Copyright © 2014, 2025, Oracle and/or its affiliates.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software, software documentation, data (as defined in the Federal Acquisition Regulation), or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs) and Oracle computer documentation or other Oracle data delivered to or accessed by U.S. Government end users are "commercial computer software," "commercial computer software documentation," or "limited rights data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, the use, reproduction, duplication, release, display, disclosure, modification, preparation of derivative works, and/or adaptation of i) Oracle programs (including any operating system, integrated software, any programs embedded, installed, or activated on delivered hardware, and modifications of such programs), ii) Oracle computer documentation and/or iii) other Oracle data, is subject to the rights and limitations specified in the license contained in the applicable contract. The terms governing the U.S. Government's use of Oracle cloud services are defined by the applicable contract for such services. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle®, Java, MySQL, and NetSuite are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Inside are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Epyc, and the AMD logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Contents

1	Introduction	
1.1	References	1
1.2	Terminology	2
2	Installation	
2.1	Prerequisites	1
2.2	Overview	1
2.2.1	Installation Strategy	1
2.2.2	SNMP Configuration	4
2.3	Verifying the Hardware Configuration	4
2.4	Installing OL8.8 and KVM	12
2.5	DSR Installation on OL8 and KVM	39
2.5.1	Installing DSR on OL8 and KVM	39
2.5.2	Creating and Installing OCDSR VMs through KVM GUI	53
2.6	Optional Features	57
3	Software Installation Procedure	
3.1	Creating DSR Guests (VMware)	1
3.1.1	Importing DSR OVA (VMware)	1
3.1.2	Configuring NOAM Guests Role Based On Resource Profile and Configure Network (VMware)	2
3.1.3	Configure Remaining DSR Guests Based on Resource Profile and Configure Network	3
3.2	Create DSR Guests (KVM/OpenStack)	4
3.2.1	Import DSR OVA (KVM/OpenStack Only)	4
3.2.2	Configure NOAM Guests Role Based on Resource Profile (KVM/OpenStack Only)	6
3.2.3	Configure Remaining DSR Guests Based on Resource Profile and Configure Network (KVM/OpenStack Only)	8
3.3	Create DSR Guests (OVM-S/OVM-M)	11
3.4	Configure Virtual Machines (OVM-S/OVM-M)	14
3.5	DSR Installation on OL7 and KVM	21
3.5.1	Install DSR on Oracle Linux/KVM	21

4 Software Installation Using HEAT Templates (OpenStack)

4.1	Prepare OpenStack Template and Environment Files	1
4.2	Create OpenStack Parameters Files	2
4.2.1	Create OpenStack Parameter File for NOAM	2
4.2.2	Create OpenStack Parameter File for Signaling	4
4.3	Deploy HEAT Templates	7

5 Application Configuration

5.1	Configure the Signaling Network Routes	36
5.2	Configure DSCP Values for Outgoing Traffic	39
5.3	Configure IP Front End	41
5.4	Configure the Desired MTU value	44
5.5	SNMP Configuration	46
5.6	Create iDIH Virtual Machines - VMware	47
5.7	Create iDIH Virtual Machines - KVM/OpenStack	48
5.8	Create iDIH Virtual Machines - OVM-S/OVM-M	54
5.9	Configure iDIH Virtual Machines Networks	60
5.10	iDIH Installation on OL7 and KVM	65
5.10.1	Install KVM	65
5.10.2	Create SDB on KVM	90
5.10.3	Attach Device (sdb) to iDIH Database VM	92
5.10.4	Fix iDIH Database Script on KVM	94
5.11	iDIH DB Installation	96
5.12	iDIH Application and Mediation Installation	98
5.13	Post iDIH Installation Configuration	99
5.13.1	Run Post Installation Scripts on iDIH VMs	99
5.13.2	Configure DSR Reference Data Synchronization for iDIH	101
5.13.3	iDIH Configuration to Configure the SSO Domain	104
5.13.4	Integrate iDIH into DSR	108
5.13.5	iDIH Configuration to Configure the Mail Server	109
5.13.6	iDIH Configuration to Configure SNMP Management Server	110
5.13.7	iDIH Configuration to Change Network Interface	112

6 Postinstallation Activities

6.1	Configure ComAgent Connections	1
6.2	Complete PCA Configuration	4
6.3	Backups and Disaster Prevention	5

6.4	Configure Port Security (KVM/OpenStack Only)	6
6.5	Enable/Disable DTLS (SCTP Diameter Connections Only)	8
6.6	Shared Secret Encryption Key Revocation (RADIUS Only)	9
6.7	DSR Performance Tuning	9
6.8	Change NOAM/SOAM Profile for Increased MP Capacity on a Virtualized Environment	9
6.9	Resolve False Alarms for DA MP and vSTP MP	9
6.10	Configuring GUI and MMI Using Label Format for FQDN/Realm	10

A Sample Network Element and Hardware Profiles

B List of Frequently Used Time Zones

C Common KVM/OpenStack Tasks

C.1	Create a Network Port	C-1
C.2	Create and Boot OpenStack Instance	C-2
C.3	Configure Networking for OpenStack Instance	C-2

D Common OVM Manager Tasks (CLI)

D.1	Set Up the Server	D-1
D.2	Server Pool	D-6

E Scale a Signaling Node

F Firewall Ports

G Application VIP Failover Options (OpenStack)

G.1	Application VIP Failover Options	G-1
G.2	Allowed Address Pairs	G-2
G.3	OpenStack Configuration Requirements	G-3
G.4	After a VM Instance has been Booted: Allowed Address Pairs	G-3
G.5	Before a VM Instance has been Booted: Allowed Address Pairs	G-4
G.6	Disable Port Security	G-5
G.7	After a VM Instance has been Booted: Port Security	G-6
G.8	Before a VM Instance has been Booted: Port Security	G-7
G.9	Managing Application Virtual IP Addresses within VM Instances	G-8

H Sample Net Rules File

I Performance Tuning Recommended

I.1	OpenStack	I-1
I.2	VMware	I-2
I.3	Multiqueue on IPFE (KVM)	I-3
I.4	Ring Buffer and txqueuelen Configuration (KVM) OL8.9	I-5
I.5	Disabling TSO GSO features for SBR server	I-7

J Example Files

J.1	Example Template File	J-1
J.2	Example Parameter File	J-1

Index

My Oracle Support

My Oracle Support (<https://support.oracle.com>) is your initial point of contact for all product support and training needs. A representative at Customer Access Support can assist you with My Oracle Support registration.

Call the Customer Access Support main number at 1-800-223-1711 (toll-free in the US), or call the Oracle Support hotline for your local country from the list at <http://www.oracle.com/us/support/contact/index.html>. When calling, make the selections in the sequence shown below on the Support telephone menu:

1. Select **2** for New Service Request.
2. Select **3** for Hardware, Networking and Solaris Operating System Support.
3. Select one of the following options:
 - For Technical issues such as creating a new Service Request (SR), select **1**.
 - For Non-technical issues such as registration or assistance with My Oracle Support, select **2**.

You are connected to a live agent who can assist you with My Oracle Support registration and opening a support ticket.

My Oracle Support is available 24 hours a day, 7 days a week, 365 days a year.

Acronyms

An alphabetized list of acronyms used in the document.

Table Acronyms

Acronym	Definition
CD	Compact Disk
DA-MP	Diameter Agent Message Processor
DSCP	Differentiated Services Code Point
DSR	Diameter Signaling Router
ESXi	Elastic Sky X Integrated
FABR	Full Address Based Resolution
iDIH	Integrated Diameter Intelligence Hub
IPFE	IP Front End
KVM	Kernel-based Virtual Machine
MP	Message Processor
NAPD	Network Architecture Planning Diagram
NE	Network Element
NOAM	Network Operation Administration and Maintenance
OS	Operating System (for example, TPD)
OVA	Open Virtualization Archive
OVM-M	Oracle VM Manager
OVM-S	Oracle VM Server
PDRA	Policy Diameter Routing Agent
PCA	Policy and Charging Application
RBAR	Range Based Address Resolution
SAN	Storage Area Network
SFTP	Secure File Transfer Protocol
SNMP	Simple Network Management Protocol
SOAM	Software Operation Administration and Maintenance
SSO	Single Sign On
TPD	Tekelec Platform Distribution
TSA	Target Set Address
VIP	Virtual IP
VM	Virtual Machine
vSTP	Virtual Signaling Transfer Point

What's New in This Guide

This section introduces the documentation updates for release 9.0.1.3.0.

Release 9.0.1.3.0 - G47539-01, November 2025

Added step 8 in the [Multiqueue on IPFE \(KVM\)](#) section to modify `ethx` interface.

1

Introduction

This document describes the procedures to install the Diameter Signaling Router (DSR) 9.0.1.0.0 and the compatible IDIH applications on a supported Cloud platform.

It is assumed that the platform-related configuration has already been done.

The audience for this document includes Oracle customers and the Software System, Product Verification, Documentation, and Customer Service including Software Operations and First Office Application groups.

1.2 Terminology

Table 1-1 Terminology

Term	Definition
Site	<p>Applicable for various applications, a site is type of place. A place is configured object that allows servers to be associated with a physical location.</p> <p>A site place allows servers to be associated with a physical site. For example, sites may be configured for Atlanta, Charlotte, and Chicago. Every server is associated with exactly one site when the server is configured.</p> <p>For the Policy and Charging DRA application, when configuring a site, only put DA-MPs and SBR MP servers in the site. Do not add NOAM, SOAM, or IPFE MPs to a site.</p>
Place Association	<p>Applicable for various applications, a Place Association is a configured object that allows places to be grouped together. A place can be a member of more than one place association.</p> <p>The Policy and Charging DRA application defines two place association types: policy binding region and Policy and Charging mated sites.</p>
Policy and Charging SBR Server Group Redundancy	<p>The Policy and Charging application use SBR server groups to store the application data. The SBR server groups support both two and three site redundancies. The server group function name is Policy and Charging SBR.</p>
Server Group Primary Site	<p>A server group primary site is a term used to represent the principle location within a SOAM or SBR server group. SOAM and SBR server groups are intended to span several sites (places). For the Policy and Charging DRA application, these sites (places) are all configured within a single Policy and Charging Mated Sites place association.</p> <p>For the Diameter custom application, these sites (places) are configured in Applications Region place association.</p> <p>The primary site may be in a different site (place) for each configured SOAM or SBR server group.</p> <p>A primary site is described as the location in which the active and standby servers reside. However, there cannot be any preferred spare servers within this location. All SOAM and SBR server groups have a primary site.</p>
Server Group Secondary Site	<p>A server group secondary site is a term used to represent location in addition to the Primary Site within a SOAM or SBR Server Group. SOAM and SBR server groups are intended to span several sites (places). For the Policy and Charging DRA application, these sites (places) are all configured within a single Policy and Charging Mated Sites place association.</p> <p>For the Diameter custom application, these sites (places) are configured in Applications Region place association.</p> <p>The secondary site may be in a different site (places) for each configured SOAM or SBR server group.</p> <p>A secondary site is described as the location in which only preferred spare servers reside. The active and standby servers cannot reside within this location. If two site redundancy is wanted, a secondary site is required for all SOAM and SBR server groups.</p>
Session Binding Repository Server Group Redundancy	<p>The DCA application may use SBR server groups to store application session data. The SBR server groups support both two and three site redundancies. The server group function name is Session and Binding Repository.</p>

Table 1-1 (Cont.) Terminology

Term	Definition
Two Site Redundancy	<p>Two site redundancy is a data durability configuration in which Policy and Charging data is unaffected by the loss of one site in a Policy and Charging Mated Sites Place Association containing two sites.</p> <p>Two site redundancy is a feature provided by server group configuration. This feature provides geographic redundancy. Some server groups can be configured with servers located in two geographically separate sites (locations). This feature ensures there is always a functioning active server in a server group even if all the servers in a single site fail.</p>

2

Installation

This section provides a brief overview of the recommended methods for installing the source release software, which is installed and running on a Cloud, to the target release software.

2.1 Prerequisites

Following are the prerequisites for installation:

- One target release DSR OVA Media
- Three iDIH OVA (Optional iDIH):
 - iDIH Application OVA
 - iDIH Oracle OVA
 - iDIH Mediation OVA

2.2 Overview

This section describes the overall strategy to follow for a single or multi-site DSR and iDIH installation. It lists the procedures required for installation with estimated times and discusses the overall installation strategy and includes an installation flowchart to determine exactly which procedures should be run for an installation. This section details the steps required to install a DSR system.

Additionally, basic firewall port information is included in the [Firewall Ports](#) section. Some procedures are cloud platform dependent and not all of these procedures are performed on cloud platforms.

2.2.1 Installation Strategy

A successful installation of DSR requires careful planning and assessment of all configuration materials and installation variables.

- An overall installation requirement is decided upon the following data:
 - The total number of sites.
 - The number of virtual machines at each site and their role(s).
 - What time zone should be used across the entire collection of DSR sites?
 - If the SNMP traps be viewed at the NOAM or if an external NMS can be used or in some cases both.
- A site survey (NAPD) is conducted with the customer to determine exact networking and site details.

Note

XMI and IMI addresses are difficult to change once configured. It is very important these addresses are well planned and not expected to change after a site is installed.

DSR currently supports the following installation strategies:

- **DSR installation without using HEAT templates**

DSR Single Site Installation Procedure Map Without Using HEAT Templates figure illustrates the overall process that each DSR installation involves. In summary, this involves creation of guests and configures each guest role based on Resource Profile and Configure Network.

Table 2-1 DSR Single Site Installation Procedure Map Without Using HEAT Templates

Sequence	VMware	KVM/OS	OVM-S/OVM-M
1	Installing DSR on OL8 and KVM		
2	Creating and Installing ODCSR VMs through KVM GUI		
3	Importing DSR OVA (VMware)		Create DSR Guests (OVM-S/OVM-M)
4	Configuring NOAM Guests Role Based On Resource Profile and Configure Network (VMware)	Configure NOAM Guests Role Based on Resource Profile (KVM/OpenStack Only)	Configure Virtual Machines (OVM-S/OVM-M)
5	Configure Remaining DSR Guests Based on Resource Profile and Configure Network	Configure Remaining DSR Guests Based on Resource Profile and Configure Network (KVM/OpenStack Only)	
6	Install DSR on Oracle Linux/KVM		
7	Create and Install DSR VMs through KVM GUI		
8	Prepare OpenStack Template and Environment Files		
9	Create OpenStack Parameter File for NOAM		
10	Create OpenStack Parameter File for Signaling		
11	Application Configuration		
12	Configure the Signaling Network Routes		
13	Configure DSCP Values for Outgoing Traffic

15	SNMP Configuration		
16	Create iDIH Virtual Machines - VMware	Create iDIH Virtual Machines - KVM/OpenStack	Create iDIH Virtual Machines - OVM-S/OVM-M
17	Configure iDIH Virtual Machines Networks		
18		Install KVM	
19		Create SDB on KVM	
20		Attach Device (sdb) to iDIH Database VM	
21		Fix iDIH Database Script on KVM	
22	iDIH DB Installation		

Table 2-1 (Cont.) DSR Single Site Installation Procedure Map Without Using HEAT Templates

Sequence	VMware	KVM/OS	OVM-S/OVM-M
23	iDIH Application and Mediation Installation		
24	Run Post Installation Scripts on iDIH VMs		
25	Configure DSR Reference Data Synchronization for iDIH		
26	iDIH Configuration to Configure the SSO Domain		
27	Integrate iDIH into DSR		
28	iDIH Configuration to Configure the Mail Server		
29	iDIH Configuration to Configure SNMP Management Server		
30	iDIH Configuration to Change Network Interface		
31	Configure ComAgent Connections		
32	Complete PCA Configuration		
33	Backups and Disaster Prevention		
34		Configure Port Security (KVM/OpenStack Only)	
35	Enable/Disable DTLS (SCTP Diameter Connections Only)		
36	Shared Secret Encryption Key Revocation (RADIUS Only)		
37	DSR Performance Tuning		
38	Change NOAM/SOAM Profile for Increased MP Capacity on a Virtualized Environment		
39	Create a Network Port		
40	Create and Boot OpenStack Instance		
41	Configure Networking for OpenStack Instance		
42	Set Up the Server		
43	Scale a Signaling Node		
44		Multiqueue on IPFE (KVM)	
45		#unique_72	

- DSR installation using HEAT templates (OpenStack)**

DSR Installation Procedure Map Using HEAT Templates figure illustrates the overall process that each DSR installation involves using the Heat Templates. It involves creation of parameter files, environment files, template files, DSR Topology Configuration xml and deploys DSR using OpenStack CLI commands.

Table 2-2 DSR Single Site Installation Procedure Map Using HEAT Templates

Sequence	Openstack Cloud Platform
1	Install DSR on Oracle Linux/KVM
2	Deploy HEAT Templates
3	Application Configuration
4	Configure the Signaling Network Routes
5	If DSCP is used, perform Configure DSCP Values for Outgoing Traffic . If not, move to next step.
6	Configure IP Front End
7	If SNMP Traps are configured, perform SNMP Configuration . If not, move to next step.
8	Configure iDIH Virtual Machines Networks

Table 2-2 (Cont.) DSR Single Site Installation Procedure Map Using HEAT Templates

Sequence	Openstack Cloud Platform
9	iDIH DB Installation
10	iDIH Application and Mediation Installation
11	Run Post Installation Scripts on iDIH VMs
12	Configure DSR Reference Data Synchronization for iDIH
13	iDIH Configuration to Configure the SSO Domain
14	Integrate iDIH into DSR
15	iDIH Configuration to Configure the Mail Server
16	iDIH Configuration to Configure SNMP Management Server
17	iDIH Configuration to Change Network Interface

2.2.2 SNMP Configuration

The network-wide plan for SNMP configuration should be finalized before DSR installation proceeds. This section provides recommendations for these decisions.

SNMP traps can originate from DSR Application Servers (NOAM, SOAM, MPs of all types) in a DSR installation.

DSR application servers can be configured to:

- Send all their SNMP traps to the NOAM by merging them from their local SOAM. All traps terminate at the NOAM and are viewable from the NOAM GUI (entire network) and the SOAM GUI (site specific). Traps are displayed on the GUI both as alarms and logged in trap history. This is the default configuration option and no changes are required for this to take effect.
- Send all their SNMP traps to an external Network Management Station (NMS). The traps are seen at the SOAM and NOAM as alarms. They are viewable at the configured NMS(s) as traps.

Application server SNMP configuration is done from the NOAM GUI at the end of DSR installation.

2.3 Verifying the Hardware Configuration

Perform the following procedure to verify hardware configuration.

1. Log in to the latest **iLOM GUI**

Figure 2-1 iLOM GUI

General Information

System Type	Rack Mount
Model	ORACLE SERVER X9-2
QPart ID	Q13719
Part Number	7601200-25889
Serial Number	2322XLD07P
RFID Serial Number	341A583DE580000000CF736
System Identifier	-
System Firmware Version	5.1.1.23
Primary Operating System	Not Available
Host Primary MAC Address	a8:69:8c:10:f5:e0
iLOM Address	10.75.132.173
iLOM MAC Address	A8:69:8C:10:F5:E2

2. Verify if the last power state of iLOM is enabled:
Go to iLOM/Web-System Management/Policy

Figure 2-2 Verify power state

ORACLE Integrated Lights Out Manager v5.1.1.23

NAVIGATION: Power, Cooling, Storage, Networking, PCI Devices, Firmware, Open Problems (0), System Log, Remote Control, Host Management, System Management, BIOS, **Policy**, Device Monitor

Policy

Configure system policies from this page. To modify a policy, select that policy, then choose Enable or Disable from the Action drop down list. [More details...](#)

Service Processor Policies

Description	Status
Auto power-on host on boot (enabling this policy disables Set host power to last power state policy)	Disabled
Set host power to last power state on boot (enabling this policy disables Auto power-on host policy)	Enabled
Set to delay host power on	Disabled
Set enhanced PCIe cooling mode policy	Disabled
Map out DIMMs with CE faults	Disabled
Immediately reset the host to map out DIMMs with excessive CE faults	Disabled
Immediately shutdown the host to clear persistent preboot	Disabled
Disable the external Host power button	Disabled

3. To reboot the server for BIOS Config, do the following:
 - a. **Turn off** the power:

Go to iLOM/System information

Figure 2-3 Turn off

ORACLE Integrated Lights Out Manager v5.1.1.23

NAVIGATION: System Information, **Summary**, Processors, Memory, Power, Cooling, Storage, Networking, PCI Devices, Firmware, Open Problems (0), System Log, Remote Control

Summary Information

View system summary information. You may also change power state and view system status and fault information. [More details...](#)

General Information

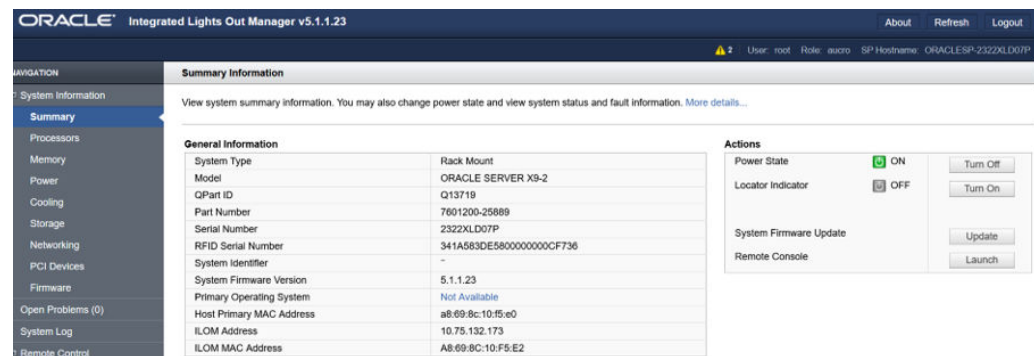

System Type	Rack Mount
Model	ORACLE SERVER X9-2
QPart ID	Q13719
Part Number	7601200-25889
Serial Number	2322XLD07P
RFID Serial Number	341A583DE580000000CF736
System Identifier	-
System Firmware Version	5.1.1.23
Primary Operating System	Not Available
Host Primary MAC Address	a8:69:8c:10:f5:e0
iLOM Address	10.75.132.173
iLOM MAC Address	A8:69:8C:10:F5:E2

Actions

Power State	OFF	Turn On
Locator Indicator	OFF	Turn On
System Firmware Update		Update
Remote Console		Launch

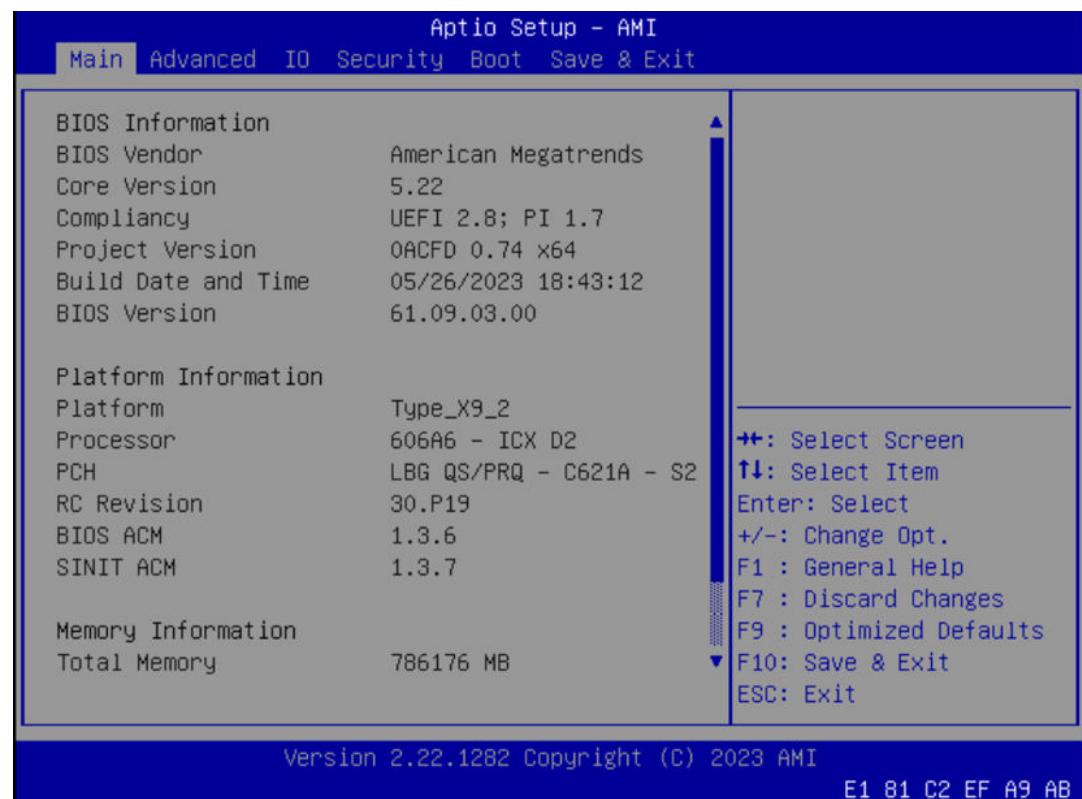

- b. Wait until the power turns off, and then Turn it on.

Figure 2-4 Turn on

4. To enable the BIOS setup, press **F2**.

Figure 2-5 F2

5. After enabling the BIOS, access the BIOS Advanced tab using the arrow key.
6. Select Intel Platform Configuration using the arrow key and press **Enter**.

Figure 2-6 Intel platform configuration

7. To verify if the SATA Controller is enabled:
 - Go to Advanced tab and verify if SATA Controller is **Enabled**
8. To verify if SATA RAID is enabled:
 - Go to Advanced tab, click on **Configure SATA as AHCI** and select **RAID**

Figure 2-7 Configure SATA

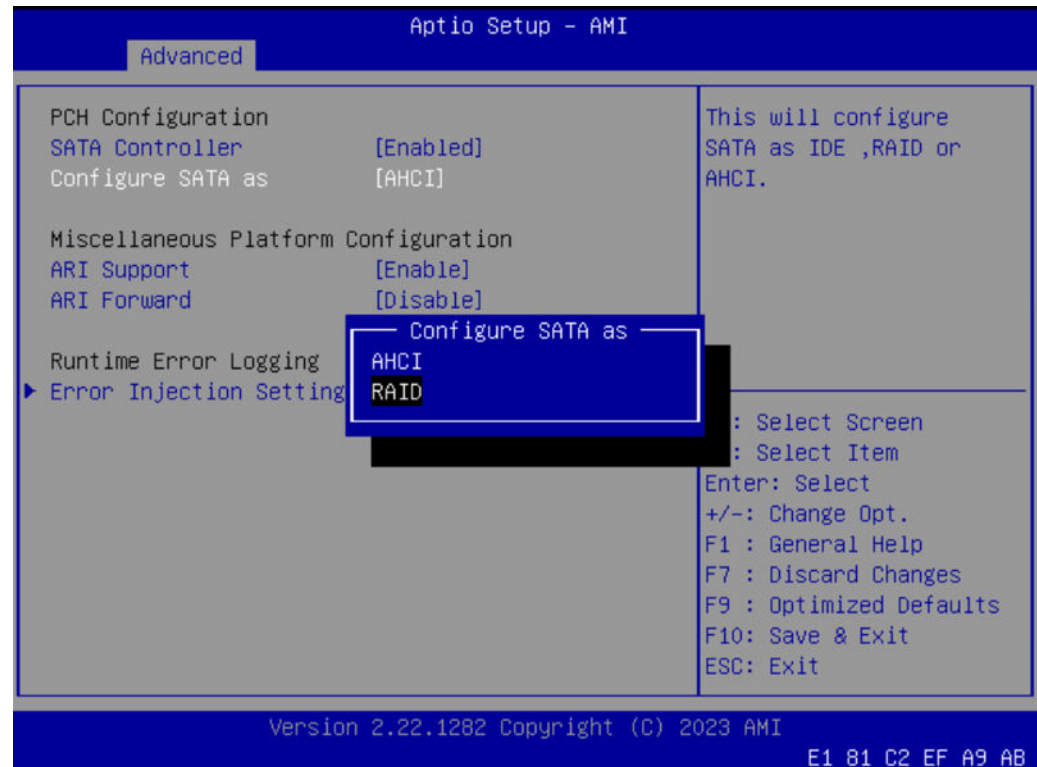

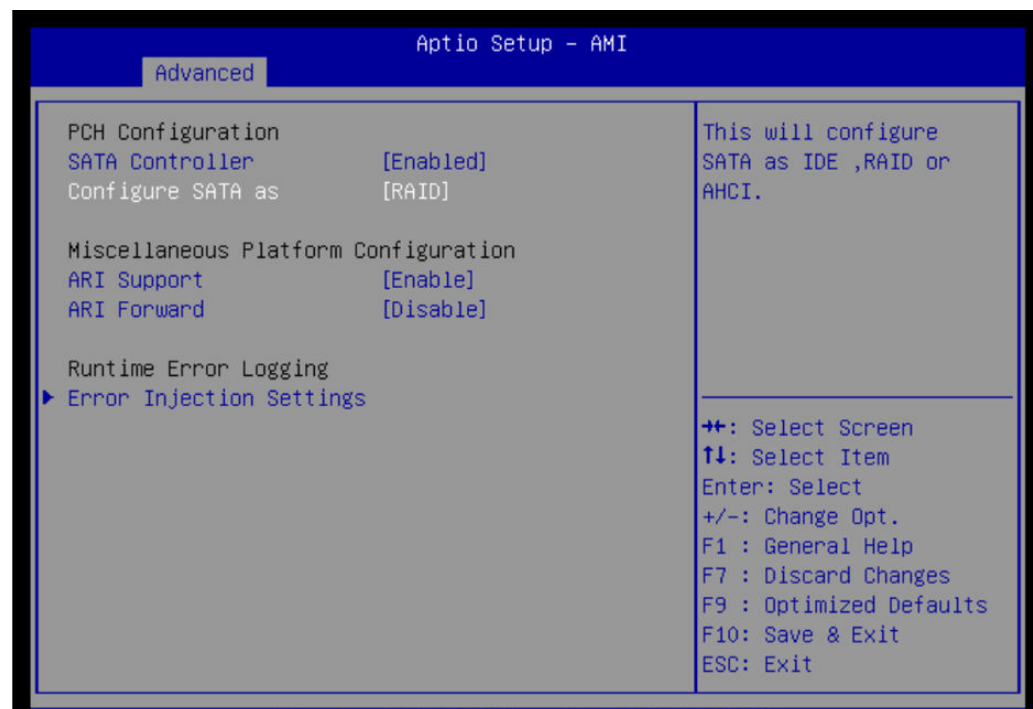

Figure 2-8 Configure SATA

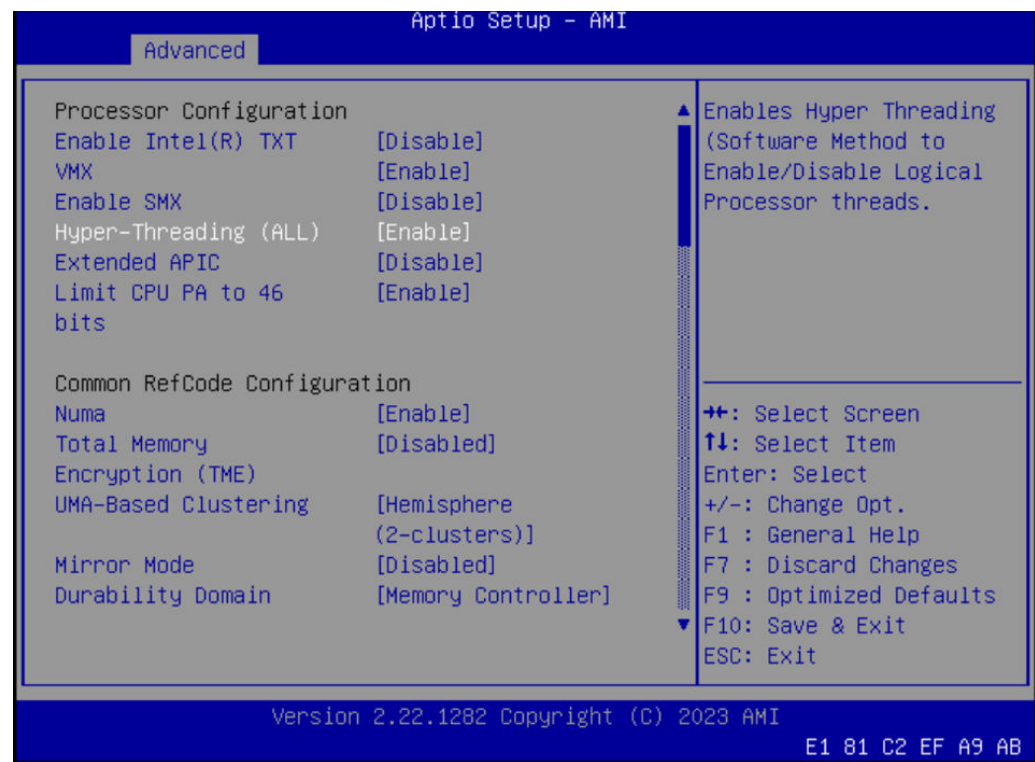

Note

- AHCI is a hardware-level architecture that enables systems to support the use of SATA disks.
- RAID is a logical disk structure that administrators can create at either the hardware or the software level. Administrators create RAID arrays on top of the AHCI hardware.

9. Verify if Hyper-Threading is enabled on the Advanced tab and do the following:

- Go to BIOS/Advanced/Intel-Socket Configuration

Figure 2-9 Intel socket configuration

10. Verify if Network Stack Configuration is enabled on the Advanced tab and do the following:

- Go to BIOS/Advanced/Network Stack Configuration

Figure 2-10 Network stack configuration

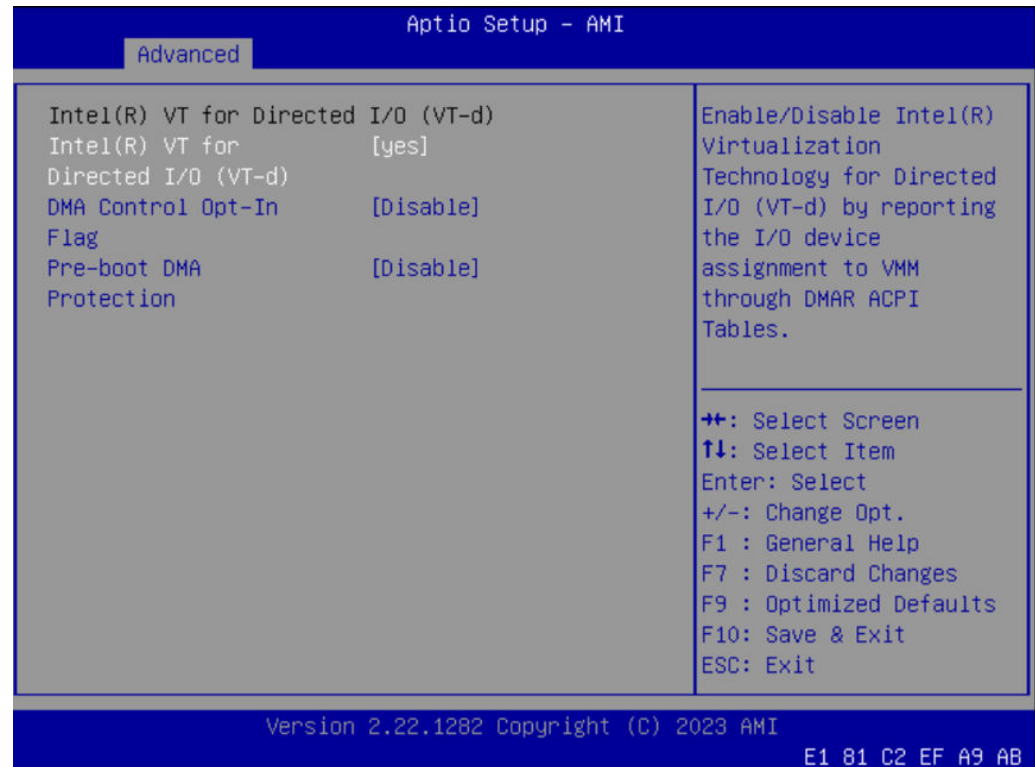

11. Verify if NET 0 is enabled on IO and do the following:

- Go to IO/Internal Devices /NET0/NIC0

Figure 2-11 Net0

12. Verify if VT-d is enabled on the Advanced tab and do the following:
 - Go to Advanced/Intel Socket Configuration/IIIO Configuration-VT-d.

Figure 2-12 Verify Vt-d

13. The server continues the boot process.
14. To save and exit, press **F10**

Figure 2-13 save and exit

This process concludes the Hardware Configuration verification.

2.4 Installing OL8.8 and KVM

Perform the following procedure to install Oracle Linux 8.8 OS with HTTP or USB media:

Note

- If you're using a hardware in a remote lab, install Linux remotely on a Windows computer. Ensure that remote Windows machine has the OL 8.8 ISO locally located.
- The installation process is specific to Oracle Linux OS installations.
- The Oracle Linux 8.8 release is utilized and validated for the Oracle Linux OS.
- The snapshot used for this procedure has been taken from ORACLE SERVER X9-2 RMS.
- This procedure can be executed on any flavor of RMS that require install on OL8.8 and KVM.

Each respective infrastructure must be operational.

Check in every step after completion.

Note

For any assistance, see My Oracle Support (MOS).

1. Log in to iLOM as **admusr** using the following URL: `https://<Ipv6 ILOM IP address>`.

Figure 2-14 Log in to iLOM

Please Log InThe image shows a web-based login interface for iLOM. At the top, it says "Please Log In". Below this, the "SP Hostname" is displayed as "ORACLESP-2322XLD07G". There are two input fields: "User Name" with the text "admusr" entered, and "Password" with ten dots representing a masked password. A blue "Log In" button is positioned below the password field.

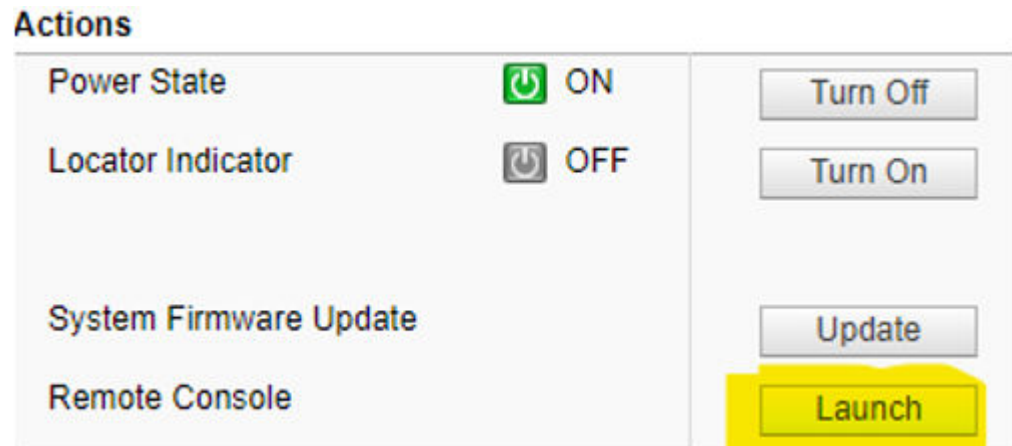

2. To launch the remote console, do the following:
 - a. Go to **Navigation** and select **Summary**.

Figure 2-15 Summary

- b. Click **Launch** that is next to the remote console and click **Continue** on the JAVA security warning pop-up.

Figure 2-16 Launch

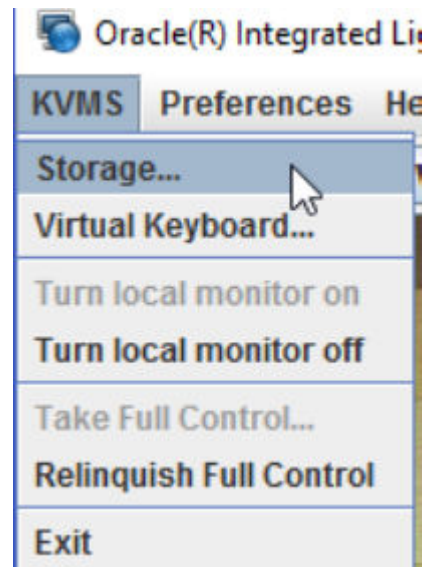

3. To install OL 8.8 image through Local USB media

Note

To install OL8.8, if requires HTTP server to start the media. Please skip this step and proceed with Step 4

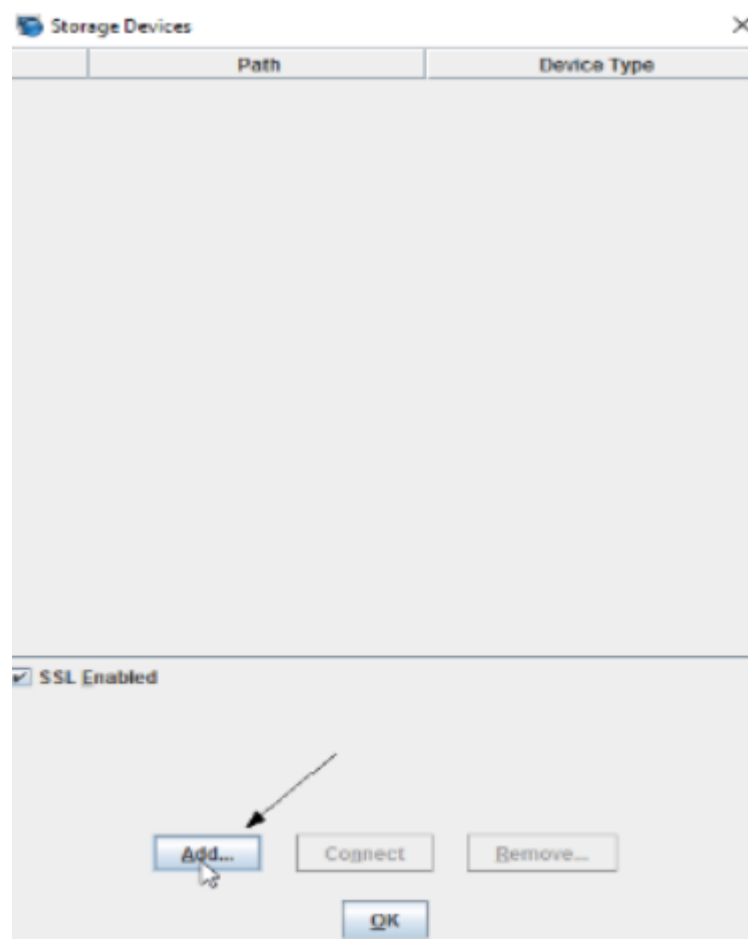

- a. On the ILOM Console, from the **KVMS** menu, select the **Storage** option.
A window entitled Storage Device will open.

Figure 2-17 Storage

- b. Click **Add** and navigate to the location of the **ISO** on the local workstation.

Figure 2-18 Storage device

- c. Select the **ISO** and click **Select**.

Figure 2-19 Select ISO

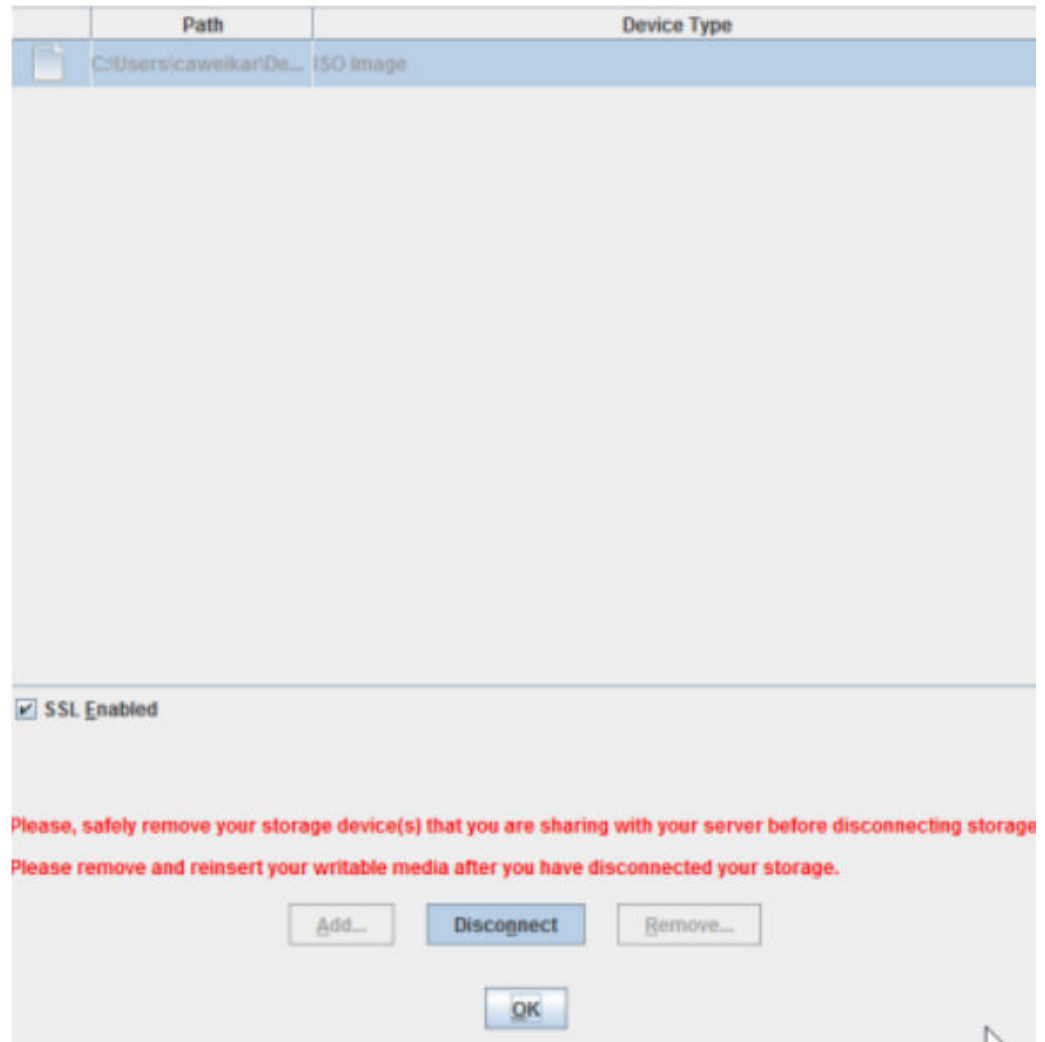

- d. The ISO file will now be included in the list of available storage devices. Select it in the Storage Devices window and then click **Connect**.

Figure 2-20 Connect

- e. Click **OK** to confirm and close the window.

Figure 2-21 Click OK

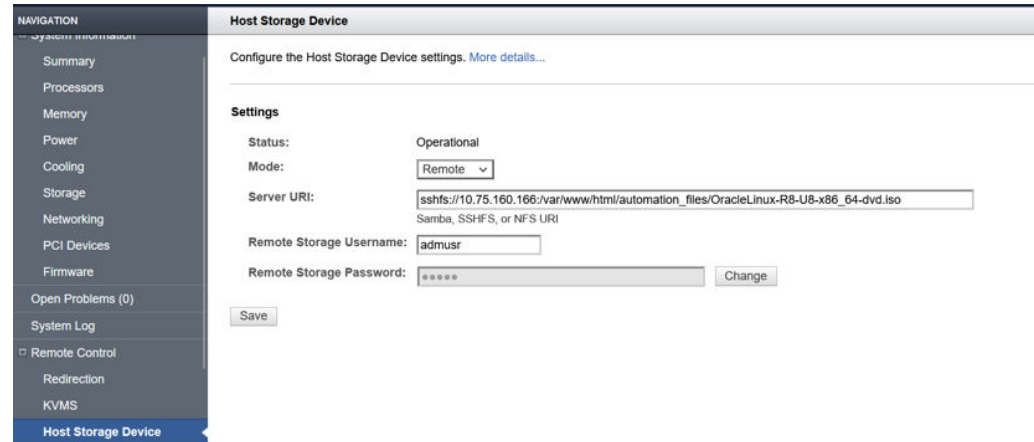

4. Install OL 8.8 image through HTTP server.

Note

To install OL8.8, if requires local USB to start the media as mentioned in step 3. Please skip this step and proceed with Step 5

- Navigate to Remote Control/Host Storage Device to place the OL 8.8 iso image on the existing HTTP web server and connect it through Server URI in **Host Storage Device** of iLOM GUI.

Figure 2-22 Host storage device

5. Shut down the server

- On the System Summary page click the **Turn Off** in the Actions Pane.

Figure 2-23 Turn off

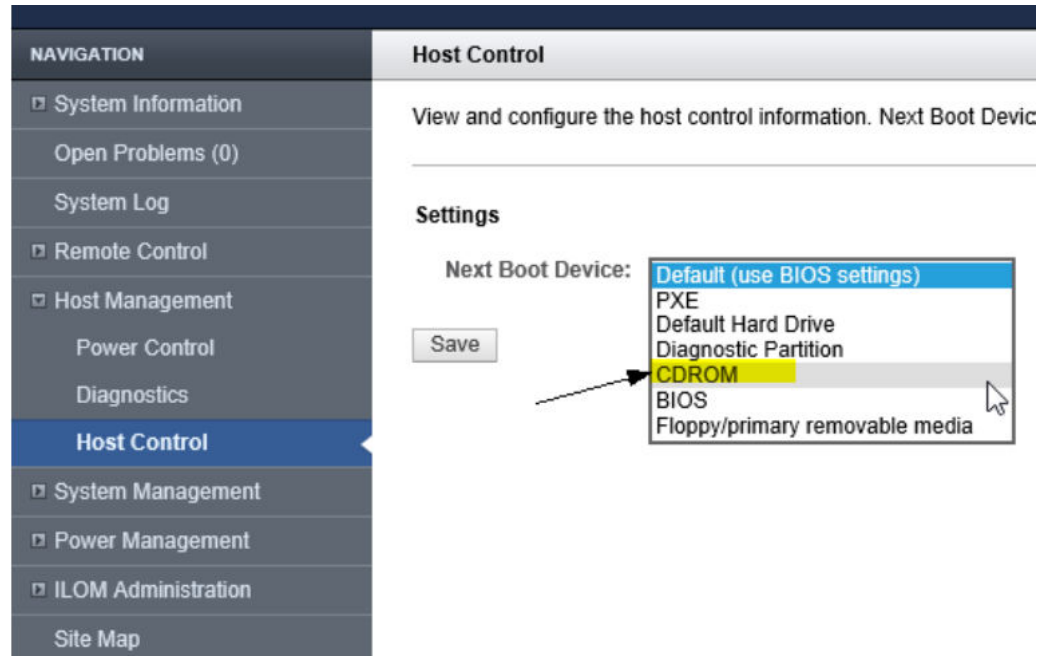

Note

- This will shut down the operating system prior to powering off the host server. Wait for the indicator to signify that the server is powered down before proceeding to the next step.
- If at any point the internet connection on the local workstation is lost, or the browser being used is closed, and the OSA has not yet been updated, the Oracle System Assistant Updater ISO must be remounted using the previous steps.

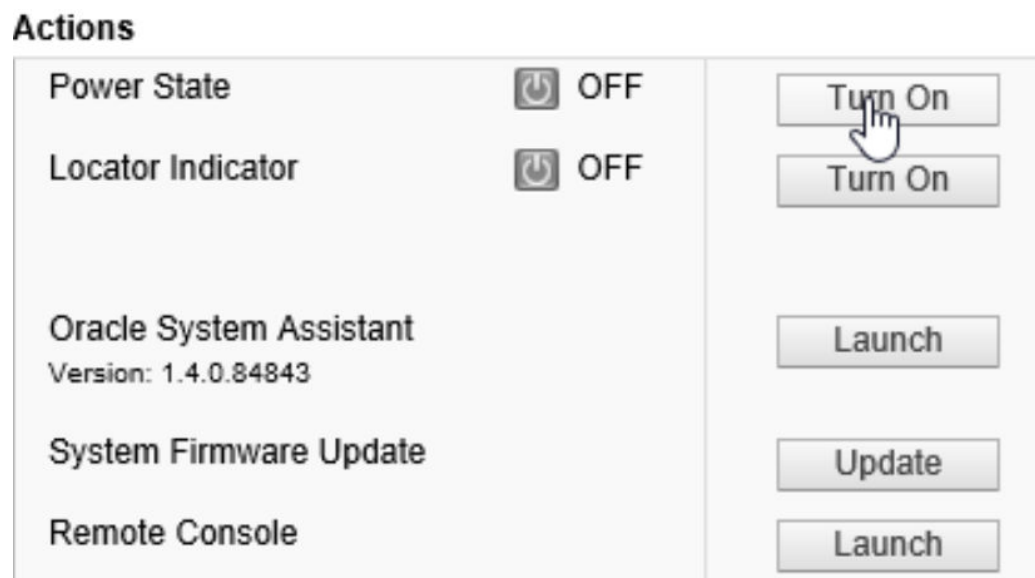

6. Set CDROM as the next boot device.
 - Under the Host Management tab select the **Host Control** option. From the drop-down menu for Next Boot Device, select the **CDROM** option and then click **Save**

Figure 2-24 CDROM

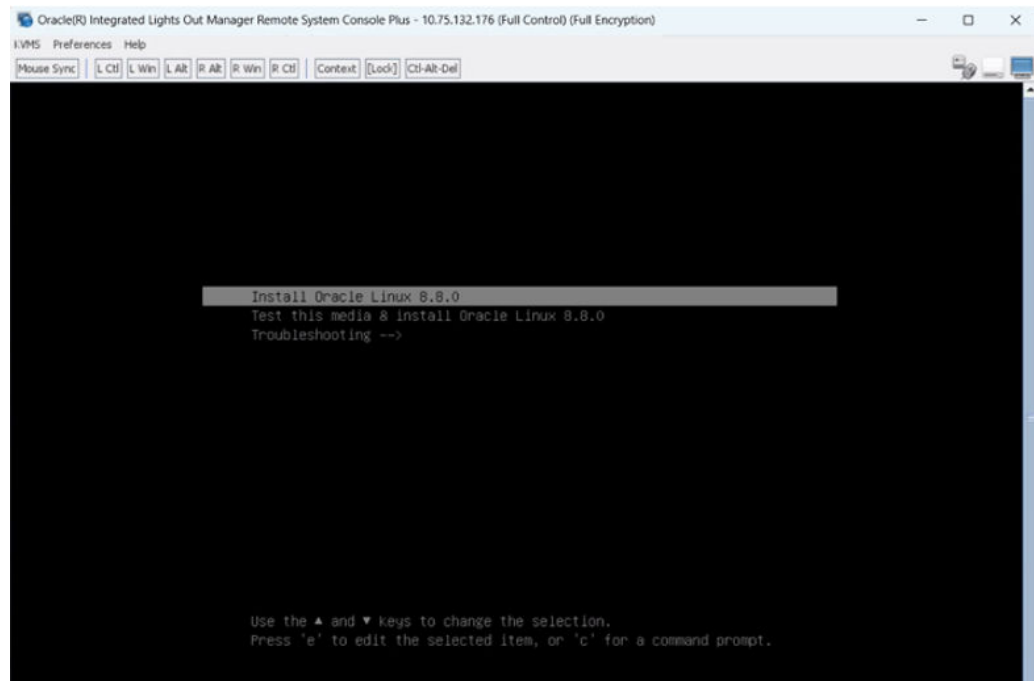

7. **Power ON** the server
 - a. On the System Summary page click the **Power State Turn On** in the **Actions Pane** to restart into the Oracle System Assistant Updater ISO.

