Editing an Ancillary Pricing Rule of a Bill Group

Prerequisites

To edit an ancillary pricing rule of a bill group, you should have:

- Business Object **C1-PricingRuleAncillary** defined for ancillary pricing rule.

Procedure

To edit an ancillary pricing rule of a bill group:

1. Search for a bill group in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the bill group *w*hose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. Click the **Broadcast** (📡) icon in the **Bill Group ASO Policy Information** zone, corresponding to the **Bill Group Information** column, whose bill group details you want to view.
   The **Bill Group ASO Policy Pricing Rules** zone appears.
5. Click the **Edit** (✎) icon in the **Bill Group ASO Policy Pricing Rules** zone, corresponding to the **Pricing Group Information** column, whose pricing details you want to edit.

   The **Ancillary Pricing Rule** screen appears. It contains the following sections:

   - **Customer Information** - Displays the customer information for bill group.

Field Name	Field Description
Bill Group Information	Displays the bill group for whom the ancillary pricing rule is define.
Policy Start Date	Displays the date from when the policy is effective.
Policy End Date	Displays the date till when the policy is effective.

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description
Policy Status	Indicates the policy status for the pricing rule.
Pricing Rule Type	Indicates the pricing rule type using which you want to define an ancillary pricing rule.
Status	Indicates the status of the bill group.

- **Main** - Used to specify basic details about the ancillary pricing rule. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Indicates the price item that is used to create ancillary pricing rule.	Yes
Pricing Start Date	Displays the date from when the ancillary pricing rule is effective.	Yes
Pricing End Date	Used to specify the date till when the ancillary pricing rule is effective. **Note:** This field by default displays the **Policy End Date**.	No
Rate Option	Indicates the rate option that you want to use while defining the price item.	Yes
Pass Through without Markup or Markdown	Used to indicate that markup and markdown prices must not be considered when the ancillary transaction is processed. **Note:** This field is enabled when the **Rate Option** field is selected.	Yes (Conditional) **Note:** This field is required when you want to calculate the ancillary pricing without the pass through charge while defining the ancillary pricing rule.

The following fields appear when the **Pass Through without Markup or Markdown** option is not selected. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Billable Charge Line Type	Used to indicate the billable charge line type using which you want to create the ancillary pricing rule. **Note:** The Search (🔍) icon appears corresponding to this field. On clicking the **Search** icon, the **Billable Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Billable Charge Line Type** field.	Yes (Conditional) **Note:** This field is required while creating a pricing arrangement with or without rate based billable charge line type.
Billable	Used to indicate whether the ancillary charge is eligible for billing or not.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
		Note: This field is required while creating a pricing arrangement with or without the **Markup or Markdown Type** field and the **Rate Based** option.
Rate Based	Used to indicate whether the ancillary charge is calculated using a particular rate.	Yes (Conditional) **Note:** This field is required while creating a pricing arrangement with the **Rate Based** option.
Rate	Used to indicate the rate for calculating the ancillary charge. **Note:** This field is enabled when the **Rate Based** option is selected.	Yes (Conditional) **Note:** This field is required when **Rate Based** option is selected.
Pricing Strategy	Used to indicate the price calculation strategy which should be applied while defining the ancillary pricing rule. The valid values are: • Markup • Markdown • None	No
Markup or Markdown Type	Used to indicate the type of charge which should be applied while defining the ancillary pricing rule. The valid values are: • Flat Amount • Percentage **Note:** This field is enabled when the **Pricing Strategy** field is selected.	Yes (Conditional) **Note:** This field is required when the **Pricing Strategy** field is selected.
Amount/Percentage	Used to specify the actual proportion of the charge that should be applied while defining the ancillary pricing rule.	Yes (Conditional) **Note:** This field is required when the **Markup or Markdown Type** field is selected.

- **Characteristics** - Used to define the characteristics for the ancillary pricing rule.

6. Modify the details in the **Main** section.
7. Define, edit, or remove characteristics for an ancillary pricing rule, if required.
8. Click **Save**.
   The changes made to an ancillary pricing rule for a bill group are saved.

Deleting an Ancillary Pricing Rule of a Bill Group

Procedure

To delete an ancillary pricing rule of a bill group:

1. Search for a bill group in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the bill group *w*hose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. Click the **Broadcast** (📡) icon in the **Bill Group ASO Policy Information** zone, corresponding to the **Bill Group Information** column, whose bill group details you want to delete.
   The **Bill Group ASO Policy Pricing Rules** zone appears.
5. Click the **Delete** (🗑) icon in the **Delete** column corresponding to the **Pricing Group Information** column, whose bill group information you want to delete.
   A message appears confirming whether you want to delete the ancillary pricing rule of a bill group.

> **Note:** You can delete an ancillary pricing rule when it is not yet used in the system.

6. Click **OK**.
   The ancillary pricing rule of a bill group is deleted.

Discount Pricing

The Administrative Services Only (ASO) provider may offer some discounts to its network hospitals and providers. A portion of these discounts is then charged to the self-funded employer. Oracle Revenue Management and Billing enables you to calculate and bill the discount share or discount guarantee amount to the self-funded employer. The system enables you to calculate the discount using the following methods:

- Discount Share on page 3307
- Discount Guarantee on page 3307

The pricing for the share or guarantee discount can be defined using the respective discount pricing rules. You can define a share or guarantee discount pricing rule only at the parent customer level. You can define the share or guarantee discount pricing rules for parent customers from the **Customer 360° Information** screen. You can define a share or guarantee discount pricing rule using a discount arrangement pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

Once a discount arrangement pricing rule type is defined, you can create discount pricing rules using the discount arrangement pricing rule type. Once a discount pricing rule is created, the system creates multiple price assignments in a price list and assigns the price list to the parent customer.

The following new batches are introduced in this release:

- **C1-ACDA** - Once the transaction legs and calculation lines are created for discount, this batch is used to accumulate the discount. It also calculates the required minimum or maximum limit on the contract. For more information about the batch refer to *Oracle Revenue Management and Billing Batch Guide*.
- **C1-BCDA** - Once the discount is accumulated, this batch is used to create the credit (if any) and discount billable charges. It is also used to calculate the bill after date. For more information about the batch refer to *Oracle Revenue Management and Billing Batch Guide*.

Types of Discount Arrangement

The Oracle Revenue Management and Billing enables you to calculate the discount using the following methods:

- Discount Share on page 3307
- Discount Guarantee on page 3307

Discount Share

In the discount share method, the discount is calculated while processing the claim transaction. It is calculated as follows:

Billable Discount Amount = Discount Savings Amount * Discount Percentage

Note that the discount share percentage varies depending on various parameters (such as health coverage class, In or Out Network, etc). Therefore, the system enables you to define different discount percentage for the claim transactions which are received from employees with different set of attributes. The system allows you to define maximum discount amount that can be charged per claim transaction. You can optionally configure the minimum and maximum discount limit on the contract. Note that the minimum limit is applicable during the settlement and maximum limit is applicable when you execute the **C1-ACDA** batch. The minimum and maximum limit can be a flat limit or enrollment based limit. Once the discount is accumulated, you can charge the customer at the pre-defined frequency. If the discount amount exceeds the maximum discount limit per claim or if the discount amount exceeds maximum discount limit defined on the contract, a credit billable charge is created for the customer.

Discount Guarantee

In the discount guarantee method, the discount is calculated while processing the claim transaction. It is calculated as follows:

Targeted Guaranteed Amount = Covered Charge Amount * Discount Guarantee Percentage

Billable Discount Amount = Discount Savings Amount - Targeted Guaranteed Amount

Note that the discount guarantee percentage varies depending on various parameters (such as health coverage class, In or Out Network, etc). Therefore, the system enables you to define different discount percentage for the claim transactions which are received from employees with different set of attributes. The system allows you to define maximum discount amount that can be charged per claim transaction. You can optionally configure the minimum and maximum discount limit on the contract. Note that the minimum limit is applicable during the settlement and maximum limit is applicable when you execute the **C1-ACDA** batch. The minimum and maximum limit can be a flat limit or enrollment based limit. Once the discount is accumulated, you can charge the customer at the pre-defined frequency. If the discount amount exceeds the maximum discount limit per claim or if the discount amount exceeds maximum discount limit defined on the contract, a credit billable charge is created for the customer.

Defining a Discount Arrangement Pricing Rule Type

Prerequisites

To define a discount arrangement pricing rule type, you should have:

- Discount Arrangement pricing rule type business object defined in the application
- Discount Arrangement pricing rule business object defined in the application

Procedure

To define a discount arrangement pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Pricing Rule Type** sub-menu.

   The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type Business Object	Used to indicate the business object using which you want to create a discount arrangement pricing rule type. The valid values are: • Aggregate Stop-Loss (ASL) Pricing Rule Type • Ancillary Pricing Rule Type • Claim Pricing Rule Type • Discount Arrangement Pricing Rule Type • Flat Fee Pricing Rule Type • Level Funded (LF) Pricing Rule Type • Retention Type Claim Based Pricing Rule Type • Retention Type Enrollment Based Pricing Rule Type • Specific Stop-Loss (SSL) Pricing Rule Type **Note:** You must select the **Discount Arrangement Pricing Rule Type** option from the **Pricing Rule Type Business Object** list while defining a discount arrangement pricing rule type.	Yes

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Pricing Rule Type** screen.

4. Select the **Discount Arrangement Pricing Rule Type** option from the **Pricing Rule Type Business Object** list.
5. Click **OK**.

   The **Discount Arrangement Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the discount arrangement pricing rule type.
   - **Algorithms** - Used to associate the algorithms with the discount arrangement pricing rule type.
   - **Additional Data** - Used to specify additional information in the discount arrangement pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the discount arrangement pricing rules using the discount arrangement pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for the discount arrangement pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

- **DA - Specific Additional Data** - Used to specify discount arrangement-specific additional data in the discount arrangement pricing rule type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to specify the discount arrangement pricing rule type.	Yes
Description	Used to specify the description for the discount arrangement pricing rule type.	Yes
Detailed Description	Used to specify additional information about the discount arrangement pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the discount arrangement pricing rule. The valid value are: • **Aggregate Stop-Loss (ASL) Pricing Rule** • **Ancillary Pricing Rule** • **Claim Pricing Rule** • **Discount Arrangement Pricing Rule** • **Flat Fee Pricing Rule** • **Level Funded (LF) Pricing Rule** • **Retention Type Claim Based Pricing Rule** • **Retention Type Enrollment Based Pricing Rule** • **Specific Stop-Loss (SSL) Pricing Rule** **Note:** You must select the **Discount Arrangement Pricing Rule** option from the **Pricing Rule Business Object** list while defining a discount arrangement pricing rule type.	Yes
Business Object	Indicates the business object using which you are defining the discount arrangement pricing rule type.	Not applicable
Status	Used to indicate the status of the discount arrangement pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to indicate whether the discount arrangement pricing rule type is a primary pricing rule type. **Note:** You must not select the **Primary** option while defining a discount arrangement pricing rule type.	Not applicable
Pricing Rule Type Category	Used to indicate the category to which the discount arrangement pricing rule type belongs. The valid value is: • **Aggregate Stop-Loss** • **Ancillary** • **Claim** • **Discount Arrangement** • **Flat Fees** • **Level Funded** • **Retention Type Claim Based**	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• **Retention Type Enrollment Based** • **Specific Stop-Loss** **Note:** You must select the **Discount Arrangement** option from the **Pricing Rule Type Category** list while defining a discount arrangement pricing rule type.	

6. Enter the required details in the **Main** section.
7. Select the **Discount Arrangement Pricing Rule** option from the **Pricing Rule Business Object** list.
8. Ensure that **Primary** option is not selected when you are defining a discount arrangement pricing rule type.
9. Select the **Discount Arrangement** option from the **Pricing Rule Type Category** list.
10. Associate the following algorithms with the discount arrangement pricing rule type:

System Event	Algorithm	Algorithm Type	Description
Account and Price Item Derivation	C1_ACCPRIDIS	C1_ACCPRIDIS	Account and Priceitem Derivation For Discount Arrangement

11. Define additional data for a discount arrangement pricing rule type, if required.
12. Add the required price items in the discount arrangement pricing rule type.
13. Add the price item parameters in the discount arrangement pricing rule type, if required.
14. Define characteristics for a discount arrangement pricing rule type, if required.
15. Add discount arrangement-specific additional data in the discount arrangement pricing rule type.
16. Click **Save**.
    The discount arrangement pricing rule type is defined.

Associating Algorithms with a Discount Arrangement Pricing Rule Type

Prerequisites

Copyright © 2026, Oracle and/or its affiliates.

To associate algorithms with a discount arrangement pricing rule type, you should have:

- An algorithm defined using the **C1_ACCPRIDIS** algorithm type.

Procedure

To associate algorithms with a discount arrangement pricing rule type:

1. Ensure that the **Algorithms** section is expanded when you are defining or editing a *d*iscount arrangement pricing rule type.

   The **Algorithms** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to execute the algorithm. The valid values are: • **Account and Price Item Derivation** - Used to derive the account and price item for the discount arrangement transaction. • **Accumulation Billable Charge Post Proc** - Used to introduce a custom logic after creating discount share or discount guarantee billable charges. This algorithm is invoked in the **C1-BCDA (Create Billable Charge for Discount)** batch. • **Accumulation Billable Charge Pre Proc** - Used to introduce a custom logic before creating discount share or discount guarantee billable charges. This algorithm is invoked in the **C1-BCDA (Create Billable Charge for Discount)** batch. • **Accumulation Post Processing** - Used to introduce a custom logic after accumulating the discount share or discount guarantee amount. This algorithm is invoked in the **C1-ACDA (Accumulate Discount Arrangement)** batch. • **Accumulation Pre Processing** - Used to introduce a custom logic before accumulating the discount share or discount guarantee amount. This algorithm is invoked in the **C1-ACDA (Accumulate Discount Arrangement)** batch. • **Pricing Rule Post Processing** - Used to introduce a custom logic once the effective discount arrangement pricing rule is derived for the discount arrangement transaction. • **Transaction Validation** - Used to introduce a custom validation for the discount arrangement transaction.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the discount arrangement pricing rule type.
Sequence	Used to specify the order in which the algorithms with the same system event must be executed.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the discount arrangement pricing rule type.
Algorithm	Used to specify the algorithm that you want to execute on the system event.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: Once you select the system event, the **Search** (🔍) icon appears corresponding to the **Algorithm** field. On clicking the **Search** (🔍) icon, the **Algorithm Search** window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the **Algorithm** field.	**Note:** This field is required when you are associating an algorithm with the discount arrangement pricing rule type.

2. Enter the following details in the **Algorithms** section:

System Event	Algorithm	Mandatory (Yes or No)	For more information, see...
Account and Price Item Derivation	C1_ACCPRIDIS	Yes	Information will be available soon...
Accumulation Billable Charge Post Proc	- **Note:** An accumulation billable charge post processing algorithm type is not shipped with the product. You can create a custom algorithm type, if required.	No	-
Accumulation Billable Charge Pre Proc	- **Note:** An accumulation billable charge pre processing algorithm type is not shipped with the product. You can create a custom algorithm type, if required.	No	-
Accumulation Post Processing	- **Note:** An accumulation post processing algorithm type is not shipped with the product. You can create a custom algorithm type, if required.	No	-
Accumulation Pre Processing	- **Note:** A accumulation pre processing algorithm type is not shipped with the product. You can create a custom algorithm type, if required.	No	-
Pricing Rule Post Processing	- **Note:** A pricing rule post processing algorithm type is not shipped with the product. You can create a custom algorithm type, if required.	No	-
Transaction Validation	-	No	-

Copyright © 2026, Oracle and/or its affiliates.

System Event	Algorithm	Mandatory (Yes or No)	For more information, see...
	Note: An algorithm type for validating a discount arrangement transaction is not shipped with the product. You can create a custom algorithm type, if required.		

3. If you want to associate more than one algorithm with the discount arrangement pricing rule type, click the **Add** (+) icon and then specify the details. However, if you want to remove an algorithm from the discount arrangement pricing rule type, click the **Delete** (🗑) icon corresponding to the algorithm.
4. Click **Save**.
   The algorithms are associated with the discount arrangement pricing rule type.

Defining Additional Data in a Discount Arrangement Pricing Rule Type

Procedure

To define additional data in a discount arrangement pricing rule type:

1. Ensure that the **Additional Data** section is expanded when you are defining or *e*diting a discount arrangement pricing rule type.

   The **Additional Data** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Eligible for Specific Stop-Loss	Used to indicate whether price items included in the discount arrangement pricing rule type are eligible for specific stop-loss. The valid values are: • Yes • No	No
Eligible for Level Funding	Used to indicate whether price items included in the discount arrangement pricing rule type are eligible for level funding. The valid values are: • Yes • No **Note:** If you do not specify the value for this field, by default, it is set to **No**.	No
Eligible for Minimum Premium Program	Used to indicate whether price items included in the discount arrangement pricing rule type are eligible for minimum premium program. The valid values are:	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• Yes • No **Note:** If you do not specify the value for this field, by default, it is set to **No**.	
Run-in Identifier Value	Used to specify the identifier value to determine whether the discount arrangement transaction is received during the run-in period of the policy.	No
Third Party Identifier Value	Used to specify the identifier value to determine whether the discount arrangement transaction is received from an external source system. **Note:** At present, this field is not used in the system.	Not applicable
Accumulation Only Identifier Value	Used to specify the identifier value to determine whether the discount arrangement transaction contains the accumulated information of ASL, SSL, and Level Funding pricing types.	No
Eligible for Write-Off in Post Runout	Used to indicate whether the discount charges should be written off when the bill is generated in the post runout period of the policy. The valid values are: • Yes • No For more information, refer to the Write-Off Charges during Post Runout section. **Note:** By default, the value is set to **No**.	No
Post Runout Write-Off Adjustment Type	Used to specify the adjustment type using which you want to create post runout write-off adjustment. **Note:** This field appears when the **Eligible for Write-Off in Post Runout** field is set to **Yes**. The **Search** (🔍) icon appears corresponding to the **Post Runout Write-Off Adjustment Type** field. On clicking the **Search** icon, the **Adjustment Type Search** window appears. On specifying the adjustment type, the description of the adjustment type appears corresponding to the **Post Runout Write-Off Adjustment Type** field.	Yes (Conditional) **Note:** This field is required when the **Eligible for Write-Off in Post Runout** field is set to **Yes**.
Rule Based Price Item Eligibility Field	Used to indicate the transaction field which you want to use in the rules as the output parameter to determine whether the price item should be considered for billing.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: For more information, refer to the Price Item Eligibility on page 3465 section. The **Search** (🔍) icon appears corresponding to the **Rule Based Price Item Eligibility Field** field. On clicking the **Search** icon, the **Field Search** window appears. On specifying the field name, the description of the field name appears corresponding to the **Rule Based Price Item Eligibility Field**.	
Rule Based Eligibility Value	Used to specify the value which the output parameter in the rule should return when the price item in the discount arrangement pricing rule type should be considered for processing.	Yes (Conditional) **Note:** This field is required when a value is specified in the **Rule Based Price Item Eligibility Field** field.

2. Enter the required details in the **Additional Data** section.
3. Click **Save**.
   The additional data is defined in the discount arrangement pricing rule type.

Related Topics

Adding a Price Item in a Discount Arrangement Pricing Rule Type

Prerequisites

To add a price item in a discount arrangement pricing rule type, you should have:

- Price item defined in the application
- Rate options defined in the **Rate Option (C1-ExtLookRetTypeRateOpt)** extendable lookup
- Values defined for the **Invoice Type (C1INVTYP)** characteristic type
- The **C1INVTYP** characteristic type set in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration
- Rule types defined in the application (where the rule type usage is set to **Price Item Eligibility**)

Procedure

To add a price item in a pricing rule type:

1. Ensure that the **Price Items** section is expanded when you are defining or *e*diting a discount arrangement pricing rule type.

   The **Price Items** section contains the following fields in a grid:

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Price Item</td><td>Used to indicate the price item that you want to include in the discount arrangement pricing rule type.

