASSES_EXECUTIONS	NUMBER	Number of times this work area ran below the one-pass memory requirement
ACTIVE_TIME	NUMBER	Average time this work area is active (in hundredths of a second)
MAX_TEMPSEG_SIZE	NUMBER	Maximum temporary segment size (in bytes) created by an instantiation of this work area. This column is NULL if this work area has never spilled to disk.
LAST_TEMPSEG_SIZE	NUMBER	Temporary segment size (in bytes) created in the last instantiation of this work area. This column is NULL if the last instantiation of this work area did not spill to disk.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- "V$SQLAREA"
- "V$SQL"

10.87 V$SQL_WORKAREA_ACTIVE

V$SQL_WORKAREA_ACTIVE contains an instantaneous view of the work areas currently allocated by the system. You can join this view against V$SQL_WORKAREA on WORKAREA_ADDRESS to access

the definition of that work area. If a work area spills to disk, then this view contains information for the temporary segment created on behalf of this work area.
The last three columns are included to enable joining V$SQL_WORKAREA_ACTIVE with V$TEMPSEG_USAGE to retrieve more information on this temporary segment.

You can use this view to answer the following:

- What are the top 10 largest work areas currently allocated in the system?
- What percentage of memory is over-allocated (EXPECTED_SIZE < ACTUAL_MEM_USED) and under-allocated (EXPECTED_SIZE > ACTUAL_MEM_USED)?
- What are the active work areas using more memory than what is expected by the memory manager?
- What are the active work areas that have spilled to disk?

Column	Datatype	Description
SQL_HASH_VALUE	NUMBER	Hash value of the SQL statement that is currently being executed
SQL_ID	VARCHAR2(13)	SQL identifier of the SQL statement that is currently being executed
SQL_EXEC_START	DATE	Time when the execution of the SQL currently executed by this session started
SQL_EXEC_ID	NUMBER	SQL execution identifier (see V$SQL_MONITOR)
WORKAREA_ADDRESS	RAW(4 | 8)	Address of the work area handle. This is the primary key for the view.
OPERATION_TYPE	VARCHAR2(40)	Type of operation using the work area. Can include values such as SORT, HASH JOIN, GROUP BY, BUFFER, BITMAP MERGE, and BITMAP CONSTRUCTION.
OPERATION_ID	NUMBER	A unique number used to identify the operation in the execution plan. This identifier can be joined to V$SQL_PLAN to locate the operation that uses this work area.
POLICY	VARCHAR2(6)	Sizing policy for this work area (MANUAL or AUTO)
SID	NUMBER	Session identifier
QCINST_ID	NUMBER	Query coordinator instance identifier. Along with QCSID, enables you to uniquely identify the query coordinator.
QCSID	NUMBER	Query coordinator session identifier. This is the same as the SID if the work area is allocated by a serial cursor.
ACTIVE_TIME	NUMBER	Average time this work area is active (in microseconds)
WORK_AREA_SIZE	NUMBER	Maximum size (in bytes) of the work area as it is currently used by the operation
EXPECTED_SIZE	NUMBER	Expected size (in bytes) for this work area. EXPECTED_SIZE is set on behalf of the operation by the memory manager. Memory can be over-allocated when WORK_AREA_SIZE has a higher value than EXPECTED_SIZE. This can occur when the operation using this work area takes a long time to resize it.
ACTUAL_MEM_USED	NUMBER	Amount of PGA memory (in bytes) currently allocated on behalf of this work area. This value should range between 0 and WORK_AREA_SIZE.
MAX_MEM_USED	NUMBER	Maximum memory amount (in bytes) used by this work area
NUMBER_PASSES	NUMBER	Number of passes corresponding to this work area (0 if running in OPTIMAL mode)
TEMPSEG_SIZE	NUMBER	Size (in bytes) of the temporary segment used on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.

Column	Datatype	Description
TABLESPACE	VARCHAR2(128)	Tablespace name for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.
SEGRFNO#	NUMBER	Relative file number within the tablespace for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.
SEGBLK#	NUMBER	Block number for the temporary segment created on behalf of this work area. This column is NULL if this work area has not (yet) spilled to disk.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- "V$SQL_WORKAREA"
- *Oracle Database Concepts* for more information about SQL work areas

10.88 V$SQL_WORKAREA_HISTOGRAM

V$SQL_WORKAREA_HISTOGRAM displays the cumulative work area execution statistics (cumulated since instance startup) for different work area groups. The work areas are split into 33 groups based on their optimal memory requirements with the requirements increasing in powers of two. That is, work areas whose optimal requirement varies from 0 KB to 1 KB, 1 KB to 2 KB, 2 KB to 4 KB, ... and 2 TB to 4 TB.
For each work area group, the V$SQL_WORKAREA_HISTOGRAM view shows how many work areas in that group were able to run in optimal mode, how many were able to run in one-pass mode, and finally how many ran in multi-pass mode. The DBA can take a snapshot at the beginning and the end of a desired time interval to derive the same statistics for that interval.

Column	Datatype	Description
LOW_OPTIMAL_SIZE	NUMBER	Lower bound for the optimal memory requirement of work areas included in this row (bytes)
HIGH_OPTIMAL_SIZE	NUMBER	Upper bound for the optimal memory requirement of work areas included in this row (bytes)
OPTIMAL_EXECUTIONS	NUMBER	Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in optimal mode since instance startup
ONEPASS_EXECUTIONS	NUMBER	Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in one-pass mode since instance startup

Column	Datatype	Description
MULTIPASSES_EXECUTIONS	NUMBER	Number of work areas with an optimal memory requirement comprised between LOW_OPTIMAL_SIZE and HIGH_OPTIMAL_SIZE which have been executed in multi-pass mode since instance startup
TOTAL_EXECUTIONS	NUMBER	Sum of OPTIMAL_EXECUTIONS, ONEPASS_EXECUTIONS, and MULTIPASSES_EXECUTIONS
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

Oracle Database Performance Tuning Guide for detailed information on how to monitor automatic PGA memory performance using this view

10.89 V$SQLAREA

V$SQLAREA displays statistics on shared SQL areas and contains one row per SQL string. It provides statistics on SQL statements that are in memory, parsed, and ready for execution.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	First thousand characters of the SQL text for the current cursor
SQL_FULLTEXT	CLOB	All characters of the SQL text for the current cursor
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
SHARABLE_MEM	NUMBER	Amount of shared memory used by a cursor. If multiple child cursors exist, then the sum of all shared memory used by all child cursors.
PERSISTENT_MEM	NUMBER	Fixed amount of memory used for the lifetime of an open cursor. If multiple child cursors exist, then the fixed sum of memory used for the lifetime of all the child cursors.
RUNTIME_MEM	NUMBER	Fixed amount of memory required during execution of a cursor. If multiple child cursors exist, then the fixed sum of all memory required during execution of all the child cursors.
SORTS	NUMBER	Sum of the number of sorts that were done for all the child cursors
VERSION_COUNT	NUMBER	Number of child cursors that are present in the cache under this parent
LOADED_VERSIONS	NUMBER	Number of child cursors that are present in the cache and have their context heap loaded
OPEN_VERSIONS	NUMBER	Number of child cursors that are currently open under this current parent
USERS_OPENING	NUMBER	Number of users that have any of the child cursors open
FETCHES	NUMBER	Number of fetches associated with the SQL statement
EXECUTIONS	NUMBER	Total number of executions, totalled over all the child cursors

Column	Datatype	Description
PX_SERVERS_EXECUTIONS	NUMBER	Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)
END_OF_FETCH_COUNT	NUMBER	Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column.
USERS_EXECUTING	NUMBER	Total number of users executing the statement over all child cursors
LOADS	NUMBER	Number of times the object was loaded or reloaded
FIRST_LOAD_TIME	VARCHAR2(19)	Timestamp of the parent creation time
INVALIDATIONS	NUMBER	Total number of invalidations over all the child cursors
PARSE_CALLS	NUMBER	Sum of all parse calls to all the child cursors under this parent
DISK_READS	NUMBER	Sum of the number of disk reads over all child cursors
DIRECT_WRITES	NUMBER	Sum of the number of direct writes over all child cursors
DIRECT_READS	NUMBER	Sum of the number of direct reads over all child cursors
BUFFER_GETS	NUMBER	Sum of buffer gets over all child cursors
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds)
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds)
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds)
USER_IO_WAIT_TIME	NUMBER	User I/O Wait Time (in microseconds)
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds)
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds)
ROWS_PROCESSED	NUMBER	Total number of rows processed on behalf of this SQL statement
COMMAND_TYPE	NUMBER	Oracle command type definition
OPTIMIZER_MODE	VARCHAR2(10)	Mode under which the SQL statement was executed
OPTIMIZER_COST	NUMBER	Cost of this query given by the optimizer
OPTIMIZER_ENV	RAW(2000)	Optimizer environment
OPTIMIZER_ENV_HASH_VALUE	NUMBER	Hash value for the optimizer environment
PARSING_USER_ID	NUMBER	User ID of the user that has parsed the very first cursor under this parent
PARSING_SCHEMA_ID	NUMBER	Schema ID that was used to parse this child cursor
PARSING_SCHEMA_NAME	VARCHAR2(128)	Schema name that was used to parse this child cursor
KEPT_VERSIONS	NUMBER	Number of child cursors that have been marked to be kept using the DBMS_SHARED_POOL package
ADDRESS	RAW(4 | 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
OLD_HASH_VALUE	NUMBER	Old SQL hash value
PLAN_HASH_VALUE	NUMBER	Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).

Column	Datatype	Description
FULL_PLAN_HASH_VALUE	NUMBER	Numeric representation of the complete SQL plan for this cursor. Comparing one FULL_PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line). Note that the FULL_PLAN_HASH_VALUE cannot be compared across databases releases. It is not backward compatible.
MODULE	VARCHAR2(64)	Contains the name of the module that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_MODULE
MODULE_HASH	NUMBER	Hash value of the module that is named in the MODULE column
ACTION	VARCHAR2(64)	Contains the name of the action that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_ACTION
ACTION_HASH	NUMBER	Hash value of the action that is named in the ACTION column
SERIALIZABLE_ABORTS	NUMBER	Number of times the transaction failed to serialize, producing ORA-08177 errors, totalled over all the child cursors
OUTLINE_CATEGORY	VARCHAR2(64)	If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise the column is left blank.
CPU_TIME	NUMBER	CPU time (in microseconds) used by this cursor for parsing, executing, and fetching
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then ELAPSED_TIME is the cumulative time for the query coordinator, plus all parallel query worker processes.
OUTLINE_SID	VARCHAR2(40)	Outline session identifier
LAST_ACTIVE_CHILD_ADDRESS	RAW(4 | 8)	Address (identifier) of the child cursor that was the last to be active in the group (that is, the child cursor on behalf of which statistics in V$SQL were updated)
REMOTE	VARCHAR2(1)	Indicates whether the cursor is remote mapped (Y) or not (N)
OBJECT_STATUS	VARCHAR2(19)	Status of the cursor: • VALID - Valid, authorized without errors • VALID_AUTH_ERROR - Valid, authorized with authorization errors • VALID_COMPILE_ERROR - Valid, authorized with compilation errors • VALID_UNAUTH - Valid, unauthorized • INVALID_UNAUTH - Invalid, unauthorized • INVALID - Invalid, unauthorized but keep the timestamp
LITERAL_HASH_VALUE	NUMBER	Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when CURSOR_SHARING is used. This is not the hash value for the SQL statement. If CURSOR_SHARING is not used, then the value is 0.
LAST_LOAD_TIME	DATE	Time at which the query plan was loaded into the library cache
IS_OBSOLETE	VARCHAR2(1)	Indicates whether the cursor has become obsolete (Y) or not (N). This can happen if the number of child cursors is too large.
IS_BIND_SENSITIVE	VARCHAR2(1)	Indicates whether the cursor is bind sensitive (Y) or not (N). A query is considered bind-sensitive if the optimizer peeked at one of its bind variable values when computing predicate selectivities and where a change in a bind variable value may cause the optimizer to generate a different plan.

Column	Datatype	Description
IS_BIND_AWARE	VARCHAR2(1)	Indicates whether the cursor is bind aware (Y) or not (N). A query is considered bind-aware if it has been marked to use extended cursor sharing. The query would already have been marked as bind-sensitive.
CHILD_LATCH	NUMBER	Child latch number that is protecting the cursor. This column is obsolete and maintained for backward compatibility.
SQL_PROFILE	VARCHAR2(64)	SQL profile used for this statement, if any
SQL_PATCH	VARCHAR2(128)	SQL patch used for this statement, if any
SQL_PLAN_BASELINE	VARCHAR2(128)	SQL plan baseline used for this statement, if any
PROGRAM_ID	NUMBER	Program identifier
PROGRAM_LINE#	NUMBER	Program line number
EXACT_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to EXACT
FORCE_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to FORCE
LAST_ACTIVE_TIME	DATE	Time at which the query plan was last active
BIND_DATA	RAW(2000)	Bind data
TYPECHECK_MEM	NUMBER	Typecheck memory
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system **See Also:** Oracle Exadata Storage Server Software documentation for more information
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
OPTIMIZED_PHY_READ_REQUESTS	NUMBER	Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL
LOCKED_TOTAL	NUMBER	Total number of times the child cursor has been locked
PINNED_TOTAL	NUMBER	Total number of times the child cursor has been pinned
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells **See Also:** Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_RETURNED_BYTES	NUMBER	Number of bytes that are returned by Exadata cell through the regular I/O path **See Also:** Oracle Exadata Storage Server Software documentation for more information
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

Column	Datatype	Description
IS_REOPTIMIZABLE	VARCHAR2(1)	This column shows whether the next execution matching this child cursor will trigger a reoptimization. The values are: • Y: If the next execution will trigger a reoptimization • R: If the child cursor contains reoptimization information, but will not trigger reoptimization because the cursor was compiled in reporting mode • N: If the child cursor has no reoptimization information
IS_RESOLVED_ADAPTIVE_PLAN	VARCHAR2(1)	This column shows whether all of the adaptive parts of a plan have been resolved to the final plan. Once the plan is resolved, the plan hash value and the plan displayed by DBMS_XPLAN will not change through the end of execution. The values for this column are: • NULL: If the plan is not adaptive • Y: If the plan is fully resolved • N: If the plan is not yet fully resolved **See Also:** *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_XPLAN package

See Also:

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_SHARED_POOL package
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_APPLICATION_INFO.SET_MODULE procedure
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_APPLICATION_INFO.SET_ACTION procedure
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_XPLAN package

10.90 V$SQLAREA_PLAN_HASH

V$SQLAREA_PLAN_HASH displays statistics on shared SQL areas (V$SQL) by grouping on the SQL_ID and PLAN_HASH_VALUE columns. It can potentially create several rows for one parent cursor, one for each distinct value of the column PLAN_HASH_VALUE.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	First thousand characters of the SQL text for the current cursor
SQL_FULLTEXT	CLOB	All characters of the SQL text for the current cursor
ADDRESS	RAW(4 | 8)	Address of the handle to the parent for this cursor
HASH_VALUE	NUMBER	Hash value of the parent statement in the library cache
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
PLAN_HASH_VALUE	NUMBER	Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).

Column	Datatype	Description
VERSION_COUNT	NUMBER	Number of child cursors that are present in the cache under this parent
LAST_ACTIVE_CHILD_ADDRESS	RAW(4 | 8)	Address (identifier) of the child cursor that was the last to be active in the group (that is, the child cursor on behalf of which statistics in V$SQL were updated)
SHARABLE_MEM	NUMBER	Amount of shared memory used by a cursor. If multiple child cursors exist, then it is the sum of all shared memory used by all child cursors.
PERSISTENT_MEM	NUMBER	Fixed amount of memory used for the lifetime of an open cursor. If multiple child cursors exist, then it is the fixed sum of memory used for the lifetime of all the child cursors.
RUNTIME_MEM	NUMBER	Fixed amount of memory required during execution of a cursor. If multiple child cursors exist, then the fixed sum of all memory required during execution of all the child cursors.
SORTS	NUMBER	Sum of the number of sorts that were done for all the child cursors
LOADED_VERSIONS	NUMBER	Number of child cursors that are present in the cache and that have their context heap loaded
OPEN_VERSIONS	NUMBER	Number of child cursors that are currently open under this parent
USERS_OPENING	NUMBER	Number of users that have any of the child cursors open
USERS_EXECUTING	NUMBER	Total number of users executing the statement over all child cursors
FETCHES	NUMBER	Number of fetches associated with the SQL statement
EXECUTIONS	NUMBER	Total number of executions, totalled over all the child cursors
PX_SERVERS_EXECUTIONS	NUMBER	Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)
END_OF_FETCH_COUNT	NUMBER	Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column.
LOADS	NUMBER	Number of times the object was loaded or reloaded
FIRST_LOAD_TIME	DATE	Timestamp of the parent creation time
LAST_LOAD_TIME	DATE	Time at which the query plan was loaded into the library cache
LAST_ACTIVE_TIME	DATE	Time at which the query plan was last active
LAST_EXEC_START_TIME	DATE	Time at which the most recent execution of this SQL started
INVALIDATIONS	NUMBER	Total number of invalidations over all the child cursors
PARSE_CALLS	NUMBER	Sum of all parse calls to all the child cursors under this parent
DISK_READS	NUMBER	Sum of the number of disk reads over all child cursors
DIRECT_WRITES	NUMBER	Sum of the number of direct writes over all child cursors
BUFFER_GETS	NUMBER	Sum of buffer gets over all child cursors
CPU_TIME	NUMBER	CPU time (in microseconds) used by this cursor for parsing, executing, and fetching
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds)
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds)
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds)

Column	Datatype	Description
USER_IO_WAIT_TIME	NUMBER	User I/O wait time (in microseconds)
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds)
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds)
ROWS_PROCESSED	NUMBER	Total number of rows processed on behalf of this SQL statement
COMMAND_TYPE	NUMBER	Oracle command type definition
OPTIMIZER_MODE	VARCHAR2(10)	Mode under which the SQL statement was executed
OPTIMIZER_COST	NUMBER	Cost of this query given by the optimizer
OPTIMIZER_ENV	RAW(2000)	Optimizer environment
OPTIMIZER_ENV_HASH_VALUE	NUMBER	Hash value for the optimizer environment
PARSING_USER_ID	NUMBER	User ID of the user that has parsed the very first cursor under this parent
PARSING_SCHEMA_ID	NUMBER	Schema ID that was used to parse this child cursor
PARSING_SCHEMA_NAME	VARCHAR2(128)	Schema name that was used to parse this child cursor
KEPT_VERSIONS	NUMBER	Number of child cursors that have been marked to be kept using the DBMS_SHARED_POOL package
MODULE	VARCHAR2(64)	Contains the name of the module that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_MODULE
MODULE_HASH	NUMBER	Hash value of the module that is named in the MODULE column
ACTION	VARCHAR2(64)	Contains the name of the action that was executing when the SQL statement was first parsed as set by calling DBMS_APPLICATION_INFO.SET_ACTION
ACTION_HASH	NUMBER	Hash value of the action that is named in the ACTION column
SERIALIZABLE_ABORTS	NUMBER	Number of times the transaction failed to serialize, producing ORA-08177 errors, totalled over all the child cursors
OUTLINE_CATEGORY	VARCHAR2(64)	If an outline was applied during construction of the cursor, then this column displays the category of that outline. Otherwise, the column is left blank.
OUTLINE_SID	VARCHAR2(40)	Outline session identifier
REMOTE	VARCHAR2(1)	Indicates whether the cursor is remote mapped (Y) or not (N)
OBJECT_STATUS	VARCHAR2(19)	Status of the cursor: • VALID - Valid, authorized without errors • VALID_AUTH_ERROR - Valid, authorized with authorization errors • VALID_COMPILE_ERROR - Valid, authorized with compilation errors • VALID_UNAUTH - Valid, unauthorized • INVALID_UNAUTH - Invalid, unauthorized • INVALID - Invalid, unauthorized but keep the timestamp
LITERAL_HASH_VALUE	NUMBER	Hash value of the literals which are replaced with system-generated bind variables and are to be matched, when CURSOR_SHARING is used. This is not the hash value for the SQL statement. If CURSOR_SHARING is not used, then the value is 0.
SQL_PROFILE	VARCHAR2(64)	SQL profile used for this statement, if any
PROGRAM_ID	NUMBER	Program identifier
PROGRAM_LINE#	NUMBER	Program line number
EXACT_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to EXACT

Column	Datatype	Description
FORCE_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to FORCE
BIND_DATA	RAW(2000)	Bind data
TYPECHECK_MEM	NUMBER	Typecheck memory
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system **See Also:** Oracle Exadata Storage Server Software documentation for more information
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
OPTIMIZED_PHY_READ_REQUESTS	NUMBER	Number of physical read I/O requests from Database Smart Flash Cache issued by the monitored SQL
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells **See Also:** Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_RETURNED_BYTES	NUMBER	Number of bytes that are returned by Exadata cell through the regular I/O path **See Also:** Oracle Exadata Storage Server Software documentation for more information
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
CON_DBID	NUMBER	The database ID of the PDB

See Also:

- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_SHARED_POOL package
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_APPLICATION_INFO.SET_MODULE procedure
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_APPLICATION_INFO.SET_ACTION procedure

10.91 V$SQLCOMMAND

V$SQLCOMMAND displays the mapping between SQL opcodes and names.

Column	Datatype	Description
COMMAND_TYPE	NUMBER	SQL command number
COMMAND_NAME	VARCHAR2(64)	SQL command name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.92 V$SQLFN_ARG_METADATA

V$SQLFN_ARG_METADATA contains metadata about function arguments. There is one row for each argument of every function found in V$SQLFN_METADATA. There are no rows for functions that do not have any arguments.

Column	Datatype	Description
FUNC_ID	NUMBER	Internal function identification number. This column can be used to join with the V$SQLFN_METADATA view.
ARGNUM	NUMBER	Argument number
DATATYPE	VARCHAR2(8)	Data type of the argument. The value is NULL if this argument is not used. Otherwise, it can take values of any Oracle data type, family data type, or EXPR data type.
DESCR	VARCHAR2(128)	This column is reserved for future use.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

"V$SQLFN_METADATA"

10.93 V$SQLFN_METADATA

V$SQLFN_METADATA contains metadata about operators and built-in functions. Note that this view does not contain information about arguments because the number of arguments will be different for various functions. Information about arguments is contained in V$SQLFN_ARG_METADATA, which can be joined with V$SQLFN_METADATA to get information about any function and its arguments.

Column	Datatype	Description
FUNC_ID	NUMBER	Internal function identification number
NAME	VARCHAR2(128)	Name of the built-in function
MINARGS	NUMBER	Minimum number of arguments for the function
MAXARGS	NUMBER	Maximum number of arguments for the function
DATATYPE	VARCHAR2(8)	Return data type, which can take any Oracle data type values, data type family values, or ARG[n] data types
VERSION	VARCHAR2(12)	Minimum version of the database that has this function
ANALYTIC	VARCHAR2(3)	Indicates whether the function is an analytic function (YES) or not (NO)
AGGREGATE	VARCHAR2(3)	Indicates whether the function is an aggregate function (YES) or not (NO)
OFFLOADABLE	VARCHAR2(3)	Indicates whether execution of the function can be offloaded to the Oracle Exadata Storage Server (YES) or not (NO) **See Also:** Oracle Exadata Storage Server Software documentation for more information
DISP_TYPE	VARCHAR2(13)	Function display type: • NORMAL • ARITHMETIC • PARENTHESIS • REL-OP • CASELIKE • NOPARENTHESIS
USAGE	VARCHAR2(128)	A text explanation of how to use this function. The text is based on the syntax diagram for the function in the *Oracle Database SQL Language Reference*.
DESCR	VARCHAR2(4000)	Description of the function
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

"V$SQLFN_ARG_METADATA"

10.94 V$SQLSTATS

V$SQLSTATS displays basic performance statistics for SQL cursors and contains one row per SQL statement (that is, one row per unique value of SQL_ID). The column definitions for columns in V$SQLSTATS are identical to those in the V$SQL and V$SQLAREA views. However, the V$SQLSTATS view differs from V$SQL and V$SQLAREA in that it is faster, more scalable, and has a greater data retention (the statistics may still appear in this view, even after the cursor has been aged out of the shared pool). Note that V$SQLSTATS contains a subset of columns that appear in V$SQL and V$SQLAREA.

Column	Datatype	Description
SQL_TEXT	VARCHAR2(1000)	First thousand characters of the SQL text for the current cursor
SQL_FULLTEXT	CLOB	Full text for the SQL statement exposed as a CLOB column. THe full text of a SQL statement can be retrieved using this column instead of joining with the V$SQLTEXT view.
SQL_ID	VARCHAR2(13)	SQL identifier of the parent cursor in the library cache
LAST_ACTIVE_TIME	DATE	Last time the statistics of a contributing cursor were updated
LAST_ACTIVE_CHILD_ADDRESS	RAW(4 | 8)	Address of the contributing cursor that last updated these statistics
PLAN_HASH_VALUE	NUMBER	Numeric representation of the current SQL plan for this cursor. Comparing one PLAN_HASH_VALUE to another easily identifies whether or not two plans are the same (rather than comparing the two plans line by line).
PARSE_CALLS	NUMBER	Number of parse calls for all cursors with this SQL text and plan
DISK_READS	NUMBER	Number of disk reads for all cursors with this SQL text and plan
DIRECT_WRITES	NUMBER	Number of direct writes for all cursors with this SQL text and plan
DIRECT_READS	NUMBER	Number of direct reads for all cursors with this SQL text and plan
BUFFER_GETS	NUMBER	Number of buffer gets for all cursors with this SQL text and plan
ROWS_PROCESSED	NUMBER	Total number of rows the parsed SQL statement returns
SERIALIZABLE_ABORTS	NUMBER	Number of times the transaction failed to serialize, producing ORA-08177 errors, per cursor
FETCHES	NUMBER	Number of fetches associated with the SQL statement
EXECUTIONS	NUMBER	Number of executions that took place on this object since it was brought into the library cache
END_OF_FETCH_COUNT	NUMBER	Number of times this cursor was fully executed since the cursor was brought into the library cache. The value of this statistic is not incremented when the cursor is partially executed, either because it failed during the execution or because only the first few rows produced by this cursor are fetched before the cursor is closed or re-executed. By definition, the value of the END_OF_FETCH_COUNT column should be less or equal to the value of the EXECUTIONS column.
LOADS	NUMBER	Number of times the object was either loaded or reloaded
VERSION_COUNT	NUMBER	number of cursors present in the cache with this SQL text and plan
INVALIDATIONS	NUMBER	Number of times this child cursor has been invalidated
PX_SERVERS_EXECUTIONS	NUMBER	Total number of executions performed by parallel execution servers (0 when the statement has never been executed in parallel)
CPU_TIME	NUMBER	CPU time (in microseconds) used by this cursor for parsing, executing, and fetching

Column	Datatype	Description
ELAPSED_TIME	NUMBER	Elapsed time (in microseconds) used by this cursor for parsing, executing, and fetching. If the cursor uses parallel execution, then ELAPSED_TIME is the cumulative time for the query coordinator, plus all parallel query worker processes.
AVG_HARD_PARSE_TIME	NUMBER	Average hard parse time (in microseconds) used by this cursor
APPLICATION_WAIT_TIME	NUMBER	Application wait time (in microseconds)
CONCURRENCY_WAIT_TIME	NUMBER	Concurrency wait time (in microseconds)
CLUSTER_WAIT_TIME	NUMBER	Cluster wait time (in microseconds). This value is specific to Oracle RAC. It shows the total time spent waiting for all waits that are categorized under the cluster class of wait events. The value is this column is an accumulated wait time spent waiting for Oracle RAC cluster resources.
USER_IO_WAIT_TIME	NUMBER	User I/O wait time (in microseconds)
PLSQL_EXEC_TIME	NUMBER	PL/SQL execution time (in microseconds)
JAVA_EXEC_TIME	NUMBER	Java execution time (in microseconds)
SORTS	NUMBER	Number of sorts that were done for the child cursor
SHARABLE_MEM	NUMBER	Total shared memory (in bytes) currently occupied by all cursors with this SQL text and plan
TOTAL_SHARABLE_MEM	NUMBER	Total shared memory (in bytes) occupied by all cursors with this SQL text and plan if they were to be fully loaded in the shared pool (that is, cursor size)
TYPECHECK_MEM	NUMBER	Typecheck memory
IO_CELL_OFFLOAD_ELIGIBLE_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system **See Also:** Oracle Exadata Storage Server Software documentation for more information
IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between Oracle Database and the storage system. Typically used for Cache Fusion or parallel queries.
PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests issued by the monitored SQL. The requests may not be disk reads.
PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disks by the monitored SQL
PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests issued by the monitored SQL
PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disks by the monitored SQL
EXACT_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to EXACT
FORCE_MATCHING_SIGNATURE	NUMBER	Signature used when the CURSOR_SHARING parameter is set to FORCE
IO_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes (that is, size after decompression) that are offloaded to the Exadata cells **See Also:** Oracle Exadata Storage Server Software documentation for more information
IO_CELL_OFFLOAD_RETURNED_BYTES	NUMBER	Number of bytes that are returned by Exadata cell through the regular I/O path **See Also:** Oracle Exadata Storage Server Software documentation for more information
DELTA_PARSE_CALLS	NUMBER	Number of parse calls for the cursor since the last Automatic Workload Repository (AWR) snapshot **See Also:** *Oracle Database Performance Tuning Guide* for an introduction to AWR

Column	Datatype	Description
DELTA_DISK_READS	NUMBER	Number of disk reads for the cursor since the last AWR snapshot
DELTA_DIRECT_WRITES	NUMBER	Number of direct writes for the cursor since the last AWR snapshot
DELTA_DIRECT_READS	NUMBER	Number of direct reads for the cursor since the last AWR snapshot
DELTA_BUFFER_GETS	NUMBER	Number of buffer gets for the cursor since the last AWR snapshot
DELTA_ROWS_PROCESSED	NUMBER	Number of rows returned by the cursor since the last AWR snapshot
DELTA_FETCH_COUNT	NUMBER	Number of fetches for the cursor since the last AWR snapshot
DELTA_EXECUTION_COUNT	NUMBER	Number of executions for the cursor since the last AWR snapshot
DELTA_PX_SERVERS_EXECUTIONS	NUMBER	Number of executions performed by parallel execution servers since the last AWR snapshot
DELTA_END_OF_FETCH_COUNT	NUMBER	Number of times the cursor was fully executed since the last AWR snapshot
DELTA_CPU_TIME	NUMBER	CPU time (in microseconds) for the cursor since the last AWR snapshot
DELTA_ELAPSED_TIME	NUMBER	Database time (in microseconds) for the cursor since the last AWR snapshot
DELTA_APPLICATION_WAIT_TIME	NUMBER	Time spent by the cursor (in microseconds) in the Application wait class since the last AWR snapshot
DELTA_CONCURRENCY_TIME	NUMBER	Time spent by the cursor (in microseconds) in the Concurrency wait class since the last AWR snapshot
DELTA_CLUSTER_WAIT_TIME	NUMBER	Time spent by the cursor (in microseconds) in the Cluster wait class since the last AWR snapshot
DELTA_USER_IO_WAIT_TIME	NUMBER	Time spent by the cursor (in microseconds) in the User I/O wait class since the last AWR snapshot
DELTA_PLSQL_EXEC_TIME	NUMBER	Time spent by the cursor (in microseconds) executing PL/SQL since the last AWR snapshot
DELTA_JAVA_EXEC_TIME	NUMBER	Time spent by the cursor (in microseconds) executing Java since the last AWR snapshot
DELTA_SORTS	NUMBER	Number of sorts for the cursor since the last AWR snapshot
DELTA_LOADS	NUMBER	Number of times the cursor was loaded since the last AWR snapshot
DELTA_INVALIDATIONS	NUMBER	Number of times the cursor was invalidated since the last AWR snapshot
DELTA_PHYSICAL_READ_REQUESTS	NUMBER	Number of physical read I/O requests for the cursor since the last AWR snapshot
DELTA_PHYSICAL_READ_BYTES	NUMBER	Number of bytes read from disk for the cursor since the last AWR snapshot
DELTA_PHYSICAL_WRITE_REQUESTS	NUMBER	Number of physical write I/O requests for the cursor since the last AWR snapshot
DELTA_PHYSICAL_WRITE_BYTES	NUMBER	Number of bytes written to disk for the cursor since the last AWR snapshot
DELTA_IO_INTERCONNECT_BYTES	NUMBER	Number of I/O bytes exchanged between the Oracle database and the storage system for the cursor since the last AWR snapshot
DELTA_CELL_OFFLOAD_ELIG_BYTES	NUMBER	Number of I/O bytes which can be filtered by the Exadata storage system for the cursor since the last AWR snapshot **See Also:** Oracle Exadata Storage Server Software documentation for more information

Column	Datatype	Description
DELTA_CELL_UNCOMPRESSED_BYTES	NUMBER	Number of uncompressed bytes that are offloaded to the Exadata cell for the cursor since the last AWR snapshot **See Also:** Oracle Exadata Storage Server Software documentation for more information
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
CON_DBID	NUMBER	The database ID of the PDB
OBSOLETE_COUNT	NUMBER	Number of times that a parent cursor became obsolete
AVOIDED_EXECUTIONS	NUMBER	Number of executions attempted on this object, but prevented due to the SQL statement being in quarantine
DELTA_AVOIDED_EXECUTIONS	NUMBER	Number of executions attempted on this object, but prevented due to the SQL statement being in quarantine, since the last AWR snapshot

- "V$SQL"
- "V$SQLAREA"

10.95 V$SQLSTATS_PLAN_HASH

V$SQLSTATS_PLAN_HASH displays basic performance statistics for SQL cursors and contains one row per execution plan of a SQL statement (that is, one row per unique combination of SQL_ID and PLAN_HASH_VALUE).
The columns for V$SQLSTATS_PLAN_HASH are the same as those for V$SQLSTATS.

See Also:

"V$SQLSTATS"

10.96 V$SQLTEXT

V$SQLTEXT displays the text of SQL statements belonging to shared SQL cursors in the SGA.

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Used with HASH_VALUE to uniquely identify a cached cursor
HASH_VALUE	NUMBER	Used with ADDRESS to uniquely identify a cached cursor

Column	Datatype	Description
SQL_ID	VARCHAR2(13)	SQL identifier of a cached cursor
COMMAND_TYPE	NUMBER	Code for the type of SQL statement (SELECT, INSERT, and so on)
PIECE	NUMBER	Number used to order the pieces of SQL text
SQL_TEXT	VARCHAR2(64)	A column containing one piece of the SQL text
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.97 V$SQLTEXT_WITH_NEWLINES

V$SQLTEXT_WITH_NEWLINES is identical to the V$SQLTEXT view except that, to improve legibility, V$SQLTEXT_WITH_NEWLINES does not replace newlines and tabs in the SQL statement with spaces.

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Used with HASH_VALUE to uniquely identify a cached cursor
HASH_VALUE	NUMBER	Used with ADDRESS to uniquely identify a cached cursor
SQL_ID	VARCHAR2(13)	SQL identifier of a cached cursor
COMMAND_TYPE	NUMBER	Code for the type of SQL statement (SELECT, INSERT, and so on)
PIECE	NUMBER	Number used to order the pieces of SQL text
SQL_TEXT	VARCHAR2(64)	A column containing one piece of the SQL text
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

"V$SQLTEXT"

10.98 V$STANDBY_EVENT_HISTOGRAM

V$STANDBY_EVENT_HISTOGRAM displays the histogram of apply lag on the physical standby. Each distinct value of apply lag has its own bucket and the count in the corresponding bucket

represents the number of occurrences so far. The physical standby samples the apply lag every second and increments the corresponding bucket in the histogram.

Column	Datatype	Description
NAME	VARCHAR2(64)	Name of the event (currently APPLY LAG is the only valid value)
TIME	NUMBER	Time duration that the bucket represents
UNIT	VARCHAR2(16)	Time unit (seconds, minutes, hours, or days)
COUNT	NUMBER	Each row is a histogram bucket for apply lag. COUNT is the number of occurrences the apply lag falls into the histogram bucket.
LAST_TIME_UPDATED	VARCHAR2(20)	Last time the bucket was updated by an event falling into that time duration
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.99 V$STANDBY_LOG

V$STANDBY_LOG displays information about standby redo logs. Standby redo logs are similar to online redo logs, but standby redo logs are only used on a standby database that is receiving redo data from the primary database.

Column	Datatype	Description
GROUP#	NUMBER	Log group number
DBID	VARCHAR2(40)	Database ID of the primary database to which the standby redo logfile is assigned. If the standby redo logfile is unassigned, the value UNASSIGNED will be displayed.
THREAD#	NUMBER	Log thread number
SEQUENCE#	NUMBER	Log sequence number
BYTES	NUMBER	Size of the log (in bytes)
BLOCKSIZE	NUMBER	Block size of the logfile (512 or 4096)
USED	NUMBER	Number of bytes used in the log
ARCHIVED	VARCHAR2(3)	Archive status (YES) or (NO). See the STATUS column for further details.
STATUS	VARCHAR2(10)	Log status: • UNASSIGNED - If ARCHIVED is NO, then the standby redo log has been archived and is again available. If ARCHIVED is YES, then the standby redo log has never been used and is available. • ACTIVE - If ARCHIVED is NO, then the standby redo log is complete and waiting to be archived. If ARCHIVED is YES, then the standby redo log is currently being written to and is therefore not ready to be archived. For a given thread, there should be only one such log.
FIRST_CHANGE#	NUMBER	Lowest SCN in the log
FIRST_TIME	DATE	Time of the first SCN in the log

Column	Datatype	Description
NEXT_CHANGE#	NUMBER	All redo records contained within this log will have an SCN lower than NEXT_CHANGE#. Only filled in once the log is complete. Also the lowest SCN of any redo record in the next log.
NEXT_TIME	DATE	All redo records contained within this log will have a timestamp lower than NEXT_TIME. Only filled in once the log is complete. Also the lowest timestamp of any redo record in the next log.
LAST_CHANGE#	NUMBER	Redo in the standby redo log that recovery can possibly apply from the log has an SCN lower than LAST_CHANGE#
LAST_TIME	DATE	Timestamp of LAST_CHANGE#
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.100 V$STATISTICS_LEVEL

V$STATISTICS_LEVEL displays the status of the statistics/advisories controlled by STATISTICS_LEVEL.

Column	Datatype	Description
STATISTICS_NAME	VARCHAR2(64)	Name of the statistic/advisory
DESCRIPTION	VARCHAR2(4000)	Description of the statistic/advisory
SESSION_STATUS	VARCHAR2(8)	Status of the statistic/advisory for the session: • ENABLED • DISABLED
SYSTEM_STATUS	VARCHAR2(8)	System-wide status of the statistic/advisory: • ENABLED • DISABLED
ACTIVATION_LEVEL	VARCHAR2(7)	Indicates the level of STATISTICS_LEVEL that enables the statistic/advisory: • BASIC • TYPICAL • ALL
STATISTICS_VIEW_NAME	VARCHAR2(64)	If there is a single view externalizing the statistic/advisory, then this column contains the name of that view. If there is no such view, then this column is null. If there are multiple views involved, then the DESCRIPTION column mentions the view names.
SESSION_SETTABLE	VARCHAR2(3)	Indicates whether the statistic/advisory can be set at the session level (YES) or not (NO)

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "STATISTICS_LEVEL"

10.101 V$STATNAME

V$STATNAME displays decoded statistic names for the statistics shown in the V$SESSTAT and V$SYSSTAT tables.

On some platforms, the NAME and CLASS columns contain additional operating system-specific statistics.

Column	Datatype	Description
STATISTIC#	NUMBER	Statistic number **Note:** Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.
NAME	VARCHAR2(64)	Statistic name. Names that appear in this column remain stable across Oracle Database releases, and they can be relied on by customer scripts.
CLASS	NUMBER	A number representing one or more statistics classes. The following class numbers are additive: • 1 - User • 2 - Redo • 4 - Enqueue • 8 - Cache • 16 - OS • 32 - Real Application Clusters • 64 - SQL • 128 - Debug • 256 - Instance level
STAT_ID	NUMBER	Identifier of the statistic
DISPLAY_NAME	VARCHAR2(64)	A clearer and more descriptive name for the statistic that appears in the NAME column. Names that appear in the DISPLAY_NAME column can change across Oracle Database releases, therefore customer scripts should not rely on names that appear in the DISPLAY_NAME column across releases.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- "V$SESSTAT" and "V$SYSSTAT"
- " Statistics Descriptions" for statistic descriptions
- Your operating system-specific Oracle documentation

10.102 V$STATS_ADVISOR_RULES

V$STATS_ADVISOR_RULES displays the rule definition information for each Optimizer Statistics Advisor rule.

Column	Datatype	Description
RULE_ID	NUMBER	ID of the rule
NAME	VARCHAR2(64)	Name of the rule
RULE_TYPE	VARCHAR2(9)	Type of the rule: • OBJECT • OPERATION • SYSTEM
DESCRIPTION	VARCHAR2(64)	Description of the rule
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.103 V$STREAMS_APPLY_COORDINATOR

V$STREAMS_APPLY_COORDINATOR displays information about each apply process coordinator. The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the coordinator's session
SERIAL#	NUMBER	Serial number of the coordinator's session
STATE	VARCHAR2(21)	State of the coordinator: • INITIALIZING - Starting up • IDLE - Performing no work • APPLYING - Passing transactions to apply servers • SHUTTING DOWN CLEANLY - Stopping without an error • ABORTING - Stopping because of an apply error
APPLY#	NUMBER	Apply process number. An apply process coordinator is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
TOTAL_APPLIED	NUMBER	Total number of transactions applied by the apply process since the apply process was last started
TOTAL_WAIT_DEPS	NUMBER	Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions
TOTAL_WAIT_COMMITS	NUMBER	Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits
TOTAL_ADMIN	NUMBER	Number of administrative jobs issued since the apply process was last started
TOTAL_ASSIGNED	NUMBER	Number of transactions assigned to apply servers since the apply process was last started
TOTAL_RECEIVED	NUMBER	Total number of transactions received by the coordinator process since the apply process was last started
TOTAL_IGNORED	NUMBER	Number of transactions which were received by the coordinator but were ignored because they had been previously applied
TOTAL_ROLLBACKS	NUMBER	Number of transactions which were rolled back due to unexpected contention
TOTAL_ERRORS	NUMBER	Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started
UNASSIGNED_COMPLETE_TXNS	NUMBER	Total number of complete transactions that the coordinator has not assigned to any apply servers
AUTO_TXN_BUFFER_SIZE	NUMBER	Current value of transaction buffer size. Transaction buffer size refers to the number of transactions that the apply reader can assemble ahead of apply servers. The apply process periodically adjusts the transaction buffer size.
LWM_TIME	DATE	Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.

Column	Datatype	Description
LWM_MESSAGE_NUMBER	NUMBER	Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.
LWM_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.
HWM_TIME	DATE	Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.
HWM_MESSAGE_NUMBER	NUMBER	Number of the message corresponding to the high watermark. That is, no messages with a commit message number greater than this message number have been applied.
HWM_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the message corresponding to the high watermark. For user-enqueued messages, time when the message corresponding to the high watermark was enqueued into the queue at the local database.
STARTUP_TIME	DATE	Time when the apply process was last started
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started
ELAPSED_IDLE_TIME	NUMBER	Elapsed idle time
LWM_POSITION	RAW(64)	Position of the low-watermark LCR
HWM_POSITION	RAW(64)	Position of the high-watermark LCR
PROCESSED_MESSAGE_NUMBER	NUMBER	Message number currently processed by the apply coordinator
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
ACTIVE_SERVER_COUNT	NUMBER	Active server count

Note:

The ELAPSED_SCHEDULE_TIME column is only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

See Also:

- "TIMED_STATISTICS"
- "STATISTICS_LEVEL"

10.104 V$STREAMS_APPLY_READER

V$STREAMS_APPLY_READER displays information about each apply reader. The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the reader's session
SERIAL#	NUMBER	Serial number of the reader's session
APPLY#	NUMBER	Apply process number. An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
STATE	VARCHAR2(36)	State of the reader: • INITIALIZING - Starting up • IDLE - Performing no work • DEQUEUE MESSAGES - Dequeuing messages from the queue • SCHEDULE MESSAGES - Computing dependencies between messages and assembling messages into transactions • SPILLING - Spilling unapplied messages from memory to hard disk • PAUSED - WAITING FOR DDL TO COMPLETE - Waiting for a data definition language (DDL) logical change record (LCR) to be applied
TOTAL_MESSAGES_DEQUEUED	NUMBER	Total number of messages dequeued since the apply process was last started
TOTAL_MESSAGES_SPILLED	NUMBER	Number of messages spilled by the reader since the apply process was last started
DEQUEUE_TIME	DATE	Time when the last message was received
DEQUEUED_MESSAGE_NUMBER	NUMBER	Number of the last message received
DEQUEUED_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the last message received. For user-enqueued messages, time when the message was enqueued into the queue at the local database.
SGA_USED	NUMBER	Amount (in bytes) of SGA memory used by the apply process since it was last started
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started. Scheduling includes computing dependencies between messages and assembling messages into transactions.
ELAPSED_SPILL_TIME	NUMBER	Elapsed time (in hundredths of a second) spent spilling messages since the apply process was last started
LAST_BROWSE_NUM	NUMBER	Reserved for internal use
OLDEST_SCN_NUM	NUMBER	Oldest SCN
LAST_BROWSE_SEQ	NUMBER	Reserved for internal use
LAST_DEQ_SEQ	NUMBER	Last dequeue sequence number

Column	Datatype	Description
OLDEST_XIDUSN	NUMBER	Transaction ID undo segment number of the oldest transaction that either has been applied or is being applied
OLDEST_XIDSLT	NUMBER	Transaction ID slot number of the oldest transaction that either has been applied or is being applied
OLDEST_XIDSQN	NUMBER	Transaction ID sequence number of the oldest transaction that either has been applied or is being applied
SPILL_LWM_SCN	NUMBER	Spill low-watermark SCN
PROXY_SID	NUMBER	When the apply process uses combined capture and apply, the session ID of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
PROXY_SERIAL	NUMBER	When the apply process uses combined capture and apply, the serial number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
PROXY_SPID	VARCHAR2(12)	When the apply process uses combined capture and apply, the process identification number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
CAPTURE_BYTES_RECEIVED	NUMBER	When the apply process uses combined capture and apply, the number of bytes received by the apply process from the capture process since the apply process last started. If the apply process does not use combined capture and apply, then this column is not populated.
DEQUEUED_POSITION	RAW(64)	Dequeued position. This column is populated only for an apply process that is functioning as an XStream inbound server.
LAST_BROWSE_POSITION	RAW(64)	Reserved for internal use
OLDEST_POSITION	RAW(64)	The earliest position of the transactions currently being dequeued and applied. This column is populated only for an apply process that is functioning as an XStream inbound server.
SPILL_LWM_POSITION	RAW(64)	Spill low-watermark position. This column is populated only for an apply process that is functioning as an XStream inbound server.
OLDEST_TRANSACTION_ID	VARCHAR2(128)	Oldest transaction ID
TOTAL_LCRS_WITH_DEP	NUMBER	Total number of LCRs with row-level dependencies since the apply process last started
TOTAL_LCRS_WITH_WMDEP	NUMBER	Total number of LCRs with watermark dependencies since the apply process last started. A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.
TOTAL_IN_MEMORY_LCRS	NUMBER	Total number of LCRs currently in memory
SGA_ALLOCATED	NUMBER	The total amount of shared memory (in bytes) allocated from the Streams pool for the apply process since the apply process last started
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> The ELAPSED_DEQUEUE_TIME and ELAPSED_SCHEDULE_TIME columns are only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

> **See Also:**
>
> - "TIMED_STATISTICS"
> - "STATISTICS_LEVEL"

10.105 V$STREAMS_APPLY_SERVER

V$STREAMS_APPLY_SERVER displays information about each apply server and its activities. An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the message to the appropriate apply handler. An apply server is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the apply server's session
SERIAL#	NUMBER	Serial number of the apply server's session
APPLY#	NUMBER	Apply process number. An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
SERVER_ID	NUMBER	Parallel execution server number of the apply server

Column	Datatype	Description
STATE	VARCHAR2(20)	State of the apply server: • INITIALIZING - Starting up • IDLE - Performing no work • RECORD LOW-WATERMARK - Performing an administrative job that maintains information about the apply progress, which is used in the ALL_APPLY_PROGRESS and DBA_APPLY_PROGRESS data dictionary views • ADD PARTITION - Performing an administrative job that adds a partition that is used for recording information about in-progress transactions • DROP PARTITION - Performing an administrative job that purges rows that were used to record information about in-progress transactions • EXECUTE TRANSACTION - Applying a transaction • WAIT COMMIT - Waiting to commit a transaction until all other transactions with a lower commit SCN are applied. This state is possible only if the COMMIT_SERIALIZATION apply process parameter is set to a value other than DEPENDENT_TRANSACTIONS and the PARALLELISM apply process parameter is set to a value greater than 1. • WAIT DEPENDENCY - Waiting to apply a logical change record (LCR) in a transaction until another transaction, on which it has a dependency, is applied. This state is possible only if the PARALLELISM apply process parameter is set to a value greater than 1. • ROLLBACK TRANSACTION - Rolling back a transaction • TRANSACTION CLEANUP - Cleaning up an applied transaction, which includes removing LCRs from the apply process's queue • WAIT FOR CLIENT - Waiting for an XStream client application to request more LCRs • WAIT FOR NEXT CHUNK - Waiting for the next set of LCRs for a large transaction
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction currently being applied
XIDSLT	NUMBER	Transaction ID slot number of the transaction currently being applied
XIDSQN	NUMBER	Transaction ID sequence number of the transaction currently being applied
COMMITSCN	NUMBER	Commit system change number (SCN) of the transaction currently being applied
DEP_XIDUSN	NUMBER	Transaction ID undo segment number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSLT	NUMBER	Transaction ID slot number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSQN	NUMBER	Transaction ID sequence number of a transaction on which the transaction being applied by this apply server depends
DEP_COMMITSCN	NUMBER	Commit system change number (SCN) of the transaction on which this apply server depends
MESSAGE_SEQUENCE	NUMBER	Number of the current message being applied by the apply server. This value is reset to 1 at the beginning of each transaction.
TOTAL_ASSIGNED	NUMBER	Total number of transactions assigned to the apply server since the apply process was last started

Column	Datatype	Description
TOTAL_ADMIN	NUMBER	Total number of administrative jobs done by the apply server since the apply process was last started. See the STATE information in this view for the types of administrative jobs.
TOTAL_ROLLBACKS	NUMBER	Number of transactions assigned to this server which were rolled back
TOTAL_MESSAGES_APPLIED	NUMBER	Total number of messages applied by this apply server since the apply process was last started
APPLY_TIME	DATE	Time the last message was applied
APPLIED_MESSAGE_NUMBER	NUMBER	Number of the last message applied
APPLIED_MESSAGE_CREATE_TIME	DATE	Creation time at the source database of the last captured message applied. No information about user-enqueued messages is recorded in this column.
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started
ELAPSED_APPLY_TIME	NUMBER	Time elapsed (in hundredths of a second) applying messages since the apply process was last started
COMMIT_POSITION	RAW(64)	Commit position of the transaction. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.
DEP_COMMIT_POSITION	RAW(64)	Commit position of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.
LAST_APPLY_POSITION	RAW(64)	For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.
TRANSACTION_ID	VARCHAR2(128)	Transaction ID that the worker is applying. This column is populated only for an apply process that is functioning as an XStream inbound server.
DEP_TRANSACTION_ID	VARCHAR2(128)	Transaction ID of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
TOTAL_LCRS_RETRIED	NUMBER	Total number of LCRs retried by this server
LCR_RETRY_ITERATION	NUMBER	Retry iteration for this transaction by this server
TOTAL_TXNS_RETRIED	NUMBER	Total transactions retried by this server
TXN_RETRY_ITERATION	NUMBER	Total retry iterations by this server
TOTAL_TXNS_RECORDED	NUMBER	Total transactions recorded in error queue by this server

> **Note:**
>
> The ELAPSED_DEQUEUE_TIME and ELAPSED_APPLY_TIME columns are only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

> **See Also:**
>
> - "TIMED_STATISTICS"
> - "STATISTICS_LEVEL"

10.106 V$STREAMS_POOL_ADVICE

V$STREAMS_POOL_ADVICE displays information about the estimated count of spilled or unspilled messages and the associated time spent in the spill or unspill activity for different Streams pool sizes. The sizes range from 10% to 200% of the current Streams pool size, in equal intervals. The value of the interval depends on the current size of the Streams pool.