Figure 2-25 Power on

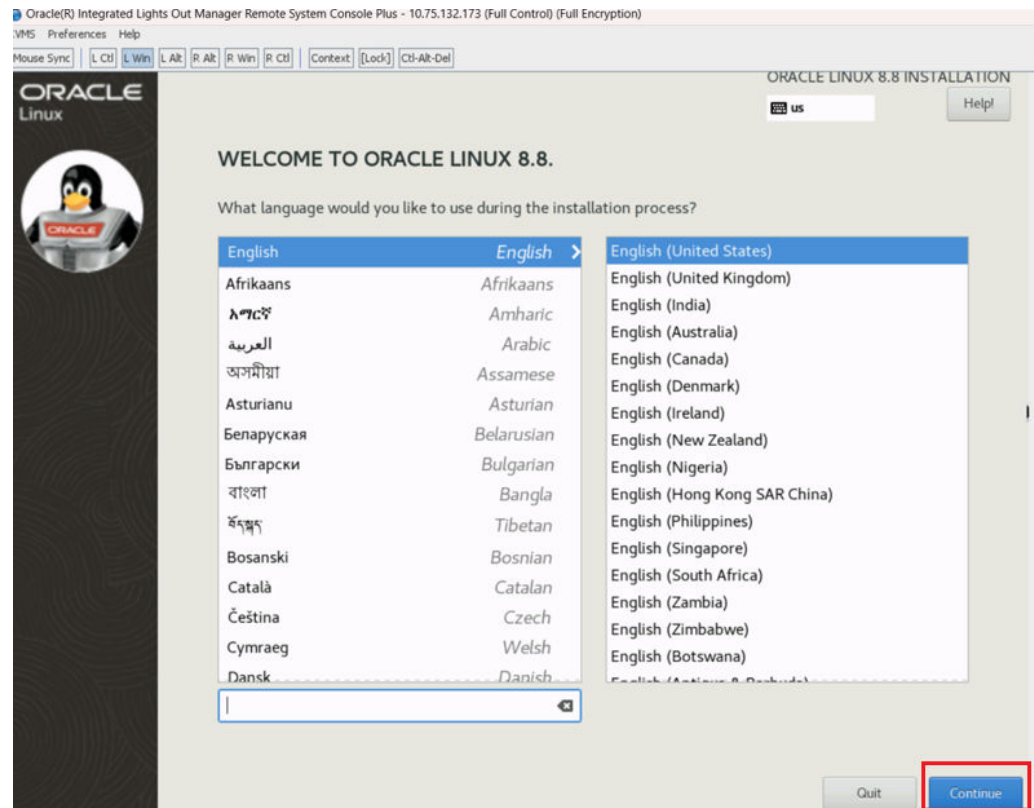

- b. Click **OK** when prompted.
- 8. Perform the following procedure to install **Oracle Linux OS**
 - a. Navigate to the window that contains the Remote Console. If the window was closed, re-launch the Console in the **Actions** Pane. The system will restart for installation.
 - b. Select **install Oracle Linux 8.8** and click **Enter**.

Figure 2-26 Install linux

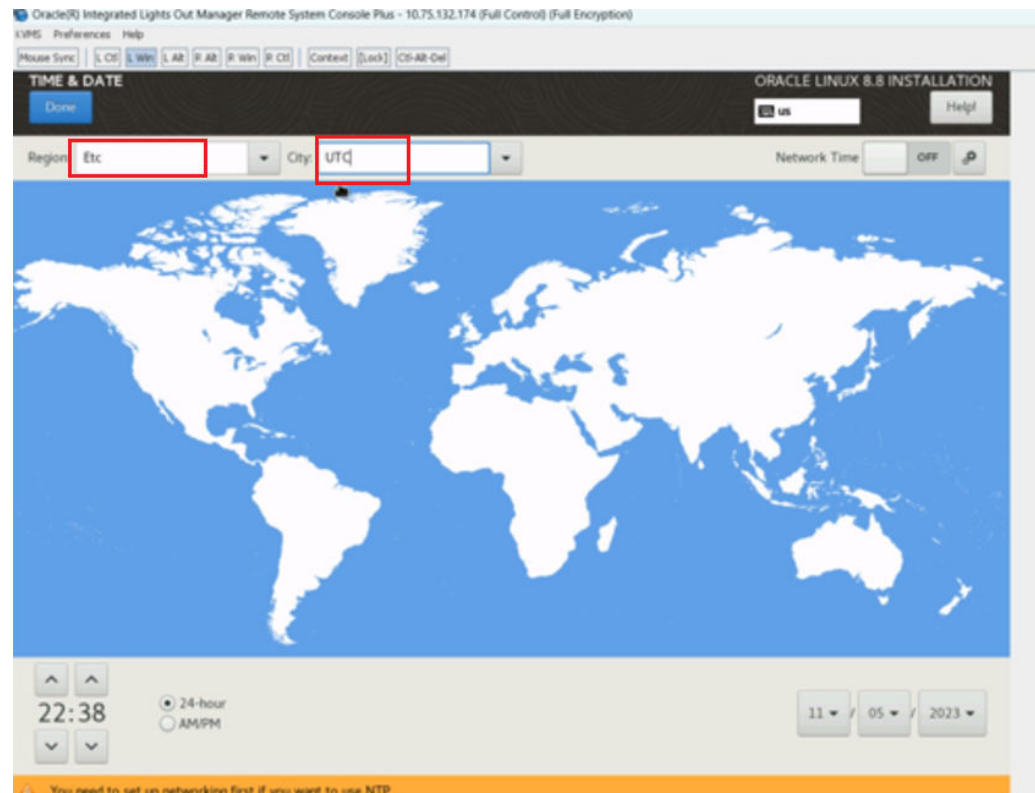

- c. Select Language and **Continue**.

Figure 2-27 Language

- d. Select Date and Time and then select **Done**.

Figure 2-28 Date and time

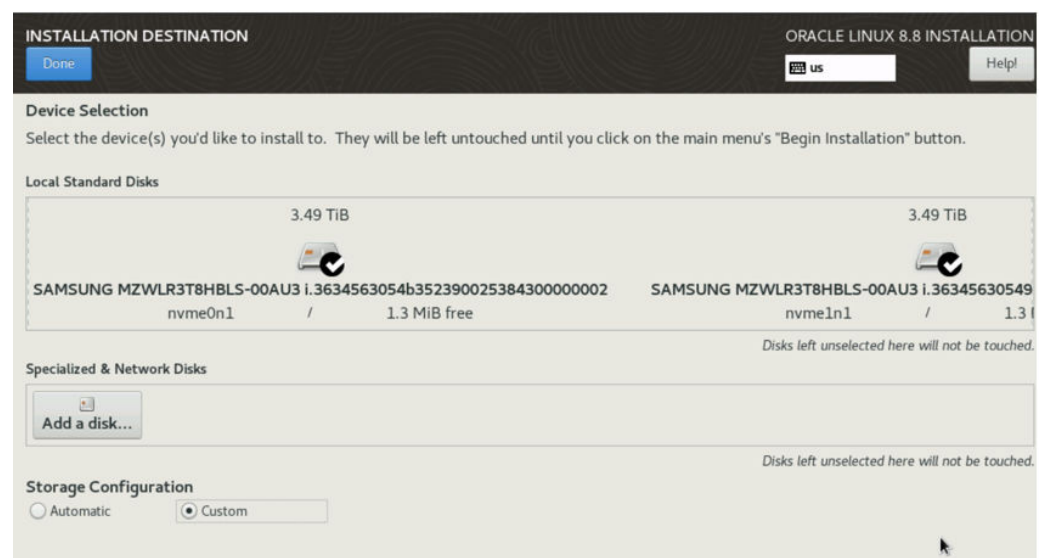

- e. Select Region as **ETC** and City as **UTC**
- f. Select Software selection with the following options:
 - i. Basic Environment: Server with GUI
 - ii. Select the following add-ons on Additional software for Selected Environment:
 - Virtualization Client
 - Virtualization Hypervisor
 - Virtualization Tools
 - Legacy UNIX Compatibility Libraries

- g. Confirm and click **Done**.
- h. Select Installation Destination
- i. Select 2 hard drives to be installed.
- j. From **Other Storage Options**, ensure **Custom configure partitioning** is selected.
- k. Click **Done**.

Figure 2-29 Click done

Note

Skip to **Step 6** if space is available for partitioning.

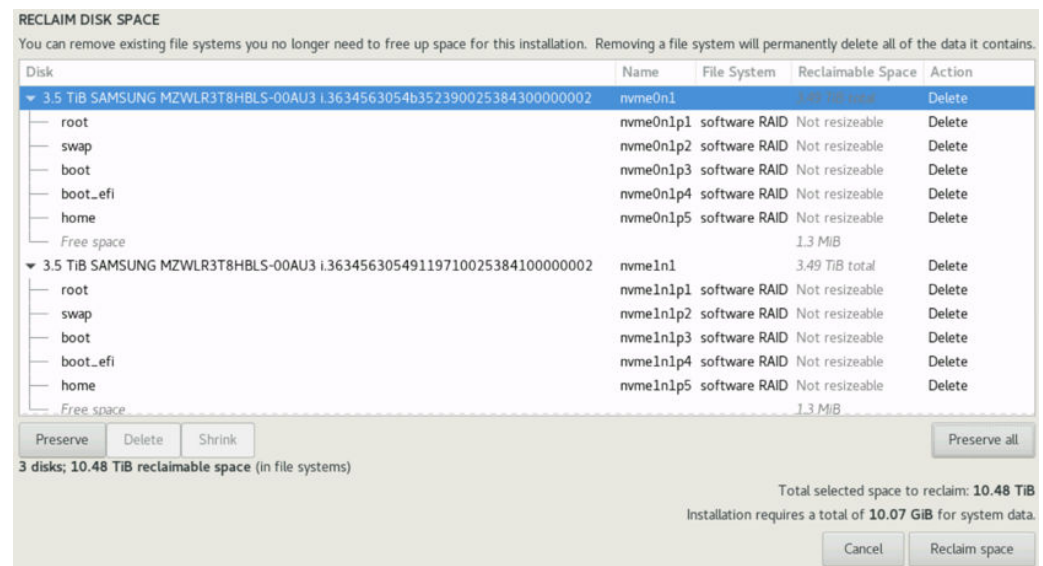

- I. If there is not enough disk space, check if you can make additional space, on the **Other Storage Options**.

Note

You may need to check the box with Automatically configure partition, later select Custom Configure.

- m. When you click **Done**, the following screen will allow you to **Delete all**, then **Reclaim space**

Figure 2-30 Reclaim space

- n. Click **Done** to continue.
- o. Again, select the **Installation Destination**.
- p. From **Other Storage Options**, select **Custom configure partitioning**.
- q. Remove any unknown volume by clicking on **Delete**.

Note

Skip this step if no unknown volume is present.

Figure 2-31 Unknown volume

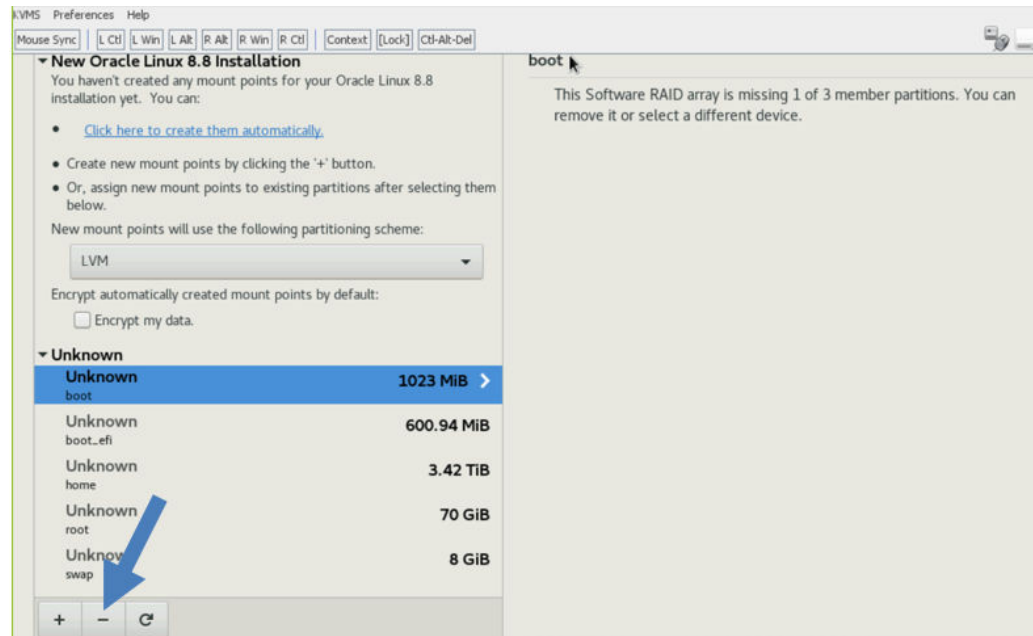

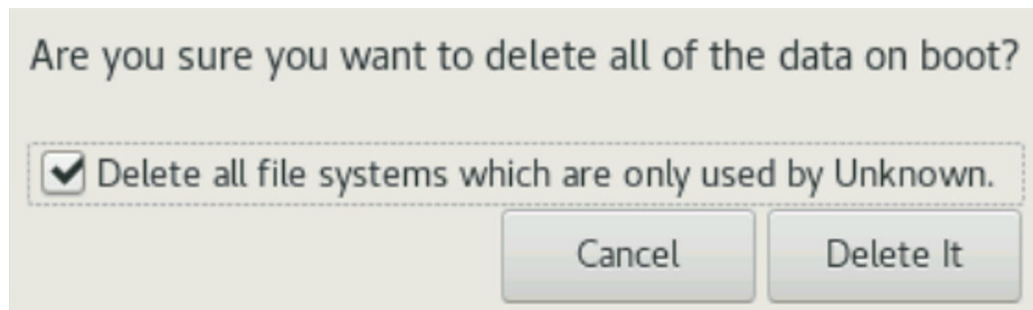

Figure 2-32 Delete

- r. Ensure the Available Space = Total Space.
- s. Click on **Click here to create them automatically**.

Figure 2-33 Available space

Linux sentinel6-6 5.15.0-101.103.2.1.el8uek.x86_64
```

13. Disconnect the ISO from storage if Step 3 is followed, if not skip the following step From ILOM Console, Go to KVMS/Storage, select the ISO and then select disconnect.

2.5 DSR Installation on OL8 and KVM

DSR Installation on OL8 and KVM includes the following procedures:

- Installing DSR on Linux/KVM
- Creating and installing OCDSR VMs through KVM GUI

Note

If using a hardware in remote Lab, then use a remote windows machine to install Linux, ensure that OEL 8 ISO is also located locally in remote windows machine.

2.5.1 Installing DSR on OL8 and KVM

This procedure lists the steps to install DSR configuration on Oracle Linux OS with direct KVM as hypervisor.

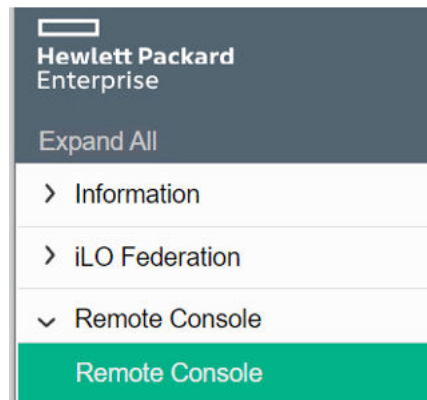

Note

- This installation procedure only applies while installing DSR on Oracle Linux OS through direct KVM.
- For the Oracle Linux OS, Oracle Linux 8.x release is used and verified.
- The screenshots shared in this procedure are taken from HP Gen-10 Blade.
- This procedure can run on any flavor of blade that requires DSR install on OL8.x and KVM.
- Perform this procedure on each blade.

Prerequisites:

All the respective infrastructures have to be up and running.

1. To mount virtual media containing Oracle Linux OS software, perform the following steps:
 - a. Open **iLO** GUI.
 - b. Click **Remote Consoles** on the left pane menu.

Figure 2-49 Remote Console

- c. Click **Web Start** under Java Integrated Remote Console (Java IRC).

Figure 2-50 Java IRC

- d. Navigate to **Virtual Drives** and select **Image File CD-ROM/DVD**.

Figure 2-51 Virtual Drives

- e. Browse and select the Oracle Linux 7.7 image file.

Figure 2-52 Browse Oracle Linux 7.7 file

2. To reboot host, perform the following steps:
 - a. Log in to **Blade Server iLO** GUI browser page and launch remote console.
 - b. Click **Power Switch** and select **Reset** from the drop-down menu.

Figure 2-53 Power Switch

- c. Click **Ok** to confirm reset.
- d. The **Remote Console** window displays that the host is rebooting.

Figure 2-54 Host rebooting

Wait for a couple of minutes for reboot to complete.

Once reboot completes, the host boots with Oracle Linux installation ISO and the GUI screen prompts for the installation options.

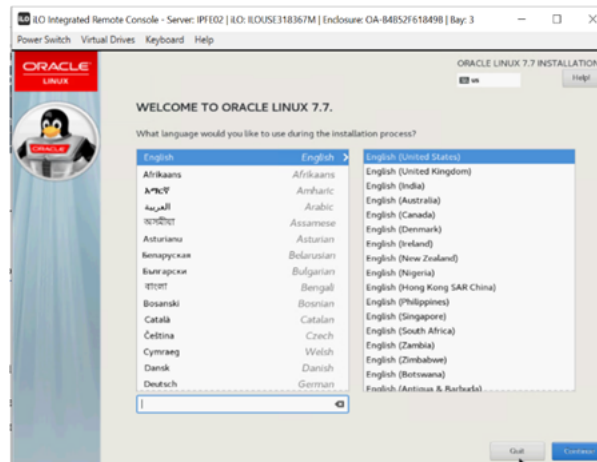

3. To initiate Oracle Linux Platform installation, select **Install Oracle Linux 8.x** to continue.

Figure 2-55 Installation Options

4. To choose Oracle Linux OS language, select **English** as Oracle Linux OS language and click **Continue** to go to next step.

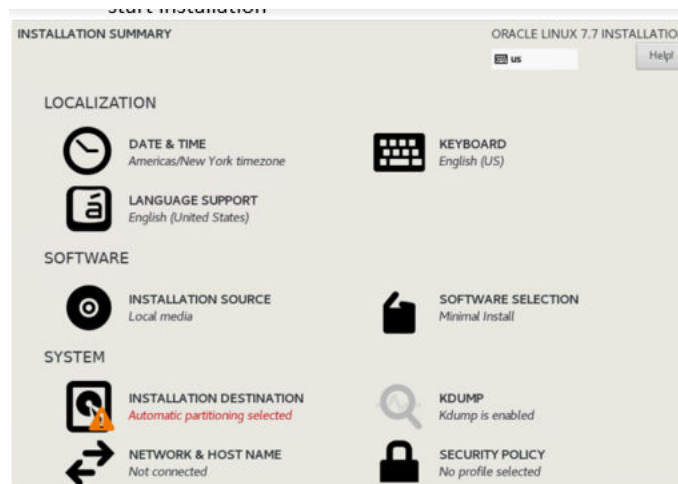

Figure 2-56 Language Selection

The next page **INSTALLATION SUMMARY** displays the required information to start installation.

5. To set up time zone, click **DATE & TIME** under **LOCALIZATION**.

Figure 2-57 Installation Summary

- a. Click **Network & Hostname** under System and ensure that the system is connected to a network.

Figure 2-58 Network and hostname

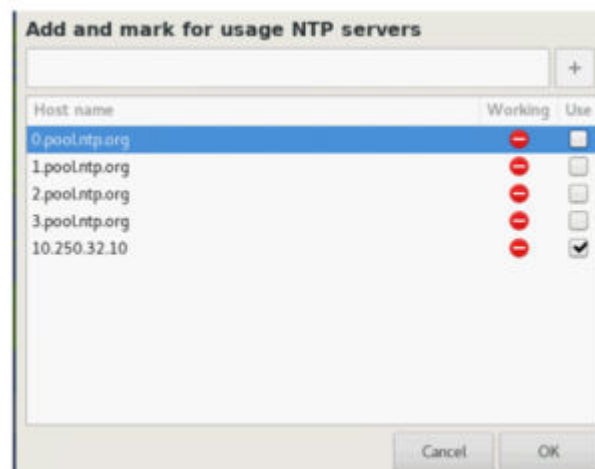

- b. Click **Done** to continue.
- c. Click **Localization** → **Date & Time**.
- d. Pick a time zone by selecting a region and city from the drop-down list, or by clicking location on the map.

Figure 2-59 Date and Time

- e. Toggle the switch to turn **ON** Network Time.
- f. Click **Settings**, configure the NTP servers used by the system.

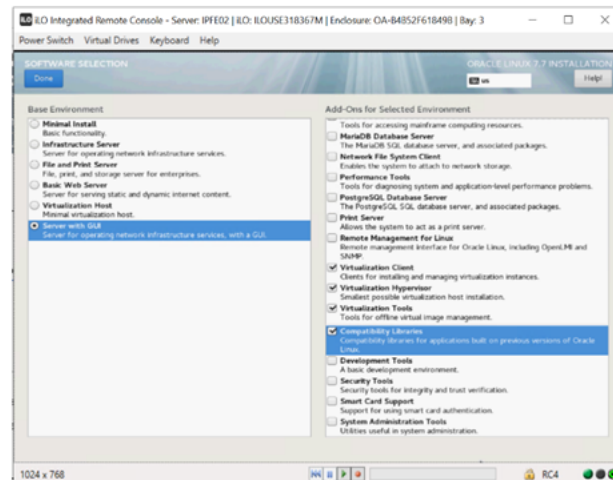

Figure 2-60 Add and mark for usage NTP servers

- g. Click **Ok** to go back to the previous screen.
- h. Click **Done** to continue.
6. To set up installation on base environment, perform the following steps:
 - a. Click **SOFTWARE SELECTION** option in the **SOFTWARE** area.

- b. Select **Server with GUI** from the **Base Environment** area, and ensure that the following add-ons are selected:
 - Virtualization Client
 - Virtualization Hypervisor
 - Virtualization Tools
 - Compatibility Libraries

Figure 2-61 Software Selection

- c. Click **Done** to save the changes and go back to the main configuration page.
7. To setup installation destination, click **INSTALLATION DESTINATION** in the **SYSTEM** area, then perform the following steps:
 - a. Select **sda** or **sdb** to be used.
 - b. Check **Automatically configure partitioning**.
 - c. Click **Done** to continue.

Figure 2-62 Installation Destination

8. To start installation, review all the information and click **Begin Installation**.

Figure 2-63 Installation Summary**Note**

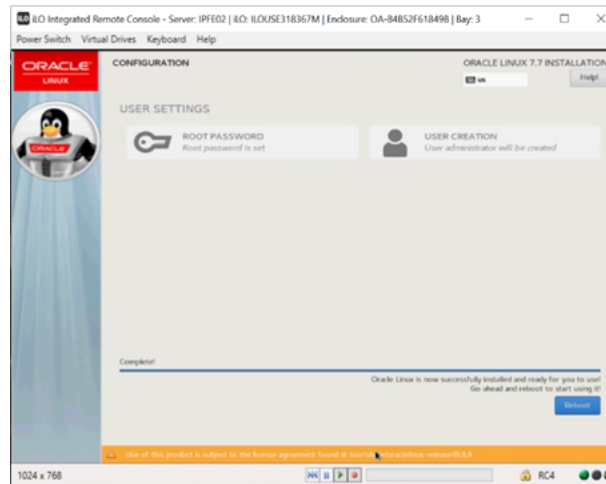

Network configuration is not mandatory at this point and can be performed after Oracle Linux OS is installed.

9. To create login credentials, configure root credential or any other login credentials as required.

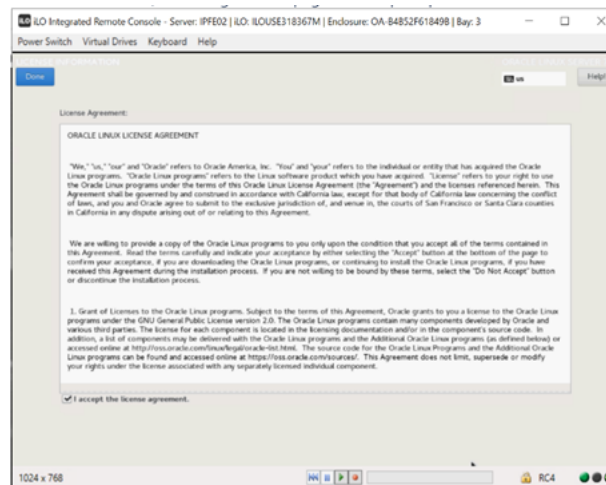

Figure 2-64 Login Credential Configuration**Note**

At the same time Oracle Linux installation software lays down files into Gen 10 local hard disk.

Wait for the installation to complete until the following screen appears.

Figure 2-65 Installation Configured

10. To reboot host after the installation is completed, click **Reboot**. After reboot is done, license agreement page appears.

Figure 2-66 License Agreement

11. To accept license agreement, read and check **I accept the license agreement** checkbox, and click **Done** to continue.

Note

Skip when prompted for ULN settings.

12. Login, select Language, and click **Next**.
13. Select Keyboard layout and click **Next**.
14. Turn off the location services and click **Next**.
15. Click **Skip** when prompted to connect to online accounts.
16. To verify kernel and KVM versions, open **SSH Console** window and check the following.

- # sudo su –
- # virt -manager
- # uname -a
- o # virsh version

17. To change network interface name pattern to **ethx**, perform the following steps:

- a. To append 'net.ifnames=0' with option GRUB_CMDLINE_LINUX, edit /etc/default/grub

```
cat /etc/default/grub
```

```
GRUB_TIMEOUT=5
GRUB_DISTRIBUTOR="$(sed 's, release .*$,g' /etc/system-release)"
GRUB_DEFAULT=saved
GRUB_DISABLE_SUBMENU=true
GRUB_TERMINAL_OUTPUT="console"
GRUB_CMDLINE_LINUX="crashkernel=auto rd.lvm.lv=ol/root rd.lvm.lv=ol/swap rhgb q
iet net.ifnames=0"
GRUB_DISABLE_RECOVERY="true"
```

- b. Re-create the grub2 config file.

```
grub2-mkconfig -o /boot/grub2/grub.cfg
```

- c. Restart host and verify that the network interfaces have **ethx** name pattern.

```
shutdown -r
```

18. To create bond0 device, perform the following steps:

- a. Create device bond0 configuration file, save the file and exit.

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-bond0
DEVICE=bond0
TYPE=Bonding
BOND_INTERFACES=eth0,eth1
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
BONDING_OPTS="mode=active-backup primary=eth0 miimon=100"
```

- b. Create device eth0 configuration file, save the file and exit.

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-eth0
DEVICE=eth0
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
MASTER=bond0
SLAVE=yes
```

- c. Create device eth1 configuration file, save the file and exit.

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-eth1
DEVICE=eth1
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
MASTER=bond0
SLAVE=yes
```

- d. Bring up devices into services.

```
[root@DSR-Gen10-ol7 ~]# ifup eth0
[root@DSR-Gen10-ol7 ~]# ifup eth1
[root@DSR-Gen10-ol7 ~]# ifup bond0
[root@DSR-Gen10-ol7 ~]# _
```

19. To create IMI bridge, perform the following steps:

- a. Create bond0.<imi_vlan> configuration file.**

```
vim /etc/sysconfig/network-scripts/ifcfg-bond0.<imi_vlan>
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-eth0
DEVICE=eth0
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
MASTER=bond0
SLAVE=yes
```

- b. Create imi device configuration file.**

```
vim /etc/sysconfig/network-scripts/ifcfg-imi
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-imi
DEVICE=imi
TYPE=Bridge
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
BRIDGE_INTERFACES=bond0.4
```

- c. Bring up devices into services.**

```
[root@DSR-Gen10-ol7 ~]# ifup bond0.4
[root@DSR-Gen10-ol7 ~]# ifup imi
[root@DSR-Gen10-ol7 ~]# _
```

20. To create XMI bridge, perform the following steps:

- a. Create bond0.<xmi_vlan> configuration file.**

```
vim /etc/sysconfig/network-scripts/ifcfg-bond0.<xmi_vlan>
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-bond0.3
DEVICE=bond0.3
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
BRIDGE=xmi
VLAN=yes
```

- b. Create xmi device configuration file.**

```
vim /etc/sysconfig/network-scripts/ifcfg-xmi
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-xmi
DEVICE=xmi
TYPE=Bridge
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
NETMASK=255.255.255.128
IPADDR=10.75.193.196
NETWORK=10.75.193.128
GATEWAY=10.75.193.129
BRIDGE_INTERFACES=bond0.3
```

- c. Set default route for xmi network.

```
vim /etc/sysconfig/network-scripts/route-xmi default via <xmi_gateway>
table main
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/route-xmi
default via 10.75.193.196 table main
```

- d. Bring up the devices into service.

```
[root@DSR-Gen10-ol7 ~]# ifup bond0.3
[root@DSR-Gen10-ol7 ~]# ifup xmi
[root@DSR-Gen10-ol7 ~]#
```

21. To create bond1 device, perform the following steps:

- a. Create device bond1 configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-bond1
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-bond1
DEVICE=bond1
TYPE=Bonding
BOND_INTERFACES=eth2,eth3
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
BONDING_OPTS="mode=active-backup primary=eth2 miimon=100"
```

- b. Create device eth2 configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-eth2
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-eth2
DEVICE=eth2
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
MASTER=bond1
SLAVE=yes
```

- c. Create device eth3 configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-eth3
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-eth3
DEVICE=eth3
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
MASTER=bond1
SLAVE=yes
```

- d. Bring up devices into services.

```
[root@DSR-Gen10-ol7 ~]# ifup eth2
[root@DSR-Gen10-ol7 ~]# ifup eth3
[root@DSR-Gen10-ol7 ~]# ifup bond1
[root@DSR-Gen10-ol7 ~]#
```

22. To create xsi1/xsi2 bridge, perform the following steps:

- a. Create device bond1.<xsi1_vlan> configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-bond1.<xsi1_vlan>
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-bond1.5
DEVICE=bond1.5
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
BRIDGE=xsi1
VLAN=yes
```

- b. Create device xsi1 configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-xsi1
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-xsi1
DEVICE=xsi1
TYPE=Bridge
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
BRIDGE_INTERFACES=bond1.5
```

- c. Bring up devices into services.

```
[root@DSR-Gen10-ol7 ~]# ifup xsi1
[root@DSR-Gen10-ol7 ~]# ifup bond1.5
```

Note

Perform similar steps to create network devices for xsi2.

23. To set hostname, rename host by modifying /etc/hostname file.

```
# cat /etc/hostname
# vim /etc/hostname
- Review the hostname
# hostnamectl status
```

24. To set NTP service, perform the following steps:

- a. Modify `/etc/chrony.conf` configuration file. Then, comment out all server * entries and append your NTP server IP to the list with prepending 'server' text.

```
# Use public servers from the pool.ntp.org project.
# Please consider joining the pool (http://www.pool.ntp.org/join.html).
#server 0.pool.ntp.org iburst
#server 1.pool.ntp.org iburst
#server 2.pool.ntp.org iburst
#server 3.pool.ntp.org iburst
server 10.250.32.10
```

- b. Force ntp to sync with newly added server.

```
$ ntpdate <NTP server IP>
$ timedatectl
$ chronyc tracking
```

25. To create `/home/ova` directory, run the following command.

```
[root@DSR-Gen10-ol7 ~]# mkdir /home/ova/
[root@DSR-Gen10-ol7 ~]# cd /home/ova/
[root@DSR-Gen10-ol7 ova]# _
```

26. To transfer OVA file directory, use sftp tool.

```
[root@DSR-Gen10-ol7 ova]# ll
total 36911960
-rw-r--r--. 1 root root 1653708800 Mar 14 16:02 DSR-8.4.0.0_84.17.0.ova
```

27. To untar the ova file, run the following command.

```
[root@DSR-Gen10-ol7 ova]# tar xvf DSR-8.4.0.0_84.17.0.ova
DSR-84_17_0.ovf
DSR-84_17_0.mf
DSR-84_17_0.vmdk
[root@DSR-Gen10-ol7 ova]#
```

28. To convert the vmdk file to qcow2 file, run the following command.

```
[root@DSR-Gen10-ol7 ova]# qemu-img convert -O qcow2 DSR-84_17_0.vmdk DSRNO-84_17_0.qcow2
[root@DSR-Gen10-ol7 ova]#
```

29. To copy the qcow2 files for **SO** and **MP**, run the following command.

```
[root@DSR-Gen10-ol7 ova]# cp DSRNO-84_17_0.qcow2 DSR50-84_17_0.qcow2
[root@DSR-Gen10-ol7 ova]# cp DSRNO-84_17_0.qcow2 DSRMP-84_17_0.qcow2
```

30. To configure storage for corresponding qcow2 files as per VMs, perform the following steps:

- a. Set the storage for each VM, by running the following command:

```
qemu-img resize <NO_qcow2_filename>.qcow2 <storage_in_gigabytes>G
```

- b. Run the command for a VM if storage required is greater than 60 G.

For example: If resource profile is 2K Sh and VM is NOAMP, whereas the storage required is 70G, then run the following command:

```
qemu-img resize DSRNO-84_17_0.qcow2 70G
```

Note

- No need to run this command if the storage required is less than or equal to 60G.
- For multiqueue settings, refer to [Multiqueue on IPFE \(KVM\)](#).

31. To set the txqueue length for the ether-net adapter to a high value on the host machine, add the following script to the created file `/sbin/ifup-local`.

```
[root@DSR-Gen10-ol7 oval]# vim /sbin/ifup-local
ifconfig eth0 txqueuelen 120000
ifconfig eth1 txqueuelen 120000
ifconfig eth2 txqueuelen 120000
ifconfig eth3 txqueuelen 120000
```

32. To verify txqueue length for the ether-net adapter to a high value on the host machine that is added on all interfaces, run the following command.

```
[root@DSR-Gen10-ol7 oval]# ifconfig <ethernet adapter>
```

Note

Verify same for eth1, eth2, and eth3.

33. To restart all the ethernet adapters (eth0, eth1, eth2, and eth3), run the following command on each adapter one at a time.

```
[root@DSR-Gen10-ol7 oval]# ifdown <ethernet adapter>
[root@DSR-Gen10-ol7 oval]# ifup <ethernet adapter>
```

34. Perform the listed steps in the [Ring Buffer and txqueuelen Configuration \(KVM\) OL8.9](#) section.

35. To reboot the host machine, run the following command.

```
[root@DSR-Gen10-ol7 oval]# reboot
```

36. To confirm the configurations, verify the following on host machine as per the configuration:

- If multiqueue configuration is performed on IPFE, ensure the configuration is done as mentioned in [Multiqueue on IPFE \(KVM\)](#).
- If the ring buffer size is set to max on all the ether-net devices by using the steps in [#unique_79](#).
- If the txqueue length for all the ether-net adapter is set to a high value by using Step 31.

2.5.2 Creating and Installing OCDSR VMs through KVM GUI

This procedure installs DSR VMs NO, SO, and MP using KVM GUI.

Note

This installation procedure is only applicable for each VM, that is NO, SO, MP and so on.

Prerequisites:

- Installation of DSR on Oracle Linux OS through KVM must be performed.
- 1. To log in to the host machine and open the Virtual Machine, run the following command:

```
virt-manager
```

Figure 2-67 Virtual Machine Manager

Note

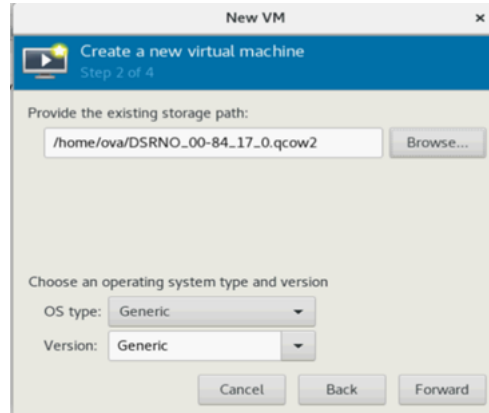

Ensure X11 forwarding is enabled before running `virt-manager` command on CLI.

2. To create a new Virtual Machine, on Virtual Manager GUI, click **File**, and then **New Virtual Machine** and select **Import existing disk image**.

Figure 2-68 Creating a New VM

3. To select the image file, select the qcow2 image by browsing the `/home/ova` location and click **Forward**.

Note

Refer to [Install DSR on Oracle Linux/KVM](#) section.

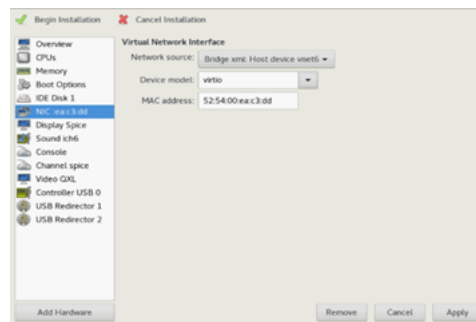

4. For each VM, select the RAM and vCPUs as required by resource profile and click **Forward**.

5. To verify and customize VM, perform the following steps:.
 - a. Update the VM name and select **Customize configuration before install**.
 - b. Select **XMI bridge** under **Network** selection and click **Finish**.

6. For XMI bridge, modify the Device model to virtio.

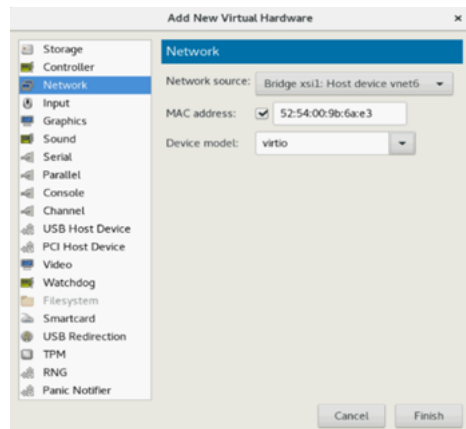

7. To customize the network configuration, perform the following steps:
 - a. On the next screen, click **Add Hardware** and configure as following:
 - Under **Network** source, choose **IMI Bridge**.
 - For NO and SO, choose IMI bridge only.
 - For MP, add XSI1, along with IMI by repeating this step.

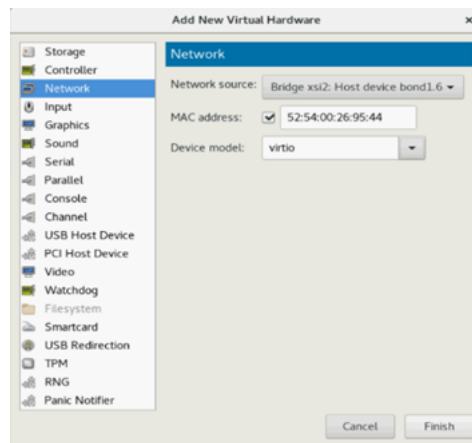

- b. Click **Finish**.

- c. For MP, add XSI1 and XSI2 bridge.
For XSI1 bridge:

For XSI2 bridge:

Note

For DSR Topology it is recommended to add all interfaces on each VM, even when the VM does not require that interface or does not use a VLAN. This is to use a standard when the topology is created from NOAM GUI.

DSR VMs	
XMI	eth0
IMI	eth1
XSI1	eth2
XSI2	eth3

Add all interfaces as needed. Once the other networks are added, the NICs appears.

8. After adding all bridges, verify and begin the VM installation.

9. To disable the TSO GSO features for SBR server, see [Disabling TSO GSO features for SBR server](#).

2.6 Optional Features

Once DSR installation is complete, perform the configuration and installation for optional features that may be present in this deployment. Refer to the following table for the post-DSR installation configuration documentation needed for their components.

Table 2-4 Post-DSR Installation Configuration Step

Feature	Document
Diameter Mediation	<i>DSR Meta Administration Feature Activation Procedure</i>
Full Address Based Resolution (FABR)	<i>DSR FABR Feature Activation Procedure</i>
Range Based Address Resolution (RBAR)	<i>DSR RBAR Feature Activation Procedure</i>
SCEF Feature Activation	<i>DSR SCEF Feature Activation Guide</i>
Policy and Charging Application (PCA)	<i>PCA Activation Procedure</i>
Host Intrusion Detection System (HIDS)	<i>DSR Security Guide, Section 3.2</i>
Diameter Custom Applications (DCA)	<i>DCA Framework and Application Activation and Deactivation Procedures</i>

3

Software Installation Procedure

The host and virtual networks configuration should be done before running the procedures in this document. It is assumed that at this point the user has access to the following:

- Consoles of all guests and hosts at all sites
- ssh access to the guests at all sites
- GUI access to hosts at all sites
- A configuration station with a web browser, ssh client, and scp client
- VM Manager Privileges to add OVAs to catalog (VMware only)
- KVM/OpenStack admin and tenant privileges
- OVM-S/OVM-M credentials and privileges, OVM-M CLI tool must be installed and accessible

SUDO

Many commands when run as admusr (non-root user) requires the use of **sudo**.

VIP/TSA (OpenStack Only)

OpenStack release Kilo or later is required to configure VIP and target set addresses. Kilo release 2015.1.2 or later is preferred.

IPv6

IPv6 configuration of XMI and IMI networks is introduced in DSR. Standard IPv6 formats for IPv6 and prefix can be used in all IP configuration screens, which enables the DSR to run in an IPv6 only environment. When using IPv6 for XMI and management, place the IPv6 address in brackets.

For example: `https://[<IPv6 address>]`

If a dual-stack (IPv4 and IPv6) network is required, configure the topology with IPv4 first, and then migrate to IPv6. Refer to *DSR IPv6 Migration Guide* for instructions on this migration.

3.1 Creating DSR Guests (VMware)

Perform the following tasks to create DSR guests for VMware.

3.1.1 Importing DSR OVA (VMware)

This procedure adds the DSR OVA to the VMware catalog or repository.

1. Launch the required VMware client.
2. Add the DSR OVA image to the VMware catalog or repository.

Note

Refer to the instructions provided by the Cloud solutions manufacturer.

3.1.2 Configuring NOAM Guests Role Based On Resource Profile and Configure Network (VMware)

This procedure configures networking on VMs.

1. To create the NOAM1 VM from the OVA image, perform the following steps:
 - a. Browse to the library or repository where the **OVA** image is placed.
 - b. Deploy the OVA Image by using **vSphere Client** or **vSphere Web Client**.
 - c. Name the **NOAM1 VM** and select the data store.
2. Configure resources for the NOAM1 VM using the **vSphere Client** or **vSphere Web Client**, by referring to the *DSR Cloud Benchmarking Guide* for the required DSR NOAM resource profile.
3. To power ON NOAM1, use the **vSphere Client** or **vSphere Web Client**.
4. To configure NOAM1, perform the following steps:
 - a. Access the **NOAM1 VM** console through the **vSphere Client** or **vSphere Web Client**.
 - b. Login as the **admusr** user.
 - c. Set the <ethX> device.

```
$ sudo netAdm add --device=<ethX> --address=<IP Address in External  
management Network> --netmask=<Netmask> --onboot=yes --bootproto=none
```

Note

Here, ethX is the interface associated with the XMI network.

- d. Add the default route for ethX.

```
$ sudo netAdm add --route=default --gateway=<gateway address for the  
External management network> --device=<ethX>
```

- e. Ping the XMI gateway for network verification.

```
$ ping -c3 <Gateway of External Management Network>
```

Note

To configure NOAM2, repeat the above 4 steps.

3.1.3 Configure Remaining DSR Guests Based on Resource Profile and Configure Network

This procedure adds network addresses for all VMs.

Note

This procedure provides an example for creating an SOAM. Follow the same steps to create other guests with their respective VM names and profiles.

1. Create the SOAM1 VM from the OVA image.
 - a. Browse to the library or repository where the **OVA** image is placed.
 - b. Deploy the OVA Image by using **vSphere Client** or **vSphere Web Client**.
 - c. Name the **SOAM1 VM** and select the data store.
2. Configure the SOAM1 VM as per the resource profiles defined in *DSR Cloud Benchmarking Guide* for the **DSR SO** using the **vSphere Client** or **vSphere Web Client**. Interfaces must be added per the OCDSR Network to Device Assignments defined in *DSR Cloud Benchmarking Guide*.
3. Power ON SOAM1 VM.
 - a. Power ON the **DSR SOAM1 VM** with the **vSphere Client** or **vSphere Web Client**.
 - b. Monitor the vApps screen's Virtual Machines tab until the DSR VM reports **Powered On** in the Status column.
4. Configure XMI interface.
 - a. Access the **VM console** through the **vSphere Client** or **vSphere Web Client**.
 - b. Login as the **admusr** user.
 - c. Set the ethX device:

```
$ sudo netAdm add --device=<ethX> --address=<IP Address in External Management Network> --netmask=<Netmask> --onboot=yes --bootproto=none
```

Note

Where ethX is the interface associated with the XMI network.

- d. Add the default route for ethX:

```
$ sudo netAdm add --route=default --gateway=<gateway address for the External management network> --device=<ethX>
```

5. Verify network connectivity.
 - a. Access the **SOAM1 VM console** using the **vSphere Client** or **vSphere Web Client**.
 - b. Login as the **admusr** user.

- c. Ping the NOAM1.

```
$ ping -c3 <IP Address in External Management Network>
```

Note

Repeat the above procedure for the following VMs. Use unique labels for the VM names:

- MP(s)
- IPFE(s)
- SOAM(s)
- Session SBRs, Binding SBR (Optional Components)
- DR NOAMs (Optional Components)

3.2 Create DSR Guests (KVM/OpenStack)

Perform the following tasks to create DSR guests in KVM or OpenStack.

3.2.1 Import DSR OVA (KVM/OpenStack Only)

This procedure adds the DSR image to the glance image catalog.

Prerequisites:

- Create instance flavors.
If not yet done, use the resource profiles defined in *DSR Cloud Benchmarking Guide* values to create flavors for each type of VM. Flavors can be created with the Horizon GUI in the **Admin** section, or with the nova flavor-create command line tool. Make the flavor names as informative as possible. As flavors describe resource sizing, a common convention is to use a name like "0406060" where the first two figures (04) represent the number of virtual CPUs, the next two figures (06) might represent the RAM allocation in GB and the final three figures (060) might represent the disk space in GB.
- If using an Intel 10 Gigabit Ethernet ixgbe driver on the host nodes, note that the default LRO (Large Receive Offload) option must be disabled on the host command line. Refer to the *Intel Release Notes* for more details. This action can be performed using the following command.

```
$ sudo ethtool -K <ETH_DEV> lro off
```

- If using IPFE Target Set Addresses (TSA):
 - Read and understand the "Disable Port Security" procedure in [Disable Port Security](#), including the warning note.
 - Enable the Neutron port security extension.

Note

- * This step is not applicable for HEAT deployment.
- * If the DSR guest type is IPFE, see [Performance Tuning Recommended](#).

To add DSR OVA image perform the following steps:

1. Copy the OVA file to the OpenStack control node.

```
$ scp DSR-x.x.x.x.x.ova admusr@node:~
```

2. Log in to the OpenStack control node.

```
$ ssh admusr@node
```

3. In an empty directory, unpack the OVA file using **tar**.

```
$ tar xvf DSR-x.x.x.x.x.ova
```

4. One of the unpacked files has a **.vmdk** suffix. This is the VM image file that must be imported.

```
DSR-x.x.x.x.x-disk1.vmdk
```

5. Source the OpenStack **admin** user credentials.

```
$ . keystone_admin
```

6. Select an informative name for the new image.

```
dsr-8.6.x.x.x-original
```

7. Import the image using the **glance** utility from the command line.

```
$ glance image-create --name dsr-x.x.x.x-original --visibility private --  
protected false --progress --container-format bare --disk-format vmdk --  
file DSR-x.x.x.x-disk1.vmdk
```

This process takes about 5 minutes depending on the underlying infrastructure.

8. Convert VMDK to QCOW2 format.
Use the **qemu-img** tool to create a qcow2 image file using this command.

```
qemu-img convert -f vmdk -O qcow2 <VMDK filename> <QCOW2 filename>
```

Example:

```
qemu-img convert -f vmdk -O qcow2 DSR-82_12_0.vmdk DSR-82_12_0.qcow2
```

Install the **qemu-img** tool (if not already installed) using this yum command.

```
sudo yum install qemu-img
```

9. Import the converted qcow2 image using the “glance” utility from the command line.

```
$ glance image-create --name dsr-x.x.x-original --is-public True --is-protected False --progress --container-format bare --disk-format qcow2 --file DSR-x.x.x-disk1.qcow2
```

This process takes about five minutes depending on the underlying infrastructure.

Note

The above two steps (8 and 9) are optional and are not needed if VMDK is used.

3.2.2 Configure NOAM Guests Role Based on Resource Profile (KVM/OpenStack Only)

This procedure configures networking on VMs.

1. Name the new VM instance.
 - a. Create an informative name for the new instance: NOAM1.
 - b. Examine the DSR Network to Device Assignments defined in *DSR Cloud Benchmarking Guide*.
2. Create and boot the NOAM VM instance from the glance image.

- a. Get the following configuration values.
The image ID

```
$ glance image-list
```

The flavor ID

```
$ nova flavor-list
```

The network ID (s)

```
$ neutron net-list
```

An informative name for the instance:

- NOAM1
 - NOAM2
- b. Create and boot the VM instance.
The instance must be owned by the DSR tenant user, not the admin user. Source the credentials of the DSR tenant user and issue the following command. Use one **--nic** argument for each IP/interface. Number of IP/interfaces for each VM type must conform with the DSR Network to Device Assignments defined in *DSR Cloud Benchmarking Guide*.

Note

IPv6 addresses should use the **v6-fixed-ip** argument instead of **v4-fixed-ip**.

```
$ nova boot --image <image ID> --flavor <flavor id> --nic net-id=<first network id>,v4-fixed-ip=<first ip address> --nic net-id=<second network id>,v4-fixed-ip=<second ip address> <instance name>
```

- c. View the newly created instance using the nova tool.

```
$ nova list --all-tenants
```

The VM takes approximately 5 minutes to boot and may be accessed through both network interfaces and the Horizon console tool.

3. Configure NOAM VIP.

This is an optional step.

Note

For information about Firewall Ports, refer to *DSR IP Flow* document. Refer to [Application VIP Failover Options \(OpenStack\)](#) for more information on VIP.

If a NOAM VIP is needed, run the following commands:

- a. Find the port ID associated with the NOAM instance XMI interface.

```
$ neutron port-list
```

- b. Add the VIP IP address to the address pairs list of the NOAM instance XMI interface port.

```
$ neutron port-update <Port ID> --allowed_address_pairs list=true type=dict ip_address=<VIP address to be added>
```

4. Check if interface is configured.

If DHCP is enabled on the Neutron subnet, VM configures the VNIC with the IP address provided in step 2. To verify, ping the XMI IP address provided with the **nova boot** command from step 2:

```
$ ping <XMI-IP-Provided-During-Nova-Boot>
```

If the ping is successful, ignore step 5 to configure the interface manually.

5. Manually configure interface, if not already done.

This is an optional step.

Note

If the instance is already configured with an interface and has successfully pinged (step 4), then ignore this step to configure the interface manually.

- a. Log in to the **Horizon** GUI as the DSR tenant user.
- b. Go to the **Compute/Instances** section.
- c. Click the **Name** field of the newly created instance.
- d. Select the **Console** tab.
- e. Log in as the `admusr` user.
- f. Configure the network interfaces, conforming with the DSR Network to Device Assignments defined in *DSR Cloud Benchmarking Guide*.

```
$ sudo netAdm add --onboot=yes --device=eth0 --address=<xmi ip> --  
netmask=<xmi net mask>  
$ sudo netAdm add --route=default --device=eth0 --gateway=<xmi gateway  
ip>
```

Verify network connectivity by pinging Gateway of XMI network.

```
$ ping -c3 <XMI Gateway>
```

Under some circumstances, it may be necessary to configure as many as 6 or more interfaces.

- g. Reboot the NOAM VM. It takes approximately 5 minutes for the VM to complete rebooting.

```
$ sudo init 6
```

The new VM should now be accessible through both network and Horizon consoles.

Note

To configure NOAM2, repeat the above steps for NOAM2.

3.2.3 Configure Remaining DSR Guests Based on Resource Profile and Configure Network (KVM/OpenStack Only)

This procedure adds network addresses for all VMs.

Note

This procedure provides an example for creating an SOAM. Follow the same steps to create other guests with their respective VM names and profiles.

1. Name the new VM instance.
 - a. Create an informative name for the new instance: **SOAM1**.
 - b. Examine the DSR Network to Device Assignments defined in *DSR Cloud Benchmarking Guide*.

2. Create and boot the SOAM VM instance from the glance image.

- a. Get the following configuration values.

The image ID

```
$ glance image-list
```

The flavor ID

```
$ nova flavor-list
```

The network ID(s)

```
$ neutron net-list
```

An informative name for the instance:

- SOAM1
- SOAM2

- b. Create and boot the VM instance.

The instance must be owned by the DSR tenant user, not the admin user. Source the credentials of the DSR tenant user and issue the following command. Use one **--nic** argument for each IP/interface. Number of IP/interfaces for each VM type must conform with the DSR Network to Device Assignments defined in *DSR Cloud Benchmarking Guide*.

Note

IPv6 addresses should use the **v6-fixed-ip** argument instead of **v4-fixed-ip**.

```
$ nova boot --image <image ID> --flavor <flavor id> --nic net-id=<first network id>,v4-fixed-ip=<first ip address> --nic net-id=<second network id>,v4-fixed-ip=<second ip address> <instance name>
```

- c. View the newly created instance using the nova tool.

```
$ nova list --all-tenants
```

The VM takes approximately 5 minutes to boot and may be accessed through both network interfaces and the **Horizon console** tool.

3. Configure SOAM VIP.

This is an optional step.

Note

Refer to [Allowed Address Pairs](#) for more information on VIP.

If an SOAM VIP is needed, run the following commands:

- a. Find the port ID associated with the SOAM instance XMI interface.

```
$ neutron port-list
```

- b. Add the VIP IP address to the address pairs list of the SOAM instance XMI interface port.

```
$ neutron port-update <Port ID> --allowed_address_pairs list=true  
type=dict ip_address=<VIP address to be added>
```

4. Check if interface is configured.

If DHCP is enabled on Neutron subnet, VM configures the VNIC with the IP address provided in step 2 above.

To verify, ping the XMI IP address provided with nova boot... command (step 2):

```
$ ping <XMI-IP-Provided-During-Nova-Boot>
```

If the ping is successful, ignore step 5.

5. Manually configure interface, if not already done.

This is an optional step.

Note

If the instance is already configured with an interface and successfully pinging (step 4), then ignore this step to configure the interface manually.

- a. Log in to the **Horizon** GUI as the DSR tenant user.
- b. Go to the **Compute/Instances** section.
- c. Click the **Name** field of the newly created instance.
- d. Select the **Console** tab.
- e. Log in as the **admusr** user.
- f. Configure the network interfaces, conforming with the DSR Network to Device Assignments defined in *DSR Cloud Benchmarking Guide*.

```
$ sudo netAdm add --onboot=yes --device=eth0 --address=<xmi ip> --  
netmask=<xmi net mask>
```

```
$ sudo netAdm add --route=default --device=eth0 --gateway=<xmi gateway  
ip>
```

Verify network connectivity by pinging Gateway of XMI network.

```
$ ping -c3 <XMI Gateway>
```

Under some circumstances, it may be necessary to configure as many as 6 or more interfaces.

6. Reboot the SOAM VM. It takes approximately 5 minutes for the VM to complete rebooting.

```
$ sudo init 6
```

The new VM should now be accessible through both network and Horizon consoles.

7. Verify network connectivity.
 - a. Access the **SOAM1 VM console** using OpenStack.
 - b. Log in as the **admusr** user.
 - c. Ping the NOAM1.

```
$ ping -c3 <IP Address in External Management Network>
```

Repeat above for the following VMs. Use unique labels for the VM names. Assign addresses to all desired network interfaces:

- MP(s)
- IPFE(s)
- MP vSTP (For vSTP configuration) (Optional Components)
- SOAM(s)
- Session SBRs, Binding SBR (Optional Components)
- DR NOAMs (Optional Components)

3.3 Create DSR Guests (OVM-S/OVM-M)

Perform the following task to create DSR guests in OVM-S or OVM-M.

Prerequisites:

This procedure requires values for these variables:

- <OVM-M IP> = IP address to access a sh prompt on the OVM server
- <URL to OVA> = Link to a source for downloading the product image (.ova)
- <MyRepository name> = Name of the repository in the OVM to hold the product image (.ova)

Running this procedure discovers and uses the values of these variables:

- <Virtual Appliance OVA ID>
- <OVA VM name_vm_vm>
- <OVM network id for (each subnet)>
- <OVM network name for (each subnet)>

This procedure imports the DSR image.

1. Access command line of OVM.

Refer to [Common OVM Manager Tasks \(CLI\)](#) for setting up the platform.

a. Get the site-specific values for these variables (overwrite example).

<OVM-M IP> = 100.64.62.221

b. Use the respective value for <OVM-M IP> into the command.