Note:
The Search (🔍) icon appears corresponding to the Price Item field. On clicking the Search icon, the Price Item Search window appears.
On specifying the price item, the description of the price item appears corresponding to the Price Item field.</td><td>Yes (Conditional)

Note: This field is required when you are adding a rate option and bill to account in the discount arrangement pricing rule type.</td></tr>
<tr><td>Rate Option</td><td>Used to indicate one or more rate options which are valid for a price item.
On clicking the Add (➕) icon, the following field appears in a grid:
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Rate Option</td><td>Used to indicate the rate option that you want to use while defining pricing for the price item.</td><td>Yes</td></tr>
</table>
Note:
If you want to define more than one rate option to the price item in the discount arrangement pricing rule type, click the Add (+) icon.
However, if you want to remove a price item from a discount arrangement pricing rule type, click the Delete (🗑) icon corresponding to the Rate Option field.</td><td>Not applicable</td></tr>
<tr><td>Bill To Account</td><td>Used to indicate a order in which the account should be considered while deriving a transaction leg.
On clicking the Add (➕) icon, the following fields appear in a grid:
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Priority</td><td>Used to specify the order in which the invoice type is considered for a price item.</td><td>Yes</td></tr>
<tr><td>Invoice Type</td><td>Used to indicate the type which is considered for billing. For more information, refer to the Bill Group's Account on page 13 section.

Note: The Search (🔍) icon appears corresponding to the Invoice Type field. On clicking the Search icon, the Invoice Type Search window appears.</td><td>Yes</td></tr>
</table>
</td><td>Not applicable</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: If you want to define more than one invoice type to the price item in a discount arrangement pricing rule type, click the **Add** (+) icon. However, if you want to remove a invoice type from the price item in a discount arrangement pricing rule type, click the **Delete** (🗑) icon corresponding to the **Priority** field.	
Eligibility Rule Type	Used to indicate the rule type which indicates the rules that should be executed to determine whether the price item is eligible for billing.	No

2. Enter the required details in the **Price Items** section.
3. If you want to define more than one price item in a discount arrangement pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a price item from a discount arrangement pricing rule type, click the **Delete** (🗑) icon corresponding to the **Price Item** field.

4. Click **Save**.
   The price items are added for a discount arrangement pricing rule type.

Adding a Price Item Parameter in a Discount Arrangement Pricing Rule Type

Prerequisites

To add a price item parameter in a discount arrangement pricing rule type, you should have:

- Parameter defined in the application where parameter usage is set to **Price Item**.
- Parameter associated with the price item.
- Transaction fields defined in the application.

Procedure

To add a price item parameter in a discount arrangement pricing rule type:

1. Ensure that the **Price Item Parameters** section is expanded when you are defining or *e*diting a discount arrangement pricing rule type.

   The **Price Item Parameters** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item Parameter	Used to specify the parameter which you can use while defining a discount arrangement pricing for the price item.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Price Item Parameter** field. On clicking the **Search** (🔍) icon corresponding to the **Price Item Parameter** field, the **Parameter Search** window appears. On specifying the parameter, the description of the price item parameter appears corresponding to the **Price Item Parameter** field.	**Note:** This field is required while adding a price item parameter in a discount arrangement pricing rule type.
Transaction Field	Used to map to a transaction field which contains the parameter value. **Note:** The **Search** (🔍) icon appears corresponding to the **Transaction Field** field. On clicking the **Search** (🔍) icon corresponding to the **Transaction Field** field, the **Transaction Field Search** window appears. On specifying the transaction field, the description of the transaction field appears corresponding to the **Transaction Field**.	Yes (Conditional) **Note:** This field is required while adding a price item parameter in a discount arrangement pricing rule type.
Eligible for Specific Stop-Loss	Used to indicate whether the price item parameter can be used while defining the accumulation criteria in the specific stop-loss or aggregate stop-loss pricing rules at the bill group level.	No
Eligible for Level Funding	Used to indicate whether the price item parameter can be used while defining the accumulation criteria in the level funding pricing rules at the bill group level.	No
Eligible for Minimum Premium Program	Used to indicate whether the price item parameter can be used while defining the accumulation criteria in the minimum premium program pricing rules at the bill group level.	No

2. Enter the required details in the **Price Item Parameters** section.
3. If you want to add more than one price item parameter in a discount arrangement pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a price item parameter from a discount arrangement pricing rule type, click the **Delete** (🗑) icon corresponding to the price item parameter.

4. Click **Save**.
   The price item parameter is added in the discount arrangement pricing rule type.

Defining a Characteristic for a Discount Arrangement Pricing Rule Type

Prerequisites

To define a characteristic for a discount arrangement pricing rule type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule Type**)

Procedure

To define a characteristic for a discount arrangement pricing rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining or *e*diting a discount arrangement pricing rule type.

   The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule Type**.	**Note:** This field is required when you are defining a characteristic for a discount arrangement pricing rule type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for a discount arrangement pricing rule type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for a discount arrangement pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove a characteristic from a discount arrangement pricing rule type, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristic is defined for a discount arrangement pricing rule type.

Defining the Discount Specific Data in a Discount Arrangement Pricing Rule Type

Procedure

To add the discount-specific data in a discount arrangement pricing rule type:

1. Ensure that the **DA - Specific Additional Data** section is expanded when you are defining or editing a discount arrangement pricing rule type.

   The **DA - Specific Additional Data** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Guaranteed Discount	Used to indicate whether the discount arrangement pricing rule type is defined for discount guarantee or discount share. The valid values are: • **Yes** - Used when you want to create a discount guarantee pricing rule type. • **No** - Used when you want to create a discount share pricing rule type.	Yes
Discount Billable Charge Line Type	Used to indicate a billable charge line type using which you want to create the charge line for discount. **Note:** The **Search** (🔍) icon appears corresponding to the **Discount Billable Charge Line Type** field. On clicking the **Search** icon, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Discount Billable Charge Line Type** field.	Yes
Credit Billable Charge Line Type	Used to indicate a billable charge line type using which you want to create the charge line for any credit to the customer. **Note:** The **Search** (🔍) icon appears corresponding to the **Credit Billable Charge Line Type** field. On clicking the **Search** icon, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Credit Billable Charge Line Type** field.	Yes
Minimum Limit Pricing Rule Type	Used to indicate the retention type enrollment based pricing rule type which you want to use while calculating the minimum limit for the discount.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Minimum Limit Pricing Rule Type** field. On clicking the **Search** icon, the **Pricing Rule Type Search** window appears. On specifying the pricing rule type, the description of the pricing rule type appears corresponding to the **Minimum Limit Pricing Rule Type** field.	**Note:** This field is required when you are defining enrollment based minimum discount limit on the contract in a discount share pricing rule.
Minimum Limit Price Item	Used to indicate the price item whose pricing you want to use while calculating the minimum limit for the discount. **Note:** The **Search** (🔍) icon appears corresponding to the **Minimum Limit Price Item** field. On clicking the **Search** icon, the **Price Item Details** window appears. On specifying the price item, the description of the price item appears corresponding to the **Minimum Limit Price Item** field.	Yes (Conditional) **Note:** This field is required when you are defining enrollment based minimum discount limit on the contract in a discount share pricing rule.
Maximum Limit Pricing Rule Type	Used to indicate the retention type enrollment based pricing rule type which you want to use while calculating the maximum limit for the discount. **Note:** The **Search** (🔍) icon appears corresponding to the **Maximum Limit Pricing Rule Type** field. On clicking the **Search** icon, the **Pricing Rule Type Search** window appears. On specifying the pricing rule type, the description of the pricing rule type appears corresponding to the **Maximum Limit Pricing Rule Type** field.	Yes (Conditional) **Note:** This field is required when you are defining enrollment based maximum discount limit on the contract in a discount share or discount guarantee pricing rule.
Maximum Limit Price Item	Used to indicate the price item whose pricing you want to use while calculating the maximum limit for the discount. Used to indicate the price item whose pricing you want to use while calculating the minimum limit for the discount. **Note:** The **Search** (🔍) icon appears corresponding to the **Maximum Limit Price Item** field. On clicking the **Search** icon, the **Price Item Details** window appears. On specifying the price item, the description of the price item appears corresponding to the **Maximum Limit Price Item** field.	Yes (Conditional) **Note:** This field is required when you are defining enrollment based maximum discount limit on the contract in a discount share or discount guarantee pricing rule.

2. Enter the required details in the **DA - Specific Additional Data** section.
3. Click **Save**.
   The discount-specific data is added in the discount arrangement pricing rule type.

Editing a Discount Arrangement Pricing Rule Type

Prerequisites

To edit a discount arrangement pricing rule type, you should have:

- Discount arrangement pricing rule type business object defined in the application.
- Discount arrangement pricing rule business object defined in the application.

Procedure

To edit a discount arrangement pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the pricing rule type whose details you want to edit.

   The **Discount Arrangement Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the discount arrangement pricing rule type.
   - **Algorithms** - Used to associate the algorithms with the discount arrangement pricing rule type.
   - **Additional Data** - Used to specify additional information in the discount arrangement pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the discount arrangement pricing rules using the discount arrangement pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for the discount arrangement pricing rule type.
   - **DA-Specific Additional Data** - Used to specify discount arrangement-specific additional data in a discount arrangement pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Displays the discount arrangement pricing rule type.	Not applicable
Description	Used to specify the description for the discount arrangement pricing rule type.	Yes
Detailed Description	Used to specify additional information about the discount arrangement pricing rule type.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Business Object	Used to indicate the business object using which you want to create the discount arrangement pricing rule. The valid value is: • Aggregate Stop-Loss (ASL) Pricing Rule • Ancillary Pricing Rule • Claim Pricing Rule • Discount Arrangement Pricing Rule • Flat Fee Pricing Rule • Level Funded (LF) Pricing Rule • Retention Type Claim Based Pricing Rule • Retention Type Enrollment Based Pricing Rule • Specific Stop-Loss (SSL) Pricing Rule **Note:** You must select the **Discount Arrangement Pricing Rule** option from the **Pricing Rule Business Object** list while defining a discount arrangement pricing rule type.	Yes
Business Object	Indicates the business object used while defining the discount arrangement pricing rule type.	Not applicable
Status	Used to indicate the status of the discount arrangement pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to indicate whether the discount arrangement pricing rule type is a primary pricing rule type. **Note:** You must not select the **Primary** option while defining the discount arrangement pricing rule type.	Not applicable
Pricing Rule Type Category	Indicates the category to which the discount arrangement pricing rule type belongs. The valid values are: • Aggregate Stop-Loss • Ancillary • Claim • Discount Arrangement • Flat Fees • Level Funded • Retention Type Claim Based • Retention Type Enrollment Based • Specific Stop-Loss **Note:** You must select the **Discount Arrangement** option from the **Pricing Rule Type Category** list while defining a discount arrangement pricing rule type.	No

Tip: Alternatively, you can edit the details of a discount arrangement pricing rule type by clicking the **Edit** button in the **Pricing Rule Type** zone.

5. Modify the required details in the **Main** section.

Copyright © 2026, Oracle and/or its affiliates.

6. Ensure that the **Discount Arrangement Pricing Rule** option is selected from the **Pricing Rule Business Object** list.
7. Ensure that **Primary** option is not selected when you are editing a discount arrangement pricing rule type.
8. Associate the following algorithms with the discount arrangement pricing rule type:

System Event	Algorithm	Algorithm Type	Description
Account and Price Item Derivation	C1_ACCPRIDIS	C1_ACCPRIDIS	Account and Priceitem Derivation For Discount Arrangement

9. Modify the additional data for a discount arrangement pricing rule type, if required.
10. Add, edit, or remove price items in the discount arrangement pricing rule type, if required.
11. Add, edit, or remove price item parameters in the discount arrangement pricing rule type, if required.
12. Add, edit, or remove characteristics in the discount arrangement pricing rule type, if required.
13. Modify the discount arrangement-specific data in the discount arrangement pricing rule type, if required.
14. Click **Save**.
    The changes made to the discount arrangement pricing rule type are saved.

Deleting a Discount Arrangement Pricing Rule Type

Procedure

To delete a discount arrangement pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.

Copyright © 2026, Oracle and/or its affiliates.

4. In the **Pricing Rule Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the discount arrangement pricing rule type that you want to delete.
   A message appears confirming whether you want to delete the discount arrangement pricing rule type.

   Note: You can delete a discount arrangement pricing rule type when it is not yet used in the system.

   Tip: Alternatively, you can delete a discount arrangement pricing rule type by clicking the **Delete** button in the **Pricing Rule Type** zone.
5. Click **OK**.
   The discount arrangement pricing rule type is deleted.

Defining a Discount Arrangement Pricing Rule for a Parent Customer

Prerequisites

To define a discount arrangement pricing rule for a parent customer, you should have:

- Pricing rule type where the category is set to **Discount Arrangement**.
- Price items associated with the discount arrangement pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

Procedure

To define a discount arrangement pricing rule for a parent customer:

1. Search for a parent customer in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the parent customer *w*hose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. Click the **Add** link in the upper-right corner of the **Parent Customer Pricing Rules** zone.

   The **Pricing Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Person Name	Indicates the parent customer for whom you want to create a discount arrangement pricing rule type.	Not applicable
Person Type	Indicates the type of the parent customer. The valid value is: • Parent Customer	Not applicable
Pricing Rule Type	Used to indicate the pricing rule type using which you want to create a discount arrangement pricing rule.	Yes

5. Select the required pricing rule type in the respective field.
6. Click **OK**.

   The **Discount Arrangement Pricing Rule** screen appears. It contains the following sections:

   - **Customer Information** - Displays information about the parent customer for whom you are defining the discount arrangement pricing rule. It contains the following fields:

Field Name	Field Description
Parent Customer Information	Indicates the parent customer for whom you are defining the discount arrangement pricing rule.
Pricing Rule Type	Indicates the pricing rule type using which you are defining the discount arrangement pricing rule.

   - **Main** - Used to specify basic details about the discount arrangement pricing rule.
   - **Discount Details** - Used to define eligibility criteria for a discount percentage and maximum discount amount which is allowed per claim.
   - **Discount Limits** - Used when you want to define minimum and maximum discount limit on the contract.
   - **Exclusion** - Used when you want to exclude certain network hospitals and providers during the discount share or discount guarantee calculation.
   - **Characteristics** - Used to define the characteristics for the discount arrangement pricing rule.

Note: The **Discount Details**, **Discount Limits**, and **Exclusion** sections appear when you specify a price item in the **Main** section.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item for which you want to define the discount arrangement pricing rule.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Pricing Start Date	Used to specify the date from when the discount arrangement pricing rule is effective. **Note:** The pricing start date cannot be later than the pricing end date.	Yes
Pricing End Date	Used to specify the date till when the discount arrangement pricing rule is effective. **Note:** The pricing end date cannot be earlier than the pricing start date.	No
Rate Option	Used to indicate the rate option that you want to use while defining the pricing for the price item.	Yes
Settlement Frequency	Used to indicate the settlement frequency which helps to determine the bill after date. The valid values are: • **Manually (At Regular Intervals)** - If you select this option from the list, the bill after date which is specified in the **Manual Settlement Bill After Date** parameter while executing the **C1-BCDA** batch is stamped on the credit billable charge. • **Yearly** - If you select this option from the list, the bill after date in the credit billable charge is set to the pricing end date. **Note:** The bill after date is stamped on the credit billable charges and not on the discount billable charges.	Yes

7. Enter the required details in the **Main** section.
8. Add the required discount details in the discount arrangement pricing rule.
9. Define the minimum and maximum discount limits on the contract in the discount arrangement pricing rule, if required.
10. Add the exclusion details of a network or a provider in the discount arrangement pricing rule, if required.
11. Define characteristics for the discount arrangement pricing rule, if required.
12. Click **Save**.
    The discount arrangement pricing rule is defined for the parent customer.

Adding the Discount Details in a Discount Arrangement Pricing Rule

Prerequisites

To add the discount details in a discount arrangement pricing rule, you should have:

- Parameters defined in the application
- Parameters associated with the price item.

Procedure

To add the discount details in a discount arrangement pricing rule:

1. Ensure that the **Discount Details** section appears when you are defining or *e*diting a discount arrangement pricing rule.

   The **Discount Details** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item Parameter	Used to indicate the parameter using which you want to define an eligibility criteria for a discount percentage and maximum discount amount which is allowed per claim.	No
	Note: The **Search** (🔍) icon appears corresponding to the **Price Item Parameter** field. On clicking the **Search** icon, the **Price Item Parameter Search** window appears. On specifying the parameter, the description of the parameter appears corresponding to the **Price Item Parameter** field. You can only select those price item parameters which are effective during the date range specified in the discount arrangement pricing rule. If a parameter associated with the price item is mandatory, then by default, the parameter appears in the **Price Item Parameter** field.	
Parameter Value	Used to specify the value for the price item parameter.	Yes (Conditional)
	Note: If you select a predefined parameter, the **Search** (🔍) icon appears corresponding to the **Parameter Value** field. On clicking the **Search** icon, the **Predefined Parameter Value Search** window appears. On specifying the parameter value, the description of the parameter value appears corresponding to the **Parameter Value** field.	**Note:** This field is required when the parameter associated with the price item is mandatory.

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Discount Percentage	Used to specify the discount share or discount guarantee percentage.	Yes
Maximum Discount Per Claim	Used to specify the maximum discount amount which is allowed per claim. If the discount amount exceeds the maximum limit per claim, the additional amount is credited to the customer.	No

Note: The **Discount Details** section appears when you specify a price item in the **Main** section.

2. Enter the required details in the **Discount Details** section.
3. If you want to define a discount percentage for another price item parameter and parameter value combination, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a discount percentage for a price item parameter and parameter value combination from the discount arrangement pricing rule, click the **Delete** (🗑) icon corresponding to the combination.

4. Click **Save**.
   The discount details are added in the discount arrangement pricing rule.

Defining the Discount Limits in a Discount Arrangement Pricing Rule

Prerequisites

To define the discount limits in a discount arrangement pricing rule, you should have:

- An account, to which you want to credit the discount, defined in the application
- Minimum limit pricing rule type and minimum limit price item defined in the respective discount arrangement pricing rule type when you want to define minimum discount limit on the contract
- Maximum limit pricing rule type and maximum limit price item defined in the respective discount arrangement pricing rule type when you want to define maximum discount limit on the contract

Procedure

To define the discount limits in a discount arrangement pricing rule:

1. Ensure that the **Discount Limits** section appears when you are defining or *e*diting a discount arrangement pricing rule.

   The **Discount Limits** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
No Limit	Used to indicate whether you want to define minimum or maximum discount limit on the contract.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Discount Credit Account	Used to indicate the account to which you want to credit the discount when the minimum or maximum discount limit is defined on the contract. **Note:** This field is enabled when the **No Limit** option is not selected.	Yes (Conditional) **Note:** This field is required when the **No Limit** option is not selected.
Settlement Days	Used to specify the number of days which helps to calculate the final settlement date (which is pricing end date + the settlement days). The valid values: • 30 Days • 60 Days • 90 Days • 120 Days • 150 Days • 180 Days	Yes

In addition, it contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Type of Discount Limit	Displays the type of discount limit. The valid values are: • Minimum • Maximum	Not applicable
Select	On clicking the check box corresponding to the type of discount limit, you can define minimum or maximum discount limit on the contract. **Note:** This field is enabled when the **No Limit** option is not selected.	Yes
Limit Type	Used to indicate whether you want to define a flat limit or an enrollment based limit. The valid values are: • Enrollment Based • Flat **Note:** This field is enabled when the **No Limit** option is not selected. If you select the check box corresponding to the **Minimum** discount limit, the **Limit Type** field corresponding to the **Minimum** discount limit is enabled.	Yes (Conditional) **Note:** This field is required when you are defining a minimum or maximum discount limit in the discount arrangement pricing rule.
Amount Limit	Used to specify the flat minimum or maximum discount amount.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field is enabled when: • The **No Limit** option is not selected. • The minimum or maximum limit type is set to **Flat**.	**Note:** This field is required when the minimum or maximum limit type is set to **Flat**.

Note: The **Discount Limits** section appears when you specify a price item in the **Main** section.

2. Enter the required details in the **Discount Limits** section.
3. Click **Save**.
   The discount limits are defined in the discount arrangement pricing rule.