Column	Datatype	Description
STREAMS_POOL_SIZE_FOR_ESTIMATE	NUMBER	Streams pool size (in megabytes) for the estimate. The size ranges from values smaller than the current Streams pool size to values larger than the current Streams pool size, and there is a separate row for each increment. There is always an entry that shows the current Streams pool size, and there are always 20 increments. The range and the size of the increments depend on the current size of the Streams pool.
STREAMS_POOL_SIZE_FACTOR	NUMBER	Size factor with respect to the current Streams pool size
ESTD_SPILL_COUNT	NUMBER	Estimated count of messages spilled from the Streams pool
ESTD_SPILL_TIME	NUMBER	Estimated elapsed time (in seconds) to spill
ESTD_UNSPILL_COUNT	NUMBER	Estimated count of unspills (read back from disk)
ESTD_UNSPILL_TIME	NUMBER	Estimated elapsed time (in seconds) to unspill
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.107 V$STREAMS_POOL_STATISTICS

V$STREAMS_POOL_STATISTICS displays information about the current Streams pool usage percentage.

Column	Datatype	Description
TOTAL_MEMORY_ALLOCATED	NUMBER	Total memory allocated to the Streams pool (in bytes). It should always be less than the current size of the Streams pool. You can get the percentage of the Streams pool used by dividing TOTAL_MEMORY_ALLOCATED by CURRENT_SIZE.
CURRENT_SIZE	NUMBER	Current size of the Streams pool (in bytes)
SGA_TARGET_VALUE	NUMBER	Value of SGA_TARGET. Used to determine whether or not streams pool automatic tuning is enabled. This should be set even if MEMORY_TARGET is set and SGA_TARGET is not set.
SHRINK_PHASE	NUMBER	This only pertains to the Streams pool in an automatic tuning environment (SGA_TARGET and MEMORY_TARGET set). In this case, this shows whether or not the Streams pool is being asked to shrink. During the shrink phase, enqueues are blocked, flow control is enabled for all components, and cached memory is returned to the SGA.
ADVICE_DISABLED	NUMBER	This determines whether or not Streams pool advice in V$STREAMS_POOL_ADVICE as well as all statistics gathering related to auto-tuning the Streams pool have been disabled.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.108 V$SUBCACHE

V$SUBCACHE displays information about the subordinate caches currently loaded into library cache memory. The view walks through the library cache, printing out a row for each loaded subordinate cache per library cache object.

Column	Datatype	Description
OWNER_NAME	VARCHAR2(64)	Owner of the object containing these cache entries
NAME	VARCHAR2(1000)	Object Name
TYPE	NUMBER	Object Type
HEAP_NUM	NUMBER	Heap number containing this subordinate cache
CACHE_ID	NUMBER	Subordinate cache ID
CACHE_CNT	NUMBER	Number of entries for this cache in this object
HEAP_SZ	NUMBER	Amount of extent space allocated to this heap
HEAP_ALOC	NUMBER	Amount of extent space allocated from this heap
HEAP_USED	NUMBER	Amount of space utilized in this heap

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.109 V$SUBSCR_REGISTRATION_STATS

V$SUBSCR_REGISTRATION_STATS displays information for diagnosability of notifications.

Column	Datatype	Description
REG_ID	NUMBER	Registration identifier
NUM_NTFNS	NUMBER	Number of notifications
NUM_GROUPING_NTFNS	NUMBER	Number of grouping notifications
NUM_NTFNS_CURRENT_GROUP	NUMBER	Number of events received in the current group
LAST_NTFN_START_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when the last notification was started
LAST_NTFN_SENT_TIME	TIMESTAMP(3) WITH TIME ZONE	Time when the last notification was sent
TOTAL_EMON_LATENCY	NUMBER	Total EMON latency (time taken by the EMON worker to process notifications)
EMON#	NUMBER	Active EMON worker serving the registration
ALL_EMON_SERVERS	RAW(2000)	EMON workers that served the registration
TOTAL_PAYLOAD_BYTES_SENT	NUMBER	Total payload bytes sent
SHARD_ID	NUMBER	Shard number for current registration used for Key Based Messaging
NUM_RETRIES	NUMBER	Number of retries in sending notifications
TOTAL_PLSQL_EXEC_TIME	NUMBER	Total PL/SQL callback execution time (relevant only for PL/SQL notifications)
LAST_ERR	VARCHAR2(90)	Last error message
LAST_ERR_TIME	TIMESTAMP(3) WITH TIME ZONE	Time of the last error
LAST_UPDATE_TIME	TIMESTAMP(3) WITH TIME ZONE	Time of the last update
NUM_PENDING_NTFNS	NUMBER	Number of notifications pending to be sent
TOTAL_PENDING_NTFN_BYTES	NUMBER	Total number of bytes for notifications pending to be sent
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.110 V$SYS_OPTIMIZER_ENV

V$SYS_OPTIMIZER_ENV displays the contents of the optimizer environment for the instance. The optimizer environment stores the value of the main parameters used by the Oracle optimizer when building the execution plan of a SQL statement. Hence, modifying the value of one or more of these parameters (for example, by issuing an ALTER SYSTEM statement) could lead to plan changes.
The parameters displayed by this view are either regular initialization parameters (such as OPTIMIZER_FEATURES_ENABLE) or pseudo parameters (such as ACTIVE_INSTANCE_COUNT).

Column	Datatype	Description
ID	NUMBER	Unique identifier of the parameter in the optimizer environment
NAME	VARCHAR2(40)	Name of the parameter
SQL_FEATURE	VARCHAR2(64)	Associated feature control ID
ISDEFAULT	VARCHAR2(3)	Indicates whether the parameter is set to the default value (YES) or not (NO)
VALUE	VARCHAR2(25)	Value of the parameter
DEFAULT_VALUE	VARCHAR2(25)	Default value of the parameter
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- "OPTIMIZER_FEATURES_ENABLE"
- "ACTIVE_INSTANCE_COUNT"

10.111 V$SYS_TIME_MODEL

V$SYS_TIME_MODEL displays the system-wide accumulated times for various operations. The time reported is the total elapsed or CPU time (in microseconds). Any timed operation will buffer at most 5 seconds of time data. Specifically, this means that if a timed operation (such as SQL execution) takes a long period of time to perform, the data published to this view is at most missing 5 seconds of the time accumulated for the operation.
The time values are 8-byte integers and can therefore hold approximately 580,000 years worth of time before wrapping. Background process time is not included in a statistic value unless the statistic is specifically for background processes.

Column	Datatype	Description
STAT_ID	NUMBER	Statistic identifier for the time statistic

Column	Datatype	Description
STAT_NAME	VARCHAR2(64)	Name of the statistic (see Table 10-1)
VALUE	NUMBER	Amount of time (in microseconds) that the system has spent in this operation
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view returns instance-wide data and a value of 0 in the CON_ID column when queried from the root of a CDB.

10.112 V$SYSAUX_OCCUPANTS

V$SYSAUX_OCCUPANTS displays SYSAUX tablespace occupant information.

Column	Datatype	Description
OCCUPANT_NAME	VARCHAR2(64)	Occupant name
OCCUPANT_DESC	VARCHAR2(64)	Occupant description
SCHEMA_NAME	VARCHAR2(64)	Schema name for the occupant
MOVE_PROCEDURE	VARCHAR2(64)	Name of the move procedure; null if not applicable
MOVE_PROCEDURE_DESC	VARCHAR2(64)	Description of the move procedure
SPACE_USAGE_KBYTES	NUMBER	Current space usage of the occupant (in KB)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.113 V$SYSMETRIC

V$SYSMETRIC displays the system metric values captured for the most current time interval for both the long duration (60-second) and short duration (15-second) system metrics.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval

Column	Datatype	Description
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric group ID
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2(64)	Metric name
VALUE	NUMBER	Metric value
METRIC_UNIT	VARCHAR2(64)	Metric unit description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- "DBA_HIST_SYS_TIME_MODEL"
- "V$CON_SYSMETRIC"
- "DBA_HIST_CON_SYS_TIME_MODEL"

10.114 V$SYSMETRIC_HISTORY

V$SYSMETRIC_HISTORY displays all system metric values available in the database. Both long duration (60-second with 1 hour history) and short duration (15-second with one-interval only) metrics are displayed by this view.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric group ID
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2(64)	Metric name
VALUE	NUMBER	Metric value
METRIC_UNIT	VARCHAR2(64)	Metric unit description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- "DBA_HIST_SYSMETRIC_HISTORY"
- "V$CON_SYSMETRIC_HISTORY"
- "DBA_HIST_CON_SYSMETRIC_HIST"

10.115 V$SYSMETRIC_SUMMARY

`V$SYSMETRIC_SUMMARY` displays a summary of all system metric values for the long-duration system metrics. The average, maximum value, minimum value, and the value of one standard deviation for the last hour are displayed for each metric item.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
GROUP_ID	NUMBER	Metric group ID
METRIC_ID	NUMBER	Metric ID
METRIC_NAME	VARCHAR2(64)	Metric name
NUM_INTERVAL	NUMBER	Number of intervals observed
MAXVAL	NUMBER	Maximum value observed
MINVAL	NUMBER	Minimum value observed
AVERAGE	NUMBER	Average value over the period
STANDARD_DEVIATION	NUMBER	One standard deviation
METRIC_UNIT	VARCHAR2(64)	Metric unit description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- "DBA_HIST_SYSMETRIC_SUMMARY"
- "V$CON_SYSMETRIC_SUMMARY"
- "DBA_HIST_CON_SYSMETRIC_SUMM"

10.116 V$SYSSTAT

`V$SYSSTAT` displays system statistics. To find the name of the statistic associated with each statistic number (`STATISTIC#`), query the `V$STATNAME` view.

Column	Datatype	Description
`STATISTIC#`	`NUMBER`	Statistic number **Note:** Statistics numbers are not guaranteed to remain constant from one release to another. Therefore, you should rely on the statistics name rather than its number in your applications.
`NAME`	`VARCHAR2(64)`	Statistic name. You can get a complete listing of statistic names by querying the `V$STATNAME` view.
`CLASS`	`NUMBER`	A number representing one or more statistics class. The following class numbers are additive: • `1` - User • `2` - Redo • `4` - Enqueue • `8` - Cache • `16` - OS • `32` - Real Application Clusters • `64` - SQL • `128` - Debug • `256` - Instance level
`VALUE`	`NUMBER`	Statistic value
`STAT_ID`	`NUMBER`	Identifier of the statistic
`CON_ID`	`NUMBER`	The ID of the container to which the data pertains. Possible values include: • `0`: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • `1`: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

Note:

This view returns instance-wide data and a value of `0` in the `CON_ID` column when queried from the root of a CDB.

"V$STATNAME" and " Statistics Descriptions"

10.117 V$SYSTEM_CURSOR_CACHE

V$SYSTEM_CURSOR_CACHE displays system wide information on cursor usage.

> **See Also:**
>
> "V$SESSION_CURSOR_CACHE"

Column	Datatype	Description
OPENS	NUMBER	Cumulative total of cursor opens
HITS	NUMBER	Cumulative total of cursor open hits
HIT_RATIO	NUMBER	Ratio of the number of times an open cursor was found divided by the number of times a cursor was sought
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.118 V$SYSTEM_EVENT

V$SYSTEM_EVENT displays information on total waits for an event. Note that the TIME_WAITED and AVERAGE_WAIT columns will contain a value of zero on those platforms that do not support a fast timing mechanism. If you are running on one of these platforms and you want this column to reflect true wait times, then you must set TIMED_STATISTICS to TRUE in the parameter file; doing this will have a small negative effect on system performance.

> **See Also:**
>
> "TIMED_STATISTICS"

Column	Datatype	Description
EVENT	VARCHAR2(64)	Name of the wait event; derived statistic name from V$EVENT_NAME **See Also:** " Oracle Wait Events"
TOTAL_WAITS	NUMBER	Total number of waits for the event
TOTAL_TIMEOUTS	NUMBER	Total number of timeouts for the event
TIME_WAITED	NUMBER	Total amount of time waited for the event (in hundredths of a second)
AVERAGE_WAIT	NUMBER	Average amount of time waited for the event (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time waited for the event (in microseconds)

Column	Datatype	Description
CPU	NUMBER	Total amount of CPU time consumed while implementing the wait event itself (in microseconds)
TOTAL_WAITS_FG	NUMBER	Total number of waits for the event, from foreground sessions
TOTAL_TIMEOUTS_FG	NUMBER	Total number of timeouts for the event, from foreground sessions
TIME_WAITED_FG	NUMBER	Total amount of time waited for the event, from foreground sessions (in hundredths of a second)
AVERAGE_WAIT_FG	NUMBER	Average amount of time waited for the event, from foreground sessions (in hundredths of a second)
TIME_WAITED_MICRO_FG	NUMBER	Total amount of time waited for the event, from foreground sessions (in microseconds)
CPU_FG	NUMBER	Total amount of CPU time consumed while implementing the wait event itself, from foreground sessions (in microseconds)
EVENT_ID	NUMBER	Identifier of the wait event
WAIT_CLASS_ID	NUMBER	Identifier of the wait class of the wait event
WAIT_CLASS#	NUMBER	Number of the wait class of the wait event
WAIT_CLASS	VARCHAR2(64)	Name of the wait class of the wait event
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view returns instance-wide data and a value of 0 in the CON_ID column when queried from the root of a CDB.

10.119 V$SYSTEM_FIX_CONTROL

V$SYSTEM_FIX_CONTROL displays information about Fix Control (enabled/disabled) at the system level.

Column	Datatype	Description
BUGNO	NUMBER	Bug number (as fix control identifier)
VALUE	NUMBER	Current value set for the fix control
SQL_FEATURE	VARCHAR2(64)	Feature control ID
DESCRIPTION	VARCHAR2(64)	Description of the fix control
OPTIMIZER_FEATURE_ENABLE	VARCHAR2(25)	Version on (and after) which the fix is enabled by default
EVENT	NUMBER	Event formerly used to control this fix

Column	Datatype	Description
IS_DEFAULT	NUMBER	Indicates whether the current value is the same as the default (1) or not (0)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.120 V$SYSTEM_PARAMETER

V$SYSTEM_PARAMETER displays information about the initialization parameters that are currently in effect for the instance. A new session inherits parameter values from the instance-wide values.

Column	Datatype	Description
NUM	NUMBER	Parameter number
NAME	VARCHAR2(80)	Name of the parameter
TYPE	NUMBER	Parameter type: • 1 - Boolean • 2 - String • 3 - Integer • 4 - Parameter file • 5 - Reserved • 6 - Big integer
VALUE	VARCHAR2(4000)	Instance-wide parameter value
DISPLAY_VALUE	VARCHAR2(4000)	Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.
DEFAULT_VALUE	VARCHAR2(255)	The default value for this parameter. This is the value of the parameter if a value is not explicitly specified for the parameter.
ISDEFAULT	VARCHAR2(9)	Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE) The database sets the value of the ISDEFAULT column to TRUE for parameters that are not specified in the init.ora or server parameter file (SPFILE).
ISSES_MODIFIABLE	VARCHAR2(5)	Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)

Column	Datatype	Description
ISSYS_MODIFIABLE	VARCHAR2(9)	Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: • IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately. • DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions. • FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.
ISPDB_MODIFIABLE	VARCHAR2(5)	Indicates whether the parameter can be modified inside a PDB (TRUE) or not (FALSE). In a non-CDB, the value of this column is NULL.
ISINSTANCE_MODIFIABLE	VARCHAR2(5)	For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.
ISMODIFIED	VARCHAR2(8)	Indicates how the parameter was modified. If an ALTER SYSTEM was performed, the value will be MODIFIED.
ISADJUSTED	VARCHAR2(5)	Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)
ISDEPRECATED	VARCHAR2(5)	Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)
ISBASIC	VARCHAR2(5)	Indicates whether the parameter is a basic parameter (TRUE) or not (FALSE)
DESCRIPTION	VARCHAR2(255)	Description of the parameter
UPDATE_COMMENT	VARCHAR2(255)	Comments associated with the most recent update
HASH	NUMBER	Hash value for the parameter name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

"V$PARAMETER" for information about initialization parameters that are currently in effect for a session

10.121 V$SYSTEM_PARAMETER2

V$SYSTEM_PARAMETER2 displays information about the initialization parameters that are currently in effect for the instance, with each list parameter value appearing as a row in the view. A new session inherits parameter values from the instance-wide values.

Presenting the list parameter values in this format enables you to quickly determine the values for a list parameter. For example, if a parameter value is a, b, then the V$SYSTEM_PARAMETER view does not tell you if the parameter has two values (both a and b) or one value (a, b). V$SYSTEM_PARAMETER2 makes the distinction between the list parameter values clear.

Column	Datatype	Description
NUM	NUMBER	Parameter number
NAME	VARCHAR2(80)	Name of the parameter
TYPE	NUMBER	Parameter type: • 1 - Boolean • 2 - String • 3 - Integer • 4 - Parameter file • 5 - Reserved • 6 - Big integer
VALUE	VARCHAR2(4000)	Parameter value
DISPLAY_VALUE	VARCHAR2(4000)	Parameter value in a user-friendly format. For example, if the VALUE column shows the value 262144 for a big integer parameter, then the DISPLAY_VALUE column will show the value 256K.
ISDEFAULT	VARCHAR2(6)	Indicates whether the parameter is set to the default value (TRUE) or the parameter value was specified in the parameter file (FALSE)
ISSES_MODIFIABLE	VARCHAR2(5)	Indicates whether the parameter can be changed with ALTER SESSION (TRUE) or not (FALSE)
ISSYS_MODIFIABLE	VARCHAR2(9)	Indicates whether the parameter can be changed with ALTER SYSTEM and when the change takes effect: • IMMEDIATE - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect immediately. • DEFERRED - Parameter can be changed with ALTER SYSTEM regardless of the type of parameter file used to start the instance. The change takes effect in subsequent sessions. • FALSE - Parameter cannot be changed with ALTER SYSTEM unless a server parameter file was used to start the instance. The change takes effect in subsequent instances.
ISPDB_MODIFIABLE	VARCHAR2(5)	Indicates whether the parameter can be modified on a per-PDB basis (TRUE) or not (FALSE). In a non-CDB, the value of this column is NULL.
ISINSTANCE_MODIFIABLE	VARCHAR2(5)	For parameters that can be changed with ALTER SYSTEM, indicates whether the value of the parameter can be different for every instance (TRUE) or whether the parameter must have the same value for all Real Application Clusters instances (FALSE). If the ISSYS_MODIFIABLE column is FALSE, then this column is always FALSE.
ISMODIFIED	VARCHAR2(8)	Indicates how the parameter was modified. If an ALTER SYSTEM was performed, the value will be MODIFIED.

Column	Datatype	Description
ISADJUSTED	VARCHAR2(5)	Indicates whether Oracle adjusted the input value to a more suitable value (for example, the parameter value should be prime, but the user input a non-prime number, so Oracle adjusted the value to the next prime number)
ISDEPRECATED	VARCHAR2(5)	Indicates whether the parameter has been deprecated (TRUE) or not (FALSE)
ISBASIC	VARCHAR2(5)	Indicates whether the parameter is a basic parameter (TRUE) or not (FALSE)
DESCRIPTION	VARCHAR2(255)	Description of the parameter
ORDINAL	NUMBER	Position (ordinal number) of the parameter value. Useful only for parameters whose values are lists of strings.
UPDATE_COMMENT	VARCHAR2(255)	Comments associated with the most recent update
HASH	NUMBER	Hash value for the parameter name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

"V$SYSTEM_PARAMETER"

10.122 V$SYSTEM_WAIT_CLASS

V$SYSTEM_WAIT_CLASS displays the instance-wide time totals for each registered wait class.

Column	Datatype	Description
WAIT_CLASS_ID	NUMBER	Identifier of the wait class
WAIT_CLASS#	NUMBER	Number of the wait class
WAIT_CLASS	VARCHAR2(64)	Name of the wait class
TOTAL_WAITS	NUMBER	Total number of waits from this wait class
TIME_WAITED	NUMBER	Total amount of time spent in waits from this wait class (in hundredths of a second)
TIME_WAITED_MICRO	NUMBER	Total amount of time spent in waits from this wait class (in microseconds)
CPU	NUMBER	Total amount of CPU time consumed while implementing waits from this wait class (in microseconds)
TOTAL_WAITS_FG	NUMBER	Total number of waits for this wait class, from foreground sessions
TIME_WAITED_FG	NUMBER	Total amount of time spent in waits from this wait class, from foreground sessions (in hundredths of a second)

Column	Datatype	Description
TIME_WAITED_MICRO_FG	NUMBER	Total amount of time spent in waits from this wait class, from foreground sessions (in microseconds)
CPU_FG	NUMBER	Total amount of CPU time consumed while implementing waits from this wait class, from foreground sessions (in microseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view returns instance-wide data and a value of 0 in the CON_ID column when queried from the root of a CDB.

10.123 V$TABLE_ACCESS_STATS

V$TABLE_ACCESS_STATS displays the scan count for tables and partitions.

The scan data collection begins at instance startup.

Column	Datatype	Description
OBJECT_ID	NUMBER	Object ID of the table or partition
READ_COUNT	NUMBER	Aggregated scan count since instance startup
LAST_ACCESSED_TIME	TIMESTAMP(0)	Date and time of the most recent scan
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.124 V$TABLESPACE

V$TABLESPACE displays tablespace information from the control file.

Column	Datatype	Description
TS#	NUMBER	Tablespace number
NAME	VARCHAR2(30)	Tablespace name
INCLUDED_IN_DATABASE_BACKUP	VARCHAR2(3)	Indicates whether the tablespace is included in full database backups using the BACKUP DATABASE RMAN command (YES) or not (NO); NO only if the CONFIGURE EXCLUDE RMAN command was used for this tablespace
BIGFILE	VARCHAR2(3)	Indicates whether the tablespace is a bigfile tablespace (YES) or a smallfile tablespace (NO)
FLASHBACK_ON	VARCHAR2(3)	Indicates whether the tablespace participates in FLASHBACK DATABASE operations (YES) or not (NO)
ENCRYPT_IN_BACKUP	VARCHAR2(3)	Indicates whether encryption is turned ON or off at the tablespace level: • ON - Encryption is turned ON at the tablespace level • OFF - Encryption is turned OFF at the tablespace level • NULL - Encryption is neither explicitly turned on nor off at the tablespace level (default or when cleared)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.125 V$TDM_STATS

V$TDM_STATS describes statistics for Oracle Connection Manager in Traffic Director Mode (CMAN-TDM).

Column	Datatype	Description
CMAN_ID	VARCHAR2(1024)	CMAN-TDM host name
GATEWAY_ID	NUMBER	Index of the gateway process of CMAN-TDM
SERVICE_NAME	VARCHAR2(1024)	Reserved for future use
PRCP_NUM_REQUESTS	NUMBER	Number of client requests that resulted in acquire on the Proxy Resident Connection Pool (PRCP)
PRCP_NUM_BUSY_CONNECTIONS	NUMBER	Number of busy server connections in the PRCP
PRCP_NUM_OPEN_CONNECTIONS	NUMBER	Number of busy and free server connections in the PRCP
PRCP_HISTORIC_MAX_CONNECTIONS	NUMBER	Maximum size (number of connections) that the PRCP has ever reached
PRCP_NUM_WAITS	NUMBER	Total number of client requests that waited due to unavailability of free server connections in the PRCP This value accumulates since the start of the process.
PRCP_NUM_WAITS_ACTIVE	NUMBER	Number of active client requests currently waiting due to unavailability of free server connections in the PRCP
PRCP_NUM_HITS	NUMBER	Total number of times that client requests found matches in the PRCP

Column	Datatype	Description
PRCP_NUM_INBOUND_CONNECTIONS	NUMBER	Total Number of active client connections for the PRCP
EDITION	VARCHAR2(1024)	Database edition name associated with the PRCP
UPDATED_TIME	TIMESTAMP(6) WITH TIME ZONE	Date and time at which the statistics were uploaded to the PDB
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.126 V$TEMP_CACHE_TRANSFER

V$TEMP_CACHE_TRANSFER is deprecated. The information that was provided in this view is now provided in the V$INSTANCE_CACHE_TRANSFER and V$SEGMENT_STATISTICS views.

Column	Datatype	Description
FILE_NUMBER	NUMBER	Number of the temp file
X_2_NULL	NUMBER	Number of blocks with Exclusive-to-NULL conversions; always 0
X_2_NULL_FORCED_WRITE	NUMBER	Number of Exclusive-to-NULL forced writes; always 0
X_2_NULL_FORCED_STALE	NUMBER	Number of Exclusive-to-NULL blocks converted to CR; always 0
X_2_S	NUMBER	Number of blocks with Exclusive-to-Shared conversions; always 0
X_2_S_FORCED_WRITE	NUMBER	Number of Exclusive-to-Shared forced writes; always 0
S_2_NULL	NUMBER	Number of blocks with Shared-to-NULL conversions; always 0
S_2_NULL_FORCED_STALE	NUMBER	Number of Shared-to-NULL blocks converted to CR; always 0
RBR	NUMBER	Number of reuse blocks cross-instance calls; always 0
RBR_FORCED_WRITE	NUMBER	Number of blocks written due to reuse blocks cross-instance calls; always 0
NULL_2_X	NUMBER	Number of blocks with NULL-to-Exclusive conversions; always 0
S_2_X	NUMBER	Number of blocks with Shared-to-Exclusive conversions; always 0
NULL_2_S	NUMBER	Number of blocks with NULL-to-Shared conversions; always 0

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

See Also:

- "V$INSTANCE_CACHE_TRANSFER"
- "V$SEGMENT_STATISTICS"

10.127 V$TEMP_EXTENT_MAP

V$TEMP_EXTENT_MAP displays the status of each unit for all LOCALLY MANAGED temporary tablespaces.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2(30)	NOT NULL	Name of the tablespace this unit belongs to
FILE_ID	NUMBER		Absolute file number
BLOCK_ID	NUMBER		Begin block number for this unit
BYTES	NUMBER		Bytes in the extent
BLOCKS	NUMBER		Blocks in the extent
OWNER	NUMBER		Instance which owns this unit
RELATIVE_FNO	NUMBER		Relative file number
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.128 V$TEMP_EXTENT_POOL

V$TEMP_EXTENT_POOL displays the state of temporary space cached and used for the instance. Note that loading of the temporary space cache is lazy and that instances can be dormant.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2(30)	NOT NULL	Name of the tablespace

Column	Datatype	NULL	Description
FILE_ID	NUMBER		Absolute file number
EXTENTS_CACHED	NUMBER		Number of extents that have been cached
EXTENTS_USED	NUMBER		Number of extents that are actually being used
BLOCKS_CACHED	NUMBER		Number of blocks that are cached
BLOCKS_USED	NUMBER		Number of blocks that are used
BYTES_CACHED	NUMBER		Number of bytes that are cached
BYTES_USED	NUMBER		Number of bytes that are used
RELATIVE_FNO	NUMBER		Relative file number
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.129 V$TEMP_SPACE_HEADER

V$TEMP_SPACE_HEADER displays aggregate information per file per LOCALLY MANAGED temporary tablespace regarding how much space is currently being used and how much is free as identified in the space header.

Column	Datatype	NULL	Description
TABLESPACE_NAME	VARCHAR2(30)	NOT NULL	Name of the temporary tablespace
FILE_ID	NUMBER		Absolute file number
BYTES_USED	NUMBER		How many bytes are in use
BLOCKS_USED	NUMBER		How many blocks are in use
BYTES_FREE	NUMBER		How many bytes are free
BLOCKS_FREE	NUMBER		How many blocks are free
RELATIVE_FNO	NUMBER		The relative file number for the file
CON_ID	NUMBER		The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.130 V$TEMPFILE

V$TEMPFILE displays temp file information.

Column	Datatype	Description
FILE#	NUMBER	Absolute file number
CREATION_CHANGE#	NUMBER	Creation System Change Number (SCN)
CREATION_TIME	DATE	Creation time
TS#	NUMBER	Tablespace number
RFILE#	NUMBER	Relative file number in the tablespace
STATUS	VARCHAR2(7)	Status of the file (OFFLINE|ONLINE)
ENABLED	VARCHAR2(10)	Enabled for read and/or write
BYTES	NUMBER	Size of the file in bytes (from the file header)
BLOCKS	NUMBER	Size of the file in blocks (from the file header)
CREATE_BYTES	NUMBER	Creation size of the file (in bytes)
BLOCK_SIZE	NUMBER	Block size for the file
NAME	VARCHAR2(513)	Name of the file
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.131 V$TEMPORARY_LOBS

V$TEMPORARY_LOBS displays information about temporary and abstract LOBs.

Column	Datatype	Description
SID	NUMBER	Session ID
CACHE_LOBS	NUMBER	Number of cache temp LOBs
NOCACHE_LOBS	NUMBER	Number of nocache temp LOBs
ABSTRACT_LOBS	NUMBER	Number of abstract LOBs
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.132 V$TEMPSEG_USAGE

V$TEMPSEG_USAGE describes temporary segment usage.

Column	Datatype	Description
USERNAME	VARCHAR2(128)	User who requested temporary space
USER	VARCHAR2(128)	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in USERNAME.
SESSION_ADDR	RAW(4 | 8)	Session address
SESSION_NUM	NUMBER	Serial number of session
SQLADDR	RAW(4 | 8)	Address of SQL statement
SQLHASH	NUMBER	Hash value of SQL statement
SQL_ID	VARCHAR2(13)	SQL identifier of SQL statement
TABLESPACE	VARCHAR2(30)	Tablespace in which space is allocated
CONTENTS	VARCHAR2(9)	Indicates whether tablespace is TEMPORARY or PERMANENT
SEGTYPE	VARCHAR2(12)	Type of sort segment: • DATA • HASH • INDEX • LOB_DATA • LOB_INDEX • RESULT_CACHE • SORT • TEMP_UNDO
SEGFILE#	NUMBER	File number of initial extent
SEGBLK#	NUMBER	Block number of the initial extent
EXTENTS	NUMBER	Extents allocated to the sort
BLOCKS	NUMBER	Extents in blocks allocated to the sort
SEGRFNO#	NUMBER	Relative file number of initial extent
TS#	NUMBER	Tablespace number
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
SQL_ID_TEMPSEG	VARCHAR2(13)	SQL identifier of the SQL statement that created the temporary segment

10.133 V$TEMPSTAT

V$TEMPSTAT displays information about file read/write statistics.

Column	Datatype	Description
FILE#	NUMBER	Number of the file
PHYRDS	NUMBER	Number of physical reads done
PHYWRTS	NUMBER	Number of times DBWR is required to write
PHYBLKRD	NUMBER	Number of physical blocks read

Column	Datatype	Description
PHYBLKWRT	NUMBER	Number of blocks written to disk, which may be the same as PHYWRTS if all writes are single blocks
SINGLEBLKRDS	NUMBER	Number of single block reads
READTIM	NUMBER	Time (in hundredths of a second) spent doing reads if the TIMED_STATISTICS parameter is true; 0 if false
WRITETIM	NUMBER	Time (in hundredths of a second) spent doing writes if the TIMED_STATISTICS parameter is true; 0 if false
SINGLEBLKRDTIM	NUMBER	Cumulative single block read time (in hundredths of a second)
AVGIOTIM	NUMBER	Average time (in hundredths of a second) spent on I/O, if the TIMED_STATISTICS parameter is true; 0 if false
LSTIOTIM	NUMBER	Time (in hundredths of a second) spent doing the last I/O, if the TIMED_STATISTICS parameter is true; 0 if false
MINIOTIM	NUMBER	Minimum time (in hundredths of a second) spent on a single I/O, if the TIMED_STATISTICS parameter is true; 0 if false
MAXIORTM	NUMBER	Maximum time (in hundredths of a second) spent doing a single read, if the TIMED_STATISTICS parameter is true; 0 if false
MAXIOWTM	NUMBER	Maximum time (in hundredths of a second) spent doing a single write, if the TIMED_STATISTICS parameter is true; 0 if false
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "TIMED_STATISTICS"

10.134 V$TEMPUNDOSTAT

V$TEMPUNDOSTAT shows various statistics related to the temporary undo log for this database instance. It displays a histogram of statistical data to show how the system is working. Each row in the view keeps statistics collected in the instance for a 10-minute interval. The rows are in the descending order of the BEGIN_TIME column value. This view contains a total of 576 rows, spanning a 4-day cycle. This view is similar to the V$UNDOSTAT view.

Column	Datatype	Description
BEGIN_TIME	DATE	Identifies the beginning of the time interval
END_TIME	DATE	Identifies the end of the time interval

Column	Datatype	Description
UNDOTSN	NUMBER	Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.
TXNCOUNT	NUMBER	Total number of transaction that have bound to the temp undo segment contained in above tablespace within the interval period
MAXCONCURRENCY	NUMBER	Highest number of transactions executed concurrently which modified temporary objects within the interval period
MAXQUERYLEN	NUMBER	Reserved for future use
MAXQUERYID	VARCHAR2(13)	Reserved for future use
UNDOBLKCNT	NUMBER	Total number of temporary undo blocks consumed
EXTCNT	NUMBER	Total number of extents consumed
USCOUNT	NUMBER	Temp undo segments created in this period
SSOLDERRCNT	NUMBER	Identifies the number of times the error ORA-01555 occurred. You can use this statistic to decide whether or not the UNDO_RETENTION initialization parameter is set properly given the size of the undo tablespace. Increasing the value of UNDO_RETENTION can reduce the occurrence of this error.
NOSPACEERRCNT	NUMBER	Total number of times the error 'no space left for temporary undo' was raised
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**

10.135 V$TEXT_WAITING_EVENTS

V$TEXT_WAITING_EVENTS displays information about Oracle Text index maintenance events that have been delayed due to errors or contentions.

Column	Datatype	Description
OWNER#	NUMBER	Text index owner number
TABLE#	NUMBER	Base table object number
INDEX#	NUMBER	Text index object number
TABLE_PARTITION#	NUMBER	Table partition object number
INDEX_PARTITION#	NUMBER	Index partition object number

Column	Datatype	Description
EVENT_TYPE	VARCHAR2(26)	Text index maintenance event type: • NONE • SYNC-Mapping Timeout • SYNC-Mapping • SYNC-Ranges • SYNC-Scheduler • SYNC-Postings Serial • SYNC-Postings Concurrent • SYNC-Writer • SYNC-Cleanup batches • SYNC-Inspect • MONITOR • EVENT Stats • EVENT Stats Clean up • OPTIMIZE-Scheduler Timeout • OPTIMIZE-Scheduler • OPTIMIZE-Merge
ITERATION	NUMBER	Event retry iteration number This value is a number between 0 and 10.
WAIT_TIME	NUMBER	Total time (in milliseconds) that the event will be waiting
ELAPSED_TIME	NUMBER	Elapsed time (in milliseconds) since the event started waiting The difference between WAIT_TIME and ELAPSED_TIME indicates how much longer the event will be left waiting.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.136 V$THREAD

V$THREAD displays thread information from the control file. This view does not return meaningful results on a physical standby database.

Column	Datatype	Description
THREAD#	NUMBER	Thread number
STATUS	VARCHAR2(6)	Thread status (OPEN| CLOSED)
ENABLED	VARCHAR2(8)	Enabled status: DISABLED, (enabled) PRIVATE, or (enabled) PUBLIC

Column	Datatype	Description
GROUPS	NUMBER	Number of log groups assigned to this thread
INSTANCE	VARCHAR2(80)	Instance name, if available
OPEN_TIME	DATE	Last time the thread was opened
CURRENT_GROUP#	NUMBER	Current log group
SEQUENCE#	NUMBER	Sequence number of current log
CHECKPOINT_CHANGE#	NUMBER	SCN at last checkpoint
CHECKPOINT_TIME	DATE	Time of last checkpoint
ENABLE_CHANGE#	NUMBER	SCN at which thread was enabled
ENABLE_TIME	DATE	Time of enable SCN
DISABLE_CHANGE#	NUMBER	SCN at which thread was disabled
DISABLE_TIME	DATE	Time of disable SCN
LAST_REDO_SEQUENCE#	NUMBER	Last redo sequence number written by LGWR
LAST_REDO_BLOCK	NUMBER	Last redo block written by LGWR
LAST_REDO_CHANGE#	NUMBER	SCN of last redo for the thread
LAST_REDO_TIME	DATE	Time of last redo for the thread
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.137 V$THRESHOLD_TYPES

V$THRESHOLD_TYPES displays information about threshold types.

Column	Datatype	Description
METRICS_ID	NUMBER	Metrics ID
METRICS_GROUP_ID	NUMBER	Metrics group ID
OPERATOR_MASK	NUMBER	Operator mask
OBJECT_TYPE	VARCHAR2(64)	Object type: • SYSTEM • FILE • SERVICE • EVENT_CLASS • TABLESPACE • SESSION
ALERT_REASON_ID	NUMBER	ID of the alert reason
METRIC_VALUE_TYPE	NUMBER	Metric value type

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.138 V$TIMER

V$TIMER displays the elapsed time in hundredths of a second. Time is measured since the beginning of the epoch, which is operating system specific, and wraps around to 0 again whenever the value overflows four bytes (roughly 497 days).

Column	Datatype	Description
HSECS	NUMBER	Elapsed time (in hundredths of a second)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.139 V$TIMEZONE_FILE

V$TIMEZONE_FILE describes the time zone file that is currently in use by the database.

Column	Datatype	Description
FILENAME	VARCHAR2(20)	Time zone file name
VERSION	NUMBER	Time zone file version
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.140 V$TIMEZONE_NAMES

V$TIMEZONE_NAMES displays valid time zone names.

Column	Datatype	Description
TZNAME	VARCHAR2(64)	Time zone region (for example, US/Pacific)
TZABBREV	VARCHAR2(64)	Corresponding daylight abbreviation (for example, PDT)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.141 V$TOPLEVELCALL

V$TOPLEVELCALL displays the mapping between Oracle top level calls and names.

Column	Datatype	Description
TOP_LEVEL_CALL#	NUMBER	Oracle top level call number
TOP_LEVEL_CALL_NAME	VARCHAR2(64)	Oracle top level call name
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.142 V$TRANSACTION

V$TRANSACTION lists the active transactions in the system.

Column	Datatype	Description
ADDR	RAW(4 | 8)	Address of the transaction state object
XIDUSN	NUMBER	Undo segment number
XIDSLOT	NUMBER	Slot number
XIDSQN	NUMBER	Sequence number
UBAFIL	NUMBER	Undo block address (UBA) filenum
UBABLK	NUMBER	UBA block number
UBASQN	NUMBER	UBA sequence number
UBAREC	NUMBER	UBA record number
STATUS	VARCHAR2(16)	Status
START_TIME	VARCHAR2(20)	Start time (wall clock)
START_SCNB	NUMBER	Start system change number (SCN) base
START_SCNW	NUMBER	Start SCN wrap

Column	Datatype	Description
START_UEXT	NUMBER	Start extent number
START_UBAFIL	NUMBER	Start UBA file number
START_UBABLK	NUMBER	Start UBA block number
START_UBASQN	NUMBER	Start UBA sequence number
START_UBAREC	NUMBER	Start UBA record number
SES_ADDR	RAW(4 | 8)	User session object address
FLAG	NUMBER	Flag
SPACE	VARCHAR2(3)	YES if a space transaction
RECURSIVE	VARCHAR2(3)	YES if a recursive transaction
NOUNDO	VARCHAR2(3)	YES if a no undo transaction
PTX	VARCHAR2(3)	YES if parallel transaction
NAME	VARCHAR2(256)	Name of a named transaction
PRV_XIDUSN	NUMBER	Previous transaction undo segment number
PRV_XIDSLT	NUMBER	Previous transaction slot number
PRV_XIDSQN	NUMBER	Previous transaction sequence number
PTX_XIDUSN	NUMBER	Rollback segment number of the parent XID
PTX_XIDSLT	NUMBER	Slot number of the parent XID
PTX_XIDSQN	NUMBER	Sequence number of the parent XID
DSCN-B	NUMBER	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in DSCN_BASE.
DSCN-W	NUMBER	This column is obsolete and maintained for backward compatibility. The value of this column is always equal to the value in DSCN_WRAP.
USED_UBLK	NUMBER	Number of undo blocks used
USED_UREC	NUMBER	Number of undo records used
LOG_IO	NUMBER	Logical I/O
PHY_IO	NUMBER	Physical I/O
CR_GET	NUMBER	Consistent gets
CR_CHANGE	NUMBER	Consistent changes
START_DATE	DATE	Start time (wall clock)
DSCN_BASE	NUMBER	Dependent SCN base
DSCN_WRAP	NUMBER	Dependent SCN wrap
START_SCN	NUMBER	Start SCN
DEPENDENT_SCN	NUMBER	Dependent SCN
XID	RAW(8)	Transaction XID
PRV_XID	RAW(8)	Previous transaction XID
PTX_XID	RAW(8)	Parent transaction XID
TXN_PRIORITY	VARCHAR2(7)	Priority of the transaction (HIGH, MEDIUM, or LOW) for the Priority Transactions feature
PRIORITY_TXNS_WAIT_TARGET	NUMBER	If TXN_PRIORITY is HIGH or MEDIUM, the maximum number of seconds the transaction will wait for a row lock before the database rolls back a lower priority transaction holding the lock If the priority is LOW, the value of this column is 0.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.143 V$TRANSACTION_ENQUEUE

V$TRANSACTION_ENQUEUE displays locks owned by transaction state objects.

Column	Datatype	Description
ADDR	RAW(4 | 8)	Address of lock state object
KADDR	RAW(4 | 8)	Address of lock
SID	NUMBER	Identifier for session holding or acquiring the lock
TYPE	VARCHAR2(2)	Type of lock. TX indicates transaction enqueue.
ID1	NUMBER	Lock identifier #1 (depends on type)
ID2	NUMBER	Lock identifier #2 (depends on type)
LMODE	NUMBER	Lock mode in which the session holds the lock: • 0 - none • 1 - null (NULL) • 2 - row-S (SS) • 3 - row-X (SX) • 4 - share (S) • 5 - S/Row-X (SSX) • 6 - exclusive (X)
REQUEST	NUMBER	Lock mode in which the process requests the lock: • 0 - none • 1 - null (NULL) • 2 - row-S (SS) • 3 - row-X (SX) • 4 - share (S) • 5 - S/Row-X (SSX) • 6 - exclusive (X)
CTIME	NUMBER	Time since current mode was granted
BLOCK	NUMBER	The lock is blocking another lock
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.144 V$TRANSPORTABLE_PLATFORM

V$TRANSPORTABLE_PLATFORM displays all platforms that support cross-platform tablespace transport. Specifically, it lists all platforms supported by the RMAN CONVERT TABLESPACE command, along with the endianness of each platform.

Column	Datatype	Description
PLATFORM_ID	NUMBER	Platform identification number
PLATFORM_NAME	VARCHAR2(101)	Platform name
ENDIAN_FORMAT	VARCHAR2(14)	Platform endian format: • Big • Little • UNKNOWN FORMAT
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.145 V$TRUE_CACHE

V$TRUE_CACHE displays True Cache configuration information.

- When you query this view on a True Cache, it returns a single row of information about the primary database to which the True Cache is connected.
- When you query this view on a primary database, it returns one row of information for each True Cache that is connected to the primary database.