```
ssh -l admin <OVM-M IP> -p 10000
```

Example:

```
ssh -l admin 100.64.62.221 -p 10000
```

Alternatively, use a terminal emulation tool like putty.

2. In OVM-M CLI, import the VirtualAppliance/OVA.

a. Get the site-specific values for these variables (overwrite example).

<URL to OVA> = http://10.240.155.70/iso/DSR/8.6/ova/
DSR-9.0.1.0.0_95.14.0.ova

<MyRepository name> = XLab Utility Repo01

b. Use the respective values for <MyRepository name> and <URL to OVA> into the command.

```
OVM> importVirtualAppliance Repository name='<MyRepository name>'  
url="<URL to OVA>"
```

Example:

```
OVM> importVirtualAppliance Repository name='XLab Utility Repo01'  
url=http://10.240.155.70/iso/DSR/8.6/ova/DSR-9.0.1.0.0_95.14.0.ova
```

c. Run the command and validate success.

d. Examine the screen results to find site-specific text for variables in these locations.

Command:

```
importVirtualAppliance Repository name='XLab Utility Repo01'
url=http://10.240.155.70/iso/DSR/8.6/ova/DSR-9.0.1.0.0_95.14.0.ova
Status: Success
Time: 2017-04-18 15:23:31,044 EDT
JobId: 1492543363365
Data:
id: 1128a1c6ce name: DSR-9.0.1.0.0_95.14.0.ova
```

- e. Use the respective values for values for these variables (overwrite example).
<Virtual Appliance OVA ID> = 1128a1c6ce
- 3. In OVM-M CLI, get the virtual appliance ID.

The virtual appliance OVA ID is used in later steps.

- a. Get the site-specific text for these variables (overwrite example).
<Virtual Appliance OVA ID> = 1128a1c6ce
- b. Use the respective values for <Virtual Appliance OVA ID> into the command.

```
OVM> show VirtualAppliance id=<Virtual Appliance OVA id>
```

Example:

```
OVM> show VirtualAppliance id=1128a1c6ce
```

- c. Run the command and validate success.
- d. Examine the screen results to find site-specific text for variables in these locations.

Command:

```
show VirtualAppliance id=1128a1c6ce
Status: Success
Time: 2017-04-18 15:23:53,534 EDT
Data:
Origin = http://10.240.155.70/iso/DSR/8.6/ova/DSR-9.0.1.0.0_95.14.0.ova
Repository = 0004fb0000030000da5738315337bfc7 [XLab Utility Repo01]
Virtual Appliance Vm 1 = 11145510c0_vm_vm [vm]
Virtual Appliance VirtualDisk 1 = 11145510c0_disk_disk1 [disk1]
Id = 11145510c0 [DSR-8.6.0.0.0_95.14.0.ova]
Name = DSR-9.0.1.0.0_95.14.0.ova
Description = Import URL: http://10.240.155.70/iso/DSR/8.6/ova/
DSR-9.0.1.0.0_95.14.0.ova
Locked = false
```

- e. Use the respective values for these variables (overwrite example).
<OVA VM name_vm_vm> = 11145510c0_vm_vm
- 4. In OVM-M CLI, determine the OVM network IDs (established during the platform installation).

```
OVM> list Network
```

- a. Run the command and validate success.
- b. Examine the screen results to find the find site-specific OVM values for each subnet:

- <OVM network ID>
 - <OVM network name>
- c. Note the entire screen results. Refer to this data in later steps.

```

Command: list network
Status: Success
Time: 2017-04-19 18:51:42,494 EDT
Data: id:10486554b5 name:XSI-7 (10.196.237.0/25)
id:10f4d5744c name:XMI-11 (10.75.159.0/25)
id:10775cf4e5 name:IDIH Internal
id:102e89a481 name:IMI Shared (169.254.9.0/24)
id:c0a80500 name:192.168.5.0
id:10d8de6d9a name:XSI-6 (10.196.236.128/25)
id:10806a91fb name:XSI-8 (10.296.237.128/25)
id:10a7289add name:Control DHCP
id:1053a604f0 name:XSI-5 (10.196.236.0/25)
id:10345112c9 name:XMI-10 (10.75.158.128/25)

```

- d. Use the respective values for network ID variables (change the examples in this table according to the values).

Table 3-1 Network ID Variables

	OAM (XMI)	Local (IMI)	Signaling A (XSI1)	Signaling B (XSI2)	Signaling C (XSI3-16)	Replication (SBR Rep)	DIH Internal
<OVM network name>	XMI-10	IMI Shared	XSI-5	XSI-6	XSI-7	DIH Internal	XMI-10
<OVM network ID>	10345112c9	102e89a481	1053a604f0	10d8de6d9a		10486554b5	10775cf4e5

3.4 Configure Virtual Machines (OVM-S/OVM-M)

This procedure creates virtual machines. Repeat this procedure for each DSR VM guest that needs to be created.

Prerequisites:

This procedure requires values for these variables:

- <OVA VM name_vm_vm>
- <ServerPool name>
- <VM name>
- <OVM network ID for XMI>
- <OVM network ID for IMI>
- <OVM network ID for XSI#> where # is a numeric from 1-16, for the signaling networks
- <OVM network ID for Replication XSI#>
- <URL for OVM GUI>
- <VM IP in XMI> from the NAPD
- <Gateway for XMI> from the NAPD
- <NetMask for XMI> from the NAPD

Running this procedure discovers and uses the values of these variables:

- <VM ID>
 - <vCPUs Production>
 - <VNIC 1 ID>
 - <interface name> defined in *DSR Cloud Benchmarking Guide*
1. In OVM-M CLI, create a VM for each guest from the VM in the OVA virtual appliance.
 - a. Get the site-specific text for these variables (overwrite example).
<OVA VM name_vm_vm> = 11145510c0_vm_vm
 - b. Use the respective values for <OVA VM name> in the command.

```
OVM> createVmFromVirtualApplianceVm VirtualApplianceVm name=<OVA VM
name>
```

Example:

```
OVM> createVmFromVirtualApplianceVm VirtualApplianceVm
name=11145510c0_vm_vm
```

- c. Run the command and validate success.
- d. Examine the screen results to find site-specific text for variables in these locations.

```
createVmFromVirtualApplianceVm VirtualApplianceVm name=11145510c0_vm_vm
Status: Success
Time: 2017-04-18 16:02:09,141 EDT
JobId: 1492545641976
Data:
id: 0004fb00000600004a0e02bdf9fc1bcd
name: DSR-9.0.1.0.0_95.14.0.ova_vm
```

- e. Use the respective values for these variables (overwrite example).
<VM ID> = 0004fb00000600004a0e02bdf9fc1bcd

2. In OVM-M CLI, add the VM to the server pool.

- a. Get the site-specific text for these variables (overwrite example).
<VM ID> = 0004fb00000600004a0e02bdf9fc1bcd
<ServerPool name> = XLab Pool 01
- b. Use the respective values for <VM ID> and <ServerPool name> in the command.

```
OVM> add Vm id=<VM id> to ServerPool name="<ServerPool name>"
```

Example:

```
OVM> add Vm id=0004fb00000600004a0e02bdf9fc1bcd to ServerPool
name="XLab Pool 01"
```

- c. Run the command and validate success.

```
add Vm id=0004fb0000060000be93da703830d3c to ServerPool name="XLab
Pool 01"
```

Status: Success
Time: 2017-04-19 21:05:10,950 EDT
JobId: 1492650310802

Note

Refer to [Server Pool](#) for more information.

3. In OVM-M CLI, edit VM to apply required profile or resources.
 - a. Get the site-specific text for these variables (overwrite example).
 <VM ID> = 0004fb00000600004a0e02bdf9fc1bcd
 <VM name > = na-noam-na-2a
 <vCPUs Production> = 4
 - b. Refer to *DSR Cloud Benchmarking Guide* for recommended resource.

Table 3-2 Recommended Resource

VM Name	vCPUs Lab	RAM (GB) Lab	vCPUs Production	RAM (GB) Production	Storage (GB) Lab and Production
Type of guest host	#	#	#	#	3

- c. Use the respective values for <VM ID>, <VM name>, and <vCPUs Production> into the command.

```
OVM> edit Vm id=<VM id> name=<VM name> memory=6144 memoryLimit=6144
cpuCountLimit=<vCPUs Production> cpuCount=<vCPUs Production>
domainType=XEN_HVM description="<VM name>"
```

Example:

```
OVM> edit Vm id=0004fb00000600004a0e02bdf9fc1bcd name=na-noam-na-2a
memory=6144 memoryLimit=6144 cpuCountLimit=4 cpuCount=4
domainType=XEN_HVM description="na-noam-na-2a"
```

- d. Run the command and validate success.

```
edit Vm id=0004fb00000600004a0e02bdf9fc1bcd name=na-noam-na-2a
memory=6144 memoryLimit=6144 cpuCountLimit=4 cpuCount=4
domainType=XEN_HVM description="na-noam-na-2a"
Status: Success
Time: 2017-04-18 17:55:25,645 EDT
JobId: 1492552525477
```

Now, the VM has a name and resources.

4. In OVM-M CLI, determine VNIC ID.
 - a. Get the site-specific text for these variables (overwrite example).
 <VM name> = na-noam-na-2a

- b. Use the respective value for <VM name> into the command.

```
OVM> show Vm name=<VM name>
```

Example:

```
OVM> show Vm name=na-noam-na-2a
```

- c. Run the command and validate success.
d. Examine the screen results to find site-specific text for variables in these locations.

```
Status = Stopped
Memory (MB) = 6144
Max. Memory (MB) = 6144
Processors = 4
Max. Processors = 4
Priority = 50

Locked = false
DeprecatedAttrs = [Huge Pages Enabled (Deprecated for PV guest)]
```

- e. Use the respective values for these variables (overwrite example).
<Vnic 1 ID> = 0004fb0000070000091e1ab5ae291d8a

5. Determine network interfaces for the type of guest host.

Refer to *DSR Cloud Benchmarking Guide* to learn which network interfaces need to be configured for each guest type. The following table provides details about the type of guest host:

Table 3-3 Network Interfaces

	OAM (XMI)	Local (IMI)	Sig A (XSI1)	Sig B (XSI2)	Sig C (XSI3-16)	Rep (SBR)	DIH Internal
Type of guest host	eth#	eth#	eth#	eth#	eth#	eth#	eth#

Note

The VNICs need to be created in the correct order so the interfaces are associated with the correct network.

6. In OVM-M CLI, attach XMI VNIC (if required by guest host type).
 - a. Get the site-specific text for these variables (overwrite example).
 <VNIC 1 ID> = 0004fb0000070000091e1ab5ae291d8a
 <OVM network ID for XMI> = 10345112c9
 - b. Use the respective values for <VNIC 1 ID> and <OVM network ID for XMI> into the command.

```
OVM> add Vnic ID=<Vnic 1 ID> to Network name=<OVM network ID for XMI>
```

Example:

```
OVM> add Vnic ID=0004fb0000070000091e1ab5ae291d8a to Network  
name=10345112c9
```

- c. Run the following command and validate success.

```
add Vnic id=0004fb0000070000091e1ab5ae291d8a to Network name=10345112c9  
Status: Success  
Time: 2017-04-19 19:08:59,496 EDT  
JobId: 1492643339327
```

7. In OVM-M CLI, create and attach IMI VNIC (if required by guest host type).
 - a. Get the site-specific text for these variables (overwrite example).
 <VM name> = na-noam-na-2a
 <OVM network ID for IMI> = 102e89a481
 - b. Use the respective values for <OVM network ID for IMI> and <VM name> into the command.

```
OVM> create Vnic network=<OVM network ID for IMI> name=<VM name>-IMI on  
VM name=<VM name>
```

Example:

```
OVM> create Vnic network=102e89a481 name=na-noam-na-2a-IMI on Vm  
name=na-noam-na-2a
```

- c. Run the command and validate success.

Command:

```
create Vnic network=102e89a481 name=na-noam-na-2a-IMI on Vm name=na-
noam-na-2a
Status: Success
Time: 2017-04-19 21:21:57,363 EDT
JobId: 1492651317194
Data:
id: 0004fb00000700004f16dc3bfe0750a7
name:na-noam-na-2a-IMI
```

8. In OVM-M CLI, create and attach XSI VNIC(s) (if required by guest host type).

Note

Repeat this step if the VM has multiple signaling networks, specifying the number of the network.

- a. Get the site-specific text for these variables (overwrite example).
 <VM name> = hostname
 <OVM network ID for XSI#> = 1053a604f0
 <#> = the number of the XSI network [1-16]
- b. Use the respective values for <OVM network ID for XSI#> and <VM name> into the command.

```
OVM> create Vnic network=<OVM network id for XSI#> name=<VM name>-
XSI<#> on Vm name=<VM name>
```

Example:

```
OVM> create Vnic network=1053a604f0 name=hostname-XSI1 on Vm
name=hostname
```

- c. Run the command and validate success.
9. In OVM-M CLI, create and attach replication VNIC (if required by guest host type).
 - a. Get the site-specific text for these variables (overwrite example).
 <VM name> = hostname
 <OVM network ID for Replication XSI#> = 10486554b5
 <OVM network name for Replication XSI#> = XSI7
 <#> = the number of the XSI Replication network [1-16]
 - b. Use the respective values for <OVM network ID for Replication XSI#>, <OVM network name for Replication XSI#>, and <VM name> into the command.

```
OVM> create Vnic network=<OVM network id for Replication XSI#> name=<VM
name>-<OVM network name for Replication XSI#> on Vm name=<VM name>
```

Example:

```
OVM> create Vnic network=10486554b5 name= hostname-XSI7 on Vm
name=hostname
```

- c. Run the command and validate success.

10. In OVM-M CLI, start VM.

- a. Get the site-specific text for these variables (overwrite example).

```
<VM name> = na-noam-na-2a
```

- b. Use the respective values for <VM name> into the command.

```
OVM> start Vm name=<VM name>
```

Example:

```
OVM> start Vm name=na-noam-na-2a
```

- c. Run the command and validate success.

Command:

```
start Vm name=na-noam-na-2a
Status: Success
Time: 2017-04-19 19:29:35,376 EDT
JobId: 1492644568558
```

11. In OVM-M GUI, configure the XMI network interface for this VM.

- a. Get the site-specific text for these variables (overwrite example).

```
<URL for OVM GUI> = https://100.64.62.221:7002/ovm/console/faces/resource/
resourceView.jspx
```

```
<interface name> = from the table in DSR Cloud Benchmarking Guide
```

```
<VM IP in XMI> = from the NAPD
```

```
<Gateway for XMI> = from the NAPD
```

```
<NetMask for XMI> = from the NAPD
```

- b. Access the CLI of the console for the VM.
- c. Log into the **OVM-M** GUI by typing the **<URL for OVM GUI>** into a browser.
 - i. Navigate to the Servers and VMs tab.
 - ii. Expand and select the <ServerPool name>.
 - iii. From the **Perspective** list, select **Virtual Machines**.
 - iv. Select the <VM name> from the rows listed, and click the **Launch Console** icon.
 - v. In the Console window, log into the VM as the admusr.
- d. Use the respective values for <interface name>, <VM IP in XMI>, <Gateway for XMI>, and <NetMask for XMI> into the commands.

XMI:

```
$ sudo netAdm set --onboot=yes --device=<interface name> --address=<VM  
IP in XMI> --netmask=<NetMask for XMI>  
$ sudo netAdm add --route=default --device=<interface name> --  
gateway=<Gateway for XMI>
```

Example:

```
$ sudo netAdm set --onboot=yes --device=eth0 --address=10.75.158.189 --  
netmask=255.255.255.128
```

Example:

```
$ sudo netAdm add --route=default --device=eth0 --gateway=10.75.158.129
```

- e. Run the command and validate success.
- f. Verify network connectivity by pinging Gateway of network.

```
$ ping -c3 <Gateway for XMI>
```

- g. Reboot the VM. It takes approximately 5 minutes for the VM to complete rebooting.

```
$ sudo init 6
```

The new VM should now be accessible through both network and console.

3.5 DSR Installation on OL7 and KVM

DSR Installation on OL7 and KVM includes the following procedures:

- Install DSR on Oracle Linux/KVM
- Create and install OCDSR VMs through KVM GUI

Note

If using a hardware in remote LAB then use a remote windows machine to install Linux. Ensure that OEL 7 ISO is also located locally in remote windows machine.

3.5.1 Install DSR on Oracle Linux/KVM

This procedure installs DSR configuration on Oracle Linux OS with direct KVM as hypervisor.

Note

- This installation procedure only applies when installing DSR on Oracle Linux OS via direct KVM.
- For the Oracle Linux OS, Oracle Linux 7.7 release is used and verified OK.
- The snapshot used for this procedure has been taken from HP Gen-10 Blade.
- This procedure can be run on any flavor of blade that requires DSR installation on OL7.7 and KVM.

Prerequisites:

All the respective infrastructures has to be up and running.

Perform the following steps on each blade:

1. Mount virtual media contains Oracle Linux OS software.

Follow steps defined in Mounting Virtual Media on Blade:

- Open the ILO.
- Attach the OEL 7.7 ISO in ILOs virtual drives->Image File CD/DVD ROM.

To mount the Oracle Linux OS software ISO from ILO GUI:

- Navigate to **Virtual drives**, and then **Menu**.
- Click on **Image File**, then select image from folder.

2. Reboot host, log in to Blade Server ILo GUI browser page and launch remote console.

To reboot host:

Click **Power Switch** and select **Reset** from the dropdown menu.

The remote console window displays that the host is rebooting.

Wait for a couple of minutes for reboot to complete.

3. Initiate Oracle Linux Platform installation.

Once reboot completes, the host boots with Oracle Linux installation ISO and the GUI screen prompts for the installation options.

Select **Install Oracle Linux 7.x** to continue.

4. Choose Oracle Linux OS language.
 - a. When prompted, select **English** as Oracle Linux OS language.
 - b. Press **Continue** to go to next step.
5. Set up time zone.

The next page INSTALLATION SUMMARY displays the required information to start installation.

Navigate to **Localization**, and then **DATE & TIME**.

- Pick a time zone by selecting a region and city from the drop-down lists, or by clicking a location on the map.
- Choose a country and city that are in the same time zone as your system.

You need to specify a time zone even if you intend to use the Network Time Protocol (NTP) to set the time on the system. Before you can enable NTP, ensure that the system is connected to a network by selecting the **Network & Hostname** option on the INSTALLATION SUMMARY screen.

To enable NTP:

- Switch **ON** the Network Time.
- Click **Settings** button to display a dialog where you can configure the NTP servers used by the system.

To set the date and time manually:

- Switch **OFF** the Network Time
- Adjust the date and time at the bottom of the screen if needed.

Click **Done** to save your configuration and return to the INSTALLATION SUMMARY screen.

6. Setup installation base environment.

Click **SOFTWARE SELECTION** options in the SOFTWARE area. Select **Server with GUI** from the Base Environment area, and ensure that the following add-ons are selected:

- Virtualization Client
- Virtualization Hypervisor
- Virtualization Tools
- Compatibility Libraries

Click **Done** to save the changes and go back to the main configuration page.

7. Set up installation destination.

Click **INSTALLATION DESTINATION** in the SYSTEM area.

- Select 'sda' (or 'sdb') to use
- Check **Automatically configure partitioning**
- Click **Done** to continue

8. Review all the information and click **Begin Installation**.

Note

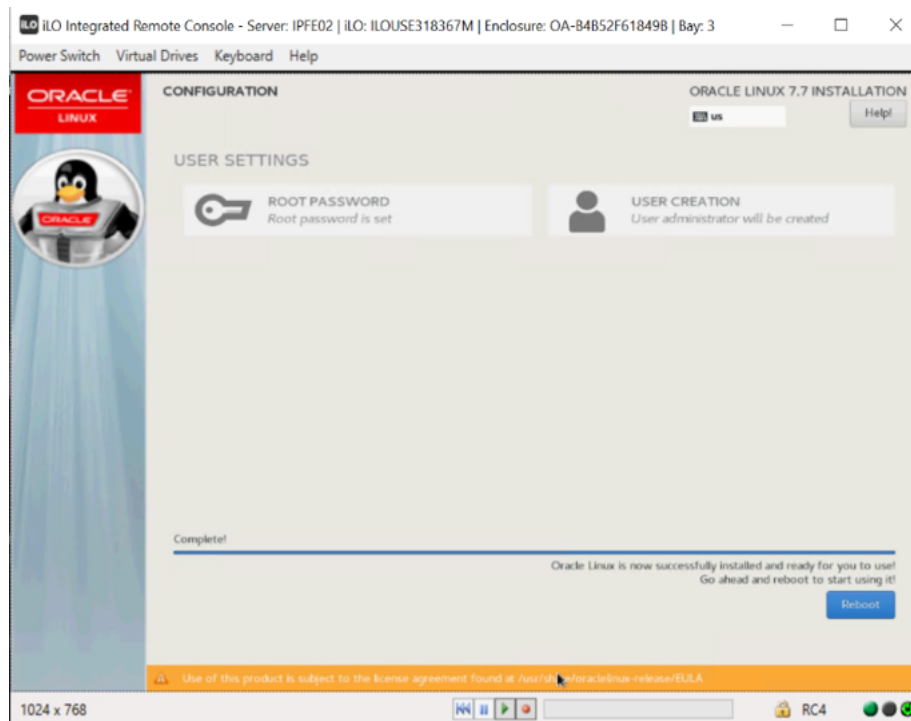

Network configuration is not mandatory at this point and can be performed after Oracle Linux OS is installed.

9. Create login credentials.

At the same time Oracle Linux installation software lays down files into Gen 10 local hard disk, you may configure root credential or any other login credentials as per the requirement.

10. Reboot host after installation completed.

Wait for the installation to complete, until the following screen appears.

Click **Reboot** button to reboot.

11. Read and Accept license agreement.

Check **I accept the license agreement** and click **Finish Configuration** to continue. Skip when prompted for ULN settings.

12. Verify kernel version and KVM version.

Open SSH console window and check following:

```

administrator@localhost:/home/administrator
File Edit View Search Terminal Help
[administrator@localhost ~]$ lvsdisplay
bash: lvsdisplay: command not found...
[administrator@localhost ~]$ su
Password:
[root@localhost administrator]# lvsdisplay
bash: lvsdisplay: command not found...
[root@localhost administrator]# virt-manager
[root@localhost administrator]# uname -a
Linux localhost.localdomain 4.14.35-1902.3.2.el7uek.x86_64 #2 SMP Tue Jul 30 03:
59:02 GMT 2019 x86_64 x86_64 x86_64 GNU/Linux
[root@localhost administrator]# virsh version
Compiled against library: libvirt 4.5.0
Using library: libvirt 4.5.0
Using API: QEMU 4.5.0
Running hypervisor: QEMU 1.5.3
[root@localhost administrator]#

```

13. Change network interface name pattern to ethx.

Edit /etc/default/grub to append 'net.ifnames=0' with option

GRUB_CMDLINE_LINUX:

```
[root@localhost ~]# cat /etc/default/grub
```

```

GRUB_TIMEOUT=5
GRUB_DISTRIBUTOR="$(sed 's, release .*$,,g' /etc/system-release)"
GRUB_DEFAULT=saved
GRUB_DISABLE_SUBMENU=true
GRUB_TERMINAL_OUTPUT="console"
GRUB_CMDLINE_LINUX="crashkernel=auto rd.lvm.lv=ol/root rd.lvm.lv=ol/swap rhgb
iet net.ifnames=0"
GRUB_DISABLE_RECOVERY="true"

```

Recreate the grub2 config file by running:

```
grub2-mkconfig -o /boot/grub2/grub.cfg
```

Restart host and verify that the network interfaces have **ethx** name pattern, by running:

```
shutdown -r
```

14. Create bond0 device.

a. Create device bond0 configuration file:

```
vim /etc/sysconfig/network-scripts/ifcfg-bond0
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-bond0
DEVICE=bond0
TYPE=Bonding
BOND_INTERFACES=eth0,eth1
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
BONDING_OPTS="mode=active-backup primary=eth0 miimon=100"
```

Save the file and exit.

- b. Create device eth0 configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-eth0
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-eth0
DEVICE=eth0
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
MASTER=bond0
SLAVE=yes
```

Save the file and exit.

- c. Create device eth1 configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-eth1
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-eth1
DEVICE=eth1
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
MASTER=bond0
SLAVE=yes
```

Save the file and exit.

- d. Bring up devices into services.

```
[root@DSR-Gen10-ol7 ~]# ifup eth0
[root@DSR-Gen10-ol7 ~]# ifup eth1
[root@DSR-Gen10-ol7 ~]# ifup bond0
[root@DSR-Gen10-ol7 ~]# _
```

15. Create IMI bridge.

- a. Create bond0.<imi_vlan> configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-bond0.<imi_vlan>
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-eth
DEVICE=eth0
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
MASTER=bond0
SLAVE=yes
```

- b. Create imi device configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-imi
```

```
[root@DSR-Gen10-ol7 ~]# vim /etc/sysconfig/network-scripts/ifcfg-imi
DEVICE=imi
TYPE=Bridge
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
BRIDGE_INTERFACES=bond0.4
```

- c. Bring up devices into services.

```
[root@DSR-Gen10-ol7 ~]# ifup bond0.4
[root@DSR-Gen10-ol7 ~]# ifup imi
[root@DSR-Gen10-ol7 ~]# _
```

16. Create XMI bridge.

- a. Create bond0.<xmi_vlan> configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-bond0.<xmi_vlan>
```

- b. Create xmi device configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-xmi
```

- c. Set default route for xmi network.

```
vim /etc/sysconfig/network-scripts/route-xmi default via <xmi_gateway>
table main
```

- d. Bring up the devices into service.

```
[root@DSR-Gen10-ol7 ~]# ifup bond0.3
[root@DSR-Gen10-ol7 ~]# ifup imi
[root@DSR-Gen10-ol7 ~]#
```

17. Create bond1 device.

- a. Create device bond1 configuration file:

```
vim /etc/sysconfig/network-scripts/ifcfg-bond1
```

- b. Create device eth2 configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-eth2
```

- c. Create device eth3 configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-eth3
```

- d. Bring up devices into services.

```
[root@DSR-Gen10-ol7 ~]# ifup eth2
[root@DSR-Gen10-ol7 ~]# ifup eth3
[root@DSR-Gen10-ol7 ~]# ifup bond1
[root@DSR-Gen10-ol7 ~]#
```

18. Create xsi1/xsi2 bridge.

- a. Create device bond1.<xsi1_vlan> configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-bond1.<xsi1_vlan>
```

- b. Create device xsi1 configuration file.

```
vim /etc/sysconfig/network-scripts/ifcfg-xsi1
```

- c. Bring up devices into services.

```
[root@DSR-Gen10-ol7 ~]# ifup xsi1
[root@DSR-Gen10-ol7 ~]# ifup bond1.5
```

Note

Perform similar step to create network devices for xsi2.

19. Set host name.

- a. Rename host by modifying /etc/hostname file.

```
[root@localhost ~]# cat /etc/hostname
DSR-Gen10-ol7
[root@localhost ~]#
```

- b. Review host name change with following command.

```
[root@localhost ~]# hostnamectl status
  Static hostname: DSR-Gen10-ol7
        Icon name: computer-server
        Chassis: server
        Machine ID: 0feb15c7d858467995a403846cc779c4
        Boot ID: 3538d11fb3004079b1164ca646b924a7
  Operating System: Oracle Linux Server 7.7
        CPE OS Name: cpe:/o:oracle:linux:7:7:server
        Kernel: Linux 4.14.35-1902.3.2.el7uek.x86_64
  Architecture: x86-64
[root@localhost ~]#
```

20. Set NTP service.

- a. Modify `/etc/chrony.conf`, comment out all server * entries and append your NTP server IP to the list with prepending 'server ' text:

```
# Use public servers from the pool.ntp.org project.
# Please consider joining the pool (http://www.pool.ntp.org/join.html).
#server 0.pool.ntp.org iburst
#server 1.pool.ntp.org iburst
#server 2.pool.ntp.org iburst
#server 3.pool.ntp.org iburst
server 10.250.32.10
```

- b. Force ntp to sync with newly added server:

- `$ ntpdate 10.250.32.10`
- `$ timedatectl`
- `$ chronyc tracking`

- c. Verify time synced.

```
[root@localhost ~]# chronyc tracking
Reference ID    : 0AFA200A (10.250.32.10)
Stratum        : 4
Ref time (UTC) : Tue Mar 17 17:53:37 2020
System time    : 0.000019021 seconds fast of NTP time

Leap status    : Normal
[root@localhost ~]# █
```

21. Create `/home/ova` directory.

```
[root@DSR-Gen10-ol7 ~]# mkdir /home/ova/
[root@DSR-Gen10-ol7 ~]# cd /home/ova/
[root@DSR-Gen10-ol7 ova]# _
```

22. Transfer OVA file dir using sftp tool.

```
[root@DSR-Gen10-ol7 ova]# ll
total 36911960
-rw-r--r--. 1 root root 1653708800 Mar 14 16:02 DSR-8.4.0.0_84.17.0.ova
```

23. Untar the ova file.

```
[root@DSR-Gen10-ol7 ova]# tar xvf DSR-8.4.0.0_84.17.0.ova
DSR-84_17_0.ovf
DSR-84_17_0.mf
DSR-84_17_0.vmdk
[root@DSR-Gen10-ol7 ova]#
```

24. Convert the vmdk file to qcow2 file.

```
[root@DSR-Gen10-ol7 ova]# qemu-img convert -O qcow2 DSR-84_17_0.vmdk DSRNO-84_17_0.qcow2
[root@DSR-Gen10-ol7 ova]#
```

25. Copy the qcow2 files for SO and MP.

```
[root@DSR-Gen10-ol7 ova]# cp DSRNO-84_17_0.qcow2 DSRNO-84_17_0.qcow2
[root@DSR-Gen10-ol7 ova]# cp DSRNO-84_17_0.qcow2 DSRMP-84_17_0.qcow2
```

26. Configure storage for corresponding qcow2 files as per VMs.

- a. To set the storage for each VM, then run:

```
qemu-img resize <NO_qcow2_filename>.qcow2 <storage_in_gigabytes>G
```

- b. Run the command for a VM if storage required is >60G. No need to run this command if the storage required is 60G.

For example: If resource profile is 2K Sh and VM is NOAMP, whereas the storage required is 70G, then run:

```
qemu-img resize DSRNO-84_17_0.qcow2 70G
```

For multiqueue setting refer to [Multiqueue on IPFE \(KVM\)](#). For Ring buffer, refer [#unique_79](#).

27. Set the txqueue length for the ether-net adapter to a high value on the host machine.

Add below script to the above created file /sbin/ifup-local

```
[root@DSR-Gen10-ol7 oval]# vim /sbin/ifup-local
```

```
ifconfig eth0 txqueuelen 120000
ifconfig eth1 txqueuelen 120000
ifconfig eth2 txqueuelen 120000
ifconfig eth3 txqueuelen 120000
```

28. Verify txqueue length for the ether-net adapter to a high value on the host machine that is added on all interfaces.

```
[root@DSR-Gen10-ol7 oval]# ifconfig <ethernet adapter>
```

Verify same for eth1, eth2, and eth3

29. Restart all ethernet adapters eth0, eth1, eth2, and eth3, one at a time.

```
[root@DSR-Gen10-ol7 oval]# ifdown <ethernet adapter>
[root@DSR-Gen10-ol7 oval]# ifup <ethernet adapter>
```

30. Reboot the host machine.

```
[root@DSR-Gen10-ol7 oval]# reboot
```

31. Verify below points on host machinering buffer sizes are set to max on all the ether-net devices txqueue length for all the ether-net adapter to a high value.

Verify that the following configurations on host machine persist as per the configuration done above:

- If you have performed Multiqueue configuration on IPFE using [Multiqueue on IPFE \(KVM\)](#), verify the configuration as mentioned the appendix.
- Ring buffer size setting to max on all the ether-net devices using Step 26.
- The txqueue length for all the ether-net adapter to a high value using Step 17.

32. Create OCDSR VMs. Repeat this step for each VM.

To create OCDSR VMs such as NO, SO, MP, IPFE and so on, see [Create and Install DSR VMs through KVM GUI](#). Repeat this procedure for each VM.

33. Add the network device.

Login to each VM created and add the network devices:

NO:

- netAdm add --device=eth0
- netAdm add --device=eth1

SO:

- netAdm add --device=eth0
- netAdm add --device=eth1

MP:

- netAdm add --device=eth0

- `netAdm add --device=eth1`
- `netAdm add --device=eth2`
- `netAdm add --device=eth3`

For example:

```
[root@hostnameef3975b010b56 ~]# netAdm add --device=eth0
ERROR: Interface eth0 already exists
ERROR: Configuration of eth0 failed
[root@hostnameef3975b010b56 ~]# netAdm add --device=eth1
Interface eth1 added
[root@hostnameef3975b010b56 ~]# netAdm add --device=eth2
Interface eth2 added
[root@hostnameef3975b010b56 ~]# netAdm add --device=eth3
Interface eth3 added
```

Note

- eth0 is XMI
- eth1 is IMI
- eth2 is XSI1
- eth3 is XSI2 (create eth3 if XSI2 is required)

34. Configure XMI network address.

Set XMI network address for each DSR VM:

```
netAdm set --device=eth0 --onboot=yes --netmask=<XMI_netmask> --
address=<XMI_network_address>
```

```
netAdm add --device=eth0 --route=default --gateway=<XMI_gateway>
```

For example:

```
[root@hostnameef3975b010b56 ~]# netAdm set --onboot=yes --device=eth0 --netmask=2
55.255.255.128 --address=10.75.193.195
Interface eth0 updated
[root@hostnameef3975b010b56 ~]# netAdm add --device=eth0 --route=default --gatewa
y=10.75.193.129
Route to eth0 added
[root@hostnameef3975b010b56 ~]#
```

35. Configure NTP service.

- Configure NTP service for each VM. Run this step on VM.
- Open the `/etc/ntp.conf` file and add the NTP servers used in your environment. You can add multiple NTP servers, similar to the examples shown below:

```
#  
# List of NTP servers and peers  
#  
server 10.250.32.10 iburst  
server ntpserver1 iburst  
server ntpserver2 iburst  
server ntpserver3 iburst  
peer ntppeerA iburst  
peer ntppeerB iburst
```

- c. Run the service ntpd start command to start the NTP service and implement the configuration changes.

```
[admusr@hostnameef37eece35d2c ~]$ sudo service ntpd restart  
Shutting down ntpd: [ OK ]  
Starting ntpd: [ OK ]
```

- d. Verify ntp status.

```
[admusr@hostnameef37eece35d2c ~]$ ntpstat  
synchronised to NTP server (10.250.32.10) at stratum 4  
time correct to within 1877 ms  
polling server every 64 s
```

3.5.2 Create and Install DSR VMs through KVM GUI

This procedure installs DSR VMs NO, SO, and MP using KVM GUI.

Note

This installation procedure is only applicable for each VM: NO, SO, MP and so on.

Prerequisites:

[Installing DSR on OL8 and KVM](#) procedure must be completed.

1. Log in to the host machine which has Oracle Linux installed and open the Virtual Machine Manager through CLI, by running:

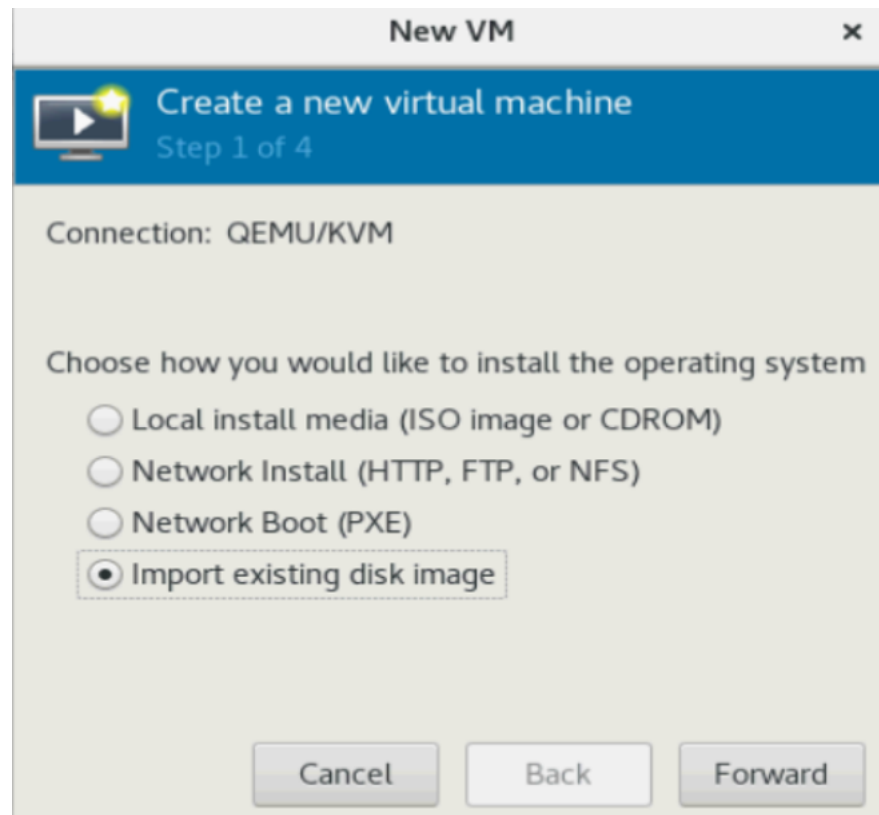

```
virt-manager
```

Note

Ensure X11 forwarding is enabled before running virt-manager command on CLI.

2. Create a new Virtual Machine using the Virtual Manager GUI.
 - a. Click **File**, and then **New Virtual Machine**.
 - b. Select **Import existing disk image**.

3. Select the qcow2 image by browsing the location `/home/ova` and click **Forward**.

Note

Refer to [Installing DSR on OL8 and KVM](#)

New VM

Create a new virtual machine
Step 2 of 4

Provide the existing storage path:

/home/ova/DSRNO_00-84_17_0.qcow2 Browse...

Choose an operating system type and version

OS type: Generic

Version: Generic

Cancel Back Forward

4. Select RAM and vCPUs for VM.

For each VM, select the RAM and vCPUs as per the required resource profile. Then, click **Forward**.

New VM

Create a new virtual machine
Step 3 of 4

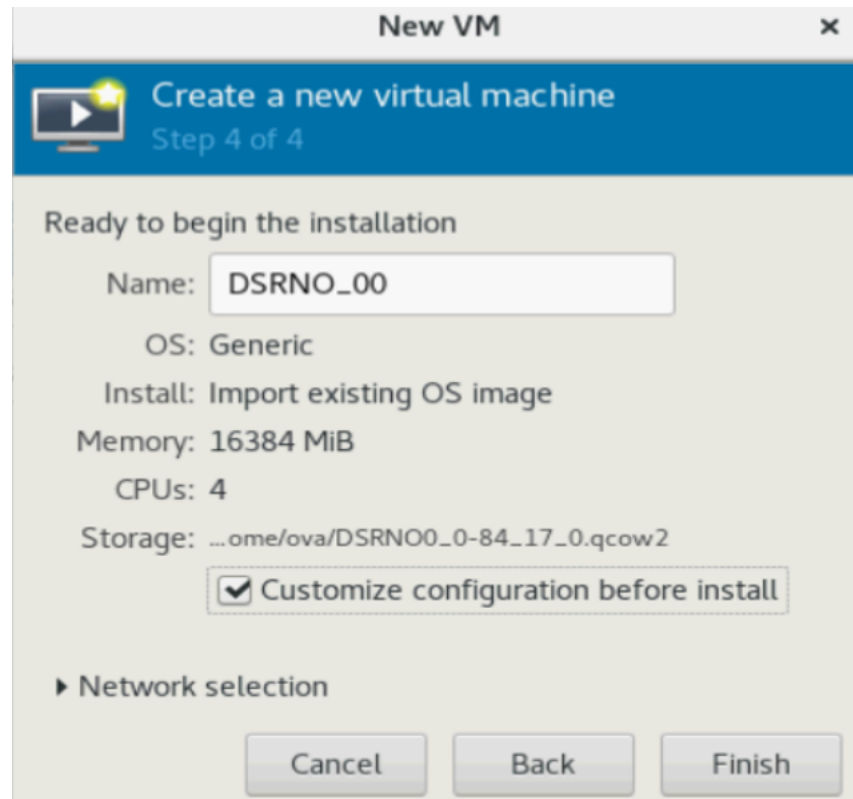

Choose Memory and CPU settings

Memory (RAM): 16384 Up to 128680 MiB available on the host

CPUs: 4 Up to 32 available

Cancel Back Forward

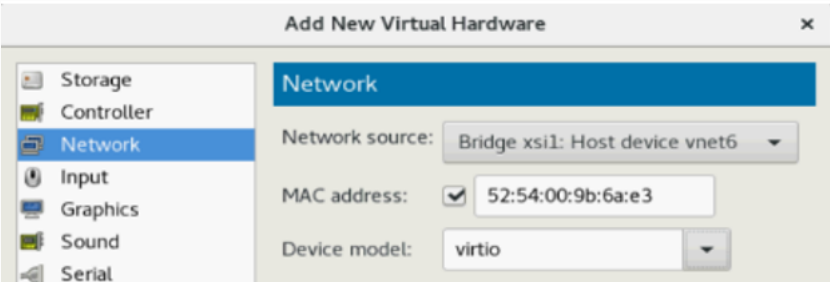

5. Verify and customize VM.
 - a. Update the VM name and select **Customize configuration before install**.
 - b. Under **Network selection**, select **XMI bridge** and click **Finish**.

6. Modify the Device model to virtio for XMI bridge.
7. Customize the network configuration.
 - a. On the next screen, click **Add Hardware**
 - b. Select as following:
 - Under Network source, choose the **IMI Bridge**.
 - For NO and SO, choose **IMI bridge only**.
 - For MP, add **XSI1**, along with **IMI** by repeating this step.
 - c. Click **Finish**.

Note

Only for MP, we need to add XSI1 & XSI2 bridge as well.
For XSI1 bridge:

For XSI2 bridge:

Note

- For DSR Topology it is recommended to add all interfaces on each VM, even when the VM does not require that interface or does not use a VLAN.
- It is just to use a standard when the topology is created from NOAM GUI.

Table 3-4 DSR VMs

DSR VMs	
XMI	eth0
IMI	eth1
XSI1	eth2
XSI2	eth3

Add all interfaces as needed. After adding the other networks, you will see the NICs appear.

Note

- After adding all bridges, verify and begin the VM installation.
- To disable the TSO GSO features for SBR server, see [Disabling TSO GSO features for SBR server](#).

4

Software Installation Using HEAT Templates (OpenStack)

4.1 Prepare OpenStack Template and Environment Files

This procedure gathers required templates and environment files to provide while deploying NOAM or signaling stacks.

Prerequisites

All the respective infrastructures has to be up and running.

1. Log in to the [Oracle Document Repository](#).

2. Select the respective DSR release folder.

Example: Release 9.0.1.0.0

3. Download the HEAT Templates zip file under **Cloud Installation and Upgrade** section.

4. Unzip the HEAT templates to a folder.

- a. Create a new folder with any name for storing the HEAT templates under the home directory.

Example: /home/heat_templates

- b. Store the downloaded HEAT templates zip file in the folder.

Example: /home/heat_templates/exampleHeat.zip

- c. Unzip the downloaded heat templates.

```
unzip /home/heat_templates/exampleHeat.zip
```

5. Determine the template and environment files.

Below are possible deployment use cases of DSR. The HEAT templates contain files for all scenarios. Determine the appropriate template and environment files with respect to your requirement.

Note

Currently, SS7 MPs are not supported. Refer to [Example Parameter File](#).

Table 4-1 Deployment Use Cases

Deployment Use Case	Template Files	Environment Files
Dynamic IP - With VIP	NOAM Template dsrNetworkOam_provider.yaml Signaling Template dsrSignalingNode_provider.yaml	dsrResources_provider.yaml

Table 4-1 (Cont.) Deployment Use Cases

Deployment Use Case	Template Files	Environment Files
Dynamic IP - Without VIP	NOAM Template dsrNetworkOamNoVip_provider.yaml Signaling Template dsrSignalingNodeNoVip_provider.yaml	dsrResourcesNoVip_provider.yaml
Fixed IP - With VIP	NOAM Template dsrNetworkOam_fixedIps.yaml Signaling Template dsrSignalingNode_fixedIps.yaml	dsrResources_fixedIps.yaml
Fixed IP - Without VIP	NOAM Template Yet to be created Signaling Template Yet to be created.	Yet to be created
Dynamic IP - With IDIH nodes	NOAM Template dsrNetworkOam_provider.yaml Signaling Template dsrSignalingNodeIdih_provider.yaml	idihResources_provider.yaml
Fixed IP - With IDIH nodes	NOAM Template dsrNetworkOam_fixedIps.yaml Signaling Template dsrSignalingNodeIdih_fixedIps.yaml	dsrResourcesIdih_fixedIps.yaml

4.2 Create OpenStack Parameters Files

4.2.1 Create OpenStack Parameter File for NOAM

This procedure instructs how to manually create input parameters file to be provided while deploying NOAM stacks.

Prerequisites:

All the respective infrastructures has to be up and running.

1. Log in to the OpenStack server though command line.
2. Create the parameter file.
 - a. Go to the folder created in [Prepare OpenStack Template and Environment Files](#) for storing the templates.
 - b. Create an empty NOAM parameter file in this folder following this naming convention to identify the purpose of the file.
<DSR Name>_<Site Name>_NetworkOam_Params.yaml

Example:

```
dsrCloudInit_Site00_NetworkOam_Params.yaml
```

Note

- Refer to [Example Template File](#) for a sample file with values.
- It is important to keep the example file ready since this helps you understand the use of each key value pair described in the next step while creating the parameter file.

Note

- Refer to [Example Template File](#) to create the parameter file in YAML format.
- Follow these guidelines while working with the YAML files.
 - The file must end with .yaml extension.
 - YAML must be case-sensitive and indentation-sensitive.
 - YAML does not support the use of tabs. Instead of tabs, it uses spaces.
 - This file is in YAML format and it contains **key:value** pairs.
 - The first key should be **parameters:** and then the remaining required key/value pairs for the topology.

This table lists all required key:value pairs.

Table 4-2 NOAM key:value pairs

Key Name	Type	Description
numPrimaryNoams	number	The number of NOAMs that receive and load DSR topology information Note: In DSR 9.0.1.0.0, use 1 as valid value. This NOAM represents active NOAM.
numNoams	number	The number of NOAMs in the DSR topology other than primary NOAM Note: In DSR 9.0.1.0.0, use 1 as valid value. This NOAM represents standby NOAM.
noamImage	string	The VM image for the NOAM Note: This image is used for both active and standby NOAMs.
noamFlavor	string	The flavor that defines the VM size for the NOAM <div>Note This flavor is used for both active and standby NOAMs.</div>
primaryNoamVmNames	comma_delimited_list	List of Primary NOAM VM names Note: Number of VMnames must be equal to the numPrimaryNoams value.

Table 4-2 (Cont.) NOAM key:value pairs

Key Name	Type	Description
noamVmNames	comma_delimited_list	List of NOAM VM names other than primary NOAM VMs Note: Number of VMnames must be equal to the numNoams value.
noamAZ	string	The availability zone into which NOAM servers should be placed Note: In DSR 9.0.1.0.0, all NOAM servers are placed in the same availability zone.
noamSG	string	The server group where NOAMs at this site belong
xmiPublicNetwork	string	External management interface
imiPrivateNetwork	string	Internal management interface
imiPrivateSubnet	string	Name of the IMI network
imiPrivateSubnetCidr	string	The address range for the subnet
ntpServer	string	IP of the NTP server
Note: The below 3 keys are only applicable for fixed IP scenario.		
primaryNoamXmilps	comma_delimited_list	Previously reserved IP for the primary NOAM to talk to external devices
noamXmilps	comma_delimited_list	Previously reserved IP for non-primary NOAMs to talk to external devices
noamVip	string	VIP for NOAMs

4.2.2 Create OpenStack Parameter File for Signaling

This procedure manually creates the input parameters file to be provided while deploying signaling stacks.

Prerequisites:

All the respective infrastructures have to be up and running.

1. Log in to the OpenStack CLI.
2. Create the parameter file.
 - a. Go to the folder created in [Prepare OpenStack Template and Environment Files](#) for storing the templates.
 - b. Create an empty signaling parameter file in this folder following this naming convention to identify the purpose of the file.

<DSR Name>_<Site Name>_SignalingNode_Params.yaml

Example:

dsrcCloudInit_Site00_SignalingNode_Params.yaml

Note

- Refer to [Example Template File](#) for a sample file with values.
- It is important to keep the example file ready since this helps you understand the use of each key value pair described in the next step while creating the parameter file.

Note

- Refer to [Example Template File](#) to create the parameter file in YAML format.
- Follow these guidelines while working with the YAML files.
 - The file must end with .yaml extension.
 - YAML must be case-sensitive and indentation-sensitive.
 - YAML does not support the use of tabs. Instead of tabs, it uses spaces.
 - This file is in YAML format and it contains **key:value** pairs.
 - The first key should be **parameters:** and then the remaining required key/value pairs for the topology.

This table lists all required key:value pairs.

Table 4-3 Signaling key:value pairs

Key Name	Type	Description
numSoams	number	The number of SOAMs at this signaling node
soamImage	string	The VM image for an SOAM
soamFlavor	string	The flavor that defines the VM size for an SOAM
soamVmNames	comma_delimited_list	List of SOAM VM names
soamAZ	string	The availability zone into which SOAM servers should be placed Note: In DSR 9.0.1.0.0, all SOAM servers are placed in the same availability zone.
soamSG	string	Server group for the SOAM VMs
numDas	number	The number of DAs at this signaling node
dalmage	string	The VM image for a DA
daFlavor	string	The flavor that defines the VM size for a DA
daVmNames	comma_delimited_list	List of DA VM names
daAZ	string	The availability zone into which DA servers should be placed Note: In DSR 9.0.1.0.0, all DA-MP servers are placed in the same availability zone.
daSG	string	Server group for the DA VMs
daProfileName	string	The MP profile to be applied to all DAs. Possible values are: VM_Relay, VM_Database, VM_6K_Mps, VM_8K_Mps, VM_10K_Mps, VM_12K_Mps, VM_14K_Mps, VM_16K_Mps, VM_18K_Mps, VM_21K_Mps, VM_24K_Mps, VM_27K_Mps, VM_30K_Mps
numIpfes	number	The number of IPFEs at this signaling node
ipfeImage	string	The VM image for an IPFE
ipfeFlavor	string	The flavor that defines the VM size for an IPFE
ipfeVmNames	comma_delimited_list	List of IPFE VM names
ipfeAZ	string	The availability zone into which IPFE servers should be placed Note: In DSR 9.0.1.0.0, all IPFE servers are placed in the same availability zone.
ipfeSGs	comma_delimited_list	Server group for each IPFE VM

Table 4-3 (Cont.) Signaling key:value pairs

Key Name	Type	Description
numStps	number	The number of STPs at this signaling node
stpImage	string	The VM image for an STP
stpFlavor	string	The flavor that defines the VM size for an STP
stpVmNames	comma_delimited_list	List of STP VM names
stpAZ	string	The availability zone into which STP servers should be placed Note: In DSR 9.0.1.0.0, all STP servers are placed in the same availability zone.
stpSG	string	Server group for the STP VMs
xmiPublicNetwork	string	External management interface
imiPrivateNetwork	string	Internal management interface
imiPrivateSubnet	string	Name of the IMI network
imiPrivateSubnetCidr	string	The address range for the subnet
xsiPublicNetwork	string	The address range for the subnet
primaryNoamVmName	string	Name of NOAM VM that the config XML was loaded onto Note: Not used in 8.6.0.0.0 In DSR 8.6.0.0.0, user should not provide any value to this key.
noamXmilps	comma_delimited_list	The XMI IPs for all NOAM servers, excluding VIPs Note: Not used in 9.0.1.0.0 In DSR 9.0.1.0.0, user should not provide any value to this key.
ntpServer	string	IP of the NTP server
Note: The below keys are ONLY applicable for fixed IP scenario, with or without IDIH nodes.		
soamXmilps	comma_delimited_list	Previously reserved IP for non-primary SOAMs to talk to external devices
soamVip	string	VIP for SOAMs
daXmilps	comma_delimited_list	Previously reserved IP for DA MP to talk to external devices
daXsilps	comma_delimited_list	Previously reserved IP for DA MP to talk to signaling devices
ipfeXmilps	comma_delimited_list	Previously reserved IP for IPFE to talk to external devices
ipfeXsilps	comma_delimited_list	Previously reserved IP for IPFE to talk to signaling devices
stpXmilps	comma_delimited_list	Previously reserved IP for STP to talk to external devices
stpXsilps	comma_delimited_list	Previously reserved IP for STP to talk to signaling devices
ipfeXsiPublicIp	string	Reserved single IP address on signaling network to which remote diameter hosts route packets for load balancing over set of message processors
stpSctpPorts	comma_delimited_list	The SCTP ports to be associated with STP Note: If there is no STP in topology. then provide empty list, for example, [] Note: Open these ports beforehand on which STP connections are going to be created while doing configuration.
These two parameters are applicable for TCP/SCTP to use with the Diameter connection. Note: Open these ports beforehand on which Diameter connections are going to be created while doing Diameter configuration.		
diameterTcpPorts	comma_delimited_list	The TCP ports to be associated with. If this parameter is not provided, then default ports are assigned.

Table 4-3 (Cont.) Signaling key:value pairs

Key Name	Type	Description
diameterSctpPorts	comma_delimited_list	The SCTP ports to be associated with. If this parameter is not provided, then default ports are assigned.
The below keys are applicable only for scenarios which include IDIH nodes.		
idihAppImage	string	The VM image for the IDIH Application VM
idihAppFlavor	string	The flavor that defines the size for the IDIH Application VM
idihAppVmName	string	The IDIH Mediation VM name
idihMedImage	string	The flavor that defines the size for the IDIH Mediation VM
idihMedVmName	string	The IDIH Mediation VM name
idihDbImage	string	The VM image for the IDIH Database VM
idihDbFlavor	string	The flavor that defines the size for the IDIH Database VM
idihDbVmName	string	The IDIH Database VM name
idihAZ	string	The availability zone into which IDIH VMs should be placed
idihIntPrivateNetwork	string	Name of the internal tenant network (that will be created) for communication between IDIH VMs
idihIntPrivateSubnet	string	Name of the subnet (that will be created) on the IDIH internal tenant network (idihIntPrivateNetwork)

4.3 Deploy HEAT Templates

This procedure details how to deploy HEAT templates to create NOAM and Signaling stacks.

Prerequisites:

All the respective infrastructures have to be up and running. The required input files are available.

1. Log in to the OpenStack CLI.
2. Prepare the input files required for the deployment.

To create NOAM and signaling stacks, provide these input files as parameters while deploying the HEAT templates.

Template Files

With respect to the deployment scenario decided in [Prepare OpenStack Template and Environment Files](#) the template files for NOAM and signaling stacks have been already determined.

Environment Files

With respect to the deployment scenario decided in [Prepare OpenStack Template and Environment Files](#) the environment files for NOAM and signaling stacks have been already determined.

Parameter Files

The parameter file for NOAM has already been created in [Create OpenStack Parameter File for NOAM](#). The parameter file for signaling has already been created in [Create OpenStack Parameter File for Signaling](#).