Excluding a Network or Provider in a Discount Arrangement Pricing Rule

Procedure

To exclude a network or provider in a discount arrangement pricing rule:

1. Ensure that the **Exclusion** section appears when you are defining or editing a discount arrangement pricing rule.

   The **Exclusion** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Exclusion Level	Used to indicate whether you want to exclude the discount offered to certain network hospitals and providers during the discount share or discount guarantee calculation. The valid values are: • Network • Provider	Yes (Conditional)
	Note: The system creates the transaction legs and calculation lines for such excluded network hospitals and providers, but does not accumulate the discount.	**Note:** This field is required while excluding a network or provider in the discount arrangement pricing rule.
Level Identifier	Used to specify the network or provider ID.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
		Note: This field is required while excluding a network or provider in the discount arrangement pricing rule.

2. Enter the required details in the **Exclusion** section.
3. If you want to exclude more than one network or provider in the discount arrangement pricing rule, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a network or provider from the exclusion list, click the **Delete** (🗑) icon corresponding to the network or provider.

4. Click **Save**.
   The network or provider is excluded in the discount arrangement pricing rule.

Defining a Characteristic for a Discount Arrangement Pricing Rule

Prerequisites

To define a characteristic for a discount arrangement pricing rule, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule**).

Procedure

To define a characteristic for a discount arrangement pricing rule:

1. Ensure that the **Characteristics** section is expanded when you are defining or editing a discount *a*rrangement pricing rule.

   The **Characteristics** section contains the following fields in the grid:

Column Name	Column Description	Mandatory (Yes or No)
Effective Date	Used to specify the date from when the characteristic is effective for the discount arrangement pricing rule.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for the discount arrangement pricing rule.
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule**.	**Note:** This field is required when you are defining a characteristic for the discount arrangement pricing rule.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for the discount arrangement pricing rule.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the discount arrangement pricing rule, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a characteristic from the discount arrangement pricing rule, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristics are defined for the discount arrangement pricing rule.

Editing a Discount Arrangement Pricing Rule of a Parent Customer

Procedure

To edit a discount arrangement pricing rule of a parent customer:

1. Search for a parent customer in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding *t*o the parent customer whose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. In the **Parent Customer Pricing Rules** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the discount arrangement pricing rule, whose details you want to edit.

   The **Discount Arrangement Pricing Rule** screen appears. It contains the following sections:

Copyright © 2026, Oracle and/or its affiliates.

- **Customer Information** - Displays information about the parent customer for whom the discount arrangement pricing rule is defined. It contains the following fields:

Field Name	Field Description
Parent Customer Information	Indicates the parent customer for whom the discount arrangement pricing rule is defined.
Pricing Rule Type	Indicates the discount arrangement pricing rule type using which the discount arrangement pricing rule is defined.

- **Main** - Used to specify basic details in the discount arrangement pricing rule.
- **Discount Details** - Used to define eligibility criteria for a discount percentage and maximum discount amount which is allowed per claim.
- **Discount Limits** - Used when you want to define minimum and maximum discount limit on the contract.
- **Exclusion** - Used when you want to exclude certain network hospitals and providers during the discount share or discount guarantee calculation.
- **Characteristics** - Used to define the characteristics for the discount arrangement pricing rule.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item for which you want to define the discount arrangement pricing rule.	Yes
Pricing Start Date	Used to specify the date from when the discount arrangement pricing rule is effective. **Note:** The pricing start date cannot be later than the pricing end date.	Yes
Pricing End Date	Used to specify the date till when the discount arrangement pricing rule is effective. **Note:** The pricing end date cannot be earlier than the pricing start date.	No
Rate Option	Used to indicate the rate option that you want to use while defining the pricing for the price item.	Yes
Settlement Frequency	Used to indicate the settlement frequency which helps to determine the bill after date. The valid values are: • **Manually (At Regular Intervals)** - If you select this option from the list, the bill after date which is specified in the **Manual Settlement Bill After Date** parameter while executing the **C1-BCDA** batch is stamped on the credit billable charge. • **Yearly** - If you select this option from the list, the bill after date in the credit billable charge is set to the pricing end date. **Note:** The bill after date is stamped on the credit billable charges and not on the discount billable charges.	Yes

5. Modify the required details in the **Main** section.
6. Modify the required discount details in the discount arrangement pricing rule.

Copyright © 2026, Oracle and/or its affiliates.

7. Modify the minimum or maximum discount limit on the contract in the discount arrangement pricing rule, if required.
8. Modify the exclusion list in the discount arrangement pricing rule, if required.
9. Define, edit, or remove characteristics of the discount arrangement pricing rule, if required.
10. Click **Save**.
    The changes made to the discount arrangement pricing rule are saved.

Deleting a Discount Arrangement Pricing Rule of a Parent Customer

Procedure

To delete a discount arrangement pricing rule of a parent customer:

1. Search for a parent customer in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the parent customer *w*hose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. In the **Parent Customer Pricing Rules** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the discount arrangement pricing rule that you want to delete.
   A message appears confirming whether you want to delete the discount arrangement pricing rule.

> **Note:** You can delete a discount arrangement pricing rule when it is not yet used in the system.

5. Click **OK**.
   The discount arrangement pricing rule of a parent customer is deleted.

Viewing the Discount Arrangement Pricing Rule Details of a Parent Customer

Procedure

To view the discount arrangement pricing rule details of a parent customer:

1. Search for a parent customer whose pricing details you want to view in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the parent customer whose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. In the **Parent Customer Pricing Rules** zone, click the link in the **Pricing Rule Information** column corresponding to the pricing rule type whose details you want to view.
   The **Pricing Rule** screen appears. It contains the following zone:
   - **Discount Arrangement** - Displays the discount arrangement pricing rule of a parent customer. It contains the following sections:
     - **Main** - Displays basic details of the discount arrangement pricing rule.
     - **Discount Details** - Displays the eligibility criteria for a discount percentage and maximum discount amount that is allowed per claim.
     - **Discount Limits** - Displays the minimum and maximum discount limit defined on the contract.
     - **Exclusions** - Displays the entity (network or provider) which is excluded in the discount arrangement pricing rule.
     - **Characteristics** - Displays the characteristics defined for the discount arrangement pricing rule.
5. View the basic details of the discount arrangement pricing rule in the **Main** section.
6. View the discount details of the discount arrangement pricing rule in the **Discount Details** section.
7. View the discount limits set on the discount arrangement pricing rule in the **Discount Limits** section.
8. View the excluded entity defined for the discount arrangement pricing rule in the **Exclusions** section.
9. View the characteristics of the discount arrangement pricing rule in the **Characteristics** section.

Write-Off Charges during Post Runout

Oracle Revenue Management and Billing enables you to write-off the claim, specific stop-loss, aggregate stop-loss, claim based fees, enrollment based fees, ancillary, discount, and funds charges when the bill is generated in the post runout period of the policy. In this case, a write-off adjustment is created against the respective bill segment during the post bill completion. The write-off adjustment is created using the post runout write-off adjustment type which is specified in the respective pricing rule type.

To enable this feature, you need to do the following:

Copyright © 2026, Oracle and/or its affiliates.

1. Set the **Eligible for Write-Off in Post Runout** field in the respective pricing rule type to **Yes**.
2. Specify the post runout write-off adjustment type in the respective pricing rule type.
3. Attach the **C1-PRCRLWOFF** algorithm to the **Post-Bill Completion** system event in the customer class of the accounts for which you want to write-off the charges in the post runout period of the policy.

Level Funding Pricing

Level funding is a type of self-funding. It offers all benefits of traditional self-funding. However, it provides one additional benefit which helps to stabilize monthly costs of the self-funded employer to pay off the claim, ancillary, claim based fee, enrollment based fee, and discount charges.

Oracle Revenue Management and Billing enables you to process and bill the funds charges to the self-funded employer in either of the following ways:

- Pay the fixed flat amount in every bill period
- Pay the amount based on the enrollment based limit in every bill period

The system enables you to define whether the price items included in the claim, retention type claim based, retention type enrollment based, ancillary, and discount pricing rule types are eligible for level funding. If the price items are eligible for level funding, you can then include them in the level funding pricing rule type indicating that the charges for these price items will not be included in the respective billable charge (for example, claim billable charge), but it would be settled against the funds billable charge. While adjusting such charges against the funds billable charge, there might be some surplus or deficit in funds at the time of settlement which is ideally at the end of year. In such case, the system enables you configure whether a flat amount or percentage of surplus should be retained by the ASO provider or whether a flat amount or percentage of deficit is offered as a discount to the self-funded employer.

The pricing for the level funding can be defined using the level funding pricing rules. You can define a level funding pricing rule at the parent customer and bill group levels. The level funding pricing rule at the bill group level takes precedence over the level funding pricing rule at the parent customer level. You can define the level funding pricing rules for parent customers and bill groups from the **Customer 360° Information** screen. You can define a level funding pricing rule using a level funding pricing rule type. It is the level funding pricing rule type which helps the system to determine:

- Business object using which the level funding pricing rule should be created in the system.

  Note: You must not select the **Primary** option while defining a level funding pricing rule type.

- Algorithm which should be triggered for deriving the account and price item while creating the funds transaction legs.

  Note: You must create an algorithm using the **C1_ACCPRISL** algorithm type and attach it to the **Account and Price Item Derivation** system event.

- Pricing rule post-processing algorithm which should be triggered once the effective level funding pricing rule is derived.

  Note: A pricing rule post-processing algorithm type is not shipped with the product. You can create a custom algorithm type, if required.

- Additional generic information, such as:
  - Whether the funds charge should be written off when the bill is generated in the post runout period of the policy. In this case, a write-off adjustment is created against the respective bill segment during the post bill completion. The write-off adjustment is created using the post runout write-off adjustment type which is specified in the level funding pricing rule type.
  - Transaction field which you want to use in the rules as the output parameter to determine whether the price item should be considered for billing.
  - Value which the output parameter in the rule should return when the price item in the level funding pricing rule type should be considered for processing.

Copyright © 2026, Oracle and/or its affiliates.

- Price items for which you can define level funding pricing rules using the level funding pricing rule type.
- Rate options that you can use while defining the pricing for the level funded price items.
- Different type of account to which a price item should be billed based on the specified priority.
- Rule type which indicates the rules that should be executed to determine whether the price item is eligible for billing.
- Additional level funding specific information, such as:
    - Whether the level funding premium (i.e. funds) should be calculated using the bill period based recurring flat fee pricing rule or using the retention type enrollment based pricing rule.
    - Bill period based recurring flat fee pricing rule type or retention type enrollment based pricing rule type which you want to use for calculating the level funded premium.
    - Price item whose pricing you want to use for calculating the level-funded premium.
    - LF billable charge line type using which you want to create billable charges for level funded premium.
    - GL only contract type which indicates the contract against which the claim, ancillary, claim based fees, enrollment based fees, and discount charges that are settled against the funds must be debited. The distribution code on the GL only contract type will indicate the GL account against which charges settled against the funds must be debited.
    - Liability distribution code will indicate the GL account against which charges settled against the funds must be credited.
    - Number of days before which you want to create a To Do for reminding the self-funded employer to renew the level funded agreement.
    - Surplus billable charge line type using which you want to create the billable charge when the surplus funds are left with the ASO provider at the time of settlement.
    - Deficit billable charge line type using which you want to create the billable charge when the funds are in deficit at the time of settlement.
    - Domestic provider billable charge line type using which you want to create billable charges for the claim, claim based fees, enrollment based fees, ancillary, and discount charges which are settled against the funds for a domestic provider.
    - Markup or markdown billable charge line type using which you want to create billable charges for markup or markdown which are settled against the funds.
    - Rule type which indicates the rules that should be executed to determine whether the markup or markdown calculation line is eligible for billing.
    - Transaction field which you want to use in the rules as the output parameter to determine whether the markup or markdown calculation line is eligible for billing.
    - Rule type which indicates the rules that should be executed to determine whether the level funded premium is for a domestic provider.
    - Transaction field which you want to use in the rules as the output parameter to determine whether the level funded premium is for a domestic provider.

Once a level funding pricing rule type is defined, you can create level funding pricing rules using the level funding pricing rule type. While defining a level funding pricing rule for a parent customer, you need to specify the following:

- Price item for which you want to define the pricing.
- Specific stop-loss pricing rule of the parent customer whose accumulation parameters you want to inherit for the level funding. On selecting a specific stop-loss pricing rule, the level funding pricing date range is set automatically. The level funding pricing date range is same as the specific stop-loss pricing rule.
- Rate option which you want to use while defining the level funding pricing.
- Settlement frequency which helps to determine the bill after date. The valid values are:
    - **Immediately** - If you select this option from the list, the bill after date is not calculated. The funds billable charge is billed immediately in the next bill cycle.
    - **Manually (At Required Intervals)** - If you select this option from the list, the bill after date which is specified in the **Manual Settlement Bill After Date** parameter while executing the **C1-BCLF** batch is stamped on the funds billable charge.
    - **Never** - If you select this option from the list, the bill after date which is specified in the **Manual Settlement Bill After Date** parameter while executing the **C1-BCLF** batch is stamped on the funds billable charge.

Copyright © 2026, Oracle and/or its affiliates.

- **Yearly** - If you select this option from the list, the bill after date is set to the pricing end date in the funds billable charge.
- **On Settlement** - If you select this option from the list, the bill after date is set to the settlement date in the funds billable charge.

Note: The accumulation parameters, such as incurred start date, incurred end date, paid start date, paid end date, and settlement days are automatically inherited from the parent customer's specific stop-loss pricing rule. You cannot change any accumulation parameter except the settlement days.

- Settlement days which helps to calculate the settlement date (which is pricing end date, incurred end date, or paid end date whichever is later + the settlement days)
- Whether the customer would like to renew or cancel the level funded agreement.
- Whether a flat amount or percentage of surplus should be retained by the ASO provider at the time of settlement.
- Whether a flat amount or percentage of deficit should be offered as discount to the self-funded employer at the time of settlement.

However, while defining a level funding pricing rule for a bill group, you need to specify the following:

- The policy status in which the level funding pricing rule is applicable.
- Price item for which you want to define the pricing.
- Parent customer's level funding pricing rule from which you want to inherit the accumulation parameters.

Note:

The pricing date range is derived from the parent customer's level funding pricing rule because the level funding pricing rules for parent customer and bill group should have the same date range.

The settlement fund price item is derived from the level funding pricing rule type using which the level funding pricing rule is created.

- Rate option which you want to use while defining the level funding pricing.
- Price items whose charges should be accumulated against the level funded price items so that it can be settled against the funds.
- Whether the line items and markup or markdown in a particular claim pricing rule should be accumulated.

  OR

  Whether the line items which are associated with the **Level Funded** pricing rule type category should be accumulated.
- Whether the charges created using the billable charge line types in a particular ancillary pricing rule should be accumulated.

  OR

  Whether the charges created using the billable charge line types where the **Pricing Rule Type Category** characteristic is set to **Ancillary** should be accumulated.
- Whether the discount calculated using a particular discount arrangement pricing rule should be accumulated.
- Whether the charges calculated using the retention type claim based or retention type enrollment based pricing for a price item should be accumulated.

You can also specify a pricing group while defining a level funding pricing rule for a bill group. Once a level funding pricing rule is defined for a bill group, the system creates a price assignment in a price list and assigns the price list to the bill group.

The following new batches are introduced in this release:

- **C1-ACLF** - This batch is used to accumulate the charges which are to be settled against the funds. During the accumulation post-processing, the level funded billable charges (which are created through the TFM process) are posted against the GL accounts which are derived using the GL only contract type and liability distribution code information in the level funding pricing rule type. For more information about the batch, refer to *Oracle Revenue Management and Billing Batch Guide*.

Copyright © 2026, Oracle and/or its affiliates.

- **C1-BCLF** - Once the level funded billable charges are accumulated, this batch is used to create the accumulated level funded billable charges. It is also used to calculate the bill after date. For more information about the batch, refer to *Oracle Revenue Management and Billing Batch Guide*.

Terminal Liability Reserve (Run Out) Level Funding Pricing

Oracle Revenue Management and Billing provides a mechanism to maintain terminal liability reserve for a self-funded policy through level funding. Now, the system supports the following types of level funding:

- Regular Enrollment Based Level Funding Without Terminal Liability Reserve (TLR)
- Flat Rate Based Level Funding Without TLR
- Regular Enrollment Based Level Funding With TLR
- Flat Rate Based Level Funding With TLR

The **C1-PricingRuleTypeLF** and **C1-PricingRuleLevelFunded** business objects are extended to support the TLR feature. Therefore, you can now define pricing rule types for the above listed types of level funding. While creating a level funding pricing rule type with TLR feature, you need to specify the following:

- **Terminal Liability Reserve (Run Out) Funding Required** - Used to indicate whether you want to define a level funding pricing rule type with TLR.
- **Claim Fund Off-Process Request Type** - Used to indicate the off-process request type using which the off-process request should be created in the **C1-BCLF** batch. Through this off-process request, the system creates billable charge when the customer decides to roll forward the claim fund.
- **Run Out Fund Off-Process Request Type** - Used to indicate the off-process request type using which the off-process request should be created in the **C1-BCLF** batch. Through this off-process request, the system creates billable charge when the customer decides to roll forward the run out fund.
- **Run Out Fund Pricing Rule Type** - Used to specify a bill period based recurring flat fee pricing rule type or retention type enrollment based pricing rule type which you want to use for calculating the run out fund.
- **Run Out Fund Price Item** - Used to specify the price item which you want to use for calculating the run out fund.
- **Run Out Billable Charge Line Type** - Used to specify the billable charge line type using which you want to create calculation line while settling charges, stop-loss, or discount through run out fund in the runout period.
- **Run Out Surplus Billable Charge Line Type** - Used to specify the billable charge line type using which you want to create the calculation line when the surplus run out funds are left with the ASO provider at the time of settlement.
- **Run Out Deficit Billable Charge Line Type** - Used to specify the billable charge line type using which you want to create the calculation line when the run out funds are in deficit at the time of settlement.

Now, the system enables you to specify the settlement rules while creating a level funding pricing rule type with or without TLR feature. While defining settlement rules, you need to specify the following:

- The policy status for which the settlement rules are applicable
- The fund type (i.e. claim or run out fund) for which you want to define the settlement rules
- The customer action (i.e. cancel or renew the self-funded policy) based on which you want to either close or roll forward the surplus or deficit claim or run out fund

The system provides an option to indicate whether the settlement rules specified for a claim or run out fund are editable. Accordingly, you can change the settlement rules when you create a pricing rule using the pricing rule type for a parent customer.

Now, the system enables you to create a different level funded pricing rule for each policy status at the parent customer level.

Defining a Level Funded Pricing Rule Type

Prerequisites

To define a level funded pricing rule type, you should have:

Copyright © 2026, Oracle and/or its affiliates.

- Level Funded Pricing Rule Type business object defined in the application.
- Level Funded Pricing Rule business object defined in the application.

Procedure

To define a level funded pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Pricing Rule Type** sub-menu.

   The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type Business Object	Used to indicate the business object using which you want to create a level funded pricing rule type.	Yes
	Note: You can create a discount arrangement pricing rule type using the **Level Funded Pricing Rule Type (C1-PricingRuleTypeDA)** business object.	

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Pricing Rule Type** screen.

4. Select the **Level Funded (LF) Pricing Rule Type** option from the **Pricing Rule Type Business Object** list.
5. Click **OK**.