Column	Datatype	Description
MY_DG_ID	NUMBER	Data Guard ID • When queried on a True Cache, the Data Guard ID of the True Cache • When queried on a primary database, the Data Guard ID of the primary database
REMOTE_DG_ID	NUMBER	Remote Data Guard ID • When queried on a True Cache, the Data Guard ID of the primary database • When queried on a primary database, the Data Guard ID of the True Cache

Column	Datatype	Description
DEST_ID	NUMBER	Log archive destination parameter identifier • When queried on a True Cache, the value of this column is always 0, because a True Cache does not send online redo log blocks to any destination. • When queried on a primary database, the corresponding destination ID (*n*) of the LOG_ARCHIVE_DEST_*n* initialization parameter. This parameter specifies the network name of the True Cache so that the primary database knows where to send online redo log blocks. This column matches the DEST_ID column in other views related to Data Guard and redo transport services, such as the V$ARCHIVE_DEST and V$DATAGUARD_STATUS views.
TRUE_CACHE_NAME	VARCHAR2(30)	Unique database name (DB_UNIQUE_NAME) of the True Cache
PRIMARY_NAME	VARCHAR2(30)	Unique database name (DB_UNIQUE_NAME) of the primary database
STATUS	VARCHAR2(256)	Text describing the current status of the True Cache configuration If there is an issue with the True Cache configuration, then this column displays information about the issue. If there are no issues with the True Cache configuration, then the value of this column is HEALTHY.
REMOTE_VERSION	VARCHAR2(18)	Remote database version • When queried on a True Cache, the database version of the primary database • When queried on a primary database, the database version of the True Cache
CON_ID	NUMBER	The ID of the container to which the data pertains The value of this column is always 0 (CDB$ROOT container).

> **Note:**
>
> This view is available starting with Oracle Database 23ai.

10.146 V$TSDP_SUPPORTED_FEATURE

V$TSDP_SUPPORTED_FEATURE displays information about the features supported by Transparent Sensitive Data Protection (TSDP).

Column	Datatype	Description
FEATURE_NAME	VARCHAR2(200)	The name of the supported feature
FUNCTIONALITY	VARCHAR2(200)	The functionality that is supported within the feature. If all of the functionality of the feature is supported, the value is ALL, otherwise the value will show the specific functionality that is supported.
COMMENTS$	VARCHAR2(4000)	More information regarding the support for the feature and the specific functionality

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> *Oracle Database Security Guide* for more information about using Transparent Sensitive Data Protection.

10.147 V$TYPE_SIZE

V$TYPE_SIZE displays the sizes of various database components for use in estimating data block capacity.

Column	Datatype	Description
COMPONENT	VARCHAR2(8)	Component name, such as segment or buffer header
TYPE	VARCHAR2(8)	Component type
DESCRIPTION	VARCHAR2(32)	Description of the component
TYPE_SIZE	NUMBER	Size of the component
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.148 V$UNDOSTAT

V$UNDOSTAT displays a histogram of statistical data to show how well the system is working. The available statistics include undo space consumption, transaction concurrency, and length of queries executed in the instance. You can use this view to estimate the amount of undo space required for the current workload. Oracle uses this view to tune undo usage in the system. The view returns NULL values if the system is in manual undo management mode. Each row in the view keeps statistics collected in the instance for a 10-minute interval. The rows are in descending order by the BEGIN_TIME column value. Each row belongs to the time interval marked by (BEGIN_TIME, END_TIME). Each column represents the data collected for the particular statistic in that time interval. The first row of the view contains statistics for the (partial) current time period. The view contains a total of 576 rows, spanning a 4 day cycle.

Column	Datatype	Description
BEGIN_TIME	DATE	Identifies the beginning of the time interval
END_TIME	DATE	Identifies the end of the time interval
UNDOTSN	NUMBER	Represents the last active undo tablespace in the duration of time. The tablespace ID of the active undo tablespace is returned in this column. If more than one undo tablespace was active in that period, the active undo tablespace that was active at the end of the period is reported.
UNDOBLKS	NUMBER	Represents the total number of undo blocks consumed. You can use this column to obtain the consumption rate of undo blocks, and thereby estimate the size of the undo tablespace needed to handle the workload on your system.
TXNCOUNT	NUMBER	Identifies the total number of transactions executed within the period
MAXQUERYLEN	NUMBER	Identifies the length of the longest query (in seconds) executed in the instance during the period. You can use this statistic to estimate the proper setting of the UNDO_RETENTION initialization parameter. The length of a query is measured from the cursor open time to the last fetch/execute time of the cursor. Only the length of those cursors that have been fetched/executed during the period are reflected in the view.
MAXQUERYID	VARCHAR2(13)	SQL identifier of the longest running SQL statement in the period
MAXCONCURRENCY	NUMBER	Identifies the highest number of transactions executed concurrently within the period
UNXPSTEALCNT	NUMBER	Number of attempts to obtain undo space by stealing unexpired extents from other transactions
UNXPBLKRELCNT	NUMBER	Number of unexpired blocks removed from certain undo segments so they can be used by other transactions
UNXPBLKREUCNT	NUMBER	Number of unexpired undo blocks reused by transactions
EXPSTEALCNT	NUMBER	Number of attempts to steal expired undo blocks from other undo segments
EXPBLKRELCNT	NUMBER	Number of expired undo blocks stolen from other undo segments
EXPBLKREUCNT	NUMBER	Number of expired undo blocks reused within the same undo segments
SSOLDERRCNT	NUMBER	Identifies the number of times the error ORA-01555 occurred. You can use this statistic to decide whether or not the UNDO_RETENTION initialization parameter is set properly given the size of the undo tablespace. Increasing the value of UNDO_RETENTION can reduce the occurrence of this error.
NOSPACEERRCNT	NUMBER	Identifies the number of times space was requested in the undo tablespace and there was no free space available. That is, all of the space in the undo tablespace was in use by active transactions. The corrective action is to add more space to the undo tablespace.
ACTIVEBLKS	NUMBER	Total number of blocks in the active extents of the undo tablespace for the instance at the sampled time in the period
UNEXPIREDBLKS	NUMBER	Total number of blocks in the unexpired extents of the undo tablespace for the instance at the sampled time in the period
EXPIREDBLKS	NUMBER	Total number of blocks in the expired extents of the undo tablespace for the instance at the sampled time in the period

Column	Datatype	Description
TUNED_UNDORETENTION	NUMBER	Amount of time (in seconds) for which undo will not be recycled from the time it was committed. At any point in time, the latest value of TUNED_UNDORETENTION is used to determine whether data committed at a particular time in the past can be recycled. The value of this column is not meaningful on an Oracle Active Data Guard standby database instance, because the system does not tune this value on such instances.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "UNDO_RETENTION"

10.149 V$UNUSABLE_BACKUPFILE_DETAILS

V$UNUSABLE_BACKUPFILE_DETAILS displays information about all backup files (backup pieces, proxy copies, or copies) that are marked unavailable and expired. You can select one of the rows and use BTYPE_KEY or FILETYPE_KEY to change the status of a backup file set or a specific file to available.

Column	Datatype	Description
SESSION_KEY	NUMBER	Session identifier
SESSION_RECID	NUMBER	Session record ID
SESSION_STAMP	NUMBER	Session stamp
RMAN_STATUS_RECID	NUMBER	Record ID of the corresponding row in the control file
RMAN_STATUS_STAMP	NUMBER	Timestamp of the row in the controlfile
BTYPE	CHAR(9)	Backup type container. Possible values are: BACKUPSET, IMAGECOPY, PROXYCOPY.
BTYPE_KEY	NUMBER	Unique identifier for the backup type, either BS_KEY or COPY_KEY.
ID1	NUMBER	If BACKUPSET, it contains SET_STAMP. If IMAGECOPY or PROXYCOPY, it is RECID from the control file.
ID2	NUMBER	If BACKUPSET, it contains SET_COUNT. If IMAGECOPY or PROXYCOPY, it is STAMP.
FILETYPE	VARCHAR2(15)	Type of file. Possible values are: BACKUPPIECE, COPY, PROXYCOPY.
FILETYPE_KEY	NUMBER	Backup piece key if the file is a backup piece; otherwise COPY_KEY.
STATUS	VARCHAR2(1)	Status of the backup file, either U (unavailable) or X (expired)
FILESIZE	NUMBER	Size of the file

Column	Datatype	Description
DEVICE_TYPE	VARCHAR2(17)	Type of device on which the file resides
FILENAME	VARCHAR2(513)	Name of the file
MEDIA	VARCHAR2(65)	Name of the media on which the copy resides. This value is informational only. It is not needed for restore.
MEDIA_POOL	NUMBER	Media pool in which the copy resides. This is the same value that was entered in the POOL operand of the Recovery Manager BACKUP command.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.150 V$VERSION

V$VERSION displays the version number of Oracle Database. The database components have the same version number as the database, so the version number is returned only once.

Column	Datatype	Description
BANNER	VARCHAR2(129)	Component name and version number
BANNER_FULL	VARCHAR2(258)	The new 2 line banner format introduced in Oracle Database 18c. The banner displays the database release and version number.
BANNER_LEGACY	VARCHAR2(129)	The legacy 1 line banner used before Oracle Database 18c. This column displays the same value as the BANNER column.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.151 V$VPD_POLICY

V$VPD_POLICY displays all the fine-grained security policies and predicates associated with the cursors currently in the library cache.

Column	Datatype	Description
ADDRESS	RAW(4 | 8)	Cursor address
PARADDR	RAW(4 | 8)	Parent cursor address
SQL_HASH	NUMBER	SQL hash number

Column	Datatype	Description
SQL_ID	VARCHAR2(13)	SQL identifier
CHILD_NUMBER	NUMBER	Cursor's child number under the parent
OBJECT_OWNER	VARCHAR2(128)	Owner of the object with the policy
OBJECT_NAME	VARCHAR2(128)	Name of the object with the policy
POLICY_GROUP	VARCHAR2(128)	Name of the policy group
POLICY	VARCHAR2(128)	Name of the policy
POLICY_FUNCTION_OWNER	VARCHAR2(128)	Owner of the policy function
PREDICATE	VARCHAR2(4000)	Predicate for the policy (truncated to 4000 bytes in length)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.152 V$WAIT_CHAINS

V$WAIT_CHAINS displays information about blocked sessions. A wait chain is composed of sessions that are blocked by one another. Each row represents a blocked and blocker session pair. If a wait chain is not a cyclical wait chain, then the last row for the chain does not have a blocker.

Column	Datatype	Description
CHAIN_ID	NUMBER	A number identifying the wait chain
CHAIN_IS_CYCLE	VARCHAR2(5)	Indicates whether the final blocked session in the wait chain is blocked by the initial blocked session (TRUE) or not (FALSE)
CHAIN_SIGNATURE	VARCHAR2(801)	An Oracle-specific text signature of the wait chain. This signature can be used to identify similar wait chains.
CHAIN_SIGNATURE_HASH	NUMBER	A numeric representation of CHAIN_SIGNATURE
INSTANCE	NUMBER	Blocked session's instance identifier
OSID	VARCHAR2(25)	Blocked session's operating system process identifier
PID	NUMBER	Blocked session's Oracle process identifier
SID	NUMBER	Blocked session's Oracle session identifier
SESS_SERIAL#	NUMBER	Blocked session's Oracle session serial number
PDB_ID	NUMBER	Blocked session's PDB identifier
PDB_NAME	VARCHAR2(31)	Blocked session's PDB name
BLOCKER_IS_VALID	VARCHAR2(5)	Indicates whether the blocked session has a blocker (TRUE) or not (FALSE)
BLOCKER_INSTANCE	NUMBER	Blocker session's instance identifier; NULL if BLOCKER_IS_VALID is FALSE
BLOCKER_OSID	VARCHAR2(25)	Blocker session's operating system process identifier; NULL if BLOCKER_IS_VALID is FALSE

Column	Datatype	Description
BLOCKER_PID	NUMBER	Blocker session's Oracle process identifier; NULL if BLOCKER_IS_VALID is FALSE
BLOCKER_SID	NUMBER	Blocker session's Oracle session identifier; NULL if BLOCKER_IS_VALID is FALSE
BLOCKER_SESS_SERIAL#	NUMBER	Blocker session's Oracle session serial number; NULL if BLOCKER_IS_VALID is FALSE
BLOCKER_PDB_ID	NUMBER	Blocker session's PDB identifier
BLOCKER_PDB_NAME	VARCHAR2(31)	Blocker session's PDB name
BLOCKER_CHAIN_ID	NUMBER	If not NULL, then the blocker session is a member of another chain specified by this chain identifier. For the remaining wait chain information, see the wait chain with the specified CHAIN_ID.
IN_WAIT	VARCHAR2(5)	Indicates whether the blocked session is in a wait (TRUE) or not (FALSE)
TIME_SINCE_LAST_WAIT_SECS	NUMBER	Number of seconds since the last time the blocked session waited; NULL if IN_WAIT is TRUE
WAIT_ID	NUMBER	A number identifying the wait; NULL if IN_WAIT is FALSE
WAIT_EVENT	NUMBER	Resource or event number for which the blocked session is waiting; NULL if IN_WAIT is FALSE
WAIT_EVENT_TEXT	VARCHAR2(64)	Resource or event for which the blocked session is waiting; NULL if IN_WAIT is FALSE
P1	NUMBER	First additional wait parameter; NULL if IN_WAIT is FALSE
P1_TEXT	VARCHAR2(64)	Description of the first additional wait parameter; NULL if IN_WAIT is FALSE
P2	NUMBER	Second additional wait parameter; NULL if IN_WAIT is FALSE
P2_TEXT	VARCHAR2(64)	Description of the second additional wait parameter; NULL if IN_WAIT is FALSE
P3	NUMBER	Third additional wait parameter; NULL if IN_WAIT is FALSE
P3_TEXT	VARCHAR2(64)	Description of the third additional wait parameter; NULL if IN_WAIT is FALSE
IN_WAIT_SECS	NUMBER	Seconds the blocked session has been in the current wait; NULL if IN_WAIT is FALSE
TIME_REMAINING_SECS	NUMBER	Seconds remaining until the blocked session ends its wait (-1 if the blocked session can indefinitely wait); NULL if IN_WAIT is FALSE
NUM_WAITERS	NUMBER	Number of sessions waiting for the blocked session
ROW_WAIT_OBJ#	NUMBER	Object ID for the table containing the row specified in ROW_WAIT_ROW#; NULL if IN_WAIT is FALSE
ROW_WAIT_FILE#	NUMBER	Identifier for the data file containing the row specified in ROW_WAIT_ROW#; NULL if IN_WAIT is FALSE. This column is valid only if the blocked session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
ROW_WAIT_BLOCK#	NUMBER	Identifier for the block containing the row specified in ROW_WAIT_ROW#; NULL if IN_WAIT is FALSE. This column is valid only if the blocked session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.
ROW_WAIT_ROW#	NUMBER	Current row being locked; NULL if IN_WAIT is FALSE. This column is valid only if the blocked session is currently waiting for another transaction to commit and the value of ROW_WAIT_OBJ# is not -1.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.153 V$WAITCLASSMETRIC

V$WAITCLASSMETRIC displays metric values of wait classes for the most recent 60-second interval. A history of the last one hour will be kept in the system.

Column	Datatype	Description
BEGIN_TIME	DATE	Begin time of the interval
END_TIME	DATE	End time of the interval
INTSIZE_CSEC	NUMBER	Interval size (in hundredths of a second)
WAIT_CLASS#	NUMBER	Number of the class of the wait event
WAIT_CLASS_ID	NUMBER	Identifier of the class of the wait event
AVERAGE_WAITER_COUNT	NUMBER	Average waiter count
DBTIME_IN_WAIT	NUMBER	Percent of database time spent in the wait
TIME_WAITED	NUMBER	Time waited during the interval (in hundredths of a second)
WAIT_COUNT	NUMBER	Number of times waited
TIME_WAITED_FG	NUMBER	Amount of time (in hundredths of a second) spent in waits from this wait class in foreground sessions
WAIT_COUNT_FG	NUMBER	Number of times foreground processes waited
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.154 V$WAITCLASSMETRIC_HISTORY

V$WAITCLASSMETRIC_HISTORY displays metric values of wait classes for all intervals in the last one hour.

The columns for V$WAITCLASSMETRIC_HISTORY are the same as those for V$WAITCLASSMETRIC.

> **See Also:**
>
> "V$WAITCLASSMETRIC"

10.155 V$WAITSTAT

V$WAITSTAT displays block contention statistics. This table is only updated when timed statistics are enabled.

Column	Datatype	Description
CLASS	VARCHAR2(18)	Class of the block
COUNT	NUMBER	Number of waits by this OPERATION for this CLASS of block
TIME	NUMBER	Sum of all wait times for all the waits by this OPERATION for this CLASS of block (in centiseconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.156 V$WALLET

V$WALLET displays metadata of certificates that may be used as a master key for Transparent Data Encryption.

> **Note:**
>
> The use of PKI encryption with Transparent Data Encryption is deprecated. To configure Transparent Data Encryption, use the ADMINISTER KEY MANAGEMENT SQL statement. See *Oracle Database Transparent Data Encryption Guide* for more information.

Column	Datatype	Description
CERT_ID	VARCHAR2(52)	A unique certificate identifier value used to specify a particular PKI certificate for use as the master key
DN	VARCHAR2(255)	Distinguished name of a particular PKI certificate
SERIAL_NUM	VARCHAR2(40)	Unique serial number assigned to a certificate by the issuer or signer
ISSUER	VARCHAR2(255)	Distinguished name of the Certificate Authority or issuer that issued and signed the certificate
KEYSIZE	NUMBER	Size of the PKI key associated with the certificate

Column	Datatype	Description
STATUS	VARCHAR2(16)	Current status of the certificate: • UNUSED • IN USE • USED This column allows the user to identify whether a certificate is currently in use or has already been used for Transparent Data Encryption.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.157 V$WORKLOAD_REPLAY_THREAD

V$WORKLOAD_REPLAY_THREAD displays information for all the different types of replay sessions.

Column	Datatype	Description
CLOCK	NUMBER	Current simulated SCN based on the SCN recorded at capture time
NEXT_TICKER	NUMBER	Next stream ID that will increment the CLOCK after a commit action
SID	NUMBER	Session ID of the replay session
SERIAL#	NUMBER	Session serial number of the replay session
SPID	VARCHAR2(24)	The server process ID of the replay session
LOGON_USER	VARCHAR2(128)	Logon username of the replay session
LOGON_TIME	DATE	Logon time of the replay session
EVENT	VARCHAR2(64)	Event name
EVENT_ID	NUMBER	Event identifier
EVENT#	NUMBER	Event operation code
P1TEXT	VARCHAR2(64)	Text for event parameter 1
P1	NUMBER	Value of event parameter 1
P2TEXT	VARCHAR2(64)	Text for event parameter 2
P2	NUMBER	Value of event parameter 2
P3TEXT	VARCHAR2(64)	Text for event parameter 3
P3	NUMBER	Value of event parameter 3
WAIT_FOR_SCN	NUMBER	The captured SCN for which the current user call should wait
FILE_ID	NUMBER	The stream ID that is being replayed
CALL_COUNTER	NUMBER	The call counter of the user call that is being replayed
DEPENDENT_SCN	NUMBER	The dependent SCN, captured to order the commit actions using block-level dependencies
STATEMENT_SCN	NUMBER	Statement SCN
COMMIT_WAIT_SCN	NUMBER	The (maximum) SCN that the current commit should wait for

Column	Datatype	Description
POST_COMMIT_SCN	NUMBER	The next SCN after the current commit
ACTION_TYPE	NUMBER	The type of commits. The possible values are: COMMIT, ROLLBACK, FAKED_COMMIT, and NULL. A value of NULL means it is not a commit operation.
SESSION_TYPE	VARCHAR2(13)	The type of replay session: LOGON ADMIN DISPATCHER REPLAY
WRC_ID	NUMBER	Unique replay client ID assigned by the server to all participating replay clients when replay starts
SCHEDULE_CAP_ID	NUMBER	An unique identifier for a workload capture added to a replay schedule. A value of 0 is used for a non-consolidated replay.
FILE_NAME	VARCHAR2(51)	File name of the captured stream
SKIP_IT	VARCHAR2(1)	Whether or not the current replayed user call is skipped or not
DIRTY_BUFFERS	VARCHAR2(1)	Reserved for internal use
DBTIME	NUMBER	Accumulated database time for the replay session
NETWORK_TIME	NUMBER	Accumulated network time for the replay session
THINK_TIME	NUMBER	Accumulated think time for the replay session
TIME_GAIN	NUMBER	If nonzero, the accumulated time in macro seconds indicating how fast the replay is
TIME_LOSS	NUMBER	If nonzero, the accumulated time in macro seconds indicating how slow the replay is
USER_CALLS	NUMBER	Total number of user calls
PLSQL_CALLS	NUMBER	Total number of PL/SQL calls recorded in the workload capture
PLSQL_SUBCALLS	NUMBER	Total number of calls recorded in the workload capture for SQL executed from PL/SQL
PLSQL_DBTIME	NUMBER	Total amount of database time in microseconds from PL/SQL calls that have been recorded in the workload capture
CLIENT_OS_USER	VARCHAR2(15)	Operating system username of the replay client
CLIENT_HOST	VARCHAR2(64)	Host name of the replay client
CLIENT_PID	VARCHAR2(24)	Process ID of the replay client
PROGRAM	VARCHAR2(84)	Program name of the replay client
CAPTURE_ELAPSED_TIME	NUMBER	Total amount of elapsed time of a session since capture starts (in seconds)
REPLAY_ELAPSED_TIME	NUMBER	Total amount of elapsed time of a session since replay starts (in seconds)
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.158 V$XML_AUDIT_TRAIL

`V$XML_AUDIT_TRAIL` shows standard, fine-grained, SYS, and mandatory audit records written in XML format files.

> **Note:**
>
> This view is deprecated and applies only to traditional auditing. Traditional auditing is desupported starting in Oracle Database 23ai. Though traditional auditing is desupported, any current traditional audit settings that you have will still be honored and are viewable with this view. See *Oracle Database Security Guide* for more information about how this desupport works.

Column	Datatype	Description
`AUDIT_TYPE`	`NUMBER`	Type of audit row: • 1 = Standard XML Audit • 2 = Fine Grained XML Audit • 4 = SYS XML Audit • 8 = Mandatory XML Audit
`SESSION_ID`	`NUMBER`	Numeric ID for the Oracle session
`PROXY_SESSIONID`	`NUMBER`	Proxy session serial number, if an enterprise user has logged in through a proxy mechanism
`STATEMENTID`	`NUMBER`	Numeric ID for the statement run (a statement may cause multiple audit records)
`ENTRYID`	`NUMBER`	Numeric ID for the audit trail entry in the session
`EXTENDED_TIMESTAMP`	`TIMESTAMP(6) WITH TIME ZONE`	Timestamp of the audited operation (the timestamp of the user's logon for entries is created by AUDIT SESSION)
`GLOBAL_UID`	`VARCHAR2(32)`	Global user identifier for the user, if the user has logged in as an enterprise user
`DB_USER`	`VARCHAR2(128)`	Database username of the user whose actions were audited
`CLIENTIDENTIFIER`	`VARCHAR2(64)`	Client identifier in the Oracle session
`EXT_NAME`	`VARCHAR2(1024)`	User's external name
`OS_USER`	`VARCHAR2(128)`	Operating system logon user name of the user whose actions were audited
`OS_HOST`	`VARCHAR2(128)`	Client host system name
`OS_PROCESS`	`VARCHAR2(16)`	Operating system process identifier of the Oracle server process
`TERMINAL`	`VARCHAR2(30)`	Identifier for the user's terminal
`INSTANCE_NUMBER`	`NUMBER`	Instance number as specified by the `INSTANCE_NUMBER` initialization parameter
`OBJECT_SCHEMA`	`VARCHAR2(128)`	Owner of the audited object
`OBJECT_NAME`	`VARCHAR2(128)`	Name of the object affected by the action
`POLICY_NAME`	`VARCHAR2(128)`	Name of the fine-grained auditing policy
`NEW_OWNER`	`VARCHAR2(128)`	Owner of the object named in the `NEW_NAME` column
`NEW_NAME`	`VARCHAR2(128)`	New name of object after renaming, or the name of an underlying object (for example, `CREATE INDEX owner.obj_name ON new_owner.new_name`)

Column	Datatype	Description
ACTION	NUMBER	Numeric code for the action type
STATEMENT_TYPE	NUMBER	Description of the action
TRANSACTIONID	RAW(8)	Identifier of the transaction in which the object is accessed or modified
RETURNCODE	NUMBER	Oracle error code generated by the action. Zero if the action succeeded.
SCN	NUMBER	System change number (SCN) of the query
COMMENT_TEXT	VARCHAR2(4000)	Text comments on standard audit entries. Also indicates how the user was authenticated - the method can be one of the following: • DATABASE - authentication was done by password • NETWORK - authentication was done by Oracle Net Services or the Advanced Networking Option • PROXY - the client was authenticated by another user. The name of the proxy user follows the method type.

Column	Datatype	Description
AUTH_PRIVILEGES	VARCHAR2(34)	Privileges granted or revoked by a GRANT or REVOKE statement recorded for standard audit trail entry The value of this column is a 34-character string of Y and dash (-) characters. Each character corresponds to a numbered privilege in the following list. The left-most character corresponds to privilege 0, the next character corresponds to privilege 1, and so on. The right-most character corresponds to privilege 33. 0 - ALTER 1 - AUDIT 2 - COMMENT 3 - DELETE 4 - GRANT 5 - INDEX 6 - INSERT 7 - LOCK 8 - CREATE 9 - SELECT 10 - UPDATE 11 - REFERENCES 12 - EXECUTE 13 - VIEW 14 - DROP 15 - ANALYZE 16 - CREATE 17 - READ 18 - WRITE 19 - KEEP SEQUENCE 20 - ENQUEUE 21 - DEQUEUE 22 - UNDER 23 - ON COMMIT 24 - REWRITE 25 - UPSERT 26 - DEBUG 27 - FLASHBACK 28 - MERGE 29 - USE 30 - FLASHBACK ARCHIVE 31 - DIRECTORY EXECUTE 32 - SIGN 33 - COLLECT DEBUG INFO A Y indicates that the privilege was granted or revoked by the statement. A dash indicates that the privilege was not affected by the statement. For example, the following value indicates that the MERGE privilege was granted or revoked by the statement: ----------------------------Y-----
GRANTEE	VARCHAR2(128)	User who granted or revoked the privilege
PRIV_USED	NUMBER	Numerical code of privileges, if any, used in the action

Column	Datatype	Description
SES_ACTIONS	VARCHAR2(16)	Session summary for standard audit records. A string of 12 characters, one for each action type, in the following order: Alter, Audit, Comment, Delete, Grant, Index, Insert, Lock, Rename, Select, Update, Flashback. Values: - = None, S=Success, F=Failure, B=Both
OS_PRIVILEGE	VARCHAR2(7)	This column is populated only for administrative authentication audit records. It contains the administrative privilege used (for example, SYSDBA, SYSOPER, NONE). For all other types of audit records, the value of this column is null.
ECONTEXT_ID	VARCHAR2(64)	Application execution context identifier
SQL_BIND	VARCHAR2(4000)	List of bind variables used in the statement
SQL_TEXT	VARCHAR2(4000)	The statement or command that triggered the audit event
OBJ_EDITION_NAME	VARCHAR2(128)	Name of the edition containing the audited object
DBID	NUMBER	Database identifier of the audited database
RLS_INFO	VARCHAR2(4000)	Stores virtual private database (VPD) policy names and predicates separated by delimiter. To format the output into individual rows, use the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML function.
CURRENT_USER	VARCHAR2(128)	Effective user for the statement execution
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

Note:

The SQL_BIND and SQL_TEXT columns are only populated if the AUDIT_TRAIL initialization parameter is set to xml, extended or if the AUDIT_SYS_OPERATIONS initialization parameter is set to TRUE.

See Also:

- "UNIFIED_AUDIT_TRAIL"
- "AUDIT_SYS_OPERATIONS"
- "AUDIT_TRAIL"
- *Oracle Database PL/SQL Packages and Types Reference* for more information about the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML function.

10.159 V$XSTREAM_APPLY_COORDINATOR

V$XSTREAM_APPLY_COORDINATOR displays information about each XStream apply process coordinator. The coordinator for an apply process gets transactions from the apply process reader and passes them to apply servers. An apply process coordinator is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the coordinator's session
SERIAL#	NUMBER	Serial number of the coordinator's session
STATE	VARCHAR2(21)	State of the coordinator: • INITIALIZING - Starting up • IDLE - Performing no work • APPLYING - Passing transactions to apply servers • SHUTTING DOWN CLEANLY - Stopping without an error • ABORTING - Stopping because of an apply error
APPLY#	NUMBER	Apply process number. An apply process coordinator is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
TOTAL_APPLIED	NUMBER	Total number of transactions applied by the apply process since the apply process was last started
TOTAL_WAIT_DEPS	NUMBER	Number of times since the apply process was last started that an apply server waited to apply a logical change record (LCR) in a transaction until another apply server applied a transaction because of a dependency between the transactions
TOTAL_WAIT_COMMITS	NUMBER	Number of times since the apply process was last started that an apply server waited to commit a transaction until another apply server committed a transaction to serialize commits
TOTAL_ADMIN	NUMBER	Number of administrative jobs issued since the apply process was last started
TOTAL_ASSIGNED	NUMBER	Number of transactions assigned to apply servers since the apply process was last started
TOTAL_RECEIVED	NUMBER	Total number of transactions received by the coordinator process since the apply process was last started
TOTAL_IGNORED	NUMBER	Number of transactions which were received by the coordinator but were ignored because they had been previously applied
TOTAL_ROLLBACKS	NUMBER	Number of transactions which were rolled back due to unexpected contention
TOTAL_ERRORS	NUMBER	Number of transactions applied by the apply process that resulted in an apply error since the apply process was last started
UNASSIGNED_COMPLETE_TXNS	NUMBER	Total number of complete transactions that the coordinator has not assigned to any apply servers
LWM_TIME	DATE	Time when the message with the lowest message number was recorded. The creation time of the message with the lowest message number was also recorded at this time.
LWM_MESSAGE_NUMBER	NUMBER	Number of the message corresponding to the low watermark. That is, messages with a commit message number less than or equal to this message number have definitely been applied, but some messages with a higher commit message number also may have been applied.

Column	Datatype	Description
LWM_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the message corresponding to the low watermark. For user-enqueued messages, time when the message corresponding to the low watermark was enqueued into the queue at the local database.
HWM_TIME	DATE	Time when the message with the highest message number was recorded. The creation time of the message with the highest message number was also recorded at this time.
HWM_MESSAGE_NUMBER	NUMBER	Number of the message corresponding to the high watermark. That is, no messages with a commit message number greater than this message number have been applied.
HWM_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the message corresponding to the high watermark. For user-enqueued messages, time when the message corresponding to the high watermark was enqueued into the queue at the local database.
STARTUP_TIME	DATE	Time when the apply process was last started
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started
ELAPSED_IDLE_TIME	NUMBER	Elapsed idle time
LWM_POSITION	RAW(64)	Position of the low-watermark LCR
HWM_POSITION	RAW(64)	Position of the high-watermark LCR
PROCESSED_MESSAGE_NUMBER	NUMBER	Message number currently processed by the apply coordinator
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
ACTIVE_SERVER_COUNT	NUMBER	Active server count

Note:

The ELAPSED_SCHEDULE_TIME column is only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

See Also:

- "TIMED_STATISTICS"
- "STATISTICS_LEVEL"

10.160 V$XSTREAM_APPLY_READER

V$XSTREAM_APPLY_READER displays information about each XStream apply reader. The apply reader is a process which reads (dequeues) messages from the queue, computes message dependencies, and builds transactions. It passes the transactions on to the coordinator in commit order for assignment to the apply servers. An apply reader is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the reader's session
SERIAL#	NUMBER	Serial number of the reader's session
APPLY#	NUMBER	Apply process number. An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
STATE	VARCHAR2(36)	Shows the state of the apply reader and the hash server. The possible values include: • INITIALIZING - Starting up • IDLE - Performing no work • DEQUEUE MESSAGES - Dequeuing messages from the queue • SCHEDULE MESSAGES - Computing dependencies between messages and assembling messages into transactions • SPILLING - Spilling unapplied messages from memory to hard disk • PAUSED – WAITING FOR DDL TO COMPLETE - Waiting for a data definition language (DDL) logical change record (LCR) to be applied The state of the apply reader is displayed first, followed by the state of the hash server. A semicolon separates the apply reader state from the hash server state.
TOTAL_MESSAGES_DEQUEUED	NUMBER	Total number of messages dequeued since the apply process was last started
TOTAL_MESSAGES_SPILLED	NUMBER	Number of messages spilled by the reader since the apply process was last started
DEQUEUE_TIME	DATE	Time when the last message was received
DEQUEUED_MESSAGE_NUMBER	NUMBER	Number of the last message received
DEQUEUED_MESSAGE_CREATE_TIME	DATE	For captured messages, creation time at the source database of the last message received. For user-enqueued messages, time when the message was enqueued into the queue at the local database.
SGA_USED	NUMBER	Amount (in bytes) of SGA memory used by the apply process since it was last started
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started
ELAPSED_SCHEDULE_TIME	NUMBER	Time elapsed (in hundredths of a second) scheduling messages since the apply process was last started. Scheduling includes computing dependencies between messages and assembling messages into transactions.
ELAPSED_SPILL_TIME	NUMBER	Elapsed time (in hundredths of a second) spent spilling messages since the apply process was last started
OLDEST_SCN_NUM	NUMBER	Oldest SCN

Column	Datatype	Description
OLDEST_XIDUSN	NUMBER	Transaction ID undo segment number of the oldest transaction that either has been applied or is being applied
OLDEST_XIDSLT	NUMBER	Transaction ID slot number of the oldest transaction that either has been applied or is being applied
OLDEST_XIDSQN	NUMBER	Transaction ID sequence number of the oldest transaction that either has been applied or is being applied
SPILL_LWM_SCN	NUMBER	Spill low-watermark SCN
PROXY_SID	NUMBER	When the apply process uses combined capture and apply, the session ID of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
PROXY_SERIAL	NUMBER	When the apply process uses combined capture and apply, the serial number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
PROXY_SPID	VARCHAR2(12)	When the apply process uses combined capture and apply, the process identification number of the propagation receiver that is responsible for direct communication between capture and apply. If the apply process does not use combined capture and apply, then this column is 0.
BYTES_RECEIVED	NUMBER	When the apply process uses combined capture and apply, the number of bytes received by the apply process from the capture process since the apply process last started. If the apply process does not use combined capture and apply, then this column is not populated.
DEQUEUED_POSITION	RAW(64)	Dequeued position. This column is populated only for an apply process that is functioning as an XStream inbound server.
SPILL_LWM_POSITION	RAW(64)	Spill low-watermark position. This column is populated only for an apply process that is functioning as an XStream inbound server.
OLDEST_TRANSACTION_ID	VARCHAR2(128)	Oldest transaction ID
TOTAL_LCRS_WITH_DEP	NUMBER	Total number of LCRs with row-level dependencies since the apply process last started
TOTAL_LCRS_WITH_WMDEP	NUMBER	Total number of LCRs with watermark dependencies since the apply process last started. A watermark dependency occurs when an apply process must wait until the apply process's low watermark reaches a particular threshold.
TOTAL_IN_MEMORY_LCRS	NUMBER	Total number of LCRs currently in memory
SGA_ALLOCATED	NUMBER	The total amount of shared memory (in bytes) allocated from the XStreams pool for the apply process since the apply process last started
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **Note:**
>
> The ELAPSED_SCHEDULE_TIME column is only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

> **See Also:**
>
> - "TIMED_STATISTICS"
> - "STATISTICS_LEVEL"

10.161 V$XSTREAM_APPLY_RECEIVER

V$XSTREAM_APPLY_RECEIVER displays information about the message receiver of the apply process. The values are reset to zero when the database (or instance in an Oracle Real Application Clusters (Oracle RAC) environment) restarts, when apply migrates to another instance, or when the XStream process is stopped.

Column	Datatype	Description
SID	NUMBER	Session ID of the apply receiver
SERIAL#	NUMBER	Serial number of the apply receiver
APPLY_NAME	VARCHAR2(128)	Name of the apply process
STARTUP_TIME	DATE	Startup time of the apply process
SOURCE_DATABASE_NAME	VARCHAR2(128)	Name of the source database
ACKNOWLEDGEMENT	NUMBER	Acknowledgement SCN of the messages received by the receiver
LAST_RECEIVED_MSG	NUMBER	Last received message
TOTAL_MESSAGES_RECEIVED	NUMBER	Total number of messages received
TOTAL_AVAILABLE_MESSAGES	NUMBER	Number of available messages
STATE	VARCHAR2(44)	State of the apply receiver: • Initializing • Sending unapplied txns • Waiting for message from client • Waiting for LCR from client • Receiving LCRs • Evaluating rules • Enqueueing LCRS • Waiting for memory • Waiting for apply to read • Waiting for client flush request to complete • Waiting for client commit to complete
LAST_RECEIVED_MSG_POSITION	RAW(64)	Last received message position
ACKNOWLEDGEMENT_POSITION	RAW(64)	Acknowledgement position of the messages received by the receiver. Corresponds to ACKNOWLEDGEMENT, except the value is in position rather than SCN.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.162 V$XSTREAM_APPLY_SERVER

V$XSTREAM_APPLY_SERVER displays information about each XStream apply server and its activities. An apply server receives messages from the apply coordinator for an apply process. For each message received, an apply server either applies the message or sends the message to the appropriate apply handler. An apply server is a subcomponent of an apply process, outbound server, or inbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the apply server's session
SERIAL#	NUMBER	Serial number of the apply server's session
APPLY#	NUMBER	Apply process number. An apply process is an Oracle background process, prefixed by ap.
APPLY_NAME	VARCHAR2(128)	Name of the apply process
SERVER_ID	NUMBER	Parallel execution server number of the apply server

Column	Datatype	Description
STATE	VARCHAR2(20)	State of the apply server: • INITIALIZING - Starting up • IDLE - Performing no work • RECORD LOW-WATERMARK - Performing an administrative job that maintains information about the apply progress, which is used in the ALL_APPLY_PROGRESS and DBA_APPLY_PROGRESS data dictionary views • ADD PARTITION - Performing an administrative job that adds a partition that is used for recording information about in-progress transactions • DROP PARTITION - Performing an administrative job that purges rows that were used to record information about in-progress transactions • EXECUTE TRANSACTION - Applying a transaction • WAIT COMMIT - Waiting to commit a transaction until all other transactions with a lower commit SCN are applied. This state is possible only if the COMMIT_SERIALIZATION apply process parameter is set to a value other than DEPENDENT_TRANSACTIONS and the PARALLELISM apply process parameter is set to a value greater than 1. • WAIT DEPENDENCY - Waiting to apply a logical change record (LCR) in a transaction until another transaction, on which it has a dependency, is applied. This state is possible only if the PARALLELISM apply process parameter is set to a value greater than 1. • ROLLBACK TRANSACTION - Rolling back a transaction • TRANSACTION CLEANUP - Cleaning up an applied transaction, which includes removing LCRs from the apply process's queue • WAIT FOR CLIENT - Waiting for an XStream client application to request more LCRs • WAIT FOR NEXT CHUNK - Waiting for the next set of LCRs for a large transaction
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction currently being applied
XIDSLT	NUMBER	Transaction ID slot number of the transaction currently being applied
XIDSQN	NUMBER	Transaction ID sequence number of the transaction currently being applied
COMMITSCN	NUMBER	Commit system change number (SCN) of the transaction currently being applied
DEP_XIDUSN	NUMBER	Transaction ID undo segment number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSLT	NUMBER	Transaction ID slot number of a transaction on which the transaction being applied by this apply server depends
DEP_XIDSQN	NUMBER	Transaction ID sequence number of a transaction on which the transaction being applied by this apply server depends
DEP_COMMITSCN	NUMBER	Commit system change number (SCN) of the transaction on which this apply server depends
MESSAGE_SEQUENCE	NUMBER	Number of the current message being applied by the apply server. This value is reset to 1 at the beginning of each transaction.
TOTAL_ASSIGNED	NUMBER	Total number of transactions assigned to the apply server since the apply process was last started

Column	Datatype	Description
TOTAL_ADMIN	NUMBER	Total number of administrative jobs done by the apply server since the apply process was last started. See the STATE information in this view for the types of administrative jobs.
TOTAL_ROLLBACKS	NUMBER	Number of transactions assigned to this server which were rolled back
TOTAL_MESSAGES_APPLIED	NUMBER	Total number of messages applied by this apply server since the apply process was last started
APPLY_TIME	DATE	Time the last message was applied
APPLIED_MESSAGE_NUMBER	NUMBER	Number of the last message applied
APPLIED_MESSAGE_CREATE_TIME	DATE	Creation time at the source database of the last captured message applied. No information about user-enqueued messages is recorded in this column.
ELAPSED_DEQUEUE_TIME	NUMBER	Time elapsed (in hundredths of a second) dequeuing messages since the apply process was last started
ELAPSED_APPLY_TIME	NUMBER	Time elapsed (in hundredths of a second) applying messages since the apply process was last started
COMMIT_POSITION	RAW(64)	Commit position of the transaction. This column is populated only for an apply process that is functioning as an XStream inbound server.
DEP_COMMIT_POSITION	RAW(64)	Commit position of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.
LAST_APPLY_POSITION	RAW(64)	For inbound servers, the position of the last message applied; for outbound servers, the position of the last message sent to the XStream client application. This column is populated only for an apply process that is functioning as an XStream outbound server or inbound server.
TRANSACTION_ID	VARCHAR2(128)	Transaction ID that the worker is applying. This column is populated only for an apply process that is functioning as an XStream inbound server.
DEP_TRANSACTION_ID	VARCHAR2(128)	Transaction ID of the transaction the worker depends on. This column is populated only for an apply process that is functioning as an XStream inbound server.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
TOTAL_LCRS_RETRIED	NUMBER	Total number of LCRs retried by this server
LCR_RETRY_ITERATION	NUMBER	Retry iteration for this transaction by this server
TOTAL_TXNS_RETRIED	NUMBER	Total transactions retried by this server
TXN_RETRY_ITERATION	NUMBER	Retry iteration for this transaction by this server
TOTAL_TXNS_RECORDED	NUMBER	Total transactions recorded in error queue by this server

> **Note:**
>
> The ELAPSED_SCHEDULE_TIME column is only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

> **See Also:**
>
> - "TIMED_STATISTICS"

10.163 V$XSTREAM_CAPTURE

V$XSTREAM_CAPTURE displays information about each capture process that sends LCRs to an XStream outbound server.

Column	Datatype	Description
SID	NUMBER	Session identifier of the capture process
SERIAL#	NUMBER	Session serial number of the capture process session
CAPTURE#	NUMBER	Capture process number. A capture process is an Oracle background process prefixed by cp
CAPTURE_NAME	VARCHAR2(128)	Name of the capture process
LOGMINER_ID	NUMBER	Session ID of the Oracle LogMiner session associated with the capture process
STARTUP_TIME	DATE	Time when the capture process was last started

Column	Datatype	Description
STATE	VARCHAR2(551)	State of the capture process: • INITIALIZING - Starting up. • WAITING FOR DICTIONARY REDO - Waiting for redo log files containing the dictionary build related to the first SCN to be added to the capture process session. A capture process cannot begin to scan the redo log files until all of the log files containing the dictionary build have been added. • DICTIONARY INITIALIZATION - Processing a dictionary build. • MINING (PROCESSED SCN = *scn_value*) - Mining a dictionary build at the SCN *scn_value*. • LOADING (step *X* of *Y*) - Processing information from a dictionary build and currently at step *X* in a process that involves *Y* steps, where *X* and *Y* are numbers. • CAPTURING CHANGES - Scanning the redo log for changes that satisfy the capture process rule sets. • WAITING FOR REDO - Waiting for new redo log files to be added to the capture process session. The capture process has finished processing all of the redo log files added to its session. This state is possible if there is no activity at a source database. For a downstream capture process, this state is possible if the capture process is waiting for new log files to be added to its session. • EVALUATING RULE - Evaluating a change against a capture process rule set. • CREATING LCR - Converting a change into an LCR. • ENQUEUING MESSAGE - Enqueuing an LCR that satisfies the capture process rule sets into the capture process queue. • PAUSED FOR FLOW CONTROL - Unable to enqueue LCRs either because of low memory or because propagations and outbound servers are consuming messages slower than the capture process is creating them. This state indicates flow control that is used to reduce spilling of captured LCRs when propagation or apply has fallen behind or is unavailable. • WAITING FOR THE BUFFERED QUEUE TO SHRINK - Waiting for the buffered queue to change to a smaller size. The buffered queue shrinks when there is a memory limitation or when an administrator reduces its size. • WAITING FOR *n* SUBSCRIBER(S) INITIALIZING - Waiting for outbound servers that receive LCRs from the capture process to start, where *n* is the number of apply processes. • WAITING FOR TRANSACTION - Waiting for LogMiner to provide more transactions. • WAITING FOR INACTIVE DEQUEUERS - Waiting for the capture process's queue subscribers to start. The capture process stops enqueuing LCRs if there are no active subscribers to the queue. • SUSPENDED FOR AUTO SPLIT/MERGE - Waiting for a merge operation to complete. • SHUTTING DOWN - Stopping. • ABORTING - Terminating.
TOTAL_PREFILTER_DISCARDED	NUMBER	Total number of prefiltered messages discarded
TOTAL_PREFILTER_KEPT	NUMBER	Total number of prefiltered messages kept
TOTAL_PREFILTER_EVALUATIONS	NUMBER	Total number of prefilter evaluations

Column	Datatype	Description
TOTAL_MESSAGES_CAPTURED	NUMBER	Total number of redo entries passed by LogMiner to the capture process for detailed rule evaluation since the capture process last started. A capture process converts a redo entry into a message and performs detailed rule evaluation on the message when capture process prefiltering cannot discard the change.
CAPTURE_TIME	DATE	Time when the most recent message was captured
CAPTURE_MESSAGE_NUMBER	NUMBER	Number of the most recently captured message
CAPTURE_MESSAGE_CREATE_TIME	DATE	Creation time of the most recently captured message
TOTAL_MESSAGES_CREATED	NUMBER	Count associated with ELAPSED_LCR_TIME to calculate rate
TOTAL_FULL_EVALUATIONS	NUMBER	Count associated with ELAPSED_RULE_TIME to calculate rate
TOTAL_MESSAGES_ENQUEUED	NUMBER	Total number of messages enqueued since the capture process was last started
ENQUEUE_TIME	DATE	Time when the last message was enqueued
ENQUEUE_MESSAGE_NUMBER	NUMBER	Number of the last enqueued message
ENQUEUE_MESSAGE_CREATE_TIME	DATE	Creation time of the last enqueued message
AVAILABLE_MESSAGE_NUMBER	NUMBER	For local capture, the last redo SCN flushed to the log files. For downstream capture, the last SCN added to LogMiner through the archived redo log files.
AVAILABLE_MESSAGE_CREATE_TIME	DATE	For local capture, the time the SCN was written to the log file. For downstream capture, the time the most recent archived redo log file (containing the most recent SCN) was added to LogMiner.
ELAPSED_CAPTURE_TIME	NUMBER	Elapsed time (in hundredths of a second) scanning for changes in the redo log since the capture process was last started
ELAPSED_RULE_TIME	NUMBER	Elapsed time (in hundredths of a second) evaluating rules since the capture process was last started
ELAPSED_ENQUEUE_TIME	NUMBER	Elapsed time (in hundredths of a second) enqueuing messages since the capture process was last started
ELAPSED_LCR_TIME	NUMBER	Elapsed time (in hundredths of a second) creating LCRs since the capture process was last started
ELAPSED_REDO_WAIT_TIME	NUMBER	Elapsed time (in hundredths of a second) spent by the capture process in the WAITING FOR REDO state
ELAPSED_PAUSE_TIME	NUMBER	Elapsed flow control pause time (in hundredths of a second)
STATE_CHANGED_TIME	DATE	Time at which the state of the capture process changed
SGA_USED	NUMBER	The total amount of shared memory (in bytes) currently used by the capture process out of the amount allocated (SGA_ALLOCATED)
SGA_ALLOCATED	NUMBER	The total amount of shared memory (in bytes) allocated from the Streams pool for the capture process
BYTES_OF_REDO_MINED	VARCHAR2(64)	The total amount of redo data mined (in bytes) since the capture process last started
SESSION_RESTART_SCN	VARCHAR2(64)	The SCN from which the capture process started mining redo data when it was last started

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

Note:

The ELAPSED_CAPTURE_TIME, ELAPSED_RULE_TIME, ELAPSED_ENQUEUE_TIME, ELAPSED_LCR_TIME, and ELAPSED_REDO_WAIT_TIME columns are only populated if the TIMED_STATISTICS initialization parameter is set to true, or if the STATISTICS_LEVEL initialization parameter is set to TYPICAL or ALL.