3. Run the OpenStack command to create NOAM stack using the three input files. Ensure the template and environment files are selected with respect to NOAM stack as in [Prepare OpenStack Template and Environment Files](#).

```
openstack stack create -e <EnvironmentFileForNOAM.yaml> -e
<ParameterFileForNOAM.yaml> -t <TemplateFileForNOAM> <NOAMStackName>
```

Example for VIP scenario:

```
$ openstack stack create -e dsrResources_provider.yaml -e
SinglesiteProvider_Site00_NetworkOam_Params.yaml -t
dsrNetworkOam_provider.yaml SinglesiteProvider_Site00_NetworkOam
```

4. Run the OpenStack command to create signaling stack using the three input files. Make sure the template and environment files are selected with respect to signaling stack as per in [Prepare OpenStack Template and Environment Files](#).

```
openstack stack create -e <EnvironmentFileForSignaling.yaml> -e
<ParameterFileForSignaling.yaml> -t <TemplateFileForSignaling>
<SignalingStackName>
```

Example for VIP scenario:

```
$ openstack stack create -e dsrResources_provider.yaml -e
SinglesiteProvider_Site00_SignalingNode_Params.yaml -t
dsrSignalingNode_provider.yaml SinglesiteProvider_Site00_Signaling
```

5. Verify the stack creation status.
 - a. Run this command to see the stack creation status.

```
$ openstack stack show <stackname>
```

ID	Name	Status	Created
(uuid)	teststack	CREATE_IN_PROGRESS	(timestamp)

It takes about two minutes to complete the creation.

- b. Run the command again to verify the status.

```
$ openstack stack show <stackname>
```

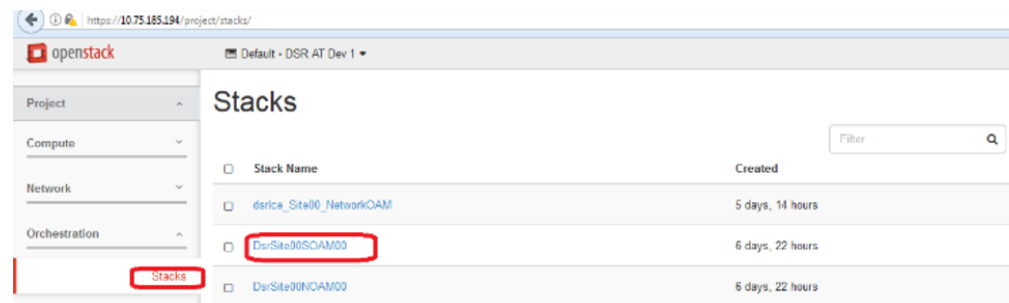

ID	Stack Name	Stack Status
950ed51a-cca7-478a-81e4-3d61562c045d	teststack	CREATE_COMPLETE

6. Retrieve required IPs from created stacks.
 - a. Log in to the OpenStack GUI with valid credentials.

The image shows the OpenStack login interface. At the top is the OpenStack logo. Below it is a 'Log in' section with three input fields: 'Domain' (containing 'default'), 'User Name' (empty), and 'Password' (empty with a toggle icon). A blue 'Connect' button is at the bottom right.

- b. Navigate to **Project**, and then **Orchestration** and click **Stacks**.

- c. Select the stack you created (<stackname>) and click **Overview** to see the IP details of the stack.

The screenshot shows the OpenStack Stacks overview page for a stack named 'DsrSite00NOAM00'. The page is divided into several sections:

- Stacks / DsrSite00NOAM00**: The main title and breadcrumb.
- Overview**: The active tab, showing details about the stack.
- Name**: DsrSite00NOAM00
- ID**: f8607941-005b-4ff1-8071-5b8e21806932
- Description**: This template creates a Network OAM site
- Status**:
 - Created**: 6 days, 22 hours
 - Last Updated**: Never
 - Status**: Create_Complete: Stack CREATE completed successfully
- Outputs**: A list of outputs for the stack.

Output Name	Output Value
imiPrivateNetworkGate...	Gateway IP for IMI tenant network 192.168.221.1
ntpServer	NTP IP 10.250.32.10
imiPrivateNetworkCidr	CIDR for IMI tenant network 192.168.221.0/24
xmiPublicNetworkGate...	Gateway IP for XMI Provider Network 10.75.191.1
noamVip	Network IPs assigned to NOAM VIP 10.75.191.185
noamIps	Network IPs assigned to NOAM VMs [{"imi": "192.168.221.3", "vmName": "DsrSite00NOAM00", "xmi": "10.75.191.187"}, {"imi": "192.168.221.4", "vmName": "DsrSite00NOAM01", "xmi": "10.75.191.19"}]

Note

- All NOAM IP information displays in the NOAM stack (<NOAMStackName>).
- All signaling IP information displays in the signaling stack (<SignalingStackName>).

d. Retrieve the IP details for DSR configuration.

5

Application Configuration

Configure the First NOAM NE and Server

This procedure configures the first NOAM VM.

1. Resolve the Hostname to Get the HTTPD running.
Change Hostname from the default value using sudo:
 - a. Edit `/etc/hosts` file.

Note

Remove any occurrence of “.” and the “.<availability zone>” name, such as “**.novalocal**” from the hostname that might have got appended.

- i. Append the hostname to the IPv4 line as,
“127.0.0.1 localhost localhost4 NOAM1”
 - ii. Append the hostname to the IPv6 line as,
“::1 localhost localhost6 NOAM1”
 - b. Edit `/etc/syconfig/network`.
 - i. Change the “HOSTNAME=XXXX” line to the new hostname.
“HOSTNAME=NOAM1”
 - ii. Set the hostname on the command line:
\$ sudo hostname NOAM1
 - c. Reboot the VM.

\$ sudo init 6
2. Establish a NOAM GUI session as the `guiadmin` user on the NOAM server by using the XMI IP address.
3. In NOAM GUI, create the NOAM network element using the XML file.
 - a. Navigate to **Configuration**, and then **Networking**, and then **Networks**.
 - b. Click **Browse** and type the pathname of the NOAM network XML file.
 - c. Click **Upload File** to upload the XML file. See the examples in [Sample Network Element and Hardware Profiles](#) and configure the NOAM network element.
 - d. Once the data has been uploaded, you should see a tabs display with the name of your network element. Click on this tab which describes the individual networks that are now configured.

Global DSR_OVM_NO_NE DSR_OVM_SO_NE

Network Name	Network Type	Default	Locked	Routed	VLAN	Configured Interfaces	Network
INTERNALXMI	OAM	Yes	Yes	Yes	6	2	10.196.227.0/24
INTERNALIMI	OAM	No	Yes	Yes	3	2	169.254.1.0/24

4. In NOAM GUI, map services to networks.
 - a. Navigate to **Configuration**, and then **Networking**, and then **Services**.
 - b. Click **Edit** and set the services as shown in the table below:

Table 5-1 Network Services

Name	Intra-NE Network	Inter-NE Network
OAM	<IMI Network>	<XMI Network>
Replication	<IMI Network>	<XMI Network>
Signaling	Unspecified	Unspecified
HA_Secondary	Unspecified	Unspecified
HA_MP_Secondary	Unspecified	Unspecified
Replication_MP	<IMI Network>	Unspecified
ComAgent	<IMI Network>	Unspecified

For example, if your IMI network is named **IMI** and your XMI network is named **XMI**, the configuration of services appears as shown below:

Name	Intra-NE Network	Inter-NE Network
OAM	INTERNALIMI ▼	INTERNALXMI ▼
Replication	INTERNALIMI ▼	INTERNALXMI ▼
Signaling	Unspecified ▼	Unspecified ▼
HA_Secondary	Unspecified ▼	Unspecified ▼
HA_MP_Secondary	Unspecified ▼	Unspecified ▼
Replication_MP	INTERNALIMI ▼	Unspecified ▼
ComAgent	INTERNALIMI ▼	Unspecified ▼

- c. Click **OK** to apply the Service-to-Network selections. Dismiss any possible popup notifications.
5. In NOAM GUI, insert the first NOAM VM.
 - a. Navigate to **Configuration**, and then **Servers**.
 - b. Click **Insert** to insert the new NOAM server into servers table (the first or server).

Attribute	Value
Hostname *	<input type="text"/>
Role *	- Select Role - 
System ID	<input type="text"/>
Hardware Profile	DSR Guest 
Network Element Name *	- Unassigned - 
Location	<input type="text"/>

- c. Fill in the fields as follows:
Hostname: <Hostname>
Role: NETWORK OAM&P
System ID: <Site System ID>
Hardware Profile: DSR Guest
Network Element Name: [Select **NE** from drop-down list]

The network interface fields are now available with selection choices based on the chosen hardware profile and network element.

OAM Interfaces [At least one interface is required.]:		
Network	IP Address	Interface
INTERNALXMI (10.196.227.0/24)	<input type="text" value="10.196.227.21"/>	eth0  <input type="checkbox"/> VLAN (6)
INTERNALIMI (169.254.1.0/24)	<input type="text" value="169.254.1.21"/>	eth1  <input type="checkbox"/> VLAN (3)

- d. Fill in the server IP addresses for the XMI network. Select **ethX** for the interface. Leave the **VLAN** checkbox unchecked.
- e. Fill in the server IP addresses for the IMI network. Select **ethX** for the interface. Leave the **VLAN** checkbox unchecked.
- f. Add the following NTP servers:

Table 5-2 NTP Servers

NTP Server	Preferred?
Valid NTP Server	Yes
Valid NTP Server	No
Valid NTP Server	No

- g. Click **OK** after entering the server data.

Note

Properly configure the NTP on the controller node to reference lower stratum NTP servers.

6. In NOAM GUI, export the initial configuration.
 - a. Navigate to **Configuration**, and then **Servers**.
 - b. From the GUI screen, select the NOAM server and click **Export** to generate the initial configuration data for that server. Go to the Info tab to confirm the file has been created.
7. In the NOAM Server, copy configuration file to first NOAM server.
 - a. Log in as an `admusr`, to obtain a terminal window to the first NOAM server.
 - b. Run the following steps if the setup is IPv6:

- Run the following command:

```
sudo rm -f /etc/sysconfig/network-scripts/ifcfg-eth*
```

- Copy the configuration file created in the previous step from the `/var/TKLC/db/filemgmt` directory on the first NOAM to the `/var/tmp` directory. The configuration file consists a filename such as: `TKLCCConfigData.<hostname>`.
- Following is an example:

```
$ sudo cp /var/TKLC/db/filemgmt/TKLCCConfigData.<hostname>.sh /var/tmp/TKLCCConfigData.sh
```

- c. Run the following step for IPv4 set up:
 - Copy the configuration file created in the previous step from the `/var/TKLC/db/filemgmt` directory on the first NOAM to the `/var/tmp` directory. The configuration file consists a filename such as: `TKLCCConfigData.sh`.
 - Following is an example:

```
$ sudo cp /var/TKLC/db/filemgmt/TKLCCConfigData.<hostname>.sh /var/tmp/TKLCCConfigData.sh
```

8. In first NOAM Server, wait for configuration to complete. The automatic configuration daemon looks for the file named `TKLCCConfigData.sh` in the `/var/tmp` directory, implements the configuration in the file, and prompts the user to reboot the server.

If you are on the console, wait to be prompted to reboot the server, but do not reboot the server, it is rebooted later in this procedure.

Verify the script completed successfully by checking the following file.

```
$ sudo cat /var/TKLC/appw/logs/Process/install.log
```

Note

Ignore the warning about removing the USB key since no USB key is present. No response occurs until the reboot prompt is issued.

9. In first NOAM Server, set the time zone (Optional) and reboot the server. To change the system time zone, from the command line prompt, run `set_ini_tz.pl`. The following command example uses the America/New_York time zone.

Replace, as appropriate, with the time zone you have selected for this installation. For a full list of valid time zones, see [List of Frequently Used Time Zones](#).

```
$ sudo /usr/TKLC/appworks/bin/set_ini_tz.pl
"America/New_York" >/dev/null 2>&1
$ date
$ sudo init 6
```

Wait for server to reboot.

10. In first NOAM Server, verify server health.
 - a. Log in to the NOAM1 as the `admusr` user.
 - b. Run the following command as `admusr` on the first NOAM server and ensure no errors are returned:

```
$ sudo syscheck
Running modules in class hardware
OK
Running modules in class disk
OK
Running modules in class net
OK
Running modules in class system
OK
Running modules in class proc
OK
LOG LOCATION: /var/TKLC/log/syscheck/fail_log
```

Configure the NOAM Server Group

This procedure configures the NOAM server group.

1. Log in to NOAM GUI.
 - a. Establish a GUI session on the first NOAM server by using the XMI IP address of the first NOAM server. Open the web browser and type `http://<N01_XMI_IP_Address>` as the URL.
 - b. Log in as the `guiadmin` user. If prompted by a security warning, click **Continue to this Website** to proceed.
2. In NOAM GUI, enter NOAM server group data.

- a. Navigate to **Configuration**, and then **Server Groups**.
- b. Click **Insert** and fill in the following fields:
Server Group Name: [Enter Server Group Name]
Level: A
Parent: None
Function: DSR (Active/Standby Pair)
WAN Replication Connection Count: Use Default Value

Adding new server group

Field	Value	Desc
Server Group Name *	<input type="text" value="ZombieNOAM"/>	Uniqu requir
Level *	<input type="text" value="A"/> ▼	Selec
Parent *	<input type="text" value="NONE"/> ▼	Selec
Function *	<input type="text" value="DSR (active/standby pair)"/> ▼	Selec
WAN Replication Connection Count	<input type="text" value="1"/>	Speci

- c. Click **OK** when all fields are filled.
3. In NOAM GUI, edit the NOAM server group.
 - a. Navigate to **Configuration**, and then **Server Groups**.
 - b. Select the new server group and click **Edit**.
 Select the network element that represents the NOAM.

Site00_noam		
Server	SG Inclusion	Preferred HA Role
DsrSite00NOAM00	<input checked="" type="checkbox"/> Include in SG	<input type="checkbox"/> Prefer server as spare

- c. In the portion of the screen that lists the servers for the server group, find the NOAM server being configured. Mark the **Include in SG** checkbox.
- d. Leave the other box unchecked.
- e. Click **OK**.
4. In NOAM server, verify NOAM VM role.
From console window of the first NOAM VM, run the `ha.mystate` command to verify the DbReplication and VIP items under the resourceId column has a value of Active under the role column.

You may have to wait a few minutes for it to be in that state.

Example:

```
[admusr@NO1 ~]$ ha.mystate
```

resourceId	role	node	DC	subResources	lastUpdate
DbReplication	Act/Act	A1348.092	*	0	0527:050750.672
VIP	Act/Act	A1348.092	*	0	0527:050750.673
CACUPROCESSRES	Act/OOS	A1348.092	*	0	0527:050750.672
CAPM_HELP_Proc	Act/OOS	A1348.092	*	0	0527:050750.625
DSROAM_Proc	Act/OOS	A1348.092	*	0	0527:050755.725
CAPM_PSFS_Proc	Act/Act	A1348.092	*	0	0527:050800.737

```
[admusr@NO1 ~]$
```

5. In NOAM GUI, restart first NOAM VM.
 - a. Navigate to **Status & Manage**, and then **Server**.
 - b. Select the first NOAM server. Click **Restart**.
 - c. Click **OK** on the confirmation screen and wait for restart to complete.
6. In NOAM server, set symmetric thresholds for VMs.

Note

These commands disable the message rate threshold alarms.

From console window of the first NOAM VM, run the `iset` commands as `admusr`:

```
$ sudo iset -feventNumber='-1' SysMetricThreshold where
"metricId='RoutingMsgRate' and function='DIAM'"
$ sudo iset -feventNumber='-1' SysMetricThreshold where
"metricId='RxRbarMsgRate' and function='RBAR'"
$ sudo iset -feventNumber='-1' SysMetricThreshold where
"metricId='RxFabrMsgRate' and function='FABR'"
```

Verify, if the correct value was configured.

Example:

```
$ sudo iqt SysMetricThreshold | grep RxFabrIngressMsgRate
```

RxFabrMsgRate	FABR	*C	RunningAvg	-1	38000	36000	3000
RxFabrMsgRate	FABR	**	RunningAvg	-1	32000	28000	3000
RxFabrMsgRate	FABR	-*	RunningAvg	-1	2400	20000	3000

Configure the Second NOAM Server

This procedure configures the second NOAM server.

1. Log in to NOAM GUI.
 - a. If not already done, establish a GUI session on the first NOAM server by using the XMI IP address of the first NOAM server. Open the web browser and type `http://<N01_XMI_IP_Address>` as the URL.
 - b. Log in as the `guiadmin` user.
2. In NOAM GUI, insert the second NOAM VM.
 - a. Navigate to **Configuration**, and then **Servers**.
 - b. Click **Insert** to insert the new NOAM server into servers table (the first or server).
 - c. Fill in the fields as follows:

Hostname: <Hostname>

Role: NETWORK OAM&P

System ID: <Site System ID>

Hardware Profile: DSR Guest

Network Element Name: [Choose NE list]

The network interface fields are now available with selection choices based on the chosen hardware profile and network element.

OAM Interfaces [At least one interface is required.]:		
Network	IP Address	Interface
INTERNALXMI (10.196.227.0/24)	10.196.227.21	eth0 <input type="checkbox"/> VLAN (6)
INTERNALIMI (169.254.1.0/24)	169.254.1.21	eth1 <input type="checkbox"/> VLAN (3)

Ok Apply Cancel

- d. Fill in the server IP addresses for the XMI network. Select **ethX** for the interface. Leave the **VLAN** checkbox unmarked.
- e. Fill in the server IP addresses for the IMI network. Select **ethX** for the interface. Leave the **VLAN** checkbox unmarked.
- f. Add the following NTP servers:

Table 5-3 NTP Server

NTP Server	Preferred?
Valid NTP Server	Yes
Valid NTP Server	No
Valid NTP Server	No

- g. Click **OK** after entering the server data.

Note

Properly configure the NTP on the controller node to reference lower stratum NTP servers.

3. In NOAM GUI, export the initial configuration.
 - a. Navigate to **Configuration**, and then **Servers**.
 - b. From the GUI screen, select server just configured and click **Export** to generate the initial configuration data for that server. Go to the Info tab to confirm the file has been created.
4. In the first NOAM server, copy configuration file to second NOAM server.
 - a. Log in as an `admusr` to obtain a terminal session to the first NOAM server.
 - b. Run the following steps if the setup is IPv6:
 - Log in as an `admusr` user to the NO1 shell and issue the following command:

```
sudo scp /var/TKLC/db/filemgmt/TKLCCConfigData.<hostname>.sh
admusr@<ipaddr>:/var/TKLC/db/filemgmt/TKLCCConfigData.sh
```

Note

`ipaddr` is the IP address of NOAM2 assigned to its `ethx` interface associated with the `xmi` network.

- Obtain a terminal session to the second NOAM as an `admusr`.
- Run the following commands on NOAM 2 shell:

```
$ sudo rm -f /etc/sysconfig/network-scripts/ifcfg-eth*
```

```
sudo cp /var/TKLC/db/filemgmt/TKLCCConfigData.sh /var/tmp/
TKLCCConfigData.sh
```

- c. Run the following command to set up IPv4:

```
sudo scp /var/TKLC/db/filemgmt/TKLCCConfigData.<hostname>.sh
admusr@<ipaddr>:/var/tmp/TKLCCConfigData.sh
```

Note

ipaddr is the IP address of NOAM2 assigned to its ethx interface associated with the xmi network.

5. In second NOAM server, wait for configuration to complete.
 - a. Obtain a terminal session to the second NOAM as the `admusr` user.
The automatic configuration daemon looks for the file named `TKLCCConfigData.sh` in the `/var/tmp` directory, implements the configuration in the file, and prompts the user to reboot the server.
 - b. If you are on the console, wait to be prompted to reboot the server, but do not reboot the server, it is rebooted later in this procedure.
 - c. Verify script completed successfully by checking the following file.

```
$ sudo cat /var/TKLC/appw/logs/Process/install.log
```

Note

Ignore the warning about removing the USB key since no USB key is present.

6. In second NOAM server, reboot the server.
Obtain a terminal session to the second NOAM as the `admusr` user.

```
$ sudo init 6
```

Wait for server to reboot.

7. In second NOAM server, verify server health.
 - a. Log in to the NOAM2 as `admusr` and wait.
 - b. Run the following command as super-user on the second NO server and make sure no errors are returned:

```
$ sudo syscheck
Running modules in class hardware...
OK
Running modules in class disk...
OK
Running modules in class net...
OK
Running modules in class system...
OK
Running modules in class proc...
OK
LOG LOCATION: /var/TKLC/log/syscheck/fail_log
```

Complete the NOAM Server Group Configuration

This procedure configures the NOAM Server Group.

1. In NOAM GUI, edit the NOAM Server Group Data.

- a. From the GUI session on the first NOAM server, navigate to **Configuration**, and then **Server Groups**.
- b. Select the NOAM server group and click **Edit**.
- c. Add the second NOAM server to the server group by marking the **Include in SG** checkbox for the second NOAM server. Then, click **Apply**.

Server	SG Inclusion	Preferred HA Role
NO1	<input checked="" type="checkbox"/> Include in SG	<input type="checkbox"/> Prefer server as spare
NO2	<input checked="" type="checkbox"/> Include in SG	<input type="checkbox"/> Prefer server as spare

- d. Click **Add** to add a NOAM VIP. Type the VIP Address and click **OK**.

VIP Assignment

VIP Address

Add

Remove

Ok

Apply

Cancel

2. Establish a GUI session on the NOAM by using the NOAM VIP address. log in as the `guiadmin` user.
3. Wait for the alarm ID 10200 Remote Database re-initialization in progress to be cleared before proceeding to **Alarms & Events**, and then **View Active**.
4. In NOAM GUI, restart the second NOAM VM.
 - a. Navigate to **Status & Manage**, and then **Server** and select the second NOAM server.
 - b. Click **Restart**.
 - c. Click **OK** on the confirmation screen.
Wait approximately 3-5 minutes before proceeding to allow the system to stabilize indicated by having the **Appl State** as **Enabled**.

Note

In case you receive alarm, 10073 - Server group max allowed HA Role warning, perform the following:

- i. Log in to the SO GUI and navigate to the **Status & Manage**, and then **HA**.
- ii. Click **Edit** and change the **Max Allowed HA role** of the current Standby SOAM to **Active**.

Note

If this deployment contains SDS, SDS can now be installed. Refer to document referenced in *SDS SW Installation and Configuration Guide*.

Configure the DR NOAM NE and Server

This procedure configures the first DR NOAM VM. This is an optional procedure.

1. Establish a GUI session on the primary NOAM server by using the XMI VIP IP address.
2. In primary NOAM VIP GUI, create the DR NOAM network element using the XML file.
 - a. Navigate to **Configuration**, and then **Networking**, and then **Networks**.
 - b. Click **Browse** and type the pathname to the NOAM network XML file.
 - c. Click **Upload File** to upload the XML file.
See the examples in [Sample Network Element and Hardware Profiles](#) and configure the NOAM network element.
 - d. A tab displaying the name of your network element will appear. Click on the tab, which describes the individual networks that are now configured.

Global

DSR_OVM_NO_NE

DSR_OVM_SO_NE

Network Name	Network Type	Default	Locked	Routed	VLAN	Configured Interfaces	Network
INTERNALXMI	OAM	Yes	Yes	Yes	6	2	10.196.227.0/24
INTERNALIMI	OAM	No	Yes	Yes	3	2	169.254.1.0/24

3. In primary NOAM VIP GUI, insert the first DR NOAM VM.
 - a. Navigate to **Configuration**, and then **Servers**.
 - b. Click **Insert** to insert the new NOAM server into servers table (the first or server).
 - c. Fill in the fields as follows:
Hostname: <Hostname>
Role: NETWORK OAM&P
System ID: <Site System ID>
Hardware Profile: DSR Guest
Network Element Name: [Select NE from list]
 The network interface fields are now available with selection choices based on the chosen hardware profile and network element.
 - d. Fill in the server IP addresses for the XMI network. Select `ethX` for the interface. Leave the **VLAN** checkbox unchecked.
 - e. Fill in the server IP addresses for the IMI network. Select `ethX` for the interface. Leave the **VLAN** checkbox unchecked.
 - f. Add the following NTP servers:

Table 5-4 NTP Servers

NTP Server	Preferred?
Valid NTP Server	Yes
Valid NTP Server	No
Valid NTP Server	No

- g. Click **OK** after entering the server data.

Note

Properly configure the NTP on the controller node to reference lower stratum NTP servers.

4. In primary NOAM VIP GUI, export the initial configuration.
 - a. Navigate to **Configuration**, and then **Servers**.
 - b. From the GUI screen, select the NOAM server and click **Export** to generate the initial configuration data for that server. Go to the Info tab to confirm the file has been created.
5. In the primary NOAM server, copy configuration file from the first primary NOAM server to the first NOAM at the DRNOAM server.

- a. Log in as an `admusr` to obtain a terminal window to the Primary NOAM server.
- b. Run the following step if the setup is IPv6:

- Copy the configuration file created in the previous step from the `/var/TKLC/db/filemgmt` directory on the first NOAM at the DRNOAM server in the `/var/TKLC/db/filemgmt` directory. The configuration file consists a filename like `TKLCConfigData.<hostname>`
- Following is an example:

```
sudo scp /var/TKLC/db/filemgmt/TKLCConfigData.<hostname>.sh
admusr@<ipaddr>:/var/TKLC/db/filemgmt/TKLCConfigData.sh
```

- Obtain a terminal session to the first NOAM at DRNOAM as the `admusr`.
- Run the following commands on the first Noam at DRNOAM shell.

```
$ sudo rm -f /etc/sysconfig/network-scripts/ifcfg-eth*
```

```
$ sudo cp /var/TKLC/db/filemgmt/TKLCConfigData.sh /var/tmp/
TKLCConfigData.sh
```

- c. Run the following step to set up IPv4:
 - Copy the configuration file created in the previous step from the `/var/TKLC/db/filemgmt` directory on the 1 st NOAM at the DRNOAM server in the `/var/tmp` directory.
 - The configuration file consists a filename such as: `TKLCConfigData.<hostname>.sh`.

- Following is an example:

```
sudo scp /var/TKLC/db/filemgmt/TKLCConfigData.<hostname>.sh  
admusr@<ippadr>:/var/tmp/TKLCConfigData.sh
```

6. In first DR NOAM server, wait for configuration to complete.
The automatic configuration daemon looks for the file named `TKLCConfigData.sh` in the `/var/tmp` directory, implements the configuration in the file, and prompts the user to reboot the server.

If you are on the console, wait to be prompted to reboot the server, but do not reboot the server, it is rebooted later in this procedure.

Verify the script completed successfully by checking the following file.

```
$ sudo cat /var/TKLC/appw/logs/Process/install.log
```

Note

Ignore the warning about removing the USB key since no USB key is present. No response occurs until the reboot prompt is issued.

7. In first DR NOAM server, reboot the server.
Obtain a terminal window to the first DR NOAM server, logging in as the `admusr` user.

```
$ sudo init 6
```

Wait for server to reboot.

8. In first DR NOAM server, verify server health.
 - a. Obtain a terminal window to the first DR NOAM server, logging in as the `admusr` user.
 - b. Run the following command as `admusr` and ensure that no errors are returned:

```
$ sudo syscheck  
Running modules in class hardware...  
OK  
Running modules in class disk...  
OK  
Running modules in class net...  
OK  
Running modules in class system...  
OK  
Running modules in class proc...  
OK  
LOG LOCATION: /var/TKLC/log/syscheck/fail_log
```

Configure the DR NOAM Server Group

This procedure configures the DR NOAM server group. This is an optional procedure.

1. Log in to primary NOAM VIP GUI.

- a. Establish a GUI session on the primary NOAM server by using the XMI IP address of the first NOAM server. Open the web browser and type `http://<NO1_XMI_IP_Address>` as the URL.
 - b. Log in as the `guiadmin` user. If prompted by a security warning, click **Continue to this Website** to proceed.
2. In primary NOAM VIP GUI, enter DR NOAM server group data.
 - a. Using the GUI session on the primary NOAM server, navigate to **Configuration**, and then **Server Groups**.
 - b. Click **Insert** and fill in the following fields:
Server Group Name: [Enter Server Group Name]
Level: A
Parent: None
Function: DSR (Active/Standby Pair)
WAN Replication Connection Count: Use Default Value
 - c. Click **OK** when all fields are filled.
3. In primary NOAM VIP GUI, edit the DR NOAM server group.
 - a. Navigate to **Configuration**, and then **Server Groups**.
 - b. Select the new server group and click **Edit**.
 - c. Select the network element that represents the DR NOAM.
 - d. In the portion of the screen that lists the servers for the server group, find the NOAM server being configured. Mark the **Include in SG** checkbox.
 - e. Leave other boxes unchecked.
 - f. Click **OK**.
4. In primary NOAM VIP GUI, restart first DR NOAM VM.
 - a. From the NOAM GUI, navigate to **Status & Manage**, and then **Server**.
 - b. Select the first NOAM server. Click **Restart**.
 - c. Click **OK** on the confirmation screen and wait for restart to complete.

Configure the Second DR NOAM Server

This procedure configures the second DR NOAM server. This is an optional procedure.

1. Log in to primary NOAM VIP GUI.
 - a. If not already done, establish a GUI session on the first NOAM server by using the XMI IP address of the first NOAM server. Open the web browser and type `http://<NOAM1_XMI_IP_Address>` as the URL.
 - b. Log in as the `guiadmin` user.
2. In primary NOAM VIP GUI, insert the second DR NOAM VM.
 - a. Navigate to **Main Menu**, and then **Configuration**, and then **Servers**.
 - b. Click **Insert** to insert the new NOAM server into servers table (the first or second server).
 - c. Fill in the fields as follows:
Hostname: <Hostname>

Role: NETWORK OAM&P

System ID: <Site System ID>

Hardware Profile: DSR Guest

Network Element Name: [Choose NE from list]

The network interface fields are now available with selection choices based on the chosen hardware profile and network element.

- d. Fill in the server IP addresses for the XMI network. Select **ethX** for the interface. Leave the **VLAN** checkbox unmarked.
- e. Fill in the server IP addresses for the IMI network. Select **ethX** for the interface. Leave the **VLAN** checkbox unmarked.
- f. Add the following NTP servers:

Table 5-5 NTP Servers

NTP Server	Preferred?
Valid NTP Server	Yes
Valid NTP Server	No
Valid NTP Server	No

- g. Click **OK** after entering the server data.

Note

Properly configure the NTP on the controller node to reference lower stratum NTP servers.

3. In primary NOAM VIP GUI, export the initial configuration.
 - a. Navigate to **Configuration**, and then **Servers**.
 - b. From the GUI screen, select the server just configured and click **Export** to generate the initial configuration data for that server.
 - c. Go to the Info tab to confirm the file has been created.
4. In the primary NOAM, copy configuration file to second DR NOAM server.
 - a. log in as an `admusr` to obtain a terminal session to the primary NOAM server.
 - b. Run the following step if the setup is IPv6:
 - Copy the configuration file created in the previous step from the `/var/TKLC/db/filemgmt` directory on the second DR-NOAM server in the `/var/TKLC/db/filemgmt` directory.
 - The configuration file consists a filename such as:
`TKLCConfigData.<hostname>.sh`.
 - Following is an example:

```
$ sudo scp /var/TKLC/db/filemgmt/TKLCConfigData.<hostname>.sh
admusr@<ipaddr>:/var/TKLC/db/filemgmt/TKLCConfigData.sh
```

Note

ipaddr is the IP address of DR NOAM assigned to its ethx interface associated with the XMI network.

- Obtain a terminal session to the second DRNOAM as an `admusr`.
- Run the following commands on second DRNOAM shell:

```
$ sudo rm -f /etc/sysconfig/network-scripts/ifcfg-eth*
```

```
sudo cp /var/TKLC/db/filemgmt/TKLCConfigData.sh /var/tmp/  
TKLCConfigData.sh
```

c. Run the following step to set up IPv4:

- Log in as the `admusr` user to the NOAM1 shell and issue the following command:

```
sudo scp /var/TKLC/db/filemgmt/TKLCConfigData.<hostname>.sh  
admusr@<ipaddr>:/var/tmp/TKLCConfigData.sh
```

Note

ipaddr is the IP address of DR NOAM assigned to its ethx interface associated with the **XMI** network.

5. In second DR NOAM server, wait for configuration to complete.

- a. Obtain a terminal session to the second DR NOAM as the `admusr` user. The automatic configuration daemon looks for the file named `TKLCConfigData.sh` in the `/var/tmp` directory, implements the configuration in the file, and prompts the user to reboot the server.
- b. If you are on the console, wait to be prompted to reboot the server, but do not reboot the server, it is rebooted later in this procedure.
- c. Verify script completed successfully by checking the following file.

```
$ sudo cat /var/TKLC/appw/logs/Process/install.log
```

Note

Ignore the warning about removing the USB key since no USB key is present.

6. In second DR NOAM server, reboot the server.
Obtain a terminal session to the second DR NOAM as the `admusr` user.

```
$ sudo init 6
```

Wait for server to reboot.

7. In second DR NO server, verify server health.

- a. Obtain a terminal session to the second DR NOAM as the `admusr` user.
- b. Run the following command as super-user and make sure no errors are returned:

```
$ sudo syscheck
Running modules in class hardware...
    OK
Running modules in class disk...
    OK
Running modules in class net...
    OK
Running modules in class system...
    OK
Running modules in class proc...
    OK
LOG LOCATION: /var/TKLC/log/syscheck/fail_log
```

Complete Configuring the DR NOAM Server Group

This procedure finishes configuring the DR NOAM Server Group. This is an optional procedure.

1. In primary NOAM VIP GUI, edit the DR NOAM server group data.
 - a. From the GUI session on the primary NOAM server, navigate to **Configuration**, and then **Server Groups**.
 - b. Select the NOAM server group and click **Edit**.
 - c. Add the second NOAM server to the server group by marking the **Include in SG** checkbox for the second NOAM server. Then, click **Apply**.
 - d. Click **Add** to add an NOAM VIP. Type the `VIP Address` and click **OK**.

The screenshot shows a 'VIP Assignment' dialog box. It contains a table with the header 'VIP Address'. To the right of the table is an 'Add' button. Below the table is a text input field and a 'Remove' button. At the bottom of the dialog are three buttons: 'Ok', 'Apply', and 'Cancel'.

2. Establish a GUI session on the primary NOAM by using the NOAM VIP address. log in as the `guiadmin` user.
3. In primary NOAM VIP GUI, wait for the alarm ID 10200 Remote Database re-initialization in progress to be cleared before proceeding to **Alarms & Events**, and then **View Active**.
4. In primary NOAM VIP GUI, restart second DR NOAM VM.
 - a. Navigate to **Status & Manage**, and then **Server** and select the second DR NOAM server.
 - b. Click **Restart**.
 - c. Select **OK** on the confirmation screen.

Wait approximately 3-5 minutes before proceeding to allow the system to stabilize indicated by having the **Appl State** as **Enabled**.

5. In primary NOAM, modify DSR OAM process.
Establish an SSH session to the primary NOAM, log in as the `admusr` user. Run the following commands:

- a. Retrieve the cluster ID of the DR-NOAM:

```
$ sudo iqt -NodeID TopologyMapping where "NodeID='<DR_NOAM_Host_Name>' "
Server_ID      NodeID      ClusterID
1              Oahu-DSR-DR-NOAM-2    A1055
```

- b. Run the following command to start the DSR OAM process on the DR-NOAM.

```
$ echo "<clusterID>|DSROAM_Proc|Yes" | iload -ha -xun -fcluster -
fresource -foptional HaClusterResourceCfg
```

Configure the SOAM NE

This procedure configures the SOAM network element.

1. If needed, establish a GUI session on the NOAM by using the NOAM VIP address. log in as the **guiadmin** user.
2. In primary NOAM VIP GUI, create the SOAM network element using an XML file. Ensure to have an SOAM network element XML file available on the PC running the web browser. The SOAM network element XML file is similar to what was created and used in [Configure the First NOAM NE and Server](#), but defines the SOAM network element.

Refer to [Sample Network Element and Hardware Profiles](#) for a sample network element xml file.

- a. Navigate to **Configuration**, and then **Networking**, and then **Networks**.
- b. Click **Browse** and type the path and name of the SOAM network XML file.
- c. Click **Upload** to upload the XML file and configure the SOAM network element.

Configure the SOAM Servers

This procedure configures the SOAM servers.

1. If needed, establish a GUI session on the NOAM by using the NOAM VIP address. log in as the `guiadmin` user.
2. In primary NOAM VIP GUI, insert the first SOAM server.
 - a. Navigate to **Configuration**, and then **Server**.
 - b. Click **Insert** to insert the new SOAM server into servers table.
 - c. Fill in the fields as follows:
Hostname: <SO1-Hostname>
Role: SYSTEM OAM
System ID: <Site System ID>
Hardware Profile: DSR Guest
Network Element Name: [Choose **NE** from list]

The network interface fields are now available with selection choices based on the chosen hardware profile and network element.

- d. Fill in the server IP addresses for the XMI network. Select **ethX** for the interface. Leave the **VLAN** checkbox unmarked.
- e. Fill in the server IP addresses for the IMI network. Select **ethX** for the interface. Leave the **VLAN** checkbox unmarked.
- f. Add the following NTP servers:

Table 5-6 NTP Servers

NTP Server	Preferred?
Valid NTP Server	Yes
Valid NTP Server	No
Valid NTP Server	No

- g. Click **OK** when you have completed entering the server data.

Note

Properly configure the NTP on the controller node to reference lower stratum NTP servers.

- 3. In primary NOAM VIP GUI, export the initial configuration.
 - a. Navigate to **Configuration**, and then **Server**.
 - b. From the GUI screen, select the desired server and click **Export** to generate the initial configuration data for that server.
 - c. Go to the **Info** tab to confirm the file has been created.
- 4. In the primary NOAM, copy configuration file to the first SOAM server. Log in as an `admusr` user to the NOAM1 shell and issue the commands:
 - a. Run the following steps if the setup is IPv6:

```
sudo scp /var/TKLC/db/filemgmt/TKLCConfigData.<hostname>.sh
admusr@<ipaddr>:/var/TKLC/db/filemgmt/TKLCConfigData.sh
```

Note

`ipaddr` is the IP address of first SOAM assigned to its `ethx` interface associated with the xmi network.

- Obtain a terminal session to the first SOAM as the `admusr`.
- Run the following commands on first SOAM shell:

```
$ sudo rm -f /etc/sysconfig/network-scripts/ifcfg-eth*
```

```
sudo cp /var/TKLC/db/filemgmt/TKLCConfigData.sh /var/tmp/
TKLCConfigData.sh
```

- b. Run the following command to set up IPv4:

```
$ sudo scp /var/TKLC/db/filemgmt/TKLCConfigData.<hostname>.sh
admusr@:/var/tmp/TKLCConfigData.sh
```

5. In the first SOAM server, wait for configuration to complete.
 - a. Obtain a terminal session on the first SOAM as the `admusr` user.
The automatic configuration daemon looks for the file named `TKLCConfigData.sh` in the `/var/tmp` directory, implements the configuration in the file, and prompts the user to reboot the server.
 - b. If you are on the console wait to be prompted to reboot the server, but do not reboot the server, it is rebooted later in this procedure.
 - c. Verify script completed successfully by checking the following file.

```
$ sudo cat /var/TKLC/appw/logs/Process/install.log
```

① Note

Ignore the warning about removing the USB key since no USB key is present.

6. In first SOAM server, reboot the server.
Obtain a terminal session to the first SOAM as the `admusr` user.

```
$ sudo init 6
```

Wait for server to reboot.

7. In first SOAM server, verify server health.
 - a. After the system reboots, log in again as the `admusr` user.
 - b. Run the following command and make sure that no errors are returned:

```
# sudo syscheck
Running modules in class hardware...
    OK
Running modules in class disk...
    OK
Running modules in class net...
    OK
Running modules in class system...
    OK
Running modules in class proc...
    OK
LOG LOCATION: /var/TKLC/log/syscheck/fail_log
```

8. Repeat steps 1 through 7 to insert and configure the second SOAM server.
 - a. Run the following steps if the setup is IPv6:

```
$ sudo scp /var/TKLC/db/filemgmt/TKLCConfigData.<hostname>.sh
admusr@<ipaddr>:/var/TKLC/db/filemgmt/TKLCConfigData.sh
```

Note

ipaddr is the IP address of second SOAM assigned to its ethx interface associated with the xmi network.

- Obtain a terminal session to the second SOAM as the admusr.
- Run the following commands on second SOAM shell.

```
$ sudo rm -f /etc/sysconfig/network-scripts/ifcfg-eth*
```

```
sudo cp /var/TKLC/db/filemgmt/TKLCCConfigData.sh /var/tmp/  
TKLCCConfigData.sh
```

- b. Run the following command to set up IPv4:

```
$ sudo scp /var/TKLC/db/filemgmt/TKLCCConfigData.<hostname>.sh  
admusr@<ipaddr>:/var/tmp/TKLCCConfigData.sh
```

- c. Wait approximately 5 minutes for the second SOAM server to restart.

Note

For DSR mated sites, repeat this step for additional or spare SOAM server.

Configure the SOAM Server Group

This procedure configures the SOAM server group.

1. In primary NOAM VIP GUI, enter SOAM server group data.
 - a. From the GUI session on the NOAM VIP address, navigate to **Configuration**, and then **Server Groups**.
 - b. Click **Insert** and add the SOAM server group name along with the values for the following fields:
Name: [Enter Server Group Name]
Level: B
Parent: [Select the NOAM Server Group]
Function: DSR (Active/Standby Pair)
WAN Replication Connection Count: Use Default Value
 - c. Click **OK** when all fields are filled.

Note

For DSR mated sites, repeat this step for additional SOAM server groups where the preferred SOAM spares may be entered before the active/standby SOAMs.

2. In primary NOAM VIP GUI, edit the SOAM server group and add VIP.

- a. Navigate to **Configuration**, and then **Server Groups**.
 - b. Select the new SOAM server group and click **Edit**.
 - c. Add both SOAM servers to the server group primary site by marking the **Include in SG** checkbox.
 - d. Click **Apply**.
3. In primary NOAM VIP GUI, add the SOAM VIP.
 - a. Navigate to **Configuration**, and then **Server Groups**.
 - b. Select the new SOAM server group and click **Edit**.
 - c. Click **Add** to add a SOAM VIP. Type the **VIP Address** and click **OK**.
 4. In primary NOAM VIP GUI, edit the SOAM server group and add preferred spares for site redundancy.
This is an optional step.

If the two-site redundancy feature is wanted for the SOAM server group, add an SOAM server located in its server group secondary site by marking the **Include in SG** and **Preferred Spare** checkboxes.

Server	SG Inclusion	Preferred HA Role
SO1	<input checked="" type="checkbox"/> Include in SG	<input type="checkbox"/> Prefer server as spare
SO2	<input checked="" type="checkbox"/> Include in SG	<input checked="" type="checkbox"/> Prefer server as spare

For more information about server group secondary site or site redundancy, see the [Terminology](#) section.

5. In primary NOAM VIP GUI, edit the SOAM server group and add additional SOAM VIPs.
This is an optional step.
 - a. Click **Add** to add SOAM VIPs.
 - b. Type the **VIP Address** and click **OK**.

Note

Additional SOAM VIPs only apply to SOAM server groups with preferred spare SOAMs.

6. In primary NOAM VIP GUI, wait for replication.
After replication, the server status should be active. Navigate to **Status & Manage**, and then **HA**.

Note

This may take up to 5 minutes while the servers figure out master/slave relationship.

Look for the alarm ID 10200 Remote Database re-initialization in progress to be cleared before proceeding. Navigate to **Alarms**, and then **View Active**.

7. In primary NOAM VIP GUI, restart first SOAM server.

- a. From the NOAM GUI, navigate to **Status & Manage**, and then **Server** and select the first SOAM server.
- b. Click **Restart**.
- c. Click **OK** on the confirmation screen.
Wait for restart to complete. Wait for the **Appl State** to change to **Enabled**, and all other columns to **Norm**.

Note

Repeat this step for the second SOAM.

8. In primary NOAM VIP GUI, restart all preferred spare SOAM servers.
This is an optional step.
 - a. If additional preferred spare servers are configured for secondary sites, navigate to **Status & Manage**, and then **Server** and select all the Preferred Spare SOAM servers.
 - b. Click **Restart** and then, click **OK** to the confirmation popup.
Wait for the **Appl State** to change to **Enabled** and all other columns to change to **Norm**.

Activate PCA/DCA

This procedure activates PCA/DCA. This is applicable only for PCA and DCA.

1. Activate PCA feature.
If you are installing PCA, run the applicable procedures (Added SOAM site activation or complete system activation) of the *DSR PCA Activation Guide* to activate PCA.

Note

- If not all SOAM sites are ready at this point, then you should repeat activation for each new SOAM site that comes online.
- Ignore steps to restart DA-MPs and SBRs that have yet to be configured.

2. Activate DCA feature.
If you are installing PCA, run *DCA Framework and Application Activation and Deactivation Guide* to activate the DCA framework and feature.

Note

- If not all SOAM sites are ready at this point, then you should repeat activation for each new SOAM site that comes online.
- Ignore steps to restart DA-MPs and SBRs that have yet to be configured.

Configure the MP Virtual Machines

This procedure configures MP VMs (IPFE, SBR, DA-MP, and vSTP).

1. If needed, establish a GUI session on the NOAM by using the NOAM VIP address. log in as the `guiadmin` user.

2. In primary NOAM VIP GUI, navigate to the signaling network configuration screen.
 - a. Navigate to **Configuration**, and then **Networking**, and then **Networks**.
 - b. Navigate to the **SO Network Element** tab under which the MPs are to be configured.
 - c. Click **Insert** in the lower left corner.
3. In primary NOAM VIP GUI, add signaling networks.
The following screen displays.

Field	Value	Description
Network Name *	XS12	The name of this network. [Default = N/A. Range = Alphanumeric string up to 31 chars, starting with a letter.] [A value is required.]
Network Type	Signaling	The type of this network.
VLAN ID *	7	The VLAN ID to use for this network. [Default = N/A. Range = 1-4094.] [A value is required.]
Network Address *	10.196.226.0	The network address of this network. [Default = N/A. Range = Valid Network Address of the network in dotted decimal (IPv4) or colon
Netmask *	255.255.255.0	Subnetting to apply to servers within this network. [Default = N/A. Range = Valid Netmask for the network in prefix length (IPv4 or IPv6;
Router IP		The IP address of a router on this network. If this is a default network, this will be used as the gateway address of the default route or enabled, this address will be the one monitored.
Default Network	<input type="radio"/> Yes <input checked="" type="radio"/> No	A selection indicating whether this is the network with a default gateway.
Routed	<input checked="" type="radio"/> Yes <input type="radio"/> No	Whether or not this network is routed outside its network element. If it is not assigned to a network element, it is assumed to be possib
<input type="button" value="Ok"/> <input type="button" value="Apply"/> <input type="button" value="Cancel"/>		

- a. Type the **Network Name**, **Network Type**, **VLAN ID**, **Network Address**, **Netmask**, and **Router IP** that matches the signaling network.

Note

Even if the network does not use VLAN tagging, you should type the correct VLAN ID here as indicated by the NAPD.

- i. Select **Signaling** for Network Type.
- ii. Select **No** for Default Network.
- iii. Select **Yes** for Routable.
- b. If you are finished adding signaling networks, click **OK**. To save this signaling network and repeat this step to enter additional signaling networks, click **Apply**.
4. In primary NOAM VIP GUI, navigate to signaling network configuration screen.

Note

Run this step only if you are defining a separate, dedicated network for SBR Replication. This step is applicable only for PCA or DCA.

- a. Navigate to **Configuration**, and then **Networking**, and then **Networks**.

- b. Click **Insert** in the lower left corner.
5. In primary NOAM VIP GUI, define SBR DB replication network.

Note

Run this step only if you are defining a separate, dedicated network for SBR replication. This is applicable only for PCA.

- a. Type the **Network Name**, **Network Type**, **VLAN ID**, **Network Address**, **Netmask**, and **Router IP** that matches the SBR DB replication network.

Note

Even if the network does not use VLAN tagging, you should type the correct VLAN ID here as indicated by the NAPD.

- i. Select **No** for Default Network.
- ii. Select **Yes** for Routable.
- b. If you are finished adding signaling networks, click **OK**. To save this signaling network and repeat this step to enter additional signaling networks, click **Apply**.
6. In primary NOAM VIP GUI, perform additional service to networks mapping.

Note

Run this step only if you are defining a separate, dedicated network for SBR replication. This is only applicable to PCA.

- a. Navigate to **Configuration**, and then **Networking**, and then **Services**.
- b. Click **Edit**.
- c. Set the services using one of the following scenarios.
 - If the dual-path HA configuration is required:
For HA_MP_Secondary, Oracle recommends the inter-NE network is set as the XMI network and intra-NE network is set as the IMI network. If the primary interface (Replication_MP) SBR DB Replication Network interface goes down, use the secondary network for sharing HA status to reduce the likelihood of a split brain. This leads to DSR mate isolation from the active SBR and results in traffic loss until SBR DB Replication Network is down.

Table 5-7 Replication Network

Name	Intra-NE Network	Inter-NE Network
HA_MP_Secondary	<IMI Network>	<XMI Network>
Replication_MP	<IMI Network>	<SBR DB Replication Network>
ComAgent	<IMI Network>	<SBR DB Replication Network>

HA_MP_Secondary	INTERNALIMI ▼	INTERNALXMI ▼
Replication_MP	INTERNALIMI ▼	Replication ▼
ComAgent	INTERNALIMI ▼	Replication ▼

- If the dual-path HA configuration is not required:
The intra-NE network is set as the IMI network and inter-NE network is set as the PCA replication network (configured in step 5. This may lead to a split database scenario in case the SBR DB Replication Network interface goes down. Due to this, an active SBR server in each site is in effect.

Table 5-8 Replication Network

Name	Intra-NE Network	Inter-NE Network
HA_MP_Secondary	<IMI Network>	<SBR DB Replication Network>
Replication_MP	<IMI Network>	<SBR DB Replication Network>
ComAgent	<IMI Network>	<SBR DB Replication Network>

HA_MP_Secondary	INTERNALIMI ▼	Replication ▼
Replication_MP	INTERNALIMI ▼	Replication ▼
ComAgent	INTERNALIMI ▼	Replication ▼

- d. Click **OK** to apply the Service-to-Network selections.
7. In primary NOAM VIP GUI, insert the MP or IPFE server – Part 1.
 - a. Navigate to **Configuration**, and then **Servers**.
 - b. Click **Insert** to add the new MP or IPFE server into servers table.
 - c. Fill in the following values:
Hostname: <Hostname>

Role: MP

System ID: <Site System ID>

Hardware Profile: DSR Guest

Network Element Name: [Choose **NE** from list]

- d. For the XMI network, type the MP's XMI IP address. Select the correct interface.
- e. Leave the **VLAN** checkbox unmarked.
- f. For the IMI network, type the MP's IMI IP address. Select the correct interface.
 - i. Leave the **VLAN** checkbox unmarked.
 - ii. For the Replication network, type the MP's XSI2 IP address. This is the IP address should be used from the name defined in step 5. This name would be the same name that is referred to as **SBR DB Replication Network** in step 6. Select the correct interface.
- g. For the XSI1 network, type the MP's XSI1 IP address. Select the correct interface.

Note

Leave the **VLAN** checkbox unmarked.

- h. For the XSI2 network, type the MP's XSI2 IP address. Select the correct interface.

Note

- Leave the **VLAN** checkbox unmarked.
- If more XSI networks are configured, follow the same method of entry as XSI1 and XSI2. All interfaces need to be added sequentially for any server.

- i. Add the following NTP servers:

Table 5-9 NTP Servers

NTP Server	Preferred?
Valid NTP Server	Yes
Valid NTP Server	No
Valid NTP Server	No

- j. Click **OK** when all fields are filled in to finish MP server insertion.

Note

Properly configure the NTP on the controller node to reference lower stratum NTP servers.

8. In primary NOAM VIP GUI, export the initial configuration.
 - a. Navigate to **Configuration**, and then **Networking**, and then **Servers**.

- b. From the GUI screen, select the server that was just configured and click **Export** to generate the initial configuration data for that server.
 - c. Go to the Info tab to confirm the file has been created.
9. In MP server, log into the MP.
Obtain a terminal window connection on the MP or IPFE server.
10. In the primary NOAM VIP GUI, copy configuration file to MP or IPFE server.
 - a. From the active NOAM console, log in as the `admusr` user.
 - b. Run the following steps if the setup is IPv6:
 - ```
$ sudo scp /var/TKLC/db/filemgmt/TKLCCConfigData.<hostname>.sh
admusr@<ipaddr>:/var/TKLC/db/filemgmt/TKLCCConfigData.sh
```

**Note**

`ipaddr` is the IP address of MP/IPFE assigned to its `ethx` interface associated with the xmi network.

- Obtain a terminal session to the MP or IPFE as an `admusr`.
- Run the following commands on MP or IPFE shell:

```
$ sudo rm -f /etc/sysconfig/network-scripts/ifcfg-eth*
```

```
$ sudo cp /var/TKLC/db/filemgmt/TKLCCConfigData..sh/var/tmp/
TKLCCConfigData.sh
```

- c. Run the following command to set up IPv4:

```
$ sudo scp /var/TKLC/db/filemgmt/TKLCCConfigData.<hostname>.sh
admusr@<ipaddr>:/var/tmp/TKLCCConfigData.sh
```

**Note**

`ipaddr` is the XMI IP address of the MP or IPFE.

11. In MP server, wait for configuration to complete.
  - a. Obtain a terminal session on the MP or IPFE as the `admusr` user.  
The automatic configuration daemon looks for the file named `TKLCCConfigData.sh` in the `/var/tmp` directory, implements the configuration in the file, and prompts the user to reboot the server.
  - b. If you are on the console, wait to be prompted to reboot the server, but **DO NOT** reboot the server, it is rebooted later in this procedure.
  - c. Verify script completed successfully by checking the following file.

```
$ sudo cat /var/TKLC/appw/logs/Process/install.log
```

**Note**

Ignore the warning about removing the USB key since no USB key is present.

12. In MP server, reboot the server.  
Obtain a terminal session on the MP or IPFE as the `admusr` user.

```
$ sudo init 6
```

Wait for server to reboot.

13. In MP server, verify server health.
  - a. After the reboot, log in as the `admusr` user.
  - b. Run the following command as super-user on the server and make sure that no errors are returned:

```
$ sudo syscheck
Running modules in class hardware...
 OK
Running modules in class disk...
 OK
Running modules in class net...
 OK
Running modules in class system...
 OK
Running modules in class proc...
 OK
LOG LOCATION: /var/TKLC/log/syscheck/fail_log
```

14. In MP server, delete auto-configured default route on MP and replace it with a Network Route using the XMI Network.

**Note**

This step is optional and should only be run to configure a default route on your MP that uses a signaling (XSI) network instead of the XMI network. Not running this step means a default route is not configurable on this MP and you have to create separate network routes for each signaling network destination.

- a. Log into the MP as the `admusr` user. Alternatively, you can log into the VM's console.
- b. Determine `<XMI_Gateway_IP>` from your SO site network element information.
- c. Gather the following items:  
`<NO_XMI_Network_Address>`  
`<NO_XMI_Network_Netmask>`

**Note**

You can either consult the XML files you imported earlier, or go to the NO GUI and view these values from the **Configuration**, and then **Networking**, and then **Networks** menu.

- d. Create network routes to the NO's XMI (OAM) network.
  - i. Navigate to NOAM VIP GUI **ConfigurationNetworkingRoutes**.
  - ii. Select the Specific MP.
  - iii. Click **Insert**.
  - iv. Enter details.
  - v. Click **OK**.
- e. In MP console if sending SNMP traps from individual servers, create host routes to customer SNMP trap destinations on the XMI network:

```
$ sudo /usr/TKLC/plat/bin/netAdm add --route=host --
address=<Customer_NMS_IP> --gateway=<MP_XMI_Gateway_IP_Address>
```

- f. Route to <MP\_XMI\_Interface> added.
- g. Repeat for any existing customer NMS stations.
- h. Delete the existing default route:

```
$ sudo /usr/TKLC/plat/bin/netAdm delete --route=default --
gateway=<MP_XMI_Gateway_IP> --device=<MP_XMI_Interface>
```

Route to <MP\_XMI\_Interface> removed.