   The **Level Funded Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify the basic details about the level funded pricing rule type.
   - **Algorithms** - Used to associate the algorithms with a level funded pricing rule type.
   - **Additional Data** - Used to specify the additional information about the level funded pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the level funded pricing rules using the level funded pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for a level funded pricing rule type.
   - **DA - Specific Additional Data** - Used to define the level funded - specific additional data in a discount arrangement pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to specify the level funded pricing rule type.	Yes
Description	Used to specify the description for the level funded pricing rule type.	Yes
Detailed Description	Used to specify additional information about the level funded pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the level funded pricing rule. The valid value is: • Level Funded (LF) Pricing Rule	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Business Object	Indicates the business object using which you are defining the level funded pricing rule type.	Not applicable
Status	Used to indicate the status of the level funded pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to indicate whether the pricing rule type is a primary pricing rule type. **Note:** You must not select the **Primary** option while defining a level funded pricing rule type.	Not applicable
Pricing Rule Type Category	Used to indicate the category to which the pricing rule type belongs. The valid value is: • Level Funded	Yes

6. Enter the required details in the **Main** section.
7. Ensure that **Primary** option is not selected when you are defining a level funded pricing rule type.
8. Associate the following algorithms with the discount arrangement pricing rule type:

System Event	Algorithm	Algorithm Type	Description
Account and Price Item Derivation	C1_ACCPRISL	C1_ACCPRIDIS	Account and Priceitem Derivation For Level Funded
Accumulation Post Processing	C1-LFACPOST	C1-LFACPOST	Level Funded Accumulation Post Processing

9. Define additional data for a level funded pricing rule type, if required.
10. Add the required price items in the level funded pricing rule type.
11. Add the price item parameters in the level funded pricing rule type, if required.
12. Define characteristics for a level funded pricing rule type, if required.
13. Add level funded-specific additional data in the level funded pricing rule type.
14. Click **Save**.
    The level funded pricing rule type is defined.

Associating an Algorithm with a Level Funded Pricing Rule Type

Prerequisites

To associate algorithms with a level funding pricing rule type, you should have:

- An algorithm defined using the **C1_ACCPRIDIS** algorithm type.

Procedure

To associate algorithms with a discount arrangement pricing rule type:

1. Ensure that the **Algorithms** section is expanded when you are defining or editing the discount *a*rrangement pricing rule type.

   The **Algorithms** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to invoke the algorithm. The valid values are: • Account and Price Item Derivation • Accumulation Billable Charge Post Proc • Accumulation Billable Charge Pre Proc • Accumulation Post Processing • Accumulation Pre Processing • Pricing Rule Post Processing • Transaction Validation	Yes **Note:** This field is required when you are associating an algorithm with the discount arrangement pricing rule type.
Sequence	Used to specify the order in which the algorithms for each system event must be executed.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the discount arrangement pricing rule type.
Algorithm	Used to specify the algorithm. **Note:** Once you select the system event, the **Search** (🔍) icon appears corresponding to the **Algorithm** field. On clicking the **Search** (🔍) icon, the **Algorithm Search** window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the **Algorithm** field.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the discount arrangement pricing rule type.

2. Enter the following details in the **Algorithms** section:

Copyright © 2026, Oracle and/or its affiliates.

System Event	Sequence	Algorithm
Account and Price Item Derivation	10	C1_ACCPRIDIS

3. If you want to associate more than one algorithm with the discount arrangement pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to disassociate an algorithm from the discount arrangement pricing rule type, click the **Delete** (🗑) icon corresponding to the algorithm.

4. Click **Save**.
   The algorithms are associated with the discount arrangement pricing rule type.

Related Topics

Defining Additional Data in a Level Funded Pricing Rule Type

Procedure

To define additional data in a level funded pricing rule type:

1. Ensure that the **Additional Data**section is expanded when you are defining *or* editing a level funded pricing rule type.

   The **Additional Data** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Eligible for Specific Stop-Loss	Used to indicate whether price items included in the level funded pricing rule type are eligible for specific stop-loss. The valid values are: • Yes • No	No
Eligible for Level Funding	Used to indicate whether price items included in the level funded pricing rule type are eligible for level funding. The valid values are: • Yes • No	No
Eligible for Minimum Premium Program	Used to indicate whether price items included in the level funded pricing rule type are eligible for minimum premium program. The valid values are: • Yes • No	No
Run-in Identifier Value	Used to specify the identifier value to determine whether the level funded transaction is received during the run-in period of the policy.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Third Party Identifier Value	Used to specify the identifier value to determine whether the level funded transaction is received from an external source system.	No
Accumulation Only Identifier Value	Used to specify the identifier value to determine whether the level funded transaction contains the accumulated information of ASL, SSL, and Level Funding pricing types.	No
Eligible for Write-Off in Post Runout	Used to indicate whether the level funded charges should be written off when the bill is generated in the post runout period of the policy. The valid values are: • Yes • No **Note:** For more information, refer to the Write-Off Charges during Post Runout section.	No
Post Runout Write-Off Adjustment Type	Used to specify the adjustment type using which you want to create post runout write-off adjustment. **Note:** This field appears when the **Eligible for Write-Off in Post Runout** field is set to **Yes**. The **Search** (🔍) icon appears corresponding to the **Post Runout Write-Off Adjustment Type** field. On clicking the **Search** icon, the **Adjustment Type Search** window appears. On specifying the adjustment type, the description of the adjustment type appears corresponding to the **Eligible for Write-Off in Post Runout** field.	Yes (Conditional) **Note:** This field is required when the **Eligible for Write-Off in Post Runout** field is set to **Yes**.
Rule Based Price Item Eligibility Field	Used to indicate the transaction field which you want to use in the rules as the output parameter to determine whether the price item should be considered for billing. **Note:** For more information, refer to the Price Item Eligibility on page 3465 section. This field appears when the **Eligible for Write-Off in Post Runout** field is set to **Yes**. The **Search** (🔍) icon appears corresponding to the **Rule Based Price Item Eligibility Field** field. On clicking the **Search** icon, the **Field Search** window appears. On specifying the field name, the description of the field name appears corresponding to the **Rule Based Price Item Eligibility Field**.	No
Rule Based Eligibility Value	Used to specify the value which the output parameter in the rule should return when the price item in the discount	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	arrangement pricing rule type should be considered for processing.	**Note:** This field is required when a value is specified in the **Rule Based Price Item Eligibility Field** field.

2. Enter the required details in the **Additional Data** section.
3. Click **Save**.
   The additional data is defined for the pricing rule type.

Related Topics

Adding a Price Item in a Level Funded Pricing Rule Type

Prerequisites

To add a price item in a level funded pricing rule type, you should have:

- Price item defined in the application
- Rate options defined in the **Rate Option (C1-ExtLookRetTypeRateOpt)** extendable lookup
- Values defined for the **Invoice Type (C1INVTYP)** characteristic type
- The **C1INVTYP** characteristic type set in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration
- Rule types defined in the application (where the rule type usage is set to **Price Item Eligibility**)

Procedure

To add a price item in a level funded pricing rule type:

1. Ensure that the **Price Items** section is expanded when you are defining or editing a *l*evel funded pricing rule type.

   The **Price Items** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item that you want to include in the level funded pricing rule type.	Yes (Conditional)
	Note: The **Search** (🔍) icon appears corresponding to the **Price Item** field. On clicking the **Search** icon, the **Price Item Search** window appears. On specifying the price item, the description of the price item appears corresponding to the **Price Item** field.	**Note:** This field is required when you are adding a rate option and bill to account in the level funded pricing rule type.
Rate Option	Used to indicate one or more rate options which are valid for a price item.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td></td><td>On clicking the Add (+) icon, the following field appears in a grid:
<table><tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr><tr><td>Rate Option</td><td>Used to indicate the rate option that you want to use while defining pricing for the price item.</td><td>Yes</td></tr></table>
Note:
If you want to define more than one rate option to the price item in the level funded pricing rule type, click the Add (+) icon.
However, if you want to remove a price item from a level funded pricing rule type, click the Delete (🗑) icon corresponding to the Rate Option field.</td><td></td></tr>
<tr><td>Bill To Account</td><td>Used to indicate a order in which the account should be considered while deriving a transaction leg.
On clicking the Add (+) icon, the following fields appear in a grid:
<table><tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr><tr><td>Priority</td><td>Used to specify the order in which the invoice type is considered for a price item.</td><td>Yes</td></tr><tr><td>Invoice Type</td><td>Used to indicate the type which is considered for billing. For more information, refer to the Bill Group's Account on page 13 section.
Note: The Search (🔍) icon appears corresponding to the Invoice Type field. On clicking the Search icon, the Invoice Type Search window appears.</td><td>Yes</td></tr></table>
Note:
If you want to define more than one invoice type to the price item in a level funded pricing rule type, click the Add (+) icon.
However, if you want to remove a invoice type from the price item in a level funded pricing rule type, click the Delete (🗑) icon corresponding to the Priority field.</td><td>Not applicable</td></tr>
<tr><td>Eligibility Rule Type</td><td>Used to indicate the rule type which indicates the rules that should be executed to determine whether the price item is eligible for billing.</td><td>No</td></tr>
</table>

2. Enter the required details in the **Price Items** section.

Copyright © 2026, Oracle and/or its affiliates.

3. If you want to define more than one price item in a level funded pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove a price item from a level funded pricing rule type, click the **Delete** (🗑) icon corresponding to the **Price Item** field.

4. Click **Save**.
   The price items are added for a level funded pricing rule type.

Adding a Price Item Parameter in a Level Funded Pricing Rule Type

Prerequisites

To add a price item parameter in a level funded pricing rule type, you should have:

- Parameter defined in the application where parameter usage is set to **Price Item**.
- Parameter associated with the price item.
- Transaction fields defined in the application.

Procedure

To add a price item parameter in a level funded pricing rule type:

1. Ensure that the **Price Item Parameters** section is expanded when you are defining or *e*diting a level funded pricing rule type.

   The **Price Item Parameters** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item Parameter	Used to specify the parameter which you can use while defining a level funded pricing for the price item. **Note:** The **Search** (🔍) icon appears corresponding to the **Price Item Parameter** field. On clicking the **Search** (🔍) icon corresponding to the **Price Item Parameter** field, the **Parameter Search** window appears. On specifying the parameter, the description of the price item parameter appears corresponding to the **Price Item Parameter** field.	Yes (Conditional) **Note:** This field is required when you are adding a price item parameter in a level funded pricing rule type.
Transaction Field	Used to specify the transaction field from where the data should be retrieved.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Transaction Field** field. On clicking the **Search** (🔍) icon corresponding to the **Transaction Field** field, the **Transaction Field Search** window appears. On specifying the transaction field, the description of the transaction field appears corresponding to the **Transaction Field**.	**Note:** This field is required when you are adding a price item parameter in a level funded pricing rule type.
Eligible for Specific Stop-Loss	Used to indicate whether the price item parameter can be used while defining the accumulation criteria in the specific stop-loss or aggregate stop-loss pricing rule.	No
Eligible for Level Funding	Used to specify whether the price item parameter can be used in level funding.	No
Eligible for Minimum Premium Program	Used to indicate whether the price item parameter can be used while defining the accumulation criteria in the minimum premium program pricing rules at the bill group level.	No

2. Enter the required details in the **Price Item Parameters** section.
3. If you want to add more than one price item parameter in a level funded pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a price item parameter from a level funded pricing rule type, click the **Delete** (🗑) icon corresponding to the price item parameter.

4. Click **Save**.
   The price item parameter is added for a level funded pricing rule type.

Defining a Characteristic for a Level Funded Pricing Rule Type

Prerequisites

To define a characteristic for a level funded pricing rule type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule Type**)

Procedure

To define a characteristic for a level funded pricing rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining or editing a discount *a*arrangement pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

The **Characteristics** section contains the following columns in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule Type**.	**Note:** This field is required when you are defining a characteristic for a level funded pricing rule type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for a level funded pricing rule type.

2. Enter the required details in the **Characteristics** section.

Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, you can search for a predefined characteristic value.

3. If you want to define more than one characteristic for a level funded pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a characteristic from a level funded pricing rule type, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
The characteristics are defined for a level funded pricing rule type.

Defining the Level Funded Specific Additional Data in a Level Funded Pricing Rule Type

Prerequisites

To define level funded specific additional data in a level funded pricing rule type, you should have:

- A rule type defined for **Markup or Markdown Eligibility Rule Type** and **Domestic Provider Eligibility Rule Type** field.

Procedure

To add the level-funded data in a level funded pricing rule type:

1. Ensure that the **Level Funded - Specific Additional Data** section is expanded when you are defining or *e*diting a level funded pricing rule type.

The **Level Funded - Specific Additional Data** section contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Funding Arrangement	Used to indicate whether the level-funded premium (i.e. funds) should be calculated using the bill period based recurring flat fee pricing rule or using the retention type enrollment based pricing rule. The valid values are: • Enrollment Based Premium • Flat Rate Based Premium	Yes
Settlement Fund Pricing Rule Type	Used to indicate the bill period based recurring flat fee pricing rule type or the retention type enrollment based pricing rule type which you want to use for calculating the level-funded premium. **Note:** The **Search** (🔍) icon appears corresponding to the **Settlement Fund Pricing Rule Type** field. On clicking the **Search** (🔍) icon corresponding to the **Settlement Fund Pricing Rule Type** field, the **Contract Type Search** window appears. On specifying the contract type, the description of the contact type appears corresponding to the **Settlement Fund Pricing Rule Type** field.	Yes
Settlement Fund Price Item	Used to indicate the price item that you want to use for calculating the level-funded premium. **Note:** The **Search** (🔍) icon appears corresponding to the **Settlement Fund Price Item** field. On clicking the **Search** (🔍) icon corresponding to the **Settlement Fund Price Item** field, the **Price Item Details** window appears. On specifying the price item details, the description of the price item details appears corresponding to the **Settlement Fund Price Item** field.	Yes
LF Billable Charge Line Type	Used to indicate the level funded billable charge line type using which you want to create the billable charges for level-funded settlement purposes. **Note:** The **Search** (🔍) icon appears corresponding to the **LF Billable Charge Line Type** field. On clicking the **Search** (🔍) icon corresponding to the **LF Billable Charge Line Type** field, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Billable Charge Line Type Search** field.	Yes
GL Only Contract Type	Used to indicate the contract against which the level-funded billable charges for claim, ancillary, claim based fees, enrollment	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	based fees, discount, specific stop-loss, and aggregate stop-loss must be debited. **Note:** The **Search** (🔍) icon appears corresponding to the **GL Only Contract Type** field. On clicking the **Search** (🔍) icon corresponding to the **GL Only Contract Type** field, the **Contract Type Search** window appears.	
Liability Distribution Code	Used to indicate the GL account against which the level-funded billable charges (that are settled against the level-funded premium billable charge) must be credited. **Note:** The **Search** (🔍) icon appears corresponding to the **Liability Distribution Code** field. On clicking the **Search** (🔍) icon corresponding to the **Liability Distribution Code** field, the **Distribution Code Search** window appears. On specifying the distribution code, the description of the distribution code appears corresponding to the **Liability Distribution Code** field.	Yes
Renewal Decision Lead Time	Used to specify the number of days before which you want to create a To Do for reminding the self-funded employer to renew the level-funded agreement.	Yes
Surplus Billable Charge Line Type	Used to indicate the surplus billable charge line type using which you want to create the billable charge when the surplus funds are left with the ASO provider at the time of settlement. **Note:** The **Search** (🔍) icon appears corresponding to the **Surplus Billable Charge Line Type** field. On clicking the **Search** (🔍) icon corresponding to the **Surplus Billable Charge Line Type** field, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Surplus Billable Charge Line Type** field.	Yes
Deficit Billable Charge Line Type	Used to indicate the deficit billable charge line type using which you want to create the billable charge when the funds are in deficit at the time of settlement.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Deficit Billable Charge Line Type** field. On clicking the **Search** (🔍) icon corresponding to the **Deficit Billable Charge Line Type** field, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Deficit Billable Charge Line Type** field.	
Domestic Provider Billable Charge Line Type	Used to indicate the domestic provider billable charge line type using which you want to create level-funded settlement billable charge for a domestic provider. **Note:** The **Search** (🔍) icon appears corresponding to the **Domestic Provider Billable Charge Line Type** field. On clicking the **Search** (🔍) icon corresponding to the **Domestic Provider Billable Charge Line Type** field, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Domestic Provider Billable Charge Line Type** field.	No
Markup or Markdown Billable Charge Line Type	Used to indicate the markup or markdown billable charge line type using which you want to create the billable charges for markup or markdown which are settled against the level-funded premium. **Note:** The **Search** (🔍) icon appears corresponding to the **Markup or Markdown Billable Charge Line Type** field. On clicking the **Search** (🔍) icon corresponding to the **Markup or Markdown Billable Charge Line Type** field, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Markup or Markdown Billable Charge Line Type** field.	No
Markup or Markdown Eligibility Rule Type	Used to indicate the rules that should be executed to determine whether the markup or markdown calculation line is eligible for billing.	No
Rule Based Markup or Markdown Eligibility Field	Used to indicate the transaction field which you want to use in the rules as the output parameter to determine whether the markup or markdown calculation line is eligible for billing.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Rule Based Markup or Markdown Eligibility Field** field. On clicking the **Search** (🔍) icon corresponding to the **Rule Based Markup or Markdown Eligibility Field Type** field, the **Field Search** window appears. On specifying the eligibility field, the description of the field appears corresponding to the **Rule Based Markup or Markdown Eligibility Field** field.	**Note:** This field is required when you are specifying a markup or markdown eligibility rule type in a level funded pricing rule type.
Domestic Provider Eligibility Rule Type	Used to indicate the rules that should be executed to determine whether the level-funded premium is for a domestic provider.	No
Rule Based Domestic Provider Claim Eligibility Field	Used to indicate the transaction field which you want to use in the rules as the output parameter to determine whether the level-funded premium is for a domestic provider. **Note:** The **Search** (🔍) icon appears corresponding to the **Rule Based Domestic Provider Claim Eligibility Field** field. On clicking the **Search** (🔍) icon corresponding to the **Rule Based Domestic Provider Claim Eligibility Field** field, the **Field Search** window appears. On specifying the eligibility field, the description of the field appears corresponding to the **Rule Based Domestic Provider Claim Eligibility Field** field.	Yes (Conditional) **Note:** This field is required when you are specifying a domestic provider eligibility rule type in a level funded pricing rule type.

2. Enter the required details in the **Level Funded - Specific Additional Data** section.
3. Click **Save**.
   The level funded-specific data is added in the level funded pricing rule type.

Editing a Level Funded Pricing Rule Type

Prerequisites

To edit a level funded pricing rule type, you should have:

- Level funded pricing rule type business object defined in the application.
- Level funded pricing rule business object defined in the application.

Procedure

Copyright © 2026, Oracle and/or its affiliates.

To edit a level funded pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding *t*o the pricing rule type whose details you want to edit.

   The **Level Funded Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the discount arrangement pricing rule type.
   - **Algorithms** - Used to associate the algorithms with a discount arrangement pricing rule type.
   - **Additional Data** - Used to specify the additional information about the discount arrangement pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the discount arrangement pricing rules using the discount arrangement pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for a discount arrangement pricing rule type.
   - **Level Funded - Specific Additional Data** - Used to define the discount arrangement - specific additional data in a discount arrangement pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Displays the level funded pricing rule type.	Not applicable
Description	Used to specify the description for the level funded pricing rule type.	Yes
Detailed Description	Used to specify additional information about the level funded pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the level funded pricing rule. The valid value is: • Level Funded (LF) Pricing Rule	Yes
Business Object	Indicates the business object used while defining the level funded pricing rule type.	Not applicable
Status	Used to indicate the status of the level funded pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to indicate whether the pricing rule type is primary. **Note:** You must not select the **Primary** option while defining the level funded pricing rule type.	Not applicable
Pricing Rule Type Category	Indicates the pricing rule type category for the level funded pricing rule type. The valid values are: • Level Funded	No

Copyright © 2026, Oracle and/or its affiliates.

> **Tip:** Alternatively, you can edit the details of a level funded pricing rule type by clicking the **Edit** button in the **Pricing Rule Type** zone.

5. Modify the details in the **Main** section.
6. Associate the following algorithms with the level funded pricing rule type:

System Event	Algorithm	Algorithm Type	Description
Account and Price Item Derivation	C1_ACCPRISL	C1_ACCPRIDIS	Account and Priceitem Derivation For Level Funded
Accumulation Post Processing	C1-LFACPOST	C1-LFACPOST	Level Funded Accumulation Post Processing

7. Modify the additional data for a level funded pricing rule type, if required.
8. Add, edit, or remove the required price items in the level funded pricing rule type.
9. Add, edit, or remove the price item parameters in the level funded pricing rule type, if required.
10. Add, edit, or remove characteristics for a level funded pricing rule type, if required.
11. Modify the level funded-specific additional data in the level funded pricing rule type, if required.
12. Click **Save**.
    The changes made to the level funded pricing rule type are saved.