See Also:

- "TIMED_STATISTICS"
- "STATISTICS_LEVEL"

10.164 V$XSTREAM_MESSAGE_TRACKING

V$XSTREAM_MESSAGE_TRACKING displays information about LCRs tracked through the stream that are processed by XStream components.

You can track an LCR through a stream using one of the following methods:

- Set the message_tracking_frequency capture process parameter to 1 or another relatively low value for XStream Outbound processes.
- Set the message_tracking_frequency apply process parameter to 1 or another relatively low value for XStream Inbound processes.
- Use the DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING procedure to specify a tracking label that becomes part of each LCR generated by the current session.

  When the actions parameter in the DBMS_XSTREAM_ADM.SET_MESSAGE_TRACKING procedure is set to DBMS_XSTREAM_ADM.ACTION_MEMORY, information about the LCRs is tracked in memory, and this view is populated with information about the LCRs. Currently, DBMS_XSTREAM_ADM.ACTION_MEMORY is the only valid setting for the actions parameter in the procedure.

> **Note:**
>
> This view does not display information about messages flowing in an Oracle GoldenGate configuration. To view information about such message streams, query the `V$GOLDENGATE_MESSAGE_TRACKING` view.

Column	Datatype	Description
`TRACKING_LABEL`	`VARCHAR2(128)`	User-specified tracking label
`TAG`	`RAW(30)`	First 30 bytes of the tag of the LCR
`COMPONENT_NAME`	`VARCHAR2(128)`	Name of the component that processed the LCR
`COMPONENT_TYPE`	`VARCHAR2(128)`	Type of the component that processed the LCR
`ACTION`	`VARCHAR2(50)`	Action performed on the LCR
`ACTION_DETAILS`	`VARCHAR2(100)`	Details of the action
`TIMESTAMP`	`TIMESTAMP(9) WITH TIME ZONE`	Time when the action was performed
`MESSAGE_CREATION_TIME`	`DATE`	Time when the message was created
`MESSAGE_NUMBER`	`NUMBER`	SCN of the message
`TRACKING_ID`	`RAW(16)`	Globally unique OID of the LCR
`SOURCE_DATABASE_NAME`	`VARCHAR2(128)`	Name of the source database
`OBJECT_OWNER`	`VARCHAR2(128)`	Owner of the object
`OBJECT_NAME`	`VARCHAR2(128)`	Name of the object
`XID`	`VARCHAR2(128)`	Transaction ID
`COMMAND_TYPE`	`VARCHAR2(128)`	Command type of the LCR
`MESSAGE_POSITION`	`RAW(64)`	Position of the message
`CON_ID`	`NUMBER`	The ID of the container to which the data pertains. Possible values include: • `0`: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • `1`: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> - *Oracle Database XStream Guide* for more information about XStream concepts

10.165 V$XSTREAM_OUTBOUND_SERVER

V$XSTREAM_OUTBOUND_SERVER displays statistics about an outbound server. An outbound server sends LCRs to the XStream client application.

> **Note:**
>
> When the COMMITTED_DATA_ONLY column is YES in the V$XSTREAM_OUTBOUND_SERVER view, the V$STREAMS_APPLY_SERVER view provides additional information about the outbound server process, and information about the apply server background processes used by the outbound server.

Column	Datatype	Description
SID	NUMBER	Session ID of the outbound server's session
SERIAL#	NUMBER	Serial number of the outbound server's session
SPID	VARCHAR2(12)	Process identification number of the operating-system process that sends LCRs to the client application
SERVER_NAME	VARCHAR2(128)	Name of the outbound server
STARTUP_TIME	DATE	Time when the client application attached to the outbound server

Column	Datatype	Description
STATE	VARCHAR2(19)	State of the outbound server When the COMMITTED_DATA_ONLY column shows YES, the following states are possible: • INITIALIZING - Starting up the outbound server. • IDLE - Performing no work because there are no LCRs to send to the XStream client application. • GET TRANSACTIONS - Receiving transactions from the outbound server's apply coordinator. • SEND TRANSACTION - Sending a transaction to an XStream client application. • WAIT FOR NEXT CHUNK - Waiting for the next set of LCRs for a large transaction. • TRANSACTION CLEANUP - Cleaning up an applied transaction, which includes removing LCRs from the outbound server's queue. • WAIT FOR CLIENT - Waiting for an XStream client application to request more LCRs. When the COMMITTED_DATA_ONLY column shows NO, the following states are possible: • INITIALIZING - Starting up the outbound server. • INITIALIZING RULE EVALUATION CONTEXT - Initializing the context to evaluate the outbound server's rules. • IDLE - Performing no work because there is no LCR to send to the XStream client application. • BROWSING LCR - Browsing the outbound server's queue for next LCR. • EVALUATING RULES - Evaluating an LCR against a rule set. • DEQUEUING LCR - Dequeuing an LCR from the outbound server's queue. • SENDING LCR - Sending an LCR to an XStream client application. • WAITING FOR CAPTURE TO TERMINATE - Waiting for the capture process to become disabled. • SUSPENDED DUE TO A DROPPED SUBSCRIBER - Suspended because a connected subscriber was dropped. For example, a subscriber can be dropped during a split or merge operation. • SUSPENDED FOR AUTO SPLIT/MERGE - Suspended because an automatic split or merge operation is being performed. • WAITING ON EMPTY QUEUE - Waiting for more LCRs from the capture process. • WAITING FOR CLIENT - Waiting for the XStream client application to request more LCRs. • WAITING FOR CAPTURE TO INITIALIZE - Waiting for the capture process to finish the data dictionary build. • WAITING TO ATTACH TO CAPTURE - Waiting for the outbound server to attach to the capture process. When a state refers to a capture process, it is the capture process that captures changes for the outbound server. When a state refers to a propagation, it is the outbound server that sends LCRs to the XStream client application.
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.

Column	Datatype	Description
XIDSLT	NUMBER	Transaction ID slot number of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
XIDSQN	NUMBER	Transaction ID sequence number of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
COMMITSCN	NUMBER	Commit SCN of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
TOTAL_TRANSACTIONS_SENT	NUMBER	Total number of transactions sent by the outbound server to the XStream client application since the last time the client application attached to the outbound server. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
MESSAGE_SEQUENCE	NUMBER	Number of the current LCR being processed by the outbound server. This value is reset to 1 at the beginning of each transaction. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
TOTAL_MESSAGES_SENT	NUMBER	Total number of LCRs sent by the outbound server to the XStream client application since the last time the client application attached to the outbound server
SEND_TIME	DATE	Time the last LCR was sent by the outbound server to the XStream client application
LAST_SENT_MESSAGE_NUMBER	NUMBER	Message number of the last LCR sent by the outbound server to the XStream client application
LAST_SENT_MESSAGE_CREATE_TIME	DATE	Creation time at the source database of the last LCR sent by the outbound server to the client application
ELAPSED_SEND_TIME	NUMBER	Time elapsed (in hundredths of a second) sending LCRs to the XStream client application since the last time the client application attached to the outbound server
COMMIT_POSITION	RAW(64)	Commit position of the transaction currently being processed. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
LAST_SENT_POSITION	RAW(64)	Position of the last LCR sent to the XStream client application. This column is populated only if the COMMITTED_DATA_ONLY column shows YES. When the COMMITTED_DATA_ONLY column shows NO, this column is NULL.
BYTES_SENT	NUMBER	Total number of bytes sent by the outbound server to the XStream client application since the last time the client application attached to the outbound server
COMMITTED_DATA_ONLY	CHAR(3)	YES if the outbound server can send only LCRs in committed transactions to the XStream client application. A committed transaction is an assembled, noninterleaving transaction with no rollbacks. NO if the outbound server can send LCRs in transactions that have not yet committed to the XStream client application. This mode is for internal Oracle use only.

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

> **See Also:**
>
> "V$STREAMS_APPLY_SERVER"

10.166 V$XSTREAM_TABLE_STATS

V$XSTREAM_TABLE_STATS shows the statistics for all the tables processed by each apply server for the XStream session.

Column	Datatype	Description
APPLY_NAME	VARCHAR2(128)	Name of XStream Out or XStream In process
SERVER_ID	NUMBER	Parallel apply server worker ID. If the server ID is 0, then this is an aggregate of statistics for servers that may have been automatically shutdown due to session inactivity.
SOURCE_TABLE_OWNER	VARCHAR2(128)	Source owner of the captured or replicated table
SOURCE_TABLE_NAME	VARCHAR2(128)	Source name of the captured or replicated table
DESTINATION_TABLE_OWNER	VARCHAR2(128)	Target owner of the captured or replicated table
DESTINATION_TABLE_NAME	VARCHAR2(128)	Target name of the captured or replicated table
LAST_UPDATE	DATE	Time of last update
TOTAL_INSERTS	NUMBER	Number of insert operations on this table processed by this apply server for the current session
TOTAL_UPDATES	NUMBER	Number of update operations on this table processed by this apply server for the current session
TOTAL_DELETES	NUMBER	Number of delete operations on this table processed by this apply server for the current session
INSERT_COLLISIONS	NUMBER	Number of insert collisions on this table encountered by this apply server for the current session
UPDATE_COLLISIONS	NUMBER	Number of update collisions on this table encountered by this apply server for the current session
DELETE_COLLISIONS	NUMBER	Number of delete collisions on this table encountered by this apply server for the current session
REPERROR_RECORDS	NUMBER	Number of change records that were recorded on this table by this apply server for the current session
REPERROR_IGNORES	NUMBER	Number of ignored change records on this table by this apply server for the current session
WAIT_DEPENDENCIES	NUMBER	Number of waits for this table due to dependency for the current session

Column	Datatype	Description
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data
CDR_INSERT_ROW_EXISTS	NUMBER	Number of conflicts where an insert gets an ORA-00001 error
CDR_UPDATE_ROW_EXISTS	NUMBER	Number of conflicts where an update gets an ORA-26786 error
CDR_UPDATE_ROW_MISSING	NUMBER	Number of conflicts where an update gets an ORA-26787 error
CDR_DELETE_ROW_EXISTS	NUMBER	Number of conflicts where a delete gets an ORA-26786 error
CDR_DELETE_ROW_MISSING	NUMBER	Number of conflicts where a delete gets an ORA-26787 error
CDR_SUCCESSFUL_RESOLUTIONS	NUMBER	Number of successfully resolved conflicts
CDR_FAILED_RESOLUTIONS	NUMBER	Number of conflicts that could not be resolved due to an error during resolution
LOB_OPERATIONS	NUMBER	The number of LOB updates (LOB writes, LOB trims, and LOB erases) applied by the inbound server.

See Also:

Oracle Database XStream Guide for more information about XStream conflict detection and resolution

10.167 V$XSTREAM_TRANSACTION

V$XSTREAM_TRANSACTION displays information about transactions that are being processed by capture processes, outbound servers, and inbound servers. This view can identify long running transactions and to display how many LCRs are being processed in each transaction. This view only contains information about captured LCRs. It does not contain information about user-enqueued LCRs or user messages.
This view only shows information about LCRs that are being processed because they satisfied the rule sets for the component at the time of the query. For capture processes, this view only shows information about changes in transactions that the capture process has converted into LCRs. It does not show information about all the active transactions present in the redo log.

For outbound servers, this view only shows information about LCRs that the outbound server has dequeued. It does not show information about LCRs in the outbound server's queue. For outbound servers, information about a transaction remains in the view until the transaction is sent to the XStream client application.

For inbound servers, information about a transaction remains in the view until the transaction commits or until the entire transaction is rolled back.

Column	Datatype	Description
COMPONENT_NAME	VARCHAR2(128)	Name of the component

Column	Datatype	Description
COMPONENT_TYPE	VARCHAR2(20)	Type of component • CAPTURE - Capture process • APPLY - Apply reader subcomponent in an outbound server or inbound server • PROPAGATION_SENDER - Propagation sender that sends LCRs from a capture process to an outbound server
XIDUSN	NUMBER	Transaction ID undo segment number of the transaction
XIDSLT	NUMBER	Transaction ID slot number of the transaction
XIDSQN	NUMBER	Transaction ID sequence number of the transaction
CUMULATIVE_MESSAGE_COUNT	NUMBER	Number of LCRs processed in the transaction. If a component is restarted while the transaction is being processed, then this column shows the number of LCRs processed in the transaction since the component was started.
TOTAL_MESSAGE_COUNT	NUMBER	Total number of LCRs processed in the transaction by an outbound server or inbound server. This column does not pertain to capture processes.
FIRST_MESSAGE_TIME	DATE	Time stamp of the first LCR processed in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the time stamp of the first LCR processed after the capture process was started.
FIRST_MESSAGE_NUMBER	NUMBER	SCN of the first message in the transaction. If a capture process is restarted while the transaction is being processed, then this column shows the SCN of the first message processed after the capture process was started.
LAST_MESSAGE_TIME	DATE	Time stamp of the last LCR processed in the transaction
LAST_MESSAGE_NUMBER	NUMBER	SCN of the most recent message encountered for the transaction
FIRST_MESSAGE_POSITION	RAW(64)	Position of the first message seen by an XStream inbound server This column is populated only for an apply process that is functioning as an XStream inbound server.
LAST_MESSAGE_POSITION	RAW(64)	Position of the last message seen by an XStream inbound server. This column is populated only for an apply process that is functioning as an XStream inbound server.
TRANSACTION_ID	VARCHAR2(128)	Transaction ID for an XStream inbound server. This column is populated only for an apply process that is functioning as an XStream inbound server.
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

10.168 V$ZONEMAP_USAGE_STATS

V$ZONEMAP_USAGE_STATS displays zone map usage statistics.

Column	Datatype	Description
ZONEMAP	VARCHAR2(257)	Name of the zone map in the form of *owner*.*name*
PRUNING_TYPE	VARCHAR2(11)	Type of data pruning performed using the zone map
EXECUTIONS	NUMBER	Number of executions, including parallel worker executions
BASE_COUNT	NUMBER	Base count accumulated over number of executions
PRUNED_COUNT	NUMBER	Pruned count accumulated over number of executions
CON_ID	NUMBER	The ID of the container to which the data pertains. Possible values include: • 0: This value is used for rows containing data that pertain to the entire CDB. This value is also used for rows in non-CDBs. • 1: This value is used for rows containing data that pertain to only the root • *n*: Where *n* is the applicable container ID for the rows containing data

The ratio (PRUNED_COUNT / BASE_COUNT) shows the fraction of data pruned by the zone map.

Part IV
Appendixes

This part includes the following appendixes:

- Database Limits
- SQL Scripts
- Oracle Wait Events
- Oracle Enqueue Names
- Statistics Descriptions
- Background Processes

A
Database Limits

This appendix lists the limits of values associated with database functions and objects. Limits exist on several levels in the database. There is usually a hard-coded limit in the database that cannot be exceeded. This value may be further restricted for any given operating system. Database limits are divided into four categories:

- Datatype Limits
- Physical Database Limits
- Logical Database Limits
- Process and Runtime Limits

> **See Also:**
>
> Your operating system-specific Oracle documentation

A.1 Datatype Limits

This table documents the limits for datatypes, and includes comments about the datatypes.

Datatypes	Limit	Comments
BFILE	Maximum size: 2^{64} bytes (18.44 exabytes) or OS file size limit, whichever is the lower value Maximum size of a file name: 255 characters Maximum size of a directory name: 128 bytes Maximum number of open BFILEs: see Comments	The maximum number of BFILEs is limited by the value of the SESSION_MAX_OPEN_FILES initialization parameter, which is itself limited by the maximum number of open files the operating system will allow.
BLOB	Maximum size: (4 GB - 1) * DB_BLOCK_SIZE initialization parameter (8 TB to 128 TB)	The number of LOB columns per table is limited only by the maximum number of columns per table (that is, 1000 if MAX_COLUMNS = STANDARD and 4096 if MAX_COLUMNS = EXTENDED[1]). **See Also:** "MAX_COLUMNS" initialization parameter for additional details
CHAR	Maximum size: 2000 bytes	None
CLOB	Maximum size: (4 GB - 1) * DB_BLOCK_SIZE initialization parameter (8 TB to 128 TB)	The number of LOB columns per table is limited only by the maximum number of columns per table (that is, 1000 if MAX_COLUMNS = STANDARD and 4096 if MAX_COLUMNS = EXTENDED[1]). **See Also:** "MAX_COLUMNS" initialization parameter for additional details
JSON	Maximum size: 32 MB	None

Datatypes	Limit	Comments
Literals (characters or numbers in SQL or PL/SQL)	Maximum size: 4000 characters	None
LONG[2]	Maximum size: 2 GB - 1	Only one LONG column is allowed per table.
NCHAR	Maximum size: 2000 bytes	None
NCLOB	Maximum size: (4 GB - 1) * DB_BLOCK_SIZE initialization parameter (8 TB to 128 TB)	The number of LOB columns per table is limited only by the maximum number of columns per table (that is, 1000 if MAX_COLUMNS = STANDARD and 4096 if MAX_COLUMNS = EXTENDED[1]). **See Also:** "MAX_COLUMNS" initialization parameter for additional details
NUMBER	999...(38 9's) x10^{125} maximum value -999...(38 9's) x10^{125} minimum value	Can be represented to full 38-digit precision (the mantissa) Can be represented to full 38-digit precision (the mantissa)
NVARCHAR2	Maximum size: 4000 bytes, or 32767 bytes if the MAX_STRING_SIZE initialization parameter is set to EXTENDED **See Also:** "MAX_STRING_SIZE" initialization parameter for additional details	None
Precision	38 significant digits	None
RAW	Maximum size: 2000 bytes, or 32767 bytes if the MAX_STRING_SIZE initialization parameter is set to EXTENDED **See Also:** "MAX_STRING_SIZE" initialization parameter for additional details	None
VARCHAR2	Maximum size: 4000 bytes, or 32767 bytes if the MAX_STRING_SIZE initialization parameter is set to EXTENDED **See Also:** "MAX_STRING_SIZE" initialization parameter for additional details	None

1 The absolute maximum number of columns in a table is 1000 or 4096, depending on the value of the MAX_COLUMNS initialization parameter. However, when you create an object table (or a relational table with columns of object, nested table, varray, or REF type), Oracle maps the columns of the user-defined types to relational columns, creating in effect hidden columns that count toward the maximum column limit. For details on how Oracle calculates the total number of columns in such a table, refer to *Oracle Database Administrator's Guide*.

2 All forms of LONG data types (LONG, LONG RAW, LONG VARCHAR, LONG VARRAW) were deprecated in Oracle8*i* Release 8.1.6. For succeeding releases, the LONG data type was provided for backward compatibility with existing applications. In new applications developed with later releases, Oracle strongly recommends that you use the CLOB or NCLOB data type for storing large amounts of character data.

See Also:

- *Oracle Database SQL Language Reference* for more information about datatypes
- *Oracle Database SQL Language Reference* for more information on naming database objects

A.2 Physical Database Limits

This table describes limit types and limit values for physical database items.

Item	Type of Limit	Limit Value
Controlfiles	Number of control files	1 minimum; 2 or more (on separate devices) strongly recommended
Controlfiles	Size of a control file	Maximum of 201031680 logical blocks
Database Block Size	Minimum	2048 bytes; must be a multiple of operating system physical block size
Database Block Size	Maximum	Operating system dependent; never more than 32 KB
Database Blocks	Minimum in initial extent of a segment	2 blocks
Database Blocks	Maximum per datafile	Platform dependent; typically 2^{22} - 1 blocks
Database extents	Maximum per dictionary managed tablespace	4 GB * physical block size (with K/M modifier); 4 GB (without K/M modifier)
Database extents	Maximum per locally managed (uniform) tablespace	256 KB * physical block size
Database file size	Maximum	Operating system dependent. Limited by maximum operating system file size. See the **Bigfile Tablespaces** and **Smallfile (traditional) Tablespaces** rows for more information about the maximum database file size in these types of tablespaces.
Database files	Maximum per tablespace	Operating system dependent; usually 1023
Database files	Maximum per database	65533 May be less on some operating systems Limited also by size of database blocks and by the DB_FILES initialization parameter for a particular instance
External Tables file	Maximum size	Dependent on the operating system An external table can be composed of multiple files.
MAXEXTENTS	Default value	Derived from tablespace default storage or DB_BLOCK_SIZE initialization parameter
MAXEXTENTS	Maximum	Not defined
Redo Log File Size	Minimum size	4 MB
Redo Log File Size	Maximum Size	Operating system limit; typically 2 TB

Item	Type of Limit	Limit Value
Redo Log Files	Maximum number of logfiles	Limited by value of `MAXLOGFILES` parameter in the `CREATE DATABASE` statement Control file can be resized to allow more entries; ultimately an operating system limit
Redo Log Files	Maximum number of logfiles per group	Not defined
Tablespaces	Maximum number per database	`64 K` Number of tablespaces cannot exceed the number of database files because each tablespace must include at least one file
Bigfile Tablespaces	Number of blocks	A bigfile tablespace contains only one datafile or tempfile, which can contain up to approximately 4 billion (2^{32}) blocks. The maximum size of the single datafile or tempfile is 128 terabytes (TB) for a tablespace with 32 K blocks and 32 TB for a tablespace with 8 K blocks.
Smallfile (traditional) Tablespaces	Number of blocks	A smallfile tablespace is a traditional Oracle tablespace, which can contain 1023 datafiles or tempfiles, each of which can contain up to approximately 4 million (2^{22}) blocks.

A.3 Logical Database Limits

This table describes limit types and limit values for logical database items.

Item	Type of Limit	Limit Value
Columns	Maximum per table	If `MAX_COLUMNS` = `STANDARD`: 1000 If `MAX_COLUMNS` = `EXTENDED`: 4096 (available starting with Oracle Database 23ai) **See Also:** "MAX_COLUMNS" initialization parameter for additional details
Columns	Maximum per index (or clustered index)	32
Columns	Maximum per bitmapped index	30
Constraints	Maximum per column	Not defined Oracle does not define a limit on the number of constraints per column. However, constraints are subject to the limit on the maximum number of constraints in the database. See the entry for "Constraints - Maximum per database" in this table.

Item	Type of Limit	Limit Value
Constraints	Maximum per database	4,294,967,293 Constraints are numbered internally from 1 to 4,294,967,294. The internal number is incremented each time a constraint is created. One number is always consumed by a special internal user called `_NEXT_CONSTRAINT`, which represents the next available number for a new constraint. Starting with Oracle Database 23ai, the database reuses constraint numbers. Therefore, the maximum number of constraints that can exist in the database at any given time is 4,294,967,293. You can view constraint numbers by querying the `CON#` column of the `SYS.CON$` table.
Dictionary-managed database objects	Maximum per database	4,254,950,911 - overhead • The value of 4,254,950,911 is derived as follows: The data type used for object identifiers can store a maximum value of 4,294,967,294. However, approximately 40 million of these values are reserved at the high end for other purposes, which results in a maximum object identifier value of 4,254,950,911. • Overhead includes the following: – Multiple object identifiers for one database object Database objects consume one object identifier at the time of creation. This identifier is displayed in both the `OBJECT_ID` and `DATA_OBJECT_ID` columns of the ALL_OBJECTS view. Over the lifetime of an object, the value of `OBJECT_ID` remains unchanged, but the value of `DATA_OBJECT_ID` changes when the object is altered, for example, with a DDL statement or a table truncation. Therefore, one object can consume more than one object identifier over its lifetime. – Object identifiers for lightweight jobs Lightweight jobs consume object identifiers, even though they are not permanent objects. Therefore, if many lightweight jobs are running in the database, the number of objects that can be created in the database is dependent upon the remaining pool of identifiers.
Indexes	Maximum per table	Not defined Oracle does not define a limit on the number of indexes per table. However, indexes are subject to the limit on the maximum number of dictionary-managed database objects allowed per database. See the entry for "Dictionary-managed database objects" in this table.
Indexes	Total size of indexed column(s)	Approximately 75% of the database block size minus some overhead

Item	Type of Limit	Limit Value
Partitions	Maximum length of linear partitioning key	4 KB - overhead
Partitions	Maximum number of columns in partition key	16 columns
Partitions	Maximum number of partitions allowed per table or index	1024K - 1
Rows	Maximum number per table	Not defined
Stored Packages	Maximum size	Approximately `6,000,000` lines of code. **See Also:** *Oracle Database PL/SQL Language Reference* for details
Subpartitions	Maximum number of subpartitions in a composite partitioned table	1024K - 1
Subqueries	Maximum levels of subqueries in a SQL statement	`255` subqueries in the `WHERE` clause A limit is not defined for subqueries in the `FROM` clause of the top-level query.
System Change Numbers (SCNs)	Maximum	$2^{63} - 2^{48}$ = 9,223,090,561,878,065,152 SCNs
Tables	Maximum per clustered table	32 tables
Tables	Maximum per database	Not defined Oracle does not define a limit on the number of tables per database. However, tables are subject to the limit on the maximum number of dictionary-managed database objects allowed per database. See the entry for "Dictionary-managed database objects" in this table.
Temporary Tablespaces	Maximum used per session	16
Users and Roles	Maximum	2,147,483,638 Users and roles are numbered internally from 0 to 2,147,483,638. The internal number is incremented each time a user or role is created, and numbers are never recycled. One number is always consumed by a special internal user called `_NEXT_USER`, which represents the next available number for a new user or role. Therefore, the maximum number of users and roles that can be created during the lifetime of a database is 2,147,483,638. You can view user and role numbers by querying the `USER#` column of the `SYS.USER$` table.

> **Note:**
>
> The limit on how long a SQL statement can be depends on many factors, including database configuration, disk space, and memory

> **Note:**
>
> When an object instance exists in memory, there is no fixed limit on the number of attributes in the object. But the maximum total amount of memory consumed by an object instance is 4 GB. When an object instance is inserted into a table, the attributes are exploded into separate columns in the table, and these columns count toward the limit on the maximum number of columns per table.

A.4 Process and Runtime Limits

This table describes limit types and limit values for process and runtime items.

Item	Type of Limit	Limit Value
Advanced Queuing Processes	Maximum per instance	10
Backup Sessions	Maximum per instance	Limited by the PROCESSES and SESSIONS initialization parameters, for instance
Dispatchers	Maximum per instance	Limited by the PROCESSES and SESSIONS initialization parameters, for instance
Global Cache Service Processes	Maximum per instance	10
Instances per database	Maximum number of cluster database instances per database	Operating system-dependent
I/O Worker Processes	Maximum per background process (DBWR, LGWR, and so on)	15
I/O Worker Processes	Maximum per Backup session	15
Job Queue Processes	Maximum per instance	1000
Locks	Row-level	Not defined
Parallel Execution Workers	Maximum per instance	Limited by the PROCESSES and SESSIONS initialization parameters, for instance
Services	Maximum per instance	8200
Sessions	Maximum per instance	2^{16}; limited by the PROCESSES and SESSIONS initialization parameters. 2^{16} is 65536.
SGA size	Maximum value	Operating system-dependent; typically 2 to 4 GB for 32-bit operating systems, and > 4 GB for 64-bit operating systems
Shared Servers	Maximum per instance	Limited by the PROCESSES and SESSIONS initialization parameters, for instance

B
SQL Scripts

This appendix describes SQL scripts that are required for optimal operation of the Oracle Database.

The SQL scripts are described in the following sections:

- Creating the Data Dictionary
- Creating Additional Data Dictionary Structures
- The "NO" Scripts
- Upgrade Scripts
- Java Scripts

> **Note:**
>
> Comments within the SQL scripts themselves contain more detailed information and examples.

> **Note:**
>
> To run scripts in a pluggable database (PDB), connect to the PDB before running the script. For more information about running scripts in a multitenant container database (CDB), see *Oracle Multitenant Administrator's Guide*.

B.1 Creating the Data Dictionary

When you use the Database Configuration Assistant to create a database, Oracle automatically creates the data dictionary. Thereafter, whenever the database is in operation, Oracle updates the data dictionary in response to every DDL statement.
The data dictionary base tables are the first objects created in any Oracle database. They are created in the `SYSTEM` tablespace and must remain there. The data dictionary base tables store information about all user-defined objects in the database.

Table B-1 lists required scripts, which are run automatically when you create a database using the Database Configuration Assistant. They are described here because you might need to run them if you create a database manually. To run these scripts, you must be connected to Oracle as a user with `SYSDBA` privileges.

Table B-1 Creating the Data Dictionary Scripts

Script Name	Needed For	Description
`catalog.sql`	All databases	Creates the data dictionary and public synonyms for many of its views Grants `PUBLIC` access to the synonyms
`catproc.sql`	All databases	Runs all scripts required for, or used with, PL/SQL
`catpcat.sql`	All databases	Runs the `catalog.sql` and `catproc.sql` scripts as parallel processes, which can speed up database creation **Note:** You must run `catpcat.sql` by using the `catctl.pl` program. See *Oracle Database Administrator's Guide* for more information.
`catclust.sql`	Oracle Real Application Clusters	Creates Oracle Real Application Clusters data dictionary views

See Also:

- Your operating system-specific Oracle documentation for the exact names and locations of these scripts on your operating system
- *Oracle Database Administrator's Guide* for more information about creating a database
- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about creating Oracle Real Application Cluster views

B.2 Creating Additional Data Dictionary Structures

Oracle Database supplies other scripts that create additional structures you can use in managing your database and creating database applications. These scripts are listed in Table B-2.

See Also:

Your operating system-specific Oracle documentation for the exact names and locations of these scripts on your operating system

Table B-2 Creating Additional Data Dictionary Structures

Script Name	Needed For	Run By	Description
`catblock.sql`	Performance management	`SYS`	Creates views that can dynamically display lock dependency graphs **See Also:** *Oracle Database Administrator's Guide*

Table B-2 (Cont.) Creating Additional Data Dictionary Structures

Script Name	Needed For	Run By	Description
`caths.sql`	Heterogeneous Services	`SYS`	Installs packages for administering heterogeneous services **See Also:** *Oracle Database Gateway for APPC Installation and Configuration Guide for Microsoft Windows*
`catio.sql`	Performance management	`SYS`	Allows I/O to be traced on a table-by-table basis
`catqueue.sql`	Advanced Queuing		Creates the dictionary objects required for Advanced Queuing
`catrep.sql`	Oracle Replication	`SYS`	Runs all SQL scripts for enabling database replication
`catwrr.sql`	Database Replay	`SYS`	Main script that creates the entire schema related to Database Replay - calls the create schema scripts for Workload Capture, Database Replay, Workload Replay, and Workload Intelligence
`catwrrwitb.sql`	Database Replay	`SYS`	Creates the schema for Workload Intelligence
`dbmsiotc.sql`	Storage management	Any user	Analyzes chained rows in index-organized tables
`dbmspool.sql`	Performance management	`SYS` or `SYSDBA`	Enables DBA to lock PL/SQL packages, SQL statements, and triggers into the shared pool **See Also:** *Oracle Database PL/SQL Packages and Types Reference*
`userlock.sql`	Concurrency control	`SYS` or `SYSDBA`	Provides a facility for user-named locks that can be used in a local or clustered environment to aid in sequencing application actions
`utlbstat.sql` and `utlestat.sql`	Performance monitoring	`SYS`	Respectively start and stop collecting performance tuning statistics
`utlchn1.sql`	Storage management	Any user	For use with the Oracle Database. Creates tables for storing the output of the `ANALYZE` command with the `CHAINED ROWS` option. Can handle both physical and logical rowids. **See Also:** *Oracle Database Administrator's Guide*
`utlconst.sql`	Year 2000 compliance	Any user	Provides functions to validate that `CHECK` constraints on date columns are year 2000 compliant
`utldtree.sql`	Metadata management	Any user	Creates tables and views that show dependencies between objects **See Also:** *Oracle Database SecureFiles and Large Objects Developer's Guide*
`utlexpt1.sql`	Constraints	Any user	For use with the Oracle Database. Creates the default table (`EXCEPTIONS`) for storing exceptions from enabling constraints. Can handle both physical and logical rowids. **See Also:** *Oracle Database Administrator's Guide*

Table B-2 (Cont.) Creating Additional Data Dictionary Structures

Script Name	Needed For	Run By	Description
utlfixdirs.sql	Moving a database to a new Oracle home	SYS	Used after moving a database to a new Oracle home. Updates directory objects to use the new path names for the Oracle home and Oracle base directories, as defined by the new values for the ORACLE_HOME and ORACLE_BASE environment variables. When you run this script in the root container of a CDB, it updates directory objects in the root, as well as any Oracle-maintained directory objects in the PDBs; you must manually update any PDB directory objects that are not Oracle-maintained.
utlip.sql	PL/SQL	SYS	Used primarily for upgrade and downgrade operations. It invalidates all existing PL/SQL modules by altering certain dictionary tables so that subsequent recompilations will occur in the format required by the database. It also reloads the packages STANDARD and DBMS_STANDARD, which are necessary for any PL/SQL compilations.
utlirp.sql	PL/SQL	SYS	Used to change from 32-bit to 64-bit word size or vice versa. This script recompiles existing PL/SQL modules in the format required by the new database. It first alters some data dictionary tables. Then it reloads the packages STANDARD and DBMS_STANDARD, which are necessary for using PL/SQL. Finally, it triggers a recompilation of all PL/SQL modules, such as packages, procedures, and types.
utllockt.sql	Performance monitoring	SYS or SYSDBA	Displays a lock wait-for graph, in tree structure format **See Also:** *Oracle Database Administrator's Guide*
utlpwdmg.sql	Security	SYS or SYSDBA	Creates PL/SQL functions for default password complexity verification. Sets the default password profile parameters and enables password management features. **See Also:** *Oracle Database Security Guide*
utlrp.sql	PL/SQL	SYS	Recompiles all existing PL/SQL modules that were previously in an INVALID state, such as packages, procedures, and types.
utlsampl.sql	Examples	SYS or any user with DBA role	Creates sample tables, such as emp and dept, and users, such as scott
utlscln.sql	Oracle Replication	Any user	Copies a snapshot schema from another snapshot site
utltkprf.sql	Performance management	SYS	Creates the TKPROFER role to allow the TKPROF profiling utility to be run by non-DBA users
utlvalid.sql	Partitioned tables	Any user	Creates tables required for storing output of ANALYZE TABLE ... VALIDATE STRUCTURE of a partitioned table

Table B-2 (Cont.) Creating Additional Data Dictionary Structures

Script Name	Needed For	Run By	Description
utlxplan.sql	Performance management	Any user	Creates the table PLAN_TABLE, which holds output from the EXPLAIN PLAN statement See Also: *Oracle Database Data Warehousing Guide*

B.3 The "NO" Scripts

These scripts are used to remove dictionary information for various optional services or components.

Table B-3 The NO Scripts

Script Name	Needed For	Run By	Description
catnoadt.sql	Objects	SYS	Drops views and synonyms on dictionary metadata that relate to object types
catnoaud.sql	Security	SYS	Drops views and synonyms on auditing metadata
catnoclust.sql	Real Application Clusters	SYS	Drops views that are specific to Oracle Real Application Clusters (Oracle RAC)
catnodrdaas.sql	DRDA Application Server	SYS	Drops all DRDA Application Server objects from the database
catnogwm.sql	Global Data Services	SYS	Drops users, roles, and other objects created for Global Data Services.
catnohs.sql	Heterogeneous Services	SYS	Removes Heterogeneous Services dictionary metadata
catnojav.sql	Java	SYS	Drops the RDBMS Java classes and system triggers created by the catjava.sql script.
catnoprt.sql	Partitioning	SYS	Drops views and synonyms on dictionary metadata that relate to partitioned tables and indexes
catnosvm.sql	Server Manager	SYS	Removes Oracle7 Server Manager views and synonyms
catnowrr.sql	Database Replay	SYS	Main script that drops the entire schema related to Database Replay - calls the drop schema scripts for Workload Capture, Database Replay, Workload Replay, and Workload Intelligence
catnowrrc.sql	Database Replay	SYS	Drops the schema related to Workload Capture
catnowrrp.sql	Database Replay	SYS	Drops the schema related to Workload Replay
catnowrrwitb.sql	Database Replay	SYS	Drops the schema related to Workload Intelligence
catnsnmp.sql	Distributed management	SYS	Drops the DBSNMP user and SNMPAGENT role

B.4 Upgrade Scripts

Upgrade scripts are used when upgrading to another release of Oracle.

> **See Also:**
>
> *Oracle Database Upgrade Guide* for information about upgrade scripts

B.5 Java Scripts

The Java scripts are useful only if the JServer option is installed.

Table B-4 Java Scripts

Script Name	Description
`initjvm.sql`	Initializes JServer by installing core Java class libraries and Oracle-specific Java classes
`rmjvm.sql`	Removes all elements of the JServer **See Also:** *Oracle Database Java Developer's Guide*
`catjava.sql`	Installs Java-related packages and classes

C

Oracle Wait Events

This appendix describes Oracle wait events.

It includes these topics:

- Classes of Wait Events
- Descriptions of Common Wait Event Parameters
- Descriptions of Wait Events

Information about wait events is displayed in three dynamic performance views:

- `V$SESSION_WAIT` displays the events for which sessions have just completed waiting or are currently waiting.
- `V$SYSTEM_EVENT` displays the total number of times all the sessions have waited for the events in that view.
- `V$SESSION_EVENT` is similar to `V$SYSTEM_EVENT`, but displays all waits for each session.

> **See Also:**
>
> "V$SESSION_WAIT", "V$SYSTEM_EVENT", and "V$SESSION_EVENT"

Many of these wait events are tied to the internal implementation of Oracle and therefore are subject to change or deletion without notice. Application developers should be aware of this and write their code to tolerate missing or extra wait events.

The following SQL statement displays an alphabetical list of all Oracle wait events and the wait class to which they belong:

```
SQL> SELECT name, wait_class FROM V$EVENT_NAME ORDER BY name;
```

C.1 Classes of Wait Events

Every wait event belongs to a class of wait event.

The following list describes each of the wait classes.

Administrative

Waits resulting from DBA commands that cause users to wait (for example, an index rebuild)

Application

Waits resulting from user application code (for example, lock waits caused by row level locking or explicit lock commands)

Cluster

Waits related to Oracle Real Application Clusters resources (for example, global cache resources such as 'gc cr block busy')

Commit

This wait class only comprises one wait event - wait for redo log write confirmation after a commit (that is, 'log file sync')

Concurrency

Waits for internal database resources (for example, latches)

Configuration

Waits caused by inadequate configuration of database or instance resources (for example, undersized log file sizes, shared pool size)

Idle

Waits that signify the session is inactive, waiting for work (for example, 'SQL*Net message from client')

Network

Waits related to network messaging (for example, 'SQL*Net more data to dblink')

Other

Waits which should not typically occur on a system (for example, 'wait for EMON to spawn')

Queueing

Contains events that signify delays in obtaining additional data in a pipelined environment. The time spent on these wait events indicates inefficiency or other problems in the pipeline. It affects features such as parallel queries or `DBMS_PIPE` PL/SQL packages.

Scheduler

Resource Manager related waits (for example, 'resmgr: become active')

System I/O

Waits for background process I/O (for example, DBWR wait for 'db file parallel write')

User I/O

Waits for user I/O (for example 'db file sequential read')

C.2 Descriptions of Common Wait Event Parameters

This section describes some of the common wait event parameters.

block#

This is the block number of the block for which Oracle needs to wait. The block number is relative to the start of the file. To find the object to which this block belongs, issue the following SQL statement:

```
select segment_name, segment_type, owner, tablespace_name
from dba_extents
where file_id = file#
     and block#
     between block_id and block_id + blocks - 1;
```

blocks

The number of blocks that is being either read from or written to the file. The block size depends on the file type:

- Database files have a block size of `DB_BLOCK_SIZE`
- Logfiles and control files have a block size that is equivalent to the physical block size of the platform

break?

If the value for this parameter equals 0, a reset was sent to the client. A nonzero value indicates that a break was sent to the client.

class

The class of the block describes how the contents of the block are used. For example, class 1 represents data block, and class 2 represents sort block. Use this SQL query to see the block classes:

```
select view_definition
from v$fixed_view_definition
where view_name='GV$WAITSTAT';
```

dba

The initials "dba" represents the data block address, which consists of a file number and a block number.

driver id

The address of the disconnect function of the driver that is currently being used.

file#

The following query returns the name of the database file:

```
select *
from v$datafile
where file# = file#;
```

id1

The first identifier (*id1*) of the enqueue or global lock takes its value from P2 or P2RAW. The meaning of the identifier depends on the name (P1).

id2

The second identifier (*id2*) of the enqueue or global lock takes its value from P3 or P3RAW. The meaning of the identifier depends on the name (P1).

mode

The *mode* is usually stored in the low order bytes of P1 or P1RAW and indicates the mode of the enqueue or global lock request. This parameter has one of the following values:

Table C-1 Lock Mode Values

Mode Value	Description
1	Null mode
2	Sub-Share
3	Sub-Exclusive
4	Share
5	Share/Sub-Exclusive
6	Exclusive

Use the following SQL statement to retrieve the name of the lock and the mode of the lock request:

```
select chr(bitand(p1,-16777216)/16777215)||
       chr(bitand(p1, 16711680)/65535) "Lock",
       bitand(p1, 65535) "Mode"
from v$session_wait
where event = 'DFS enqueue lock acquisition';
```

name and type

The name or "type" of the enqueue or global lock can be determined by looking at the two high order bytes of P1 or P1RAW. The name is always two characters. Use the following SQL statement to retrieve the lock name.

```
select chr(bitand(p1,-16777216)/16777215)||
      chr(bitand(p1,16711680)/65535) "Lock"
from v$session_wait
where event = 'DFS enqueue lock acquisition';
```

namespace

The name of the object namespace as it is displayed in `V$DB_OBJECT_CACHE` view.

requests

The number of I/Os that are "requested." This differs from the number of blocks in that one request could potentially contain multiple blocks.

session#

The number of the inactive session. Use the following SQL statement to find more information about the session:

```
select *
from v$session
where sid = session#;
```

waited

This is the total amount of time the session has waited for this session to terminate.

C.3 Descriptions of Wait Events

This section provides detailed descriptions for those wait events of greatest interest.

Where appropriate, pointers are provided to further information elsewhere in Oracle Database documentation. For a complete listing of wait events, in alphabetical order, you can issue the following SQL statement:

```
SQL> SELECT name FROM V$EVENT_NAME ORDER BY name;
```

C.3.1 alter system set dispatcher

A session has issued a statement `ALTER SYSTEM SET DISPATCHER = string` and is waiting for the dispatchers to get started.

Wait Time: The session will wait 1 / 100 of a second and verify if the new dispatchers have started, else the session will wait again

Parameter	Description
waited	Number of times that the session has waited 1 / 100 of a second

C.3.2 ARCH Remote Write

Used to track the time (in centiseconds) that ARC*n* background processes spend blocked waiting for network write operations to complete.

C.3.3 ASYNC Remote Write

Used to track the time (in centiseconds) for asynchronous streaming RFSWRITE operations. This includes stall reaps and streaming network submission time. This time is accumulated by TT*nn* (Redo Transport Worker) background processes.

> **See Also:**
>
> *Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

C.3.4 BFILE check if exists

The session waits to check if an external large object (LOB) exists.

Wait Time: The total elapsed time for the **exists** call

Parameter	Description
session#	See "session#"
waited	See "waited"

C.3.5 BFILE check if open

The session waits for an external large object (LOB) to open.

Wait Time: The total elapsed time for the **isopen** call

Parameter	Description
session#	See "session#"
waited	See "waited"

C.3.6 BFILE closure

The session waits for an external large object (LOB) to close.

Wait Time: The total elapsed time for the **close** call

Parameter	Description
session#	See "session#"
waited	See "waited"

C.3.7 BFILE get length

The session waits on a call to check the size of an external large object (LOB).

Wait Time: The total elapsed time for the call to check the LOB size

Parameter	Description
session#	See "session#"
waited	See "waited"

C.3.8 BFILE get name object

The session waits on a call to find or generate the external name of a external large object.

Wait Time: The total elapsed time for **make external file name** to complete

Parameter	Description
session#	See "session#"
waited	See "waited"

C.3.9 BFILE get path object

The session is waiting on a call to find or generate the external path name of an external large object (LOB).

Wait Time: The total elapsed time for **make external path** to complete

Parameter	Description
session#	See "session#"
waited	See "waited"

C.3.10 BFILE internal seek

The session waits for a positioning call within the external large object (LOB) to complete.

Wait Time: The total elapsed time for the **seek** to complete

Parameter	Description
session#	See "session#"
waited	See "waited"

C.3.11 BFILE open

The session waits for an external large object (LOB) to open.

Wait Time: The total elapsed time for the **isopen** call

Parameter	Description
session#	See "session#"
waited	See "waited"

C.3.12 BFILE read

The session waits for a read from a external large object (LOB) to complete.

Wait Time: The total elapsed time for the **read** to complete

Parameter	Description
session#	See "session#"
waited	See "waited"

C.3.13 broadcast mesg queue transition

Processes enter "wait for broadcast mesg queue transition" when cleaning up a publisher channel handle to a RELIABLE broadcast channel. The publisher is responsible for moving the message to the free queue, but it cannot do so until the message is in the done queue. If the message is still not in the done queue, process enters this wait. This wait event will most likely appear when an Oracle process is about to exit normally, or when PMON cleans up a terminated process.

Wait Time: Varies

Parameter	Description
channel handle	publisher channel handle pointer

Parameter	Description
message	broadcast message pointer
location	A number indicating the function in KSR where the process is waiting

C.3.14 broadcast mesg recovery queue transition

Processes enter "wait for broadcast mesg recovery queue transition" when cleaning up a publisher channel handle to a RELIABLE broadcast channel. The broadcasted message is in the recovery queue of another channel handle (for example, ch2). Process enters this wait, if the message is yet to be removed from the recovery queue of the ch2 channel handle. This wait event will most likely appear when an Oracle process is about to exit normally, or when PMON cleans up a terminated process.

Wait Time: Varies

Parameter	Description
channel handle	Publisher channel handle pointer
message	Broadcast message pointer
location	A number indicating the function in KSR where the process is waiting

C.3.15 buffer busy waits

Wait until a buffer becomes available.

There are four reasons that a session cannot pin a buffer in the buffer cache, and a separate wait event exists for each reason:

1. "buffer busy waits": A session cannot pin the buffer in the buffer cache because another session has the buffer pinned.
2. "read by other session": A session cannot pin the buffer in the buffer cache because another session is reading the buffer from disk.
3. "gc buffer busy acquire": A session cannot pin the buffer in the buffer cache because another session is reading the buffer from the cache of another instance.
4. "gc buffer busy release": A session cannot pin the buffer in the buffer cache because another session on another instance is taking the buffer from this cache into its own cache so it can pin it.

Prior to release 10.1, all four reasons were covered by "buffer busy waits." In release 10.1, the "gc buffer busy" wait event covered both the "gc buffer busy acquire" and "gc buffer busy release" wait events.

Wait Time: Normal wait time is 1 second. If the session was waiting for a buffer during the last wait, then the next wait will be 3 seconds.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about the potential causes of the buffer busy waits wait event

C.3.16 buffer deadlock

Oracle does not really wait on this event; the foreground only yields the CPU. Thus, the chances of catching this event are very low. This is not an application induced deadlock, but an assumed deadlock by the cache layer. The cache layer cannot get a buffer in a certain mode within a certain amount of time.