- i. In MP console, ping active NO XMI IP address to verify connectivity:

```
$ ping <ACTIVE_NO_XMI_IP_Address>
PING 10.240.108.6 (10.240.108.6) 56(84) bytes of data.
64 bytes from 10.240.108.6: icmp_seq=1 ttl=64 time=0.342 ms
64 bytes from 10.240.108.6: icmp_seq=2 ttl=64 time=0.247 ms
```

- j. In MP console, ping customer NMS Station(s):

```
$ ping <Customer_NMS_IP>
PING 172.4.116.8 (172.4.118.8) 56(84) bytes of data.
64 bytes from 172.4.116.8: icmp_seq=1 ttl=64 time=0.342 ms
64 bytes from 172.4.116.8: icmp_seq=2 ttl=64 time=0.247 ms
```

- k. If you do not get a response, then verify your network configuration. If you continue to get failures, then halt the installation and contact Oracle customer support.

**Note**

Repeat steps 7 through 14 for all remaining MP (SBR, DA-MP, IPFE and vSTP) servers.

## Configure Places and Assign MP Servers to Places

This procedure adds places in the PCA, and DCA networks. This is applicable only for PCA and DCA.

1. In primary NOAM VIP GUI, configure places.
  - a. Establish a GUI session on the NOAM by using the XMI VIP address. log in as the `guiadmin` user.
  - b. Navigate to **Configuration**, and then **Networking**, and then **Places**.
  - c. Click **Insert**.
  - d. Fill in the fields as follows:

| Place        |                                          |                                                                                      |
|--------------|------------------------------------------|--------------------------------------------------------------------------------------|
| Field        | Value                                    | Description                                                                          |
| Place Name * | <input type="text" value="ZombiePlace"/> | Unique identifier used to label a Place. [Default and space.] [A value is required.] |
| Parent *     | <input type="text" value="NONE"/> ▼      | The Parent of this Place [A value is required.]                                      |
| Place Type * | <input type="text" value="Site"/> ▼      | The Type of this Place [A value is required.]                                        |

**Place Name:** <Site Name>

**Parent:** NONE

**Place Type:** Site

- e. Repeat this step for each of the PCA or DCA Places (Sites) in the network. See the [Terminology](#) section for more information on Sites & Places.
2. In NOAM VIP GUI, assign MP server to places.
  - a. Select the place configured in step 1 and click **Edit**.

|                                                                                                              |                                                                                                                                                                                    |         |
|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------|
| Place Type *                                                                                                 | Site                                                                                                                                                                               | The Ty  |
| <b>Servers</b>                                                                                               |                                                                                                                                                                                    |         |
| ZombieNOAM                                                                                                   | <input type="checkbox"/> ZombieNOAM1<br><input type="checkbox"/> ZombieNOAM2                                                                                                       | Availal |
| ZombieDRNOAM                                                                                                 | <input type="checkbox"/> ZombieDRNOAM1<br><input type="checkbox"/> ZombieDRNOAM2                                                                                                   | Availal |
| ZombieSOAM                                                                                                   | <input type="checkbox"/> ZombieSOAM1<br><input type="checkbox"/> ZombieSOAM2<br><input checked="" type="checkbox"/> ZombieDAMP1<br><input checked="" type="checkbox"/> ZombieDAMP2 | Availal |
| <input type="button" value="Ok"/> <input type="button" value="Apply"/> <input type="button" value="Cancel"/> |                                                                                                                                                                                    |         |

- b. Mark all the checkboxes for PCA/DCA DA-MP and SBR servers that are assigned to this place.
- c. Repeat this step for all other DA-MP or SBR servers you wish to assign to places.

**Note**

All **DA-MPs** and **SBR** servers must be added to the **Site Place** that corresponds to the physical location of the server.  
See the [Terminology](#) section for more information on Sites & Places.

### Configure the MP Server Group(s) and Profiles

This procedure configures MP server groups.

1. In primary NOAM VIP GUI, enter MP Server Group Data applicable to all C level servers (DAMP, IPFE, VSTP, SBRs).
  - a. From the GUI session on the NOAM VIP address, navigate to **Configuration**, and then **Server Groups**.
  - b. Click **Insert** and fill out the following fields:
 

**Server Group Name:**[Server Group Name]

**Level:** C

**Parent:** [SOAM Server Group That is Parent To this MP]

**Function:** Select the Proper Function for this MP Server Group:

**Table 5-10 MP Server Group**

| Server Group Function      | MPs Will Run                                                         | Redundancy Model                                   |
|----------------------------|----------------------------------------------------------------------|----------------------------------------------------|
| DSR (multi-active cluster) | Diameter Relay and Application Services                              | Multiple MPs Active per SG                         |
| DSR (active-standby pair)  | Diameter Relay and Application Services                              | 1 Active MP and 1 Standby MP/Per SG                |
| IP Front End               | IPFE application                                                     | 1 Active MP Per SG                                 |
| SBR                        | Policy and Charging Session/or Policy Binding Function/Universal SBR | 1 Active MP, 1 Standby MP, 2 Optional Spare Per SG |
| STP                        | vSTP                                                                 | Multiple vSTP MP per SG                            |
| STPService                 | vSTP                                                                 | MP for the SMS Home Router feature.                |

**For vSTP:**

If configuring only vSTP application, ignore all other IPFE configuration. Currently, there is no specific MP profile for vSTP MP.

**Note**

- IPFE interaction with vSTP MP is not supported. There is no support of TSA/Auto selection for vSTP MPs.
- vSTP MP can co-exist with DA-MP under a SOAM but different server group.
- vSTP MP requires 8 GB of RAM.
- vSTP STPService MP must be configured if the SMS Home Router feature is activated by the user after the installation is complete.

**For PCA application:**

- Online Charging function(only)  
At least one MP Server Group with the **SBR** function must be configured.  
At least one MP Server Group with the **DSR (multi-active cluster)** function must be configured.
- Policy DRA function  
At least two MP Server Groups with the **SBR** function must be configured. One stores session data and one stores binding data.  
At least one MP Server Group with the **DSR (multi-active cluster)** function must be configured.

**WAN Replication Connection Count:**

For non-Policy and Charging SBR Server Groups: Default Value

For Policy and Charging Server Groups: 8

**For the PCA application, the following types of MP Server Groups must be configured:**

DA-MP (Function: DSR (multi-active cluster))

SBR (Function: SBR)

IPFE (Function: IP Front End)

- c. Click **OK** when all fields are filled.
2. In primary NOAM VIP GUI, repeat step 1 for any remaining MP and IPFE server groups you wish to create.  
For instance, when installing an IPFE, you need to create an IP front end server group for each IPFE server.
3. In primary NOAM VIP GUI, edit the MP server groups to include MPs.
  - a. Navigate to **Configuration**, and then **Server Groups**, select a server group that you just created, and click **Edit**.
  - b. Select the network element representing the MP server group you wish to edit.
  - c. Mark the **Include in SG** checkbox for every MP server you wish to include in this server group. Leave other checkboxes blank.

| Server | SG Inclusion                                      | Preferred HA Role                               |
|--------|---------------------------------------------------|-------------------------------------------------|
| DAMP1  | <input checked="" type="checkbox"/> Include in SG | <input type="checkbox"/> Prefer server as spare |
| DAMP2  | <input checked="" type="checkbox"/> Include in SG | <input type="checkbox"/> Prefer server as spare |

**Note**

Each IPFE and vSTP-MP server should be in its own server group.

- d. Click **OK**.
4. In primary NOAM VIP GUI, edit the MP server group and add preferred spares for site redundancy. This is an optional step, applicable only to PCA.  
If two-site redundancy for the Policy and Charging SBR Server Group is wanted, add a MP server that is physically located in a separate site (location) to the server group by marking the **Include in SG** checkbox and also mark the **Preferred Spare** checkbox.

| Server | SG Inclusion                                      | Preferred HA Role                                          |
|--------|---------------------------------------------------|------------------------------------------------------------|
| SBR1   | <input checked="" type="checkbox"/> Include in SG | <input checked="" type="checkbox"/> Prefer server as spare |

If three-site redundancy for the SBR MP server group is wanted, add two SBR MP servers that are both physically located in separate sites (location) to the server group by marking the **Include in SG** and **Preferred Spare** checkboxes for both servers.

**Note**

- The preferred spare servers should be different sites from the original server. There should be servers from three separate sites (locations).
- There must first be non-preferred spare present in the server group before adding the preferred spare.

For more information about site redundancy for Policy and Charging SBR Server Groups, see the [Terminology](#) section.

Click **OK** to save.

5. In primary NOAM VIP GUI, repeat steps 1 through 4 for any remaining MP and IPFE server groups you need to create.
6. In primary NOAM VIP GUI, wait for replication to complete on all MPs.  
Wait for the alarm 10200: Remote Database re-initialization in progress to be cleared and navigate to **Alarms & Events**, and then **Active Alarms**.  
  
This should happen shortly after you have verified the `Norm DB` status in the previous step.
7. In SOAM VIP GUI, assign profiles to DA-MPs from SOAM GUI.
  - a. Log in to the GUI of the active SOAM server as the `guiadmin` user.
  - b. From the SO GUI, navigate to **Diameter Common**, and then **MPs**, and then **Profiles Assignments**.
  - c. For each MP, select the proper profile assignment based on the MP's type and the function it serves:

```
VM:10K_MPS
VM:6K_MPS
VM:8K_MPS
VM:12K_MPS
VM:14K_MPS
VM:16K_MPS
VM:18K_MPS
VM:21K_MPS
VM:24K_MPS
VM:27K_MPS
VM:30K_MPS
```

- d. When finished, click **Assign**.
8. In primary NOAM VIP GUI, restart MP VM.
  - a. From the NOAM GUI, navigate to **Status & Manage**, and then **Server**.
  - b. For each MP server:
    - i. Select the MP server.
    - ii. Click **Restart**.
    - iii. Click **OK** on the confirmation screen. Wait for the message that tells you that the restart was successful.  
**Policy and Charging DRA/DCA Installations:** You may continue to see alarms related to ComAgent until you complete PCA/DCA installation.

## 5.1 Configure the Signaling Network Routes

This procedure configures signaling network routes on MP-type servers (DA-MP, IPFE, SBR, etc.).

1. Establish a GUI session on the NOAM by using the NOAM VIP address. Log in as the `guiadmin` user.

2. In NOAM VIP, navigate to routes configuration screen.
  - a. Navigate to **Configuration**, and then **Networking**, and then **Network**, and then **Routes**.
  - b. Select the first MP Server you see listed on the first row of tabs as shown and click the **Entire Server Group** link. Initially, no routes should display.

|                |  |             |  |          |  |              |  |             |  |             |  |                      |  |            |  |        |  |       |  |        |  |
|----------------|--|-------------|--|----------|--|--------------|--|-------------|--|-------------|--|----------------------|--|------------|--|--------|--|-------|--|--------|--|
| Entire Network |  | DA_SG       |  | IPFE1_SG |  | IPFE2_SG     |  | NO_SG       |  | SBRb_SG     |  | SBRs_SG              |  | SO_SG      |  | SS7_SG |  |       |  |        |  |
| NO1            |  | NO2         |  | SO1      |  | DAMP1        |  | DAMP2       |  | IPFE1       |  | IPFE2                |  | SS7MP1     |  | SBR-b  |  | SBR-s |  | SS7MP2 |  |
| Route Type     |  | Destination |  | Netmask  |  | Gateway      |  | Device Name |  | Route Scope |  | Configuration Status |  | Is Locked? |  |        |  |       |  |        |  |
| default        |  | 0.0.0.0     |  |          |  | 10.196.227.1 |  | eth0        |  | Server      |  | Discovered           |  | Locked     |  |        |  |       |  |        |  |

3. Click **Insert** at the bottom of the screen to add additional routes.
4. In primary NOAM VIP GUI, add default route for MPs going through signaling network gateway.

#### Note

This is an optional step. Only perform this step if you performed [Configure the MP Virtual Machines](#). That is if you have deleted default XMI route and plan to replace it with default XSI routes.

To delete the existing default route:

- a. Log in to the PRIMARY NOAM VIP GUI.
  - b. Navigate to **Configuration**, and then **Networking**, and then **Networks**.
  - c. Select the specific SO tab.
  - d. Select the XMI network and click **Unlock**. Click **OK**.
  - e. Navigate to **Configuration**, and then **Networking**, and then **Routes**.
  - f. Select the Specific MP XMI route and click **Delete**.
  - g. Click **OK**.
  - h. Repeat the above steps for all required MPs to delete the XMI routes.
  - i. Navigate to **Configuration**, and then **Networking**, and then **Networks**.
  - j. Select the respective SOAM tab.
  - k. Select the XMI network and click **Lock**.
  - l. Click **OK**.
- If your MP servers no longer have a default route, then you can insert a default route here, which uses one of the signaling network gateways.

## Insert Route on DAMP1

| Field                                                                                                        | Value                                                                                               | Description                                                                |
|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|
| Route Type *                                                                                                 | <input type="radio"/> Net<br><input checked="" type="radio"/> Default<br><input type="radio"/> Host | Select a route type. [Default = N/A. Options = Net,                        |
| Device *                                                                                                     | eth3 ▼                                                                                              | Select the network device name through which tra<br>[A value is required.] |
| Destination                                                                                                  |                                                                                                     | The destination network address. [Default = N/A. F                         |
| Netmask                                                                                                      |                                                                                                     | A valid netmask for the network route destination I                        |
| Gateway IP *                                                                                                 |                                                                                                     | The IP address of the gateway for this route. [Def:                        |
| <input type="button" value="Ok"/> <input type="button" value="Apply"/> <input type="button" value="Cancel"/> |                                                                                                     |                                                                            |

**Route Type:** Default**Device:** Select the signaling device directly attached to the network where the XSI default gateway resides.**Gateway IP:** The XSI gateway you wish to use for default signaling network access.

- m. Click **OK**.
5. In primary NOAM VIP GUI, add network routes for diameter peers.
  - a. Use this step to add IP4 and/or IPv6 routes to **Diameter** peer destination networks. The goal for this step is to ensure Diameter traffic uses the gateway(s) on the signaling networks.

## Insert Route on BuenosAires-DAMP1

| Field                                                                                                        | Value                                                                                                 | Description                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Route Type                                                                                                   | <input checked="" type="radio"/> Net<br><input type="radio"/> Default<br><input type="radio"/> Host * | Select a route type. [Default = N/A. Options = Net, Default, Host. You can configure at most one IPv4 default route and one IPv6 default route on a given target machine.]                                                            |
| Device                                                                                                       | eth2 ▼ *                                                                                              | Select the network device name through which traffic is being routed. The selection of AUTO will result in the device being selected automatically, if possible. [Default = N/A. Range = Provisioned devices on the selected server.] |
| Destination                                                                                                  |                                                                                                       | The destination network address. [Default = N/A. Range = Valid Network Address of the network in dotted decimal (IPv4) or colon hex (IPv6) format.]                                                                                   |
| Netmask                                                                                                      |                                                                                                       | A valid netmask for the network route destination IP address. [Default = N/A. Range = Valid Netmask for the network in prefix length (IPv4 or IPv6) or dotted decimal (IPv4) format.]                                                 |
| Gateway IP                                                                                                   |                                                                                                       | The IP address of the gateway for this route. [Default = N/A. Range = Valid IP address of the gateway in dotted decimal (IPv4) or colon hex (IPv6) format.]                                                                           |
| <input type="button" value="Ok"/> <input type="button" value="Apply"/> <input type="button" value="Cancel"/> |                                                                                                       |                                                                                                                                                                                                                                       |

**Route Type:** Net**Device:** Select the appropriate signaling interface that is used to connect to that network

**Destination:** Type the **Network ID** of network to which the peer node is connected to

**Netmask:** Type the corresponding Netmask

**Gateway IP:** Type the **IP** of the customer gateway.

- b. If you have more routes to enter, click **Apply** to save the current route entry. Repeat this step to enter more routes.
  - c. If you have finished entering routes, click **OK** to save the latest route and leave this screen.
6. Repeat steps 2-5 for all other MP server groups.

The routes entered in this procedure should now be configured on all MPs in the server group for the first MP you selected. If you have additional MP server groups, repeat from step 2 but this time, select an MP from the next MP server group. Continue until you have covered all MP server groups.

## 5.2 Configure DSCP Values for Outgoing Traffic

This procedure configures the DSCP values for outgoing packets on servers. DSCP values can be applied to an outbound interface as a whole, or to all outbound traffic using a specific TCP or SCTP source port. This step is optional and should only be executed if has been decided that your network uses packet DSCP markings for Quality-of-Service purposes.

1. Establish a GUI session on the NOAM by using the NOAM VIP address. Login as the `guiadmin` user.
2. In primary NOAM VIP GUI, option 1 is to configure interface DSCP.

### Note

The values displayed in the screenshots are for demonstration purposes only. The exact DSCP values for your site will vary.

- a. Navigate to **Configuration**, and then **Networking**, and then **DSCP**, and then **Interface DSCP**.
- b. Select the server to configure from the list of servers on the 2nd line. You can view all servers with Entire Network selected; or limit yourself to a particular server group by clicking on the server group name's tab.
- c. Click **Insert**.

| Entire Network |       |          |          |       |         |         |        |        |       |        |
|----------------|-------|----------|----------|-------|---------|---------|--------|--------|-------|--------|
|                | DA_SG | IPFE1_SG | IPFE2_SG | NO_SG | SBRb_SG | SBRs_SG | SO_SG  | SS7_SG |       |        |
| NO1            | NO2   | SO1      | DAMP1    | DAMP2 | IPFE1   | IPFE2   | SS7MP1 | SBR-b  | SBR-s | SS7MP2 |
| Interface      | DSCP  | Protocol | Scope    |       |         |         |        |        |       |        |

- d. Select the network **Interface** from the list, and type the **DSCP** value to apply to packets leaving this interface.

**Main Menu: Configuration -> DSC**

Info\*

**Insert DSCP by Interface on Zombiel**

|             |      |            |
|-------------|------|------------|
| Interface * | eth3 | The server |
| DSCP *      | 34   | Note: To o |
| Protocol *  | TCP  | Valid DS   |
|             |      | TCP or SC  |

Ok Apply Cancel

- e. Click **OK** if there are no more interfaces on this server to configure, or **Apply** to finish this interface and continue with more interfaces by selecting them from the list and typing their **DSCP** values.
3. In primary NOAM VIP GUI, option 2 is to configure port DSCP.

**Note**

The values displayed in the screenshots are for demonstration purposes only. The exact DSCP values for your site varies.

- a. Navigate to **Configuration**, and then **Networking**, and then **DSCP**, and then **Port DSCP**.
- b. Select the server to configure from the list of servers on the 2nd line. You can view all servers with **Entire Network** selected or limit yourself to a particular server group by clicking on the server group name's tab.
- c. Click **Insert**.

**Main Menu: Configuration -> DSCP -> Port DSCP**

|                       |             |                 |              |       |         |         |        |        |       |        |
|-----------------------|-------------|-----------------|--------------|-------|---------|---------|--------|--------|-------|--------|
| <b>Entire Network</b> | DA_SG       | IPFE1_SG        | IPFE2_SG     | NO_SG | SBRb_SG | SBRs_SG | SO_SG  | SS7_SG |       |        |
| <b>H01</b>            | NO2         | SO1             | DAMP1        | DAMP2 | IPFE1   | IPFE2   | SS7MP1 | SBR-b  | SBR-s | SS7MP2 |
| <b>Port</b>           | <b>DSCP</b> | <b>Protocol</b> | <b>Scope</b> |       |         |         |        |        |       |        |

- d. Type the source **Port** and **DSCP** value, and select the transport **Protocol**.

### Main Menu: Configuration -> DSCP -> Port DSCP

**Info\*** ▼

#### Insert DSCP by Port on ZombieNOAM2

|            |                                    |                                            |
|------------|------------------------------------|--------------------------------------------|
| Port *     | <input type="text" value="3568"/>  | A valid TCP or SCTP port. [Default = 3568] |
| DSCP *     | <input type="text" value="15"/>    | A valid DSCP value. [Default = N/A]        |
| Protocol * | <input type="text" value="TCP"/> ▼ | TCP or SCTP protocol. [Default = TCP]      |

Ok Apply Cancel

- e. Click **OK** if there are no more port DSCPs on this server to configure, or **Apply** to finish this port entry and continue entering more port DSCP mappings.

#### Note

Repeat steps 2-3 for all remaining servers.

## 5.3 Configure IP Front End

If the DSR guest type is IPFE, see [Performance Tuning Recommended](#) .

This procedure configures IP Front End (IPFE) and optimizes performance.

1. Log in to the SOAM VIP GUI as the guiadmin user.
2. In SOAM VIP, configuration of replication IPFE association data.
  - a. Navigate to **IPFE**, and then **Configuration**, and then **Options**.
  - b. Type the IP address of the 1st IPFE in the **IPFE-A1 IP Address** field and the IP address of the 2nd IPFE in the **IPFE-A2 IP Address** field.
  - c. If applicable, type the address of the 3rd and 4th IPFE servers in **IPFE-B1 IP Address** and **IPFE-B2 IP Address** fields.

| Variable                          | Value                | Description                                                                                                   |
|-----------------------------------|----------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Inter-IPFE Synchronization</b> |                      |                                                                                                               |
| IPFE-A1 IP Address                | 169.254.1.26 - IPFE1 | IPv4 or IPv6 address of IPFE-A1. This selection is disabled when a Target Set has IPFE-A1 selected as Active. |
| IPFE-A2 IP Address                | 169.254.1.27 - IPFE2 | IPv4 or IPv6 address of IPFE-A2. This selection is disabled when a Target Set has IPFE-A2 selected as Active. |
| IPFE-B1 IP Address                | <unset>              | IPv4 or IPv6 address of IPFE-B1. This selection is disabled when a Target Set has IPFE-B1 selected as Active. |
| IPFE-B2 IP Address                | <unset>              | IPv4 or IPv6 address of IPFE-B2. This selection is disabled when a Target Set has IPFE-B2 selected as Active. |

### Note

- It is recommended that the address resides on the **IMI (Internal Management Interface)** network.
- IPFE-A1** and **IPFE-A2** must have connectivity between each other using these addresses. The same applies to **IPFE-B1** and **IPFE-B2**.

3. In SOAM VIP, configuration of IPFE target sets (Part 1).
  - a. Log into the SOAM VIP GUI as the `guiadmin` user.
  - b. Navigate to **IPFE**, and then **Configuration**, and then **Target Sets**.
  - c. Click either **Insert IPv4** or **Insert IPv6** depending on the IP version of the target set you plan to use.

This screen displays the following configurable settings:

**Protocols:** Protocols the target set supports.

**Delete Age:** Specifies when the IPFE should remove its association data for a connection. Any packets presenting a source IP address/port combination that had been previously stored as association state but have been idle longer than the **Delete Age** configuration are treated as a new connection and does not automatically go to the same application server.

**Load Balance Algorithm:** Hash or Least Load options.

### Note

- For the IPFE to provide Least Load distribution, navigate to **IPFE**, and then **Configuration**, and then **Options**. Monitoring Protocol must be set to Heartbeat so the application servers can provide the load information the IPFE uses to select the least-loaded server for connections.
- The Least Load option is the default setting, and is the recommended option with exception of unique backward compatibility scenarios.

4. In SOAM VIP, configuration of IPFE target sets (Part 2).
  - a. Navigate to **IPFE**, and then **Configuration**, and then **Target Sets**.  
**(Optional):** If you have selected the **Least Load** algorithm, then you may configure the following fields to adjust the algorithm's behavior:

**MPS Factor:** Messages per Second (MPS) is one component of the least load algorithm. This field allows you to set it from 0 (not used in load calculations) to 100 (the only component used for load calculations). It is recommended that IPFE

connections have Reserved Ingress MPS set to something other than the default, which is 0. To configure **Reserved Ingress MPS**, navigate to **Main Menu**, and then **Diameter**, and then **Configuration**, and then **Configuration Sets**, and then **Capacity Configuration**. If you choose not to use **Reserved Ingress MPS**, set **MPS Factor** to 0, and **Connection Count Factor**, described below, to 100.

**Connection Count Factor:** This is the other component of the **least load** algorithm. This field allows you to set it from 0 (not used in load calculations) to 100 (the only component used for load calculations). Increase this setting if connection storms (the arrival of many connections at a very rapid rate) are a concern.

**Allowed Deviation:** Percentage within which two application server's load calculation results are considered to be equal. If very short, intense connection bursts are expected to occur, increase the value to smooth out the distribution.

**Primary Public IP Address:** IP address for the target set.

**Note**

This address must reside on the XSI (External Signaling Interface) network because it is used by the application clients to reach the application servers. This address must not be a real interface address (that is, must not be associated with a network interface card).

**Active IPFE:** IPFE to handle the traffic for the target set address.

**Secondary Public IP Address:** If this target set supports either multi-homed SCTP or Both TCP and SCTP, provide a Secondary IP Address.

**Note**

- A secondary address is required to support SCTP multi-homing. A secondary address can support TCP, but the TCP connections are not multi-homed.
- If SCTP multi-homing is to be supported, select the mate IPFE of the Active IPFE for the Active IPFE for secondary address to ensure SCTP failover functions as designed.

**Target Set IP List:** Select an IP address, a secondary IP address if supporting **SCTP multi-homing**, a description, and a weight for the application server.

**Note**

- The IP address must be on the XSI network since they must be on the same network as the target set address. This address must also match the IP version of the target set address (IPv4 or IPv6). If the Secondary Public IP Address is configured, it must reside on the same application server as the first IP address.
- A port must be created to associate the IP that needs to be used as TSA IP in cloud. Create a port using the following command:

```
neutron port-create <xsi network-id>
```

The command results in an IP that can be used as TSA IP.

- If all application servers have an equal weight (for example, 100, which is the default), they have an equal chance of being selected. Application servers with larger weights have a greater chance of being selected.

- Click **Add** to add more application servers (up to 16).
  - Click **Apply**.
- In SOAM VIP, repeat for additional configuration of IPFE target sets.

Repeat steps 3 and 4 for each target set (up to 16).  
At least one target set must be configured.

## 5.4 Configure the Desired MTU value

By default DSR defines MTU size of all its management and/or signaling networks as 1500 bytes. If the configured virtual network(s) on cloud is VXLAN based and MTU size defined/negotiated on it is 1500 bytes, then we need to accommodate VXLAN header (size 65 bytes) within these 1500 bytes.

This procedure configures the desired MTU value.

- Verify the MTU on DSR system, by running the following command:

```
iqt -pE NetworkDeviceOption
```

### Sample output:

```
DeviceOption_ID=0 Keyword=MTU Device_ID=0 Value=1500
DeviceOption_ID=1 Keyword=bootProto Device_ID=0 Value=none
DeviceOption_ID=2 Keyword=onboot Device_ID=0 Value=yes
DeviceOption_ID=3 Keyword=MTU Device_ID=1 Value=1500
DeviceOption_ID=4 Keyword=bootProto Device_ID=1 Value=none
DeviceOption_ID=5 Keyword=onboot Device_ID=1 Value=yes
DeviceOption_ID=6 Keyword=MTU Device_ID=2 Value=1500
DeviceOption_ID=7 Keyword=bootProto Device_ID=2 Value=none
DeviceOption_ID=8 Keyword=onboot Device_ID=2 Value=yes
DeviceOption_ID=9 Keyword=MTU Device_ID=3 Value=1500
DeviceOption_ID=10 Keyword=bootProto Device_ID=3 Value=none
DeviceOption_ID=11 Keyword=onboot Device_ID=3 Value=yes
```

```
DeviceOption_ID=12 Keyword=MTU Device_ID=4 Value=1500
DeviceOption_ID=13 Keyword=bootProto Device_ID=4 Value=none
DeviceOption_ID=14 Keyword=onboot Device_ID=4 Value=yes
```

## 2. Change the MTU value on DSR system.

This is an optional step.

If the MTU value is 1500 bytes, change it to 1435 bytes, by executing:

```
sudo iset -fValue=1435 NetworkDeviceOption where "Keyword='MTU'"
=== changed 256 records ===
```

Wait for few minutes.

## 3. Verify the MTU value on DSR system by running the following command:

```
ip addr
```

### Sample output:

```
1: lo: <LOOPBACK,UP,LOWER_UP> mtu 65536 qdisc noqueue state UNKNOWN link/
loopback 00:00:00:00:00:00 brd 00:00:00:00:00:00 inet 127.0.0.1/8 scope

DeviceOption_ID=13 Keyword=bootProto Device_ID=4 Value=none
DeviceOption_ID=14 Keyword=onboot Device_ID=4 Value=yes
```

## 5.5 SNMP Configuration

This procedure configures forwarding of SNMP.

### Note

This is an optional procedure.

1. In NOAM VIP, configure system-wide SNMP trap receiver(s).
  - a. Using a web browser, log in to the NOAM VIP as the `guiadmin` user. Navigate to **Administration**, and then **SNMP**.
  - b. Click **Insert**.
  - c. Type the **IP address** or **Hostname** of the Network Management Station (NMS) to forward traps to. This IP should be reachable from the NOAM's **XMI** network.
  - d. Continue to add secondary manager IPs in the corresponding fields, if needed.
  - e. **Traps Enabled** checkboxes can be marked on a per manager basis.

|                      |                                    |
|----------------------|------------------------------------|
| <b>Traps Enabled</b> | <input type="checkbox"/> Manager 1 |
|                      | <input type="checkbox"/> Manager 2 |
|                      | <input type="checkbox"/> Manager 3 |
|                      | <input type="checkbox"/> Manager 4 |
|                      | <input type="checkbox"/> Manager 5 |

- f. Type the SNMP Community Name.

|                                          |          |
|------------------------------------------|----------|
| <b>SNMPv2c Read-Only Community Name</b>  | ●●●●●●●● |
| <b>SNMPv2c Read-Write Community Name</b> |          |

### Note

Leave all other fields with their default values.

- g. Click **OK**.
2. In NOAM VIP, enable traps from individual servers.  
This is an optional step.

**Note**

By default, SNMP traps from MPs are aggregated and displayed at the active NOAM. If instead, you want every server to send its own traps directly to the NMS, then perform this procedure.

This procedure requires all servers, including MPs, have an XML interface on which the customer SNMP Target server (NMS) is reachable.

- Using a web browser, log in to the NOAM VIP as the `guiadmin` user. Navigate to **Administration**, and then **SNMP**.
- Ensure the **Enabled** checkbox is marked, if not, mark it as shown below:

- c. Click **Apply** and verify the data is committed.

## 5.6 Create iDIH Virtual Machines - VMware

This procedure creates the iDIH Oracle, Mediation, and Application guest. This is an optional step.

## Prerequisites

**Needed Materials:** iDIH Oracle OVA, iDIH Mediation OVA, and iDIH Application OVA.

1. Add the iDIH Oracle OVA to VMware.
  - a. Launch the VMware client of your choice.
  - b. Add the **iDIH Oracle OVA** image to the VMware catalog or repository. Follow the instructions provided by the Cloud solutions manufacturer.
2. Create the Oracle VM from the OVA image.
  - a. Browse the library or repository that you placed the **iDIH Oracle OVA** image.
  - b. Deploy the OVA Image using **vSphere Client** or the **vSphere Web Client**.
  - c. Name the **iDIH Oracle VM** and select the data store.
3. Configure resources for the iDIH Oracle VM.
  - a. Configure the **iDIH Oracle VM** per the resource profiles defined in *DSR Cloud Benchmarking Guide* using the vSphere client or the vSphere web client.
  - b. Record the Ethernet addresses associated with each interface and the virtual network with which it is associated.

**Note**

Ensure the order of the interface creation is XMI, INT, and then IMI, if there is any. Only the Mediation VM requires the IMI interface.

4. Create a raw storage block device (external device).

**Note**

This step is only required for iDIH Oracle VM

Create an extra disk for the Oracle VM. Add the second disk using the **vSphere client** or the **vSphere web client**.

5. Use the **vSphere client** or **vSphere web client** to power on the iDIH Oracle VM.
6. Verify the extra/second disk exists.

**Note**

This step is only required for iDIH Oracle VM.

Check if the raw storage block device (external disk) added in step 3 exists by executing any of these commands:

```
$ ls /dev/[sv]db
$ fdisk -l
$ df -h
```

**Note**

- Do not mount or format the added raw block device. Oracle ASM (Automatic Storage Management) automatically manages it. If you see it has been mounted, unmount it and make sure to completely remove the entry in the `/etc/fstab`.
- Repeat steps 1 through 6 for the following VMs. Use unique labels for the VM names:
  - iDIH Application
  - iDIH Mediation

## 5.7 Create iDIH Virtual Machines - KVM/OpenStack

This procedure creates the iDIH Oracle, Mediation, and Application guest. This is an optional procedure.

**Prerequisites**

**Material required:** iDIH Oracle OVA, iDIH Mediation OVA, and iDIH Application OVA

1. Add the iDIH Oracle OVA to KVM/OpenStack.

- a. Copy the OVA file to the OpenStack control node.

```
$ scp oracle-8.6.x.x.x.ova admusr@node:~
```

- b. Log in to the OpenStack control node.

```
$ ssh admusr@node
```

- c. In an empty directory, unpack the OVA file using `tar`.

```
$ tar xvf oracle-8.6.x.x.x.ova
```

- d. One of the unpacked files has a `.vmdk` suffix. This is the VM image file that must be imported.

```
oracle-8.6.x.x.x-disk1.vmdk
```

**Note**

The OVA format only supports files with a max size of 8GB, so a vmdk file larger than that is split. You should be able to concatenate the files together to merge them back into one file:

```
$ cat ORA-80_x_x.vmdk.000000000 ORA-80_x_x.vmdk.000000001 >
ORA-80_x_x.vmdk
```

- e. Source the OpenStack `admin` user credentials.

```
$. keystone_admin
```

- f. Select an informative name for the new image. For example:

```
ORA-8.6_x_x
```

- g. Import the image using the **glance** utility from the command line.

```
$ glance image-create --name oracle-8.6.x.x.x-original --visibility
public --protected false --progress --container-format bare --disk-
format vmdk --file oracle-8.6.x.x.x-disk1.vmdk
```

This process takes about 5 minutes depending on the underlying infrastructure.

**Note**

Optional – Steps h and i are not needed if VMDK is used.

- h. Convert VMDK to QCOW2 format.  
Use the **qemu-img** tool to create a `qcow2` image file using this command.

```
qemu-img convert -f vmdk -O qcow2 <VMDK filename> <QCOW2 filename>
```

**For example:**

```
qemu-img convert -f vmdk -O qcow2 DSR-82_12_0.vmdk DSR-82_12_0.qcow2
```

Install the **qemu-img** tool (if not already installed) using this `yum` command.

```
sudo yum install qemu-img
```

- i. Import the converted qcow2 image using the `glance` utility from the command line.

```
$ glance image-create --name dsr-x.x.x-original --is-public True --is-protected False --progress --container-format bare --disk-format qcow2 --file DSR-x.x.x-disk1.qcow2
```

This process take about five minutes depending on the underlying infrastructure.

2. Create flavors for iDIH.

Examine the storage recommendations in the resource profiles defined in *DSR Cloud Benchmarking Guide*. A block storage must be created and attached for the Oracle VM. For example, create an `idih.db` for the Oracle database with a 100GB ephemeral disk.

| Flavor Name | VCPUs | RAM  | Root Disk | Ephemeral Disk | Swap Disk | ID                                   | Public | Metadata | Actions     |
|-------------|-------|------|-----------|----------------|-----------|--------------------------------------|--------|----------|-------------|
| dsr.so.no   | 4     | 6GB  | 60GB      | 0GB            | 0MB       | 48c0c717-2b78-401c-b24e-4455e26159ac | Yes    | No       | Edit Flavor |
| idih        | 4     | 8GB  | 64GB      | 0GB            | 0MB       | 50eb1952-d8bc-418a-ab2d-66e923d460d1 | Yes    | No       | Edit Flavor |
| idih.db     | 4     | 8GB  | 120GB     | 100GB          | 0MB       | 4936397c-827a-499d-a4ad-4784e0bd4ef0 | Yes    | No       | Edit Flavor |
| sds         | 4     | 12GB | 125GB     | 0GB            | 0MB       | 537ce226-d602-43f1-b68f-4163a67bc1ec | Yes    | No       | Edit Flavor |
| dsr.riple   | 4     | 16GB | 60GB      | 0GB            | 0MB       | 793a6e79-2a59-4dad-894d-0ad46e7a8aa2 | Yes    | No       | Edit Flavor |
| dsr.mp      | 8     | 16GB | 60GB      | 0GB            | 0MB       | 3af68e73-293c-498f-bef9-a6810dffa6cb | Yes    | No       | Edit Flavor |

3. Create network interfaces.

Examine the network interface recommendations defined in *DSR Cloud Benchmarking Guide*. Network ports must be created for each recommended interface.

**For example:**

| Project | Network Name     | Subnets Associated              | DHCP Agents | Shared | Status | Admin State | Actions      |
|---------|------------------|---------------------------------|-------------|--------|--------|-------------|--------------|
| admin   | imi_network      | imi_subnet 192.168.99.0/24      | 1           | No     | Active | UP          | Edit Network |
| admin   | int_network      | int_subnet 10.254.254.0/27      | 1           | No     | Active | UP          | Edit Network |
| admin   | private_network  | private_subnet 192.168.100.0/24 | 1           | No     | Active | UP          | Edit Network |
| admin   | xsi1_network     | xsi1_subnet 192.168.101.0/24    | 1           | No     | Active | UP          | Edit Network |
| admin   | xsi2_network     | xsi2_subnet 192.168.102.0/24    | 1           | No     | Active | UP          | Edit Network |
| admin   | external_network | public_subnet 10.250.65.0/24    | 1           | Yes    | Active | UP          | Edit Network |

Displaying 6 items

4. Create and boot the iDIH VM instance from the glance image.

a. Get the following configuration values.

The image ID

```
$ glance image-list
```

The flavor ID

```
$ nova flavor-list
```

The network ID(s)

```
$ neutron net-list
```

An informative name for the instance.

- iDIH-Oracle
- iDIH-Mediation
- iDIH-Application

b. Create and boot the VM instance.

The instance must be owned by the DSR tenant user, not the admin user. Source the credentials of the DSR tenant user and issue the following command. Use one **--nic** argument for each IP/interface. Number of IP/interfaces for each VM type must conform with the interface-to-network mappings defined in *DSR Cloud Benchmarking Guide*.

**Note**

IPv6 addresses should use the **v6-fixed-ip** argument instead of **v4-fixed-ip**.

**For Oracle VM Only**

Create the ephemeral storage for only the Oracle VM.

```
$ nova boot --image <image ID> --flavor <flavor id or name> --nic net-id=<xmi network id>,v4-fixed-ip=<xmi ip address> --nic net-id=<int
```

```
network id>,v4-fixed-ip=<int ip address> --ephemeral size=100 --config-
drive true <instance name>
```

For example:

```
$ nova boot --image 7e881048-190c-4b66-b26e-dc5b9dc3c07f --flavor
idih.db --nic net-id=e96cb10a-9514-4702-b0c5-64fc99eb3fdd,v4-fixed-
ip=10.250.65.161 --nic net-id=674b8461-ffed-4818-8dea-7544f9c06e5f,v4-
fixed-ip=10.254.254.2 --ephemeral size=100 -config-drive true iDIH-
Oracle
```

### For Application VM Only

```
$ nova boot --image <image ID> --flavor <flavor id or name> --nic net-
id=<xmi network id>,v4-fixed-ip=<xmi ip address> --nic net-id=<int
network id>,v4-fixed-ip=<int ip address> --config-drive true <instance
name>
```

For example:

```
$ nova boot --image 7e881048-190c-4b66-b26e-dc5b9dc3c07f --flavor
idih.db --nic net-id=e96cb10a-9514-4702-b0c5-64fc99eb3fdd,v4-fixed-
ip=10.250.65.161 --nic net-id=674b8461-ffed-4818-8dea-7544f9c06e5f,v4-
fixed-ip=10.254.254.4 -config-drive true iDIH-App
```

### For Mediation VM Only

For Mediation, add the IMI interface as the IMI interface.

```
$ nova boot --image <image ID> --flavor <flavor id or name> --nic net-
id=<xmi network id>,v4-fixed-ip=<xmi ip address> --nic net-id=<int
network id>,v4-fixed-ip=<int ip address> --nic net-id=<imi network
id>,v4-fixed-ip=<imi ip address> -config-drive true <instance name>
```

For example:

```
$ nova boot --image f548c2cd-1ddd-4c56-b619-b49a69af8801 --flavor idih
--nic net-id=e96cb10a-9514-4702-b0c5-64fc99eb3fdd,v4-fixed-
ip=10.250.65.162 --nic net-id=674b8461-ffed-4818-8dea-7544f9c06e5f,v4-
fixed-ip=10.254.254.3 --nic net-
id=3d9b9da8-96ad-4f29-9f82-98b00ea30446,v4-fixed-ip=192.168.99.3 -
config-drive true iDIH-Mediation
```

- c. View the newly created instance using the nova tool.

```
$ nova list --all-tenants
```

The VM takes approximately 5 minutes to boot and may be accessed through both network interfaces and the Horizon console tool.

5. Verify configured interface.

If DHCP is enabled on the Neutron subnet, VM configures the VNIC with the IP address provided in step 4. To verify, ping the XMI IP address provided with the **nova bootcommand** from step 4:

```
$ ping <XMI-IP-Provided-During-Nova-Boot>
```

If successfully pinging, ignore step 6 to manually configuring the interface.

**6. Manually configure interface, if not already done.**

This is an optional step.

**Note**

If the instance is already configured with an interface and has successfully pinged (step 5), then **ignore** this step to configure the interface manually.

- a. Log in to the **Horizon** GUI as the DSR tenant user.
- b. Go to the **Compute/Instances** section.
- c. Click the **Name** field of the newly created instance.
- d. Select the **Console** tab.
- e. Log in as the `admusr` user.
- f. Configure the network interfaces, conforming with the interface-to-network mappings defined in *DSR Cloud Benchmarking Guide*.

```
$ sudo netAdm add --onboot=yes --device=eth0 --address=<xmi ip> --
netmask=<xmi net mask>
```

```
$ sudo netAdm add --onboot=yes --device=eth1 --address=<int ip> --
netmask=<int net mask>
```

```
$ sudo netAdm add --route=default --device=eth0 --gateway=<xmi gateway
ip>
```

An additional interface eth2 needs to be configured **ONLY** for Mediation VM. To configure the eth2:

```
$ sudo netAdm add --onboot=yes --device=eth2 --address=<imi ip> --
netmask=<imi net mask>
```

- g. Reboot the VM. It takes approximately 5 minutes for the VM to complete rebooting.

```
$ sudo init 6
```

The new VM should now be accessible using both network and Horizon consoles.

- 7. Repeat steps 1 through 6 for the following VMs. Use unique labels for the VM names: **iDIH-Application** and **iDIH-Mediation**.**

## 5.8 Create iDIH Virtual Machines - OVM-S/OVM-M

This procedure imports the IDIH image and creates/configures a VM. Repeat this procedure three times for:

- IDIH-Oracle (db)
- IDIH-Application (app)
- IDIH-Mediation (med)

### Prerequisites

- Replace XXX in variable names with the different suffix – when repeating.
- This procedure requires values for these variables:
  - <OVM-M IP> = IP address to access a sh prompt on the OVM server
  - <URL to IDIH-XXX OVA> = Link(s) to a source for each IDIH product image (.ova)
  - <MyRepository name> = Name of the repository in the OVM to hold the product images (.ova)
  - <ServerPool name>
  - <VM name>
  - <OVM network ID for XMI>
  - <OVM network ID for IDIH Internal>
  - <OVM network ID for IMI>
- Execution of this procedure will discover and use the values of these variables:
  - <Virtual Appliance IDIH-XXX OVA ID>
  - <IDIH-XXX-OVA VM name\_vm\_vm>
  - <VM id>
  - <vCPUs Production>
  - <Vnic 1 id>
  - <size in GB>
  - <VirtualDiskId>
  - <VirtualDiskName>
  - <Slot#>

#### 1. Access command line of OVM.

Refer to [Common OVM Manager Tasks \(CLI\)](#) for setting up the platform.

- a. Use the respective value for <OVM-M IP> into the command.

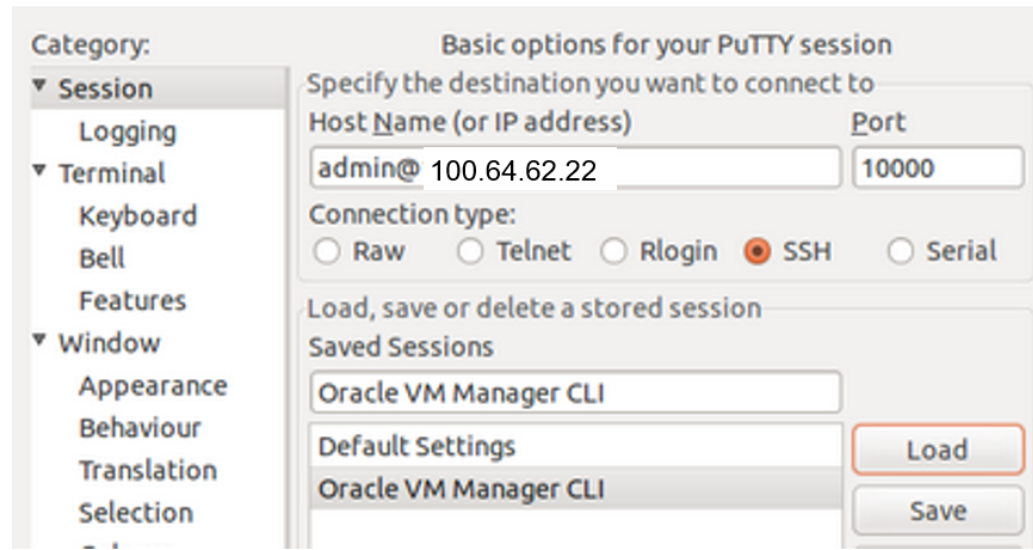

```
ssh -l admin <OVM-M IP> -p 10000
```

#### Example:

```
ssh -l admin 100.64.62.221 -p 10000
```

Alternate: use a terminal emulation tool like putty.

2. In OVM-M CLI, import the VirtualAppliance/OVA for IDIH-XXX.
  - a. Use the respective values for <MyRepository name> and <URL to IDIH-XXX OVA> into the command.

```
OVM>importVirtualAppliance Repository name='<MyRepository name>'
url=<URL to IDIH-XXX OVA>
```

**Example:**

```
OVM> importVirtualAppliance Repository name='XLab Utility Repo01'
url=http://10.240.155.70/iso/IDIH/8.2/ova/oracle- 8.2.3.0.0_82.40.0.ova
```

- b. Run the command and validate success.
- c. Examine the screen results to find site-specific text for variables in these locations:

```
importVirtualAppliance Repository name='XLab Utility Repo01'
url=http://10.240.155.70/iso/DSR/8.6/ova/DSR-9.0.1.0.0_95.14.0.ova
Status: Success
Time: 2017-04-18 15:23:31,044 EDT
JobId: 1492543363365
Data:
ID: 1128alc6ce name: DSR-9.0.1.0.0_95.14.0.ova
```

- d. Use the respective values for values for these variables (overwrite example).  
<Virtual Appliance IDIH-XXX OVA ID> = 1128alc6ce
3. In OVM-M CLI, get the virtual appliance name. It is used in <IDIH-XXX OVA VM name> in later steps.
  - a. Use the respective values for <Virtual Appliance IDIH-XXX OVA ID> in the command.

```
OVM> show VirtualAppliance id=<Virtual Appliance IDIH-XXX OVA id>
```

**Example:**

```
OVM> show VirtualAppliance id=1128alc6ce
```

- b. Run the command and validate success.
- c. Examine the screen results to find site-specific text for variables in these locations:

```
show VirtualAppliance id=1128alc6ce
Status: Success
Time: 2017-04-18 15:23:53,534 EDT
Data:
Origin = http://10.240.155.70/iso/DSR/8.6/ova/DSR-8.6.0.0.0_95.14.0.ova
Repository = 0004fb0000030000da5738315337bfc7 [XLab Utility Repo01]
Virtual Appliance Vm 1 = 11145510c0_vm_vm [vm]
Virtual Appliance VirtualDisk 1 = 11145510c0_disk_disk1 [disk1]
Id = 11145510c0 [DSR-9.0.1.0.0_95.14.0.ova]
Name = DSR-9.0.1.0.0_95.14.0.ova
Description = Import URL: http://10.240.155.70/iso/DSR/8.6/ova/
DSR-8.6.0.0.0_95.14.0.ova
Locked = false
```

- d. Use the respective values for these variables (overwrite example).

```
<IDIH-XXX-OVA VM name_vm_vm> = 11145510c0_vm_vm
```

4. In OVM-M CLI, create a virtual machine from the virtual machine in the OVA virtual appliance.

- a. Use the respective value for <IDIH-db-OVA VM name\_vm\_vm> into the command.

```
OVM> createVmFromVirtualApplianceVm VirtualApplianceVm name=<IDIH-XXX-
OVA VM name_vm_vm>
```

**Example:**

```
OVM> createVmFromVirtualApplianceVm VirtualApplianceVm
name=11145510c0_vm_vm
```

- b. Run the command and validate success.
- c. Examine the screen results to find site-specific text for variables in these locations:  
**Command:**

```
createVmFromVirtualApplianceVm VirtualApplianceVm name=11145510c0_vm_vm
Status: Success
Time: 2017-04-18 16:02:09,141 EDT
JobId: 1492545641976
Data:
id: 0004fb00000600004a0e02bdf9fc1bcd name: oracle-9.0.1.0.0_95.14.0.ova
```

- d. Use the respective values for these variables (overwrite example).

```
<VM id> = 0004fb00000600004a0e02bdf9fc1bcd
```

5. In OVM-M CLI, add the VM to the server pool.

- a. Use the respective values for <VM ID> and <ServerPool name> into the command.

```
OVM> add Vm id=<VM id> to ServerPool name="<ServerPool name>"
```

**Example:**

```
OVM> add Vm id=0004fb00000600004a0e02bdf9fc1bcd to ServerPool
name="XLab Pool 01"
```

- b. Run the command and validate success.

**Note**

Refer [Server Pool](#) for further information on Server Pool.

6. In OVM-M CLI, edit VM to apply required profile/ resources.
  - a. Refer to *DSR Cloud Benchmarking Guide* for recommended resource.

**Table 5-11 Recommended Resource**

| VM Name            | vCPUs Lab | RAM (GB) Lab | vCPUs Production | RAM (GB) Production | Storage (GB) Lab and Production |
|--------------------|-----------|--------------|------------------|---------------------|---------------------------------|
| Type of guest host | #         | #            | #                | #                   | #                               |

- b. Use the respective values for <VM ID>, <VM name>, and <vCPUs Production> into the command.

```
OVM> edit Vm id=<VM id> name=<VM name> memory=6144 memoryLimit=6144
cpuCountLimit=<vCPUs Production> cpuCount=<vCPUs Production>
domainType=XEN_HVM description="<VM name>"
```

**Example:**

```
OVM> edit Vm id=0004fb00000600004a0e02bdf9fc1bcd name= na_idih-db
memory=6144 memoryLimit=6144 cpuCountLimit=4 cpuCount=4
domainType=XEN_HVM description="na_idih-db"
```

- c. Run the command and validate success.  
Now, the VM has a name and resources.
7. In OVM-M CLI, determine VNIC ID.
  - a. Use the respective value for <VM name> in the command.

```
OVM> show Vm name=<VM name>
```

**Example:**

```
OVM> show Vm name= na_idih-db
```

- b. Run the command and validate success.

- c. Examine the screen results to find site-specific text for variables in these locations:  
Vnic 1 = 0004fb0000070000091e1ab5ae291d8a
  - d. Use the respective values for these variables (overwrite example).  
<Vnic 1 ID> = 0004fb0000070000091e1ab5ae291d8a
8. Determine network interfaces for the type of guest host.

Refer to *DSR Cloud Benchmarking Guide* to learn which network interfaces need to be configured for each guest type. The table looks like this:

**Table 5-12 Network Interfaces**

|                    | OAM (XMI) | Local (IMI) | Sig A (XSI1) | Sig B (XSI2) | Sig C (XSI3-16) | Rep (SBR) | DIH Internal |
|--------------------|-----------|-------------|--------------|--------------|-----------------|-----------|--------------|
| Type of guest host | eth#      | eth#        | eth#         | eth#         | eth#            | eth#      | eth#         |

**Note**

The VNICs need to be created in the correct order so the interfaces are associated with the correct network.

9. In OVM-M CLI, add (attach) XMI VNIC ID of the XMI network to VM (if required by guest host type).
- a. Use the respective values for <Vnic 1 ID> and <OVM network ID for XMI> into the command
- ```
OVM> add Vnic ID=<Vnic 1 ID> to Network name=<OVM network ID for XMI>
```
- Example:**
- ```
OVM> add Vnic ID=0004fb0000070000091e1ab5ae291d8a to Network
name=10345112c9
```
- b. Run the command and validate success.
10. In OVM-M CLI, create and attach IDIH Internal VNIC to VM (if required by guest host type).

- a. Use the respective values for <OVM network ID for IDIH Internal> and <VM name> into the command

```
OVM> create Vnic network=<OVM network id for IDIH Internal> name=<VM
name>-int on Vm name=<VM name>
```

**Example:**

```
OVM> create Vnic network=DIH Internal name=na_idih-db-int on Vm
name=na_idih-db
```

- b. Run the command and validate success.
11. In OVM-M CLI, create and attach IMI VNIC ID to VM (if required by guest host type).

- a. Use the respective values for <OVM network ID for IMI> and <VM name> into the command

```
OVM> create Vnic network=<OVM network ID for IMI> name=<VM name>-IMI on
VM name=<VM name>
```

**Example:**

```
OVM> create Vnic network=102e89a481 name= na_idih-db-IMI on Vm name=
na_idih-db
```

- b. Run the command and validate success.

**12. Create an extra virtual disk (only required on IDIH-Oracle (db) if the system is using OVM).**

- a. Decide on a name for the virtual disk: <VirtualDiskName>
- b. Refer the resource profiles defined in *DSR Cloud Benchmarking Guide* to learn the required GB of Storage for the IDIH type: <size in GB>
- c. Use the respective value for <MyRepository Name> into the command.

```
OVM> create VirtualDisk name='<VirtualDiskName>' size=<size in GB>
sparse=<Yes/No> shareable=<Yes/No> on Repository name='<MyRepository
Name>'
```

```
OVM> create VirtualDisk name=idih-db_disk1 size=100 sparse=No
shareable=No on Repository name='XLab Utility Repo01'
```

- d. Examine the screen results to find site-specific text for variables in these locations:

**Command:**

```
create VirtualDisk name=idih-db_disk size=100 sparse=No shareable=No on
Repository name='XLab Utility
Repo01'
Status: Success
Time: 2017-04-24 15:29:12,502 EDT
JobId: 1493061481113
Data:
id: 0004fb00001200001bae7adbe6b20e19.img name:idih-db_disk
```

- e. Use the respective values for these variables (overwrite example).

```
<VirtualDiskId> = 0004fb00001200001bae7adbe6b20e19.img
```

```
<VirtualDiskName> = idih-db_disk
```

**13. In OVM-M CLI, map the created virtual disk to a slot on the VM. This step is for iDIH Oracle VM only.**

- a. Decide on a slot for the virtual disk: <Slot#>
- b. Use the respective values for <Slot#> & <VirtualDiskId> & <VirtualDiskName> & <VM name> into the command.

```
OVM> create VmDiskMapping slot=<Slot#> virtualDisk=<VirtualDiskId>
name="<VirtualDiskName>" on Vm name=<VM name>
```

**Example:**

```
OVM> create VmDiskMapping slot=2
virtualDisk=0004fb00001200001bae7adbe6b20e19.img name='idih-db_disk' on
Vm name=na_idih-db
```

- c. Run the command and validate success.

```
create VmDiskMapping slot=2
virtualDisk=0004fb00001200001bae7adbe6b20e19.img
name='idih-db_disk' on Vm name=na_idih-db
Status: Success
Time: 2017-04-24 15:32:50,875 EDT
JobId: 1493062370724
Data:
id:0004fb000013000057ab9b00e6d47add name:idih-db_disk
```

14. In OVM-M CLI, start VM.

- a. Use the respective values for <VM name> into the command

```
OVM> start Vm name=<VM name>
```

**Example:**

```
OVM> start Vm name= na_idih-db
```

- b. Run the command and validate success.