Deleting a Level Funded Pricing Rule Type

Procedure

To delete a level funded pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.

Copyright © 2026, Oracle and/or its affiliates.

4. In the **Pricing Rule Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the level funded pricing rule type that you want to delete.
   A message appears confirming whether you want to delete the level funded pricing rule type.

   Note: You can delete a level funded pricing rule type when it is not yet used in the system.

   Tip: Alternatively, you can delete a level funded pricing rule type by clicking the **Delete** button in the **Pricing Rule Type** zone.
5. Click **OK**.
   The level funded pricing rule type is deleted.

Defining a Level Funded Pricing Rule for a Parent Customer

Prerequisites

To define a level funded pricing rule for a parent customer, you should have:

- Pricing rule type where the category is set to **Level Funded**.
- Price items associated with the level funded pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

- Specific stop-loss pricing rule of the parent customer, whose accumulation parameters you want to inherit for level funding.

Procedure

To define a level funded pricing rule for a parent customer:

1. Search for a parent customer in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding *t*o the parent customer whose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. Click the **Add** link in the upper-right corner of the **Parent Customer Pricing Rules** zone.

   The **Pricing Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Person Name	Indicates the parent customer for whom you want to create a level funded pricing rule type.	Not applicable
Person Type	Indicates the type of the parent customer. The valid value is: • **Parent Customer**	Not applicable
Pricing Rule Type	Used to indicate the pricing rule type using which you want to create a level funded pricing rule.	Yes

5. Select the required pricing rule type in the respective field.
6. Click **OK**.

   The **Level Funded (LF) Pricing Rule** screen appears. It contains the following sections:

   - **Customer Information** - Displays the information about the parent customer for whom you are defining the level funded pricing rule. It contains the following fields:

Field Name	Field Description
Parent Customer Information	Indicates the parent customer for whom you are defining the level funded pricing rule.
Pricing Rule Type	Indicates the pricing rule type using which you are defining the level funded pricing rule.

   - **Main** - Used to specify basic details in the level funding pricing rule.
   - **Accumulation Parameters** - Used to define the accumulation parameters in a level funded pricing rule.
   - **Final Settlement Rules** - Used to define the final settlement rules when the customer decides to renew or cancel the level-funded agreement.
   - **Characteristics** - Used to define the characteristics for the level funded pricing rule.

> **Note:**
>
> The **Accumulation Parameters** and **Final Settlement Rules** section appear when you specify a price item in the **Main** section.

   The **Main** section contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item for which you want to define the level funded pricing rule.	Yes
Parent Customer's Pricing Rule	Used to indicate the date range of each specific stop-loss pricing rule, defined for the parent customer. **Note:** On selecting the specific stop-loss pricing rule of the parent customer, the level funded **Pricing Start Date** and **Pricing End Date** field is set automatically.	Yes
Pricing Start Date	Used to specify the date from when the level funded pricing rule is effective. **Note:** The pricing start date cannot be later than the pricing end date.	Yes
Pricing End Date	Used to specify the date till when the level funded pricing rule is effective. **Note:** The pricing end date cannot be earlier than the pricing start date.	No
Rate Option	Used to indicate the rate option that you want to use while defining the pricing for the price item.	Yes
Settlement Frequency	Used to indicate the settlement frequency which helps to determine the bill after date. The valid values are: • **Immediately** - If you select this option from the list, the bill after date is not calculated. The level-funded settlement billable charge is billed immediately in the next bill cycle. • **Manually (At Regular Intervals)** - If you select this option from the list, the bill after date which is specified in the **Manual Settlement Bill After Date** parameter while executing the **C1-BCLF** batch is stamped on the level-funded settlement billable charge. • **Monthly** - If you select this option from the list, the bill after date is set to the last day of the month. • **On Settlement** - If you select this option from the list, the bill after date is set to the settlement date in the level-funded settlement billable charge. • **Yearly** - If you select this option from the list, the bill after date in the credit billable charge is set to the pricing end date in the level-funded settlement billable charge.	Yes
Underwriter Review	Used to indicate whether the underwriter settlement review flag is on or off. The valid values are: • Yes • No **Note:** By default the value of this option type is set to **Yes**.	No

7. Enter the required details in the **Main** section.

Copyright © 2026, Oracle and/or its affiliates.

8. Define the accumulation parameters in the level funded pricing rule.
9. Define the final settlement rules in the level funded pricing rule.
10. Define characteristics for the level funded pricing rule, if required.
11. Click **Save**.
    The level funded pricing rule is defined for the parent customer.

Editing a Level Funded Pricing Rule of a Parent Customer

Procedure

To edit a discount arrangement pricing rule of a parent customer:

1. Search for a parent customer in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the parent customer whose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. In the **Parent Customer Pricing Rules** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the level funded pricing rule, whose details you want to edit.

   The **Level Funded (LF) Pricing Rule** screen appears. It contains the following sections:

   - **Customer Information** - Displays information about the parent customer for whom the discount arrangement pricing rule is defined. It contains the following fields:

Field Name	Field Description
Parent Customer Information	Indicates the parent customer for whom the level funded pricing rule is defined.
Pricing Rule Type	Indicates the level funded pricing rule type using which the level funded pricing rule is defined.

   - **Main** - Used to specify basic details in the level funded pricing rule.
   - **Accumulation Parameters** - Used to define the accumulation parameters in a level funded pricing rule.
   - **Final Settlement Rules** - Used to define the final settlement rules when the customer decides to renew or cancel the level funded agreement.
   - **Characteristics** - Used to define the characteristics for the level funded pricing rule.

Copyright © 2026, Oracle and/or its affiliates.

Note: The **Accumulation Parameters** and **Final Settlement Rules** section appear when you specify a price item in the **Main** section.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item for which you want to define the level funded pricing rule.	Yes
Parent Customer's Pricing Rule	Used to indicate the date range of each specific stop-loss pricing rule which is defined for the parent customer. **Note:** On selecting the specific stop-loss pricing rule of the parent customer, the level funded **Pricing Start Date** and **Pricing End Date** field is set automatically.	Yes
Pricing Start Date	Used to specify the date from when the level funded pricing rule is effective. **Note:** The pricing start date cannot be later than the pricing end date.	Yes
Pricing End Date	Used to specify the date till when the level funded pricing rule is effective. **Note:** The pricing end date cannot be earlier than the pricing start date.	No
Rate Option	Used to indicate the rate option that you want to use while defining the pricing for the price item.	Yes
Settlement Frequency	Used to indicate the settlement frequency which helps to determine the bill after date. The valid values are: • **Immediately** - If you select this option from the list, the bill after date is not calculated. The level-funded settlement billable charge is billed immediately in the next bill cycle. • **Manually (At Regular Intervals)** - If you select this option from the list, the bill after date which is specified in the **Manual Settlement Bill After Date** parameter while executing the **C1-BCLF** batch is stamped on the level-funded settlement billable charge. • **Monthly** - If you select this option from the list, the bill after date is set to the last day of the month. • **On Settlement** - If you select this option from the list, the bill after date is set to the settlement date in the level-funded settlement billable charge. • **Yearly** - If you select this option from the list, the bill after date in the credit billable charge is set to the pricing end date in the level-funded settlement billable charge.	Yes
Underwriter Review	Used to indicate whether the underwriter settlement review flag is on or off. The valid values are: • Yes	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• No **Note:** By default the value of this option type is set to **Yes**.	

5. Modify the required details in the **Main** section.
6. Modify the required accumulation parameters in the level funded pricing rule.
7. Modify the final settlement rules in the level funded pricing rule.
8. Define, edit, or remove characteristics of the level funded pricing rule, if required.
9. Click **Save**.
   The changes made to the level funded pricing rule are saved.

Deleting a Level Funded Pricing Rule of a Parent Customer

Procedure

To delete a level funded pricing rule of a parent customer:

1. Search for a parent customer in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the parent customer whose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. In the **Parent Customer Pricing Rules** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the level funded pricing rule that you want to delete.
   A message appears confirming whether you want to delete the level funded pricing rule.

> **Note:** You can delete a level funded pricing rule when it is not yet used in the system.

5. Click **OK**.
   The level funded pricing rule of a parent customer is deleted.

Viewing the Details of a Level Funded Pricing Rule Defined for a Policy of a Parent Customer

Procedure

To view the level funded pricing rule details of a parent customer:

1. Search for a parent customer whose pricing details you want to view in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the parent customer whose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. In the **Parent Customer Pricing Rules** zone, click the link in the **Pricing Rule Information** column corresponding to the pricing rule type whose details you want to view.
   The **Pricing Rule** screen appears. It contains the following zone:
   - **Level Funding** - Displays the level funded pricing rule of a parent customer. It contains the following sections:
     - **Main** - Displays basic details of the level funded pricing rule.
     - **Accumulation Parameters** - Displays the accumulation parameters defined for a parent customer in the level funded pricing rule.
     - **Final Settlement Rules** - Displays the final settlement rules defined for the level funded pricing rule.
     - **Characteristics** - Displays the characteristics defined for the level funded pricing rule.
5. View the basic details of the level funded pricing rule in the **Main** section.
6. View the accumulation parameters defined for a parent customer in the **Accumulation Parameters** section.
7. View the final settlement rules defined for the level funded pricing rule in the **Final Settlement Rules** section.
8. View the characteristics of the level funded pricing rule in the **Characteristics** section.

Defining Accumulation Parameters in a Level Funded Pricing Rule

Procedure

To define accumulation parameters in a level funding pricing rule:

1. Ensure that the **Accumulation Parameters** section is expanded when you have selected an option from the **Price Item** field of the **Main** section while defining a level funded pricing rule.

   The **Accumulation Parameters** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Accumulation Group ID	Displays a blank field. An accumulation group ID is generated when accumulation parameter values are defined for a level funded pricing rule.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: It is a read-only field.	
Settlement Account ID	Used to indicate the account ID to whom the settlement amount is credited.	Yes
Incurred Start Date	Displays the incurred start date (inherited from parent customer's specific stop-loss pricing rule) based on which you want to accumulate the level funded pricing. **Note:** It is a read-only field.	Not applicable
Incurred End Date	Displays the incurred end date (inherited from parent customer's specific stop-loss pricing rule) based on which you want to accumulate the level funded pricing. **Note:** It is a read-only field.	Not applicable
Paid Start Date	Displays the paid start date (inherited from parent customer's specific stop-loss pricing rule) based on which you want to accumulate the level funded pricing. **Note:** It is a read-only field.	Not applicable
Paid End Date	Displays the paid end date (inherited from parent customer's specific stop-loss pricing rule) based on which you want to accumulate the level funded pricing. **Note:** It is a read-only field.	Not applicable
Settlement Days	Used to indicate the number of days as the settlement days which help in calculating the settlement date. The valid values are: • 30 Days • 60 Days • 90 Days • 120 Days • 150 Days • 180 Days **Note:** Settlement date is calculated as the pricing end date, incurred end date, or paid end date whichever is later plus the settlement days.	Not applicable

2. Enter the required details in the **Accumulation Parameters** section.
3. Click **Save**.
   The accumulation parameters are defined in the level funded pricing rule.

Defining the Final Settlement Rules in a Level Funded Pricing Rule

Procedure

To define the final settlement rules in a level funded pricing rule:

1. Ensure that the **Final Settlement Rules** section is expanded when you are defining or editing a level funded pricing rule type.

   The **Final Settlement Rules** section contains the following sub-sections:

   - **Customer Renews** - Used to define the final settlement rules when the customer renews the contract.
   - **Customer Cancels** - Used to define the final settlement rules when the customer cancels the contract.
   - **Renewal Decision** - Used to indicate the status for the upcoming level funded contract.

   The **Customer Renews** sub-section contains the following fields:

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Final Settlement Mode</td><td>Displays the final settlement mode when the customer renews the level funded agreement. The valid values are:
Final Settlement Surplus
Final Settlement Deficit</td><td>Not applicable</td></tr>
<tr><td>Final Settlement Option</td><td>Used to indicate the final settlement option when the customer renews the level funded agreement.
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Final Settlement Surplus</td><td>Used to indicate the final settlement option in case of surplus.</td><td>Yes</td></tr>
<tr><td>Final Settlement Deficit</td><td>Used to indicate the final settlement option in case of deficit.</td><td>Yes</td></tr>
</table></td><td>Not applicable</td></tr>
<tr><td>Flat/Percentage</td><td>Used to indicate the final settlement payment type when the customer renews the level funded agreement.
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Final Settlement Surplus</td><td>Used to indicate the payment type in case of surplus. The valid values are:
Flat Dollar
Percentage</td><td>Yes</td></tr>
</table></td><td>Not applicable</td></tr>
</table>

Defining a Characteristic for a Level Funded Pricing Rule

Prerequisites

To define a characteristic for a level funded pricing rule, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule**).

Procedure

To define a characteristic for a level funded pricing rule:

1. Ensure that the **Characteristics** section is expanded when you are defining or editing a *l*evel funded pricing rule.

   The **Characteristics** section contains the following fields in the grid:

Column Name	Column Description	Mandatory (Yes or No)
Effective Date	Used to specify the date from when the characteristic is effective for a level funded pricing rule.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for a level funded pricing rule.
Characteristic Type	Used to indicate the characteristic type. **Note:** The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule**.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for a level funded pricing rule.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for a level funded pricing rule.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the level funded pricing rule, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove a characteristic from the level funded pricing rule, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristics are defined for the level funded pricing rule.

Defining a Level Funded Pricing Rule for a Bill Group

Prerequisites

To define a level funded pricing rule for a bill group, you should have:

- Pricing rule type where the category is set to **Level Funded**.
- Price items associated with the level funded pricing rule type.
- Specific stop-loss pricing rule of the parent customer, whose accumulation parameters you want to inherit for level funding.
- Policy status defined in the application.

Procedure

To define a level funded pricing rule for a bill group:

1. Search for the Administrative Services Only (ASO) person, whose person type is set to **Bill Group**, in the **Customer 360° View** screen.

Copyright © 2026, Oracle and/or its affiliates.

2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the person *w*hose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears.
4. Click the **Broadcast** (📡) icon in the **Bill Group ASO Policy Information** zone, corresponding to the **Bill Group Information** column, whose bill group details *y*ou want to view.
   The **Bill Group ASO Policy Pricing Rules** zone is displayed.
5. Click the **Add** link in the upper right corner of the **Bill Group ASO Policy Pricing Rules** zone.

   The **Pricing Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Person Name	Indicates the name of the parent customer.	Not applicable
Person Type	Indicates the type of the parent customer. **Note:** If you are defining the pricing rule type for the parent customer, then the person type will be **Parent Customer**.	Not applicable
Pricing Rule Type	Used to indicate the pricing rule type using which you want to create a level funded pricing rule. **Note:** Select the **Level Funded Pricing Rule Type** option, as the pricing rule.	Yes **Note:** If the pricing rule type is not selected then the application displays an error message.
Pricing Group	Used to indicate the pricing group which is used while defining the pricing.	No
Policy Status	Used to indicate the policy status for the pricing rule. The valid values are: • In Force/Active • Runout	Yes (Conditional) **Note:** Policy Status is required once the Pricing Rule Type is selected.

6. Click **OK**.

   The **Level Funded (LF) Pricing Rule** screen appears. It contains the following sections:

   - **Customer Information** - Displays the information about the bill group. It contains the following columns:

Column Name	Column Description
Bill Group Information	Displays the bill group information.
Policy Start Date	Displays the date from when the policy is effective.
Policy End Date	Displays the date till when the policy is effective.
Policy Status	Indicates the policy status for the pricing rule.
Pricing Rule Type	Indicates the pricing rule type for whom the level funded pricing rule is created.

   - **Main** - Used to specify basic details in the level funding pricing rule.
   - **Accumulation Criteria** - Used to define the accumulation criteria in a level funded pricing rule.
   - **Pricing Information for rule type category : Claim** - Used to define the line items in a particular claim pricing rule or those which are associated with the level funded rule type category.

Copyright © 2026, Oracle and/or its affiliates.

- **Pricing Information for rule type category : Ancillary** - Used to define the line items in a particular ancillary pricing rule or those which are associated with the level funded rule type category.
- **Pricing Information for rule type category : Discount** - Used to define the discount arrangement pricing rule which is effective for level funding calculations.
- **Pricing Information for rule type category : Retention** - Used to define the retention pricing rule which is effective for level funding calculations.
- **Characteristics** - Used to define the characteristics for the level funded pricing rule.

Note:

The **Accumulation Criteria**, **Pricing Information for rule type category: Claim**, **Pricing Information for rule type category: Ancillary**, **Pricing Information for rule type category: Discount**, and **Pricing Information for rule type category: Retention** section appear when you specify a price item in the **Main** section.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item for which you want to define the level funded pricing rule.	Yes
Parent Customer's Pricing Rule	Used to indicate the date range of each specific stop-loss pricing rule, defined for the parent customer. **Note:** On selecting the specific stop-loss pricing rule of the parent customer, the level funded **Pricing Start Date** and **Pricing End Date** field is set automatically.	Yes
Pricing Start Date	Used to specify the date from when the level funded pricing rule is effective. **Note:** The pricing start date cannot be later than the pricing end date.	Not applicable
Pricing End Date	Used to specify the date till when the level funded pricing rule is effective. **Note:** The pricing end date cannot be earlier than the pricing start date.	Not applicable
Rate Option	Used to indicate the rate option that you want to use while defining the pricing for the price item.	Yes
Settlement Fund Price Item	Used to indicate the price item derived from the level funded pricing rule type, used to create the level funded pricing rule type.	Not applicable

7. Enter the required details in the **Main** section.
8. Define the accumulation criteria in the level funded pricing rule for a bill group.
9. Define the pricing information for the claim rule type category for a bill group.
10. Define the pricing information for the ancillary rule type category for a bill group, if required.
11. Define the pricing information for the discount rule type category for a bill group, if required.
12. Define the pricing information for the retention rule type category for a bill group, if required.
13. Define characteristics for the level funded pricing rule for a bill group, if required, if required.
14. Click **Save**.
    The level funded pricing rule is defined for a bill group.

Editing a Level Funded Pricing Rule of a Bill Group

Prerequisites

To edit a level funded pricing rule of a bill group, you should have:

- Business Object **C1-PricingRuleLevelFunded** defined for the level funded pricing rule.

Procedure

To edit a a level funded pricing rule of a bill group:

1. Search for a parent customer in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the parent customer whose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing** tab.
   The **Pricing** tab appears. It consists of the following zones:
   - **Parent Customer Pricing Rule Summary**
   - **Bill Group ASO Policy Information**
   - **Bill Group ASO Policy Pricing Rules**
   - **Bill Group Pricing Groups**
   - **Pricing Rule Approval Transactions**
4. Click the Broadcast (📡) icon in the **Bill Group ASO Policy Information** zone, corresponding to the **Bill Group Information** column, whose details you want to view.
   The **Bill Group ASO Policy Pricing Rules** zone appears.
5. Click the **Edit** (✎) icon in the **Bill Group ASO Policy Pricing Rules** zone, corresponding to the **Pricing Rule Type** column, whose details you want to edit.
   The **Level Funded (LF) Pricing Rule** screen appears. It contains the following sections:
   - **Customer Information** - Displays the customer information for the bill group.

Copyright © 2026, Oracle and/or its affiliates.

- **Main** - Used to specify basic details about the level funded pricing rule.
- **Accumulation Criteria** - Used to define the accumulation criteria in a level funded pricing rule.
- **Pricing Information for rule type category : Claim** - Used to define the line items in a particular claim pricing rule or those which are associated with the level funded rule type category.
- **Pricing Information for rule type category : Ancillary** - Used to define the line items in a particular ancillary pricing rule or those which are associated with the level funded rule type category.
- **Pricing Information for rule type category : Discount** - Used to define the discount arrangement pricing rule which is effective for level funding calculations.
- **Pricing Information for rule type category : Retention** - Used to define the retention pricing rule which is effective for level funding calculations.
- **Characteristics** - Used to define the characteristics for the level funded pricing rule.