Wait Time: 0 seconds. The foreground process only yields the CPU and will usually be placed at the end of the CPU run queue.

Parameter	Description
class	See "class"
mode	See "mode"
flag	The flag points to the internal flags used by the session to get this block
dba	See "dba"

C.3.17 buffer latch

The session waits on the buffer hash chain latch. Primarily used in the dump routines.

Wait Time: 1 second

Parameter	Description

latch addr	The virtual address in the SGA where this latch is located. Use the following statement to find the name of this latch:
	`select *`
	`from v$latch a, v$latchname b`
	`where addr = latch addr`
	`and a.latch# = b.latch#;`

chain#	The index into array of buffer hash chains. When the chain is 0xffffffff, the foreground waits on the LRU latch.

C.3.18 buffer read retry

This event occurs only if the instance is mounted in shared mode (Oracle Real Application Cluster).
During the read of the buffer, the contents changed. This means that either:

- The version number, dba, or the incarnation and sequence number stored in the block no longer match
- The checksum on the block does not match the checksum in the block

The block will be reread (this may fail up to 3 times), then corruption is assumed and the corrupt block is dumped in the trace file.

Wait Time: The wait time is the elapsed time of the read

Parameter	Description
file#	See "file#"
block#	See "block#"

C.3.19 checkpoint completed

A session waits for a checkpoint to complete. This could happen, for example, during a close database or a local checkpoint.

Wait Time: 5 seconds

Parameters: None

C.3.20 cleanup of aborted process

When a process spawn is terminated while the process spawning background is in the middle of spawning, the current session must wait until the pid of the new process is filled in. Once the pid is filled in, then the process spawn can be actually terminated.

Wait Time: Usually 3 seconds

Parameter	Description
location	Location of the wait

C.3.21 control file parallel write

This event occurs while the session is writing physical blocks to all control files. This happens when:

- The session starts a control file transaction (to ensure the control files are up to date in case the session crashes before committing the control file transaction)
- The session commits a transaction to a control file
- Changing a generic entry in the control file, the new value is being written to all control files

Wait Time: The wait time is the time it takes to finish all writes to all control files

Parameter	Description
files	The number of control files to which the session is writing
blocks	The number of blocks that the session is writing to the control file
requests	The number of I/O requests which the session wants to write

C.3.22 control file sequential read

Reading from the control file. This happens often. For example, while:

- Making a backup of the control files
- Sharing information (between instances) from the control file
- Reading other blocks from the control files

- Reading the header block

Wait Time: The wait time is the elapsed time of the read

Parameter	Description
file#	The control file from which the session is reading
block#	Block number in the control file from where the session starts to read. The block size is the physical block size of the port (usually 512 bytes, some UNIX ports have 1 or 2 Kilobytes).
blocks	The number of blocks that the session is trying to read

C.3.23 control file single write

This wait is signaled while the control file's shared information is written to disk. This is an atomic operation protected by an enqueue (CF), so that only one session at a time can write to the entire database.

Wait Time: The wait time is the elapsed time of the write

Parameter	Description
file#	This identifies the control file to which the session is currently writing
block#	Block number in the control file where the write begins. The block size is the as the physical block size of the port (usually 512 bytes, some UNIX ports have 1 or 2 Kilobytes).
blocks	The number of blocks that the session is trying to write

C.3.24 cursor: mutex S

A session waits on this event when it is requesting a mutex in shared mode, when another session is currently holding a this mutex in exclusive mode on the same cursor object.

Parameter	Description
P1	Hash value of cursor
P2	Mutex value (top 2 bytes contain SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0)
P3	Mutex where (an internal code locator) OR'd with Mutex Sleeps

C.3.25 cursor: mutex X

The session requests the mutex for a cursor object in exclusive mode, and it must wait because the resource is busy. The mutex is busy because either the mutex is being held in exclusive mode by another session or the mutex is being held shared by one or more sessions. The existing mutex holder(s) must release the mutex before the mutex can be granted exclusively.

Parameter	Description
P1	Hash value of cursor
P2	Mutex value (top 2 bytes contain SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0)

Parameter	Description
P3	Mutex where (an internal code locator) OR'd with Mutex Sleeps

C.3.26 cursor: pin S

A session waits on this event when it wants to update a shared mutex pin and another session is currently in the process of updating a shared mutex pin for the same cursor object. This wait event should rarely be seen because a shared mutex pin update is very fast.

Wait Time: Microseconds

Parameter	Description
P1	Hash value of cursor
P2	Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0)
P3	Mutex where (an internal code locator) OR'd with Mutex Sleeps

C.3.27 cursor: pin S wait on X

A session waits for this event when it is requesting a shared mutex pin and another session is holding an exclusive mutex pin on the same cursor object.

Wait Time: Microseconds

Parameter	Description
P1	Hash value of cursor
P2	Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0)
P3	Mutex where (an internal code locator) OR'd with Mutex Sleeps

C.3.28 cursor: pin X

A session waits on this event when it is requesting an exclusive mutex pin for a cursor object and it must wait because the resource is busy. The mutex pin for a cursor object can be busy either because a session is already holding it exclusive, or there are one or more sessions which are holding shared mutex pin(s). The exclusive waiter must wait until all holders of the pin for that cursor object have released it, before it can be granted.

Wait Time: Microseconds

Parameter	Description
P1	Hash value of cursor
P2	Mutex value (top 2 bytes contains SID holding mutex in exclusive mode, and bottom two bytes usually hold the value 0)
P3	Mutex where (an internal code locator) OR'd with Mutex Sleeps

C.3.29 db file async I/O submit

When asynchronous I/O is available, this wait event captures any time spent in submitting I/Os to the underlying storage.

> **See Also:**
>
> "db file parallel write"

C.3.30 db file parallel read

This happens during recovery. It can also happen during buffer prefetching, as an optimization (rather than performing multiple single-block reads). Database blocks that must be changed as part of recovery are read in parallel from the database.

Wait Time: Wait until all of the I/Os are completed

Parameter	Description
files	This indicates the number of files to which the session is reading
blocks	This indicates the total number of blocks to be read
requests	This indicates the total number of I/O requests, which will be the same as blocks

C.3.31 db file parallel write

This event occurs in the DBWR. It indicates the time that DBWR spends waiting for I/O completion.

If asynchronous I/O is available, then the db file async I/O submit wait event captures any time spent in submitting I/Os to the underlying storage.

When asynchronous I/O is not available, db file parallel write captures the time spent during submit and reap.

Wait Time: While there are outstanding I/Os, DBWR waits for some of the writes to complete. DBWR does not wait for all of the outstanding I/Os to complete.

Parameter	Description
requests	This indicates the total number of I/O requests, which will be the same as blocks
interrupt	
timeout	This indicates the timeout value in hundredths of a second to wait for the I/O completion.

See Also:

- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems
- "db file async I/O submit"

C.3.32 db file scattered read

Similar to the “db file sequential read” wait event, except that the session is reading multiple data blocks.

Wait Time: The wait time is the actual time it takes to do all of the I/Os

Parameter	Description
file#	See "file#"
block#	See "block#"
blocks	The number of blocks that the session is trying to read from the *file#* starting at *block#*

See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems
- *Oracle Database Performance Tuning Guide* about potential causes for this wait event

C.3.33 db file sequential read

The session waits while a sequential read from the database is performed. This event is also used for rebuilding the control file, dumping data file headers, and getting the database file headers.

Wait Time: The wait time is the actual time it takes to do the I/O

Parameter	Description
file#	See "file#"
block#	See "block#"
blocks	This is the number of blocks that the session is trying to read (should be 1)

> **See Also:**
>
> - *Oracle Database Performance Tuning Guide* for more information about this wait event
> - *Oracle Database Performance Tuning Guide* for more information about how this wait event can help identify I/O problems
> - *Oracle Database Performance Tuning Guide* about potential causes for this wait event

C.3.34 db file single write

This event is used to wait for the writing of the file headers.

Wait Time: The wait time is the actual time it takes to do the I/O

Parameter	Description
file#	See "file#"
block#	See "block#"
blocks	This is the number of blocks that the session is trying to write in *file# starting at block#*

> **See Also:**
>
> - *Oracle Database Performance Tuning Guide* about how this wait event can help identify I/O problems

C.3.35 DFS lock handle

The session waits for the lock handle of a global lock request. The lock handle identifies a global lock. With this lock handle, other operations can be performed on this global lock (to identify the global lock in future operations such as conversions or release). The global lock is maintained by the DLM.

Wait Time: The session waits in a loop until it has obtained the lock handle from the DLM. Inside the loop there is a wait of 0.5 seconds.

Parameter	Description
name	See "name and type"
mode	See "mode"
id1	See "id1"
id2	See "id2"

C.3.36 direct path read

During Direct Path operations the data is asynchronously read from the database files. At some stage the session needs to make sure that all outstanding asynchronous I/O have been completed to disk. This can also happen if during a direct read no more slots are available to store outstanding load requests (a load request could consist of multiple I/Os).

Wait Time: 10 seconds. The session will be posted by the completing asynchronous I/O. It will never wait the entire 10 seconds. The session waits in a tight loop until all outstanding I/Os have completed.

Parameter	Description
descriptor address	This is a pointer to the I/O context of outstanding direct I/Os on which the session is currently waiting
first dba	The dba of the oldest I/O in the context referenced by the descriptor address
block cnt	Number of valid buffers in the context referenced by the descriptor address

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.37 direct path sync

During Direct Path write operations the data is asynchronously written to the database files. At some point the session needs to ensure that all outstanding asynchronous I/O have been completed to disk. On UNIX the `fsync` command, which synchronizes data to disk, is issued to confirm that all the writes have completed and the data is all on disk.

Wait Time: The time taken for the fsync operation to complete, which normally is the time taken to complete the outstanding I/Os.

Parameters	Description
file#	See "file#"
flags	Flags used for debugging purposes

C.3.38 direct path write

During Direct Path operations, the data is asynchronously written to the database files. At some stage the session needs to make sure that all outstanding asynchronous I/O have been completed to disk. This can also happen if, during a direct write, no more slots are available to store outstanding load requests (a load request could consist of multiple I/Os).

Wait Time: 10 seconds. The session will be posted by the completing asynchronous I/O. It will never wait the entire 10 seconds. The session waits in a tight loop until all outstanding I/Os have completed.

Parameter	Description
descriptor address	This is a pointer to the I/O context of outstanding direct I/Os on which the session is currently waiting
first dba	The dba of the oldest I/O in the context referenced by the descriptor address
block cnt	Number of valid buffers in the context referenced by the descriptor address

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this parameter

C.3.39 Disk file operations I/O

This event is used to wait for disk file operations (for example, open, close, seek, and resize). It is also used for miscellaneous I/O operations such as block dumps and password file accesses.

Wait Time: The wait time is the actual time it takes to do the I/O

Parameter	Description
FileOperation	Type of file operation
fileno	File identification number
filetype	Type of file (for example, log file, data file, and so on)

C.3.40 dispatcher shutdown

During shutdown immediate or normal, the shutdown process must wait for all the dispatchers to shutdown. As each dispatcher is signaled, the session that causes the shutdown waits on this event until the requested dispatcher is no longer running.

Wait Time: 1 second

Parameter	Description
waited	Indicates the cumulative wait time. After 5 minutes, the session writes to the alert and trace files to indicate that there might be a problem.

> **See Also:**
>
> *Oracle Database SQL Language Reference* for information about shutting down a dispatcher using `SHUTDOWN` clause of the SQL `ALTER SYSTEM` statement

C.3.41 dispatcher timer

This basically means that the dispatcher is idle and waiting for some work to arrive.

Wait Time: 60 seconds

Parameter	Description
sleep time	The intended sleep time. The dispatcher will return to work sooner if it is posted by either data arriving on the network or by a post from a shared server process to send data back to the client.

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.42 dupl. cluster key

It is possible for a race condition to occur when creating a new cluster key. If it is found that another process has put the cluster key into the data/index block, then the session waits and retries. The retry should then find a valid cluster key.

Wait Time: 0.01 seconds

Parameter	Description
dba	The dba of the block into which the session is trying to insert a cluster key

C.3.43 enq: IQ - Text index maintenance

Used for coordinating concurrent execution of Oracle Text index maintenance events. Serialization behavior depends on the event type.

Wait Time: Varies. Depends on the duration of the Oracle Text index maintenance event type.

Parameter	Description
event type	Event type To interpret this numeric value, refer to the view "V$TEXT_WAITING_EVENTS". The list of values for the `EVENT_TYPE` column is ordered by event type number, starting with `0`. For example, event type `0` = `NONE`, event type `1` = `SYNC-Mapping Timeout`, event type `2` = `SYNC-Mapping`, and so on.
objn	Object number of the Oracle Text index or index partition

C.3.44 enq: OW - initialization

A session will wait on this event if it is trying to initialize the database wallet, and another session has already begun an initialization.

Wait Time: Total time necessary to initialize the wallet context

Parameters: None

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about the potential causes of an enqueue wait event

C.3.45 enq: OW - termination

A session will wait on this event if it is trying to terminate the database wallet, and another session has already begun a termination.

Wait Time: Total time necessary to deallocate memory used by the wallet context and terminate the context.

Parameters: None

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about the potential causes of an enqueue wait event

C.3.46 enq: SV - contention

A session is accessing a sequence number from an ordered sequence object.

Wait Time: The wait time is the actual time waited until the requested sequence number is acquired.

Parameter	Description
id1	Sequence object#

> **See Also:**
>
> *Oracle Database SQL Language Reference* for more information about sequences

C.3.47 enq: TX - index contention

Occurs when a transaction inserting a row in an index has to wait for the end of an index block split being done by another transaction.

C.3.48 enq: TX - row lock (HIGH priority)

This wait event occurs when a transaction with `HIGH` priority is waiting for a row lock being held by another transaction.

This wait event is useful when configuring Priority Transactions. You can observe the statistics for this wait event to determine whether the wait time for `HIGH` priority transactions is appropriate for your environment.

Wait Time: The amount of time specified by the `PRIORITY_TXNS_HIGH_WAIT_TARGET` initialization parameter.

Parameter	Description
name	See "name and type"
mode	See "mode"
usn<<16	Undo segment number
slot	Slot number
sequence	Sequence number

> **See Also:**
>
> - *Oracle Database Administrator's Guide* for information about configuring Priority Transactions
> - "PRIORITY_TXNS_HIGH_WAIT_TARGET"

C.3.49 enq: TX - row lock (LOW priority)

This wait event occurs when a transaction with `LOW` priority is waiting for a row lock being held by another transaction.

This wait event is useful when configuring Priority Transactions. You can observe the statistics for this wait event to determine how long `LOW` priority transactions are waiting for row locks.

Wait Time: Total time necessary to obtain the row lock

Parameter	Description
name	See "name and type"
mode	See "mode"
usn<<16	Undo segment number
slot	Slot number
sequence	Sequence number

> **See Also:**
>
> - *Oracle Database Administrator's Guide* for information about configuring Priority Transactions

C.3.50 enq: TX - row lock (MEDIUM priority)

This wait event occurs when a transaction with `MEDIUM` priority is waiting for a row lock being held by another transaction.

This wait event is useful when configuring Priority Transactions. You can observe the statistics for this wait event to determine whether the wait time for `MEDIUM` priority transactions is appropriate for your environment.

Wait Time: The amount of time specified by the `PRIORITY_TXNS_MEDIUM_WAIT_TARGET` initialization parameter.

Parameter	Description
name	See "name and type"
mode	See "mode"
usn<<16	Undo segment number
slot	Slot number
sequence	Sequence number

> **See Also:**
>
> - *Oracle Database Administrator's Guide* for information about configuring Priority Transactions
> - "PRIORITY_TXNS_MEDIUM_WAIT_TARGET"

C.3.51 enq: TX - row lock contention

This wait event can occur for several reasons.

- If one user is wanting to update or delete a row or rows that another session is modifying. The session holding the lock will release it when it performs a COMMIT or ROLLBACK.
- If a session is waiting due to potential duplicates in a UNIQUE index. If two sessions try to insert the same key value, the second session has to wait to see if an ORA-0001 should be raised or not. The session holding the lock will release it when it performs a COMMIT or ROLLBACK.
- If a session is waiting due to a shared bitmap index fragment. Bitmap indexes index key values and a range of rowids. Each entry in a bitmap index can cover many rows in the actual table. If two sessions want to update rows covered by the same bitmap index fragment, then the second session waits for the first transaction to either COMMIT or ROLLBACK by waiting for the TX lock.

C.3.52 enqueue

The session is waiting for a local enqueue.

The wait depends on the name of the enqueue (see Oracle Enqueue Names).

Wait Time: Depends on the enqueue name

Parameter	Description
name	See "name and type"
mode	See "mode"

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about the potential causes of an enqueue wait event

C.3.53 flashback buf free by RVWR

This wait event only occurs when Flashback Database is turned on. A session waits for recovery writer (RVWR) to write flashback data to the flashback logs on disk because the buffers are full. Until RVWR can free up the buffers, the session may need to wait.

If this event becomes a top wait event for the database, it is typically because the file system or storage system for the Fast Recovery Area does not support enough bandwidth for Oracle to write the flashback database logs. Refer to the Flashback Database section in *Oracle Database Backup and Recovery User's Guide* for tuning considerations.

Wait Time: 1 second

Parameters: None

C.3.54 flashback log file sync

Waits for flashback database data to be written to disk.

Wait Time: Includes RVWR writing the flashback database data and posting this process

Parameters: None

C.3.55 free buffer waits

This wait event can occur for several reasons.

- All buffer gets have been suspended. This could happen when a file was read-only and is now read/write. All the existing buffers must be invalidated since they are not linked to lock elements (needed when mounted parallel (shared)). So cache buffers are not assigned to data block addresses until the invalidation is finished.
- The session moved some dirty buffers to the dirty queue and now this dirty queue is full. The dirty queue must written first. The session will wait on this event and try again to find a free buffer

- This also happens after inspecting **free buffer inspected** buffers. If no free buffer is found, Oracle waits for one second, and then tries to get the buffer again (depends on the context). For more information, see free buffer inspected.

Wait Time: 1 second

Parameter	Description
file#	See "file#"
block#	See "block#"

> **See Also:**
>
> - *Oracle Database Performance Tuning Guide* for more information about this wait event
> - *Oracle Database Performance Tuning Guide* about potential causes of this wait event

C.3.56 free global transaction table entry

The session is waiting for a free slot in the global transaction table (used by the Distributed Database option). It will wait for 1 second and try again.

Wait Time: 1 second

Parameter	Description
tries	The number of times the session tried to find a free slot in the global transaction table

C.3.57 free process state object

Used during the creation of a process. The session will scan the process table and look for a free process slot. If none can be found, PMON is posted to check if all the processes currently in the process table are still running. If there are terminated processes, then PMON will clean them and make the process slot available to new processes. The waiting process will then rescan the process table to find the new slot.

Wait Time: 1 second

Parameters: None

C.3.58 gc buffer busy acquire

This event indicates that the requested buffer was globally busy in the cluster, because it had already been requested from a remote instance by another local client.

Wait Time: The wait time is the actual time it took to resolve the buffer contention.

Parameter	Description
file#	See "file#"

Parameter	Description
block#	See "block#"
class#	See "class"

C.3.59 gc buffer busy release

This event indicates that the requested buffer was globally busy in the cluster, because the requested buffer had been transferred away by a remote instance and needed to be requested again.

Wait Time: The wait time is the actual time it took to resolve the buffer contention.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.60 gc cr block 2-way

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and 2 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.61 gc cr block 3-way

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and 3 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.62 gc cr block busy

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, but the request had to be put on hold at the serving instance.

This could happen when a dirty buffer had to be transferred, in which case REDO needs to be flushed before the Cache Fusion transfer could be processed. This could also happen if the requested buffer was being held by another process on the remote instance. The serving instance would transfer the requested buffer once the REDO flush is complete, or once the buffer is released by the holding process.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.63 gc cr block congested

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, but the request was queued at the serving instance for too long.

This could happen when the GCS server processes (LMS*n* and LM*nn*) are very busy due to having a high volume of incoming Cache Fusion requests. Increasing the GCS server processes (`GCS_SERVER_PROCESSES`) is usually the remedy to alleviate congestion for the GCS server processes.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

> **See Also:**
>
> "GCS_SERVER_PROCESSES"

C.3.64 gc cr block direct read

This event indicates that the requested consistent read (CR) buffer was transferred from another instance in the cluster, and the buffer was directly read from the remote cache utilizing the RDMA protocol.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.65 gc cr block lost

This event indicates that a Cache Fusion consistent read (CR) buffer request resulted in a potentially lost block. The request will be re-tried automatically.

This is typically caused by unreliable interconnect network protocols, usually when the network is congested and packets are dropped. It can also be the result of interconnect hardware errors or simply the result of an overloaded system, or a sign that a public network path is used for Cache Fusion instead of a private network.

Wait Time: The wait time is the actual time it took to detect the potentially lost block.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.66 gc cr grant read-mostly invalidation

The client is performing a DML on a read-mostly object, which requires a read lock invalidation on all other instances.

Wait Time: The wait time is the actual time it takes to complete the invalidation on all other instances.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.67 gc cr multi block grant

This event indicates that a client requested multiple consistent read (CR) buffers from another instance in the cluster, and the request resulted in multiple lock grants from the remote instance.

Wait Time: The wait time is the actual time waited for the multi-block request to complete.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.68 gc cr multi block mixed

This event indicates that a client requested multiple consistent read (CR) buffers from another instance in the cluster, and the remote instance returned a mixture of blocks and grants.

Wait Time: The wait time is the actual time waited for the multi-block request to complete.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.69 gc cr request

This event is used for ongoing Cache Fusion consistent read (CR) buffer requests. The event is renamed to reflect the actual outcome of the request (example: "gc cr block 2-way") upon completion of the wait. Therefore, these events will not be reported in AWR reports, but may appear in ASH data.

Wait Time: The wait time is the actual time waited for the request.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.70 gc current block 2-way

This event indicates that the requested current buffer was transferred from another instance in the cluster, and 2 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
file#	See "file#"
block#	See "block#"
id#	Block class and global access mode held and requested

C.3.71 gc current block 3-way

This event indicates that the requested current buffer was transferred from another instance in the cluster, and 3 network hops were involved in the request. The Cache Fusion protocol guarantees that requests are fulfilled in 3 hops or less, regardless of the number of instances in the cluster.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
file#	See "file#"
block#	See "block#"
id#	Block class and global access mode held and requested

C.3.72 gc current block busy

This event indicates that the requested current buffer was transferred from another instance in the cluster, but the request had to be put on hold at the serving instance.

This could happen when a dirty buffer had to be transferred, in which case REDO needs to be flushed before the Cache Fusion transfer could be processed. This could also happen if the requested buffer was being held by another process on the remote instance. The serving instance would transfer the requested buffer once the REDO flush is complete, or once the buffer is released by the holding process.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
file#	See "file#"
block#	See "block#"
id#	Block class and global access mode held and requested

C.3.73 gc current block congested

This event indicates that the requested current buffer was transferred from another instance in the cluster, but the request was queued at the serving instance for too long.

This could happen when the GCS server processes (LMS) are very busy due to having a high volume of incoming Cache Fusion requests. Increasing the GCS server processes (`GCS_SERVER_PROCESSES`) is usually the remedy to alleviate congestion for the GCS server processes.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
file#	See "file#"
block#	See "block#"
id#	Block class and global access mode held and requested

> **See Also:**
>
> "GCS_SERVER_PROCESSES"

C.3.74 gc current block direct read

This event indicates that the requested current buffer was transferred from another instance in the cluster, and the buffer was directly read from the remote cache utilizing the RDMA protocol.

Wait Time: The wait time is the actual time it took to receive the requested buffer.

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.75 gc current block lost

This event indicates that a Cache Fusion current buffer request resulted in a potentially lost block. The request will be re-tried automatically.

This is typically caused by unreliable interconnect network protocols, usually when the network is congested and packets are dropped. It can also be the result of interconnect hardware errors or simply the result of an overloaded system, or a sign that a public network path is used for Cache Fusion instead of a private network.

Wait Time: The wait time is the actual time it took to detect the potentially lost block.

Parameter	Description
file#	See "file#"
block#	See "block#"
id#	Block class and global access mode held and requested

C.3.76 gc current request

This event is used for ongoing Cache Fusion current buffer requests. The event is renamed to reflect the actual outcome of the request (example: "gc current block 2-way") upon completion of the wait. Therefore, these events will not be reported in AWR reports, but may appear in ASH data.

Wait Time: The wait time is the actual time waited for the request.

Parameter	Description
file#	See "file#"
block#	See "block#"
id#	Block class and global access mode held and requested

C.3.77 inactive session

This event is used for switching and terminating sessions.

- Switching sessions

If a timeout period has been specified, then wait that amount of time for the session to be detached.

- Terminating sessions

  From either `KILL SESSION` or internal request. Having posted a session that it should terminate itself, wait for up to 1 minute for the session to terminate.

Wait Time: 1 second

Parameter	Description
session#	See "session#"
waited	See "waited"

C.3.78 inactive transaction branch

The session waits for a transaction branch that is currently used by another session.

Wait Time: 1 second

Parameter	Description
branch#	The serial number of the transaction for which the session is waiting
waited	See "waited"

C.3.79 index split completion

This event occurs when a transaction inserting a row into an index must wait for the end of an index block split being performed by another transaction. In an Oracle RAC database, some index split waits will use this wait event in lieu of the "enq: TX - index contention" wait event.

Wait Time: The wait time is the actual time waited for the split to complete.

Parameter	Description
undo seg#	The rollback segment ID
slot#	The slot ID inside the rollback segment
wrap#	The sequence number that is incremented for each transaction
count	The number of times that the session has waited on this transaction

C.3.80 instance state change

The session waits for SMON to enable or disable cache or transaction recovery. This usually happens during `ALTER DATABASE OPEN` or `CLOSE`.

Wait Time: Wait time depends on the amount of time the action takes (that is, the amount of recovery needed)

Parameter	Description
layer	This value can be 1 or 2. If 1, it means that the transaction layer wants transaction recovery to be performed. If 2, it means that cache recovery will be performed.
value	This value can be 0 (disable) or 1 (enable)

Parameter	Description
waited	The number of seconds waited so far

C.3.81 io done

The session waits for an I/O to complete or it waits for a worker process to become available to submit the I/O request. This event occurs on platforms that do not support asynchronous I/O.

Wait Time: 50 milliseconds

Parameter	Description
msg ptr	A pointer to the I/O request

C.3.82 ksxr wait for mount shared

The cross instance broadcast facility of this Oracle instance is waiting for the database mount in shared mode to complete.

Wait Time: The time taken for the instance to mount. An indefinite wait on this event implies that the instance startup is hanging.

C.3.83 ktm: instance recovery

The session waits for SMON to finish the instance, transaction recovery, or sort segment cleanup.

Wait Time: The wait time can vary and depends on the amount of recovery needed

Parameter	Description

undo segment#	If the value is 0, SMON is probably performing instance recovery. If P1 > 0, use this query to find the undo segment:
	`select *`
	`from v$rollstat`
	`where usn = undo segment#;`

C.3.84 latch activity

This event is used as part of the process of determining whether a latch must be cleaned.

Wait Time: 0.05 to 0.1 seconds

Parameter	Description
address	The address of the latch that is being checked

number	The latch number of the latch that has activity. To find more information on the latch, use the following SQL statement:
	`select *`
	`from v$latchname`
	`where latch# = number;`

Parameter	Description
process#	If this is 0, it is the first phase of the in-flux tests

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about latch wait events

C.3.85 latch free

The process waits for a latch that is currently busy (held by another process).

Wait Time: The wait time increases exponentially and does not include spinning on the latch (active waiting). The maximum wait time also depends on the number of latches that the process is holding. There is an incremental wait of up to 2 seconds.

Parameter	Description
address	The address of the latch for which the process is waiting

number	The latch number that indexes in the `V$LATCHNAME` view.To find more information on the latch, use the following SQL statement:
	`select *`
	`from v$latchname`
	`where latch# = number;`

tries	A count of the number of times the process tried to get the latch (slow with spinning) and the process has to sleep

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about latch wait events

C.3.86 latch: redo copy

Redo copy latches are acquired by sessions in order to write changes into the redo log buffer and by the LGWR process to ensure that there are no current writers before it copies data from the buffer to the redo log.

C.3.87 library cache load lock

The session tries to find the load lock for the database object so that it can load the object. The load lock is always obtained in Exclusive mode, so that no other process can load the same object. If the load lock is busy the session will wait on this event until the lock becomes available.

Wait Time: 3 seconds (1 second for PMON)

Parameter	Description
object address	Address of the object being loaded
lock address	Address of load lock being used
mask	Indicates which data pieces of the object that must loaded

C.3.88 library cache lock

This event controls the concurrency between clients of the library cache. It acquires a lock on the object handle so that either:

- One client can prevent other clients from accessing the same object
- The client can maintain a dependency for a long time (for example, no other client can change the object)

This lock is also obtained to locate an object in the library cache.

Wait Time: 3 seconds (1 second for PMON)

Parameter	Description
handle address	Address of the object being loaded
lock address	Address of the load lock being used. This is not the same thing as a latch or an enqueue, it is a State Object.
mode	Indicates the data pieces of the object which must be loaded
namespace	See "namespace"

See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

C.3.89 library cache pin

This event manages library cache concurrency. Pinning an object causes the heaps to be loaded into memory. If a client wants to modify or examine the object, the client must acquire a pin after the lock.

Wait Time: 3 seconds (1 second for PMON)

Parameter	Description
handle address	Address of the object being loaded
pin address	Address of the load lock being used. This is not the same thing as a latch or an enqueue, it is basically a State Object.
mode	Indicates which data pieces of the object that must be loaded
namespace	See "namespace"

See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

C.3.90 library cache shutdown

The process shutting down the instance waits for sessions to complete before proceeding with library cache shutdown.

C.3.91 library cache: mutex X

Library cache mutexes protect hash buckets within the shared pool. Each hash bucket contains a number of cursors. The mutex must be held in exclusive mode before any of the structures that it protects can be changed. This wait event is often associated with high parse activity.

C.3.92 Log archive I/O

Used local archiving of online redo logs (for a production database) or standby redo logs (for a standby database). When the archiving process exhausts its I/O buffers because all of them are being used for on-going I/O's, the wait for an available I/O buffer is captured in this system wait event.

Wait Time: Depends on the speed of the disks

Parameters: None

C.3.93 log buffer space

Waiting for space in the log buffer because the session is writing data into the log buffer faster than LGWR can write it out. Consider making the log buffer bigger if it is small, or moving the log files to faster disks such as striped disks.

Wait Time: Usually 1 second, but 5 seconds if it is waiting for a Switch Logfile to complete

Parameters: None

See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for more information about potential causes of this wait event

C.3.94 log file parallel write

Writing redo records to the redo log files from the log buffer.

Wait Time: Time it takes for the I/Os to complete. Even though redo records are written in parallel, the parallel write is not complete until the last I/O is on disk.

Parameter	Description
files	Number of files to be written
blocks	Number of blocks to be written
requests	Number of I/O requests

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for information about how this wait event can help identify I/O problems

C.3.95 log file sequential read

Waiting for the read from this logfile to return. This is used to read redo records from the log file.

Wait Time: Time it takes to complete the physical I/O (read)

Parameter	Description
log#	The relative sequence number of the logfiles within a log group (used only when dumping the logfiles)
block#	See "block#"
blocks	The number of blocks to read

C.3.96 log file single write

Waiting for the write to this logfile to complete. This event is used while updating the header of the logfile. It is signaled when adding a log file member and when incrementing sequence numbers.

Wait Time: Time it takes for the physical I/O (write) to complete

Parameter	Description
log#	This is the number of the group/log to which the session is currently writing
block#	See "block#"
blocks	The number of blocks to write

C.3.97 log file switch (archiving needed)

Waiting for a log switch because the log that the LGWR will be switching into has not been archived yet. Check the alert log to ensure that archiving has not stopped due to a failed archive write. To speed archiving, consider adding more archive processes or putting the archive files on striped disks.

Wait Time: 1 second

Parameters: None

C.3.98 log file switch (checkpoint incomplete)

Waiting for a log switch because the session cannot wrap into the next log. Wrapping cannot be performed because the checkpoint for that log has not completed.

Wait Time: 1 second

Parameters: None

C.3.99 log file switch (clearing log file)

Waiting for a log switch because the log is being cleared due to a `CLEAR LOGFILE` command or implicit clear logfile executed by recovery.

Wait Time: 1 second

Parameters: None

C.3.100 log file switch (private strand flush incomplete)

User sessions trying to generate redo, wait on this event when LGWR waits for DBWR to complete flushing redo from IMU buffers into the log buffer; when DBWR is complete LGWR can then finish writing the current log, and then switch log files.

Wait Time: 1 second

Parameters: None

C.3.101 log file switch completion

Waiting for a log switch to complete.

Wait Time: 1 second

Parameters: None

C.3.102 log file sync

When a user session commits, the session's redo information must be flushed to the redo logfile. The user session will post the LGWR to write the log buffer to the redo log file. When the LGWR has finished writing, it will post the user session.

Wait Time: The wait time includes the writing of the log buffer and the post.

Parameter	Description
buffer#	The number of the physical buffer in the redo log buffer that must be synchronized

See Also:

- *Oracle Database Performance Tuning Guide* for more information about this wait event
- *Oracle Database Performance Tuning Guide* for information about potential causes of this wait event

C.3.103 log switch/archive

Used as part of the `ALTER SYSTEM ARCHIVE LOG CHANGE` *scn* statement. The session waits for the current log from all open threads to be archived.

Wait Time: Wait for up to 10 seconds

Parameter	Description
thread#	The thread number of the thread that is currently archiving its current log

C.3.104 optimizer stats update retry

When concurrent sessions try to update optimizer statistics for the same object, all of them except the one that successfully acquired all necessary locks/pins on the library/row cache entries, wait on this wait event and then retry locking after a short period of time. In addition to explicit statistics gathering and maintenance operations using the `DBMS_STATS` package, Oracle database itself may try to update statistics for some objects, either on behalf of the user or for its own maintenance purposes.

Wait Time: 10 ms

Parameters: None

C.3.105 parallel recovery change buffer free

The parallel recovery coordinator is waiting for a change mapping buffer to be released by one of the recovery workers.

Wait Time: 100ms

Parameters: None

C.3.106 parallel recovery control message reply

The parallel recovery coordinator is waiting for all recovery workers to respond to a synchronous control message.

Wait Time: 100ms

Parameters: None

C.3.107 parallel recovery coord send blocked

The parallel recovery coordinator cannot send a redo change message because the recovery worker is still actively applying redo that it has already received and has not yet released the channel.

Wait Time: 100ms

Parameters: None

C.3.108 parallel recovery coord wait for reply

The parallel recovery coordinator is waiting for all recovery workers to exit.

Wait Time: 100ms

Parameters: None

C.3.109 parallel recovery coordinator waits for slave cleanup

The parallel recovery coordinator is waiting for all recovery workers to exit gracefully.

Wait Time: 10ms

Parameters: None

C.3.110 parallel recovery read buffer free

The parallel recovery coordinator is waiting for a log read buffer to be released by all recovery workers. Only after every recovery worker finishes applying redo from a log read buffer, can the buffer be used by the coordinator to issue the next log read.

Wait Time: 100ms

Parameters: None

C.3.111 parallel recovery slave next change

A parallel recovery worker is idle and waiting for the next change message from the coordinator.

Wait Time: 100ms

Parameters: None

C.3.112 pending global transaction(s)

This event should happen only during testing. The session waits for pending transactions to clear.

Wait Time: 30 seconds

Parameter	Description
scans	Number of times the session has scanned the `PENDING_TRANS$` table

C.3.113 pipe get

The session waits for a message to be received on the pipe or for the pipe timer to expire.

Wait Time: There is a 5 second wake up (check) and the pipe timer set by the user

Parameter	Description
handle address	The library cache object handle for this pipe
buffer length	The length of the buffer
timeout	The pipe timer set by the user

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.114 pipe put

The session waits for the pipe send timer to expire or for space to be made available in the pipe.

Wait Time: There is the 5 second wakeup (check) and the user-supplied timeout value

Parameter	Description
handle address	The library cache object handle for this pipe
record length	The length of the record or buffer that has been put into the pipe
timeout	The pipe timer set by the user

C.3.115 PL/SQL lock timer

This event is called through the `DBMS_LOCK.SLEEP` procedure. This event will most likely originate from procedures written by a user.

Wait Time: The wait time is in hundredths of seconds and depends on the user context

Parameter	Description
duration	The duration that the user specified in the `DBMS_LOCK.SLEEP` procedure

C.3.116 pmon timer

This is the main wait event for PMON. When PMON is idle, it is waiting on this event.

Wait Time: Up to 3 seconds, if not posted before

Parameter	Description
duration	The actual amount of time that the PMON is trying to sleep

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.117 prior spawner clean up

When a prior process has terminated while spawning a background, the current process which is trying to spawn new a background must wait until the prior process state is cleaned up.

Wait Time: Usually 3 - 10 seconds

Parameter	Description
process_pid	process identifier (see `V$PROCESS.PID`) of the process whose state must be cleaned up.
process_sno	process serial number (see `V$PROCESS.SERIAL#`) of the process whose state must be cleaned up.

C.3.118 process startup

Wait for a shared server, Dispatcher, or other background process to start.

Wait Time: Wait up to 1 second for a background process to start. If timed out, then re-wait until 5 minutes have passed and signal an error. If the process has started, the event will acknowledge this.

Parameter	Description
type	The process type that was started
process#	The process number of the process being started
waited	Cumulative time waited for the process to start

C.3.119 PX Deque wait

The process is waiting for a message during a parallel execute.

Wait Time: The wait time depends on how quickly the message arrives. Wait times can vary, but it will normally be a short period of time.

Parameter	Description
reason	The reason for dequeuing
sleeptime	The amount of time that the session slept
loop	The total number of times that the session has slept

C.3.120 PX qref latch

Each parallel execution process has a parallel execution qref latch, which must be acquired before the queue buffers can be manipulated.

Wait Time: Wait up to 1 second

Parameter	Description
function	Indicates the type of wait that the session is doing
sleeptime	The amount of time that the session waits (in hundredths of a second)
qref	The address of the process queue for which the session is waiting

C.3.121 PX server shutdown

During normal or immediate shutdown the parallel execution servers are posted to shutdown cleanly. If any parallel execution servers are still running after 10 seconds, they are terminated.

Wait Time: Wait up to 0.5 seconds

Parameter	Description
nalive	The number of parallel execution servers that are still running
sleeptime	The total sleeptime since the session started to wait on this event
loop	The number of times the session waited for this event

C.3.122 PX signal server

This event occurs only in Exclusive mode. The query coordinator is signaling the Query Workers that an error has occurred.

Wait Time: 0.5 seconds

Parameter	Description
serial	The serial number of the worker process queue
error	The error that has occurred
nbusy	The number of worker processes that are still busy

C.3.123 rdbms ipc message

The background processes (LGWR, DBWR, LMS0) use this event to indicate that they are idle and are waiting for the foreground processes to send them an IPC message to do some work.

Wait Time: Up to 3 seconds. The parameter *timeout* shows the true sleep time.

Parameter	Description
timeout	The amount of time that the session waits for an IPC message

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.124 rdbms ipc message block

This event indicates that all message blocks are in use and that the session had to wait for a message block to become available.

Wait Time: Wait up to 60 seconds

Parameters: None

C.3.125 rdbms ipc reply

This event is used to wait for a reply from one of the background processes.

Wait Time: The wait time is specified by the user and is indicated by the parameter *timeout*.

Parameter	Description
from_process	The background process for which the session is waiting. The wait is for a reply to an IPC message sent by the session.
timeout	The amount of time in seconds that this process will wait for a reply

C.3.126 read by other session

This event occurs when a session requests a buffer that is currently being read into the buffer cache by another session. Prior to release 10.1, waits for this event were grouped with the other reasons for waiting for buffers under the 'buffer busy waits' event.

Wait Time: Time waited for the buffer to be read by the other session (in microseconds)

Parameter	Description
file#	See "file#"
block#	See "block#"
class#	See "class"

C.3.127 recovery active instance mapping setup

This event is used to track the time taken (in centiseconds) to set up recovery context on remote instances.

C.3.128 recovery apply pending

This event tracks the time the logmerger process waited (in centiseconds) for apply workers to apply all pending changes up to a certain SCN.

C.3.129 recovery cancel

This wait event is used to track the time taken (in centiseconds) to cancel multi instance media recovery.

C.3.130 recovery checkpoint

This wait event tracks the time (in centiseconds) spent waiting for DBWR processes on all instances to write dirty buffers to disk up to a certain SCN.

C.3.131 recovery file header update for checkpoint

This wait event tracks the time (in centiseconds) spent by MRP0 process waiting on logmerger to update file headers to record the latest checkpoint.

C.3.132 recovery file header update for fuzziness

This wait event tracks the time taken (in centiseconds) to update file headers to record media recovery fuzziness.

C.3.133 recovery marker apply

This wait event is used to track the time (in centiseconds) taken to process a recovery marker.

C.3.134 recovery merge pending

This wait event is used to track the time spent (in centiseconds) by the MRP0 process waiting for remote logmergers to merge changes up to a certain SCN.

C.3.135 recovery metadata latch

This wait event tracks the time taken (in centiseconds) to get the active DataGuard metadata update latch to advance a query SCN.

C.3.136 recovery move influx buffers

This wait event is used to track the time spent (in centiseconds) waiting for all apply workers to move their influx buffers to the dirty queue.

C.3.137 recovery read

A parallel recovery worker (or serial recovery process) is waiting for a batch of data block reads to complete.

Wait Time: Time it takes to complete the physical I/O (read)

Parameters: None

C.3.138 recovery receive buffer free

This wait event is used to track the time (in centiseconds) spent by the receiver process on instance waiting for apply workers to apply changes from received buffers so that they can be freed for the next change.

C.3.139 recovery remote file verification

This wait event tracks the time spent (in centiseconds) by the MRP0 process waiting for remote logmergers to finish file verification on remote instances.

C.3.140 recovery send buffer free

This wait event is used to track the time spent (in centiseconds) by the sender process waiting for apply workers to apply changes from the local instance so that the buffer can be reused for new changes.

C.3.141 recovery shutdown

This wait event is used to track the time (in centiseconds) taken for remote logmergers to shut down.

C.3.142 Redo Transport Attach

Used to track the time spent (in centiseconds) doing Connect, Logon, and RFSATTACH for *any* network process.

> **See Also:**
>
> *Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

C.3.143 Redo Transport Close

Used to track the time spent (in centiseconds) by ARC*n*, NSS*n*, and TT*nn* processes doing RFSCLOSE and RFSRGSTR operations.

> **See Also:**
>
> *Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

C.3.144 Redo Transport Detach

Used to track the time spent (in centiseconds) doing RFSDETACH and Disconnect for *any* network process.

> **See Also:**
>
> *Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

C.3.145 Redo Transport Open

Used to track the time spent (in centiseconds) by ARC*n*, NSS*n*, and TT*nn* background processes doing RFSCREAT and RFSANNCE operations.

> **See Also:**
>
> *Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

C.3.146 Redo Transport Ping

Used to track the time spent (in centiseconds) by ARC*n* background processes doing RFSPING operations.

> **See Also:**
>
> *Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

C.3.147 Redo Transport Slave Startup

Used to track the time spent (in centiseconds) by LGWR doing NSS*n* and TT*nn* process startup and initialization.

C.3.148 Redo Writer Remote Sync Complete

Used to track the time spent (in centiseconds) by LGWR reaping completed network writes to remote destinations.

C.3.149 Redo Writer Remote Sync Notify

Used to track the time spent (in centiseconds) by LGWR issuing network writes to remote destinations.

C.3.150 resmgr:become active

The session is waiting for a resource manager active session slot. This event occurs when the resource manager is enabled and the number of active sessions in the session's current consumer group exceeds the current resource plan's active session limit for the consumer group. To reduce the occurrence of this wait event, increase the active session limit for the session's current consumer group.

Wait Time: The time the session waited to be allocated an active session slot

Parameter	Description
location	location of the wait

C.3.151 resmgr:cpu quantum

The session is waiting to be allocated a quantum of CPU. This event occurs when the resource manager is enabled and is throttling CPU consumption. To reduce the occurrence of this wait event, increase the CPU allocation for the sessions's current consumer group.

Wait Time: The time the session waited to acquire a CPU quantum

Parameter	Description
location	Location of the wait
Consumer Group ID	Consumer group ID of the session waiting. This value is from the `CONSUMER_GROUP_ID` column in the `DBA_RSRC_CONSUMER_GROUPS` view.

> **See Also:**
>
> "DBA_RSRC_CONSUMER_GROUPS"

C.3.152 resmgr: I/O rate limit

The session is waiting for I/O bandwidth to be available to issue I/Os. This event occurs when PDB I/O rate limits are enabled by setting the `MAX_IOPS` and/or `MAX_MBPS` parameters.

To reduce the occurrence of this wait event, the PDB I/O rate limit values need to be increased. This can be achieved by increasing the values of `MAX_IOPS` and `MAX_MBPS` or by removing the limits altogether by setting the parameter value to 0.

Wait Time: The time the session waited for the I/O bandwidth to become available.

Parameter	Description
P1: PDB_ID	This the PDB ID of the PDB that has its I/O throttled because the `MAX_IOPS` or `MAX_MBPS` parameter was set for it.

> **See Also:**
>
> - "MAX_IOPS"
> - "MAX_MBPS"

C.3.153 resmgr:pq queued

The session is waiting in the parallel statement queue.

Wait Time: The time the session waited for sufficient parallel query processes to become available to run this session with the requested degree of parallelism

Parameter	Description
location	Location of the wait

> **See Also:**
>
> *Oracle Database VLDB and Partitioning Guide* for more information about this wait event

C.3.154 rolling migration: cluster quiesce

This is the wait event that instances wait on when cluster is about to start a rolling migration. The instances are waiting for any privileged operations that blocks rolling migration to complete before allowing rolling migration.

Wait Time: 1 second

Parameter	Description
location	Its value will be 1 if the wait is for completion of the privileged operations so that a rolling upgrade/downgrade can start. Its value will be 2 if the wait is for completion of the rolling upgrade/downgrade on all the nodes in the cluster.
waits	The number of seconds spent waiting at the current location.

C.3.155 row cache lock

The session is trying to get a data dictionary lock.

Wait Time: Wait up to 60 seconds.

Parameter	Description
cache id	The `CACHE#` column value in the `V$ROWCACHE` view
mode	See "mode"
request	The pipe timer set by the user

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.156 RVWR wait for flashback copy

Waits for a process to copy flashback database data into the flashback buffer, in order to write out the requested flashback data.

Wait Time: 10 milliseconds

Parameter	Description
copy latch #	The number of flashback copy latch RVWR is waiting on

C.3.157 sbtbufinfo

This function is called when Oracle needs to discover the size, and number, of I/O buffers that have been allocated by the SBT layer. It should be very fast and never block.

Wait Time: Less than one millisecond

Parameters: None

C.3.158 sbtgetbuf

This function obtains one I/O buffer that Oracle will use for I/O during a backup job.

Wait Time: Less than one millisecond

Parameters: None

C.3.159 sbtmapbuf

This is an internal function used to facilitate multi-process buffer management. It should be very fast and never block.

Wait Time: Less than one millisecond

Parameters: None

C.3.160 sbtrelbuf

This function releases an I/O buffer that has been already processed during a restore job, so that the SBT layer can fill it with more data. It should be very fast and never block.

Wait Time: Less than one millisecond

Parameters: None

C.3.161 scginq AST call

Called by the session to find the highest lock mode that is held on a resource.

Wait Time: Wait up to 0.2 seconds, but the wait will continue until the NULL mode Acquisition AST has fired.

Parameters: None

C.3.162 SGA: allocation forcing component growth

Process waiting on an immediate mode memory transfer with auto-tune SGA after a 4031 for MMAN to get the memory and post it.