**Note**

Repeat steps 2 through 14 for the following VMs. Use unique labels for the VM names:

- iDIH-Application
- iDIH-Mediation

## 5.9 Configure iDIH Virtual Machines Networks

This procedure configures the iDIH guest VM external management networks. This is an optional procedure.

1. Log in to the Oracle VM console.
  - a. Access the iDIH Oracle VM console.
  - b. Log in as the `admusr` user.
2. Verify the extra or second disk exists.

**Note**

This step is required only for the Oracle VM.

Check if the raw storage block device (external disk) exists by executing any of below commands (similar to the screenshot):

```
$ ls /dev/[sv]db
```

**Note**

The command [sv] db means, sdb and vdb, depending on the hardware.

Example using, `$ ls /dev/sdb`

```
Disk /dev/sdb: 107.4 GB, 107374182400 bytes
255 heads, 63 sectors/track, 13054 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00000000
```

```
$ sudo fdisk -l
```

```
Disk /dev/vda: 75.2 GB, 75161927680 bytes
16 heads, 63 sectors/track, 145635 cylinders
Units = cylinders of 1008 * 512 = 516096 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x000af813

 Device Boot Start End Blocks Id System
/dev/vda1 * 3 1043 524288 83 Linux
/dev/vda2 1043 145636 72875008 8e Linux LVM

Disk /dev/mapper/vgroot-plat_root: 1073 MB, 1073741824 bytes
255 heads, 63 sectors/track, 130 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00000000
```

```
$ df -h
```

```
[admusr@DsrSite00NOAM00 ~]$ df -h
Filesystem Size Used Avail Use% Mounted on
/dev/mapper/vgroot-plat_root
 976M 289M 637M 32% /
tmpfs 2.9G 0 2.9G 0% /dev/shm
/dev/vda1 488M 38M 426M 9% /boot
/dev/mapper/vgroot-plat_tmp
 976M 1.6M 924M 1% /tmp
/dev/mapper/vgroot-plat_usr

 8.3G 230M 7.6G 3% /var/TKLC/rundb
```

If the extra disk does not exist, revisit the procedures for respective hypervisors. ([Create iDIH Virtual Machines - VMware](#), [Create iDIH Virtual Machines - KVM/OpenStack](#), and [Create iDIH Virtual Machines - OVM-S/OVM-M](#)).

#### Note

Do not mount or format the added raw block device. Oracle ASM (Automatic Storage Management) automatically manages it. To verify it, run the following command:

```
$ df
```

If you see it has been mounted, unmount it and completely remove the entry in the `/etc/fstab`.

#### For example:

- a. If any external drive (such as, `/dev/vdb`) is mounted, then unmount the external drive by executing the following command on oracle server: `umount /dev/vdb`
- b. Edit the `/etc/fstab` file on oracle server and if any entry for `/dev/vdb` is present in the file, then remove the entry and save the file.
3. Delete the `eth0` interface.

```
$ sudo netAdm delete --device=eth0
```

**Note**

Note down the MAC address before the eth0 is deleted. This helps in identifying the MAC address of eth0 in case the persistence net rules file is not generated.

4. Trigger net rules file creation.

Run the `udevadm` command to recreate net rules file.

```
$ sudo udevadm trigger --subsystem-match=net
```

**Note**

If this command does not create the net rules file, create it manually. Refer to [Sample Net Rules File](#).

5. Modify the ethernet interface names in the net rules file.
  - a. Update the net rules file to replace the default interfaces names ethX with XMI and INT interfaces names. Replace **eth0** with **xmi** and **eth1** with **int** interface. Also, respective MAC addresses should be updated for each interface in lower case. MAC addresses can be determined using `ifconfig -a` command from the console.

**Note**

The Mediation VM requires the user to rename a third interface: **eth2** as **imi** interface.

- b. Refer to [Sample Net Rules File](#) for a sample net rules file.

```
$ sudo vi /etc/udev/rules.d/70-persistent-net.rules
```

```
PCI device 0x15ad:0x07b0 (vmxnet3)
SUBSYSTEM=="net", ACTION=="add", DRIVERS=="?*", ATTR{address}=="00:50:56:b9:2d:b
b", ATTR{type}=="1", KERNEL=="eth*", NAME="eth1"

PCI device 0x15ad:0x07b0 (vmxnet3)
SUBSYSTEM=="net", ACTION=="add", DRIVERS=="?*", ATTR{address}=="00:50:56:b9:ea:b
2", ATTR{type}=="1", KERNEL=="eth*", NAME="eth0"

PCI device 0x15ad:0x07b0 (vmxnet3)
SUBSYSTEM=="net", ACTION=="add", DRIVERS=="?*", ATTR{address}=="00:50:56:b9:2d:b
b", ATTR{type}=="1", KERNEL=="eth*", NAME="int"

PCI device 0x15ad:0x07b0 (vmxnet3)
SUBSYSTEM=="net", ACTION=="add", DRIVERS=="?*", ATTR{address}=="00:50:56:b9:ea:b
2", ATTR{type}=="1", KERNEL=="eth*", NAME="xmi"
```

- c. Reboot the VM.

```
$ sudo init 6
```

6. As `admusr` on the Oracle VM configure the networks with `netAdm`.

- a. Log in to the **iDIH Oracle VM** console as the `admusr` user.
- b. The XMI network should already exist, but it can be created with the following command.

```
$ sudo netAdm add --device=xmi --address=<IP Address in External
Management Network> --netmask=<Netmask> --onboot=yes
```

- c. Configure the int network IP address and netmask.

```
$ sudo netAdm add --device=int --address=10.254.254.2 --
netmask=255.255.255.224
```

**Note**

It is advisable to use the following IP as internal IP addresses defined for: Oracle VM internal IP = 10.254.254.2; the Mediation VM internal IP = 10.254.254.3; and the application internal IP address = 10.254.254.4. The netmasks for all is 255.255.255.224.

- d. **Mediation Only.** If this is a Mediation VM, configure the Mediation internal management network.

```
$ sudo netAdm add --device=imi --address=<IP Address in Internal
Management Network> --netmask=<Netmask>
```

- e. Configure the default gateway.

```
$ sudo netAdm add --route=default --gateway=<gateway address for the
External Management Network> --device=xmi
```

The VM network configuration has been completed. You should be able to **ssh** into the server through XMI interface.

7. As `admusr` on the Oracle VM configure NTP and the Oracle VM hostname.

- a. On the Oracle VM console, launch the platform configuration menu.

```
$ sudo su - platcfg
```

- b. From the platform configuration menu configure `ntpserver1` with the IP address supplied for NTP.
  - i. Navigate to **Network Configuration**, and then **NTP**, and then **Edit**, and then **ntpserver1**.
  - ii. Click **Yes** when asked to restart NTP.

**Note**

Properly configure the NTP on the controller node to reference lower stratum NTP servers.

- c. Exit the network configuration menu.
- d. Configure the Oracle VM hostname.

Navigate to **Server Configuration**, and then **Hostname**, and then **Edit**.

**Note**

- Typically, we select hostname and identify the host as iDIH application, iDIH Mediation, and iDIH Oracle.
- Remove any occurrence of “.” and the “.<availability zone>” name, such as “.novalocal” from the hostname that might have got appended.

- e. Exit the platform configuration menu.
8. Repeat Steps 1 through 7 for the following VMs. Use unique labels for the VM names:
  - iDIH Mediation
  - iDIH Application

**Note**

Logout and Login to each VM to update the environment variable before executing the next procedure ([Create iDIH Virtual Machines - OVM-S/OVM-M](#) for Post Installation Scripts on iDIH VMs).

## 5.10 iDIH Installation on OL7 and KVM

iDIH Installation on OL7 and KVM includes the following procedures:

- Install KVM
- Create SDB on KVM
- Attach device (sdb) to iDIH database VM
- Fix iDIH database script on KVM

### 5.10.1 Install KVM

1. Log in to the ILOM as `root` user.

SP Hostname: ORACLESP-1546NM10J4

User Name:

Password:

2. Launch the remote console.

- a. On the main Summary page, select **Launch** next to remote console.

- b. Select **Continue** on the JAVA security warning pop-up.
3. Connect the Oracle Linux ISO Image.

**Note**

If firmware upgrade is required, apply same procedure.

- a. In the **KVMS** menu, select **Storage** option.

A window entitled Storage Devices appears.

- b. Click **Add** and navigate to the location of the ISO on the local workstation.
- c. Select the ISO and then click **Select**.

The ISO file will be included in the list of available storage devices.

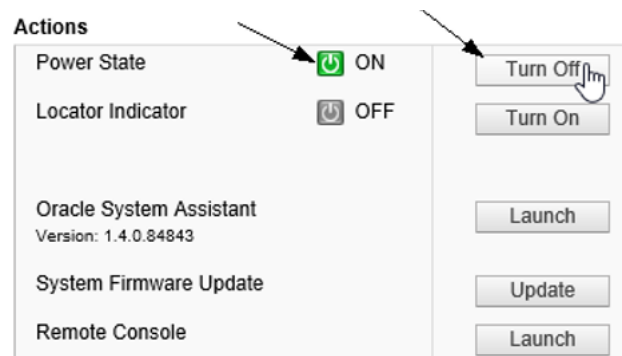

- d. Select it in the **Storage Devices** window and then click **Connect**.

Message when the ISO is connected will be displayed.

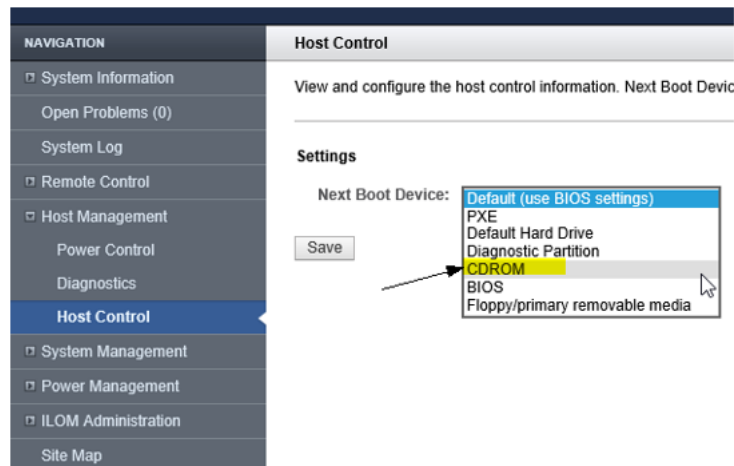

4. Click **OK** to confirm and close the window.
5. Shut down the server gracefully.
  - a. On the System Summary page, click **Turn Off** next to **Power State** in the **Actions** pane. Click **OK** at the confirmation prompt.

**Note**

- This performs a graceful shutdown of the operating system prior to powering off the host server. Wait for the indicator to signify that the server is powered down before proceeding to the next step.
- If at any point the internet connection on the local workstation is lost or the browser being used is closed and the OSA has not yet been updated, the Oracle System Assistant Updater ISO must be remounted using the previous steps.

6. Set CDROM as the next boot device.
  - a. Under the **Host Management** tab, select **Host Control** option.
  - b. From the drop-down menu for **Next Boot Device**, select **CDROM** option and then, click **Save**.

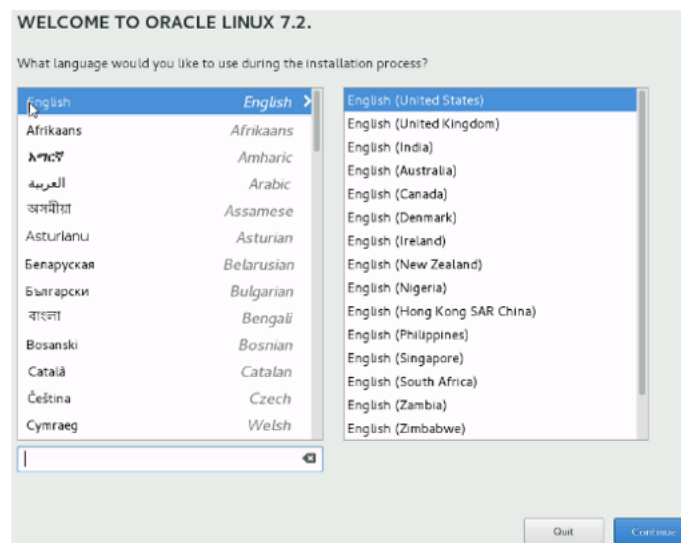

7. Power ON the server.
  - a. On the System Summary page, click **Turn On** next to **Power State** in the **Actions** Pane to boot into the Oracle System Assistant Updater ISO.
  - b. Click **OK** at the confirmation prompt.
8. Oracle Linux OS installation.

Go back to the window that contains the **Remote Console**. If the window was closed, re-launch the console in the **Actions** Pane. The system will boot into the installation.

- a. Select **Install Oracle Linux xx** and **Enter**.

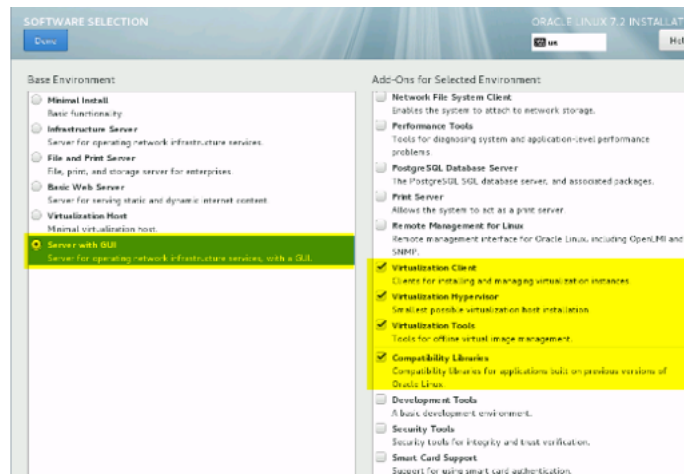

- b. Select Language and click **Continue**.

- c. Select Date and Time, confirm and then, click **Done**.

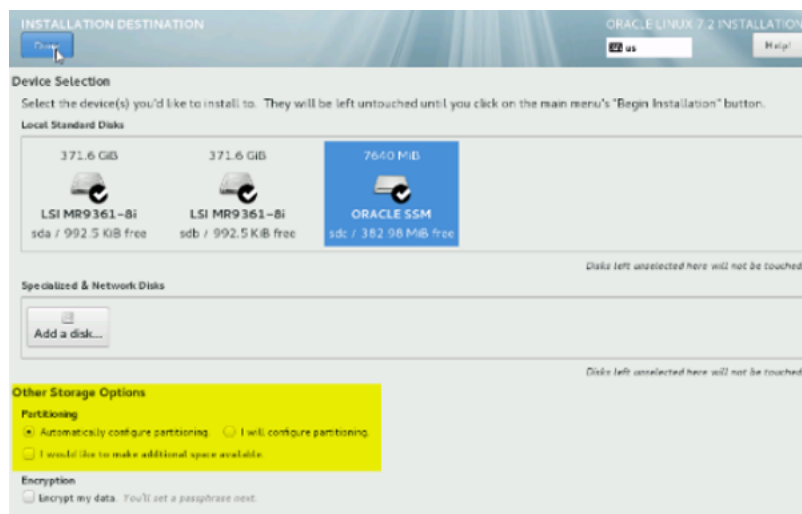

- d. Select **Software selection** with the following options.
- Under Basic Environment, select **Server with GUI**
  - Under Add-ons for Selected Environment, select:
    - Virtualization Client
    - Virtualization Hypervisor
    - Virtualization Tools
    - Compatibility Libraries

**Confirm** and then click **Done**.

- e. Select Installation Destination.
- i. Select all hard drives to be installed.
  - ii. Under Other Storage Options, ensure **Automatically configure partitioning** is selected.
- c. Click **Done**.

When prompted with INSTALLATION OPTIONS screen, select **Reclaim space**.

## INSTALLATION OPTIONS

Your current [Oracle Linux software selection](#) requires **7671.42 MiB** of available space, including **3575.42 MiB** for software and **4096 MiB** for swap space. The disks you've selected have the following amounts of free space:

**384.92 MiB** Free space available for use.

**48.8 GiB** Free space unavailable but reclaimable from existing partitions.

You don't have enough space available to install Oracle Linux. You can shrink or remove existing partitions via our guided reclaim space tool, or you can adjust your partitions on your own in the custom partitioning interface.

Cancel & add more disks

Reclaim space

When prompted with RECLAIM DISK SPACE screen, select **Delete all**, followed by **Reclaim space**.

**RECLAIM DISK SPACE**

You can remove existing file systems you no longer need to free up space for this installation. Removing a file system will permanently delete all of the data it contains.

There is also free space available in pre-existing file systems. While it's risky and we recommend you back up your data first, you can recover that free disk space and make it available for this installation below.

| Disk                                               | Name | File System           | Reclaimable Space      | Action   |
|----------------------------------------------------|------|-----------------------|------------------------|----------|
| ▼ 371.6 GiB LSI MR9361-B                           | sda  |                       | 371.6 GiB total        | Preserve |
| — /boot (Oracle VM server Linux 3.3.3 for x86_64)  | sda1 | ext4                  | 417 MiB of 500 MiB     | Preserve |
| — /boot (Oracle Linux Server Linux 7.2 for x86_64) | sda2 | xfs                   | Not resizable          | Preserve |
| — ol                                               | sda3 | physical volume (LVM) | Not resizable          | Preserve |
| ▼ 371.6 GiB LSI MR9361-B                           | sdb  |                       | 369.99 GiB total       | Preserve |

## 9. Reduce Home space on KVM (IDIH Database).

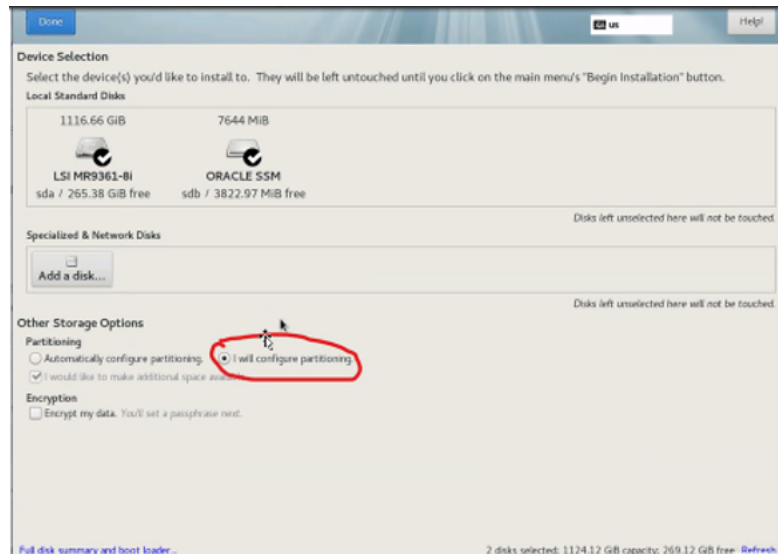

### Note

- This is an optional step.
- The steps from 7 to 12 only apply for KVM that will store the VM for IDIH Database.

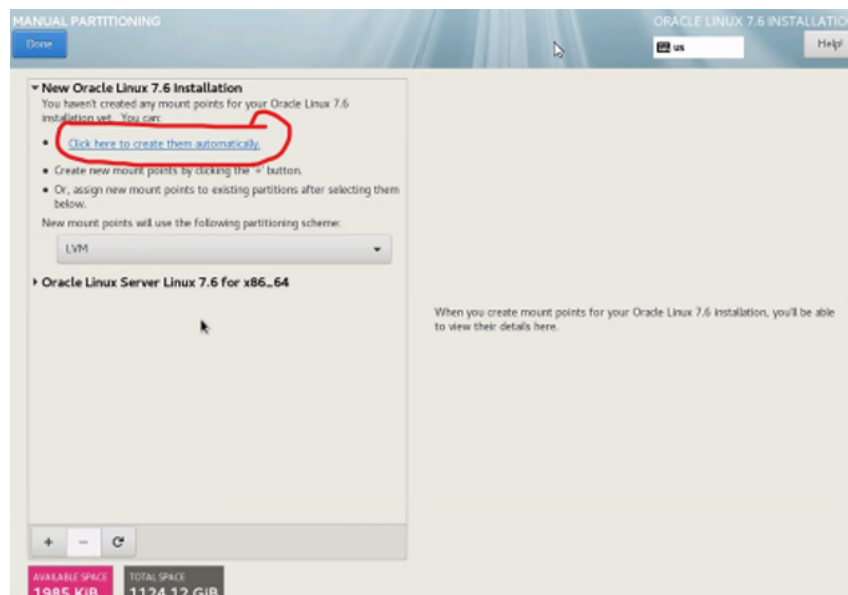

### a. Select **Installation Destination**.

- Select all hard drives to be installed.
- Under Other Storage Options, ensure I will configure partitioning.
- Click **Done**.

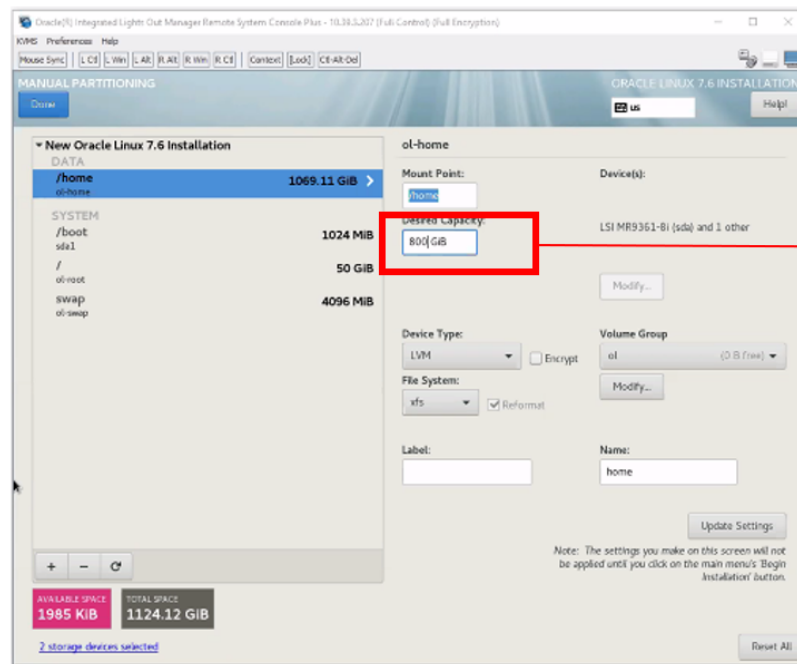

- b. Select **Click here to create them automatically**.

**Note**

Modify **home** to 800Gi and click **Update Settings**.

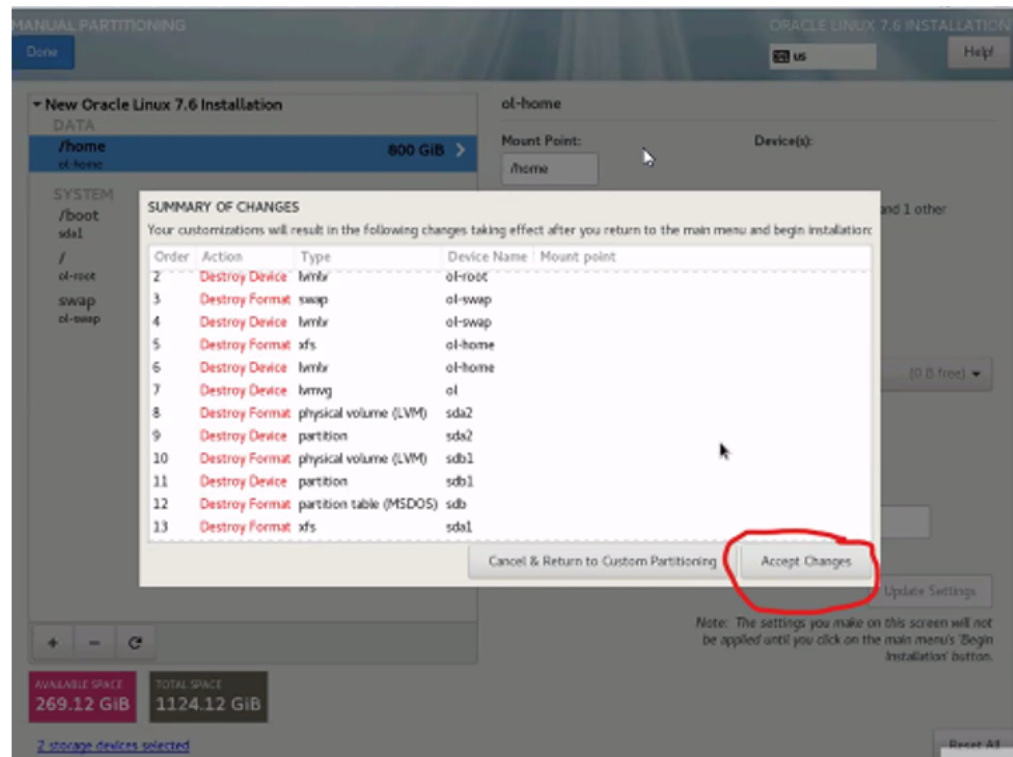

**Adjust to  
800Gib**

**Note**

The desired capacity field is customizable. In the above scenario, 800GB has been allocated to /home directory out of 1TB space. It is expected to retain about 200GB of free space out of total memory. This space can later be utilized for adding ephemeral disk.

- c. Click **Accept Changes** and **Done**.

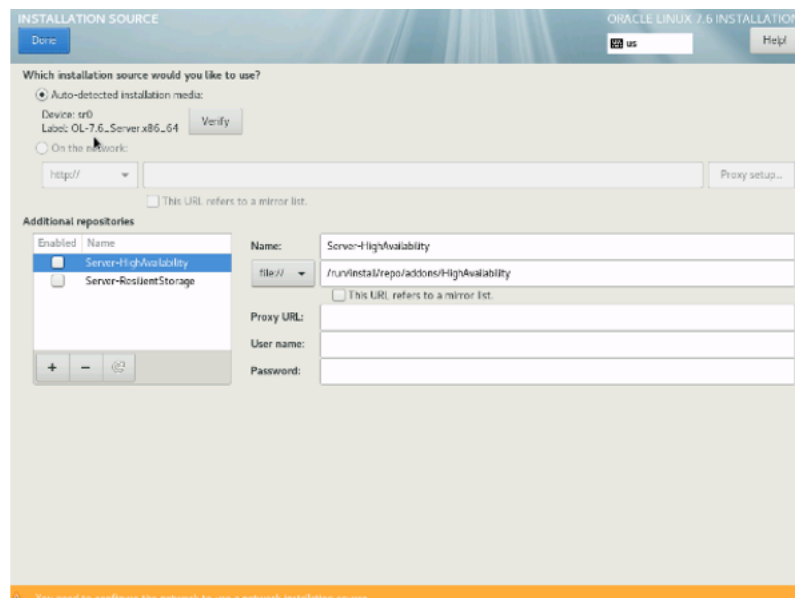

## 10. Run installation on KVM.

- Verify Installation Source **Auto-detected** should be automatically selected with the correct image.

### Note

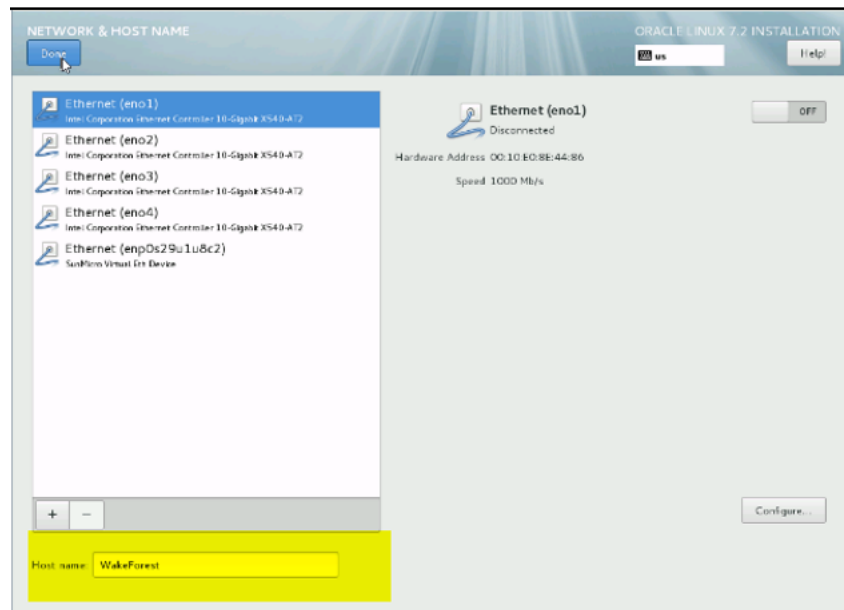

Verify the media if needed, but it takes a very long time to do so.

- b. Select **Network** and **host name**.

**Note**

Update server Host Name, but do not consider about networking at this time, as it will be configured later. Click **Done** after editing the host name.

11. Begin installation.

- a. Click **Begin Installation** to start the install.

Installation will begin.

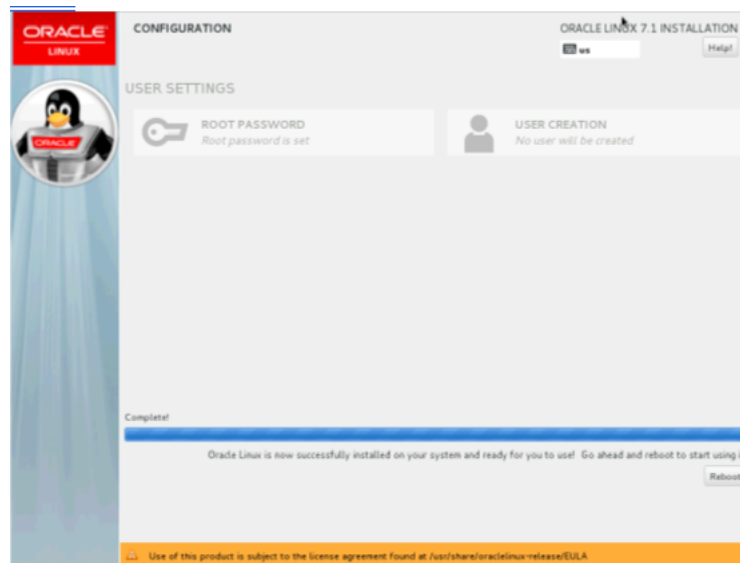

If needed, select and enter information for **root password** and **user creation**.

b. Create an Administrative user. (NextGen)

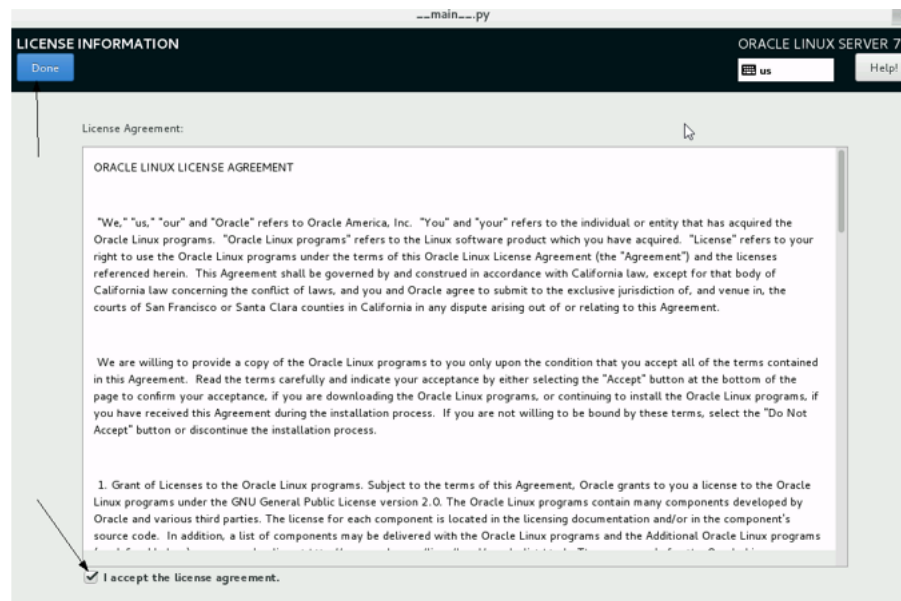

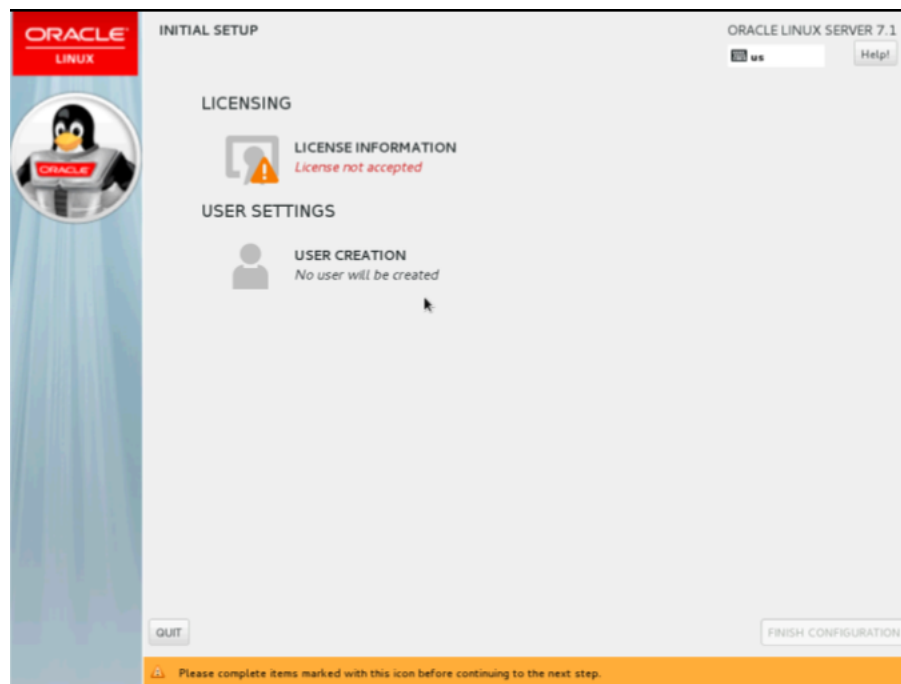

The screenshot shows the 'CREATE USER' window in the Oracle Linux 7.2 installation process. The window has a title bar with 'CREATE USER' and 'ORACLE LINUX 7.2 INSTALLATION'. Below the title bar, there are fields for 'Full name' (admin), 'User name' (admin), 'Password' (masked with asterisks), and 'Confirm password' (masked with asterisks). There are checkboxes for 'Make this user administrator' and 'Require a password to use this account', both of which are checked. A progress bar indicates the password strength is 'Good'. There is an 'Advanced...' button at the bottom.

12. Reboot after installation.

When OL7.x installation is complete, and you are prompted, reboot server to start OL7.x.

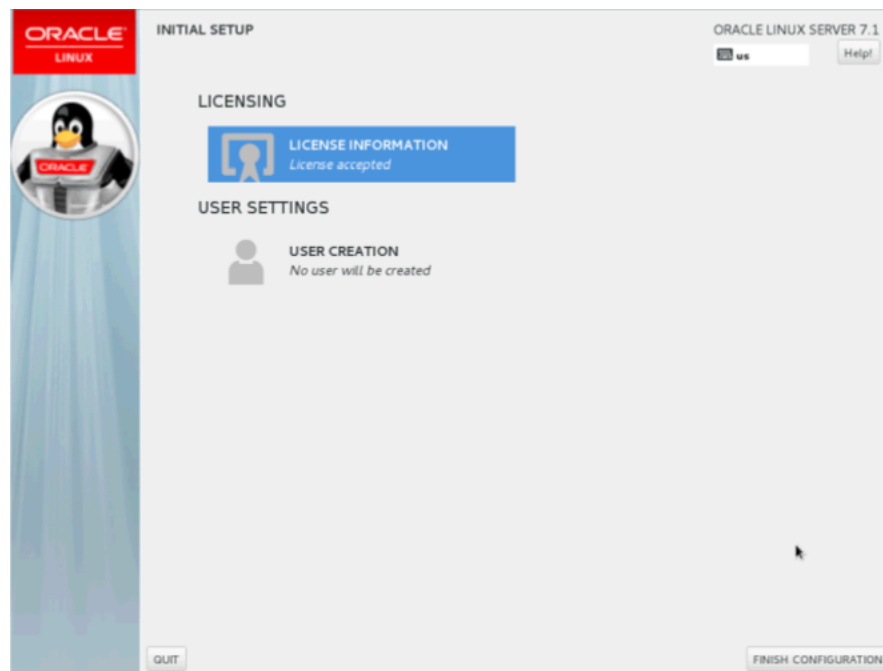

13. Accept the license.

Then, select finish installation.

14. Disconnect the ISO from storage.

From **KVMS**, and then **storage**, select the ISO and then select disconnect.

15. Revert KVM Hypervisor host interface naming convention to ETHx.

- a. Edit `/etc/default/grub` using VI editor.

```
$ cd /etc/default
$ sudo vi grub
```

- b. Add the following to the `GRUB_CMDLINE_LINUX` parameter:

```
rhgb quiet net.ifnames=0
```

```
GRUB_TIMEOUT=5
GRUB_DISTRIBUTOR="$(sed 's, release .*$,g' /etc/system-release)"
GRUB_DEFAULT=saved
GRUB_DISABLE_SUBMENU=true
GRUB_TERMINAL_OUTPUT="console"
GRUB_CMDLINE_LINUX="crashkernel=auto rd.lvm.lv=ol/root rd.lvm.lv=ol/swap rhgb quiet net.ifnames=0"
GRUB_DISABLE_RECOVERY="true"
```

Recreate the grub2 config file, run `grub2-mkconfig -o /boot/grub2/grub.cfg`

```
[admusr@WakeForest default]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
Generating grub configuration file ...
Found linux image: /boot/vmlinuz-3.10.0-327.el7.x86_64
Found initrd image: /boot/initramfs-3.10.0-327.el7.x86_64.img
Found linux image: /boot/vmlinuz-3.8.13-98.7.1.el7uek.x86_64
Found initrd image: /boot/initramfs-3.8.13-98.7.1.el7uek.x86_64.img
Found linux image: /boot/vmlinuz-0-rescue-4619ece62c09419a8971fb20e8bdc1b3
Found initrd image: /boot/initramfs-0-rescue-4619ece62c09419a8971fb20e8bdc1b3.img
done
[admusr@WakeForest default]$ █
```

- c. Restart server, run `shutdown -r now`

```
[admusr@WakeForest default]$ sudo shutdown -r now
```

After server restart, devices should be shown as ETHx.

**16. Create KVM Hypervisor HOST MGMT interface.**

- a. Create bond0 interface configuration file (/etc/sysconfig/network-scripts/ifcfg-bond0):**

```
$ sudo vi /etc/sysconfig/network-scripts/ifcfg-bond0
```

```
DEVICE=bond0
TYPE=Bonding
BOND_INTERFACES=eth0,eth1
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
BONDING_OPTS="mode=active-backup primary=eth0"
```

- b. Create eth0 interface configuration file (/etc/sysconfig/network-scripts/ifcfg-eth0):**

```
$ sudo vi /etc/sysconfig/network-scripts/ifcfg-eth0
```

```
DEVICE=eth0
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
MASTER=bond0
SLAVE=yes
```

- c. Create eth1 interface configuration file (/etc/sysconfig/network-scripts/ifcfg-eth1):**

```
$ sudo vi /etc/sysconfig/network-scripts/ifcfg-eth1
```

```
DEVICE=eth1
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
MASTER=bond0
SLAVE=yes
```

Identify VLANs that apply for the system VM (IDIH).

**Table 5-13 VLAN for System VM**

| VLAN Name | VLAN ID (example) |
|-----------|-------------------|
| OAM/Mgt   | 1982              |
| XMI       | 1983              |
| IMI       | 405               |
| INT       | 406               |

According the architecture OAM & XMI could be a unique VLAN.

- d. Create bond0.<vlan> OAM/Mgmt interface configuration file (/etc/sysconfig/network-scripts/ifcfg-bond0.<vlan>):

```
$ sudo vi /etc/sysconfig/network-scripts/ifcfg-bond0.1982
```

```
DEVICE=bond0.<vlan>
TYPE=Ethernet
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
VLAN=yes
IPADDR= <OAM/Mgmt IP>
NETMASK= <OAM/Mgmt netmask>
GATEWAY= <OAM/Mgmt gateway>
```

Save.

```
:wq!
```

- e. Create bond0.<vlan> OAM/Mgmt route file (/etc/sysconfig/network-scripts/route-bond0.<vlan>) default through <bond0.<vlan> gateway>

```
$ sudo vi /etc/sysconfig/network-scripts/route-bond0.1982
default via 10.x.x.x.
```

Save.

```
:wq!
```

```
$ sudo more route-bond0.1982
default via 10.x.x.x.
```

- f. Bring KVM hypervisor host OAM/Mgmt interfaces into service ... ifup eth0 ifup eth1 ifup bond0 ifup bond0.<vlan>

```
[admusr@WakeForest network-scripts]$ sudo ifup eth0
[admusr@WakeForest network-scripts]$ sudo ifup eth1
[admusr@WakeForest network-scripts]$ sudo ifup bond0
[admusr@WakeForest network-scripts]$ sudo ifup bond0.17
RTNETLINK answers: File exists
[admusr@WakeForest network-scripts]$
```

**17. Create interface bridges.**

Create XMI interface bridge (/etc/sysconfig/network-scripts ifcfg-br\_XMI):

```
$ sudo vi /etc/sysconfig/network-scripts/XMI
```

```
DEVICE=br_XMI
TYPE=Bridge
BOOTPROTO=none
ONBOOT=yes
NM_CONTROLLED=no
```

**Note**

Repeat this step for all identify interfaces. For IDIH, we need XMI,IMI and INT interfaces.

**18. Create VLAN interfaces and bond them to the appropriate bridge.**

Create guests XMI vlan interface (/etc/sysconfig/network-scripts ifcfg-bond0.<XMI Vlan>)

```
$ sudo vi /etc/sysconfig/network-scripts/ifcfg-bond0.1983
```

```
ONBOOT=yes
NM_CONTROLLED=no
BOOTPROTO=none
VLAN=yes
BRIDGE=XMI
TYPE=Ethernet
DEVICE=bond0.1983
```

**Note**

Repeat above step for all identify interfaces. For IDIH, we need XMI,IMI and INT interfaces.

**19. Verify interfaces and restart the network.**

- a. Verify that all interfaces have been created with `ls` command.

```
$ sudo ls -l /etc/sysconfig/network-scripts/
```

**Example:**

```
[root@MXPTLM01DRA01S05KVM03 ~]# sudo ls /etc/sysconfig/network-scripts/
ifcfg-bond0 ifcfg-br_XMI ifdown ifdown-tunnel ifup-routes
ifcfg-bond0.1504 ifcfg-br_XSI1 ifdown-bnep ifup ifup-sit
ifcfg-bond0.1982 ifcfg-br_XSI2 ifdown-eth ifup-aliases ifup-Team
ifcfg-bond0.1983 ifcfg-br_XSI3 ifdown-ib ifup-bnep ifup-TeamPort
ifcfg-bond0.405 ifcfg-br_XSI4 ifdown-ippv ifup-eth ifup-tunnel
ifcfg-bond0.406 ifcfg-enol ifdown-ipv6 ifup-ib ifup-wireless
ifcfg-bond0.74 ifcfg-eno2 ifdown-isdn ifup-ippv init.ipv6-global
ifcfg-bond0.75 ifcfg-eno3 ifdown-post ifup-ipv6 network-functions
ifcfg-bond0.76 ifcfg-eno4 ifdown-ppp ifup-isdn network-functions-ipv6
ifcfg-bond0.77 ifcfg-enp0s29ulu8c2 ifdown-routes ifup-plip route-bond0.1982
ifcfg-br_IDIH ifcfg-eth0 ifdown-sit ifup-plusb
ifcfg-br_IMI ifcfg-eth1 ifdown-Team ifup-post
ifcfg-br_SBRREP ifcfg-lo ifdown-TeamPort ifup-ppp
[root@MXPTLM01DRA01S05KVM03 ~]#
```

- b. Execute the following:

```
$ sudo service network restart
```

20. Create image repository.

- a. Verify disk space.

```
$ df -h
```

- b. Create an images directory called `repository` for IMGs and ISOs in `/home` partition.

```
$ cd /home
$ sudo -i
$ mkdir repository
```

21. Copy image to the repository on the management server.

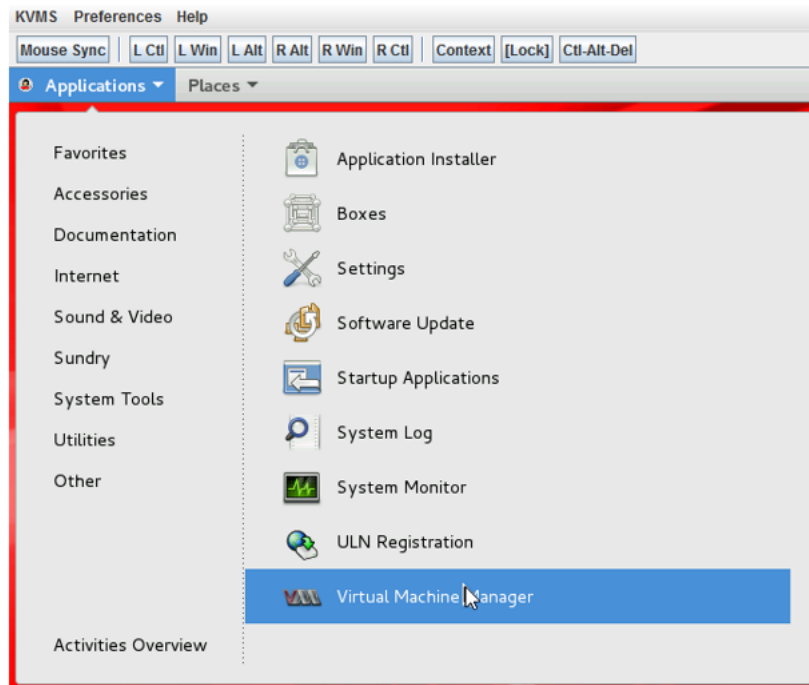

Copy one of the two image types to the `.qcow2` directory created.

#### Note

- The image pack for OCPM is located on the Oracle Software Delivery Site.
- Copy IDIH Oracle, Mediation and application images to the repository.

22. Launch the virtual manager from the ILOM console.

virt-manager from the OS (virt-manager and its dependencies are included in Oracle Linux ISO and installed on the host).

### 23. Resize ORA (database) ova image on KVM.

- a. Resize ova from KVM to 120G. Run the following commands:

```
cd /home/repository/qemu-img resize <image_name.qcow2> +<New_Size>
```

```
cd /home/repository qemu-img resize ORA-82_32_0.qcow2 +56G
```

- b. Verify actual size.  
Apply command, virtual size to 120G.

```
[root@MXMERM01DRA01S05KVM03 repository]# qemu-img
info ORA-82_32_0.qcow2
image: ORA-82_32_0.qcow2
file format: qcow2
virtual size: 120G (68719476736 bytes)
disk size: 20G
cluster_size: 65536
Format specific information:
 compat: 1.1
 lazy refcounts: false
[root@MXMERM01DRA01S05KVM03 repository]#
```

- c. Initiate VM using the following command:

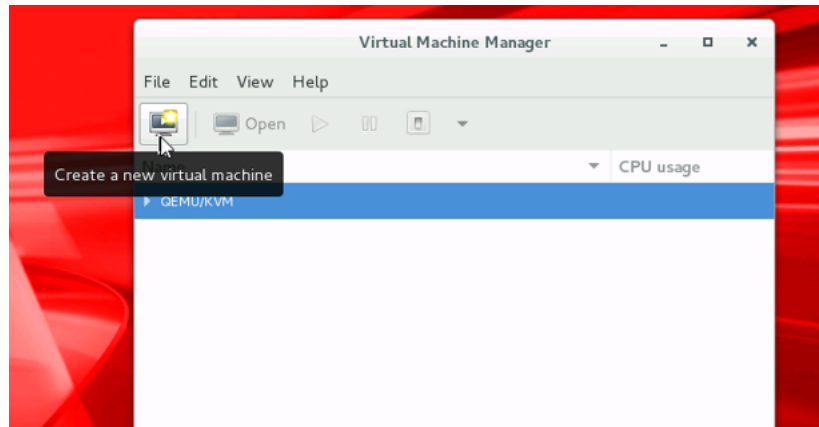

```
[root@MXTIJM01DRA01S05KVM03 admusr]# virsh start TIJDRA01S05PCIDHD01
```

- d. Validate SDB is attached to VM. Login to Database VM and run the following command:

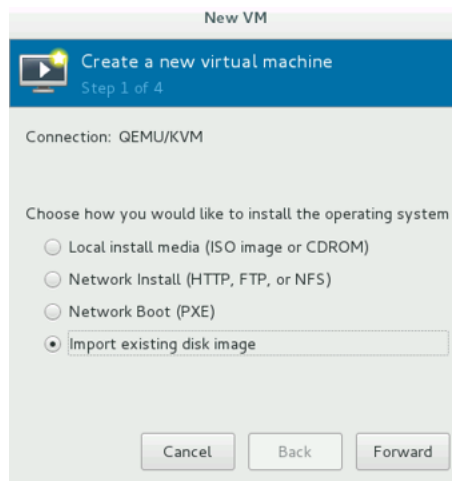

```
$ sudo df -h
```

**24. Create VM.**

- a. From the Virtual Machine Manager, select the Monitor ICON to create the new virtual machine.

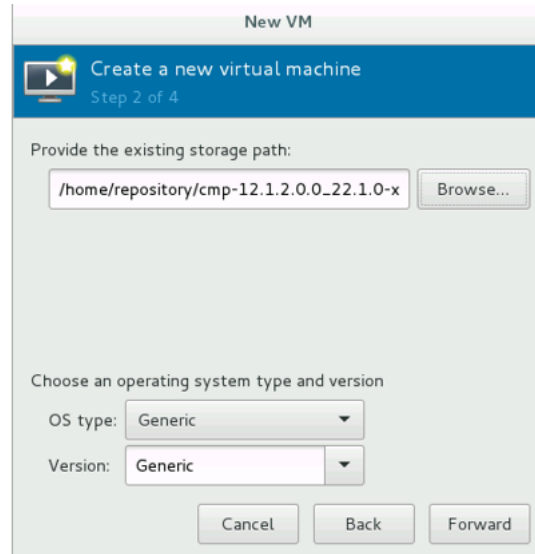

- b. Select **Import existing disk image** and click **forward**.

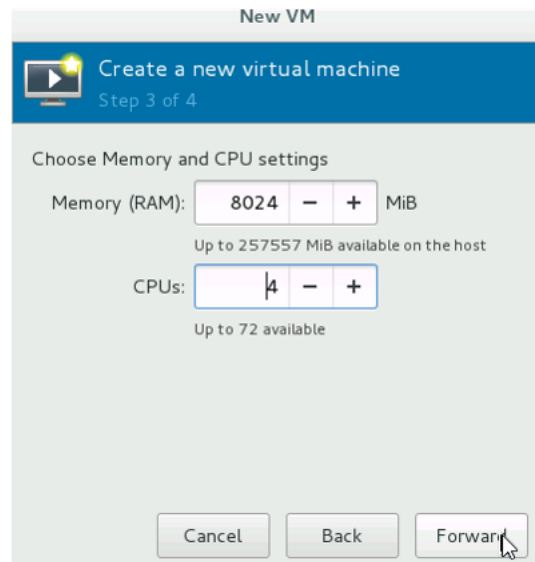

- c. Next, select the path where the `.qcow2` image resides. Browse local to add the repository.

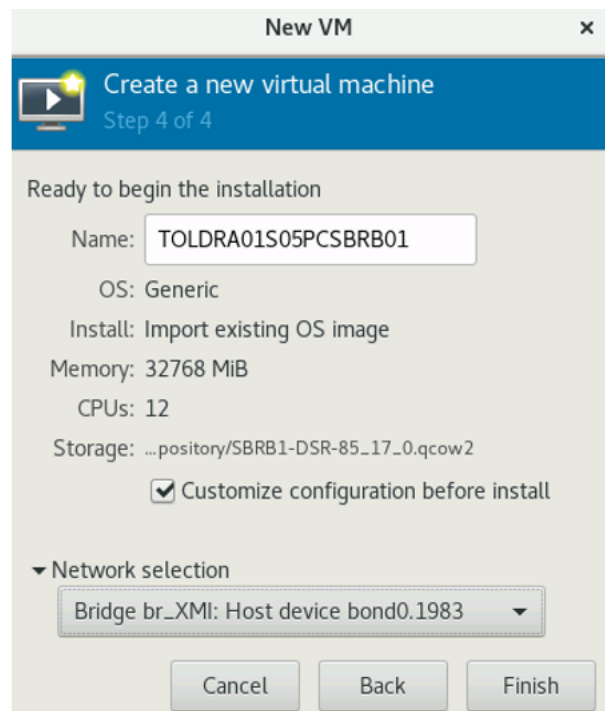

OPTIONS**OS type = generic****Version = generic****Select forward when complete**

- d. Next, select the memory and CPU settings. Refer to pinning tool to setup correct information.

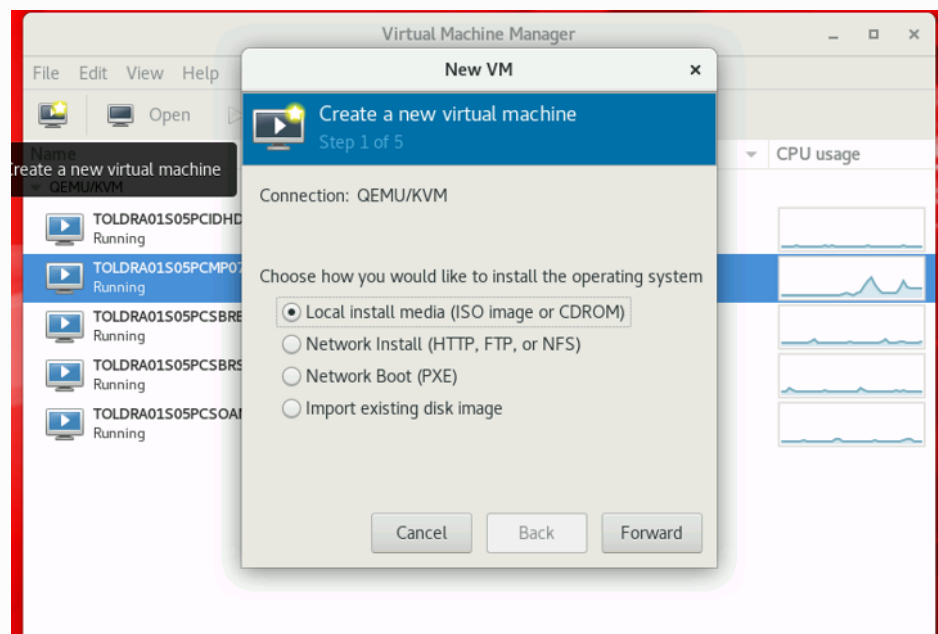

- e. Name the Virtual Machine and click **Finish**.  
f. Choose Customize configuration before install.  
g. Select **XMI Bridge** from drop down list.