The **Customer Information** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Bill Group Information	Displays the bill group information of the level funded pricing rule.	Not applicable
Policy Start Date	Displays the policy start date.	Not applicable
Policy End Date	Displays the policy end date.	Not applicable
Policy Status	Indicates the policy status for the level funded pricing rule. The valid values are: • In Force/Active • Post Runout • Runout	Not applicable
Pricing Rule Type	Indicates the pricing rule type for the level funded pricing rule.	Not applicable

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Indicates the price item.	Not applicable
Parent Customer's Pricing Rule	Indicates the pricing rule of the parent customer.	Not applicable
Pricing Start Date	Indicates the pricing rule start date.	Not applicable
Pricing End Date	Indicates the pricing rule end date.	Not applicable
Rate Option	Indicates the rate option to edit the level funded pricing rule for the price item.	Not applicable
Settlement Fund Item	Indicates the price item derived from the level funded pricing rule type, used to create the level funded pricing rule type.	Not applicable

6. Modify the details in the **Main** section.
7. Modify the accumulation criteria in a level funded pricing rule for a bill group.
8. Modify the pricing information for the claim rule type category for a bill group.
9. Modify the pricing information for the ancillary rule type category for a bill group, if required.
10. Modify the pricing information for the discount rule type category for a bill group, if required.
11. Modify the pricing information for the retention rule type category for a bill group, if required.

Copyright © 2026, Oracle and/or its affiliates.

12. Add, edit, or remove characteristics for the characteristics for a level funded pricing rule, if required.
13. Click **Save**.
    The changes made to a level funded pricing rule for a bill group are saved.

Defining Claim Pricing Information in a Level Funded Pricing Rule

Procedure

To define the claim pricing information in the level funded pricing rule:

1. Ensure that the **Pricing Information for rule type category : Claim** zone is expanded when you have selected an option from the **Price Item** field of the **Main** section while defining or editing a level funded pricing rule for a bill group.

   The **Pricing Information for rule type category : Claim** zone contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to indicate the claim pricing rule type effective for level funded pricing.	Yes
Derive Using	Used to indicate the method through which the claim pricing rule information is derived. The valid values are: • LF Line Items • Pricing Rules	Yes

   If **LF Line Items** option is selected from the **Derive Using** field, the following sub-sections appear:

   - **Domestic Provider Claims** - Used to specify the domestic provider claims while calculating the level funding line items.
   - **Markup or Markdown Values** - Used to define the markup or markdown values for level funding line items.
   - **Line Items** - Used to associate the line items which are eligible for billing.

   The **Domestic Provider Claims** section contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Exclude LF (Percentage)	Used to specify the billable charge line excluding the level funding charge in the percentage to create the domestic provider claim calculation lines.	No

   The **Markup or Markdown Values** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Strategy	Used to indicate the pricing strategy for the claim line items. The valid values are: • Markdown • Markup • None	Not applicable
Markup or Markdown Type	Used to indicate the markup or markdown value type for the claim line items. The valid values are: • Flat Amount • Percentage	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Markup or Markdown Amount	Used to specify the markup or markdown amount for the claim line items. **Note:** This field displays amount when **Markup or Markdown Type** field is set as **Flat Amount**.	Not applicable
Markup / Markdown Included in Settlement?	Used to specify whether markup or markdown amount should be included in the level funding settlement. The valid values are: • Yes • No **Note:** This field is required when **Flat Amount** option is selected from the **Markup or Markdown Type** field.	Yes (Conditional) **Note:** This field is required when **Flat Amount** option is selected from the **Markup or Markdown Type** field.

The **Line Items** section contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Line Item	Used to indicate the line item which is eligible for level funded pricing. **Note:** The **Search** (🔍) icon appears corresponding to the **Line Item** field. On clicking the **Search** (🔍) icon corresponding to the **Line Item** field, the **Pricing Rule Line Item Search** window appears. On specifying the pricing rule line item, the description of the pricing rule line item appears corresponding to the **Line Item** field.	No

If **Pricing Rule Type** option is selected from the **Derive Using** field, following sub-sections appear:

- **Claim Pricing Rule** - Used to indicate the claim pricing rule. It contains the following sub-sections:
  - **Domestic Provider Claims** - Used to specify the domestic provider claims while calculating the level funded pricing.
  - **Markup or Markdown Values** - Used to define the markup or markdown values for the billable charge line items.
  - **Line Items** - Used to associate the line items which are eligible for billing.

The **Claim Pricing Rule** section contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Effective Claim Pricing Rule	Used to indicate the claim pricing rule effective for level funded pricing.	No

Copyright © 2026, Oracle and/or its affiliates.

Note: If you are editing a bill group's level funded pricing rule for the **Claim** rule type category (where the bill group's pricing has ended), a**Reapply** button appears corresponding to the **Effective Claim Pricing Rule** field. You can select an effective claim pricing rule and click the **Reapply** button to set a new pricing for the claim rule type that is eligible for level funding.

The **Domestic Provider Claims** section contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Exclude LF (Percentage)	Used to specify the billable charge line excluding the level funding charge in the percentage to create the domestic provider claim calculation lines.	No

The **Markup or Markdown Values** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Strategy	Used to indicate the pricing strategy for the claim line items. The valid values are: • Markdown • Markup • None	Not applicable
Markup or Markdown Type	Used to indicate the markup or markdown value type for the claim line items. The valid values are: • Flat Amount • Percentage	Not applicable
Markup or Markdown Amount	Used to specify the markup or markdown amount for the claim line items. **Note:** This field displays amount when **Markup or Markdown Type** field is set as **Flat Amount**.	Not applicable
Markup / Markdown Included in Settlement?	Used to specify whether markup or markdown amount should be included in the level funding settlement. The valid values are: • Yes • No **Note:** This field is required when **Flat Amount** option is selected from the **Markup or Markdown Type** field.	Yes (Conditional) **Note:** This field is required when **Flat Amount** option is selected from the **Markup or Markdown Type** field.

The **Line Items** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Sequence	Displays the sequence number for the line items.	Not applicable
Line Item	Displays the billing line items.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Include in Settlement	Used to indicate whether the line item should be included in the level funded claim pricing settlement.	No
Markup or Markdown Included in Settlement	Used to indicate whether markup or markdown should be included in the level funded claim settlement.	No
Markup or Markdown Percentage Eligibility	Used to indicate whether the line item is eligible or not eligible for markup or markdown percentage. The valid values are: • Eligible • Not Eligible	Not applicable
Markup or Markdown Percentage	Used to indicate the percentage for markup or markdown value.	Not applicable

2. Enter the required details in the appropriate sections, based on the option that is selected from the **Derive Using** field.
3. If you want to add information for more than one claim pricing rule type to the level funded pricing rule, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove information of more than one claim pricing rule type from the level funded pricing rule, click the **Delete** (🗑) icon corresponding to the pricing rule type field.

4. Click **Save**.
   The claim line items are defined in the level funded pricing rule.

Defining Ancillary Pricing Information in a Level Funded Pricing Rule

Procedure

To define the ancillary pricing information in the level funded pricing rule:

1. Ensure that the **Pricing Information for rule type category : Ancillary** zone is expanded only when you have selected an option from the **Price Item** field of the **Main** section while defining or editing a level funded pricing rule for a bill group.

   The **Pricing Information for rule type category : Ancillary** zone contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to indicate the ancillary pricing rule type effective for level funded pricing.	Yes
Derive Using	Used to indicate the method through which the ancillary pricing rule information is derived. The valid values are: • Ancillary Billable Charge Line Type • Pricing Rules	Yes

Copyright © 2026, Oracle and/or its affiliates.

If **Ancillary Billable Charge Line Type** option is selected from the **Derive Using** field, the following sub-sections appear:

- **Billable Charge Line Types** - Used to associate the billable charge line items which are eligible for billing.

The **Billable Charge Line Types** section contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Billable Charge Line Type	Used to indicate the billable charge line type using which you want to create the calculation line for the charge (i.e. line item). **Note:** The **Search** (🔍) icon appears corresponding to the **Billable Charge Line Type** field. On clicking the **Search** icon, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Billable Charge Line Type** field.	Yes
Rate Based	Used to indicate that the billable charge line type is rate based.	No
Rate	Used to specify the rate for the billable charge line type. **Note:** This field is enabled when the **Rate Based** option is selected.	Yes (Conditional) **Note:** This field is required when the **Rate Based** option is selected.
Markup / Markdown Included in Settlement?	Used to indicate that markup or markdown amount must be included in the level funding settlement.	No
Pricing Strategy	Used to indicate the pricing strategy for the billable charge line items. The valid values are: • Markdown • Markup • None	Yes
Markup or Markdown Type	Used to indicate the markup or markdown type for the billable line items. The valid values are: • Flat Amount • Percentage **Note:** This field is enabled when the **Pricing Strategy** option is selected either as **Markup** or **Markdown**.	Yes (Conditional) **Note:** This field is required when the **Rate Based** option is selected either as **Markup** or **Markdown**.
Amount/Percentage	Used to specify the amount or percentage for markup or markdown value. **Note:** This field appears when the **Markup or Markdown Type** option is selected.	Yes (Conditional) **Note:** This field is required when the **Markup or Markdown Type** option is selected.

Copyright © 2026, Oracle and/or its affiliates.

If **Pricing Rule Type** option is selected from the **Derive Using** field, the following zone appears:

- **Ancillary Pricing Rule** - Used to indicate the ancillary pricing rule. It contains the following sub-section:
  - The **Billable Charge Line Types** - Used to define the billable charge line types for an ancillary pricing rule, eligible for level funding.

The **Ancillary Pricing Rule** section contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Effective Ancillary Pricing Rule	Used to indicate the ancillary pricing rule effective for level funded pricing.	No

Note: If you are editing a bill group's level funded pricing rule for the **Ancillary** rule type category (where the bill group's pricing has ended), a**Reapply** button appears corresponding to the **Effective Ancillary Pricing Rule** field. You can select an effective ancillary pricing rule and click the **Reapply** button to set a new pricing for the ancillary rule type that is eligible for level funding.

The **Billable Charge Line Types** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Sequence	Displays the sequence number for the line items.	Not applicable
Billable Charge Line Type	Used to indicate the billable charge line type using which you want to create the calculation line for the charge (i.e. line item). **Note:** The **Search** (🔍) icon appears corresponding to the **Billable Charge Line Type** field. On clicking the **Search** icon, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Billable Charge Line Type** field.	Not applicable
Include in Settlement	Used to indicate whether the billable charge line item should be included in the level funded ancillary pricing settlement.	Not applicable
Rate Based	Indicates that the billable charge line type is rate based.	Not applicable
Rate	Displays the rate for the billable charge line type.	Not applicable
Markup / Markdown Included in Settlement?	Used to indicate that markup or markdown amount must be included in the level funding settlement.	Not applicable
Pricing Strategy	Displays the pricing strategy for the billable charge line items. The valid values are: • Markdown • Markup • None	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Markup or Markdown Type	Indicates the markup or markdown type for the billable charge line items. The valid values are: • Flat Amount • Percentage **Note:** This field is enabled when the **Pricing Strategy** option is selected either as **Markup** or **Markdown**.	Not applicable
Amount/ Percentage	Displays the amount or percentage which is specified as the markup or markdown value.	Not applicable

2. Enter the required details in the appropriate sections, based on the option selected from the **Derive Using** field.
3. If you want to add information for more than one ancillary pricing rule type to the level funded pricing rule, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove information of more than one ancillary pricing rule type from the level funded pricing rule, click the **Delete** (🗑) icon corresponding to the pricing rule type field.

4. Click **Save**.
   The ancillary line items are defined in the level funded pricing rule.

Defining Discount Arrangement Pricing Information in a Level Funded Pricing Rule

Procedure

To define the discount arrangement pricing information in the level funded pricing rule:

1. Ensure that the **Pricing Information for rule type category : Discount** zone is expanded only when you have selected an option from the **Price Item** field of the **Main** section while defining or editing a level funded pricing rule for a bill group.

   The **Pricing Information for rule type category : Discount** zone contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to indicate the discount arrangement pricing rule type which is effective for level funding.	Yes
Derive Using	Used to indicate the method through which the discount arrangement pricing rule information is derived. The valid values are: • Pricing Rules	Yes

Copyright © 2026, Oracle and/or its affiliates.

On selecting the **Pricing Rule Type** option from the **Derive Using** field, the following sub-section appears:

- **Discount Pricing Rule** - Used to indicate the discount arrangement pricing rule. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Discount Pricing Rule	Used to indicate the discount arrangement pricing rule which is effective for level funding.	Yes

2. Select the appropriate discount arrangement pricing rule from the **Discount Pricing Rule** section.

> **Note:**
>
> On selecting the discount arrangement pricing rule, the system does not generate any line items for the discount arrangement pricing information. This discount arrangement pricing rule is used at the time of level funding calculations in the TFM module.

3. If you want to add information for more than one discount pricing rule type to the level funded pricing rule, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove information of more than one discount pricing rule type from the level funded pricing rule, click the **Delete** (🗑) icon corresponding to the pricing rule type field.

4. Click **Save**.
   The discount arrangement pricing information is defined in the level funded pricing rule.

Defining Retention Type Claim Based and/or Retention Type Enrollment Based Pricing Rule Information in a Level Funded Pricing Rule

Procedure

To define the retention type claim based and/or retention type enrollment based pricing rule information in a level funded pricing rule:

1. Ensure that the **Pricing Information for rule type category : Retention** zone is expanded when you have selected an option from the **Price Item** field of the **Main** section while defining or editing a level funded pricing rule for a bill group.

   The **Pricing Information for rule type category : Retention** zone contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Retention Rule Type	Used to indicate the retention type claim based and/or retention type enrollment based pricing rule type for the level funded pricing rule.	Yes
Price Item	Used to indicate the price item for the level funded pricing rule.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Price Item** field. On clicking the **Search** (🔍) icon corresponding to the **Price Item** field, the **Get Retention Type Pricing Rules** window appears. On specifying the retention type pricing rule, the description of the retention type pricing rule appears corresponding to the **Price Item** field.	

2. Select the appropriate **Retention Rule Type** and **Price Item** from the **Pricing Information for rule type category : Retention** zone.

> **Note:**
>
> Once the retention type claim based and/or retention type enrollment based pricing rule type is selected along with the price item, the system does not generate line items for the retention type claim/enrollment based pricing rule. This retention type claim/enrollment based pricing rule is used at the time of level funding calculations in the TFM module.

3. If you want to add more than one retention type claim based and/or retention type enrollment based pricing rule type to the level funded pricing rule, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove more than one retention type claim based and/or retention type enrollment based pricing rule type from the level funded pricing rule, click the **Delete** (🗑) icon corresponding to the pricing rule type field.

4. Click **Save**.
   The retention type claim based and/or retention type enrollment based pricing rules eligible for level funding are defined in the level funded pricing rule.

Defining a Characteristic for a Level Funded Pricing Rule

Prerequisites

To define a characteristic for a level funded pricing rule, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule**).

Procedure

To define a characteristic for a level funded pricing rule:

1. Ensure that the **Characteristics** section is expanded when you are defining or editing a *l*evel funded pricing rule.

   The **Characteristics** section contains the following fields in the grid:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
Effective Date	Used to specify the date from when the characteristic is effective for a level funded pricing rule.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for a level funded pricing rule.
Characteristic Type	Used to indicate the characteristic type. **Note:** The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule**.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for a level funded pricing rule.
Characteristic Value	Used to specify the value for the characteristic type. **Note:** If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for a level funded pricing rule.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the level funded pricing rule, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a characteristic from the level funded pricing rule, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristics are defined for the level funded pricing rule.

Minimum Premium Program

To keep up with the changing healthcare dynamics and reduce the rising cost of employer sponsored health plans, the Administrative Services Only (ASO) service providers are constantly thriving to develop innovative pricing models. The ASO service providers are at the forefront designing alternative funding arrangements by amalgamating fully-insured and self-funded plans to trade-off some of the disadvantages of traditional models. The alternative funding arrangements make the self-funded plans more viable to small and medium size employers who traditionally go for the fully-insured plans.

A minimum premium program (MPP) is a self-funded plan that is partly self-insured where an employer is responsible to pay for claims up to a certain level and the remaining is covered by the ASO service provider. A premium is charged to the employer by the ASO service provider for undertaking the risk, processing the claims and for providing all other administrative services.

The following terminologies are used with respect to the minimum premium program:

- **Minimum Premium** - A premium which is paid for the minimum premium program by the employer to the ASO service provider.
- **Capping Limit (i.e. MPP Limit)** - The claim amount within the MPP limit is paid by the employer; whereas the amount exceeding the MPP limit is paid by the ASO service provider.
- **Minimum Attachment Point (MAP)** - This is a guaranteed claim liability by an employer to safeguard the insurer from the financial risk if the enrollment is drastically declines.
- **Effective MPP Limit** - The MPP limit and MAP value whichever is greater is considered as the effective MPP limit.

Oracle Revenue Management and Billing provides the ability to setup the minimum premium program pricing model. You can define a minimum premium program pricing rule at the parent customer and bill group levels. You can define minimum premium program pricing rules for parent customers and bill groups from the **Customer 360° Information** screen. You can define a minimum premium program pricing rule using a minimum premium program pricing rule type.

Note: You cannot create a minimum premium program pricing rule type and a minimum premium program pricing rule through an inbound message.

A minimum premium program pricing rule type is not a primary pricing rule type. You must include a minimum premium program pricing rule type as a related pricing rule type in the claim or ancillary pricing rule types which are used for calculating the claim amount or ancillary charges, respectively.

While creating a minimum premium program pricing rule type, you need to do the following:

- Set the pricing rule type business object to **Minimum Premium Program Pricing Rule Type**
- Set the pricing rule type category to **Minimum Premium Program**
- Set the pricing rule business object to **Minimum Premium Program Pricing Rule**
- Specify algorithms for the following system events:

System Event	Algorithm
Accumulation Pre-Processing	C1-MPPACPREP
Account and Price Item Derivation	C1_ACCPRISL
Bill After Date Determination	C1_BAFTDRV
Bill Group Derivation	C1_TXNBGDRV
Final Settlement Derivation	C1-FSBCDV

- Specify the price items (i.e. services related to minimum premium program) for which you want to define pricing using a minimum premium program pricing rule
- Specify the rate options that you can use while defining pricing for a price item
- Specify different types of accounts to which the price item should be billed based on the priority

Copyright © 2026, Oracle and/or its affiliates.

> **Note:** Ideally, the price item parameters should not be specified in a minimum premium program pricing rule type. The price item parameters which are specified in the claim or ancillary pricing rule type are used for minimum premium program accumulation.