Wait Time: 10 msec

Parameters: None

C.3.163 SGA: MMAN sleep for component shrink

MMAN to wait and post itself for satisfying an auto-tuned memory request while trying to fully free a component's quiesced granules. In Release 10.1, the name of this event was 'wait for SGA component shrink'.

Wait Time: 10 msec

Parameter	Description
P1	component_id (corresponding to the memory pool)
P2	Current size in granules
P3	Target size in granules

C.3.164 SGA: sga_target resize

Memory resize requests wait while sga target is being resized. In Release 10.1, the name of this event was 'wait for sga_target resize'.

Wait Time: 10 msec

Parameters: None

C.3.165 Shared IO Pool Memory

Wait until a shared I/O pool buffer becomes available. This happens when processes are using these buffers for I/O and the current process needs to wait for the release of any one of the buffers to the shared I/O pool.

Wait Time: 10msec

Parameters: None

C.3.166 shared server idle wait

Idle wait event for a shared server.

The server waits on the common queue for a virtual circuit. (See also "virtual circuit wait".)

Wait Time: 30 seconds

Parameters: None

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.167 single-task message

When running single task, this event indicates that the session waits for the client side of the executable.

Wait Time: Total elapsed time that this session spent in the user application

Parameters: None

C.3.168 smon timer

This is the main idle event for SMON. SMON will be waiting on this event most of the time until it times out or is posted by another process.

Wait Time: 5 minutes (300 seconds)

Parameter	Description
sleeptime	The amount of time that SMON tries to wait on this event in seconds
failed	The number of times SMON was posted when there some kind of error

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.169 SQL*Net break/reset to client

The server sends a break or reset message to the client. The session running on the server waits for a reply from the client.

Wait Time: The actual time it takes for the break or reset message to return from the client

Parameter	Description
driver id	See "driver id"
break?	See "break?"

C.3.170 SQL*Net break/reset to dblink

Same as **SQL*Net break/reset to client**, but in this case, the break/reset message is sent to another server process over a database link.

Wait Time: The actual time it takes for the break or reset message to return from the other server process

Parameter	Description
driver id	See "driver id"
break?	See "break?"

C.3.171 SQL*Net message from client

The server process (foreground process) waits for a message from the client process to arrive.

Wait Time: The time it took for a message to arrive from the client since the last message was sent to the client

Parameter	Description
driver id	See "driver id"
#bytes	The number of bytes received by the server (foreground process) from the client.

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.172 SQL*Net message from dblink

The session waits while the server process (foreground process) receives messages over a database link from another server process.

Wait Time: The time it took for a message to arrive from another server (foreground process) since a message was sent to the other foreground process.

Parameter	Description
driver id	See "driver id"
#bytes	The number of bytes received by the server (foreground process) from another foreground process over a database link.

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.173 SQL*Net message to client

The server (foreground process) is sending a message to the client.

Wait Time: The actual time the **send** takes

Parameter	Description
driver id	See "driver id"
#bytes	The number of bytes sent by the server process to the client

C.3.174 SQL*Net message to dblink

The server process (foreground process) is sending a message over a database link to another server process.

Wait Time: The actual time the **send** takes

Parameter	Description
driver id	See "driver id"
#bytes	The number of bytes sent by the server process to another server process over a database link

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.175 SQL*Net more data from client

The server is waiting on the client to send more data to its client shadow process, in an already initiated operation.

Wait Time: The time waited depends on the time it took to receive the data (including the waiting time)

Parameter	Description
driver id	See "driver id"
#bytes	The number of bytes received from the client

C.3.176 SQL*Net more data from dblink

The foreground process is expecting more data from a data base link.

Wait Time: The total time it takes to read the data from the database link (including the waiting time for the data to arrive)

Parameter	Description
driver id	See "driver id"
#bytes	The number of bytes received

C.3.177 SQL*Net more data to client

The server process is sending more data/messages to the client. The previous operation to the client was also a **send**.

Wait Time: The actual time it took for the **send** to complete

Parameter	Description
driver id	See "driver id"
#bytes	The number of bytes that are being sent to the client

> **See Also:**
>
> *Oracle Database Performance Tuning Guide* for more information about this wait event

C.3.178 SQL*Net more data to dblink

The event indicates that the server is sending data over a database link again. The previous operation over this database link was also a **send**.

Wait Time: The actual time it takes to send the data to the other server

Parameter	Description
driver id	See "driver id"
#bytes	The number of bytes that are sent over the database link to the other server process

C.3.179 Streams AQ: waiting for messages in the queue

The session is waiting on an empty OLTP queue (Advanced Queuing) for a message to arrive so that the session can dequeue that message.

Wait Time: The amount of time that the session wants to wait is determined by the parameter *wait time*

Parameter	Description
queue id	The ID of the OLTP queue for which this session is waiting
process#	The process number of the process in which this session runs
wait time	The intended wait time for this session

C.3.180 switch logfile command

The session waits on the user command `SWITCH LOGFILE` to complete.

Wait Time: 5 seconds

Parameters: None

C.3.181 SYNC Remote Write

Used to track the time spent by LGWR doing SYNC RFSWRITE operations.

> **See Also:**
>
> *Oracle Data Guard Concepts and Administration* for more information about using RFS to manage standby redo logs.

C.3.182 TCP Socket (KGAS)

A session is waiting for an external host to provide requested data over a network socket. The time that this wait event tracks does not indicate a problem, and even a long wait time is not a reason to contact Oracle Support. It naturally takes time for data to flow between hosts over a network, and for the remote aspect of an application to process any request made to it.

An application that communicates with a remote host must wait until the data it will read has arrived. In addition, on Microsoft Windows, a separate thread monitors the arrival of traffic. This thread spends most of its life in waits tracked by the TCP Socket (KGAS) wait event.

Wait Time: The total elapsed time for the network connection to be established or for data to arrive from over the network

Parameter	Description
P0	For Oracle internal use only. Values 8, 9, and 10 occur within the special thread present on Microsoft Windows; other P0 values occur in normal user sessions.
P1	For Oracle internal use only

C.3.183 Text batch free

Waiting for any of the Oracle Text index in-memory postings lists batches to free up. Batches free up when they are written to Oracle Text internal index tables by `IRnn` background processes.

Wait Time: 9 seconds maximum (3 seconds per wait or until posted by an `IRnn` process)

Parameters: None

C.3.184 Text sync complete

Waiting for an Oracle Text index to complete a background sync in the `CTX_DDL.SYNC_INDEX()` procedure.

Wait Time: Unlimited (3 seconds per wait or until posted by an `IRnn` process)

Parameter	Description
objn	Object number of the Oracle Text index or index partition
location	ID of the PDB in which the wait is occuring

C.3.185 timer in sksawat

The session waits for the Archiver (ARC*n*) asynchronous I/O to complete.

Wait Time: 0.01 seconds

Parameters: None

C.3.186 transaction

Wait for a blocking transaction to be rolled back. Continue waiting until the transaction has been rolled back.

Wait Time: 1 second

Parameter	Description
undo seg#	The rollback segment ID
slot#	The slot ID inside the rollback segment
wrap#	The sequence number that is incremented for each transaction
count	The number of times that the session has waited on this transaction

C.3.187 unbound tx

The session waits to see if there are any transactions that have been started but do not have a Rollback Segment associated with them.

Wait Time: 1 second

Parameters: None

C.3.188 undo_retention publish retry

This wait can occur for two reasons. A session issuing an `ALTER SYSTEM SET UNDO_RETENTION` may wait on this event wait while a cluster reconfiguration takes place. Or the background process MMNL may wait for cluster reconfiguration while attempting to determine the max `UNDO_RETENTION`.

Wait time: 1 second

Parameter	Description
P1	Identifies where the retry is happening. Id = 1 retry while publishing into the max undo_retention namespace. Id = 2 retry while iterator accessing the max undo_retention namespace.
P2	Retry count (maximum number of retries is 5)

C.3.189 undo segment extension

The undo segment is being extended or shrunk. The session must wait until the operation on the undo segment has finished.

Wait Time: 0.01 seconds

Parameter	Description
segment#	The ID of the rollback segment that is being extended or shrunk

C.3.190 undo segment recovery

PMON is rolling back a terminated transaction. The wait continues until rollback finishes.

Wait Time: 3 seconds

Parameter	Description
segment#	The ID of the rollback segment that contains the transaction that is being rolled back
tx flags	The transaction flags (options) set for the transaction that is being rolled back

C.3.191 undo segment tx slot

Wait for a transaction slot to become available within the selected rollback segment. Continue waiting until the slot is available.

Wait Time: 1 second

Parameter	Description
segment#	The ID of the rollback segment that contains the transaction that is being rolled back

C.3.192 utl_file I/O

Waits associated with operations performed using the `UTL_FILE` package.

C.3.193 virtual circuit wait

The session waits for a virtual circuit operation to complete.

Wait Time: 30 seconds

Parameter	Description
circuit#	Indicates the virtual circuit# being waited on
type	Indicates the type of operation the session is waiting for

C.3.194 WCR: replay client notify

During replay, the Workload Replay Client always keeps an open connection to the database to detect some special errors. This session will normally be in the wait state until some specific replay-related exception occurs.

Wait Time: Waits until notified. Times out every 30 seconds.

Parameter	Description
who am I	Identifies the reason for wait for the admin thread. 1 - waiting for REPLAY.START() to be issued. 2 - waiting for the replay to run to completion or REPLAY.CANCEL() to be issued.

C.3.195 WCR: replay clock

A session will wait on this event during replay if it has some logical dependencies on another session that has not yet committed its work.

Wait Time: Depends upon the amount of row lock contention in the original capture

Parameter	Description
wait for scn's hi 4 bytes	High 4 bytes of the 8-byte replay SCN that the session is waiting on
wait for scn's lo 4 bytes	Low 4 bytes of the 8-byte replay SCN that the session is waiting on

C.3.196 WCR: replay lock order

A session will wait on this event during replay if it saw some lock contention during capture.

Wait Time: Depends upon the amount of row lock contention in the original capture

Parameter	Description
wait for scn's hi 4 bytes	High 4 bytes of the 8-byte replay SCN that the session is waiting on
wait for scn's lo 4 bytes	Low 4 bytes of the 8-byte replay SCN that the session is waiting on

C.3.197 WCR: replay paused

When the user issues a DBMS_WORKLOAD_REPLAY.PAUSE_REPLAY command, all the replayed sessions are waiting on this wait event until replay is resumed.

Parameters: None

C.3.198 WCR: Sync context busy

In the default replay mode, commits during replay are synchronized to follow the same order as capture. All commits are serialized using the Sync context. A replayed session will wait on this event if it is trying to commit at the same time as another replayed session.

Parameters: None

C.3.199 write complete waits

The session waits for a buffer to be written. The write is caused by normal aging or by a cross-instance call.

Wait Time: 1 second

Parameter	Description
file#	The rollback segment id that contains the transaction that is being rolled back
block#	The transaction flags (options) set for the transaction that is being rolled back
id	Identifies the reason for waiting

D

Oracle Enqueue Names

This appendix lists Oracle enqueues. **Enqueues** are shared memory structures (locks) that serialize access to database resources. They can be associated with a session or transaction. Enqueue names are displayed in the `LOCK_TYPE` column of the `DBA_LOCK` and `DBA_LOCK_INTERNAL` data dictionary views.
A **resource** uniquely identifies an object that can be locked by different sessions within an instance (local resource) or between instances (global resource). Each session that tries to lock the resource will have an **enqueue** on the resource.

> **Note:**
>
> The names of enqueues and their definitions may change from release to release.

> **See Also:**
>
> "DBA_LOCK_INTERNAL" and "DBA_LOCK"

The Oracle enqueues are:

- BL, Buffer Cache Management
- BR, Backup/Restore
- CF, Controlfile Transaction
- CI, Cross-instance Call Invocation
- CU, Bind Enqueue
- DF, Datafile
- DL, Direct Loader Index Creation
- DM, Database Mount
- DR, Distributed Recovery Process
- DW, SecureFiles
- DX, Distributed Transaction
- FP, File Object
- FS, File Set
- HW, High-Water Lock
- IN, Instance Number
- IQ, Text index maintenance
- IR, Instance Recovery

- IS, Instance State
- IV, Library Cache Invalidation
- JI, Enqueue used during AJV snapshot refresh
- JQ, Job Queue
- KK, Redo Log "Kick"
- KP, contention in Oracle Data Pump startup and shutdown processes
- KO, Multiple Object Checkpoint
- L[A-P], Library Cache Lock
- LS, Log Start or Switch
- MM, Mount Definition
- MR, Media Recovery
- N[A-Z], Library Cache Pin
- PE, ALTER SYSTEM SET PARAMETER = VALUE
- PF, Password File
- PI, Parallel Slaves
- PR, Process Startup
- PS, Parallel Slave Synchronization
- Q[A-Z], Row Cache
- RO, Object Reuse
- RT, Redo Thread
- RW, Row Wait
- SC, System Change Number
- SM, SMON
- SN, Sequence Number
- SQ, Sequence Number Enqueue
- SR, Synchronized Replication
- SS, Sort Segment
- ST, Space Management Transaction
- SV, Sequence Number Value
- TA, Transaction Recovery
- TC, Thread Checkpoint
- TE, Extend Table
- TM, DML Enqueue
- TO, Temporary Table Object Enqueue
- TS, Temporary Segment (also TableSpace)
- TT, Tablespace
- TX, Transaction
- UL, User-defined Locks

- UN, User Name
- US, Undo Segment, Serialization
- WL, Being Written Redo Log
- XA, Instance Attribute Lock
- XI, Instance Registration Lock
- ZA, Exclusive Lock When Moving Audit Table

E
Statistics Descriptions

This appendix describes the statistics stored in the `V$SESSTAT` and `V$SYSSTAT` dynamic performance tables. These statistics are useful in identifying and correcting performance problems.

This appendix contains the following topics:

- Displaying Statistics
- Statistics Descriptions

E.1 Displaying Statistics

The `V$SESSTAT` view displays statistics on a per-session basis and is valid only for the session currently connected. When a session disconnects, all statistics for the session are updated in `V$SYSSTAT`. The values for the statistics are cleared until the next session uses them.
The `V$STATNAME` view contains all of the statistics for an Oracle release.

Many of these statistics are tied to the internal implementation of Oracle and therefore are subject to change or deletion without notice, even between patch releases. Application developers should be aware of this and write their code to tolerate missing or extra statistics.

> **See Also:**
>
> "V$SESSTAT", "V$STATNAME", and "V$SYSSTAT" for more information on these views

E.2 Statistics Descriptions

This section describes some of the statistics stored in the `V$SESSTAT` and `V$SYSSTAT` views.

The statistics are listed in alphabetical order.

The `CLASS` column contains a number representing one or more statistics classes. The following class numbers are additive:

- 1, User
- 2, Redo
- 4, Enqueue
- 8, Cache
- 16, OS
- 32, Real Application Clusters
- 64, SQL
- 128, Debug

- 256, Instance level

For example, a class value of 72 represents a statistic that relates to SQL statements and caching.

Some statistics are populated only if the `TIMED_STATISTICS` initialization parameter is set to `true`. Those statistics are flagged with a `Y` in the right-hand column.