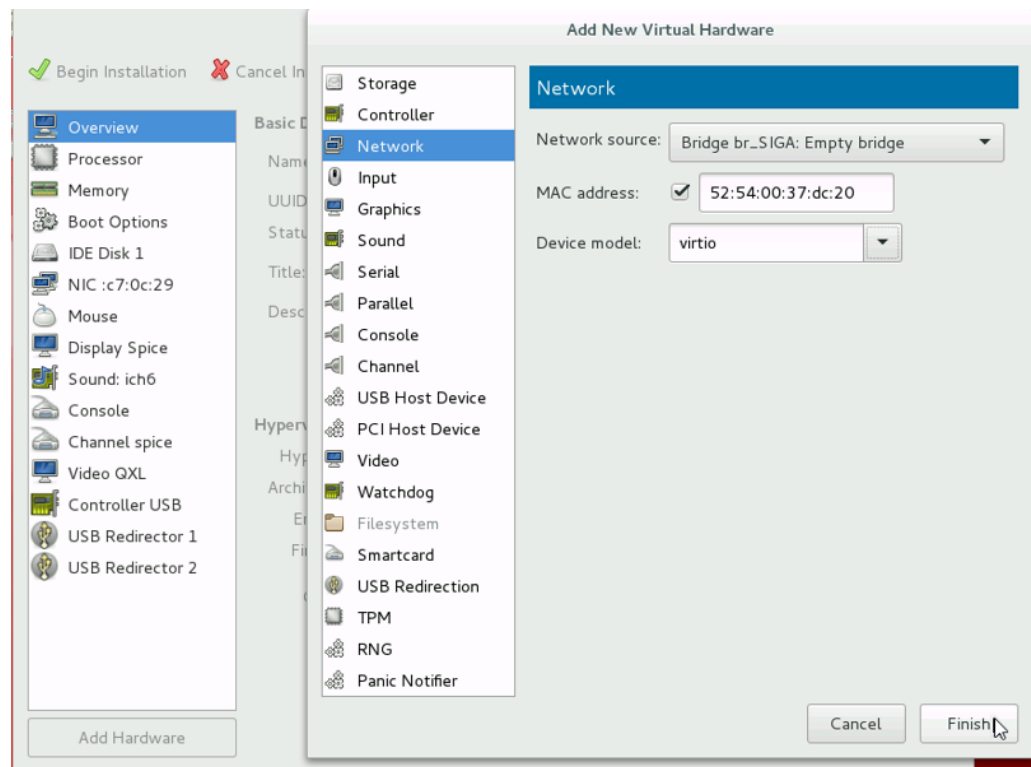

### Note

In case the bridges are not listed, it is recommended to check the network parameters configured in the KVM.

25. Create VMs using `.qcow2` image.
  - a. Click **Add Hardware**, select **Network**.

Interfaces for IDIH VMs:

Oracle: XMI and INT

Mediation: XMI, INT and IMI

Application: XMI and INT

#### **Note**

Ensure that all 3 IDIH VMs are created and corresponding interfaces have been added to them (as listed above). The interfaces naming convention XMI, IMI, INT must be used in place of eth0, eth1, eth2. This change must be done in 70-persistent-net.rules file. Check HWaddr of each interface using ifconfig command and edit the file to change interface names accordingly. Ensure that interface names are not interchanged while editing the file. Caution is advised.

**Table 5-14 IDIH VM Interfaces**

| IDIH VM interfaces |      |
|--------------------|------|
| XMI                | eth0 |
| IMI                | eth1 |
| IN                 | eth2 |

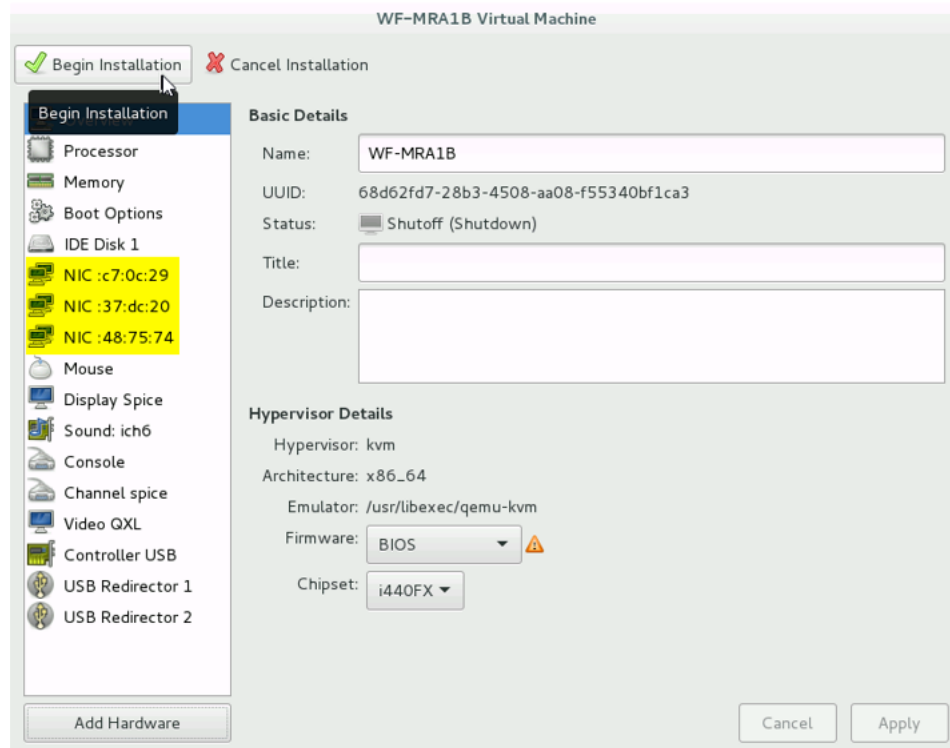

#### **PARAMETERS:**

Network source = XMI (select appropriate network source from the dropdown)

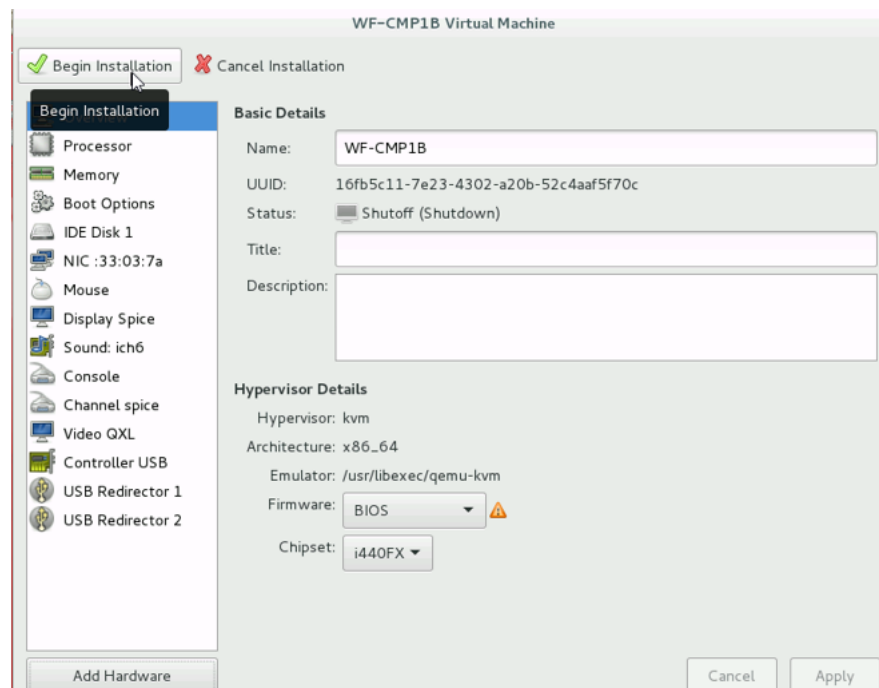

Device Model = virtio

- b. Click **Finish**.

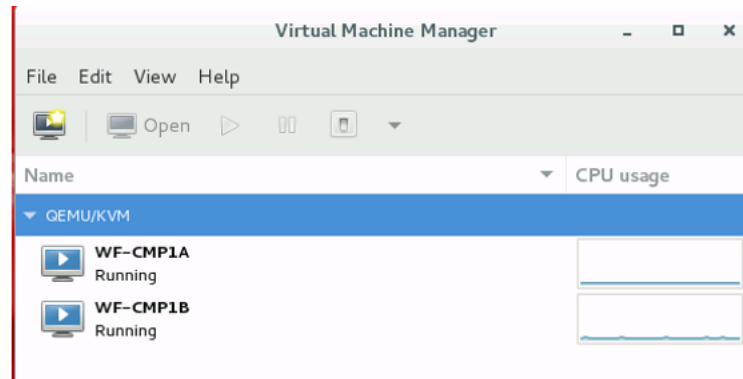

Add all interfaces as needed. After adding the other networks, you will see the NICs appear.

c. Click **Begin Installation**.

Installation takes a few minutes. From the Virtual Machine Manager, you will see the newly created VM.

## 5.10.2 Create SDB on KVM

### Note

This procedure only applies for KVM that has iDIH database.

1. Log in to the KVM as root.

SP Hostname: ORACLESP-1546NM10J4

User Name:

Password:

2. Check partitions and disk space.

Run `lsblk` command.

```
[root@MXTIJM01DRA01S05KVM03 admusr]# lsblk
NAME MAJ:MIN RM SIZE RO TYPE MOUNTPOINT
sdb 8:16 1 7.5G 0 disk
├─sdb1 8:17 1 3.7G 0 part
│ └─ol00-swap 252:1 0 4G 0 lvm [SWAP]
└─sr0 11:0 1 4.3G 0 rom /run/media/admusr/OL-7.6 Server.x86_64
sda 8:0 0 1.1T 0 disk
├─sda2 8:2 0 850.3G 0 part
│ └─ol00-swap 252:1 0 4G 0 lvm [SWAP]
│ └─ol00-home 252:2 0 800G 0 lvm /home
│ └─ol00-root 252:0 0 50G 0 lvm /
└─sda1 8:1 0 1G 0 part /boot
[root@MXTIJM01DRA01S05KVM03 admusr]#
```

**Note**

In case that SDA has no free space to add a new device, it is recommended re-install KVM as detailed in [Install KVM](#).

sda = 1TG

sda2 = 850.3G

home = 800G

The above values depend on environment where IDIH is installed. Customer's machine might have greater or lesser memory, adjust these accordingly.

**3. Create SDB.**

Run `fdisk` and enter options as shown bellow:

```
[root@mxtolm01dra01s05kvm03 ~]# fdisk /dev/sda
Welcome to fdisk (util-linux 2.23.2).
```

Changes will remain in memory only, until you decide to write them.

Be careful before using the write command.

```
Command (m for help): n
Partition type:
 p primary (2 primary, 0 extended, 2 free)
 e extended
Select (default p): p
Partition number (3,4, default 3): 3
First sector (1785249792-2341795839, default 1785249792): (press enter)
Using default value 1785249792
Last sector, +sectors or +size{K,M,G} (1785249792-2341795839, default
2341795839): +100G
Partition 3 of type Linux and of size 100 GiB is set
```

**4. Verify SDB was created. Then, save and reboot.**

```
Command (m for help): p

Disk /dev/sda: 1199.0 GB, 1198999470080 bytes, 2341795840 sectors
Units = sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk label type: dos
Disk identifier: 0x000d0c0e

 Device Boot Start End Blocks Id System
 /dev/sda1* 2048 2099199 1048576 83 Linux
 /dev/sda2 2099200 1785249791 891575296 8e Linux LVM
 /dev/sdb 1785249792 1994964991 104857600 83 Linux
```

```
Command (m for help): w
The partition table has been altered!
```

```
Calling ioctl() to re-read partition table.
```

```
WARNING: Re-reading the partition table failed with error 16: Device or
resource
busy.
The kernel still uses the old table. The new table will be used at the
next reboot
or after you run partprobe(8) or kpartx(8) Syncing disks.
```

```
[root@mxtolm01dra01s05kvm03 ~]# partprobe
```

### 5.10.3 Attach Device (sdb) to iDIH Database VM

#### Note

This procedure only applies to iDIH database.

#### 1. List existing VM.

Run `virsh list --all` on KVM.

```
[root@MXTIJM01DRA01S05KVM03 admusr]# virsh list --all
```

| Id | Name                 | State   |
|----|----------------------|---------|
| 1  | TIJDRA01S05PCMP07    | running |
| 2  | TIJDRA01S05PCMP06    | running |
| 3  | TIJDRA01S05PCSB RB01 | running |
| 4  | TIJDRA01S05PCSB RS03 | running |
| 6  | TIJDRA01S05PCSOAM01  | running |
| 7  | TIJDRA01S05PCIDHD01  | running |

#### 2. Shut down Oracle VM.

```
[root@MXTIJM01DRA01S05KVM03 admusr]# virsh shutdown TIJDRA01S05PCIDHD01
```

#### 3. Verify VM status.

Run `virsh list --all` on KVM.

```
[root@MXTIJM01DRA01S05KVM03 admusr]# virsh list --all
```

| Id | Name                 | State    |
|----|----------------------|----------|
| 1  | TIJDRA01S05PCMP07    | running  |
| 2  | TIJDRA01S05PCMP06    | running  |
| 3  | TIJDRA01S05PCSB RB01 | running  |
| 4  | TIJDRA01S05PCSB RS03 | running  |
| 6  | TIJDRA01S05PCSOAM01  | running  |
| 7  | TIJDRA01S05PCIDHD01  | shutdown |

#### 4. Attach SDB to Oracle VM.

## a. Edit vm XML.

```
[root@MXTIJM01DRA01S05KVM03 admusr]# virsh shutdown TIJDRA01S05PCIDHD01
```

```
[root@MXTIJM01DRA01S05KVM03 admusr]# virsh edit TIJDRA01S05PCIDHD01
```

## Sample xml:

```

domain type='kvm'>
 <name>MERDRA01S05PCIDHD01</name>
 <uuid>3f5cf9bc-8790-42d7-8709-09a7dafcfdd8</uuid>
 <memory unit='KiB'>8388608</memory>
 <currentMemory unit='KiB'>8388608</currentMemory>
 <vcpu placement='static'>4</vcpu>
 <os>
 <type arch='x86_64' machine='pc-i440fx-rhel7.0.0'>hvm</type>
 <boot dev='hd'>/>
 </os>
 <features>
 <acpi/>
 <apic/>
 </features>
 <cpu mode='custom' match='exact' check='partial'>
 <model fallback='allow'>Haswell-noTSX-IBRS</model>
 </cpu>
 <clock offset='utc'>
 <timer name='rtc' tickpolicy='catchup'>/>
 <timer name='pit' tickpolicy='delay'>/>
 <timer name='hpet' present='no'>/>
 </clock>
 <on_poweroff>destroy</on_poweroff>
 <on_reboot>restart</on_reboot>
 <on_crash>destroy</on_crash>
 <pm>
 <suspend-to-mem enabled='no'>/>
 <suspend-to-disk enabled='no'>/>
 </pm>
 <devices>
 <emulator>/usr/libexec/qemu-kvm</emulator>
 <disk type='file' device='disk'>
 <driver name='qemu' type='qcow2'>/>
 <source file='/home/repository/ORA-82_32_0.qcow2'>/>
 <target dev='hda' bus='ide'>/>
 <address type='drive' controller='0' bus='0' target='0' unit='0'>/>
 </disk>
 <controller type='usb' index='0' model='ich9-ehci1'>

```

## b. After existing disk --second last line in the above image, insert below lines in the xml file.

```

<disk type='block' device='disk'>
 <driver name='qemu' type='raw'>/>
 <source dev='/dev/sdb'>/>
 <target dev='hdc' bus='scsi'>/>
 <address type='drive' controller='0' bus='0' target='0' unit='1'>/>
</disk>

```

Save changes with `wq!` command.

The domain TIJDRA01S05PCIDHD01 XML configuration is edited.

## 5.10.4 Fix iDIH Database Script on KVM

### Note

This procedure only applies to iDIH database over KVM (not OpenStack/KVM).

#### 1. Edit script.

##### a. Edit ASMSetup file.

```
$ sudo vi /opt/xIH/oracle/instances/ASMSetup
```

##### b. Locate line 94, modify the expression `^vd` by `^sd` and save

```

76 l=1
77 fi
78
79 #
80 # search all the virtual drives
81 log "Searching for virtual drives..."
82 for vmDrive in /dev/*[sv]d[bcdefg]
83 do
84 #
85 # Is it a block device:
86 if [-b "${vmDrive}"]
87 then
88 #
89 # Get just the file name to store:
90 vmDrive=$(basename -s . ${vmDrive})
91
92 #
93 # On on KVM hardware we don't want anything but vdx drives:
94 [[$hwType == 'KVM' && ! $vmDrive =~ ^s$]] && continue
95
96 #
97 # We don't want to add a rule for a device that is actually in the fstab.
98 # XXX: Is this still a real problem?
99 $GREP_CMD -q "${vmDrive}" /etc/fstab && continue
100
101 #
102 # Store it:
103 device="${device} ${vmDrive}"
104 fi
105 done

```

##### c. Save and exit.

```
:wq!
```

```
$ sudo vi /opt/xIH/oracle/instances/ASMSetup
```

#### 2. Perform iDIH DB installation, by referring to the steps in [iDIH Application and Mediation Installation](#) and [Run Post Installation Scripts on iDIH VMs](#) with respect to Oracle VM configuration and post installation.

#### 3. Check iDIH DB installation.

Check if that partitions were mounted as expected before proceeding with Mediation and Application Installation.

```
[root@TLADRA01S02MMIDHD01 ~]# lsblk
NAME MAJ:MIN RM SIZE RO TYPE MOUNTPOINT
sda 8:0 0 120G 0 disk
├─sda1 8:1 0 512M 0 part /boot
└─sda2 8:2 0 63.5G 0 part
 ├─vgroot-plat_root (dm-0) 253:0 0 10G 0 lvm /
 ├─vgroot-plat_var (dm-1) 253:1 0 1G 0 lvm /var
 ├─vgroot-plat_usr (dm-2) 253:2 0 4G 0 lvm /usr
 ├─vgroot-plat_tmp (dm-3) 253:3 0 2G 0 lvm /tmp
 ├─vgroot-plat_var_tklc (dm-4) 253:4 0 8G 0 lvm /var/TKLC
 ├─vgroot-oracle (dm-5) 253:5 0 25G 0 lvm /u01/app
 ├─vgroot-plat_swap (dm-6) 253:6 0 8G 0 lvm [SWAP]
 └─vgroot-external0 (dm-7) 253:7 0 3G 0 lvm
sdb 8:16 0 100G 0 disk
```

```
[root@TLADRA01S02MMIDHD01 ~]# fdisk -l

Disk /dev/sda: 128.8 GB, 128849018880 bytes
255 heads, 63 sectors/track, 15665 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x000c35df

 Device Boot Start End Blocks Id System
/dev/sda1 * 1 66 524288 83 Linux
Partition 1 does not end on cylinder boundary.
/dev/sda2 66 8355 66583552 8e Linux LVM

Disk /dev/sdb: 107.4 GB, 107374182400 bytes
255 heads, 63 sectors/track, 13054 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x00000000
```

#### 4. iDIH Med and App installation.

##### Note

Follow the steps in [SNMP Configuration](#) and [Create iDIH Virtual Machines - VMware](#) with respect to Mediation and application VM configuration and post installation.

#### 5. Verification of DB tables to check the values are similar to the showed values.

```
[admusr@APODRA01S05PCIDHD01 ~]$ sudo -i
[root@APODRA01S05PCIDHD01 ~]# su - oracle
[oracle@APODRA01S05PCIDHD01 ~]$ sqlplus /@NSP;
SQL> select count(*) from tab;
183
[oracle@APODRA01S05PCIDHD01 ~]$ sqlplus /@IXP;
SQL> select count(*) from tab;
63
[admusr@APODRA01S05PCIDHD01 ~]$ sudo su - grid
[grid@APODRA01S05PCIDHD01 ~]$ sqlplus / as sysasm
SQL> select group_number, name, state, type from v$asm_diskgroup;
```

#### 6. Check ViewTbspceUsage.sh on MED VM.

Verify that information was transfer from DATA1 to DATA

- DATA1 must have 9% usage or similar
- DATA must have 7% usage or similar

```
[root@APODRA01S04PCIDHM01 ~]# su - tekelec cd /usr/TKLC/xIH/mediation/
xdrDbInstall/utils/cmd./ViewTbspceUsage.sh /@NSP
```

| Tablespace   | Used (MB) | Alloc (MB) | Max (MB) | Used/Max % |

| DATA          | 6872           | 102400     | 7      |

7. Perform steps in [Create iDIH Virtual Machines - KVM/OpenStack](#) and [Configure iDIH Virtual Machines Networks](#).

#### Note

- Refer to [Configure DSR Reference Data Synchronization for iDIH](#) and [Integrate iDIH into DSR](#) procedures.
- There are few iDIH procedures which are optional and may be followed if there is a requirement in customer environment:
  - a. [iDIH Configuration to Configure the SSO Domain](#)
  - b. [iDIH Configuration to Configure the Mail Server](#)
  - c. [iDIH Configuration to Configure SNMP Management Server](#)
  - d. [iDIH Configuration to Change Network Interface](#)

## 5.11 iDIH DB Installation

1. Log in to the host machine as a `root` user where you need to install the iDIH DB.
2. Delete existing VM.
  - a. Identify the VM by its domain:

```
virsh list -all
```

- b. Remove the VM.

```
virsh destroy <VM Name>
virsh undefine <VM Name>
```

- c. Remove the VM qcow2 file by deleting the file from path /home/repository
- d. Refresh storage pool dedicated for DSR.

```
virsh pool - -list
virsh pool-refresh <pool_name>
```

3. Create a VM on the host machine.

- a. Copy the iDIH Oracle ova's zip file to path /home/repository.
- b. Convert the resulting .vmdk file to a qcow2.

```
qemu-img convert -f vmdk -O qcow2 ORA-XX_XX_XX.vmdk ORA-XX_XX_XX.qcow2
```

- c. Refresh storage pool dedicated for DSR.

```
virsh pool - -list
virsh pool-refresh <pool_name>
```

- d. Resize ORA (database) ova image on KVM.

```
qemu-img info ORA-XX_XX_XX.qcow2
```

The output of above command would reflect “virtual size” as 64 GB.

```
qemu-img resize ORA-82_40_0.qcow2 +56G
qemu-img info ORA-82_40_0.qcow2
```

The output of above command would reflect “virtual size” as 120 GB.

```
chown qemu:qemu ORA-82_40_0.qcow2
```

- e. Create additional disk of 100GB required for Oracle database as mentioned in the cloud installation doc [Create SDB on KVM](#) on KVM.
- f. Create a VM with following command:

```
virt-install --name=<VM-NAME> --ram=8192 --vcpus=4 --cpuset=32-35 --
disk path=/var/lib/libvirt/images/
ORA-82_40_0.qcow2,format=qcow2,bus=<scsi/virtio> --network bridge:<XMI-
BRIDGE>,model=virtio --network bridge:<INT-BRIDGE>,model=virtio --
graphics none --autostart --watchdog i6300esb,action=reset --import
```

- g. Run `virsh list --all` on KVM to verify whether VM has been created.
- h. Shut down Oracle VM.

```
virsh shutdown <VM-NAME>
```

- i. Attach the additional 100GB disk created in [Attach Device \(sdb\) to iDIH Database VM](#).

- j. Follow the steps in [Run Post Installation Scripts on iDIH VMs](#) and [Configure DSR Reference Data Synchronization for iDIH](#) for Oracle VM configuration and post installation.

## 5.12 iDIH Application and Mediation Installation

1. Delete the existing VM.

- a. Identify the VM by its domain.

```
virsh list -all
```

- b. Remove the VM.

```
virsh destroy <VM Name>
virsh undefine <VM Name>
```

- c. Remove the VM qcow2 file by deleting the file from path /home/repository
  - d. Refresh storage pool dedicated for DSR.

```
virsh pool - --list
virsh pool-refresh <pool_name>
```

2. Create a VM on the host machine.

- a. Copy the iDIH Oracle ova's zip file to path /home/repository.
  - b. Convert the resulting '.vmdk' file to a 'qcow2' for mediation and application server.

```
qemu-img convert -f vmdk -O qcow2 <IMAGE_NAME>.vmdk Med.qcow2
```

```
qemu-img convert -f vmdk -O qcow2 <IMAGE_NAME>.vmdk App.qcow2
```

3. Refresh storage pool dedicated for DSR.

Run the following commands:

```
virsh pool - --list
virsh pool-refresh <pool_name>
```

4. Create a VM for App server and mediation server.

For App server, run the following command:

```
virt-install --name=< APP_VM_Name > --ram=8192 --vcpus=4 --disk path=</home/repository/App.qcow2>,format=raw,bus=<scsi/virtio> --network bridge:<br_XMI>,model=virtio --network bridge:<br_INT>,model=virtio --graphics none --autostart --watchdog i6300esb,action=reset -import
```

For mediation server:

```
virt-install --name=<MED-VM-NAME> --ram=8192 --vcpus=4 --disk path=</home/repository/Med.qcow2>,format=raw,bus=<scsi/virtio> --network bridge:<br_XMI>,model=virtio --network bridge:<br_IMI>,model=virtio --
```

```
network bridge:<br_INT>,model=virtio --graphics none --autostart --
watchdog i6300esb,action=reset --import
```

5. Verify if the VM has been created.
  - a. Run `virsh list --all` on KVM to verify whether VM has been created.
  - b. Follow the steps in [Run Post Installation Scripts on iDIH VMs](#) and [Configure DSR Reference Data Synchronization for iDIH](#) for Oracle VM configuration and post installation.

## 5.13 Post iDIH Installation Configuration

### 5.13.1 Run Post Installation Scripts on iDIH VMs

This procedure runs post installation scripts on the iDIH VMs.

#### Prerequisites

[Configure Remaining DSR Guests Based on Resource Profile and Configure Network](#) procedure has to be completed.

1. Log in to the iDIH Oracle VM console.
  - a. Access the iDIH Oracle VM console.
  - b. Log in as the `admusr` user.
2. Run the iDIH Oracle post installation script.
  - a. Wait for the software upgrades to complete on all iDIH VMs.

#### Note

Verify the `/etc/hosts` file before, and after running the script `configureOracle.sh`, having internal IP address for all the three guests.

- b.As `admusr` on the **iDIH Oracle VM** console, run the Oracle postinstallation script.

```
$ sudo /opt/xIH/oracle/configureOracle.sh
```

#### Note

- The Oracle post installation script runs for 5 to 15 minutes depending on the Oracle version and patch level. Wait for it to complete before the next step is performed. Once the script execution is over, it will come out without any message.
- To verify the install status, check the `/var/TKLC/xIH/log/oracle/post_image_install.log` file for any errors. The error stating `Cannot use backup/restore functions while using dispatcher` can be ignored.

3. Log in to the iDIH Mediation VM Console as `admusr`.
  - a. Access the **iDIH Mediation VM** console.
  - b. Log in as the `admusr` user.

4. Run the iDIH Mediation VM post installation script.

**Note**

The Oracle postinstallation script must come to completion before the Mediation post installation script is run.

- a. As the `admusr` user on the **iDIH Mediation VM** console, run the Mediation post installation script.

```
$ sudo /opt/xIH/mediation/install.sh
```

**Note**

- The Mediation postinstallation script runs for 2 to 10 minutes. Wait for it to complete before the next step is performed. To verify the install status, check the `/var/TKLC/xIH/log/mediation/post_image_install.log` file for any errors.
- It is assumed network configuration and functionality is correct before installation. If you encounter an issue of the mediation postinstallation script `/opt/xIH/mediation/install.sh` hanging at the beginning as shown below, but you are still able to ssh to **Oracle VM** using internal IP, make sure the internal interface (`int`) MTU has the correct setting - 1500 MTU. If yes, MTU size adjustment may be needed. For verification, connect to oracle using `sqlplus` using the following steps:

- i. Log in to the Mediation server as `admusr`.
- ii. Run the following command:

```
sudo su - tekelec
```

- iii. Run the following command:

```
sqlplus /@NSP
```

- b. As `tekelec` on the **iDIH Mediation VM** console, run the following commands:

```
$ sudo su - tekelec
```

```
$ iset -fnodeName='hostname' -fhostName='hostname' NodeInfo where 1=1
```

**Note**

Replace `hostname` with the actual hostname of Mediation VM.

5. Log in to the iDIH application VM console as `admusr`.

- a. Access the iDIH Application VM console.

- b. Log in as the `admusr` user.
6. Run the iDIH Application postinstallation script.

The Mediation postinstallation script must come to completion before the Application post installation script is run.  
As the `admusr` user on the **iDIH Application VM** console, run the Application postinstallation script.

```
$ sudo /opt/xIH/apps/install.sh
```

**Note**

- The application postinstallation script runs for 2 to 10 minutes. Wait for it to complete before running the next step.
- Verify the `/etc/hosts` file before, and after running the script `configureOracle.sh`, having internal IP address for all the three guests.

7. Run the iDIH health check script on each of the iDIH VMs.

**Note**

Once all of the iDIH VMs have restarted. Run the health check scripts on each iDIH VM.

- a. As `admusr` user on the **iDIH Oracle VM** console, run the health check script and verify the results.

```
$ sudo /usr/TKLC/xIH/plat/bin/analyze_server.sh -i
```

- b. As `admusr` on the **iDIH Application VM** console, run the health check script and verify the results.

```
$ sudo /usr/TKLC/xIH/plat/bin/analyze_server.sh -i
```

- c. As `admusr` on the **iDIH Mediation VM** console, run the health check script and verify the results.

```
$ sudo /usr/TKLC/xIH/plat/bin/analyze_server.sh -i
```

**Note**

Ignore the NTP message stating `tvcoe-host` is not integrated

## 5.13.2 Configure DSR Reference Data Synchronization for iDIH

This procedure configures DSR reference data synchronization for iDIH. This is an optional procedure.

1. Log in to iDIH Application server.

- a. Establish an SSH session to the iDIH Application server.
- b. Log in as the `admusr` user.
- c. Issue the following command to log in as a `tekelec` user.

```
$ sudo su - tekelec
```

2. Run configuration script in iDIH Application server.
  - a. Run the following script using SOAM VIP address:

```
Apps/trda-config.sh
```

### **Note**

The SO IP address to be used here is the internal xmi address of the SO and not the floating-ip or external address (if used any).

### **Example output:**

```
corsair-app:/usr/TKLC/xIH apps/trda-config.sh
dos2unix: converting file
/usr/TKLC/xIH/bea/user_projects/domains/tekelec/nsp/trace-refdata-ad

```

- b. When asked to enter DSR OAM server IP address, type the **VIP** of the DSR SOAM (or active DSR SOAM if VIP is not available) and click **Enter**.

#### Note

If the address typed is unreachable, the script exits with error Unable to connect to <ip-address>!

3. Monitor completion in iDIH Application server.

- a. Monitor the log file located at:

```
/var/TKLC/xIH/log/apps/weblogic/apps/application.log
```

- b. Examine the log file for entries containing text Trace Reference Data Adapter.

4. In iDIH Application server, switch iDIH from one DSR to another DSR in a different network.

**Note**

This is an optional step which is needed to switch an iDIH from one DSR to another DSR in a different network.

- a. Establish an SSH session to the iDIH Application server.
- b. Log in as the `tekelec` user.
- c. Run the following commands:

```
cd /usr/TKLC/xIH/apps/trace-refdata-adapter

ant clean.data

cd /usr/TKLC/xIH/apps/xihoam

ant imp.init (flush comagent connection data)

cd /usr/TKLC/xIH/apps/trace-refdata-adapter

ant app.enable (Sync MOs from SOAM)

cd /usr/TKLC/xIH/apps

./trda-config.sh <DSR SOAM VIP in different network>
```

### 5.13.3 iDIH Configuration to Configure the SSO Domain

This procedure configures the SSO domain for iDIH.

1. Establish a GUI session on the NOAM server by using the VIP IP address of the NOAM server. Open the web browser and type `https://<Primary_NOAM_VIP_IP_Address>` as the URL. Log in as the `admusr` user.
2. In NOAM VIP GUI, configure DNS.
  - a. Navigate to **Administration**, and then **Remote Servers**, and then **DNS Configuration**.
  - b. Select the NOAM tab.
  - c. Configure values for the following fields:
    - Domain Name
    - Name Server
    - Search Domain 1

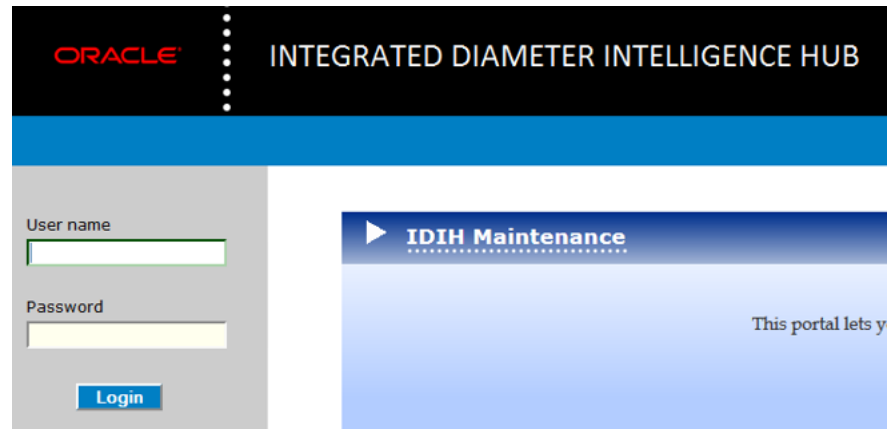

| External DNS Name Server |                                                                           |
|--------------------------|---------------------------------------------------------------------------|
|                          | Address                                                                   |
| Configuration Mode *     | <input checked="" type="radio"/> Global<br><input type="radio"/> Per-site |
| Name Server              | <input type="text"/>                                                      |
| Domain Search Order      |                                                                           |
|                          | Domain Name                                                               |
| Search Domain 1          | <input type="text"/>                                                      |
| Search Domain 2          | <input type="text"/>                                                      |

- d. If values have already been configured, click **Cancel**. Otherwise configure the values and click **OK**.
3. In NOAM VIP GUI, establish SSO local zone.
  - a. Navigate to **Access Control**, and then **Certification Management**.
  - b. Click **Establish SSO Zone**.
  - c. Type a value for **Zone Name**.
  - d. Click **OK**.  
Information for the new certificate type of SSO local displays.
  - e. Click **Report**.  
The Certificate Report appears.
  - f. Select and copy the encoded certificate text to the clipboard for future access.

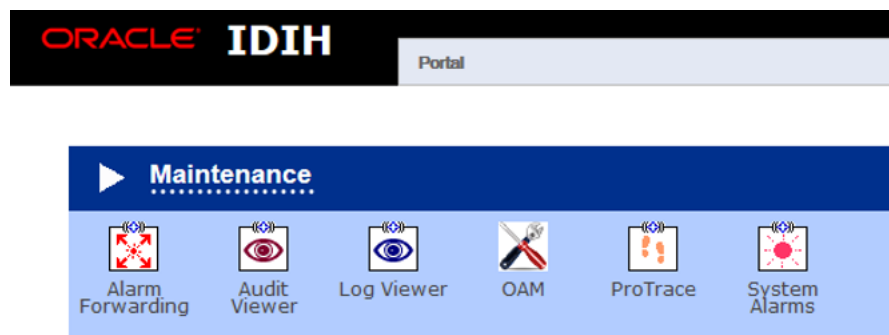

**Example of Certificate Report:**

```

```

4. Log in to iDIH Application server GUI.
  - a. Establish a GUI session on the iDIH application server, using the xmi IP address  
`https://<app server IP>`
  - b. Log in as the `idihadmin` user.

5. In iDIH Application server GUI, launch the OAM portal.  
Navigate to the OAM portal icon to start the OAM web application.

6. In iDIH Application server GUI, configure the SSO domain.
  - a. Navigate to **System**, and then **Single Sign On**.

- b. Select **SSO Parameters** tab.

- c. Click **Edit Value** icon.
- d. Type a value for the **Domain Name**.

**Note**

This should be the same domain name assigned in the DSR NOAM DNS Configuration (step 2).

- e. Click **Save** icon.
  - f. Click **Refresh** icon to display data saved for the remote zone.
7. In iDIH Application server GUI, configure the SSO Remote Zone.
- a. Navigate to **System**, and then **Single Sign On**.
  - b. Select **SSO Zones** tab.
  - c. Click **Add** icon.
  - d. Type a value for field **Remote Name**.
  - e. For field X.509 Certificate, paste the encoded certificate text from the clipboard that was previously copied from the DSR NOAM.

**X.509 Certificate**

- f. Click **Save**.
- g. Click **Refresh** to display data saved for the remote zone.

## 5.13.4 Integrate iDIH into DSR

This procedure configures the iDIH connections to DSR.

1. Configure the iDIH ComAgent connection on the NOAM.
  - a. Navigate to **Communication Agent**, and then **Configuration**, and then **Remote Servers**.
  - b. Click **Insert**.
  - c. Add the iDIH Mediation server.
  - d. For the **Remote Server IP Address** field, type the IMI IP address of the iDIH Mediation server.
  - e. For the **IP Address Preference** field, select the **IP protocol preference** (if IPv6 and IPv4 are configured).

| Field                         | Value                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Remote Server Name *          | <input type="text"/>                                                                                              |
| Remote Server IPv4 IP Address | <input type="text"/>                                                                                              |
| Remote Server IPv6 IP Address | <input type="text"/>                                                                                              |
| Remote Server Mode *          | -- Select --                   |
| IP Address Preference         | ComAgent Network Preference  |

- f. Set **Remote Server Mode** to **Server**.
2. Configure the Troubleshooting with iDIH on the SOAM.
  - a. Navigate to **Diameter**, and then **Troubleshooting with iDIH**, and then **Configuration**, and then **Options**.
  - b. Type the fully qualified iDIH host name (or IP address) in the iDIH **Visualization Address** field:

Main Menu: Diameter -&gt; Troubleshooting with IDIH -&gt; Configuration -&gt; Options

## IDIH Configuration

| Field                                                                      | Value                | Description                                                                                                                                                                                                               |
|----------------------------------------------------------------------------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Max bandwidth *                                                            | 25                   | Maximum amount of bandwidth specified in kbps. If the bandwidth is exceeded, the peer IDIH server will discard TTRs so that the bandwidth requirement is not exceeded. [Default = 25Mbps (26214400 bps); Range = 1-10000] |
| IDIH Host Name                                                             | Med (10.196.228.142) | The Host Name of the peer IDIH server used for authentication. [Default = n/a].                                                                                                                                           |
| IDIH Visualization address                                                 | 10.240.30.150        | The IP address or FQDN of the remote IDIH server used for visualization. If an IP address is used in place of a FQDN, the peer IDIH server must be reachable from the Application server. [Default=n/a].                  |
| <input type="button" value="Apply"/> <input type="button" value="Cancel"/> |                      |                                                                                                                                                                                                                           |

- c. Click **Apply**.

## 5.13.5 iDIH Configuration to Configure the Mail Server

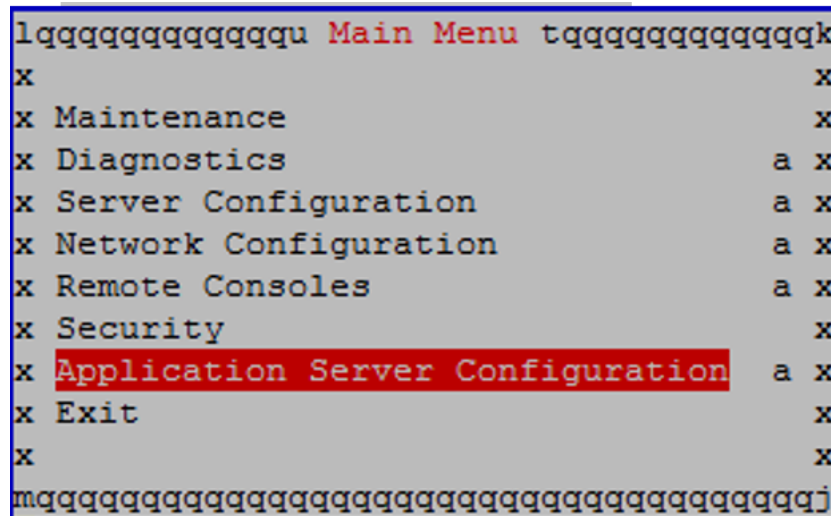

This procedure configures the SMTP mail server.

### Note

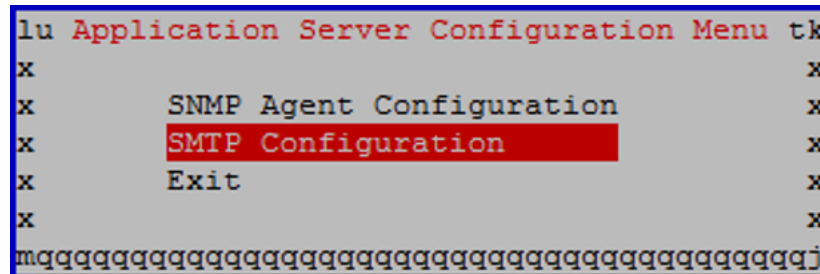

This procedure is optional. However, this option is required for security (password initialization set to automatic) and forwarding (forwarding by mail filter defined), and is available only on the Application server.

1. Log in to iDIH Application server.
  - a. Establish an SSH session to the iDIH Application server.
  - b. Log in as the `admusr` user.
2. In iDIH Application server, configure the authenticated mail server.
  - a. From the **placfg** menu, type the following command:
 

```
$ sudo su - placfg
```
  - b. Select **Application Server Configuration**.

- c. Select **SMTP Configuration**.

- d. Click **Edit**.
- e. Enter the following parameters:
  - Mail Server IP Address
  - User
  - Password
  - Email Address (From)
  - Mail smtp timeout
  - Mail smtp connectiontimeout
  - SNMP over SSL used?
- f. Click **OK**.
- g. Select **Exit** to exit the platcfg menu.

### 5.13.6 iDIH Configuration to Configure SNMP Management Server

This procedure configures the SNMP management server.

**Note**

This procedure is optional. However, this option is required for forwarding (forwarding by SNMP filter defined), and is available only on the Application server.

1. Log in to iDIH Application server.
  - a. Establish an SSH session to the iDIH Application server.
  - b. Login as the `admusr` user.
2. In iDIH Application server, configure the authenticated mail server.
  - a. From the **platcfg** menu, type the following command:

```
$ sudo su - platcfg
```

- b. Select **Application Server Configuration**.

```

x Security x
x Application Server Configuration a x
x Exit x
x x
mqqq
```

- c. Select **SNMP Agent Configuration**.

```
lu Application Server Configuration Menu tk
x
x SNMP Agent Configuration x
x SMTP Configuration x
x Exit x
x x
mqqq
```

- d. Select **Edit**.
- e. Enter the IP Address of the SNMP management server.

**Note**

The SNMP agent configuration is updated and the SNMP management server automatically restarts.

- f. Select **OK**.
- g. Select **Exit** to exit the **platcfg** menu.

## 5.13.7 iDIH Configuration to Change Network Interface

This procedure changes the default network interface. This is an optional procedure.

**Note**

- Initially, the default network interface used to transport TTRs from DSR to DIH uses the internal IMI network. However, this can be changed, if required. It should be noted that changing this interface could degrade performance of TTR transmission.
- A script is provided to manage the settings so the operator does not need to know the details required to apply the settings. There are two settings **interface.name** and **interface.enabled**.

When `interface.enabled` is `True`, communications over the `interface.name =value`, where `value` is the name of the network interface as defined on the platform, is the only specified interface used for communications.

When `interface.enabled` is `False` then communications over the named interface is not enforced, that is, all interfaces configured on the platform are allowed to be used for communications.

**For example:** If it is required to use the XMI interface for communication instead of the default internal IMI interface, then the operator would supply **XMI** when asked for the interface name and **True** when asked if interface filtering should be applied.

1. Login to iDIH Mediation server.
  - a. Establish an SSH session to the iDIH Mediation server.
  - b. Log in as the `admusr` user.
  - c. Type the following command to log in as the `Tekelec` user.

```
$ sudo su - tekelec
```

2. In iDIH Mediation server, run the change interface script.
  - a. To run the change interface script, type the following command:

```
$ chgIntf.sh
```

- b. Answer the questions during the script as follows.

This script is used to change the interface name (default = `imi`) used for mediation communications and whether to enable network interface

filtering or not. Please answer the following questions or enter CTRL-C to exit out of the script.

Current setting are: interface.name=imi interface.enabled=True

Enter new network interface name, return to keep current [imi]: xmi  
Do you want to enable network interface filtering [True|False], return to keep current [True]:  
Updating configuration properties file with 'interface.name=xmi' and 'interface.enable=True', and restarting mediation configuration bundle...

# 6

## Postinstallation Activities

### 6.1 Configure ComAgent Connections

This procedure configures ComAgent connections on DSR for use in the FABR application.

**Prerequisites:**

FABR application is activated.

1. Log in to SDS NOAM VIP GUI.
  - a. Establish a GUI session on the SDS NOAM server by using the VIP IP address of the NOAM server. Open the web browser and type `https://<Primary_SDS_NOAM_VIP_IP_Address>` as the URL.
  - b. Log in as the `admusr` user.
2. In SDS NOAM VIP GUI, configure remote server IP address.
  - a. Navigate to **Communication Agent**, and then **Configuration**, and then **Remote Servers**.
  - b. Click **Insert**.
3. In SDS NOAM VIP GUI, configure remote server IP address.
  - a. Type `Remote Server Name` for the DSR MP server.

|                      |             |
|----------------------|-------------|
| Remote Server Name * | ZombieDAMP1 |
|----------------------|-------------|

- b. Type the `Remote Server IMI IP address`.

|                               |              |
|-------------------------------|--------------|
| Remote Server IPv4 IP Address | 169.254.1.13 |
| Remote Server IPv6 IP Address |              |

**Note**

This should be the IMI IP address of the DAMP server.

- c. Select **Client** for the Remote Server Mode from the list.

Remote Server Mode \*

Client

- d. Select **IP Address Preference** (ComAgent Network Preference, IPv4, or IPv6) from the list.

IP Address Preference

ComAgent Network Preference

ComAgent Network Preference

IPv4 Preferred

IPv6 Preferred

- e. Select the **Local Server Group** from the available SDS DP server groups and click **Add** to assign.

|                                |                                                              |
|--------------------------------|--------------------------------------------------------------|
|                                | <div>Available Local Server Groups</div> <div>SDS SDP</div>  |
| Assigned Local Server Groups * | <div>AddRemove</div> <div>Assigned Local Server Groups</div> |

- f. Click **Apply**.

**Note**

Repeat steps 2-3 for each remote MP in the same SOAM NE.

4. Log in to DSR NOAM VIP GUI.
  - a. Establish a GUI session on the DSR NOAM server by using the VIP IP address of the NOAM server. Open the web browser and type `https://<Primary_DSR_NOAM_VIP_IP_Address>` as the URL.
  - b. Log in as the `guiadmin` user.
5. In DSR NOAM VIP GUI, configure remote server IP address.
  - a. Navigate to **Communication Agent**, and then **Configuration**, and then **Remote Servers**.
  - b. Click **Insert**.
6. In DSR NOAM VIP GUI, configure remote server IP address.
  - a. Type `Remote Server Name` for the DSR MP server.
  - b. Type the `Remote Server IMI IP address`.

**Note**

This should be the IMI IP address of the DP server.

- c. Select **Server** for the Remote Server Mode from the list.
- d. Select **IP Address Preference** (ComAgent Network Preference, IPv4, or IPv6) from the list.
- e. Select the **Local Server Group** from the available DSR MP server groups and click **Add** to assign.

- f. Click **Apply**.

**Note**

Repeat steps 5-6 for each remote DP in the same SOAM NE.

7. In DSR NOAM VIP GUI, configure connection groups.
- Navigate to **Communication Agent**, and then **Configuration**, and then **Connection Groups**.
8. In DSR NOAM VIP GUI, edit connection groups.
- Select the **DPSvcGroup** connection group.

| Connection Group | Server    |
|------------------|-----------|
| DPSvcGroup       | 0 Servers |

- Click **Edit**.
- Select the DP Servers from the Available Servers in Network Element list and click **>>** to assign.

### Editing existing Connection Groups

| Field                   | Value      | Description                                                                                                                                                                                                                     |
|-------------------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Connection Group Name * | DPSvcGroup | Unique identifier used to label a Connection Group.<br>[Default: n/a; Range: A 32-character string. Valid character alphanumeric and underscore. Must contain at least one must not start with a digit.] [A value is required.] |

Available Servers in Network Element

SDSDP1

Assigned Servers in Connection Group

>>
<<

- Click **OK**.
9. In DSR NOAM VIP GUI, verify the correct number of servers are in the connection group.

| Connection Group | Server   |
|------------------|----------|
| DPSvcGroup       | 1 Server |
|                  | SDSDP1   |

## 6.2 Complete PCA Configuration

This procedure completes PCA configuration. This is an optional procedure.

**Prerequisites:**

PCA application must be activated.

**Note**

Refer to "Section PCA Configuration" in *DSR PCA Activation Guide* for the steps required to complete PCA configuration.

## 6.3 Backups and Disaster Prevention

This procedure provides information on backups and disaster prevention.

**Prerequisites:**

DSR and optional sub-systems are installed configured.

**1. Backup from VIM.**

The preferred method of backing up cloud system VM instances is by snapshotting. Once the DSR and optional sub-systems are installed and configured, but before adding traffic, use the appropriate cloud tool such as the VMware Manager or the OpenStack Horizon GUI, to take snapshots of critical VM instances. It is particularly important to snapshot the control instances, such as the NOAM and SOAM.

**Note**

Perform the following steps also to back up the NOAM and SOAM database.

**2. Identify Backup Server.**

Identify an external server to be used as a backup server for the following steps. The server should not be co-located with any of the following items:

- Cloud Infrastructure Manager Server/Controller
- DSR NOAM
- DSR SOAM

**3. Log in to NOAM/SOAM VIP.**

- a. Establish a GUI session on the NOAM or SOAM server by using the VIP IP address of the NOAM or SOAM server.
- b. Open the web browser and enter a URL `http://<Primary_NOAM/SOAM_VIP_IP_Address>`
- c. Login as the **guiadmin** user.

**4. In NOAM/SOAM VIP, perform backup configuration data for the system.**

- a. Navigate to **Main Menu**, and then **Status & Manage**, and then **Database**.
- b. Select the active NOAM server and click **Backup**.
- c. Ensure the **Configuration** checkbox is marked.

## Database Backup

| Field                                                                   | Value                                                                                              | Description                                                                                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Server: Martinique-NO1                                                  |                                                                                                    |                                                                                                                                                                                                                                                                                                          |
| Select data for backup                                                  | <input type="checkbox"/> Provisioning<br><input checked="" type="checkbox"/> Configuration         | Select the type of Backup to perform.                                                                                                                                                                                                                                                                    |
| Compression *                                                           | <input type="radio"/> gzip<br><input checked="" type="radio"/> bzip2<br><input type="radio"/> none | Select the backup archive compression algorithm.<br>The following file suffix will be applied for the selected option: <ul style="list-style-type: none"> <li>• .tar.gz - gzip compression,</li> <li>• .tar.bz2 - bzip2 compression,</li> <li>• .tar - no compression.</li> </ul> [A value is required.] |
| Archive Name *                                                          | Backup.dsr.Martinique-NO1.Configuration.NETWORK_OAMP.20161006_0640                                 | Modify archive name if desired. Do not include the compression type suffix. [A value is required.]                                                                                                                                                                                                       |
| Comment                                                                 | <input type="text"/>                                                                               | May not contain the following characters: ' ' \$                                                                                                                                                                                                                                                         |
| <input type="button" value="Ok"/> <input type="button" value="Cancel"/> |                                                                                                    |                                                                                                                                                                                                                                                                                                          |

- d. Enter a filename for the backup and click **OK**.
5. In NOAM/SOAM VIP, verify the backup file existence.
  - a. Navigate to **Main Menu**, and then **Status & Manage**, and then **Files**.
  - b. Select the active NOAM or SOAM tab.  
The files on this server are displayed.
  - c. Verify the existence of the backup file.
6. In NOAM/SOAM VIP, download the file to a local machine.
  - a. From the previous step, select the backup file.
  - b. Click **Download**.
  - c. Click **OK**.

**Note**

- Transfer the backed up image to a secure location identified in step 2 where the server backup files are fetched in case of system disaster recovery.
- Repeat Steps 3 through 6 to back up the active SOAM.

## 6.4 Configure Port Security (KVM/OpenStack Only)

This procedure configures port security on TSA.

**Prerequisites:**

- Perform "**Enable the Neutron port security extension**".
  - We require this extension to disable the Neutron anti-spoofing filter rules for a given port.
  - Refer to [Disable Port Security](#) where this is discussed.
1. IPFE with TSA only. Remove allowable address pair security on IPFE XSI network and DAMP XSI interfaces on IPFE and MP instances.

If stacks are deployed using HEAT template, follow this step.

- a. Determine the TSA IP address used in [Configure IP Front End](#).

- b. Determine the corresponding XSI interface IP address assigned to that TSA used in [Configure IP Front End](#).
- c. Determine the XSI IP address of IPFE used in [Configure IP Front End](#).
- d. Log in to the OpenStack control node as the **admusr** user.
- e. Source the tenant user credentials.
- f. Determine the port ID of the XSI interface IP address.

```
$ neutron port-list -F id -F fixed_ips | grep <XSI network>
```

**Note**

<port ID> is the value in first column of the output to this command.

- g. Remove `allowed_address_pairs`:

```
$ neutron port-update <Port ID> --no-allowed-address-pairs
```

**Note**

Run `neutron port-show` command to verify `allowed_address_pairs` attribute is empty.

2. IPFE with TSA only. Remove port security on TSA XSI network interfaces on IPFE and MP instances.

If using IPFE with Target Set Addresses (TSA).

- a. Determine the TSA IP address as used in [Configure IP Front End](#) section.
- b. Determine the corresponding XSI interface IP address as used in [Configure IP Front End](#) section.
- c. Log in to the OpenStack control node as the `admusr` user.
- d. Source the tenant user credentials.
- e. Determine security groups associated with the IPFE instance.

```
$ nova list-secgroup <VM instance ID>
```

**Note**

<VM instance ID> can be queried from the output of `nova list` command in the ID column for the given VM.

- f. Save the ID and names of the listed security groups for later use.
- g. Remove all listed security groups.

```
$ nova remove-secgroup <VM instance ID> <Security group ID>
```

**Note**

Use the <VM instance ID> and <Security group ID> as noted down in the step-f above.

Alternatively, use the following syntax:

```
$ nova remove-secgroup <VM instance name> <Security group name>
```

- h. Determine the port ID of the XSI interface IP address from step b above.

```
$ neutron port-list -F id -F fixed_ips | grep <instance IP on TSA/XSI network>
```

**Note**

<port ID> is the value in first column of the output to this command.

- i. Disable port security for the port found in step g.

```
$ neutron port-update <Port ID> --port-security-enabled=false
```

- j. Re-enable port security for all the interfaces not on the TSA/XSI port used in step i, including XMI, IMI, and others.

- k. Determine the port IDs of the instance IP addresses not associated with the TSA/XSI network.

```
$ neutron port-list -F id -F fixed_ips | grep <instance IP not on TSA/XSI network>
```

- l. For each of the non TSA/XSI instance ports perform the following command for each of the security groups from step f.

```
$ neutron port-update <Port ID> --security-group <Security group ID>
```

**Note**

Use the <Security Group ID> as noted down in the step f above.

## 6.5 Enable/Disable DTLS (SCTP Diameter Connections Only)

This procedure prepares clients before configuring SCTP Diameter connections.

Oracle's SCTP Datagram Transport Layer Security (DTLS) has SCTP AUTH extensions by default. SCTP AUTH extensions are required for SCTP DTLS. However, there are known impacts with SCTP AUTH extensions as covered by the CVEs referenced below. It is highly recommended that customers prepare clients before the DSR connections are established after installation. This ensures the DSR to client SCTP connection establishes with SCTP AUTH extensions enabled. See RFC 6083. If customers DO NOT prepare clients to

accommodate the DTLS changes, then the SCTP connections to client devices will not establish after the DSR is installed.

- <https://access.redhat.com/security/cve/CVE-2015-1421>
- <https://access.redhat.com/security/cve/CVE-2014-5077>

Run the procedures in *DSR DTLS Feature Activation Procedure* to disable or enable the DTLS feature.