- Specify additional information, such as:
  - Pricing rule type and price item to derive the pricing rule using which the enrollment based MPP limit is calculated

    > **Note:** At present, we are not supporting flat MPP limit for the minimum premium program pricing model.
  - Off process request type using which the deficit should be roll forwarded during the policy renewal
  - MPP, surplus, and deficit billable charge line types using which you want to create the respective charges
  - Number of days before which you want to create a To Do for reminding the self-funded employer to renew the minimum premium program
- Specify the details for the minimum attachment point arrangement:
  - Pricing rule type and price item using which the minimum attachment point pricing rule should be created
  - Specify default values for the following:
    - **Minimum Attachment Point Arrangement Type** - Used to specify the method using which minimum attachment point should be calculated. The system supports the following methods:
      - **Enrollment Percentage of First Month** - Here, the minimum attachment point is calculated using the enrollment based percentage of the first month's MPP limit. For example, If the enrollment based percentage of the first month's MPP limit is set to 75, the system sets the minimum attachment point to (75*First Month's MPP Limit)/100.
      - **Enrollment Percentage of Previous Month** - Here, the minimum attachment point is calculated using the enrollment based percentage of the previous month's MPP limit. For example, If the enrollment based percentage of the previous month's MPP limit is set to 90, the system sets the minimum attachment point to (90*Previous Month's MPP Limit)/100.
      - **Flat Amount** - Here, the minimum attachment point is set to a flat amount.
    - **Default Arrangement Value** - Used to specify default percentage or flat amount for minimum attachment point. You can change the value (if required) while defining a minimum premium program pricing rule using the respective pricing rule type.
- Specify settlement rules, such:
  - How to settle any deficit or surplus when the customer decides to cancel or renew the policy
  - Whether the system should close out or roll forward the deficit or surplus on policy renewal
  - Whether the system should close out the deficit or surplus on policy cancelation

Once a minimum premium program pricing rule type is defined, you can create minimum premium program pricing rules using the minimum premium program pricing rule type. While defining a minimum premium program pricing rule for a parent customer, you need to specify the following:

- Minimum premium program accumulation price item for which you want to define the pricing
- Specific stop-loss pricing rule of the parent customer whose accumulation parameters you want to inherit for the minimum premium program. On selecting a specific stop-loss pricing rule, the minimum premium program pricing date range is set automatically. The minimum premium program pricing date range is same as the specific stop-loss pricing rule.
- Rate option that you want to use while defining the minimum premium program pricing
- Settlement frequency which helps to determine the bill after date. The valid values are:
  - **Immediately** - If you select this option from the list, the bill after date is not calculated. The minimum premium program settlement billable charge is billed immediately in the next bill cycle.
  - **Manually (At Required Intervals)** - If you select this option from the list, the bill after date which is specified in the **Manual Settlement Bill After Date** parameter while executing the **C1-BCMPP** batch is stamped on the minimum premium program settlement billable charge.
  - **Monthly** - If you select this option from the list, the bill after date is set as per the bill cycle.

Copyright © 2026, Oracle and/or its affiliates.

- **Yearly** - If you select this option from the list, the bill after date is set to the pricing end date in the minimum premium program settlement billable charge.
- **On Settlement** - If you select this option from the list, the bill after date is set to the settlement date in the minimum premium program settlement billable charge.

Note: The accumulation parameters, such as incurred start date, incurred end date, paid start date, paid end date, and settlement days are automatically inherited from the parent customer's specific stop-loss pricing rule. You cannot change any accumulation parameter except the settlement days.

- Settlement days which helps to calculate the settlement date (which is pricing end date, incurred end date, or paid end date whichever is later + the settlement days)
- Settlement account for which the minimum premium program settlement billable charge should be created
- Minimum premium attachment point and its value using which the effective MPP limit is calculated
- Whether the customer would like to renew or cancel the minimum premium program

However, while defining a minimum premium program pricing rule for a bill group, you need to specify the following:

- The policy status in which the minimum premium program pricing rule is applicable.
- Minimum premium program accumulation price item for which you want to define the pricing
- Parent customer's minimum premium program pricing rule from which you want to inherit the accumulation parameters.

Note: The pricing date range is derived from the parent customer's minimum premium program pricing rule because the minimum premium program pricing rules of parent customer and bill group should have the same date range.

- Rate option that you want to use while defining the minimum premium program pricing
- Accumulation criteria that indicates the price items whose charges can be accumulated against the minimum premium program accumulation price item so that it can be settled against the minimum premium program premium.
- Whether the line items and markup or markdown in a particular claim pricing rule should be accumulated for minimum premium program.

  OR

  Whether the line items which are associated with the **Minimum Premium Program** pricing rule type category should be accumulated for minimum premium program.
- Whether the charges created using the billable charge line types in a particular ancillary pricing rule should be accumulated for minimum premium program.

  OR

  Whether the charges created using the billable charge line types where the **Pricing Rule Type Category** characteristic is set to **Ancillary** should be accumulated for minimum premium program.
- Whether the charges calculated using the retention type claim based or retention type enrollment based pricing for a price item should be accumulated for minimum premium program.

Once a minimum premium program pricing rule is defined for a bill group, the system creates a price assignment in a price list and assigns the price list to the bill group.

You must create an algorithm using the **C1-ASOEXPOS** algorithm type and attach it to the **TFM - Rate Post-Processing** algorithm spot of the division to which the bill group's account belongs. Otherwise, erroneous results might occur. For more information about the algorithm, refer to the application.

The following new batches are introduced in this release:

- **C1-ACMPP** - This batch is used to accumulate the minimum premium program billable charges which are to be settled against the minimum premium program premium. It creates an accumulation record for an active accumulation group of an account whose bill cycle window is open. It calculates the following:
  - Minimum Attachment Point
  - MPP Limit (Enrollment X MPP Limit Rate)
  - Effective MPP Limit

Copyright © 2026, Oracle and/or its affiliates.

- Cumulative MPP Limit
- Claims
- Specific Stop Loss (Credit)/Debit Adjustments
- Net Claims
- Cumulative Net Claims
- Max Claim Liability (Monthly Billed Claim)
- Cumulative Billed Claims
- Minimum Premium Adjustment Amount
- Cumulative Surplus/Deficit
- Roll Forward Charge

This batch also invokes algorithms which are attached to the **Accumulation Pre-Processing** and **Accumulation Post-Processing** system events in the respective pricing rule type and accordingly updates the accumulation record.

- **C1-BCMPP** - This batch is used to create a billable charge for a minimum premium program accumulation records. The charge contains the minimum premium adjustment amount which is calculated by the **C1-ACMPP** batch. This batch also creates the roll forward billable charge on the successive pricing rule, if applicable, based on the settlement configuration. It calculates and stamps the bill after date on the minimum premium program settlement billable charge.

  This batch also invokes algorithms which are attached to the **Accumulation Billable Charge Pre-Processing** and **Accumulation Billable Charge Post-Processing** system events in the respective pricing rule type and accordingly updates the minimum premium program settlement billable charge.
- **C1-CMMPP** - This batch is used to do the following:
  - Update the MPP billable charge ID on the respective transaction legs in the **CI_TXN_DTL_PRITM** table
  - Mark the transaction as **COMP** if it is in **IGNR** status in the **CI_TXN_DETAIL** table
  - Update the transaction aggregation criteria of the corresponding records in the **CI_TXN_CALC** table to **RITA**

You can opt to configure approval workflow for a minimum premium program pricing rule. The **C1PRRLMPPN** approval workflow group is shipped for the minimum premium program pricing rules. You need to create an appropriate approval workflow chain, approval workflow criterion type, approval workflow group chain linkage, and approval workflow settings for the **C1PRRLMPPN** approval workflow group. Once the approval workflow configuration is done, ensure that **C1PRRLMPPN** is specified in the **Approval Workflow Group for MPP** option type of the **C1-ASOBLLNG** feature configuration.

The following enhancements are made to the **Minimum Premium Program** pricing:

- Until now, when a deficit amount was rolled forward to the successive contract (that is, to the successive MPP pricing rule) during renewal as part of the final settlement process, the system incorrectly calculated the roll-forward billable charge. The system considered the arrangement value specified in the deficit settlement rule while calculating the roll forward billable charge amount. For example, if the arrangement value was set to 90% in the deficit settlement rule, the system roll-forwarded 90% , the system roll-forwarded 90% of cumulative deficit amount and retained 10% of cumulative deficit amount. Now, while creating a roll-forward billable charge using an MPP pricing rule on final settlement, the system roll-forwards 10% of cumulative deficit amount on the successive contract and retains 90% of cumulative deficit amount.
- Earlier, the **Minimum Premium Attachment Point** field was mandatory while defining a **Minimum Premium Program** pricing rule. Now, this field is non mandatory. Until you select any value from the **Minimum Premium Attachment Point** list, the system, by default, sets the minimum premium attachment point value to **zero (0)**. In addition, the **Minimum Premium Attachment Point Value** field is non-editable. The **Minimum Premium Attachment Point Value** field is editable only when you select any value from the **Minimum Premium Attachment Point** list.
- A new column named **Arrangement Value Editable** is available in the **Settlement Rules** section while defining a minimum premium program pricing rule type. If you select the **Arrangement Value Editable** option corresponding to the settlement rule, you can edit the arrangement value while defining a minimum premium program pricing rule using the respective pricing rule type. However, if you do not select the **Arrangement Value Editable** option corresponding to the settlement rule, you cannot edit the default arrangement value derived from the respective pricing rule type.

Defining a Minimum Premium Program Pricing Rule Type

Prerequisites

To define a minimum premium program pricing rule type, you should have:

- Minimum premium program pricing rule type business objects defined in the application.
- Minimum premium program pricing rule business objects defined in the application.
- Pricing rule type category for minimum premium program defined in the application.

Procedure

To define a minimum premium program pricing rule type:

1. Click the **Menu** (☰) icon in the **Application** toolbar.
   A list appears.
2. Click the **Admin Menu** option from the list.
   A sub menu appears.
3. Select **P** and then click the **Add** button corresponding to the **Pricing Rule Type** option from the sub menu.

   The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type Business Object	Used to indicate the business object using which you want to create the minimum premium program pricing rule type. The valid value is: • **Minimum Premium Program Pricing Rule Type (i.e., C1-PricingRuleTypeMPP)** - Enables you to maintain a minimum premium program pricing rule type. **Note:** The above business object is shipped with the product. The list includes those business objects which are created using the **Pricing Rule Type** (i.e., **C1-PRCRLTYPE**) maintenance object.	Yes

Tip: Alternatively, you can access the **Select Business Object** screen by clicking the **Add** button in the **Page Title** area of the **Pricing Rule Type** screen.

4. Select the required minimum premium program pricing rule type business object from the respective field.
5. Click **OK**.

   The **Minimum Premium Program Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify the basic details for the minimum premium program pricing rule type.
   - **Algorithms** - Used to associate the algorithms with a minimum premium program pricing rule type.
   - **Additional Data** - Used to specify the additional information about the minimum premium program pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the minimum premium program pricing rules using the minimum premium program pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters in the minimum premium program pricing rule type.
   - **Characteristics** - Used to define the characteristics for the minimum premium program pricing rule type.
   - **Minimum Premium Program - Specific Additional Data** - Used to define the minimum premium program specific additional data in the minimum premium program pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

- **Minimum Attachment Arrangement Detail** - Used to define the minimum attachment arrangement details that are used while defining the minimum premium program pricing rule type.
- **Settlement Rules** - Used to define the settlement rules for the minimum premium program pricing rule type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to specify the minimum premium program pricing rule type.	Yes
Description	Used to specify the description for the minimum premium program pricing rule type.	Yes
Detailed Description	Used to specify additional information about the minimum premium program pricing rule type. **Note:** You can resize the text box depending on your requirement by clicking the **Resize Handle** (⇲) icon at the bottom right corner of the text box.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the minimum premium program pricing rule type. The valid values is: • Minimum Premium Program Pricing Rule **Note:** The above mentioned business object is shipped with the product. The list includes those business objects which are created using the **Pricing Rule** (i.e., **C1-PRCRULE**) maintenance object.	Yes
Business Object	Indicates the business object using which you are defining the minimum premium program pricing rule type.	Not applicable
Status	Used to indicate the status of the minimum premium program pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to indicate whether the minimum premium program pricing rule type is primary or not. **Note:** A minimum premium program pricing rule type is not a primary pricing rule type.	No
Pricing Rule Type Category	Used to indicate the pricing rule type category for the minimum premium program pricing rule type. The valid value is: • Minimum Premium Program **Note:** The list includes only those values which are defined in the **PRC_RULE_TYPE_CAT** lookup field.	Yes

6. Enter the required details in the **Main** section.
7. Ensure that **Primary** option is not selected when you are defining a minimum premium program pricing rule type.
8. Associate the required algorithms with the minimum premium program pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

9. Define additional data for the minimum premium program pricing rule type, if required.
10. Add the pricing items in the minimum premium program pricing rule type, if required.
11. Add the price item parameters in the minimum premium program pricing rule type, if required.
12. Define characteristics for the minimum premium program pricing rule type, if required.
13. Define the minimum premium program specific additional data in the pricing rule type, if required.
14. Define, edit, or remove minimum attachment arrangement detail in the minimum premium program pricing rule type, if required.
15. Define, edit, or remove settlement rules in the minimum premium program pricing rule type, if required.
16. Click **Save**.
    The minimum premium program pricing rule type is defined.

Associating an Algorithm with a Minimum Premium Program Pricing Rule Type

Prerequisites

To associate algorithm with a minimum premium program pricing rule type, you should have:

- An algorithm defined using the **C1-MPPACPREP** algorithm type.
- An algorithm defined using the **C1_ACCPRISL** algorithm type.
- An algorithm defined using the **C1_BAFTDRV** algorithm type.
- An algorithm defined using the **C1_TXNBGDRV** algorithm type.

Copyright © 2026, Oracle and/or its affiliates.

- An algorithm defined using the **C1-FSBCDV** algorithm type.

Procedure

To associate algorithms with a minimum premium program pricing rule type:

1. Ensure that the **Algorithms** section is expanded when you are defining or editing a minimum premium program pricing rule type.

   The **Algorithms** section contains the following columns:

Column Name	Column Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to invoke the algorithm. The valid values are: • **Accumulation Pre-Processing** - Used to execute logic to determine the minimum and maximum premium attachment point value amount and its related fields cumulative limit, cumulative limit original, cumulative limit delta and cumulative monthly maximum amount. • **Account and Price Item Derivation** - Used to derive the account and price item for a membership. • **Bill After Date Determination** - Used to set the bill after date to the end date of the aggregation schedule period in which the transaction date falls. • **Bill Group Derivation** - Used to derive the bill group, parent customer, and policy for a membership. • **Final Settlement Derivation** - Used to perform final settlement accumulation processing base on final settlement rule define on pricing rule.	Yes
Sequence	Used to specify the order in which the algorithms for each system event must be executed. **Note:** This field is enabled when an option is selected from the **System Event** field.	Yes (Conditional) **Note:** This field is required when an option is selected from the **System Event**field.
Algorithm	Used to indicate the algorithm that you want to attach to the system event. **Note:** This field is enabled when an option is selected from the **System Event** field. Once you select the system event, the **Search** (🔍) icon appears corresponding to the **Algorithm** field. On clicking the **Search** (🔍) icon, the **Algorithm Search** window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the **Algorithm** field.	Yes (Conditional) **Note:** This field is required when an option is selected from the **System Event** field.

2. Enter the following details in the **Algorithms** section:

Copyright © 2026, Oracle and/or its affiliates.

System Event	Algorithm	Algorithm Type	Description
Accumulation Pre-Processing	C1-MPPACPREP	C1-MPPACPREP	Minimum Premium Program Accumulation Pre-Processing
Account and Price Item Derivation	C1_ACCPRISL	C1_ACCPRISL	Account and Price Item Derivation For Stop Loss and Level Funded
Bill After Date Determination	C1_BAFTDRV	C1_BAFTDRV	Bill After Date Determination
Bill Group Derivation	C1_TXNBGDRV	C1_TXNBGDRV	Derive Bill Group
Final Settlement Derivation	C1-FSBCDV	C1-FSBCDV	Final Settlement Accumulation Processing

3. If you want to associate more than one algorithm with the minimum premium program pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to disassociate an algorithm from the minimum premium program pricing rule type, click the **Delete** (🗑) icon corresponding to the algorithm.

4. Click **Save**.
   The algorithms are associated with the minimum premium program pricing rule type.

Defining the Additional Data for a Minimum Premium Program Pricing Rule Type

Prerequisites

To define the additional data for a minimum premium program pricing rule type, you should have:

- Post run out write-off adjustment type defined in the application.
- Rule based price item eligibility field defined in the application.

Procedure

To define the additional data for a minimum premium program pricing rule type:

1. Ensure that the **Additional Data** section is expanded when you are defining or editing a pricing rule type.

> **Note:** This section does not appear when the **Pricing Rule Type Category** is **Flat Fees**.

   The **Additional Data** section contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Eligible for Specific Stop-Loss	Used to indicate whether the price items included in the pricing rule type are eligible for specific stop-loss. The valid values are: • Yes • No **Note:** By default, the value is set to **No**. This field appears when the **Pricing Rule Type Category** is either **Ancillary**, **Claim**, **Discount Arrangement**, **Retention Type Claim Based**, or **Retention Type Enrollment Based**.	No
Eligible for Level Funding	Used to indicate whether the price items included in the pricing rule type are eligible for level funding. The valid values are: • Yes • No **Note:** By default, the value is set to **No**. This field appears when the **Pricing Rule Type Category** is either **Ancillary**, **Claim**, **Discount Arrangement**, **Retention Type Claim Based**, or **Retention Type Enrollment Based**.	No
Eligible for Minimum Premium Program	Used to indicate whether the pricing rule type is eligible for minimum premium program. The valid values are: • Yes • No **Note:** By default, this field is set to **No**. This field appears when the **Pricing Rule Type Category** is either **Ancillary**, **Claim**, **Discount Arrangement**, **Retention Type Claim Based**, or **Retention Type Enrollment Based**.	No
Run-in Identifier Value	Used to specify the identifier value to determine whether the transaction is received during the run-in period of the policy.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field appears when either of the following **Pricing Rule Type Category** is selected: • Aggregate Stop-Loss • Ancillary • Claim • Discount Arrangement • Level Funded • Minimum Premium Program • Pass-Through Billable Charge • Retention Type Claim Based • Retention Type Enrollment Based • Specific Stop-Loss	
Third Party Identifier Value	Used to specify the identifier value to determine whether the transaction is received from an external source system. **Note:** This field appears when either of the following **Pricing Rule Type Category** is selected: • Aggregate Stop-Loss • Ancillary • Claim • Discount Arrangement • Level Funded • Minimum Premium Program • Pass-Through Billable Charge • Retention Type Claim Based • Retention Type Enrollment Based • Specific Stop-Loss	No
Accumulation Only Identifier Value	Used to specify the value when received in a transaction indicates that the transaction should only be considered for calculating specific stop-loss and aggregate stop-loss. In such case, a transaction leg is not derived for the transaction. **Note:** This field appears when either of the following **Pricing Rule Type Category** is selected: • Aggregate Stop-Loss • Ancillary • Claim • Discount Arrangement • Level Funded • Minimum Premium Program • Pass-Through Billable Charge • Retention Type Claim Based • Retention Type Enrollment Based • Specific Stop-Loss	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Eligible for Write-Off in Post Runout	Used to indicate whether the pricing rule is eligible for write-off in post runout. The valid values are: • Yes • No For more information, refer to the Write-Off Charges during Post Runout on page 2963 section. **Note:** By default, the value is set to **No**. This field appears when either of the following **Pricing Rule Type Category** is selected: • Aggregate Stop-Loss • Ancillary • Claim • Discount Arrangement • Level Funded • Minimum Premium Program • Pass-Through Billable Charge • Retention Type Claim Based • Retention Type Enrollment Based • Specific Stop-Loss	No
Post Runout Write-Off Adjustment Type	Used to specify the adjustment type using which the post runout write-off adjustments must be created. **Note:** This field appears when the **Eligible for Write-Off in Post Runout** field is set to **Yes**. The **Search** (🔍) icon appears corresponding to the **Post Runout Write-Off Adjustment Type** field. On clicking the **Search** icon, the **Adjustment Type Search** window appears. On specifying the adjustment type, the description of the adjustment type appears corresponding to the **Post Runout Write-Off Adjustment Type** field.	Yes (Conditional) **Note:** This field is required when the **Eligible for Write-Off in Post Runout** field is set to **Yes**.
Rule Based Price Item Eligibility Field	Used to indicate the transaction field which you want to use in the rules as the output parameter to determine whether the price item should be considered for billing. For more information, refer to the Price Item Eligibility on page 3465.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field appears when either of the following **Pricing Rule Type Category** is selected: • Aggregate Stop-Loss • Ancillary • Claim • Discount Arrangement • Level Funded • Minimum Premium Program • Pass-Through Billable Charge • Retention Type Claim Based • Retention Type Enrollment Based • Specific Stop-Loss The **Search** (🔍) icon appears corresponding to the **Rule Based Price Item Eligibility Field** field. On clicking the **Search** icon, the **Field Search** window appears. On specifying the field name, the description of the field name appears corresponding to the **Rule Based Price Item Eligibility Field**.	
Rule Based Eligibility Value	Used to specify the value which the output parameter in the rule should return when the price item and related pricing rule type in the pricing rule type should be considered for processing. **Note:** This field appears when either of the following **Pricing Rule Type Category** is selected: • Aggregate Stop-Loss • Ancillary • Claim • Discount Arrangement • Level Funded • Minimum Premium Program • Pass-Through Billable Charge • Retention Type Claim Based • Retention Type Enrollment Based • Specific Stop-Loss	Yes (Conditional) **Note:** This field is required when a value is specified in the **Rule Based Price Item Eligibility Field** field.