Table E-1 Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
application wait time	1	Total wait time (in centiseconds) for waits that belong to the Application wait class	
background checkpoints completed	8	Number of checkpoints completed by the background process. This statistic is incremented when the background process successfully advances the thread checkpoint.	
background checkpoints started	8	Number of checkpoints started by the background process. This statistic can be larger than "background checkpoints completed" if a new checkpoint overrides an incomplete checkpoint or if a checkpoint is currently under way. This statistic includes only checkpoints of the redo thread. It does not include: • Individual file checkpoints for operations such as offline or begin backup • Foreground (user-requested) checkpoints (for example, performed by `ALTER SYSTEM CHECKPOINT LOCAL` statements)	
background timeouts	128	Number of times a background process has set an alarm for itself and the alarm has timed out rather than the background process being posted by another process to do some work	
branch node splits	128	Number of times an index branch block was split because of the insertion of an additional value	
buffer is not pinned count	72	Number of times a buffer was free when visited. Useful only for internal debugging purposes.	
buffer is pinned count	72	Number of times a buffer was pinned when visited. Useful only for internal debugging purposes.	
bytes received via SQL*Net from client	1	Total number of bytes received from the client over Oracle Net Services	
bytes received via SQL*Net from dblink	1	Total number of bytes received from a database link over Oracle Net Services	
bytes sent via SQL*Net to client	1	Total number of bytes sent to the client from the foreground processes	
bytes sent via SQL*Net to dblink	1	Total number of bytes sent over a database link	
Cached Commit SCN referenced	128	Useful only for internal debugging purposes	
calls to get snapshot scn: kcmgss	32	Number of times a snapshot system change number (SCN) was allocated. The SCN is allocated at the start of a transaction.	
calls to kcmgas	128	Number of calls to routine kcmgas to get a new SCN	
calls to kcmgcs	128	Number of calls to routine kcmgcs to get a current SCN	
calls to kcmgrs	128	Number of calls to routine kcsgrs to get a recent SCN	
cell flash cache read hits	8	Number of read requests that were satisfied by the cache	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
cell flash cache read hits for smart IO	8	Number of read requests for smart IO that were satisfied by the cache	
cell flash cache read hits for temp IO	8	Number of read requests for temp IO that were satisfied by the cache	
cell IO uncompressed bytes	64	Total size of uncompressed data that is processed on the cell For operations on segments compressed using Exadata Hybrid Columnar Compression, this statistic is the size of the data after decompression.	
cell num bytes in passthru due to quarantine	8	Number of bytes that were not offloaded and sent back to the database for processing due to a quarantine on the cell	
cell num bytes in passthru during predicate offload	64	Number of bytes that were not offloaded and sent back to the database for processing	
cell overwrites in flash cache	8	Total number of write requests that overwrote an existing cacheline in Exadata Smart Flash Cache that had not been written to disk In effect, this is the amount of disk I/O saved by using Write-Back mode. This statistic is incremented once per mirror write.	
cell partial writes in flash cache	8	Total number of write requests written to both Exadata Smart Flash Cache and disk Part of the data was written to flash, and the rest was written to disk. This statistic is incremented once per mirror write.	
cell physical IO bytes added to storage index	8	Number of bytes added to the storage index during a Smart Scan This is an indication that the storage index is being built.	
cell physical IO bytes eligible for predicate offload	64	Number of bytes on-disk eligible for predicate offload	
cell physical IO bytes eligible for smart IOs	8	Number of actual bytes eligible for predicate offload For example, when using columnar cache, this is the size of columnar cache instead of the on-disk size.	
cell physical IO bytes processed for IM capacity	64	Number of bytes read from the columnar cache in `memcompress for capacity` format	
cell physical IO bytes processed for IM query	64	Number of bytes read from the columnar cache in `memcompress for query` format	
cell physical IO bytes processed for no memcompress	64	Number of bytes read from the columnar cache in `no memcompress` format	
cell physical IO bytes saved by columnar cache	8	Number of bytes saved by columnar cache, that is, the number of bytes of reading that were avoided	
cell physical IO bytes saved by storage index	8	Number of bytes saved by the storage index	
cell physical IO bytes saved during optimized file creation	64	Number of I/O bytes saved by the database host by offloading the file creation operation to the cells This statistic shows the benefit of optimized file creation operations.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
cell physical IO bytes saved during optimized RMAN file restore	64	Number of I/O bytes saved by the database host by offloading the RMAN file restore operation to the cells This statistic shows the benefit of optimized RMAN file restore operations.	
cell physical IO bytes sent directly to DB node to balance CPU	64	Number of I/O bytes sent back to the database server for processing due to high storage server CPU usage	
cell physical IO interconnect bytes	64	Number of I/O bytes exchanged over the interconnect between the database host and the cells	
cell physical IO interconnect bytes returned by smart scan	64	Number of I/O bytes that are returned by the cell for Smart Scan operations This value does not include bytes for other database I/O.	
cell pmem cache read hits	8	Number of non-RDMA read requests processed by `cellsrv` resulting in a PMEM cache hit	
cell pmem cache writes	264	Number of non-RDMA write requests processed by `cellsrv` resulting in a PMEM cache write	
cell pmem log writes	258	Number of redo log write requests that used PMEM log	
cell ram cache read hits	8	Number of read requests that hit the RAM cache on the cell	
cell RDMA reads	8	Number of PMEM cache read requests using RDMA	
cell RDMA writes	264	Number of PMEM cache write requests using RDMA	
cell writes to flash cache	8	Total number of write requests written entirely to Exadata Smart Flash Cache This statistic is incremented once per mirror write.	
cell writes to flash cache for temp IO	8	Number of write requests for temporary segments that were absorbed by Exadata Smart Flash Cache	
change write time	8	Elapsed redo write time for changes made to `CURRENT` blocks in 10s of milliseconds.	Y
cleanouts and rollbacks - consistent read gets	128	Number of "consistent gets" that require both block rollbacks and block cleanouts	
cleanouts only - consistent read gets	128	Number of "consistent gets" that require only block cleanouts, no rollbacks	
cluster key scan block gets	64	Number of blocks obtained in a cluster scan	
cluster key scans	64	Number of cluster scans that were started	
cluster wait time	1	Total wait time (in centiseconds) for waits that belong to the Cluster wait class	
cold recycle reads	8	Number of buffers that were read through the least recently used end of the recycle cache with fast aging strategy	
commit cleanout failures: block lost	8	Number of times Oracle attempted a cleanout at commit but could not find the correct block due to forced write, replacement, or switch `CURRENT`	
commit cleanout failures: buffer being written	8	Number of times Oracle attempted a cleanout at commit, but the buffer was currently being written	
commit cleanout failures: callback failure	8	Number of times the cleanout callback function returns `FALSE`	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
commit cleanout failures: cannot pin	8	Total number of times a commit cleanout was performed but failed because the block could not be pinned	
commit cleanout failures: hot backup in progress	8	Number of times Oracle attempted block cleanout at commit during hot backup. The image of the block must be logged before the buffer can be made dirty.	
commit cleanout failures: pmem only	264	Number of time Oracle attempted a cleanout at commit, but could not modify PMEM buffers directly without a DRAM version	
commit cleanout failures: write disabled	8	Number of times a cleanout block at commit was performed but the writes to the database had been temporarily disabled	
commit cleanouts	8	Total number of times the cleanout block at commit function was performed	
commit cleanouts successfully completed	8	Number of times the cleanout block at commit function completed successfully	
commit nowait performed	1	Number of asynchronous commits that were actually performed. These commits did not wait for the commit redo to be flushed and be present on disk before returning.	
commit nowait requested	1	Number of no-wait commit or asynchronous commit requests that were made either using SQL or the OCI transaction control API	
Commit SCN cached	128	Number of times the system change number of a commit operation was cached	
commit wait/nowait performed	1	Number of asynchronous/synchronous commits that were actually performed	
commit wait/nowait requested	1	Number of no-wait or wait commits that were made either using SQL or the OCI transaction control API	
commit wait performed	1	Number of synchronous commits that were actually performed. These commits waited for the commit redo to be flushed and be present on disk before returning.	
commit wait requested	1	Number of waiting or synchronous commit requests that were made either using SQL or the OCI transaction control API	
concurrency wait time	1	Total wait time (in centiseconds) for waits that belong to the Concurrency wait class	
consistent changes	8	Number of times a user process has applied rollback entries to perform a consistent read on the block Work loads that produce a great deal of consistent changes can consume a great deal of resources. The value of this statistic should be small in relation to the "consistent gets" statistic.	
consistent gets	8	Number of times a consistent read was requested for a block. **See Also:** "consistent changes" and "session logical reads"	
consistent gets direct	8	Number of times a consistent read was requested for a block bypassing the buffer cache (for example, direct load operation). This is a subset of "consistent gets".	
consistent gets from cache	8	Number of times a consistent read was requested for a block from buffer cache. This is a subset of "consistent gets".	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
consistent gets from pmem	8	Number of direct-mapped blocks accessed in CR (consistent read) mode from PMEM. This is a subset of "consistent gets".	
consistent gets pmem direct	8	Number of CR gets from pmem in direct read (e.g. tablescan) code path. This is a subset of "consistent gets from pmem".	
consistent gets pmem examination	8	Number of direct-mapped blocks accessed and examined in CR mode from PMEM, via regular path. This is a subset of "consistent gets from pmem".	
consistent gets pmem examination (fastpath)	8	Number of direct-mapped blocks accessed and examined in CR mode from PMEM, via fast path. This is a subset of both "consistent gets from pmem" and "consistent gets pmem examination".	
consistent gets pmem pin	8	Number of direct-mapped blocks accessed and pinned in CR mode from PMEM, via regular path. This is a subset of "consistent gets from pmem".	
consistent gets pmem pin (fastpath)	8	Number of direct-mapped blocks accessed and pinned in CR mode from PMEM, via fast path. This is a subset of both "consistent gets from pmem" and "consistent gets pmem pin".	
CPU used by this session	1	Amount of CPU time (in 10s of milliseconds) used by a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistic, and 0 milliseconds are added. A similar problem can exist in the reporting by the operating system, especially on systems that suffer from many context switches.	Y
CPU used when call started	128	Amount of CPU time (in 10s of milliseconds) used when the call is started **See Also:** " CPU used by this session"	Y
CR blocks created	8	Number of `CURRENT` blocks cloned to create CR (consistent read) blocks. The most common reason for cloning is that the buffer is held in a incompatible mode.	
cumulative begin requests	32	Total number of begin requests received by the Oracle database allowing the database to detect and process requests	
cumulative DB time in requests	288	Total DB Time (in microseconds) within requests to the Oracle database, measuring DB time used from the beginning to the end of each request. **See Also:** "DB time"	
cumulative DB time protected in requests	288	Total DB Time (in microseconds) within requests to the Oracle database protected by Application Continuity or Transparent Application Continuity, measuring DB time used from the beginning to the end of each request. **See Also:** "DB time" This is a subset of "cumulative DB time in requests", which enables you to calculate the ratio of total time in requests to protected time in requests. See also Application Continuity Protection Check (ACCHK).	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
cumulative end requests	32	Total number of end requests received by the Oracle database allowing the database to detect and process requests	
cumulative time in requests	32	Total wall clock time (in microseconds) within requests to the Oracle database, measuring time spent from the beginning to the end of each request. This statistic is used by draining and planned failover.	
cumulative user calls in requests	32	Total number of user calls received by the Oracle database within requests to the Oracle database	
cumulative user calls protected by Application Continuity	32	Total number of user calls received by the Oracle database within requests to the Oracle database that were protected by Application Continuity or Transparent Application Continuity	
current blocks converted for CR	8	Number `CURRENT` blocks converted to CR state	
cursor authentications	128	Number of privilege checks conducted during execution of an operation	
data blocks consistent reads - undo records applied	128	Number of undo records applied to data blocks that have been rolled back for consistent read purposes	
data warehousing cooling action	8	Number of times that cooling occurred on this instance	
data warehousing evicted objects	8	Number of times that objects got evicted by automatic big table caching on this instance	
data warehousing evicted objects - cooling	8	Number of times that objects got evicted on this instance due to a cooling action	
data warehousing evicted objects - replace	8	Number of times that objects got evicted due to caching replacement, that is, when an object is evicted because a hotter object forces it to be evicted from the cache	
data warehousing scanned blocks	8	Number of blocks scanned by automatic big table caching on this instance using parallel query	
data warehousing scanned blocks - disk	8	Number of blocks scanned by automatic big table caching on this instance by direct read from disk	
data warehousing scanned blocks - memory	8	Number of blocks scanned by automatic big table caching on this instance by cache read from memory	
data warehousing scanned blocks - offload	8	Number of blocks scanned by automatic big table caching on this instance by Exadata offloading	
data warehousing scanned objects	8	Number of times the objects in automatic big table caching are scanned using parallel query	
db block changes	8	Closely related to "consistent changes", this statistic counts the total number of changes that were part of an update or delete operation that were made to all blocks in the SGA. Such changes generate redo log entries and hence become permanent changes to the database if the transaction is committed. This approximates total database work. This statistic indicates the rate at which buffers are being dirtied (on a per-transaction or per-second basis, for example).	
db block gets	8	Number of times a `CURRENT` block was requested **See Also:** "consistent gets"	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
db block gets direct	8	Number of times a `CURRENT` block was requested bypassing the buffer cache (for example, a direct load operation). This is a subset of "db block gets".	
db block gets from cache	8	Number of times a `CURRENT` block was requested from the buffer cache. This is a subset of "db block gets".	
db block gets from pmem	8	Number of direct-mapped blocks accessed in `CURRENT` mode from PMEM, via regular path	
db block gets from pmem (fastpath)	8	Number of direct-mapped blocks accessed in `CURRENT` mode from PMEM, via fast path	
DB time	1	Total time (in microseconds) spent in database calls for foreground sessions. This statistic is an indicator of the total instance workload. It is measured cumulatively from the time of instance startup and is calculated by aggregating the CPU and wait times of all foreground sessions not waiting on idle wait events (non-idle user sessions).	
DB time of LWTs for this session	1	Total DB time (in microseconds) used by lightweight threads (LWTs) in a session. **See Also:** "DB time"	
DBWR checkpoint buffers written	8	Number of buffers that were written for checkpoints	
DBWR checkpoints	8	Number of times the DBWR was asked to scan the cache and write all blocks marked for a checkpoint or the end of recovery. This statistic is always larger than "background checkpoints completed".	
DBWR lru scans	8	Number of times that DBWR scans the LRU queue looking for buffers to write. This count includes scans to fill a batch being written for another purpose (such as a checkpoint).	
DBWR revisited being-written buffer	8	Number of times that DBWR tried to save a buffer for writing and found that it was already in the write batch. This statistic measures the amount of "useless" work that DBWR had to do in trying to fill the batch. Many sources contribute to a write batch. If the same buffer from different sources is considered for adding to the write batch, then all but the first attempt will be "useless" because the buffer is already marked as being written.	
DBWR transaction table writes	8	Number of rollback segment headers written by DBWR. This statistic indicates how many "hot" buffers were written, causing a user process to wait while the write completed.	
DBWR undo block writes	8	Number of rollback segment blocks written by DBWR	
DDL statements parallelized	32	Number of DDL statements that were executed in parallel	
deferred (CURRENT) block cleanout applications	128	Number of times cleanout records are deferred, piggyback with changes, always current get	
DFO trees parallelized	32	Number of times a serial execution plan was converted to a parallel plan	
dirty buffers inspected	8	Number of dirty buffers found by the user process while it is looking for a buffer to reuse	
DML statements parallelized	32	Number of DML statements that were executed in parallel	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
DML statements retried	64	When a long-running DML is executing, the cursor may get invalidated due to some concurrent DDL on one of the cursor's dependencies. In this case, an internal ORA-14403 error is thrown and is caught and cleared in one of the calling functions. The current work is rolled back and the DML is restarted without the user being notified of this. The statistic counts the number of times that the thrown, caught, and cleared (ORA-14403) sequence occurred for DML statements. Should a DML vary widely in execution time, check this statistic to see if it increments during the DML execution. If so, then concurrent DDL may be the cause of the extra elapsed time.	
enqueue conversions	4	Total number of conversions of the state of table or row lock	
enqueue deadlocks	4	Total number of deadlocks between table or row locks in different sessions	
enqueue releases	4	Total number of table or row locks released	
enqueue requests	4	Total number of table or row locks acquired	
enqueue timeouts	4	Total number of table and row locks (acquired and converted) that timed out before they could complete	
enqueue waits	4	Total number of waits that occurred during an enqueue convert or get because the enqueue get was deferred	
exchange deadlocks	8	Number of times that a process detected a potential deadlock when exchanging two buffers and raised an internal, restartable error. Index scans are the only operations that perform exchanges.	
execute count	64	Total number of calls (user and recursive) that executed SQL statements	
fbda woken up	128	Number of times the flashback data archive background process was woken up to do archiving	
file io wait time	1	Total time spent in wait (in microseconds) for I/O to datafiles, excluding the service time for such I/O. This is cumulative for all I/Os for all datafiles. The service time for one I/O operation is estimated as the minimum time spent in the I/O call seen so far. This service time is subtracted from the time spent in each I/O call to get the wait time for that I/O.	
flash cache eviction: aged out	8	Flash cache buffer is aged out of the Database Smart Flash Cache	
flash cache eviction: buffer pinned	8	Database Smart Flash Cache buffer is invalidated due to object or range reuse, and so on. The Database Flash Cache Buffer was in use at the time of eviction.	
flash cache eviction: invalidated	8	Database Smart Flash Cache buffer is invalidated due to object or range reuse, and so on. The Database Smart Flash Cache buffer was not in use at the time of eviction.	
flash cache insert skip: corrupt	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because the buffer was corrupted	
flash cache insert skip: DBWR overloaded	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because DBWR was busy writing other buffers	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
flash cache insert skip: exists	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was already in the flash cache	
flash cache insert skip: modification	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was being modified	
flash cache insert skip: not current	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because it was not current	
flash cache insert skip: not useful	8	In-memory buffer was skipped for insertion into the Database Smart Flash Cache because the type of buffer was not useful to keep	
flash cache inserts	8	Total number of in-memory buffers inserted into the Database Smart Flash Cache	
flashback log write bytes	2	Total size in bytes of flashback database data written by RVWR to flashback database logs	
flashback log writes	2	Total number of writes by RVWR to flashback database logs	
foreground propagated tracked transactions	128	Number of transactions modifying tables enabled for flashback data archive which were archived by a foreground process	
free buffer inspected	8	Number of buffers skipped over from the end of an LRU queue to find a reusable buffer. The difference between this statistic and "dirty buffers inspected" is the number of buffers that could not be used because they had a user, a waiter, or were being read or written, or because they were busy or needed to be written after rapid aging out.	
free buffer inspected for pmem	8	Number of PMEM buffers skipped over from the end of an LRU queue to find a reusable PMEM buffer	
free buffer requested	8	Number of times a reusable buffer or a free buffer was requested to create or load a block	
free buffer requested for pmem	8	Number of times a reusable PMEM buffer or a free PMEM buffer was requested to directly access a block	
gc read wait failures	40	A read wait is when a CR server waits for a disk read to complete before serving a block to another instance. This statistic displays the number of times a read wait ended in failure, that is, after waiting it was unable to serve a block.	
gc read wait timeouts	40	A read wait is when a CR server waits for a disk read to complete before serving a block to another instance. This statistic displays the number of times a read wait timed out, that is, the disk read did not complete in time, so the wait was terminated.	
gc read waits	40	Number of times a CR server waited for a disk read, and then successfully served a block	
global enqueue CPU used by this session	32	Amount of CPU time (in 10s of milliseconds) used by synchronous and asynchronous global enqueue activity in a session from the time a user call starts until it ends. If a user call completes within 10 milliseconds, the start and end user-call time are the same for purposes of this statistic, and 0 milliseconds are added.	
global enqueue get time	32	Total elapsed time in 10s of milliseconds of all synchronous and asynchronous global enqueue gets and converts	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
global enqueue gets async	32	Total number of asynchronous global enqueue gets and converts	
global enqueue gets sync	32	Total number of synchronous global enqueue gets and converts	
global enqueue releases	32	Total number of synchronous global enqueue releases	
HCC analyze table CUs	128	Number of Compression Units that were decompressed for `ANALYZE TABLE`	
HCC analyzer calls	128	Number of times `ANALYZE TABLE` has been run on Hybrid Columnar Compression (HCC) compressed tables	
HCC block compressions attempted	128	Number of times the system failed to recompress an OLTP compressed block in HCC format	
HCC block compressions completed	128	Number of times an OLTP compressed block was successfully recompressed in HCC format	
HCC DML conventional	128	Number of searched DML statements (`UPDATE` and `DELETE`) issued against HCC compressed tables	
HCC DML CUs	128	Number of Compression Units that were decompressed for searched DMLs (`UPDATE` and `DELETE`)	
HCC fetch by rowid CUs	128	Number of Compression Units that were decompressed by single row fetch	
HCC load conventional bytes compressed	128	Length of the data after compression stored in Compression Units by conventional loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.	
HCC load conventional bytes uncompressed	128	Length of the data before compression stored in Compression Units by conventional loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.	
HCC load conventional CUs	128	Number of Compression Units that were successfully compressed in any format from conventional loads	
HCC load conventional CUs archive high	128	Number of Compression Units that were successfully compressed in HCC `ARCHIVE HIGH` format from conventional loads	
HCC load conventional CUs archive low	128	Number of Compression Units that were successfully compressed in HCC `ARCHIVE LOW` format from conventional loads	
HCC load conventional CUs query high	128	Number of Compression Units that were successfully compressed in HCC `QUERY HIGH` format from conventional loads	
HCC load conventional CUs query low	128	Number of Compression Units that were successfully compressed in HCC `QUERY LOW` format from conventional loads	
HCC load conventional rows	128	Number of rows that were successfully compressed in HCC format from conventional loads	
HCC load conventional rows not compressed	128	Number of rows that were unable to be compressed in HCC format from conventional loads because the compression resulted in taking more space, not less	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
HCC load direct bytes compressed	128	Length of the data after compression stored in Compression Units by Direct Path Loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.	
HCC load direct bytes uncompressed	128	Length of the data before compression stored in Compression Units by Direct Path Loads. The amount of space used on disk is the sum of the data stored plus the metadata needed to locate the stored data.	
HCC load direct CUs	128	Number of Compression Units that were successfully HCC compressed by Direct Path Loads	
HCC load direct CUs archive high	128	Number of rows from Direct Path Loads that were HCC compressed with `ARCHIVE HIGH` successfully	
HCC load direct CUs archive low	128	Number of rows from Direct Path Loads that were HCC compressed with `ARCHIVE LOW` successfully	
HCC load direct CUs query high	128	Number of rows from Direct Path Loads that were HCC compressed with `QUERY HIGH` successfully	
HCC load direct CUs query low	128	Number of rows from Direct Path Loads that were HCC compressed with `QUERY LOW` successfully	
HCC load direct rows	128	Number of rows from Direct Path Loads that were HCC compressed successfully	
HCC load direct rows not compressed	128	Number of rows from Direct Path Loads that were OLTP compressed instead of HCC compressed due to negative compression	
HCC scan cell bytes compressed	128	Length of the compressed data stored in Compression Units prior to decompression. This is the length of all columns, not just the columns accessed.	
HCC scan cell bytes decompressed	128	Length of the data after decompression stored in Compression Units. This is the length of all columns, not just the columns accessed.	
HCC scan cell CUs archive high	128	Number of Compression Units scanned that had been compressed with `ARCHIVE HIGH`	
HCC scan cell CUs archive low	128	Number of Compression Units scanned that had been compressed with `ARCHIVE LOW`	
HCC scan cell CUs columns accessed	128	Number of columns that needed to be decompressed on the storage server to process the Compression Unit	
HCC scan cell CUs decompressed	128	Number of Compression Units that needed to be decompressed on the storage server	
HCC scan cell CUs decompression time	128	Total time spent decompressing the columns that were needed on the storage server	
HCC scan cell CUs optimized read	128	Number of Compression Units where all the rows were within the stored Min/Max values. Evaluation of those predicates was optimized out.	
HCC scan cell CUs pruned	128	Number of Compression Units that were pruned based on the Min/Max value checks	
HCC scan cell CUs query high	128	Number of Compression Units scanned that had been compressed with `QUERY HIGH`	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
HCC scan cell CUs query low	128	Number of Compression Units scanned that had been compressed with `QUERY LOW`	
HCC scan cell CUs sent compressed	64	Number of Compression Units that the storage server returned to the RDBMS still compressed after predicate evaluation was done	
HCC scan cell CUs sent head piece	64	Number of Compression Units that the storage server was unable to process and the block header was returned to the RDBMS to be processed	
HCC scan cell CUs sent uncompressed	64	Number of Compression Units that the storage server returned to the RDBMS in uncompressed columnar format	
HCC scan cell rows	128	Number of rows from columnar formatted data that were returned by the storage server to the RDBMS	
HCC scan CUs pcode aggregation pushdown	128	Number of Compression Units that were aggregated on the cell using P(ortable)-byte code	
HCC scan CUs pcode pred evaled	128	Number of predicates that were evaluated using P(ortable)-byte code	
HCC scan CUs pcode pred evaled using rowsets	128	Number of predicates that were evaluated using P(ortable)-byte code using vectorized data	
HCC scan CUs predicates applied	128	Number of predicates where at least some value passed the Min/Max check	
HCC scan CUs predicates optimized	128	Number of predicates that could be evaluated directly against columnar data	
HCC scan CUs predicates received	128	Number of predicates sent to the storage server that could be evaluated directly against HCC format data after decompression	
HCC scan rdbms bytes compressed	128	Length of the compressed data stored in Compression Units prior to decompression. This is the length of all columns, not just the columns accessed.	
HCC scan rdbms bytes decompressed	128	Length of the data after decompression stored in Compression Units. This is the length of all columns, not just the columns accessed.	
HCC scan rdbms CUs archive high	128	Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with `ARCHIVE HIGH`	
HCC scan rdbms CUs archive low	128	Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with `ARCHIVE LOW`	
HCC scan rdbms CUs columns accessed	128	Number of columns that were decompressed	
HCC scan rdbms CUs decompressed	128	Number of Compression Units that were decompressed on the RDBMS server	
HCC scan rdbms CUs decompression time	128	Total time spent decompressing the columns that were needed on the RDBMS server	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
HCC scan rdbms CUs normal	128	Number of HCC Compression Units decompressed by the RDBMS regular table scan, i.e., 'Table Access Full' in a query plan. This is typically used in specialized scans that, for example, use row versions, row SCN, or use the `LONG RAW` datatype.	
HCC scan rdbms CUs pruned	128	Number of Compression Units that were eliminated by comparing the predicates to the stored Min and Max values for that Comprssion Unit	
HCC scan rdbms CUs query high	128	Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with `QUERY HIGH` (which is the default)	
HCC scan rdbms CUs query low	128	Number of HCC Compression Units decompressed by the RDBMS table scan that had been compressed with `QUERY LOW`	
HCC scan rdbms CUs turbo	128	Number of HCC Compression Units decompressed by the RDBMS fast table scan (TurboScan). This is separate to decompression that happens on an Exadata cell.	
HCC scan rdbms rows	128	Number of rows returned from HCC blocks or that were returned from an Exadata cell in columnar format that passed the predicates on that table	
HCC scan rows pcode aggregated	128	Number of rows from HCC blocks or from columnar format blocks returned by an Exadata cell that could be aggregated using the P(ortable)-code style of query compilation	
HCC usage cloud	128	Internal count of how often TurboScan is invoked for HCC data stored in an Oracle Cloud environment. It does not include Oracle on other vendor's clouds. This may or may not correspond with the number of queries or granules scanned.	
HCC usage pillar	128	Internal count of how often TurboScan is invoked for HCC data stored on Pillar storage. This may or may not correspond with the number of queries or granules scanned.	
HCC usage ZFS	128	Internal count of how often TurboScan is invoked for HCC data stored on ZFS storage. This may or may not correspond with the number of queries or granules scanned.	
hot buffers moved to head of LRU	8	When a hot buffer reaches the tail of its replacement list, Oracle moves it back to the head of the list to keep it from being reused. This statistic counts such moves.	
hot buffers moved to head of LRU for pmem	8	When a hot PMEM buffer reaches the tail of its replacement list, Oracle moves it back to the head of the list to keep it from being reused. This statistic counts such moves.	
hot pmem block exchange with dram attempts	264	Number of hot PMEM buffers that were attempted to be exchanged with colder DRAM buffers, to ensure both blocks are still cached	
hot pmem block exchange with dram successes	264	Number of hot PMEM buffers that were successfully exchanged with colder DRAM buffers, with both blocks still cached	
hot pmem block migration to dram attempts	8	Number of hot PMEM buffer cache blocks that were attempted to be migrated to DREM to reduce access latency	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
hot pmem block migration to dram successes	264	Number of hot PMEM buffer cache blocks that were successfully migrated to DRAM to reduce access latency	
immediate (CR) block cleanout applications	128	Number of times cleanout records are applied immediately during consistent-read requests	
immediate (CURRENT) block cleanout applications	128	Number of times cleanout records are applied immediately during current gets. Compare this statistic with "deferred (CURRENT) block cleanout applications".	
IM (HPK4SQL) hash joins attempted	384	Number of in-memory vectorized hash joins attempted	
IM (HPK4SQL) hash joins completed	384	Number of in-memory vectorized hash joins completed	
IM (hybrid) scan blocks on hybrid list	384	Number of blocks on the hybrid In-Memory scan list	
IM (hybrid) scan rows on hybrid list	384	Number of rows on the hybrid In-Memory scan list	
IM default area resized	128	Amount of memory by which the column store got resized	
IM populate accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent populating CUs into the IM column store due to segment scans	
IM populate bytes in-memory EU data	128	Size in bytes of in-memory EU data populated due to segment scans	
IM populate bytes uncompressed EU data	128	Uncompressed size in bytes of in-memory EU data populated due to segment scans	
IM populate CUs	128	Number of CUs populated in the IM column store due to segment scans	
IM populate CUs memcompress for capacity high	128	Number of CUs populated in the IM column store due to segment scans using memcompress for capacity high	
IM populate CUs memcompress for capacity low	128	Number of CUs populated in the IM column store due to segment scans using memcompress for capacity low	
IM populate CUs memcompress for dml	128	Number of CUs populated in the IM column store due to segment scans using memcompress for DML	
IM populate CUs memcompress for query high	128	Number of CUs populated in the IM column store due to segment scans using memcompress for query high	
IM populate CUs memcompress for query low	128	Number of CUs populated in the IM column store due to segment scans using memcompress for query low	
IM populate CUs no memcompress	128	Number of CUs populated in the IM column store due to segment scans without compression	
IM populate CUs requested	128	Number of CUs requested to be populated due to segment scans	
IM populate EUs	128	Number of EUs populated in the IM column store due to segment scans	
IM populate EUs accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent populating EUs into the IM column store due to segment scans	
IM populate EUs columns	128	Number of columns populated in EUs due to segment scans	
IM populate EUs memcompress for capacity high	128	Number of EUs populated in the IM column store due to segment scans at memcompress for capacity high	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM populate EUs memcompress for capacity low	128	Number of EUs populated in the IM column store due to segment scans at memcompress for capacity low	
IM populate EUs memcompress for dml	128	Number of EUs populated in the IM column store due to segment scans at memcompress for dml	
IM populate EUs memcompress for query high	128	Number of EUs populated in the IM column store due to segment scans at memcompress for query high	
IM populate EUs memcompress for query low	128	Number of EUs populated in the IM column store due to segment scans at memcompress for query low	
IM populate EUs no memcompress	128	Number of EUs populated in the IM column store without compression due to segment scans	
IM populate EUs requested	128	Number of EUs requested to be populated in the IM column store due to segment scans	
IM populate no contiguous inmemory space	128	Number of CUs that fail to populate due to lack of contiguous space in the In-Memory Area	
IM populate segments	128	Number of segments populated due to segment scan	
IM populate segments requested	128	Number of segments requested to be populated due to segment scan	
IM populate segments wall clock time (ms)	128	Total amount of wall clock time (in milliseconds) spent populating CUs into the IM column store due to segment scans	
IM prepopulate accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent prepopulating CUs into the IM column store priority	
IM prepopulate bytes in-memory EU data	128	Size in bytes of in-memory EU data populated due to priority	
IM prepopulate bytes uncompressed EU data	128	Uncompressed size in bytes of in-memory EU data populated due to priority	
IM prepopulate CUs	128	Number of CUs prepopulated in the IM column store due to priority	
IM prepopulate CUs memcompress for capacity high	128	Number of CUs prepopulated in the IM column store due to priority using memcompress for capacity high	
IM prepopulate CUs memcompress for capacity low	128	Number of CUs prepopulated in the IM column store due to priority using memcompress for capacity low	
IM prepopulate CUs memcompress for dml	128	Number of CUs prepopulated in the IM column store due to priority using memcompress for DML	
IM prepopulate CUs memcompress for query high	128	Number of CUs prepopulated in the IM column store due to priority using memcompress for query high	
IM prepopulate CUs memcompress for query low	128	Number of CUs prepopulated in the IM column store due to priority using memcompress for query low	
IM prepopulate CUs no memcompress	128	Number of CUs prepopulated in the IM column store due to priority without compression	
IM prepopulate CUs requested	128	Number of CUs requested to be prepopulated due to priority	
IM prepopulate EUs	128	Number of EUs populated in the IM column store due to priority	
IM prepopulate EUs accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent populating EUs into the IM column store due to priority	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM prepopulate EUs columns	128	Number of columns populated in EUs due to priority	
IM prepopulate EUs memcompress for capacity high	128	Number of EUs populated in the IM column store due to priority at memcompress for capacity high	
IM prepopulate EUs memcompress for capacity low	128	Number of EUs populated in the IM column store due to priority at memcompress for capacity low	
IM prepopulate EUs memcompress for dml	128	Number of EUs populated in the IM column store due to priority at memcompress for dml	
IM prepopulate EUs memcompress for query high	128	Number of EUs populated in the IM column store due to priority at memcompress for query high	
IM prepopulate EUs memcompress for query low	128	Number of EUs populated in the IM column store due to priority at memcompress for query low	
IM prepopulate EUs no memcompress	128	Number of EUs populated in the IM column store without compression due to priority	
IM prepopulate EUs requested	128	Number of EUs requested to be populated in the IM column store due to priority	
IM prepopulate segments	128	Number of segments prepopulated due to priority	
IM prepopulate segments requested	128	Number of segments requested to be prepopulated due to priority	
IM repopulate accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent repopulating CUs into the IM column store due to DML changes	
IM repopulate bytes in-memory EU data	128	Size in bytes of in-memory EU data repopulated due to EU reaching staleness threshold	
IM repopulate CUs	128	Total number of CUs requested to be repopulated due to CU reaching staleness threshold	
IM repopulate CUs memcompress for capacity high	128	Number of CUs repopulated in the IM column store using memcompress for capacity high due to CU reaching staleness threshold	
IM repopulate CUs memcompress for capacity low	128	Number of CUs repopulated in the IM column store using memcompress for capacity low due to CU reaching staleness threshold	
IM repopulate CUs memcompress for dml	128	Number of CUs repopulated in the IM column store using memcompress for DML due to CU reaching staleness threshold	
IM repopulate CUs memcompress for query high	128	Number of CUs repopulated in the IM column store using memcompress for query high due to CU reaching staleness threshold	
IM repopulate CUs memcompress for query low	128	Number of CUs repopulated in the IM column store using memcompress for query low due to CU reaching staleness threshold	
IM repopulate CUs no memcompress	128	Number of CUs repopulated in the IM column store without compression due to CU reaching staleness threshold	
IM repopulate CUs requested	128	Total number of CUs requested to be repopulated due to CU reaching staleness threshold	
IM repopulate (doublebuffering) CUs	128	Number of CUs repopulated with double-buffering enabled on the earlier version of the CUs	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM repopulate (doublebuffering) CUs requested	128	Number of CUs requested to be repopulated with double-buffering enabled on the earlier version of the CUs	
IM repopulate EUs	128	Number of EUs requested to be repopulated due to EU reaching staleness threshold	
IM repopulate EUs accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent repopulating EUs into the IM column store due to DML changes	
IM repopulate EUs columns	128	Number of columns repopulated in EUs due to EU reaching staleness threshold	
IM repopulate EUs memcompress for capacity high	128	Number of EUs repopulated in the IM column store at memcompress for capacity high due to EU reaching staleness threshold	
IM repopulate EUs memcompress for capacity low	128	Number of EUs repopulated in the IM column store at memcompress for capacity low due to EU reaching staleness threshold	
IM repopulate EUs memcompress for dml	128	Number of EUs repopulated in the IM column store at memcompress for DML due to EU reaching staleness threshold	
IM repopulate EUs memcompress for query high	128	Number of EUs repopulated in the IM column store at memcompress for query high due to EU reaching staleness threshold	
IM repopulate EUs memcompress for query low	128	Number of EUs repopulated in the IM column store at memcompress for query low due to EU reaching staleness threshold	
IM repopulate EUs no memcompress	128	Number of EUs repopulated in the IM column store without compression due to EU reaching staleness threshold	
IM repopulate EUs requested	128	Total number of EUs requested to be repopulated due to EU reaching staleness threshold	
IM repopulate (incremental) CUs	128	Number of CUs repopulated incrementally from earlier versions of the CUs	
IM repopulate (incremental) CUs requested	128	Number of CUs requested to be repopulated incrementally from earlier versions of the CUs	
IM repopulate (incremental) EUs	128	Number of EUs repopulated using unchanged data from the current EU due to EU reaching staleness threshold	
IM repopulate (incremental) EUs requested	128	Number of EUs requested to be repopulated using unchanged data from the current EU due to EU reaching staleness threshold	
IM repopulate no contiguous inmemory space	128	Number of CUs that failed to repopulate due to lack of contigunous space in the In-Memory Area	
IM repopulate (scan) CUs	128	Number of CUs repopulated in the IM column store due to scans	
IM repopulate (scan) CUs requested	128	Number of CUs requested to be repopulated in the IM column store due to scans	
IM repopulate (scan) EUs	128	Number of EUs repopulated in the IM column store that were triggered by scans on the EU	
IM repopulate (scan) EUs requested	128	Number of EUs requested for repopulation in the IM column store that were triggered by scans on the EU	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM repopulate segments	128	Number of segments repopulated	
IM repopulate segments requested	128	Indicates the number of segments requested to be repopulated	
IM repopulate (trickle) accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent trickle repopulating CUs into the IM column store due to DML changes	
IM repopulate (trickle) bytes in-memory EU data	128	Size in bytes of in-memory EU data repopulated due to DML changes	
IM repopulate (trickle) bytes uncompressed EU data	128	Uncompressed size in bytes of in-memory EU data repopulated due to EU reaching staleness threshold	
IM repopulate (trickle) CUs	128	Number of CUs trickle repopulated in the IM column store due to DML changes	
IM repopulate (trickle) CUs memcompress for capacity high	128	Number of CUs trickle repopulated in the IM column store using memcompress for capacity high due to DML changes	
IM repopulate (trickle) CUs memcompress for capacity low	128	Number of CUs trickle repopulated in the IM column store using memcompress for capacity low due to DML changes	
IM repopulate (trickle) CUs memcompress for dml	128	Number of CUs trickle repopulated in the IM column store using memcompress for DML due to DML changes	
IM repopulate (trickle) CUs memcompress for query high	128	Number of CUs trickle repopulated in the IM column store using memcompress for query high due to DML changes	
IM repopulate (trickle) CUs memcompress for query low	128	Number of CUs trickle repopulated in the IM column store using memcompress for query low due to DML changes	
IM repopulate (trickle) CUs no memcompress	128	Number of CUs trickle repopulated in the IM column store without compression due to DML changes	
IM repopulate (trickle) CUs requested	128	Total number of CUs requested to be trickle repopulated due to DML changes	
IM repopulate (trickle) CUs resubmitted	128	Number of CUs trickle repopulate tasks submitted	
IM repopulate (trickle) EUs	128	Number of EUs trickle repopulated in the IM column store due to DML changes	
IM repopulate (trickle) EUs accumulated time (ms)	128	Total amount of DB time (in milliseconds) spent trickle repopulating EUs into the IM column store due to DML changes	
IM repopulate (trickle) EUs columns	128	Number of columns repopulated in EUs due to DML changes	
IM repopulate (trickle) EUs memcompress for capacity high	128	Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for capacity high	
IM repopulate (trickle) EUs memcompress for capacity low	128	Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for capacity low	
IM repopulate (trickle) EUs memcompress for dml	128	Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for dml	
IM repopulate (trickle) EUs memcompress for query high	128	Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for query high	
IM repopulate (trickle) EUs memcompress for query low	128	Number of EUs trickle repopulated in the IM column store due to DML changes at memcompress for query low	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM repopulate (trickle) EUs no memcompress	128	Number of EUs trickle repopulated in the IM column store without compression due to DML changes	
IM repopulate (trickle) EUs requested	128	Number of EUs requested to be trickle repopulated in the IM column store due to DML changes	
IM scan CUs column not in memory	128	Number of extents that could not be read from the IM column store because one of the columns required was not in memory	
IM scan CUs invalid or missing revert to on disk extent	128	Number of extents where no IMCU exists	
IM scan CUs memcompress for query low	128	Number of memcompress for query high CUs scanned in the IM column store	
IM scan CUs memcompress for query high	128	Number of memcompress for query high CUs scanned in the IM column store	
IM scan CUs memcompress for capacity low	128	Number of memcompress for capacity low CUs scanned in the IM column store	
IM scan CUs memcompress for capacity high	128	Number of memcompress for capacity high CUs scanned in the IM column store	
IM scan CUs memcompress for dml	128	Number of memcompress for DML CUs scanned in the IM column store	
IM scan CUs predicates applied	128	Number of where clause predicates applied to the In-Memory storage index	
IM scan CUs predicates optimized	128	Number of where clause predicates applied to the IM column store for which either all rows pass min/max pruning via an In-Memory storage index or no rows pass min/max pruning	
IM scan CUs pruned	128	Number of CUs pruned by the storage index	
IM scan (dynamic) multi-threaded scans	128	Number of In-Memory table scans which benefited from In-Memory dynamic scans	
IM scan (dynamic) tasks processed by parent	128	Number of IMCUs processed normally because of Resource Manager limit	
IM scan (dynamic) tasks processed by thread	128	Number of IMCUs processed in parallel by a worker thread	
IM scan (dynamic) rows	128	Number of rows processed by In-Memory dynamic scans	
IM scan EU bytes in-memory	128	Size in bytes of in-memory EU data accessed by scans	
IM scan EU bytes uncompressed	128	Uncompressed size in bytes of in-memory EU data accessed by scans	
IM scan EU rows	128	Number of rows scanned from EUs in the IM column store before where clause predicate applied	
IM scan EUs columns accessed	128	Number of columns in the EUs accessed by scans	
IM scan EUs columns decompressed	128	Number of columns in the EUs decompressed by scans	
IM scan EUs columns theoretical max	128	Number of columns that would have been accessed from the EU if the scans looked at all columns	
IM scan EUs memcompress for capacity high	128	Number of memcompress for capacity high EUs scanned in the IM column store	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
IM scan EUs memcompress for capacity low	128	Number of memcompress for capacity low EUs scanned in the IM column store	
IM scan EUs memcompress for dml	128	Number of memcompress for DML EUs scanned in the IM column store	
IM scan EUs memcompress for query high	128	Number of memcompress for query high EUs scanned in the IM column store	
IM scan EUs memcompress for query low	128	Number of memcompress for query low EUs scanned in the IM column store	
IM scan EUs no memcompress	128	Number of uncompressed EUs scanned in the IM column store	
IM scan EUs split pieces	128	Number of split EU pieces among all IM EUs	
IM scan rows	128	Number of rows in scanned In-Memory Compression Units (IMCUs)	
IM scan rows optimized	128	Number of rows that were not scanned in the IM column store as they were pruned via a number of optimizations such as min/max pruning via In-Memory storage indexes	
IM scan rows projected	128	Number of rows returned from the IM column store	
IM scan rows valid	128	Number of rows scanned from the IM column store after applying valid vector	
IM scan segments minmax eligible	128	Number of CUs that are eligible for min/max pruning via storage index	
IM space CU bytes allocated	128	Number of In-Memory bytes allocated	
IM space CU creations initiated	128	Number of space requests for CUs	
IM space CU extents allocated	128	Number of In-Memory extents allocated	
IM space segments allocated	128	Number of snapshot segments created	
IM space segments freed	128	Number of snapshot segments deleted	
IM transactions	128	Number of transactions that triggered data to be journaled in the IM column store	
IM transactions CUs invalid	128	Number of CUs in the IM column store invalidated by transactions	
IM transactions rows invalidated	128	Number of rows in the IM column store invalidated by transactions	
IM transactions rows journaled	128	Number of rows logged in the transaction journal	
in call idle wait time	1	Total wait time (in microseconds) for waits that belong to the Idle wait class. **See Also:** "non-idle wait count" and "non-idle wait time"	
index cmph cu, uncomp sentinels	128	Number of CUs created with uncompressed sentinels	
index cmph dm, cu lock expand	128	Number of times CU lock structure expanded	
index cmph dm, cu migrate row	128	Number of times a row migrated from a CU	
index cmph dm, insert unpurge CU row	128	Number of times a CU row was unpurged during insert	
index cmph dm, purge dummy CU	128	Number of times dummy CU purged from leaf block	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
index cmph dm, split for cu lock expand	128	Number of times leaf block split for CU lock expansion	
index cmph dm, split for cu migrate row	128	Number of leaf block splits due to CU row migration	
index cmph ld, CU fit	128	Number of times load created a well sized CU, no space for uncompressed rows	
index cmph ld, CU fit, add rows	128	Number of times load created a well sized CU, with space for uncompressed rows	
index cmph ld, CU negative comp	128	Number of times load CU gave negative compression	
index cmph ld, CU over-est	128	Number of times load created an oversized CU	
index cmph ld, CU under-est	128	Number of times load created a small CU	
index cmph ld, infinite loop	128	Number of times shrink CU attempts resulted in uncompressed rows	
index cmph ld, lf blks flushed	128	Number of leaf blocks flushed by load	
index cmph ld, lf blks w/ und CU	128	Number of leaf blocks flushed with small CU	
index cmph ld, lf blks w/o CU	128	Number of leaf blocks flushed without a CU	
index cmph ld, lf blks w/o unc r	128	Number of leaf blocks flushed without uncompressed rows	
index cmph ld, retry in over-est	128	Number of times CU was resized after creating an oversized CU	
index cmph ld, rows compressed	128	Number of rows compressed by load	
index cmph ld, rows uncompressed	128	Number of rows left uncompressed by load	
index cmph sc, ffs decomp buffers	128	Number of blocks decompressed for fast scan	
index cmph sc, ffs decomp buffers released and found valid	128	Number of times decompressed CU buffer was reused by fast scan	
index cmph sc, ffs decomp buffers rows avail	128	Number of rows in decompressed buffer for fast scan	
index cmph sc, ffs decomp buffers rows used	128	Number of rows used from decompressed buffer for fast scan	
index cmph sc, ffs decomp failures	128	Number of time decompress CU was not possible for fast scan	
	128	Number of times 90-10 leaf block CU splits were made 50-50	
index cmph sp, leaf norecomp limit	128	Number of times leaf block recompression reached the recompression limit	
index cmph sp, leaf norecomp negcomp	128	Number of times leaf block recompression returned negative compression	
index cmph sp, leaf norecomp nospace	128	Number of times leaf block recompression returned not enough space	
index cmph sp, leaf norecomp notry	128	Number of times leaf block recompression not attempted	
index cmph sp, leaf norecomp oversize	128	Number of times leaf block recompression returned an oversized CU	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
index cmph sp, leaf norecomp zerocur	128	Number of times leaf block recompression returned a CU with 0 rows	
index cmph sp, leaf recomp fewer ucs	128	Number of CUs created with reduced number of sentinels	
index cmph sp, leaf recomp zero ucs	128	Number of CUs created with zero sentinels	
index cmph sp, leaf recompress	128	Number of times a leaf block CU was recompressed	
index cmpl co, prefix mismatch	128	Number of times reorg found a neighboring block prefix count mismatch	
index cmpl ro, blocks not compressed	128	Number of times prefix compression was not applied to avoid negative compression	
index cmpl ro, prefix change at block	128	Number of times prefix count was changed to an optimal value	
index cmpl ro, prefix no change at block	128	Number of times prefix count was already the optimal value	
index cmpl ro, reorg avoid load new block	128	Number of times a block reorg avoided a new block being created during load	
index cmpl ro, reorg avoid split	128	Number of times a block reorg avoided a block split during DML	
index fast full scans (direct read)	64	Number of fast full scans initiated using direct read	
index fast full scans (full)	64	Number of fast full scans initiated for full segments	
index fast full scans (rowid ranges)	64	Number of fast full scans initiated with rowid endpoints specified	
large tracked transactions	128	For tables tracked by flashback data archive, the number of transactions modifying rows in those tables which are large in terms of size or number of changes	
leaf node splits	128	Number of times an index leaf node was split because of the insertion of an additional value	
lob reads	8	Number of LOB API read operations performed in the session/system. A single LOB API read may correspond to multiple physical/logical disk block reads.	
lob writes	8	Number of LOB API write operations performed in the session/system. A single LOB API write may correspond to multiple physical/logical disk block writes.	
lob writes unaligned	8	Number of LOB API write operations whose start offset or buffer size is not aligned to the internal chunk size of the LOB. Writes aligned to chunk boundaries are the most efficient write operations. The internal chunk size of a LOB is available through the LOB API (for example, `DBMS_LOB.GETCHUNKSIZE()`).	
logons cumulative	1	Total number of logons since the instance started. Useful only in `V$SYSSTAT`. It gives an instance overview of all processes that logged on.	
logons current	1	Total number of current logons. Useful only in `V$SYSSTAT`.	
memopt r failed puts	128	Total failed puts on hash index	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
memopt r failed reads on blocks	128	Total lookup failures due to read failure on blocks because of concurrent changes	
memopt r failed reads on buckets	128	Total lookup failures due to concurrent hash bucket changes	
memopt r hits	128	Total hits on hash index – primary key found	
memopt r lookup detected CR buffer	128	Total lookup failures due to block pointed to by hash index being no longer the current version	
memopt r lookups	128	Total number of lookups on hash index	
memopt r misses	128	Total misses on hash index due to primary key not found	
memopt r puts	128	Total puts on hash index	
memopt r successful puts	128	Total successful puts on hash index	
messages received	128	Number of messages sent and received between background processes	
messages sent	128	Number of messages sent and received between background processes	
MLE JIT compilation duration cumulative	1	Total amount of cpu time (in milliseconds) spent by asynchronous just-in-time compilations for a session	
MLE JIT compilation duration max	1	Duration (in milliseconds) of the most time-consuming just-in-time compilation per session (not applicable for `V$SYSSTAT`)	
MLE JIT compilation error count	1	Number of just-in-time compilation operations in a session that failed with an error	
MLE JIT compilation success count	1	Number of successful just-in-time compilations in a session	
MLE full GC accumulated time	1	Cumulative time (in milliseconds) spent collecting the entire MLE heap	
MLE full GC count	1	Number of times the entire MLE heap was collected	
MLE incremental GC accumulated time	1	Cumulative time (in milliseconds) spent collecting the young-generation portion of the MLE heap	
MLE incremental GC count	1	Number of times the young-generation portion of the MLE heap was collected	
MLE total memory in use	1	Total amount of memory (in bytes) used for the MLE instance in a session, across all contexts	
no buffer to keep pinned count	72	Number of times a visit to a buffer attempted, but the buffer was not found where expected. Like "buffer is not pinned count" and "buffer is pinned count", this statistic is useful only for internal debugging purposes.	
no work - consistent read gets	128	Number of "consistent gets" that require neither block cleanouts nor rollbacks.	
non-idle wait count	1	Total number of waits performed with wait events that were not part of the Idle wait class. **See Also:** "in call idle wait time" and "non-idle wait time"	
non-idle wait time	1	Total wait time (in microseconds) for waits that do not belong to the Idle wait class. **See Also:** "in call idle wait time" and "non-idle wait count"	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
OLAP Aggregate Function Calc	64	Number of times the `AGGREGATE` function computes a parent value based on the values of its children.	
OLAP Aggregate Function Logical NA	64	Number of times an `AGGREGATE` function evaluates to a logical NA value. This could be because the `AGGINDEX` is on and the composite tuple does not exist.	
OLAP Aggregate Function Precompute	64	Number of times the `AGGREGATE` function is to compute a value and finds it precomputed in the cube.	
OLAP Custom Member Limit	64	Number of times an OLAP table function issues a custom member limit	
OLAP Engine Calls	64	Total number of OLAP transactions executed within the session. This value provides a general indication of the level of OLAP activity in the session.	
OLAP Fast Limit	64	Number of times an OLAP table function issues a fast limit	
OLAP Full Limit	64	Number of times an OLAP table function issues a full limit	
OLAP GID Limit	64	Number of times an OLAP table function issues a Cube Grouping ID (CGID) limit. Typically, this type of limit occurs for query rewrite transformations that resolve to a cube organized materialized view.	
OLAP Import Rows Loaded	64	Number of OLAP import rows loaded. This statistic provides the number of rows of the source cursor that are actually loaded into an Analytic Workspace (AW). The difference between the OLAP Import Rows Pushed and OLAP Import Rows Loaded provides the number of rejected rows.	
OLAP Import Rows Pushed	64	Number of OLAP import rows pushed. This statistic refers to the number of rows encountered from a source cursor and is useful during cube build operations.	
OLAP INHIER Limit	64	Number of times an OLAP table function issues an in-hierarchy limit. This type of limit can occur when you use cube dimension hierarchy views.	
OLAP Limit Time	64	Total time taken by all the OLAP Limit operations that were performed during the last call to the OLAP table function	
OLAP Paging Manager Cache Changed Page	64	Number of times the OLAP page pool is changed for any attached AW.	
OLAP Paging Manager Cache Hit	64	Number of times a requested page is found in the OLAP page pool. Use this statistic in conjunction with "OLAP Paging Manager Cache Miss" to determine the OLAP page pool efficiency ratio.	
OLAP Paging Manager Cache Miss	64	Number of times a requested page is not found in the OLAP page pool. Use this statistic in conjunction with "OLAP Paging Manager Cache Hit" to determine the OLAP page pool efficiency ratio.	
OLAP Paging Manager Cache Write	64	Number of times the OLAP paging manager writes to a page in the OLAP page pool	
OLAP Paging Manager New Page	64	Number of newly-created pages in the OLAP page pool that have not yet been written to the workspace LOB	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
OLAP Paging Manager Pool Size	64	Size (in bytes) of the OLAP page pool allocated to a session and the sum of all OLAP page pools in the system	
OLAP Perm LOB Read	64	Number of times data was read from the table where the AW is stored. These are permanent LOB reads.	
OLAP Row Id Limit	64	Number of times an OLAP table function issues a row ID limit	
OLAP Row Load Time	64	Total time spent loading rows into an AW during cube build and OLAP SQL import operations Use this statistic along with the "OLAP engine elapsed time" to measure time spent running OLAP engine routines that involve loading data into AWs from a SQL source. This statistic has the following levels of precision: • Low precision timer This captures the elapsed time of the entire fetch phase of the SQL cursor that is being loaded into AWs. It includes the SQL execution time that occurs during a fetch operation from a source cursor and time taken by the OLAP engine to populate AWs. • High precision timer This captures the elapsed time, excluding the SQL processing of the cursor being loaded. It records the time spent in the OLAP engine only. • Default timer precision: This is based on the `STATISTIC_LEVEL` parameter. If the low precision is used, then `STATISTICS_LEVEL` is `TYPICAL`. The high precision timer is used when `STATISTIC_LEVEL` is set to `ALL`. No timing is captured when `STATISTICS_LEVEL` is `BASIC`.	
OLAP Row Source Rows Processed	64	Number of rows processed by the OLAP row source	
OLAP Session Cache Hit	64	Number of times the requested, dynamically-aggregated value of an AW object, was found in the OLAP session cache.	
OLAP Session Cache Miss	64	Number of times the requested, dynamically-aggregated value of an AW object, was not found in the OLAP session cache.	
OLAP Temp Segment Read	64	Number of times data was read from a temporary segment and not from the OLAP page pool	
OLAP Temp Segments	64	Number of OLAP pages stored in temporary segments for analytic workspaces	
OLAP Unique Key Attribute Limit	64	Number of times an OLAP table function issues a unique key attribute limit	
opened cursors cumulative	1	In `V$SYSSTAT`: Total number of cursors opened since the instance started In `V$SESSTAT`: Total number of cursors opened since the start of the session	
opened cursors current	1	Total number of current open cursors	
OS CPU Qt wait time	1	Amount of time a session spends on the CPU run queue (in microseconds), waiting to get the CPU to run	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
OS Involuntary context switches	16	Number of context switches that were enforced by the operating system	
OS Signals received	16	Number of signals received	
OS Swaps	16	Number of swap pages	
OS Voluntary context switches	16	Number of voluntary context switches (for example, when a process gives up the CPU by a SLEEP() system call)	
Parallel operations downgraded 1 to 25 pct	32	Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers	
Parallel operations downgraded 25 to 50 pct	32	Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers	
Parallel operations downgraded 50 to 75 pct	32	Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers	
Parallel operations downgraded 75 to 99 pct	32	Number of times parallel execution was requested and the degree of parallelism was reduced because of insufficient parallel execution servers	
Parallel operations downgraded to serial	32	Number of times parallel execution was requested but execution was serial because of insufficient parallel execution servers	
Parallel operations not downgraded	32	Number of times parallel execution was executed at the requested degree of parallelism	
parse count (describe)	64	Total number of parse calls on a describe cursor. This operation is a less expensive than a hard parse and more expensive than a soft parse.	
parse count (hard)	64	Total number of parse calls (real parses). A hard parse is a very expensive operation in terms of memory use, because it requires Oracle to allocate a workheap and other memory structures and then build a parse tree.	
parse count (total)	64	Total number of parse calls (hard, soft, and describe). A soft parse is a check on an object already in the shared pool, to verify that the permissions on the underlying object have not changed.	
parse time cpu	64	Total CPU time used for parsing (hard and soft) in 10s of milliseconds	Y
parse time elapsed	64	Total elapsed time for parsing, in 10s of milliseconds. Subtract "parse time cpu" from this statistic to determine the total waiting time for parse resources.	Y
physical maps pmem	264	Number of direct-mapped references acquired from FsDirect. Note that in steady state this is approximately the same as the number of unmaps, because each map requires an unmap (e.g. reuses a PMEM buffer).	
physical read bytes	8	Total size in bytes of all disk reads by application activity (and not other instance activity) only.	
physical read flash cache hits	8	Total number of reads from flash cache instead of disk	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
physical read IO requests	8	Number of read requests for application activity (mainly buffer cache and direct load operation) which read one or more database blocks per request. This is a subset of "physical read total IO requests".	
physical read requests optimized	8	Number of read requests that read one or more database blocks from the Database Smart Flash Cache or the Exadata Smart Flash Cache.	
physical read total bytes	8	Total size in bytes of disk reads by all database instance activity including application reads, backup and recovery, and other utilities. The difference between this value and "physical read bytes" gives the total read size in bytes by non-application workload.	
physical read total IO requests	8	Number of read requests which read one or more database blocks for all instance activity including application, backup and recovery, and other utilities. The difference between this value and "physical read total multi block requests" gives the total number of small I/O requests which are less than 128 kilobytes down to single block read requests.	
physical read total multi block requests	8	Total number of Oracle instance read requests which read 128 kilobytes or more in two or more database blocks per request for all instance activity including application, backup and recovery, and other utilities.	
physical reads	8	Total number of data blocks read from disk. This value can be greater than the value of "physical reads direct" plus "physical reads cache" as reads into process private buffers also included in this statistic.	
physical reads cache	8	Total number of data blocks read from disk into the buffer cache. This is a subset of "physical reads".	
physical reads cache prefetch	8	Number of contiguous and noncontiguous blocks that were prefetched.	
physical reads direct	8	Number of reads directly from disk, bypassing the buffer cache. For example, in high bandwidth, data-intensive operations such as parallel query, reads of disk blocks bypass the buffer cache to maximize transfer rates and to prevent the premature aging of shared data blocks resident in the buffer cache.	
physical reads direct (lob)	8	Number of buffers that were read directly for LOBs	
physical reads direct temporary tablespace	8	Number of buffers that were read directly from temporary tablespaces	
physical reads for flashback new	8	Number of blocks read for newing (that is, preparing a data block for a completely new change) blocks while flashback database is enabled	
physical reads pmem	8	Number of blocks read/copied from PMEM into DRAM cache	
physical reads pmem decrypt	8	Number of blocks read/copied from PMEM into DRAM cache due to the need for decryption. This is a subset of "physical reads pmem".	
physical reads pmem direct path	8	Number of blocks read from PMEM into PGA memory due to direct path access. This is a subset of "physical reads pmem".	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
physical reads pmem exclusive	8	Number of blocks read/copied from PMEM into DRAM cache due to exclusive access requests, which prevents other processes from accessing the block on PMEM directly. This is a subset of "physical reads pmem".	
physical reads pmem modification	8	Number of blocks read/copied from PMEM into DRAM cache due to modification. This is a subset of "physical reads pmem".	
physical reads pmem promote	8	Number of blocks read/copied from PMEM into DRAM cache due to hot block promotion. This is a subset of "physical reads pmem". This statistic is further categorized into "hot pmem block migration to dram successes" and ""hot pmem block exchange with dram successes".	
physical reads pmem rollback	8	Number of blocks read/copied from PMEM into DRAM cache due to CR rollback. This is a subset of "physical reads pmem".	
physical reads prefetch warmup	8	Number of data blocks that were read from the disk during the automatic prewarming of the buffer cache.	
physical unmaps pmem forced	264	Number of forfeited direct-mapped references requested by FsDirect due to PMEM memory pressure	
physical write bytes	8	Total size in bytes of all disk writes from the database application activity (and not other kinds of instance activity).	
physical write IO requests	8	Number of write requests for application activity (mainly buffer cache and direct load operation) which wrote one or more database blocks per request.	
physical write total bytes	8	Total size in bytes of all disk writes for the database instance including application activity, backup and recovery, and other utilities. The difference between this value and "physical write bytes" gives the total write size in bytes by non-application workload.	
physical write total IO requests	8	Number of write requests which wrote one or more database blocks from all instance activity including application activity, backup and recovery, and other utilities. The difference between this stat and "physical write total multi block requests" gives the number of single block write requests.	
physical write total multi block requests	8	Total number of Oracle instance write requests which wrote two or more blocks per request to the disk for all instance activity including application activity, recovery and backup, and other utilities.	
physical writes	8	Total number of data blocks written to disk. This value equals the sum of "physical writes direct" and "physical writes from cache".	
physical writes direct	8	Number of writes directly to disk, bypassing the buffer cache (as in a direct load operation)	
physical writes direct (lob)	8	Number of buffers that were directly written for LOBs	
physical writes direct temporary tablespace	8	Number of buffers that were directly written for temporary tablespaces	
physical writes from cache	8	Total number of data blocks written to disk from the buffer cache. This is a subset of "physical writes".	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
physical writes non checkpoint	8	Number of times a buffer is written for reasons other than advancement of the checkpoint. Used as a metric for determining the I/O overhead imposed by setting the `FAST_START_IO_TARGET` parameter to limit recovery I/Os. (Note that `FAST_START_IO_TARGET` is a deprecated parameter.) Essentially this statistic measures the number of writes that would have occurred had there been no checkpointing. Subtracting this value from "physical writes" gives the extra I/O for checkpointing.	
pinned buffers inspected	8	Number of times a user process, when scanning the tail of the replacement list looking for a buffer to reuse, encountered a cold buffer that was pinned or had a waiter that was about to pin it. This occurrence is uncommon, because a cold buffer should not be pinned very often.	
pinned buffers inspected for pmem	8	Number of times a user process, when scanning the tail of the replacement list looking for a PMEM buffer to reuse in DRAM, encountered a cold buffer that was pinned or had a waiter that was about to pin it. This occurrence is uncommon, because a cold buffer should not be pinned very often.	
prefetched blocks aged out before use	8	Number of contiguous and noncontiguous blocks that were prefetched but aged out before use	
process last non-idle time	128	The last time this process executed	Y
PX local messages recv'd	32	Number of local messages received for parallel execution within the instance local to the current session	
PX local messages sent	32	Number of local messages sent for parallel execution within the instance local to the current session	
PX remote messages recv'd	32	Number of remote messages received for parallel execution within the instance local to the current session	
PX remote messages sent	32	Number of remote messages sent for parallel execution within the instance local to the current session	
queries parallelized	32	Number of `SELECT` statements executed in parallel	
recovery array read time	8	Elapsed time of I/O during recovery	
recovery array reads	8	Number of reads performed during recovery	
recovery blocks read	8	Number of blocks read during recovery	
recovery blocks read for lost write detection	8	Number of blocks read for lost write checks during recovery.	
recovery blocks skipped lost write checks	8	Number of Block Read Records that skipped the lost write check during recovery.	
recursive calls	1	Number of recursive calls generated at both the user and system level. Oracle maintains tables used for internal processing. When Oracle needs to make a change to these tables, it internally generates an internal SQL statement, which in turn generates a recursive call.	
recursive cpu usage	1	Total CPU time used by non-user calls (recursive calls). Subtract this value from "CPU used by this session" to determine how much CPU time was used by the user calls.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
redo blocks checksummed by FG (exclusive)	2	Number of exclusive redo blocks that were checksummed by the generating foreground processes. An exclusive redo block is the one whose entire redo content belongs to a single redo entry.	
redo blocks checksummed by LGWR	2	Number of redo blocks that were checksummed by the LGWR.	
redo blocks written	2	Total number of redo blocks written. This statistic divided by "redo writes" equals number of blocks per write.	
redo buffer allocation retries	2	Total number of retries necessary to allocate space in the redo buffer. Retries are needed either because the redo writer has fallen behind or because an event such as a log switch is occurring.	
redo entries	2	Number of times a redo entry is copied into the redo log buffer	
redo entries for lost write detection	2	Number of times a Block Read Record is copied into the log buffer.	
redo log space requests	2	Number of times the active log file is full and Oracle must wait for disk space to be allocated for the redo log entries. Such space is created by performing a log switch. Log files that are small in relation to the size of the SGA or the commit rate of the work load can cause problems. When the log switch occurs, Oracle must ensure that all committed dirty buffers are written to disk before switching to a new log file. If you have a large SGA full of dirty buffers and small redo log files, a log switch must wait for DBWR to write dirty buffers to disk before continuing. Also examine the **log file space** and **log file space switch** wait events in `V$SESSION_WAIT`.	
redo log space wait time	2	Total time waited in centiseconds for available space in the redo log buffer. See also "redo log space requests"	Y
redo ordering marks	2	Number of times that a system change number was allocated to force a redo record to have a higher SCN than a record generated in another thread using the same block	
redo size	2	Total amount of redo generated in bytes	
redo size for lost write detection	2	Total amount of Block Read Records generated in bytes	
redo synch time	8	Elapsed time of all "redo synch writes" calls in 10s of milliseconds	Y
redo synch writes	8	Number of times the redo is forced to disk, usually for a transaction commit. The log buffer is a circular buffer that LGWR periodically flushes. Usually, redo that is generated and copied into the log buffer need not be flushed out to disk immediately.	
redo wastage	2	Number of bytes wasted because redo blocks needed to be written before they are completely full. Early writing may be needed to commit transactions, to be able to write a database buffer, or to switch logs.	
redo write broadcast ack count	2	Number of times a commit broadcast acknowledgment has not been received by the time when the corresponding log write is completed. This is only for Oracle RAC.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
redo write broadcast ack time	2	Total amount of the latency associated with broadcast on commit beyond the latency of the log write (in microseconds). This is only for Oracle RAC.	Y
redo write time	2	Total elapsed time of the write from the redo log buffer to the current redo log file in 10s of milliseconds	Y
redo writes	2	Total number of writes by LGWR to the redo log files. "redo blocks written" divided by this statistic equals the number of blocks per write	
rollback changes - undo records applied	128	Number of undo records applied to user-requested rollback changes (not consistent-read rollbacks)	
rollbacks only - consistent read gets	128	Number of "consistent gets" that require only block rollbacks, no block cleanouts.	
rows fetched via callback	64	Rows fetched via callback. Useful primarily for internal debugging purposes.	
scheduler wait time	1	Total wait time (in microseconds) for waits that belong to the Scheduler wait class	
SCN increments due to another database	128	SCN increments due to communication with another database	
serializable aborts	1	Number of times a SQL statement in a serializable isolation level had to terminate	
session connect time	1	The connect time for the session in 10s of milliseconds. This value is useful only in `V$SESSTAT`. It is the wall clock time since the logon to this session occurred.	Y
session cursor cache count	64	Total number of cursors cached. This statistic is incremented only if `SESSION_CACHED_CURSORS` > 0. This statistic is the most useful in `V$SESSTAT`. If the value for this statistic in `V$SESSTAT` is close to the setting of the `SESSION_CACHED_CURSORS` parameter, the value of the parameter should be increased.	
session cursor cache hits	64	Number of hits in the session cursor cache. A hit means that the SQL (including recursive SQL) or PL/SQL statement did not have to be reparsed. Subtract this statistic from "parse count (total)" to determine the real number of parses that occurred.	
session logical reads	1	The sum of "db block gets" plus "consistent gets". This includes logical reads of database blocks from either the buffer cache or process private memory.	
session logical reads - IM	128	Number of database blocks read from the IM column store (number of blocks in IMCU - number of blocks with invalid rows)	
session pga memory	1	Current PGA size for the session (in bytes). Useful only in `V$SESSTAT`; it has no meaning in `V$SYSSTAT`.	
session pga memory max	1	Peak PGA size for the session (in bytes). Useful only in `V$SESSTAT`; it has no meaning in `V$SYSSTAT`.	
session stored procedure space	1	Amount of memory this session is using for stored procedures	
session uga memory	1	Current UGA size for the session (in bytes). Useful only in `V$SESSTAT`; it has no meaning in `V$SYSSTAT`.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
session uga memory max	1	Peak UGA size for a session (in bytes). Useful only in V$SESSTAT; it has no meaning in V$SYSSTAT.	
shared hash latch upgrades - no wait	8	A shared hash latch upgrade is when a hash latch is upgraded from shared mode to exclusive mode. This statistic displays the number of times the upgrade completed immediately.	
shared hash latch upgrades - wait	8	A shared hash latch upgrade is when a hash latch is upgraded from shared mode to exclusive mode. This statistic displays the number of times the upgrade did not complete immediately.	
shared io pool buffer get failure	128	Number of unsuccessful buffer gets from the shared I/O pool from instance startup time.	
shared io pool buffer get success	128	Number of successful buffer gets from the shared I/O pool from instance startup time.	
slave propagated tracked transactions	128	Number of transactions modifying tables enabled for flashback data archive which were archived by a worker process	
sorts (disk)	64	Number of sort operations that required at least one disk write Sorts that require I/O to disk are quite resource intensive. Try increasing the size of the initialization parameter SORT_AREA_SIZE.	
sorts (memory)	64	Number of sort operations that were performed completely in memory and did not require any disk writes You cannot do much better than memory sorts, except maybe no sorts at all. Sorting is usually caused by selection criteria specifications within table join SQL operations.	
sorts (rows)	64	Total number of rows sorted	
SQL*Net roundtrips to/from client	1	Total number of Oracle Net Services messages sent to and received from the client	
SQL*Net roundtrips to/from dblink	1	Total number of Oracle Net Services messages sent over and received from a database link	
summed dirty queue length	8	The sum of the dirty LRU queue length after every write request. Divide by **write requests** to get the average queue length after write completion.	
switch current from pmem	8	Number of times the CURRENT PMEM block moved to a DRAM buffer, leaving a CR block in the original PMEM buffer. This happens when one Oracle process pins a CURRENT PMEM buffer for read, and another Oracle process wants to pin the same buffer for modification. The latter process clones the PMEM buffer into a new DRAM buffer for modification, while converting the original PMEM current buffer into a PMEM CR buffer.	
switch current to new buffer	8	Number of times the CURRENT block moved to a different buffer, leaving a CR block in the original buffer	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
table fetch by rowid	64	Number of rows that are fetched using a ROWID (usually recovered from an index) This occurrence of table scans usually indicates either non-optimal queries or tables without indexes. Therefore, this statistic should increase as you optimize queries and provide indexes in the application.	
table fetch continued row	64	Number of times a chained or migrated row is encountered during a fetch Retrieving rows that span more than one block increases the logical I/O by a factor that corresponds to the number of blocks than need to be accessed. Exporting and re-importing may eliminate this problem. Evaluate the settings for the storage parameters `PCTFREE` and `PCTUSED`. This problem cannot be fixed if rows are larger than database blocks (for example, if the `LONG` data type is used and the rows are extremely large).	
table scan blocks gotten	64	During scanning operations, each row is retrieved sequentially by Oracle. This statistic counts the number of blocks encountered during the scan. This statistic tells you the number of database blocks that you had to get from the buffer cache for the purpose of scanning. Compare this value with the value of "consistent gets" to determine how much of the consistent read activity can be attributed to scanning.	
table scan disk IMC fallback	128	Number of rows fetched from the buffer cache because they were not present in the IM column store (in a scan that was otherwise performed in memory)	
table scan disk non-IMC rows gotten	128	Number of rows fetched during non-In-Memory scan	
table scan rows gotten	64	Number of rows that are processed during scanning operations	
table scans (cache partitions)	64	Number of range scans performed on tables that have the CACHE option enabled	
table scans (direct read)	64	Number of table scans performed with direct read (bypassing the buffer cache)	
table scans (IM)	128	Number of segments / granules scanned using In-Memory	
table scans (long tables)	64	Long (or conversely short) tables can be defined as tables that do not meet the short table criteria as described in "table scans (short tables)"	
table scans (rowid ranges)	64	During parallel query, the number of table scans conducted with specified ROWID ranges	
table scans (short tables)	64	Long (or conversely short) tables can be defined by optimizer hints coming down into the row source access layer of Oracle. The table must have the CACHE option set.	
tracked rows	128	Number of rows modified in tables enabled for flashback data archive	
tracked transactions	128	Number of transactions which modified a table enabled for flashback data archive	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
transaction lock background get time	128	Useful only for internal debugging purposes	
transaction lock background gets	128	Useful only for internal debugging purposes	
transaction lock foreground requests	128	Useful only for internal debugging purposes	
transaction lock foreground wait time	128	Useful only for internal debugging purposes	
transaction rollbacks	128	Number of transactions being successfully rolled back	
transaction tables consistent read rollbacks	128	Number of times rollback segment headers are rolled back to create consistent read blocks	
transaction tables consistent reads - undo records applied	128	Number of undo records applied to transaction tables that have been rolled back for consistent read purposes	
True Cache potentially current buffer made CR	264	Count of data blocks arriving at True Cache as potentially current buffers due to timing conditions, and later deemed to be good only as consistent read buffers, so they will be aged out.	
True Cache potentially current buffer made current	264	Count of data blocks arriving at True Cache as potentially current buffers due to timing conditions, and later confirmed to be real current buffers, so redo will continue to apply.	
True Cache: message count data send	256	Total number of messages this primary instance sends to True Cache for returning data blocks.	
True Cache: message count request send	256	Total number of messages this True Cache sends to the primary database for requesting data blocks.	
True Cache: message roundtrip time data send	256	Cumulative, elapsed, round-trip messaging time in microseconds of this primary instance sending data blocks to True Cache.	
True Cache: message roundtrip time request send	256	Cumulative, elapsed, round-trip messaging time in microseconds of this True Cache sending data block fetching requests to the primary database.	
TrueCache: block requests to preferred primary	264	Number of block fetch requests sent to the preferred primary Oracle RAC instance with object or undo affinity.	
TrueCache: block requests to primary	264	Total number of block fetch requests sent to the primary database.	
txns rollback priority_txns_high_wait_target	384	Total number of times a `LOW` or `MEDIUM` priority transaction was rolled back by the Priority Transactions feature because the wait time specified by the `PRIORITY_TXNS_HIGH_WAIT_TARGET` initialization parameter was exceeded for a `HIGH` priority transaction This statistic is updated when the Priority Transactions feature is enabled, that is, when the `PRIORITY_TXNS_MODE` initialization parameter is set to `ROLLBACK`.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
txns rollback priority_txns_medium_wait_target	384	Total number of times a LOW priority transaction was rolled back by the Priority Transactions feature because the wait time specified by the PRIORITY_TXNS_MEDIUM_WAIT_TARGET initialization parameter was exceeded for a MEDIUM priority transaction This statistic is updated when the Priority Transactions feature is enabled, that is, when the PRIORITY_TXNS_MODE initialization parameter is set to ROLLBACK.	
txns track mode priority_txns_high_wait_target	384	Total number of times a LOW or MEDIUM priority transaction would potentially be rolled back by the Priority Transactions feature because the wait time specified by the PRIORITY_TXNS_HIGH_WAIT_TARGET initialization parameter was exceeded for a HIGH priority transaction This statistic is updated when the Priority Transactions feature is running in tracking mode, that is, when the PRIORITY_TXNS_MODE initialization parameter is set to TRACK.	
txns track mode priority_txns_medium_wait_target	384	Total number of times a LOW priority transaction would potentially be rolled back by the Priority Transactions feature because the wait time specified by the PRIORITY_TXNS_MEDIUM_WAIT_TARGET initialization parameter was exceeded for a MEDIUM priority transaction This statistic is updated when the Priority Transactions feature is running in tracking mode, that is, when the PRIORITY_TXNS_MODE initialization parameter is set to TRACK.	
user calls	1	Number of user calls such as login, parse, fetch, or execute When determining activity, the ratio of user calls to RPI calls, give you an indication of how much internal work gets generated because of the type of requests the user is sending to Oracle.	
user commits	1	Number of user commits. When a user commits a transaction, the redo generated that reflects the changes made to database blocks must be written to disk. Commits often represent the closest thing to a user transaction rate.	
user I/O wait time	1	Total wait time (in centiseconds) for waits that belong to the User I/O wait class	
user rollbacks	1	Number of times users manually issue the ROLLBACK statement or an error occurs during a user's transactions	
very large tracked transactions	128	For tables tracked by flashback data archive, number of transactions modifying those tables which are very large in terms of size or number of changes	
write clones created in background	8	Number of times a background or foreground process clones a CURRENT buffer that is being written. The clone becomes the new, accessible CURRENT buffer, leaving the original buffer (now the clone) to complete writing.	

Table E-1 (Cont.) Database Statistics Descriptions

Name	Class	Description	TIMED_STATISTICS
write clones created in foreground	8	Number of times a background or foreground process clones a `CURRENT` buffer that is being written. The clone becomes the new, accessible `CURRENT` buffer, leaving the original buffer (now the clone) to complete writing.	

F

Background Processes

An Oracle Database **background process** is defined as any process that is listed in `V$PROCESS` and has a non-null value in the `PNAME` column.

Table F-1 describes Oracle Database background processes.

The External Properties column lists the type of instance in which the process runs. If the process is specific to a particular feature, then the column names the feature.

> **Note:**
>
> When the `THREADED_EXECUTION` initialization parameter is set to `TRUE` on Linux and UNIX, the `DBW`, `PMON`, `PSP`, and `VKTM` background processes run as operating system processes, and the other background processes run as operating system threads.
>
> See "THREADED_EXECUTION" for more information about the `THREADED_EXECUTION` initialization parameter.