## 6.6 Shared Secret Encryption Key Revocation (RADIUS Only)

This procedure changes the shared secret encryption key on DSR RADIUS setup.

Refer to "RADIUS Shared Secret Key revocation MOP" to change the encryption key on the DSR installed setup. Refer to "DSR RADIUS Shared Secret Encryption Key Revocation" MOP MO008572.

### Note

It is highly recommended to change the key after installation due to security reasons.

## 6.7 DSR Performance Tuning

This procedure changes tuning parameters for the system to achieve better performance. This is an optional step.

Refer to [Performance Tuning Recommended](#) for performance tuning on DSR.

## 6.8 Change NOAM/SOAM Profile for Increased MP Capacity on a Virtualized Environment

This procedure describes how to change NOAM and SOAM VM profile when the MP capacity is increased on OpenStack and VMware.

1. Log in to OpenStack/VMware.
  - To change the VM profile when the MP capacity is increased on OpenStack, log in to Openstack GUI horizon dashboard.
  - To change the VM profile when the MP capacity is increased on VMware, log in to VM manager.
2. Refer to the section "Change NOAM/SOAM VM Profile for Increased MP Capacity" in *DSR Cloud Upgrade Guide*.

## 6.9 Resolve False Alarms for DA MP and vSTP MP

The following critical alarms raised for DA MP (Diameter Agent Message Processor), Virtual Session Transfer Protocol Message Processor (vSTP MP) in DSR or vSTP for combined deployments with multiple sites can be ignored:

- 25500 - No DA MP Leader Detected
- 70371 - No vSTP MP Leader Detected

If required, perform the following procedure to resolve the above alarms:

1. On DSR SOAM, run the following commands:

```
iset -fcntl=off PmControl where "procTag='vstpoam' "
iset -fcntl=respawn PmControl where "procTag='dsroam' "
```

2. On vSTP SOAM, run the following commands:

```
iset -fcntl=off PmControl where "procTag='dsroam' "
iset -fcntl=respawn PmControl where "procTag='vstpoam' "
```

**Note**

In future, system restarts, these alarms will not reappear.

## 6.10 Configuring GUI and MMI Using Label Format for FQDN/Realm

For the users who prefer to configure with `label` format instead `label.label` format for FQDN/Realm, perform the following procedure for GUI (Graphical user interface) and MMI configuration changes:

1. Navigate to `cd /usr/TKLC/dpi/prod/maint/scripts/` folder.
2. Run the following command:

```
sudo ./rfcRealmFqdn.sh
```

3. Select an option from the list and proceed with the FQDN/Realm configuration:

**Note**

The code is compliant by default.

- a. Non-Compliant: to allow RFC Non-compliant label format
- b. Compliant: to allow RFC compliant label format
- c. Quit

**Note**

To continue with the switchover, this manual step must be performed on every OAM server.

# A

## Sample Network Element and Hardware Profiles

To enter all the network information for a network element into an AppWorks-based system, a specially formatted XML file needs to be filled out with the required network information. The network information is needed to configure both the NOAM and any SOAM network elements.

It is expected that the maintainer/creator of this file has networking knowledge of this product and the customer site at which it is being installed. The following is an example of a network element XML file.

The SOAM network element XML file needs to have same network names for the networks as the NOAM network element XML file has. It is easy to accidentally create different network names for NOAM and SOAM network elements, and then the mapping of services to networks are not possible.

### Example for Network Element XML File

```
<?xml version="1.0"?>
<networkelement>
 <name>NE</name>
 <networks>
 <network>
 <name>XMI</name>
 <vlanId>3</vlanId>
 <ip>10.2.0.0</ip>
 <mask>255.255.255.0</mask>
 <gateway>10.2.0.1</gateway>
 <isDefault>true</isDefault>
 </network>
 <network>
 <name>IMI</name>
 <vlanId>4</vlanId>
 <ip>10.3.0.0</ip>
 <mask>255.255.255.0</mask>
 <nonRoutable>true</nonRoutable>
 </network>
 </networks>
</networkelement>
```

#### Note

NetworkElement Name must be unique while creating multiple Network Element.

# B

## List of Frequently Used Time Zones

This table lists several valid time zone strings that can be used for the time zone setting in a CSV file, or as the time zone parameter when manually setting a DSR time zone.

**Table B-1 List of Selected Time Zone Values**

Time Zone Value	Description	Universal Time Code (UTC) Offset
UTC	Universal Time Coordinated	UTC-00
America/New_York	Eastern Time	UTC-05
America/Chicago	Central Time	UTC-06
America/Denver	Mountain Time	UTC-07
America/Phoenix	Mountain Standard Time — Arizona	UTC-07
America/Los Angeles	Pacific Time	UTC-08
America/Anchorage	Alaska Time	UTC-09
Pacific/Honolulu	Hawaii	UTC-10
Africa/Johannesburg		UTC+02
America/Mexico City	Central Time — most locations	UTC-06
Africa/Monrovia		UTC+00
Asia/Tokyo		UTC+09
America/Jamaica		UTC-05
Europe/Rome		UTC+01
Asia/Hong Kong		UTC+08
Pacific/Guam		UTC+10
Europe/Athens		UTC+02
Europe/London		UTC+00
Europe/Paris		UTC+01
Europe/Madrid	mainland	UTC+01
Africa/Cairo		UTC+02
Europe/Copenhagen		UTC+01
Europe/Berlin		UTC+01
Europe/Prague		UTC+01
America/Vancouver	Pacific Time — west British Columbia	UTC-08
America/Edmonton	Mountain Time — Alberta, east British Columbia & west Saskatchewan	UTC-07
America/Toronto	Eastern Time — Ontario — most locations	UTC-05
America/Montreal	Eastern Time — Quebec — most locations	UTC-05
America/Sao Paulo	South & Southeast Brazil	UTC-03
Europe/Brussels		UTC+01
Australia/Perth	Western Australia — most locations	UTC+08
Australia/Sydney	New South Wales — most locations	UTC+10
Asia/Seoul		UTC+09

**Table B-1 (Cont.) List of Selected Time Zone Values**

Time Zone Value	Description	Universal Time Code (UTC) Offset
Africa/Lagos		UTC+01
Europe/Warsaw		UTC+01
America/Puerto Rico		UTC-04
Europe/Moscow	Moscow+00 — west Russia	UTC+04
Asia/Manila		UTC+08
Atlantic/Reykjavik		UTC+00
Asia/Jerusalem		UTC+02

# C

## Common KVM/OpenStack Tasks

### C.1 Create a Network Port

Perform the following steps to create the network ports for the NO network interfaces:

1. Each network interface on an instance must have an associated network port.  
An instance usually has at least eth0 and eth1 for a public and private network respectively.  
Some configurations require 6 or more interfaces and corresponding network ports.

2. Determine the IP address for the interface.

For eth0, the IP might be 10.x.x.157

For eth1, the IP might be 192.168.x.157

3. Identify the neutron network ID associated with each IP/interface using the neutron command line tool.

```
$ neutron net-list
```

4. Identify the neutron subnet ID associated with each IP/interface using the neutron command line tool.

```
$ neutron subnet-list
```

5. Create the network port using the neutron command line tool, being sure to choose an informative name. Note the use of the subnet ID and the network ID (final argument).

Port names are usually a combination of instance name and network name.

NO1-xmi

SO2-imi

MP5-xsi2

The ports must be owned by the DSR tenant user, not the admin user. Either source the credentials of the DSR tenant user or use the DSR tenant user ID as the value for the — **tenant-id** argument.

```
$. keystone_rc_dsr_user
$ keystone user-list
$ neutron port-create --name=NO1-xmi --tenant-id <tenant id> --fixed-ip
 subnet_id=<subnet id>,ip_address=10.x.x.157 <network id>
$ neutron port-create --name=NO1-imi --tenant-id <tenant id> --fixed-ip
 subnet_id=<subnet id>,ip_address=192.168.x.157 <network id>
```

View your newly created ports using the neutron tool.

```
$ neutron port-list
```

## C.2 Create and Boot OpenStack Instance

Perform the following steps to create a VM instance from a glance image.

1. Get the following configuration values.

The image ID.

```
$ glance image-list
```

The flavor ID.

```
$ nova flavor-list
```

The network ID(s).

```
$ neutron net-list
```

An informative name for the instance.

NO1

SO2

MP5

2. Create and boot the VM instance.

The instance must be owned by the DSR tenant user, not the admin user. Source the credentials of the DSR tenant user and issue the following command. Number of IP/ interfaces for each VM type must conform with the DSR Network to Device Assignments defined in *DSR Cloud Benchmarking Guide*.

### Note

IPv6 addresses should use the **v6-fixed-ip** argument instead of **v4-fixed-ip**.

```
$ nova boot --image <image ID> --flavor <flavor id> --nic net-id=<first network id>,v4-fixed-ip=<first ip address> --nic net-id=<second network id>,v4-fixed-ip=<second ip address> InstanceName
```

View the newly created instance using the nova tool.

```
$ nova list --all-tenants
```

The VM takes approximately 5 minutes to boot. At this point, the VM has no configured network interfaces and can only be accessed by the Horizon console tool.

## C.3 Configure Networking for OpenStack Instance

Perform the following steps to verify or configure Networking for OpenStack Instance.

1. Check if the interface is configured automatically.
2. If DHCP is enabled on Neutron subnet, VM configures the VNIC with the IP address. To verify, ping the XMI IP address provided with the nova boot command:

```
$ ping <XMI-IP-Provided-During-Nova-Boot>
```

If the ping is successful, ignore the next part to configure the interface manually.

Manually configure the interface, if not already done (optional).

- a. Log in to the **Horizon** GUI as the DSR tenant user.
- b. Go to the **Compute/Instances** section.
- c. Click on the **Name** field of the newly created instance.
- d. Select the **Console** tab.
- e. Log in as the **admusr** user.
- f. Configure the network interfaces, conforming with the interface-to-network mappings defined in *DSR Cloud Benchmarking Guide*.

```
$ sudo netAdm add --onboot=yes --device=eth0 --address=<xmi ip> --
netmask=<xmi net mask>
$ sudo netAdm add --route=default --device=eth0 --gateway=<xmi gateway
ip>
```

Under some circumstances, it may be necessary to configure as many as 6 or more interfaces.

3. Reboot the VM. It takes approximately 5 minutes for the VM to complete rebooting.

```
$ sudo init 6
```

The new VM should now be accessible using both network and Horizon console.

# D

## Common OVM Manager Tasks (CLI)

### D.1 Set Up the Server

This section sets up the server using the command line interface of OVM Manager. All configurations/setup can also be done from the GUI/dashboard of OVM Manager.

1. Log in to the OVM-M command line interface.

```
ssh -l admin <OVM-M IP> -p 1000
```

**Example:**

```
[root@manager01 ~]# ssh -l admin 10.240.16.138 -p 10000
admin@10.240.16.138's password:
```

2. In OVM-M CLI: Discover Oracle VM server.

```
discoverServer ipAddress=value password=value takeOwnership= { Yes | No }
```

**Example:**

```
OVM>discoverServer ipAddress=10.240.16.139 password=password
takeOwnership=Yes
```

3. In OVM-M CLI, create an ethernet-based network with the VM role.

```
create Network [roles= { MANAGEMENT | LIVE_MIGRATE | CLUSTER_HEARTBEAT |
VIRTUAL_MACHINE | STORAGE }] name=value [description=value] [on Server
instance]
```

**Example:**

```
OVM>create Network name=XMI roles=VIRTUAL_MACHINE
```

4. In OVM-M CLI, add a port from each Oracle VM server to the network.

**Note**

Skip this step and proceed to step 5 for bonded interfaces.

- a. Find the ID of an Ethernet port.

```
OVM> show Server name=MyServer1
...
```

```

Ethernet Port 1 = 0004fb00002000007711332ff75857ee
[eth0 on MyServer3.virtlab.info]
Ethernet Port 2 = 0004fb0000200000d2e7d2d352a6654e
[eth1 on MyServer3.virtlab.info]
Ethernet Port 3 = 0004fb0000200000c12192a08f2236e4
[eth2 on MyServer3.virtlab.info]

```

- b. Add a port from each Oracle VM Server to the network.

```
OVM>add Port instance to { BondPort | Network } instance
```

**Example:**

```

OVM>add Port id=0004fb0000200000d2e7d2d352a6654e to Network
name=MyVMNetwork

```

5. In OVM-M CLI, create Bondport (For Bonded Interfaces).

- a. Find the ID of an Ethernet port.

```

OVM>list Port
Status: Success
Time: 2016-08-22 04:43:02,565 EDT
Data:
id:0004fb0000200000045b4e8dc0b3acc6 name:usb0 on vms01.test.com
id:0004fb00002000005fde208ce6392c0a name:eth4 on vms01.test.com
id:0004fb0000200000b1dceeb39006d839 name:eth5 on vms01.test.com
id:0004fb000020000027e3a02bc28dd153 name:eth2 on vms01.test.com
id:0004fb0000200000fce443e0d30cd3d5 name:eth3 on vms01.test.com
id:0004fb0000200000a908e402fc542312 name:eth0 on vms01.test.com
id:0004fb0000200000247b03c2a4a090ec name:eth1 on vms01.test.com

```

- b. Create Bondport on required interfaces.

```

OVM>create BondPort
ethernetPorts="0004fb0000200000b1dceeb39006d839,0004fb0000200000fce443e0
d30cd3d5" mode=ACTIVE_PASSIVE mtu=1500 name=bond1 on Server
name=compute01.test.com

```

**Command:**

```

create BondPort
ethernetPorts="0004fb0000200000b1dceeb39006d839,0004fb0000200000fce443e0
d30cd3d5" mode=ACTIVE_PASSIVE mtu=1500 name=bond1 on Server
name=compute01.test.com
Status: Success

```

6. In OVM-M CLI, add VLAN Interface to network (for VLAN tagged networks).

- a. Find the ID of an Ethernet port.

```

OVM>list BondPort
Command: list BondPort
Status: Success
Time: 2016-08-22 04:38:22,327 EDT

```

```
Data:
id:0004fb00002000005a45a0761813d512 name:bond1
id:0004fb0000200000645cfc865736cea8 name:bond0 on compute01.test.com
```

**b. Create VLAN interface.**

```
OVM>create VlanInterface vlanId=43 name=bond1.43 on BondPort
id=0004fb00002000005a45a0761813d512
```

```
create VlanInterface vlanId=43 name=bond1.43 on BondPort
id=0004fb00002000005a45a0761813d512
Status: Success
```

**c. Add remaining VLAN interfaces to the same bond accordingly, like:**

```
OVM>create VlanInterface vlanId=44 name=bond1.44 on BondPort
id=0004fb00002000005a45a0761813d512
OVM>create VlanInterface vlanId=30 name=bond1.30 on BondPort
id=0004fb00002000005a45a0761813d512
OVM>create VlanInterface vlanId=31 name=bond1.31 on BondPort
id=0004fb00002000005a45a0761813d512
```

**d. Add VLAN interfaces to network.**

```
OVM>add VlanInterface name=bond1.43 to Network name=XMI
Command: add VlanInterface name=bond1.43 to Network name=XMI
Status: Success
Time: 2016-08-22 05:14:29,321 EDT
JobId: 1471857258238
OVM>add VlanInterface name=bond1.44 to Network name=IMI
Command: add VlanInterface name=bond1.44 to Network name=IMI
Status: Success
Time: 2016-08-22 05:15:24,216 EDT
JobId: 1471857321329
OVM>add VlanInterface name=bond1.30 to Network name=XSI1
Command: add VlanInterface name=bond1.30 to Network name=XSI1
Status: Success
Time: 2016-08-22 05:15:39,190 EDT
JobId: 1471857337005
OVM>add VlanInterface name=bond1.31 to Network name=XSI2
Command: add VlanInterface name=bond1.31 to Network name=XSI2
Status: Success
Time: 2016-08-22 05:15:52,576 EDT
JobId: 1471857349684
```

**7. In OVM-M CLI, create unclustered server pool.**

**Note**

To create clustered server pool, ignore this step and proceed to next.

```
OVM>create ServerPool clusterEnable=No name=MyServerPool
description='Unclustered server pool'
```

**8. In OVM-M CLI, create clustered server pool.**

This is an optional step.

**Note**

Skip this step if an unclustered server pool is already created. This step is only if required to create a clustered server pool.

- a.** To create a clustered server pool you must provide a file system or physical disk to use for the server pool file system. To find a file system or physical disk, use the `list` command:

```
OVM>list FileSystem
id:66a61958-e61a-44fe-b0e0-9dd64abef7e3 name:nfs on 10.172.76.125:/mnt/
vol1/poolfs03
id:0004fb0000050000b85745f78b0c4b61 name:fs on 350014ee2568cc0cf
id:4ebb1575-e611-4662-87b9-a84b40ce3db7 name:nfs on 10.172.76.125:/mnt/
vol1/poolfs04
id:858d98c5-3d8b-460e-9160-3415cbdda738 name:nfs on 10.172.76.125:/mnt/
vol1/poolfs01
id:0dea4818-20e6-4d3a-958b-b12cf91588b5 name:nfs on 10.172.76.125:/mnt/
vol1/poolfs02
id:35b4f1c6-182b-4ea5-9746-51393f3b515c name:nfs on 10.172.76.125:/mnt/
vol2/repo03
id:aeb6143d-0a96-4845-9690-740bbf1e225e name:nfs on 10.172.76.125:/mnt/
vol1/repo01
id:05e8536f-8d9c-4d7c-bbb2-29b3ffafe011 name:nfs on 10.172.76.125:/mnt/
vol2/repo02
id:0004fb00000500006a46a8dbd2461939 name:MyServerPool_cluster_heartbeat
id:0004fb00000500000809e28f4fab56b1 name:fs on 350014ee20137ee44
OVM>list PhysicalDisk
id:0004fb000018000019b86ccf3f473a9e name:FreeBSD (9)
id:0004fb0000180000c4609a67d55b5803 name:FreeBSD (3)
id:0004fb00001800002179de6afe5f0cf3 name:SATA_WDC_WD5001ABYS-_WD-
WCAS86288968
id:0004fb0000180000a0b43f9684fc78ac name:FreeBSD (2)
id:0004fb0000180000732be086afb26911 name:FreeBSD (7)
id:0004fb000018000067ce80973e18374e name:FreeBSD (8)
id:0004fb000018000035ce16ee4d58dc4d name:FreeBSD (1)
id:0004fb00001800006855117242d9a537 name:FreeBSD (6)
id:0004fb0000180000a9c7a87ba52ce5ec name:FreeBSD (5)
id:0004fb0000180000ebabef9838188d78 name:SATA_WDC_WD5001ABYS-_WD-
WCAS86571931
id:0004fb00001800008f6ea92426f2cfb8 name:SATA_WDC_WD5001ABYS-_WD-
WCAS86257005
```

```
id:0004fb00001800008ccb1925cdbbd181 name:SATA_WDC_WD5001ABYS-_WD-
WCAS86578538
id:0004fb0000180000e034b4662665161c name:FreeBSD (4)
```

- b.** Before you create a clustered server pool you must refresh the file system or physical disk to be used for the server pool file system. To refresh a file system:

```
OVM>refresh { AccessGroup | Assembly | FileServer | FileSystem |
PhysicalDisk | Repository | Server | StorageArray | VirtualAppliance }
instance
```

For example, to refresh a physical disk:

```
OVM>refresh PhysicalDisk id=0004fb000018000035ce16ee4d58dc4d
```

- c.** Refresh a file system:

```
OVM>refresh FileSystem name="nfs on 10.172.76.125://mnt//vol1//repo01"
OVM>create ServerPool clusterEnable=Yes filesystem="nfs on
10.172.76.125://mnt//vol1//poolfs01" name=MyServerPool
description='Clustered server pool'
```

- 9.** In OVM-M CLI, add Oracle VM servers to the server pool.

```
OVM>add Server name=MyServer to ServerPool name=MyServerPool
```

- 10.** In OVM-M CLI, create storage repository.

- a.** Find the physical disk (LUN) to use for creating the storage repository.

```
OVM>list FileServer
Command: list FileServer
Status: Success
Time: 2016-08-19 02:11:39,779 EDT
Data:
id:0004fb00000900000445dac29e88bc38 name:Local FS vms03.test.com
id:0004fb000009000045715cad6f165ecf name:Local FS vms01.test.com
id:0004fb0000090000df4cd9c3170092e4 name:Local FS vms02.test.com
id:0004fb000009000064b96ed88a9a0185 name:Local FS vms04.test.com
```

- b.** Find a local file system on an Oracle VM server that has access to the LUN.

```
OVM>list FileServer
Command: list FileServer
Status: Success
Time: 2016-08-19 02:11:39,779 EDT
Data:
id:0004fb00000900000445dac29e88bc38 name:Local FS vms03.test.com
id:0004fb000009000045715cad6f165ecf name:Local FS vms01.test.com
id:0004fb0000090000df4cd9c3170092e4 name:Local FS vms02.test.com
id:0004fb000009000064b96ed88a9a0185 name:Local FS vms04.test.com
```

c. Create file system.

```
OVM>create FileSystem name=VmsFs01
physicalDisk="OVM_SYS_REPO_PART_3600605b00a2a024000163e490ac3f392" on
FileServer name="Local FS vms01.test.com"
```

**Command:**

```
create FileSystem name=VmsFs01
physicalDisk="OVM_SYS_REPO_PART_3600605b00a2a024000163e490ac3f392" on
FileServer name="Local FS vms01.test.com"
Status: Success
Time: 2016-08-19 02:22:46,581 EDT
JobId: 1471587738752
Data:
id:0004fb00000500006779d42da60c0be6 name:VmsFs01
```

d. Create repository.

```
OVM>create Repository name=Vms01Repo on FileSystem name=VmsFs01
```

**Command:**

```
create Repository name=Vms01Repo on FileSystem name=VmsFs01
Status: Success
Time: 2016-08-19 02:24:04,092 EDT
JobId: 1471587843432Data:id:0004fb00000300003c8f771791114d53
name:Vms01Repo
```

e. Add server pool to repository.

```
OVM> add ServerPool name=TestPool001 to Repository name=Vms01Repo
```

Refresh the storage repository using the syntax:

```
OVM> refresh Repository name=MyRepository
```

## D.2 Server Pool

A server pool is a required entity in Oracle VM, even if it contains a single Oracle VM Server. In practice, several Oracle VM servers form a server pool, and an Oracle VM environment may contain one or several server pools. Server pools are typically clustered, although an unclustered server pool is also possible. Server pools have shared access to storage repositories and exchange and store vital cluster information in the server pool file system. Refer to *Oracle VM Concepts Guide* for more information.

# E

## Scale a Signaling Node

Perform this procedure only if an additional signaling node(s) needs to be deployed to an existing DSR deployment.

### Note

This procedure is only required if additional Signaling Node(s) needs to be deployed to an existing DSR deployment.

### Prerequisites:

DSR topology is already deployed and configured as per [Software Installation Using HEAT Templates \(OpenStack\)](#).

1. Create new signaling stack.
  - a. Prepare OpenStack templates and environment files for signaling stacks by following instructions in **<Procedure 13>** for signaling stacks.
  - b. Create OpenStack parameter file for signaling stacks by following instructions in **<Procedure 15>**.

### Note

Change the number of signaling node(s) as per the requirement.

- c. Deploy the stacks by following instructions in **<Procedure 16>**.

### Note

New stack is created as part of this procedure.

2. Configure new site in the existing topology.
  - Create a new network element by following **<Procedure 25>** to define the network for new site being configured.
  - Configure the SOAM servers by following **Procedure 26** to create the SOAM servers.
  - Configure the SOAM server group by following **Procedure 27** to create SOAM server group.
  - Configure the MP virtual machines by following **Procedure 28**.
  - Configure the MP server group(s) and profiles by following **Procedure 31**.
  - Configure the signaling network routes by following **Procedure 32**.
  - If deployed stack contains IPFE servers, then configure the IPFE by following **Procedure 34**.

**Note**

Repeat this procedure if more signaling nodes are required.

## F

# Firewall Ports

**Table F-1 Firewall Ports**

Flow Description	Purpose	Protocol/Port	IP Protocol Version
NTP flow for time sync	XMI network	UDP:123	IPv4, IPv6
hostname resolution (dns)	XMI, IMI Network	UDP/TCP: 53	IPv4, IPv6
LightWeight Directory Access Protocol (LDAP)	XMI network	UDP/TCP: 389	IPv4, IPv6
SSH	XMI network	TCP: 22	IPv4, IPv6
GUI	XMI network	TCP: 80, TCP:443	IPv4, IPv6

For information about Firewall Ports, refer to *DSR IP flow document*.

# G

## Application VIP Failover Options (OpenStack)

### G.1 Application VIP Failover Options

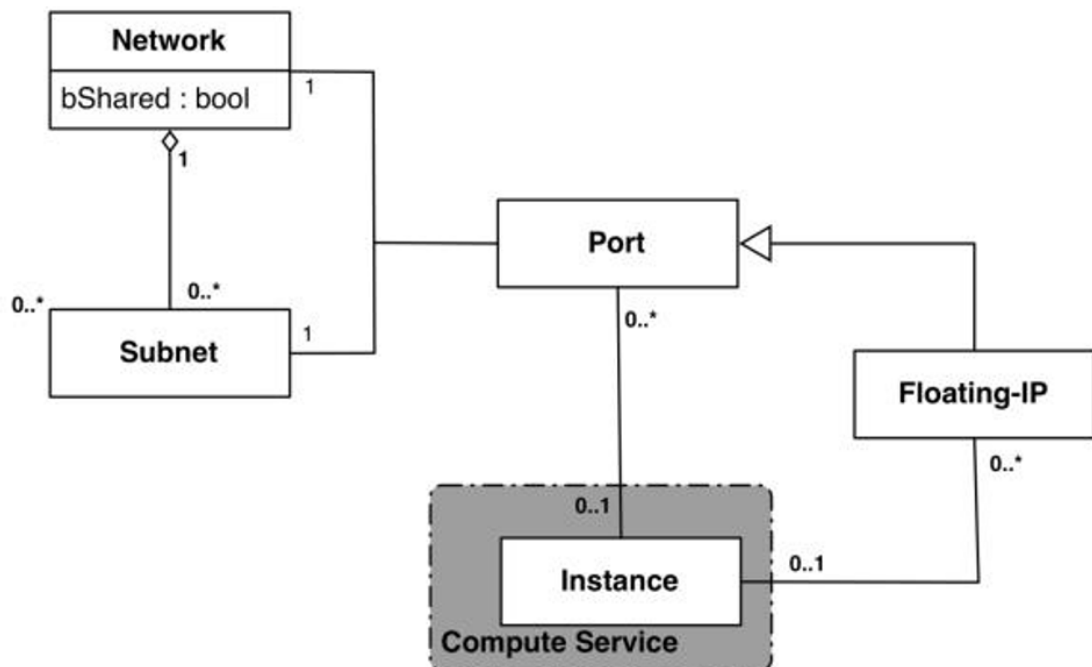

Within an OpenStack cloud environment, there are several options for allowing applications to manage their own virtual IP (VIP) addresses as is traditionally done in telecommunications applications. This document describes two of those options:

- Allowed address pairs
- Disable port security

Each of these options is covered in the major sub-sections that follow. The last major sub-section discusses how to utilize application managed virtual IP addresses within an OpenStack VM instance.

Both of these options effectively work around the default OpenStack Networking (Neutron) service anti-spoofing rules that ensure that a VM instance cannot send packets out a network interface with a source IP address different from the IP address Neutron has associated with the interface. In the Neutron data model, the logical notion of networks, sub-networks and network interfaces are realized as networks, subnets, and ports as shown in below figure.

**Figure G-1 Neutron High-Level Data Model**

Note how a port in the Neutron data model maps to at most one VM instance where internal to the VM instance, the port is represented as an available network device such as eth0. VM

instances can have multiple network interfaces in which case there are multiple Neutron ports associated with the VM instance, each with different MAC and IP addresses.

Each Neutron port by default has one MAC Address and one IPv4 or IPv6 address associated with it. The IP address associated with a port can be assigned in two ways:

- Automatically by Neutron when creating a port to fulfill an OpenStack Compute (Nova) service request to associate a network interface with a VM instance to be instantiated
- Manually by a cloud administrator when creating or updating a Neutron port

The anti-spoofing rules are enforced at the Neutron port level by ensuring that the source IP address of outgoing packets matches the IP address Neutron has associated with the corresponding port assigned to the VM instance. By default if the source IP address in the outgoing packet does not match the IP address associated with the corresponding Neutron port then the packet is dropped.

These anti-spoofing rules clearly create a complication for the use of application managed virtual IP addresses since Neutron is not going to know about the VIPs being applied by the application to VM instance network interfaces without some interaction between the application (or a higher level management element) and Neutron. Which is why the two options in this document either fully disable the port security measures within Neutron, including the anti-spoofing rules, or expand the set of allowable source IP addresses to include the VIPs that may be used by the application running within a VM instance.

Note that for both of the options described in the following sub-sections, there is a particular Neutron service extension or feature that must be enabled for the option to work. For one option (allowed address pairs) the required Neutron extension is enabled in most default deployments whereas for the other option (allow port security to be disabled) it is not.

Within this document when describing how to use either of these two options, there is example command line operations that interact with the OpenStack Neutron service using its command line utility, simply named neutron. However, be aware that all of the operations performed using the neutron command line utility can also be performed through the Neutron REST APIs, see the [Networking v2.0 API documentation](#) for more information.

## G.2 Allowed Address Pairs

This section describes an option that extends the set of source IP addresses that can be used in packets being sent out a VM instance's network interface (which maps to a Neutron port). This option utilizes a Neutron capability, called the allowed-address-pairs extension, which allows an entity (cloud administrator, management element, etc.) to define additional IP addresses to be associated with a Neutron port. In this way, if an application within the VM instance sends an outgoing packet with one of those additional IP addresses, then Neutron anti-spoofing rules enforcement logic does not drop those packets. The Neutron allowed-address-pairs extension is available starting with the OpenStack Havana release.

The three sub-sections that follow describe the OpenStack configuration requirements for this option, how to use this option after a VM instance has already booted, and how to utilize this option before a VM instance has booted.

## G.3 OpenStack Configuration Requirements

The Neutron allowed-address-pairs extension needs to be enabled for this option to work. For most OpenStack cloud deployments this extension should be enabled by default but to check, run the following command (after sourcing the appropriate user credentials file):

```
neutron ext-list
```

alias	name
security-group	security-group
l3_agent_scheduler	L3 Agent Scheduler
net-mtu	Network MTU
ext-gw-mode	Neutron L3 Configurable external gateway mode
binding	Port Binding
provider	Provider Network
agent	agent
quotas	Quota management support
subnet_allocation	Subnet Allocation
dhcp_agent_scheduler	DHCP Agent Scheduler
l3-ha	HA Router extension
multi-provider	Multi Provider Network
external-net	Neutron external network
router	Neutron L3 Router
<b>allowed-address-pairs</b>	<b>Allowed Address Pairs</b>
extraroute	Neutron Extra Route
extra_dhcp_opt	Neutron Extra DHCP opts
dvr	Distributed Virtual Router

The allowed-address-pairs extension should appear in the list of extensions as shown in the bold line above.

## G.4 After a VM Instance has been Booted: Allowed Address Pairs

If a VM instance has already been booted, that is, instantiated, and you need to associate one or more additional IP addresses with the Neutron port assigned to the VM instance, then you need to run a command of the following form:

```
neutron port-update <Port ID> --allowed_address_pairs list=true type=dict
ip_address=<VIP address to be added>
```

Where the bolded items have the following meaning:

- **<Port ID>**  
Identifies the ID of the port within Neutron which can be determined by listing the ports, `neutron port-list`, or if the port is named then the port ID can be obtained directly in the above command with a sequence like `$ (neutron port-show -f value -F id <Port Name>)` to replace the **<Port ID>** placeholder.
- **<VIP address to be added>**

Identifies the IP address, a virtual IP address in this case, that should additionally be associated with the port where this can be a single IP address, for example, 10.133.97.135/32, or a range of IP addresses as indicated by a value such as 10.133.97.128/30.

For example, if you wanted to indicate to Neutron that the allowed addresses for a port should include the range of addresses between 10.133.97.136 to 10.133.97.139 and the port had an ID of 8a440d3f-4e5c-4ba2-9e5e-7fc942111277, then you would type the following command:

```
neutron port-update 8a440d3f-4e5c-4ba2-9e5e-7fc942111277 --
allowed_address_pairs list=true type=dict ip_address=10.133.97.136/30
```

## G.5 Before a VM Instance has been Booted: Allowed Address Pairs

If you want to associate additional allowed IP addresses with a port before it is associated with a VM instance then you need to first create the port and then associate one or more ports with a VM instance when it is booted. The command to create a new port with defined allowed address pairs is of the following form:

```
neutron port-create --name <Port Name> --fixed-ip subnet-id=$(neutron
subnet-show -f value -F id <Subnet name>),ip_address=<Target IP address>
$(neutron net-show -f value -F id <Network name>) --allowed_address_pairs
list=true type=dict ip_address=<VIP address to be added>
```

Where the bolded items have the following meaning:

- **<Port Name>**  
This is effectively a string alias for the port that is useful when trying to locate the ID for the port but the **--name <Port Name>** portion of the command is completely optional.
- **<Subnet name>**  
The name of the subnet to which the port should be added.
- **<Target IP address>**  
The unique IP address to be associated with the port.
- **<Network Name>**  
The name of the network with which the port should be associated.
- **<VIP address to be added>**  
This parameter value has the same meaning as described in the previous section.

For example, if you wanted to indicate to Neutron that a new port should have an IP address of 10.133.97.133 on the **ext-subnet** subnet with a single allowed address pair, 10.133.97.134, then you would type a command similar to the following:

```
neutron port-create -name foo --fixed-ip subnet-id=$(neutron subnet-show -f
value -F id ext-subnet),ip_address=10.133.97.133 $(neutron net-show -f value -
F id ext-net) --allowed_address_pairs list=true type=dict
ip_address=10.133.97.134/32
```

Once the port or ports with the additional allowed addresses have been created, when you boot the VM instance use a nova boot command similar to the following:

```
nova boot --flavor m1.xlarge --image testVMimage --nic port-id=$(neutron
port-show -f value -F id <Port Name>) testvm3
```

where the flavor, image, and VM instance name values need to be replaced by values appropriate for your VM. If the port to be associated with the VM instance is not named, then you need to obtain the port's ID using the neutron port-list command and replace the \$(neutron port-show -f value -F id <Port Name>) sequence in the above command with the port's ID value.

## G.6 Disable Port Security

This section describes an option that rather than extending the set of source IP addresses that are associated with a Neutron port, as is done with the allowed-address-pairs extension, to disable the Neutron anti-spoofing filter rules for a given port. This option allows all IP packets originating from the VM instance to be propagated no matter whether the source IP address in the packet matches the IP address associated with the Neutron port or not. This option relies upon the Neutron port security extension that is available starting with the OpenStack Kilo release.

The three sub-sections that follow describe the OpenStack configuration requirements for this option, how to use this option after a VM instance has already booted, and how to use this option before a VM instance has booted.

### OpenStack Configuration Requirements

The Neutron port security extension needs to be enabled for this method to work. For the procedure to enable the port security extension see the [ML2 Port Security Extension Wiki page](#).

**Note**

Enabling the port security extension when there are already existing networks within the OpenStack cloud causes all network related requests into Neutron to fail due to a known bug in Neutron. There is a fix identified for this bug that is part of the Liberty release and is scheduled to be backported to the Kilo 2015.1.2 release. In the meantime, this option is only non-disruptive when working with a new cloud deployment where the cloud administrator can enable this feature before any networks and VM instances that use those networks are created. The port security extension can be enabled in an already deployed OpenStack cloud, but all existing networks, subnets, ports, and so on, need to be deleted before enabling the port security extension. This typically means all VM instances also need to be deleted as well, but a knowledgeable cloud administrator may be able to do the following to limit the disruption of enabling the port security extension:

- Record the current IP address assignments for all VM instances
- Remove the network interfaces from any existing VM instances
- Delete the Neutron resources
- Enable the port security extension
- Recreate the previously defined Neutron resources (networks, subnets, ports, and so on)
- Re-add the appropriate network interfaces to the VMs

Depending on the number of VM instances running in the cloud, this procedure may or may not be practical.

## G.7 After a VM Instance has been Booted: Port Security

If you need to disable port security for a port after it has already been associated with a VM instance, then you need to run one or both of the following commands to use the port security option. First, if the VM instance with which the existing port is associated has any associated security groups (run `nova list-secgroup <VM instance name>` to check), then you first need to run a command of the following form for each of the security group(s) associated with the VM instance:

```
nova remove-secgroup <VM instance name> <Security group name>
```

Where the bolded item has the following meaning:

- **<VM instance name>**  
Identifies the name of the VM instance for which the identified security group name should be deleted.
- **<Security group name>**  
Identifies the name of the security group that should be removed from the VM instance.

For example, if you wanted to remove the default security group from a VM instance named 'testvm4', then you would type a command similar to the following:

```
nova remove-secgroup testvm4 default
```

Once any security groups associated with VM instance to which the Neutron port is assigned have been removed, then the Neutron port(s) associated with the target VM instance need to be updated to disable port security on those ports. The command to disable port security for a specific Neutron port is of the form:

```
neutron port-update <Port ID> -- port-security-enabled=false
```

Where the bolded item has the following meaning:

- **<Port ID>**  
Identifies the ID of the port within Neutron which can be determined by listing the ports, `neutron port-list`, or if the port is named then the port ID can be obtained directly in the above command with a sequence such as `$(neutron port-show -f value -F id <Port Name>)`.

So for example if you wanted to indicate to Neutron that port security should be disabled for a port with an ID of 6d48b5f2-d185-4768-b5a4-c0d1d8075e41 then you would type the following command:

```
neutron port-update 6d48b5f2-d185-4768-b5a4-c0d1d8075e41 --port-security-enabled=false
```

If the port-update command succeeds, within the VM instance with which the 6d48b5f2-d185-4768-b5a4-c0d1d8075e41 port is associated, application managed VIPs can now be added to the network interface within the VM instance associated with the port and network traffic using that VIP address should now propagate.

## G.8 Before a VM Instance has been Booted: Port Security

If you want to disable port security for a port before it is associated with a VM instance, then you need to first create the port at which time you can specify that port security should be disabled. The command to create a new port with port security disabled is of the following form:

```
neutron port-create --name <Port Name> --port-security-enabled=false --fixed-ip subnet-id=$(neutron subnet-show -f value -F id <Subnet name>),ip_address=<Target IP address> $(neutron net-show -f value -F id <Network name>)
```

where the bolded items have the following meaning:

- **<Port Name>**  
This is effectively a string alias for the port that is useful when trying to locate the ID for the port but the **--name <Port Name>** portion of the command is completely optional.
- **<Subnet name>**  
The name of the subnet to which the port should be added.
- **<Target IP address>**  
The unique IP address to be associated with the port.
- **<Network Name>**  
The name of the network with which the port should be associated.

For example, if you wanted to indicate to Neutron that a new port should have port security disabled and an IP address of 10.133.97.133 on the **ext-subnet** subnet, then you would type a command similar to the following:

```
neutron port-create -name foo --port-security-enabled=false --fixed-ip
subnet-id=$(neutron subnet-show -f value -F id ext-
subnet),ip_address=10.133.97.133 $(neutron net-show -f value -F id ext-net)
```

Once the port or ports with port security disabled have been created, when you boot the VM instance, you need to run a command similar to the following:

```
nova boot --flavor m1.xlarge --image testVMimage --nic port-id=$(neutron
port-show -f value -F id <Port Name>) testvm3
```

Where the flavor, image, and VM instance name values need to be replaced by values appropriate for your VM. If the port to be associated with the VM instance is not named, then you need to obtain the port's ID using the `neutron port-list` command and replace the `$(neutron port-show -f value -F id <Port Name>)` sequence in the above command with the port's ID value.

## G.9 Managing Application Virtual IP Addresses within VM Instances

Once either of the previously described options is in place to enable applications to manage their own virtual IP addresses, there should be no modifications required for the way application already manages its VIPs in a non-virtualized configuration. There are many ways that an application can add or remove virtual IP addresses but as a reference point, here are some example command line operations to add a virtual IP address of 10.133.97.136 to the `eth0` network interface within a VM and then send four gratuitous ARP packets to refresh the ARP caches of any neighboring nodes:

```
ip address add 10.133.97.136/23 broadcast 10.133.97.255 dev eth0 scope
global
```

```
arping -c 4 -U -I eth0 10.133.97.136
```

As the creation of virtual IP addresses typically coincides with when an application is assigned an active role, the above operations would be performed both when an application instance first receives an initial active HA role or when an application instance transitions from a standby HA role to the active HA role.

# H

## Sample Net Rules File

Udev uses rules files that determine how it identifies devices and creates device names. The udev daemon (udevvd) reads the rules files at system startup and stores the rules in memory. If the kernel discovers a new device or an existing device goes offline, the kernel sends an event action (uevent) notification to udevd, which matches the in-memory rules against the device attributes in /sys to identify the device. As part of device event handling, rules can specify additional programs that should run to configure a device. Rules file, which have the file extension .rules, is located in the following directory: /etc/udev/rules.d/\*.rules

### Sample File:

```
eth0 interface with MAC address "fa:16:3e:cc:12:d6" will be assigned "xmi"
SUBSYSTEM=="net", ACTION=="add", DRIVERS=="?*",
ATTR{address}=="fa:16:3e:cc:12:d6", ATTR{dev_id}=="0x0", ATTR{type}=="1",
KERNEL=="eth*", NAME="xmi"
```

```
eth1 interface with MAC address "fa:16:3e:1a:8d:8a" will be assigned "int"
SUBSYSTEM=="net", ACTION=="add", DRIVERS=="?*",
ATTR{address}=="fa:16:3e:1a:8d:8a", ATTR{dev_id}=="0x0", ATTR{type}=="1",
KERNEL=="eth*", NAME="int"
```

#### Note

If you need a 3rd interface add respective entry also. The iDIH Mediation VM needs an imi interface too.

```
eth1 interface with MAC address "fa:16:3e:1a:8d:8a" will be assigned "int"
SUBSYSTEM=="net", ACTION=="add", DRIVERS=="?*", ATTR{address}=="
fa:16:3e:8a:1a:12", ATTR{dev_id}=="0x0", ATTR{type}=="1", KERNEL=="eth*",
NAME="imi":
```

#### Note

- MAC address of each interfaces can be determined using the following command issued from the console:

```
ifconfig -a
```

- Update MAC address for each interface. The MAC addresses must be entered in all lower case.
- Update the interface names as in the above example.

# Performance Tuning Recommended

## I.1 OpenStack

For the DSR system to achieve 50K MPS or more through IPFE, a few tuning parameters need to be changed.

### **txqueuelen**

Tuned on the compute hosts.

**Purpose:** The default value of 500 is too small. Our recommendation is to set to 120,000. Increases the network throughput of a VM. On each compute host, do the following as root.

```
cat > /etc/udev/rules.d/60-tap.rules << EOF
KERNEL=="tap*", RUN+="/sbin/ip link set %k txqueuelen 120000"
EOF
```

Reload and apply to the running system.

```
udevadm control --reload-rules
udevadm trigger --attr-match=subsystem=net
```

### **Ring buffer increase on the physical ethernet interfaces**

Tuned on the compute hosts.

**Purpose:** Improves the overall network throughput of the host. This varies depending on the Host OS. The following steps are applicable to centos or fedora or rhel.

Add the following line into the network script of the interface you want to change.

For example: To change the ring buffer on the eth2 interface, edit /etc/sysconfig/network-scripts/ifcfg-eth2 to add the `ETHTOOL_OPTS=` line as shown.

```
DEVICE=eth2
TYPE=Ethernet
ETHTOOL_OPTS="--set-ring eth2 rx 4096 tx 4096"
```

Restart the network using `service network restart` as root. Check the setting using `ethtool -g eth2`.

### **Multiqueue [on IPFE]**

To be enabled on the OpenStack flavor and glance image for IPFE instance.

**Purpose:** Improves the network throughput of a VM.

You need to update the flavor and the image to enable multiqueue. All guests using that image will be created with multiqueue.

```
openstack flavor set m1.large --property hw:vif_multiqueue_enabled=true
glance image-update b5592ed4-8f41-48a9-9f0c-e0e46cb3dd6c --property
hw_vif_multiqueue_enabled=true
```

On the Guest set the number of queues to number of vcpus.

Add the following line into the network script of the interface you want to change.

**For example:** To set the number of queues to number of vcpus.

Edit `/etc/sysconfig/network-scripts/ifcfg-eth_interface` to set the multiqueue value to the number of vCPUs:

```
DEVICE=eth
TYPE=Ethernet
ETHTOOL_OPTS="-L ${DEVICE} combined <no_of_vCPUs>
```

Restart the network using `service network restart` as root.

Check the setting using `ethtool -l <eth_interface>`.

## I.2 VMware

### txqueuelen

Tuned on the ESXi hosts.

**Purpose:** Default value of 500 is too small. The recommendation is to set to 10000 which increases the network throughput of a VM. ESXi defaults the value to 500 and permits a max value of 10000.

Log in to the CLI console of the ESX host and run the below esxcli command:

```
esxcli system settings advanced set -i=10000 -o=/Net/MaxNetifTxQueueLen
```

### Increase Ring Buffer on the Physical Ethernet interfaces

Tuned on the ESXi hosts.

**Purpose:** Improves the overall network throughput of the host. On an ESXi host Rx buffer defaults to 512 and Tx buffer defaults to 1024 and the max value for both is 4096.

Log in to the CLI console of the ESX host and run the below esxcli commands:

```
esxcfg-nics -l (lists all the physical NICs attached to the host)
ethtool -g <interface name> (shows the current ring buffer size)
ethtool -G <interface name> rx 4096 (increases the rx buffer size to 4096)
ethtool -G <interface name> tx 4096 (increases the tx buffer size to 4096)
```

### Multiqueue

Already enabled on ESXi for vmxnet3 adapters.

**Purpose:** Improves the network throughput of a VM.

### Advanced NUMA settings

Tuned on ESXi hosts.

**Purpose:** Prevents the ESXi scheduler to move VMs around from one NUMA node to another.

Log in to the CLI console of the ESX host and run the below esxcli commands:

```
esxcli system settings advanced set -i=0 -o=/Numa/SwapLoadEnable
esxcli system settings advanced set -i=0 -o=/Numa/SwapLocalityEnable
```

## I.3 Multiqueue on IPFE (KVM)

To enable multiqueue on the KVM flavor and glance image for the IPFE instance. Perform the following procedure, this improves the network throughout VM.

Update the flavor and image to enable multiqueue. All guests using that image are created with multiqueue enabled. By default, the combined number of queues for a VM is 1. KVM supports a maximum of 8 queues per VM in its TAP devices.

### Note

The maximum number of queues can be increased in the VM's configuration XML, but it must also be set within the VM during runtime.

#### 1. Enable Multiqueue on IPFE:

Increase the number of queues. By default, the combined number of queues for a VM is 1. KVM supports a maximum of 8 queues per VM in its TAP devices. The KVM only supports a maximum of eight queues per VM in its TAP devices.

### Note

The max can be increased in the VM's configuration XML but must be set to max inside the VM during runtime.

#### 2. View the list of all the VMs:

```
virsh list --all
```

#### 3. Shut down the VM before modifying its XML configuration:

```
virsh shutdown <VM Name>
```

#### 4. Edit the VM's XML configuration to set the maximum number of combined RX and TX queues:

```
virsh edit <VM Name>
```

**Example:** `virsh edit DSRMP`

5. Locate the XML tag for `<interface . . .>` and modify it for each interface.

**Note**

Follow this process for all the interfaces in the XML.

The existing interface tag appears as below:

```
<interface type='bridge'>
 <mac address='52:54:00:f7:eb:7d' />
 <source bridge='xsil' />
 <model type='virtio' />
 <driver name='vhost' queues='6' />
 <address type='pci' domain='0x0000' bus='0x00' slot='0x05' function='0x0' />
</interface>
```

6. Modify the XML and add the following line to the interface.

```
<driver name='vhost' queues='6' />
```

Here, 6 represents the number of queues and can be maximum upto 8.

The updated tag appears as below:

```
<interface type='bridge'>
 <mac address='52:54:00:bf:2f:a0' />
 <source bridge='xsil' />
 <model type='virtio' />
 <driver name='vhost' queues='6' />
 <address type='pci' domain='0x0000' bus='0x00' slot='0x05'
function='0x0' />
</interface>
```

7. After the XML is modified, Perform the following command to start the VM for the changes to take effect:

```
virsh start <VM Name>
```

8. Log in to the VM using the IP or virsh console and set the number of multiqueues as required for the interfaces.

```
virsh console <VM Name>
```

9. Run the following command to make these changes persistent. To change `ethx` interface, edit `/etc/sysconfig/network-scripts/ifcfg-ethx` file and edit or append "ethx combined" in this parameter `ETHTOOL_OPTS=` as shown below.

```
ETHTOOL_OPTS=".....;--set-channels ethx combined 6"
```

**Note**

The value 6 is for number of `vcpu` in the VM. Modify the value according to your VM.

10. Set the number of combined queues to 6:

```
ethtool -L eth2 combined 6
```

**Note**

Perform this for all the interfaces (`xsi1` and `xsi2`). The number of combined queues can vary from 1 to the value set in the guest XML in Step 5.

11. To verify, list the current number of combined queues for the interface:

```
[root@DSR-Gen10-ol7 administrator]# ethtool -l eth2
```

## I.4 Ring Buffer and txqueuelen Configuration (KVM) OL8.9

To enable ring buffer configuration, use the KVM flavor and glance image. This increases the network throughput the VM.

1. Ensure that the ring buffer sizes and `txqueuelen` are set to max on all the ethernet devices on the host machine.
  - a. Before setting ring buffer value for VMs, verify the pre-set maximum value on the hostmachine of RX and TX for all the interfaces using the following command:

```
ethtool -g <interface-name>
```

For example:

```
/sbin/ethtool -g eth0
/sbin/ethtool -g eth1
/sbin/ethtool -g eth2
/sbin/ethtool -g eth3
Sample output of above command:
ethtool -g eth0
Ring parameters for eth0:
Pre-set maximum:
RX: 4096
RX Mini: n/a
RX Jumbo: n/a
TX: 4096
Current hardware settings:
RX: 2080
RX Mini: n/a
RX Jumbo: n/a
TX: 2080
```

- b. Create 30\_ring\_buff file by performing the following commands:

```
[root@DSR-X9KVM-1 dispatcher.d]# cd /etc/NetworkManager/dispatcher.d/
```

```
[root@DSR-X9KVM-1 dispatcher.d]# vim 30_ring_buff
#!/bin/bash
/sbin/ethtool -G ens1f0 rx 4078 tx 4078
/sbin/ethtool -G ens1f1 rx 4078 tx 4078
/sbin/ethtool -G ens1f2 rx 4078 tx 4078
/sbin/ethtool -G ens1f3 rx 4078 tx 4078
ifconfig ens1f0 txqueuelen 120000
ifconfig ens1f1 txqueuelen 120000
ifconfig ens1f2 txqueuelen 120000
ifconfig ens1f3 txqueuelen 120000
```

**Note**

The above content is an example file, which will change according to host parameters.

- c. Change the permission by performing the following command:

```
[root@DSR-X9KVM-1 dispatcher.d]# chmod +x 30_ring_buff
```

- d. Use the pre-set maximum of **RX** and **TX** for each interface. Then, add the below script to file 30\_ring\_buff.

```
/sbin/ethtool -G <interface-name> rx <RX-Preset Maximum> tx <TX-Preset Maximum>
For example:
#!/bin/bash
/sbin/ethtool -G eth0 rx 4078 tx 4096
/sbin/ethtool -G eth1 rx 4078 tx 4096
/sbin/ethtool -G eth2 rx 4078 tx 4096
/sbin/ethtool -G eth3 rx 4078 tx 4096
```

**Note**

The above example files will change according to host parameters.

2. Restart all ethernet adapter eth0, eth1, eth2, and eth3 by performing the following command:

```
systemctl restart NetworkManager
```

3. Verify that the ring buffer sizes are set to max on all the ethernet devices on the host machine by performing the following command:

```
ethtool -g <ethernet adapter>
```

Verify the same for eth0, eth1, eth2, and eth3.

4. Run the following command to verify `txqueue` length for the ethernet adapter to a high value on the host machine that is added on all interfaces.

```
ifconfig <ethernet adapter>
```

**Note**

These commands were tested on OL7.7 and OL8.9 KVM host machine and might vary for different versions.

## I.5 Disabling TSO GSO features for SBR server

This procedure is used to disable the TSO GSO features. This is applicable for SBR servers installed on KVM.

Run the following command to disable TSO GSO features on SBR VM:

```
ethtool -K eth<X> tso off gso off
```

After disabling the TSO GSO features, the TCP queue is cleared and replication should come up.

# J

## Example Files

### J.1 Example Template File

Basic guidelines to follow while working with YAML files:

- The file must be ended with .yaml extension.
- YAML must be case-sensitive and indentation-sensitive.
- YAML does not support the use of tabs. Instead of tabs, it uses spaces.

YAML is a human-friendly data serialization standard for all programming languages.

The values of the **key:value** can be broadly classified into the following types:

**Table J-1 key:value Types**

Type	Description	Examples
string	A literal string.	"String param"
number	An integer or float.	"2"; "0.2"
comma_delimited_list	An array of literal strings that are separated by commas. The total number of strings should be one more than the total number of commas.	["one", "two"]; "one, two"; <b>Note:</b> "one, two" returns ["one", " two"]
json	A JSON-formatted map or list.	{"key": "value"}
boolean	Boolean type value, which can be equal "t", "true", "on", "y", "yes", or "1" for true value and "f", "false", "off", "n", "no", or "0" for false value.	"on"; "n"

### J.2 Example Parameter File

The parameter file defines the topology details. This includes all VM details such as the number of VMs, flavors, network names, etc. It is a list of key/value pairs. By referring to the parameters definition section in the template file, the initialization of the parameters has to be done in this section.

#### File Naming Convention

It is not mandatory to have a specific name for the file; but just to provide a self-explanatory name for the file, it is recommended to follow this convention:

```
<DSR Name>_<Site Name>_<NetworkOam/SignallingNode>_Params.yaml
```

#### Example:

- dsrCloudInit\_Site00\_NetworkOam\_Params.yaml
- dsrCloudInit\_Site00\_SignalingNode\_Params.yaml

## Sample File

### Network OAM params file

```
parameters:
 numPrimaryNoams: 1
 numNoams: 1
 noamImage: DSR-60147
 noamFlavor: dsr.noam
 primaryNoamVmNames: ["DsrSite00NOAM00"]
 noamVmNames: ["DsrSite00NOAM01"]
 noamAZ: nova
 xmiPublicNetwork: ext-net
 imiPrivateNetwork: imi
 imiPrivateSubnet: imi-sub
 imiPrivateSubnetCidr: 192.168.221.0/24
 ntpServer: 10.250.32.10
 noamSG: Site00_NOAM_SG
```

### Signaling params file

```
parameters:
 numSoams: 2
 numDas: 1
 numIpfes: 1
 numStps: 0
 soamImage: DSR-60147
 soamFlavor: dsr.soam
 soamVmNames: ["DsrSite00SOAM00", "DsrSite00SOAM01"]
 daImage: DSR-60147
 daFlavor: dsr.da
 daVmNames: ["DsrSite00DAMP00", "DsrSite00DAMP01"]
 daProfileName: "VM_30K_Mps"
 ipfeImage: DSR-60147
 ipfeFlavor: dsr.ipfe
 ipfeVmNames: ["DsrSite00IPFE00", "DsrSite00IPFE01"]
 stpImage: none
 stpFlavor: none
 stpVmNames: none
 xmiPublicNetwork: ext-net
 imiPrivateNetwork: imi
 imiPrivateSubnet: imi-sub
 imiPrivateSubnetCidr: 192.167.2.0/24
 xsiPublicNetwork: ext-net
 ntpServer: 10.250.32.10