Table F-1 Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
ABMR	Auto BMR Background Process	Coordinates execution of tasks such as filtering duplicate block media recovery requests and performing flood control	When a process submits a block media recovery request to ABMR, it dynamically spawns worker processes (BMR*n*) to perform the recovery. ABMR and BMR*n* terminate after being idle for a long time. **See Also:** *Oracle Database Backup and Recovery User's Guide*	Database instances
ACFS	Oracle Advanced Cluster File System (Oracle ACFS) CSS Process	Tracks the cluster membership in CSS and informs the file system driver of membership changes	The ACFS process delivers CSS membership changes to the cluster file system. These membership changes are required for the file system to maintain file system consistency within the cluster.	Oracle ASM instances, Oracle RAC
ACMS	Atomic Control File to Memory Service Process	Coordinates consistent updates to a control file resource with its SGA counterpart on all instances in an Oracle RAC environment	The ACMS process works with a coordinating caller to ensure that an operation is executed on every instance in Oracle RAC despite failures. ACMS is the process in which a distributed operation is called. As a result, this process can exhibit a variety of behaviors. In general, ACMS is limited to small, nonblocking state changes for a limited set of cross-instance operations.	Database instances, Oracle RAC
AMB*n*	**See** ASMB, AMB*n*			

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
AP*nn*	Replication Apply Process Coordinator Process	Obtains transactions from the reader server and passes them to apply servers	The coordinator process name is AP*nn*, where *nn* can include letters and numbers. For more information about the coordinator process, see `V$XSTREAM_APPLY_COORDINATOR` for XStream and `V$GG_APPLY_COORDINATOR` for Oracle GoldenGate. **See Also:** *Oracle Database XStream Guide*	Database instances, Logical Standby, XStream Inbound servers, XStream Outbound servers, GoldenGate Integrated Replicat
AQPC	AQ Process Coordinator	Per instance AQ global coordinator	AQPC is responsible for performing administrative tasks for AQ Primary Class Processes including commands like starting, stopping, and other administrative tasks. This process is automatically started on instance startup.	Database instances Advanced Queueing
ARB0	ASM Rebalance Process	Rebalances data extents within an Oracle ASM disk group	ARB0 uses the value of the `ASM_POWER_LIMIT` initialization parameter for the Oracle ASM instance as the maximum power for disk rebalancing.	Oracle ASM instances
ARC*n*	Archiver Process	Copies the redo log files to archival storage when they are full or an online redo log switch occurs	ARC*n* processes exist only when the database is in `ARCHIVELOG` mode and automatic archiving is enabled, in which case ARC*n* automatically archives online redo log files. LGWR cannot reuse and overwrite an online redo log group until it has been archived. The database starts multiple archiver processes as needed to ensure that the archiving of filled online redo logs does not fall behind. Possible processes are ARC0-ARC9 and ARCa-ARCt. The `LOG_ARCHIVE_MAX_PROCESSES` initialization parameter specifies the number of ARC*n* processes that the database initially invokes. **See Also:** *Oracle Database Concepts* and *Oracle Database Administrator's Guide*	Database instances
ARS*n*	ASM Recovery Worker Process	Recovers ASM transactional operations	The ASM RBAL background process coordinates and spawns one or more of these worker processes to recover terminated ASM transactional operations. These processes run only in the Oracle ASM instance. Possible processes are ARS0-ARS9.	Oracle ASM instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
ASMB, AMB*n*	ASM Background Process	Communicates with an Oracle ASM instance, managing storage and providing statistics	In a database instance, the ASMB and AMB*n* processes enable the database instance to connect to an Oracle ASM instance in order to access Oracle ASM disk groups. Possible processes are ASMB and AMB1-AMB3. In an Oracle ASM instance, the ASMB process runs when the ASMCMD `cp` command runs, or when a database instance first starts if the server parameter file is stored in Oracle ASM. ASMB also runs with Oracle Cluster Registry on Oracle ASM. The only possible process is ASMB; AMB*n* processes do not run in Oracle ASM instances. In an Oracle IOServer (IOS) instance, the ASMB process enables the IOS instance to connect to an Oracle ASM instance in order to access Oracle ASM disk groups. The only possible process is ASMB; AMB*n* processes do not run in IOS instances.	Database instances, Oracle ASM instances, Oracle IOServer (IOS) instances
AS*nn*	Replication Apply Reader or Apply Server	Computes dependencies between logical change records (LCRs) and assembles messages into transactions (Reader Server) Applies LCRs to database objects or passes LCRs and user messages to their appropriate apply handlers (Apply Server)	When the reader server finishes computing dependencies between LCRs and assembling transactions, it returns the assembled transactions to the coordinator process. Query `V$STREAMS_APPLY_READER`, `V$XSTREAM_APPLY_READER`, and `V$GG_APPLY_READER` for information about the reader server background process. An apply server receives the transactions from the coordinator background process, and either applies database changes in LCRs or sends LCRs or messages to apply handlers. Apply servers can also enqueue a queue. If an apply server encounters an error, then it then tries to resolve the error with a user-specified conflict handler or error handler. If an apply server cannot resolve an error, then it rolls back the transaction and places the entire transaction, including all of its messages, in the error queue. When an apply server commits a completed transaction, this transaction has been applied. When an apply server places a transaction in the error queue and commits, this transaction also has been applied. Query `V$STREAMS_APPLY_SERVER` for information about the apply server background process. For XStream Inbound servers, query `V$XSTREAM_APPLY_SERVER`. For GoldenGate Integrated Replicat, query `V$GG_APPLY_SERVER`. The coordinator process name is AS*nn*, where *nn* can include letters and numbers.	Database instances, XStream Outbound servers, XStream Inbound servers, GoldenGate Integrated Replicat
BG*nn*	Background Scheduler Group Process	Runs assorted background maintenance actions in the database	The database instance runs various background maintenance tasks that are necessary for database operation. BG*nn* runs assorted background actions for these maintenance tasks.	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
BMR*n*	Automatic Block Media Recovery Worker Pool Process	Fetches blocks from a real-time readable standby database	When a process submits a block media recovery request to ABMR, it dynamically spawns worker processes (BMR*n*) to perform the recovery. BMR*n* processes fetch blocks from a real-time readable standby database. ABMR and BMR*n* terminate after being idle for a long time. **See Also:** *Oracle Database Backup and Recovery User's Guide*	Database instances
B*nnn*	ASM Blocking Worker Process for GMON	Performs maintenance actions on Oracle ASM disk groups	B*nnn* performs actions that require waiting for resources on behalf of GMON. GMON must be highly available and cannot wait. A B*nnn* worker is spawned when a disk is taken offline in an Oracle ASM disk group. Offline timer processing and drop of the disk are performed in this worker. Up to five process (B000 to B004) can exist depending on the load.	Oracle ASM instances
BW*nn*	Database Writer Process	Writes modified blocks from the database buffer cache to the data files	See the **Long Description** for the DBW*n* process in this table for more information about the BW*nn* process.	Database instances
CJQ0	Job Queue Coordinator Process	Selects jobs that need to be run from the data dictionary and spawns job queue worker processes (J*nnn*) to run the jobs	CJQ0 is automatically started and stopped as needed by Oracle Scheduler. The `JOB_QUEUE_PROCESSES` initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. CJQ0 starts only as many job queue processes as required by the number of jobs to run and available resources. **See Also:** *Oracle Database Concepts* and *Oracle Database Administrator's Guide*	Database instances
CKPT	Checkpoint Process	Signals DBW*n* at checkpoints and updates all the data files and control files of the database to indicate the most recent checkpoint	At specific times CKPT starts a checkpoint request by messaging DBW*n* to begin writing dirty buffers. On completion of individual checkpoint requests, CKPT updates data file headers and control files to record most recent checkpoint. CKPT checks every three seconds to see whether the amount of memory exceeds the value of the `PGA_AGGREGATE_LIMIT` initialization parameter, and if so, takes the action described in "PGA_AGGREGATE_LIMIT". **See Also:** *Oracle Database Concepts*	Database instances, Oracle ASM instances
CL*nn*	Cleanup Worker Process	Performs cleanup of terminated processes	Cleanup workers assist in the cleanup of terminated processes and terminated sessions. The number of workers will be proportional to the amount of cleanup work to be done and the current efficiency of cleanup.	Database instances, Oracle ASM instances
CLG	Persistent Cluster Flash Cache Background Process	For Oracle Data Appliance only, this process performs actions related to recovery of a terminated instance's database flash cache	For Oracle Data Appliance only, in the event of an instance crash, the running instance will recover the crashed instance's database flash cache. The CLG process will perform actions related to scanning the crashed instance's database flash cache and claim flash blocks mastered by the crashed instance.	Database instances, Oracle RAC

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
CLMN	Cleanup Main Process	Performs cleanup of terminated processes, terminated sessions, terminated transactions, and terminated network connections	CLMN periodically performs cleanup of all the following: terminated processes, terminated sessions, transactions, network connections, idle sessions, detached transactions, and detached network connections that have exceeded their idle timeout.	Database instances, Oracle ASM instances
CP*nn*	Replication Capture Process	Captures database changes from the redo log by using the infrastructure of LogMiner	The capture process name is CP*nn*, where *nn* can include letters and numbers. The underlying LogMiner process name is MS*nn*, where *nn* can include letters and numbers. The capture process includes one reader server that reads the redo log and divides it into regions, one or more preparer servers that scan the redo log, and one builder server that merges redo records from the preparer servers. Each reader server, preparer server, and builder server is a process. Query the `V$XSTREAM_CAPTURE` and `V$GOLDENGATE_CAPTURE` views for information about this background process. **See Also:***Oracle Database XStream Guide*	Database instances, XStream Outbound Servers
CR*nn*	LMS CR Worker Process	Offloads the work from LMS so that blocks that require lots of UNDO to be applied do not block the LMS. Such requests are passed on to the worker so that the LMS is not stalled	There can be a maximum of eight CR processes per LMS process, with names from CR00 to CR07. Each LMS has its own set with similar name. The CR*nn* processes are threads and the process ID part will be the same as the owning LMS's process ID. The names for CRnn processes will have the format CR0*n*_<spawning process id>_<thread id>.	Oracle RAC
CS*nn*	I/O Calibration Process	Issues I/Os to storage as part of storage calibration.	CS*nn* worker processes are started on execution of the `DBMS_RESOURCE_MANAGER.CALIBRATE_IO()` procedure. There is one worker process per CPU on each node of the database.	Database instances, Oracle RAC
CTWR	Change Tracking Writer Process	Tracks changed data blocks as part of the Recovery Manager block change tracking feature	CTWR tracks changed blocks as redo is generated at a primary database and as redo is applied at a standby database. The process is slightly different depending on the type of database. **See Also:** *Oracle Database Backup and Recovery User's Guide*	Database instances
CX*nn*	Replication Capture Worker Process	Sends captured LCRs to a receiver, such as an XStream Outbound Server	The capture worker process name is CX*nn*, where *nn* can include letters and numbers.	Database instances, XStream Outbound Server
DBRM	Database Resource Manager Process	Sets resource plans and performs other tasks related to the Database Resource Manager	If a resource plan is not enabled, then this process is idle. **See Also:** *Oracle Database Administrator's Guide*	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
DBW*n*	Database Writer Process	Writes modified blocks from the database buffer cache to the data files	The primary responsibility of the Database Writer Process is to write data blocks to disk. It also handles checkpoints, file open synchronization, and logging of Block Written records. In many cases the blocks that the Database Writer Process writes are scattered throughout the disk. Thus, the writes tend to be slower than the sequential writes performed by LGWR. The Database Writer Process performs multiblock writes when possible to improve efficiency. The number of blocks written in a multiblock write varies by operating system. The `DB_WRITER_PROCESSES` initialization parameter specifies the number of Database Writer Processes. There can be 1 to 100 Database Writer Processes. The names of the first 36 Database Writer Processes are DBW0-DBW9 and DBWa-DBWz. The names of the 37th through 100th Database Writer Processes are BW36-BW99. The database selects an appropriate default setting for the `DB_WRITER_PROCESSES` parameter or adjusts a user-specified setting based on the number of CPUs and processor groups. **See Also**: "DB_WRITER_PROCESSES"	Database instances
DIA0	Diagnostic Process	Detects and resolves hangs and deadlocks		Database instances, Oracle ASM instances
DIAG	Diagnostic Capture Process	Performs diagnostic dumps	DIAG performs diagnostic dumps requested by other processes and dumps triggered by process or instance termination. In Oracle RAC, DIAG performs global diagnostic dumps requested by remote instances.	Database instances, Oracle ASM instances
DM*nn*	Data Pump Control Job Process	Coordinates the Data Pump job tasks performed by Data Pump worker processes and handles client interactions	The Data Pump control job process is started during job creation and coordinates all tasks performed by the Data Pump job. It handles all client interactions and communication, establishes all job contexts, and coordinates all worker process activities on behalf of the job.	Database instances, Data Pump

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
DMON	Data Guard Broker Monitor Process	Manages and monitors a database that is part of a Data Guard broker configuration	When you start the Data Guard broker, a DMON process is created. DMON runs for every database instance that is managed by the broker. DMON interacts with the local database and the DMON processes of the other databases to perform the requested function. DMON also monitors the health of the broker configuration and ensures that every database has a consistent description of the configuration. DMON maintains profiles about all database objects in the broker configuration in a binary configuration file. A copy of this file is maintained by the DMON process for each of the databases that belong to the broker configuration. The process is created when the `DG_BROKER_START` initialization parameter is set to `true`. **See Also:** *Oracle Data Guard Broker*	Database instances, Data Guard
D*nnn*	Dispatcher Process	Performs network communication in the shared server architecture	In the shared server architecture, clients connect to a dispatcher process, which creates a virtual circuit for each connection. When the client sends data to the server, the dispatcher receives the data into the virtual circuit and places the active circuit on the common queue to be picked up by an idle shared server. The shared server then reads the data from the virtual circuit and performs the database work necessary to complete the request. When the shared server must send data to the client, the server writes the data back into the virtual circuit and the dispatcher sends the data to the client. After the shared server completes the client request, the server releases the virtual circuit back to the dispatcher and is free to handle other clients. Several initialization parameters relate to shared servers. The principal parameters are: `DISPATCHERS`, `SHARED_SERVERS`, `MAX_SHARED_SERVERS`, `LOCAL_LISTENER`, `REMOTE_LISTENER`. **See Also:** *Oracle Database Concepts*	Database instances, shared servers
DSKM	Worker Diskmon Process	Acts as the conduit between the database, Oracle ASM instances, and the Primary Diskmon daemon to communicate information to Exadata storage	This process is active only if Exadata Storage is used. DSKM performs operations related to Exadata I/O fencing and Exadata cell failure handling.	Oracle ASM instances, Exadata
DW*nn*	Data Pump Worker Process	Performs Data Pump tasks as assigned by the Data Pump control job process	The Data Pump worker process is responsible for performing tasks that are assigned by the Data Pump control job process, such as the loading and unloading of metadata and data.	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
EMNC	EMON Coordinator Process	Coordinates database event management and notifications	EMNC is a primary background process that coordinates event management and notification activity in the database, including Streams Event Notifications, Continuous Query Notifications, and Fast Application Notifications.	Database instances
E*nnn*	EMON Worker Process	Performs database event management and notifications	The database event management and notification load is distributed among the EMON worker processes. These processes work on the system notifications in parallel, offering a capability to process a larger volume of notifications, a faster response time, and a lower shared memory use for staging notifications.	Database instances
FBDA	Flashback Data Archiver Process	Archives historical rows for tracked tables into flashback data archives and manages archive space, organization, and retention	When a transaction that modifies a tracked table commits, FBDA stores the pre-image of the rows in the archive. FBDA maintains metadata on the current rows and tracks how much data has been archived. FBDA is also responsible for automatically managing the flashback data archive for space, organization (partitioning tablespaces), and retention. FBDA also keeps track of how far the archiving of tracked transactions has progressed. **See Also:** *Oracle Database Development Guide*	Database instances
FD*nn*	Oracle ASM Stale FD Cleanup Worker Process	Cleans up Oracle ASM stale file descriptors on foreground processes	This process cleans up Oracle ASM stale file descriptors on foreground processes if an Oracle ASM disk is globally closed.	Database and Oracle ASM instances
FENC	Fence Monitor Process	Processes fence requests for RDBMS instances which are using Oracle ASM instances	CSS monitors RDBMS instances which are connected to the Oracle ASM instance and constantly doing I/Os. When the RDBMS instance terminates due to a failure, all the outstanding I/O's from the RDBMS instance should be drained and any new I/O's rejected. FENC receives and processes the fence request from CSSD.	Oracle ASM instances
FMON	File Mapping Monitor Process	Manages mapping information for the Oracle Database file mapping interface	The `DBMS_STORAGE_MAP` package enables you to control the mapping operations. When instructed by the user, FMON builds mapping information and stores it in the SGA, refreshes the information when a change occurs, saves the information to the data dictionary, and restores it to the SGA at instance startup. FMON is started by the database whenever the `FILE_MAPPING` initialization parameter is set to `true`.	Database instances, Oracle ASM instances
FSFP	Data Guard Broker Fast Start Failover Pinger Process	Maintains fast-start failover state between the primary and target standby databases	FSFP is created when fast-start failover is enabled.	Database instances, Data Guard
GCR*n*	Global Conflict Resolution Worker Process	Performs synchronous tasks on behalf of LMHB	GCR*n* processes are transient worker processes that are started and stopped as required by LMHB to perform synchronous or resource intensive tasks.	Database instances, Oracle ASM instances, Oracle RAC

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
GCW*n*	GCR Monitor processes (LMHB)	GCR(DRF) monitor processes (LMHB)	Infrastructure helper processes for LMHB. Monitors the LMHB process for stalls, and restarts if necessary.	Database instances, Oracle ASM instances, Oracle RAC instances (prior to Oracle Database 23ai only)
GEN0	General Task Execution Process	Performs required tasks including SQL and DML		Database instances, Oracle ASM instances, Oracle ASM Proxy instances
GMON	ASM Disk Group Monitor Process	Monitors all mounted Oracle ASM disk groups	GMON monitors all the disk groups mounted in an Oracle ASM instance and is responsible for maintaining consistent disk membership and status information. Membership changes result from adding and dropping disks, whereas disk status changes result from taking disks offline or bringing them online.	Oracle ASM instances
GTX*n*	Global Transaction Process	Provides transparent support for XA global transactions in an Oracle RAC environment	These processes help maintain the global information about XA global transactions throughout the cluster. Also, the processes help perform two-phase commit for global transactions anywhere in the cluster so that an Oracle RAC database behaves as a single system to the externally coordinated distributed transactions. The `GLOBAL_TXN_PROCESSES` initialization parameter specifies the number of GTX*n* processes, where *n* is 0-9 or a-j. The database automatically tunes the number of these processes based on the workload of XA global transactions. You can disable these processes by setting the parameter to 0. If you try to run XA global transactions with these processes disabled, an error is returned. **See Also:** *Oracle Real Application Clusters Administration and Deployment Guide*	Database instances, Oracle RAC
I*nnn*	Disk and Tape I/O Worker Process	Serves as an I/O worker process spawned on behalf of DBWR, LGWR, or an RMAN backup session	I/O worker process can be configured on platforms where asynchronous I/O support is not available. These workers are started by setting the corresponding worker enable parameter in the server parameter file. The I/O workers simulate the asynchronous I/O behavior when the underlying platform does not have native support for asynchronous I/O.	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
IMCO	In-Memory Coordinator	Initiates background population and repopulation of in-memory enabled objects	The IMCO background process initiates population (prepopulation) of in-memory enabled objects with priority LOW/MEDIUM/HIGH/CRITICAL. In-memory enabled objects with priority NONE will not be prepopulated but will be populated on demand via W*nnn* processes when queried. The IMCO background process can also initiate repopulation of in-memory objects. Starting with Oracle Database 19c, IMXT (In-Memory External Table) segments are dropped by the IMCO background process. In previous releases, IMXT segments were dropped by foreground processes.	Database instances
IMR0	Instance Membership Recovery Worker Process	Performs synchronous tasks on behalf of LMON	The IMR0 background process performs the Instance Member Recovery synchronous operations on behalf of LMON	Oracle RAC, Database instances, Oracle ASM instances
INSV	Data Guard Broker Instance Worker Process	Performs Data Guard broker communication among instances in an Oracle RAC environment	INSV is created when the `DG_BROKER_START` initialization parameter is set to `true`.	Database instances, Data Guard
IPC0	IPC Service Background Process	Common background server for basic messaging and RDMA primitives based on IPC (Inter-process communication) methods.	IPC0 handles very high rates of incoming connect requests, as well as, completing reconfigurations to support basic messaging and RDMA primitives over several transports such as UDP, RDS, InfiniBand and RC.	Oracle RAC
IR*nn*	Text Index Asynchronous Maintenance	Performs deferred DML maintenance for all Text Indexes in the instance	The IR*nn* (Information Retrieval) processes perform deferred DML maintenance for all Text Indexes in the instance. They perform all stages of index sync and index optimization. These worker processes are shared across all Text indexes and index partitions for all PDBs. The processes are usually initiated as a result of a `COMMIT` after a DML on a table with a Text Index.	Database instances
J*nnn*	Job Queue Worker Process	Executes jobs assigned by the job coordinator	Job worker processes are created or awakened by the job coordinator when it is time for a job to be executed. Job workers gather all the metadata required to run the job from the data dictionary. The worker processes start a database session as the owner of the job, execute triggers, and then execute the job. After the job is complete, the worker processes commit and then execute appropriate triggers and close the session. The worker can repeat this operation in case additional jobs need to be run.	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
JP*n*	Java Patching Worker Process	Patches and updates the Java in the database classes	JP*n* patches and updates the Java in the database classes. It is only started for Oracle Real Application Clusters (Oracle RAC) databases, and one of the database instances is responsible for patching the Java in the database objects. For mulitenant container databases (CDBs), the process updates each pluggable database (PDB) individually. JP*n* is started automatically and does not require user intervention.	Oracle RAC
LCK*n*	Lock Process	Manages global enqueue requests and cross-instance broadcasts	The process handles all requests for resources other than data blocks. For examples, LCK*n* manages library and row cache requests. Possible processes are LCK0 and LCK1.	Database instances, Oracle ASM instances, Oracle RAC
LDD*n*	Global Enqueue Service Daemon Helper Worker	Helps the LMD*n* processes with various tasks	LDD*n* processes are worker processes spawned on demand by LMD*n* processes. They are spawned to help the dedicated LMD*n* processes with various tasks when certain workloads start creating performance bottlenecks. These worker processes are transient as they are started on demand and they can be shutdown when no longer needed. There can be up to 36 of these worker processes (LDD0-LDDz).	Database instances, Oracle ASM instances, Oracle RAC
LG*nn*	Log Writer Worker	Writes redo log	On multiprocessor systems, LGWR creates worker processes to improve the performance of writing to the redo log. LGWR workers are not used when there is a SYNC standby destination. Possible processes are LG00-LG99.	Database instances
LGWR	Log Writer Process	Writes redo entries to the online redo log	Redo log entries are generated in the redo log buffer of the system global area (SGA). LGWR writes the redo log entries sequentially into a redo log file. If the database has a multiplexed redo log, then LGWR writes the redo log entries to a group of redo log files. **See Also:** *Oracle Database Concepts* and *Oracle Database Administrator's Guide*	Database instances, Oracle ASM instances
LM*nn*	**See** LMSn, LMnn			
LMD*n*	Global Enqueue Service Daemon Process	Manages incoming remote resource requests from other instances	LMD*n* processes enqueue resources managed under Global Enqueue Service. In particular, they process incoming enqueue request messages and control access to global enqueues. They also perform distributed deadlock detections. There can be up to 36 of these processes (LMD0-LMDz).	Database instances, Oracle ASM instances, Oracle RAC
LMFC	Lock Manager Flash Cache Process	For Oracle Database Appliance only, performs actions related to recovery of a terminated instance's database flash cache.	For Oracle Database Appliance only, in the event of a instance crash, the running instance will recover the crashed instance's database flash cache. The LMFC process will perform actions related to scanning the crashed instance's database flash cache and claim flash blocks mastered by the crashed instance.	Database instances, Oracle RAC
LMHB	Global Cache/ Enqueue Service Heartbeat Monitor	Monitor the heartbeat of several processes	LMHB monitors the CKPT, DIA*n*, LCK*n*, LG*nn*, LGWR, LMD*n*, LMON, LMS*n* , and RMS*n* processes to ensure they are running normally without blocking or spinning.	Database instances, Oracle ASM instances, Oracle RAC

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
LMON	Global Enqueue Service Monitor Process	Monitors an Oracle RAC cluster to manage global resources	LMON maintains instance membership within Oracle RAC. The process detects instance transitions and performs reconfiguration of GES and GCS resources. **See Also:** *Oracle Real Application Clusters Administration and Deployment Guide*	Database instances, Oracle ASM instances, Oracle RAC
LMS*n*, LM*nn*	Global Cache Service Process	Manages resources and provides resource control among Oracle RAC instances	LMS*n* and LM*nn* processes maintain a lock database for Global Cache Service (GCS) and buffer cache resources. These processes receive, process, and send GCS requests, block transfers, and other GCS-related messages. There can be up to 100 of these processes, named as follows: LMS0-LMS9 LMSA-LMSZ LM10-LM19 LM1A-LM1Z LM20-LM29 LM2A-LM2R **See Also:** *Oracle Real Application Clusters Administration and Deployment Guide*	Database instances, Oracle ASM instances, Oracle RAC
LREG	Listener Registration Process	Registers the instance with the listeners	LREG notifies the listeners about instances, services, handlers, and endpoint.	Database instances, Oracle ASM instances, Oracle RAC
LSP0	Logical Standby Coordinator Process	Schedules transactions for Data Guard SQL Apply	LSP0 is the initial process created upon startup of Data Guard SQL Apply. In addition to managing LogMiner and Apply processes, LSP0 is responsible for maintaining inter-transaction dependencies and appropriately scheduling transactions with applier processes. LSP0 is also responsible for detecting and enabling run-time parameter changes for the SQL Apply product as a whole.	Database instances, Data Guard
LSP1	Logical Standby Dictionary Build Process	Performs a logical standby dictionary build on a primary database	The LSP1 process is spawned on a logical standby database that is intended to become the new primary database. A logical standby database becomes a primary database because of switchover or failover. The dictionary is necessary for logical standby databases to interpret the redo of the new primary database.	Database instances, Data Guard
LSP2	Logical Standby Set Guard Process	Determines which database objects will be protected by the database guard	The LSP2 process is created as needed during startup of SQL Apply to update the list of objects that are protected by the database guard.	Database instances, Data Guard

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
L*nnn*	Pooled Server Process	Handles client requests in Database Resident Connection Pooling	In Database Resident Connection Pooling, clients connect to a connection broker process. When a connection becomes active, the connection broker hands off the connection to a compatible pooled server process. The pooled server process performs network communication directly on the client connection and processes requests until the client releases the server. After being released, the connection is returned to the broker for monitoring, leaving the server free to handle other clients. **See Also:** *Oracle Database Concepts*	Database instances, Database Resident Connection Pooling
MARK	Mark AU for Resynchronization Coordinator Process	Marks ASM allocation units as stale following a missed write to an offline disk	MARK essentially tracks which extents require resynchronization for offline disks. This process runs in the database instance and is started when the database instance first begins using the Oracle ASM instance. If required, MARK can also be started on demand when disks go offline in the Oracle ASM redundancy disk group.	Database instances, Oracle ASM instances
MMAN	Memory Manager Process	Serves as the instance memory manager	This process performs the resizing of memory components on the instance.	Database instances, Oracle ASM instances
MMNL	Manageability Monitor Lite Process	Performs tasks relating to manageability, including active session history sampling and metrics computation	MMNL performs many tasks relating to manageability, including session history capture and metrics computation.	Database instances, Oracle ASM instances
MMON	Manageability Monitor Process	Performs or schedules many manageability tasks	MMON performs many tasks related to manageability, including taking Automatic Workload Repository snapshots and performing Automatic Database Diagnostic Monitor analysis.	Database instances, Oracle ASM instances
M*nnn*	Shared MMON Worker Process	Performs manageability tasks on behalf of MMON	The M*nnn* processes are a pool of worker processes that can be shared by multiple MZ*nn* processes. See the **Long Description** for MZ*nn* in this table for more information about the MZ*nn* processes.	Database instances, Oracle ASM instances
MRP0	Managed Standby Recovery Process	Coordinates the application of redo on a physical standby database	MRP0 is spawned at the start of redo apply on a physical standby database. This process handles the extraction of redo and coordinates the application of that redo on a physical standby database. **See Also:** *Oracle Data Guard Concepts and Administration*	Database instances, Data Guard
MS*nn*	LogMiner Worker Process	Reads redo log files and translates and assembles into transactions	Multiple MS*nn* processes can exists, where *n* is 0-9 or a-Z. A minimum of three MS*nn* processes work as a group to provide transactions to a LogMiner client, for example, a logical standby database or a database capture. There may be more than one such group, for example, multiple capture processes configured for either local or downstream capture in a database.	Database instances, Logical Standby, XStream Outbound servers, Oracle GoldenGate

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
MZ*nn*	Dedicated MMON Worker Process	Performs manageability tasks on behalf of MMON	MZ*nn* is a dedicated process for a single MMON worker action. It performs manageability tasks dispatched by MMON, which include taking Automatic Workload Repository snapshots and performing Automatic Database Diagnostic Monitor analysis.	Database instances, Oracle ASM instances
N*nnn*	Connection Broker Process	Monitors idle connections and hands off active connections in Database Resident Connection Pooling	In Database Resident Connection Pooling, clients connect to a connection broker process. When a connection becomes active, the connection broker hands off the connection to a compatible pooled server process. The pooled server process performs network communication directly on the client connection and processes requests until the client releases the server. After being released, the connection is returned to the broker for monitoring, leaving the server free to handle other clients. **See Also:** *Oracle Database Concepts*	Database instances, Database Resident Connection Pooling
NFS*n*	Direct NFS Dispatcher IO Worker Process	Performs direct NFS I/O for database processes	The dispatcher worker processes enable scaling of Direct NFS connections to a clustered NAS storage. These dedicated set of workers will be used to perform Direct NFS I/Os on behalf of database processes. The dispatcher processes are enabled by the `ENABLE_DNFS_DISPATCHER` initialization parameter. NFSn is spawned only if Direct NFS library is enabled for I/O to NFS servers. The number of worker processes spawned is based on the `CPU_COUNT` value. **See Also:** "ENABLE_DNFS_DISPATCHER"	Database instances
NSS*n*	Network Server SYNC Process	Transfers redo from current online redo logs to remote standby destinations configured for SYNC transport	NSS*n* can run as multiple processes, where *n* is 1-9 or A. **See Also:** *Oracle Data Guard Concepts and Administration*	Database instances, Data Guard
NSV*n*	Data Guard Broker NetSlave Process	Performs broker network communications between databases in a Data Guard environment	NSV*n* is created when a Data Guard broker configuration is enabled. There can be as many NSV*n* processes (where *n* is 0- 9 and A-U) created as there are databases in the Data Guard broker configuration.	Database instances, Data Guard
OCF*n*	ASM CF Connection Pool Process	Maintains a connection to the Oracle ASM instance for metadata operations		Database instances, Oracle ASM instances
OFSD	Oracle File Server Background Process	Serves file system requests submitted to an Oracle instance	This background process listens for new file system requests, both management (like mount, unmount, and export) and I/O requests, and executes them using Oracle threads.	Database instances, Oracle RAC
OF*nn*	Oracle File Server Background Process Thread	Serves file system requests submitted to an Oracle instance	This is a thread for the OFSD background process This background process thread is available only on Linux systems.	Database instances, Oracle RAC

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
O*nnn*	ASM Connection Pool Process	Maintains a connection to the Oracle ASM instance for metadata operations	O*nnn* worker processes are spawned on demand. These processes communicate with the Oracle ASM instance.	Database instances, Oracle ASM instances
PING	Interconnect Latency Measurement Process	Assesses latencies associated with communications for each pair of cluster instances	Every few seconds, the process in one instance sends messages to each instance. The message is received by PING on the target instance. The time for the round trip is measured and collected.	Database instances, Oracle ASM instances, Oracle RAC
PMAN	Process Manager	Manages several background processes including shared servers, pooled servers, and job queue processes	PMAN monitors, spawns, and stops the following as needed: • dispatcher and shared server processes • connection broker and pooled server processes for database resident connection pools • job queue processes • restartable background processes	Database instances, Oracle ASM instances, Oracle ASM Proxy instances
PMON	Process Monitor	Scans for terminated processes and coordinates cleanup	PMON periodically scans all processes to find any that have terminated in a nonstandard way. PMON is then responsible for coordinating cleanup performed by the CLMN process and the CL*nn* workers. **See Also:** *Oracle Database Concepts* and *Oracle Database Net Services Administrator's Guide*	Database instances, Oracle ASM instances, Oracle ASM Proxy instances
P*nnn*	Parallel Query Worker Process	Perform parallel execution of a SQL statement (query, DML, or DDL)	Parallel Query has two components: a foreground process that acts as query coordinator and a set of parallel workers (P*nnn*) that are background processes. These background processes are spawned or reused during the start of a parallel statement. They receive and perform units of work sent from the query coordinator. The maximum number of P*nnn* processes is controlled by the initialization parameter `PARALLEL_MAX_SERVERS`. Worker processes are numbered from 0 to the `PARALLEL_MAX_SERVERS` setting. If the query is a `GV$` query, then these background processes are numbered backward, starting from PPA7.	Database instances, Oracle ASM instances
PR*nn*	Parallel Recovery Process	Performs tasks assigned by the coordinator process performing parallel recovery	PR*nn* serves as a worker process for the coordinator process performing parallel media recovery and carries out tasks assigned by the coordinator. The default number of these processes is based on number of CPUs.	Database instances
PSP0	Process Spawner Process	Spawns Oracle background processes after initial instance startup		Database instances, Oracle ASM instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
PXMN	Parallel Execution Monitor	Spawns parallel server processes on local instances in an Oracle RAC environment for Query Coordinator in remote instances.		Database instances
QMNC	Non-sharded queue primary process	Monitors AQ	QMNC is the non-sharded queue primary process responsible for facilitating various background activities required by AQ: time management of messages, management of nonpersistent queues, cleanup of resources, and so on. QMNC dynamically spawns Q*nnn* processes as needed for performing these tasks. Note that if the `AQ_TM_PROCESSES` initialization parameter is set to 0, this process will not start. The database writes the following message to the alert log: `WARNING: AQ_TM_PROCESSES is set to 0. System might be adversely affected.`	Database instances Advanced Queueing
QM*nn*	AQ Primary Class Process	Per instance per AQ Primary Class Process	Each of this type of process represents a single class of work item such as AQ notification, queue monitors, and cross process.	Database instances Advanced Queueing
Q*nnn*	AQ Server Class Process	Per AQ Primary Class server process	Each server class process acts on behalf of an AQ primary class process. This relationship is maintained until the primary requires services of a particular service process. Once released, the server class processes are moved to a free server pool.	Database instances Advanced Queueing
R*nnn*	ASM Block Remap Worker Process	Remaps a block with a read error	A database instance reading from an Oracle ASM disk group can encounter an error during a read. If possible, Oracle ASM asynchronously schedules a R*nnn* worker process to remap this bad block from a mirror copy.	Oracle ASM instances
RBAL	ASM Rebalance Primary Process	Coordinates rebalance activity	In an Oracle ASM instance, it coordinates rebalance activity for disk groups. In a database instance, it manages Oracle ASM disk groups.	Database instances, Oracle ASM instances
RCBG	Result Cache Background Process	Handles result cache messages	This process is used for handling invalidation and other messages generated by server processes attached to other instances in Oracle RAC.	Database instances, Oracle RAC
RECO	Recoverer Process	Resolves distributed transactions that are pending because of a network or system failure in a distributed database	RECO uses the information in the pending transaction table to finalize the status of in-doubt transactions. At timed intervals, the local RECO attempts to connect to remote databases and automatically complete the commit or rollback of the local portion of any pending distributed transactions. All transactions automatically resolved by RECO are removed from the pending transaction table. **See Also:** *Oracle Database Concepts* and *Oracle Database Net Services Administrator's Guide*	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
RL*nn*	ResetLogs Process	Clear online redo logs when performing open resetlogs and converting to physical standby	RL*nn* processes are spawned to clear online redo logs. These workers are terminated after the online redo logs are cleared, and the session does not persist. Possible processes are RL00-RL31.	Database instances
RM	RAT Masking Worker Process	Extracts and masks bind values from workloads like SQL tuning sets and DB Replay capture files	This background process is used with Data Masking and Real Application Testing.	Database instances
RMON	Rolling Migration Monitor Process	Manages the rolling migration procedure for an Oracle ASM cluster	The RMON process is spawned on demand to run the protocol for transitioning an ASM cluster in and out of rolling migration mode.	Oracle ASM instance, Oracle RAC
RMS*n*	Oracle RAC Management Process	Performs manageability tasks for Oracle RAC	RMS*n* performs a variety of tasks, including creating resources related to Oracle RAC when new instances are added to a cluster. **See Also:** *Oracle Real Application Clusters Administration and Deployment Guide*	Database instances, Oracle RAC
RP*nn*	Capture Processing Worker Process	Processes a set of workload capture files	RP*nn* are worker processes spawned by calling `DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE(capture_dir,parallel_level)`. Each worker process is assigned a set of workload capture files to process. Worker processes execute in parallel without needing to communicate with each other. After each process is finished processing its assigned files, it exits and informs its parent process. The number of worker processes is controlled by the `parallel_level` parameter of `DBMS_WORKLOAD_REPLAY.PROCESS_CAPTURE`. By default, `parallel_level` is null. Then, the number of worker processes is computed as follows: `SELECT VALUE FROM V$PARAMETER WHERE NAME='cpu_count';` When `parallel_level` is `1`, no worker processes are spawned.	Database instances
RPOP	Instant Recovery Repopulation Daemon	Responsible for re-creating and/or repopulating data files from snapshot files and backup files	The RPOP process is responsible for re-creating and repopulating data files from snapshots files. It works with the instant recovery feature to ensure immediate data file access. The local instance has immediate access to the remote snapshot file's data, while repopulation of the recovered primary data files happens concurrently. Any changes in the data are managed between the instance's DBW processes and RPOP to ensure the latest copy of the data is returned to the user.	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
RS*nn*	Global Cache Service Remaster Process	Performs remastering for cluster reconfiguration and dynamic remastering	Each RS*nn* process is a worker process for LMS*n* to handle remastering work. They are also helper processes for LMS to handle non-critical work from global cache service. The RS*nn* processes were named RMV*n* in Oracle Database 12c and earlier releases.	Database instances, Oracle RAC
RSM0	Data Guard Broker Worker Process	Performs monitoring management tasks related to Data Guard on behalf of DMON	The process is created when a Data Guard broker configuration is enabled.	Database instances, Data Guard
RSMN	Remote Worker Monitor Process	Manages background worker process creation and communication on remote instances in Oracle RAC	This background process manages the creation of worker processes and the communication with their coordinators and peers. These background worker processes perform tasks on behalf of a coordinating process running in another cluster instance.	Database instances, Oracle RAC
RVWR	Recovery Writer Process	Writes flashback data to the flashback logs in the fast recovery area	RVWR writes flashback data from the flashback buffer in the SGA to the flashback logs. RVWR also creates flashback logs and performs some tasks for flashback log automatic management.	Database instances, Flashback Database
S*nnn*	Shared Server Process	Handles client requests in the shared server architecture	In the shared server architecture, clients connect to a dispatcher process, which creates a virtual circuit for each connection. When the client sends data to the server, the dispatcher receives the data into the virtual circuit and places the active circuit on the common queue to be picked up by an idle shared server. The shared server then reads the data from the virtual circuit and performs the database work necessary to complete the request. When the shared server must send data to the client, the server writes the data back into the virtual circuit and the dispatcher sends the data to the client. After the shared server completes the client request, the server releases the virtual circuit back to the dispatcher and is free to handle other clients. Several initialization parameters relate to shared servers. The principal parameters are: `DISPATCHERS`, `SHARED_SERVERS`, `MAX_SHARED_SERVERS`, `LOCAL_LISTENER`, `REMOTE_LISTENER`. **See Also:** *Oracle Database Concepts*	Database instances, shared servers
SA*nn*	SGA Allocator	Allocates SGA	A small fraction of SGA is allocated during instance startup. The SA*nn* process allocates the rest of SGA in small chunks. The process exits upon completion of SGA allocation. Possible processes are SA00-SAzz.	Database instances
SCC*n*	ASM Disk Scrubbing Worker Check Process	Performs Oracle ASM disk scrubbing check operation	SCC*n* acts as a worker process for SCRB and performs the checking operations. Possible processes are SCC0-SCC9.	Oracle ASM instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
SCM0	DLM Statistics Collection and Management Worker	Collects and manages statistics related to global enqueue service (GES) and global cache service (GCS)	The DLM Statistics Collection and Management worker (SCM0) is responsible for collecting and managing the statistics related to global enqueue service (GES) and global cache service (GCS). This worker exists only if DLM statistics collection is enabled.	Database instances
SCMN	Statistics Collection and Management	Main thread for a multithreaded process in a threaded Oracle RAC architecture	All other threads are spawned within the processes through SCMN, based on the requests in the instance. SCMN is an idle main thread, which waits for any requests, especially spawn threads, and takes care of them, along with performing periodic maintenance operations.	Oracle RAC
SCRB	ASM Disk Scrubbing Primary Process	Coordinates Oracle ASM disk scrubbing operations	SCRB runs in an Oracle ASM instance and coordinates Oracle ASM disk scrubbing operations.	Oracle ASM instances
SCR*n*	ASM Disk Scrubbing Worker Repair Process	Performs Oracle ASM disk scrubbing repair operation	SCR*n* acts as a worker process for SCRB and performs the repairing operations. Possible processes are SCR0-SCR9.	Oracle ASM instances
SCV*n*	ASM Disk Scrubbing Worker Verify Process	Performs Oracle ASM disk scrubbing verify operation	SCV*n* acts as a worker process for SCRB and performs the verifying operations. Possible processes are SCV0-SCV9.	Oracle ASM instances
SMCO	Space Management Coordinator Process	Coordinates the execution of various space management tasks	This background process coordinates the execution of various space management tasks, including proactive space allocation and space reclamation. SMCO dynamically spawns worker processes (W*nnn*) to implement these tasks.	Database instances
SMON	System Monitor Process	Performs critical tasks such as instance recovery and terminated transaction recovery, and maintenance tasks such as temporary space reclamation, data dictionary cleanup, and undo tablespace management	SMON performs many database maintenance tasks, including the following: • Reclaims space used by orphaned temporary segments • Maintains the undo tablespace by onlining, offlining, and shrinking the undo segments based on undo space usage statistics • Cleans up the data dictionary when it is in a transient and inconsistent state • Maintains the SCN to time mapping table used to support Oracle Flashback features In an Oracle RAC database, the SMON process of one instance can perform instance recovery for other instances that have failed. SMON is resilient to internal and external errors raised during background activities. **See Also:** *Oracle Database Concepts*	Database instances
SP	SPA Exec Worker	Analyzes single SQL statements sent from SQL Performance Analyzer (SPA)	Executions of SPA tasks created from a SQL tuning set use this worker to analyze the SQL statements of the SQL tuning set concurrently.	Database instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
SVCB	Service Background Process	Provides database service run-time load balancing and topology information to clients.	Every 30 seconds the process processes and publishes run-time load-balancing information and keeps the topology information current. This process is started only if Oracle Real Application Clusters (Oracle RAC) is enabled.	Oracle RAC
TEM*n*	ASM disk Test Error Emulation Process	Emulates I/O errors on Oracle ASM disks through named events	I/O errors can be emulated on Oracle ASM disk I/O through named events. The scope can be the process, instance, or even cluster. Optionally, a set of AUs can be chosen for error emulation.	Oracle ASM instances
TT*nn*	Redo Transport Worker Process	Ships redo from current online and standby redo logs to remote standby destinations configured for ASYNC transport	TT*nn* can run as multiple processes, where *nn* is 00 to ZZ. **See Also:** *Oracle Data Guard Concepts and Administration*	Database instances, Data Guard
U*nnn*	Container process for threads	Host processes where database processes execute as threads.	U*nnn* processes are database container operating system processes where database backgrounds processes like SMON, CJQ0, and database foreground processes run. The `V$PROCESS` view lists database processes running in these container processes. These container processes are created only when the `THREADED_EXECUTION` initialization parameter is set to `TRUE`. The number of these processes vary depending on the active database processes. On a host with multiple NUMA nodes, there will be at least one U*nnn* process per NUMA node. These processes are irrecoverable processes; if any of them is terminated, it will result in instance termination. These processes exit when the instance is shut down or terminated.	Database instances
VBG*n*	Volume Background Process	Communicates between the Oracle ASM instance and the operating system volume driver	VBG*n* handles messages originating from the volume driver in the operating system and sends them to the Oracle ASM instance. VBG*n* can run as multiple processes, where *n* is 0-9.	Oracle ASM instances, Oracle ASM Proxy instances
VDBG	Volume Driver Process	Forwards Oracle ASM requests to perform various volume-related tasks	VDBG handles requests to lock or unlock an extent for rebalancing, volume resize, disk offline, add or drop a disk, force and dismount disk group to the Dynamic Volume Manager driver.	Oracle ASM instances, Oracle ASM Proxy instances
VI*nn*	Volume I/O	Route ADVM volume I/O for ASM instances on compute nodes within an Exadata	These processes handle requests for I/Os targeted at storage not locally accessible. They are used for Exadata targeted storage as well. These background processes only start when an ASM Volume is created and set up to be used. One process will start for each NUMA node on target machines. Under normal operation on non-Exadata hardware and on Exadata hardware that is not utilizing ASM volumes, these processes will not be started. There can be up to 32 VI processes, and they are named sequentially from VI00 to VI31.	Oracle ASM Proxy instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
VKRM	Virtual Scheduler for Resource Manager Process	Serves as centralized scheduler for Resource Manager activity	VKRM manages the CPU scheduling for all managed Oracle processes. The process schedules managed processes in accordance with an active resource plan.	Database instances
VKTM	Virtual Keeper of Time Process	Provides a wall clock time and reference time for time interval measurements	VKTM acts as a time publisher for an Oracle instance. VKTM publishes two sets of time: a wall clock time using a seconds interval and a higher resolution time (which is not wall clock time) for interval measurements. The VKTM timer service centralizes time tracking and offloads multiple timer calls from other clients.	Database instances, Oracle ASM instances
VMB0	Volume Membership Process	Maintains cluster membership on behalf of the Oracle ASM volume driver	This process membership in the cluster as an I/O-capable client on behalf of the Oracle ASM volume driver.	Oracle ASM instances, Oracle ASM Proxy instances
VOSD	Virtual Operating System Daemon	Executes time-bound Oracle database service actions	This process is spawned on instance startup and is responsible for executing system service actions critical for the database.	Database instances, Oracle ASM instances, Oracle RAC
VUBG	Volume drive Umbilicus Background	Relays messages between Oracle ASM instance and Oracle ASM Proxy instance that is used by ADVM (for ACFS)		Oracle ASM instances, Oracle ASM Proxy instances

Table F-1 (Cont.) Background Processes

Name	Expanded Name	Short Description	Long Description	External Properties
W*nnn*	Space Management Worker Process	Performs various background space management tasks, including proactive space allocation and space reclamation	W*nnn* worker processes perform work on behalf of Space Management and on behalf of the Oracle Database In-Memory option. • When performing work on behalf of Space Management, W*nnn* processes are worker processes dynamically spawned by SMCO to perform space management tasks in the background. These tasks include preallocating space into locally managed tablespace and SecureFiles segments based on space usage growth analysis, and reclaiming space from dropped segments. After being started, the worker acts as an autonomous agent. After it finishes task execution, it automatically picks up another task from the queue. The process terminates itself after being idle for a long time. • When performing work on behalf of the Oracle Database In-Memory option, W*nnn* processes execute tasks for population or repopulation of objects that are enabled for the In-Memory column store (IM columns store), and tasks that drop in-memory segments when an object is disabled for the IM columns store. For in-memory population and repopulation, both the IMCO background process and foreground processes will utilize W*nnn* workers. W*nnn* processes are utilized by the IMCO background process for prepopulation of in-memory enabled objects with priority LOW/MEDIUM/HIGH/CRITICAL, and for repopulation of in-memory objects. In-memory populate and repopulate tasks running on W*nnn* workers are also initiated from foreground processes in response to queries and DMLs that reference in-memory enabled objects.	Database instances
XDMG	Exadata Automation Manager	Initiates automation tasks involved in managing Exadata storage	XDMG monitors all configured Exadata cells for state changes, such as a bad disk getting replaced, and performs the required tasks for such events. Its primary tasks are to watch for when inaccessible disks and cells become accessible again, and to initiate the ASM ONLINE operation. The ONLINE operation is handled by XDWK.	Oracle ASM instances, Exadata
XDWK	Exadata Automation Manager	Performs automation tasks requested by XDMG	XDWK gets started when asynchronous actions such as ONLINE, DROP, and ADD an Oracle ASM disk are requested by XDMG. After a 5 minute period of inactivity, this process will shut itself down.	Oracle ASM instances, Exadata
X*nnn*	ASM Disk Expel Worker Process	Performs Oracle ASM post-rebalance activities	This process expels dropped disks after an Oracle ASM rebalance.	Oracle ASM instances