2. Enter the required details in the **Additional Data** section.
3. Click **Save**.
   The additional data is defined for the minimum premium program pricing rule type.

Adding a Price Item in a Minimum Premium Program Pricing Rule Type

Prerequisites

To add a price item in a minimum premium program pricing rule type, you should have:

- Price items defined in the application.
- Rate options defined in the **Rate Option (C1-ExtLookRetTypeRateOpt)** extendable lookup.
- Values defined for the **Invoice Type (C1INVTYP)** characteristic type.
- The **C1INVTYP** characteristic type set in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration.
- Rule types defined in the application (where the rule type usage is set to **Price Item Eligibility**).

Procedure

To add a price item in a minimum premium program pricing rule type:

1. Ensure that the **Price Items** section is expanded when you are defining or editing a minimum premium program pricing rule type.

   The **Price Items** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item that you want to include in a pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Price Item** field. On clicking the **Search** (🔍) icon, the **Price Item Search** window appears. On specifying the price item, the description of the price item appears corresponding to the **Price Item** field.	Yes (Conditional) **Note:** This field is required when you are adding a rate option and bill to account in the pricing rule type.
Rate Option	Used to indicate one or more rate options which are valid for a price item while defining the pricing rule type. **Note:** This field does not appear when the **Benefit** or **Flat Fees** option is selected from the **Pricing Rule Type Category** field in the **Main** section.	Not applicable
Bill To Account	Used to indicate a order in which the account bills the respective price item.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Eligibility Rule Type	Used to indicate the rule type which indicates the rules that should be executed to determine whether the price item is eligible for billing. **Note:** The list includes only those eligibility rule types which are already defined in the system.	No
Rate Guarantee	Used to indicate whether the rate guarantee is applicable for the respective price item. **Note:** This field appears when the **Age Based** or **Tier Based** option is selected from the **Pricing Rule Type Category** field in the **Main** section.	No
Proration Required	Used to indicate whether the system will prorate the charges of the respective price item whenever required during membership enrolment or termination. **Note:** This field appears when the **Benefit** option is selected from the **Pricing Rule Type Category** field in the **Main** section.	No
Sponsored	Used to indicate that the system should consider the sponsor billing arrangement while creating and billing the charge for the price item. **Note:** If the **Sponsored** option is not selected, the system considers retiree billing arrangement while creating and billing the charge for the price item. This field appears when the **Discount Charge** option is selected from the **Pricing Rule Type Category** field in the **Main** section.	No

On clicking the **Add** (+) icon in the **Rate Option** field, the following field appears in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Rate Option	Used to indicate the rate option that you want to use while defining pricing for the price item. **Note:** The list includes only those rate options which are already defined in the system.	Yes

Note:

If you want to define more than one rate option to the price item in a minimum premium program pricing rule type, click the **Add** (+) icon.

However, if you want to remove a rate option from the price item in a minimum premium program pricing rule type, click the **Delete** (🗑) icon corresponding to the **Rate Option** field.

On clicking the **Add** (+) icon in the **Bill To Account** field, the following field appears in a grid:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Priority	Used to specify the order in which the invoice type is considered for a price item.	Yes
Invoice Type	Used to indicate the invoice type which is considered for billing. For more information, refer to the section. **Note:** The **Search** (🔍) icon appears corresponding to the **Invoice Type** field. On clicking the **Search** icon, the **Invoice Type Search** window appears.	Yes

Note:

If you want to define more than one invoice type to the price item in a minimum premium program pricing rule type, click the **Add** (+) icon.

However, if you want to remove a invoice type from the price item in a minimum premium program pricing rule type, click the **Delete** (🗑) icon corresponding to the **Priority** field.

2. Enter the required details in the **Price Items** section.
3. If you want to define more than one price item for a minimum premium program pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a price item from a minimum premium program pricing rule type, click the **Delete** (🗑) icon corresponding to the price item.

4. Click **Save**.
   The price items are added for a minimum premium program pricing rule type.

Related Topics

Adding a Price Item Parameter in a Minimum Premium Program Pricing Rule Type

Prerequisites

To add a price item parameter in a minimum premium program pricing rule type, you should have:

- Price item parameters defined in the application.
- Transaction fields defined in the application.

Procedure

To add a price item parameter in a minimum premium program pricing rule type:

Copyright © 2026, Oracle and/or its affiliates.

1. Ensure that the **Price Item Parameters** section is expanded when you are defining or editing a minimum premium program pricing rule type.

   The **Price Item Parameters** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item Parameter	Used to specify the price item parameter which you can use while defining a minimum premium program pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Price Item Parameter** field. On clicking the **Search** (🔍) icon, the **Parameter Search** window appears. On specifying the price item parameter, the description of the price item parameter appears corresponding to the **Price Item Parameter** field.	Yes (Conditional) **Note:** This field is required when you are adding a price item parameter in a minimum premium program pricing rule type.
Transaction Field	Used to specify the transaction field from where the data should be retrieved. **Note:** This field appears when either of the following option is selected from the**Pricing Rule Type Category** field in the **Main** section: • Aggregate Stop-Loss • Ancillary • Claim • Discount Arrangement • Level Funded • Minimum Premium Program • Retention Type Claim Based • Retention Type Enrollment Based • Specific Stop-Loss On clicking the **Search** (🔍) icon corresponding to the **Transaction Field** field, the **Transaction Field Search** window appears. On specifying the transaction field, the description of the transaction field appears corresponding to the **Transaction Field**.	Yes (Conditional) **Note:** This field is required once the price item parameter is specified.
Eligible for Specific Stop-Loss	Used to indicate whether price items included in the pricing rule type are eligible for specific stop-loss.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field appears when either of the following option is selected from the**Pricing Rule Type Category** field in the **Main** section: • Ancillary • Claim • Discount Arrangement • Pass-Through Billable Charge • Retention Type Claim Based • Retention Type Enrollment Based	
Eligible for Level Funding	Used to indicate whether price items included in the pricing rule type are eligible for level funding. **Note:** This field appears when either of the following option is selected from the**Pricing Rule Type Category** field in the **Main** section: • Ancillary • Claim • Discount Arrangement • Pass-Through Billable Charge • Retention Type Claim Based • Retention Type Enrollment Based	No
Eligible for Minimum Premium Program	Used to indicate whether price items included in the pricing rule type are eligible for minimum premium program. **Note:** This field appears when either of the following option is selected from the**Pricing Rule Type Category** field in the **Main** section: • Ancillary • Claim • Discount Arrangement • Pass-Through Billable Charge • Retention Type Claim Based • Retention Type Enrollment Based	No

Note: Ideally, the price item parameters should not be specified in a minimum premium program pricing rule type. The price item parameters which are specified in the claim or ancillary pricing rule type are used for minimum premium program accumulation.

2. Enter the required details in the **Price Item Parameters** section.
3. If you want to add more than one price item parameter for a minimum premium program pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a price item parameter from a pricing rule type, click the **Delete** (🗑) icon corresponding to the price item parameter.

4. Click **Save**.

Copyright © 2026, Oracle and/or its affiliates.

The price item parameter is added for a minimum premium program pricing rule type.

Defining a Characteristic for a Minimum Premium Program Pricing Rule Type

Prerequisites

To define a characteristic for a minimum premium program pricing rule type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule Type**)

Procedure

To define a characteristic for a minimum premium program pricing rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining or editing a minimum premium program pricing rule type.

   The **Characteristics** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule Type**.	**Note:** This field is required when you are defining a characteristic for the minimum premium program pricing rule type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for the minimum premium program pricing rule type.

2. Enter the required details in the **Characteristics** section.

Copyright © 2026, Oracle and/or its affiliates.

3. If you want to define more than one characteristic for the minimum premium program pricing rule type, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove a characteristic from the minimum premium program pricing rule type, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristic is defined for the minimum premium program pricing rule type.

Defining the Specific Additional Data for a Minimum Premium Program Pricing Rule Type

Prerequisites

To define the specific additional data in a minimum premium program pricing rule type, you should have:

- Limit arrangements defined in the application.
- A rule type defined for **Markup or Markdown Eligibility Rule Type** and **Domestic Provider Eligibility Rule Type** field.

Procedure

To define the specific additional data for a minimum premium program pricing rule type:

1. Ensure that the **Minimum Premium Program - Specific Additional Data** section is expanded when you are defining or editing a minimum premium program pricing rule type.

   The **Minimum Premium Program - Specific Additional Data** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Limit Arrangement	Used to indicate the MPP limit for the minimum premium program pricing model. The valid values are: • Enrollment Based Premium • Flat Rate Based Premium **Note:** The list includes only those processes which are added in the **LIMIT_ARRANGEMENT_FLG** lookup field.	Yes
Limit Arrangement Pricing Rule Type	Used to indicate the limit arrangement pricing rule type to derive the pricing rule using which the enrollment based MPP limit is calculated. **Note:** The **Search** (🔍) icon appears corresponding to the **Limit Arrangement Pricing Rule Type** field. On clicking the **Search** (🔍) icon, the **Pricing Rule Type Search** window appears. On specifying the pricing rule type, the description of the pricing rule type appears corresponding to the **Limit Arrangement Pricing Rule Type** field.	Yes
Limit Arrangement Price Item	Used to indicate the limit arrangement price item to derive the pricing rule using which the enrollment based MPP limit is calculated.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Limit Arrangement Price Item** field. On clicking the **Search** (🔍) icon, the **Price Item Details** window appears. On specifying the price item details, the description of the price item details appears corresponding to the **Limit Arrangement Price Item** field.	
Claim Fund Off-Process Request Type	Used to indicate the claim fund off-process request type using which the deficit should be roll forwarded during the policy renewal. **Note:** The **Search** (🔍) icon appears corresponding to the **Claim Fund Off-Process Request Type** field. On clicking the **Search** (🔍) icon, the **Off-Process Request Type Search** window appears.	No
Renewal Decision Lead Time	Used to indicate the number of days before which you want to create a To Do for reminding the self-funded employer to renew the minimum premium program.	Yes
MPP Billable Charge Line Type	Used to indicate the MPP billable charge line types using which you want to create the respective charges. **Note:** The **Search** (🔍) icon appears corresponding to the **MPP Billable Charge Line Type** field. On clicking the **Search** (🔍) icon, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **MPP Billable Charge Line Type** field.	Yes
GL Only Contract Type	Used to indicate the contract against which the MPP billable charges for claim, ancillary, claim based fees, enrollment based fees, discount, specific stop-loss, and aggregate stop-loss must be debited. **Note:** The **Search** (🔍) icon appears corresponding to the **GL Only Contract Type** field. On clicking the **Search** (🔍) icon, the **Contract Type Search** window appears.	Yes
Surplus Billable Charge Line Type	Used to indicate the surplus billable charge line type using which you want to create the billable charge when the surplus funds are left with the ASO provider at the time of settlement.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Surplus Billable Charge Line Type** field. On clicking the **Search** (🔍) icon, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Surplus Billable Charge Line Type** field.	
Deficit Billable Charge Line Type	Used to indicate the deficit billable charge line type using which you want to create the billable charge when the funds are in deficit at the time of settlement. **Note:** The **Search** (🔍) icon appears corresponding to the **Deficit Billable Charge Line Type** field. On clicking the **Search** (🔍) icon, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Deficit Billable Charge Line Type** field.	Yes
Domestic Provider Billable Charge Line Type	Used to indicate the domestic provider billable charge line type using which you want to create billable charge for a domestic provider. **Note:** The **Search** (🔍) icon appears corresponding to the **Domestic Provider Billable Charge Line Type** field. On clicking the **Search** (🔍) icon, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Domestic Provider Billable Charge Line Type** field.	No
Markup or Markdown Billable Charge Line Type	Used to indicate the markup or markdown billable charge line type using which you want to create the billable charges for markup or markdown. **Note:** The **Search** (🔍) icon appears corresponding to the **Markup or Markdown Billable Charge Line Type** field. On clicking the **Search** (🔍) icon, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Markup or Markdown Billable Charge Line Type** field.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Markup or Markdown Eligibility Rule Type	Used to specify the markup or markdown eligibility rule type for the minimum premium program pricing rule type. The valid values is: • Rule 1	No
Rule Based Markup or Markdown Eligibility Field	Used to specify the transaction field which you want to use in the rules as the output parameter to determine whether the markup or markdown calculation line is eligible for billing. **Note:** The **Search** (🔍) icon appears corresponding to the **Rule Based Markup or Markdown Eligibility Field** field. On clicking the **Search** (🔍) icon, the **Field Search** window appears. On specifying the eligibility field, the description of the eligibility field appears corresponding to the **Rule Based Markup or Markdown Eligibility Field**.	No
Domestic Provider Eligibility Rule Type	Used to indicate the rules that should be executed to determine whether the minimum premium program is for a domestic provider.	No
Rule Based Domestic Provider Claim Eligibility Field	Used to specify the rule based domestic provider for claim eligibility field. **Note:** The **Search** (🔍) icon appears corresponding to the **Rule Based Domestic Provider Claim Eligibility Field** field. On clicking the **Search** (🔍) icon, the **Field Search** window appears. On specifying the eligibility field, the description of the eligibility field appears corresponding to the **Rule Based Domestic Provider Claim Eligibility Field** field.	No

2. Enter the required details in the **Minimum Premium Program - Specific Additional Data** section.
3. Click **Save**.
   The specific additional data is defined for the minimum premium program pricing rule type.

Defining the Minimum Attachment Arrangement Details for a Minimum Premium Program Pricing Rule Type

Prerequisites

To define the minimum attachment arrangement detail for a minimum premium program pricing rule type, you should have:

- Arrangement types defined in the application.

Procedure

To define the minimum attachment arrangement detail for a minimum premium program pricing rule type:

1. Ensure that the **Minimum Attachment Arrangement Detail** section is *e*xpanded when you are defining or editing a minimum premium program pricing rule type.

   The **Minimum Attachment Arrangement Detail** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Minimum Attachment Point Pricing Rule Type	Used to specify the minimum attachment point pricing rule type while defining the minimum premium program pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Minimum Attachment Point Pricing Rule Type** field. On clicking the **Search** (🔍) icon, the **Pricing Rule Type Search** window appears. On specifying the pricing rule type, the description of the pricing rule type appears corresponding to the **Minimum Attachment Point Pricing Rule Type** field.	Yes
Minimum Attachment Point Price Item	Used to specify the price item using which the minimum attachment point pricing rule should be created. **Note:** The **Search** (🔍) icon appears corresponding to the **Minimum Attachment Point Price Item** field. On clicking the **Search** (🔍) icon, the **Price Item Details** window appears. On specifying the price item, the description of the price item appears corresponding to the **Minimum Attachment Point Price Item** field.	Yes

   In addition, the following column appears in the **Minimum Attachment Arrangement Detail** section:

Column Name	Column Description
Arrangement Type	Used to specify the method using which minimum attachment point should be calculated. The valid values are: • **Enrollment Percentage of First Month** - If you select this option from the list, the minimum attachment point is calculated using the enrollment based percentage of the first month's MPP limit. For example, If the enrollment based percentage of the

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
	first month's MPP limit is set to 75, the system sets the minimum attachment point to (75XFirst Month's MPP Limit)/100. • **Enrollment Percentage of Previous Month** - If you select this option from the list, the minimum attachment point is calculated using the enrollment based percentage of the previous month's MPP limit. For example, If the enrollment based percentage of the previous month's MPP limit is set to 90, the system sets the minimum attachment point to (90*Previous Month's MPP Limit)/100. • **Flat Amount** - If you select this option from the list, the minimum attachment point is set to a flat amount.
Default Arrangement Value	Used to specify the default arrangement value for the minimum attachment point. You can change the value while defining a minimum premium program pricing rule using the respective pricing rule type.

2. Enter the required details in the **Minimum Attachment Arrangement Detail** section.
3. Click **Save**.
   The minimum attachment arrangement detail is defined in the minimum premium program pricing rule type.

Defining the Settlement Rules for a Minimum Premium Program Pricing Rule Type

Prerequisites

To define the settlement rules for a minimum premium program pricing rule type, you should have:

- Fund types defined in the application.

Procedure

To define the settlement rules for a minimum premium program pricing rule type:

1. Ensure that the **Settlement Rules** section is expanded when you are defining or editing a minimum premium program pricing rule type.

   The **Settlement Rules** section contains the following columns:

Column Name	Column Description	Mandatory (Yes or No)
Policy Status	Used to indicate the policy status for which the settlement rules of the minimum premium program pricing rule type are applicable. The valid values are: • Active • Runout	Yes
Fund Type	Used to indicate the fund type in which the minimum premium program pricing rule type is applicable. The valid value is:	Yes

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
	• MPP Adjusment	
Customer Action	Used to indicate the customer action whether you want to either close or roll forward the surplus or deficit claim or run out fund. The valid values are: • Cancel • Renew	Yes
Customer Action Editable	Used to indicate whether the customer can manually update the **Customer Action** when defining the settlement rule or the **Customer Action** will be inherited directly from the associated rule type and cannot be altered during rule configuration.	No
Mode	Used to indicate how to settle any mode when the customer decides to cancel or renew the policy. The valid values are: • Deficit • Surplus	Yes
Customer Mode Editable	Used to indicate whether the customer can manually update the **Mode** while defining the settlement rule or the mode specified in the rule type is inherited and remains fixed.	No
Settlement Option	Used to indicate the settlement option when the customer decides to cancel or renew the policy. The valid values are: • Close Out • Roll Forward	Yes
Settlement Option Editable	Used to indicate whether the customer can manually update the **Settlement Option** while defining the settlement rule or the option specified in the rule type is inherited and remains fixed.	No
Arrangement	Used to indicate the type of arrangement when the customer decides to cancel or renew the policy. The valid values are: • Flat • Percentage	Yes
Arrangement Editable	Used to indicate whether the customer can manually update the **Arrangement** while defining the settlement rule or the arrangement type is inherited and remains fixed.	No
Arrangement Value	Used to specify the arrangement value for the respective type of arrangement.	No

2. Enter the required details in the **Settlement Rules** section.
3. Click **Save**.
   The settlement rules are defined in the minimum premium program pricing rule type.

Defining a Minimum Premium Program Pricing Rule for a Parent Customer

Prerequisites

To define a minimum premium program pricing rule for a parent customer, you should have:

- Pricing rule business objects defined in the application.
- Minimum premium program pricing rule business objects defined in the application.
- Pricing rule types defined in the application.
- Price items defined in the application.
- Rate options defined in the rate option extendable lookup.

Procedure

To define a minimum premium program pricing rule for a parent customer:

1. Search for the account, person, or policy whose pricing details you want to view in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the account, person, or policy whose pricing details you want to view.
   The **Account**, **Person**, *or* **Policy** tab in the **Customer 360° Information** screen appears.
3. Click the **Pricing Information** tab and then click the **Add** link in the upper right corner of the **Parent Customer Pricing Rules** zone.

   The **Pricing Rule** screen appears. It contains the following section:

   - **Main** - Used to specify the basic details for the pricing rule. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Person Name	Displays the person name.	Not applicable
Person Type	Displays the person type.	Not applicable
Pricing Rule Type	Used to indicate the pricing rule type using which you want to create the minimum premium program pricing rule. **Note:** The list includes only those pricing rule types which are already defined in the system.	Yes

4. Click **OK**.

   The **Minimum Premium Program Rule** screen appears. It contains the following sections:

   - **Customer Information** - Displays the information about the parent customer while defining the minimum premium program pricing rule.
   - **Main** - Used to specify the basic details for the minimum premium program pricing rule.
   - **Accumulation Parameters** - Used to define the accumulation parameters in a minimum premium program pricing rule.

Copyright © 2026, Oracle and/or its affiliates.

- **Settlement Rules** - Used to define the settlement rules for the minimum premium program pricing rule.
- **Characteristics** - Used to define the characteristics for the minimum premium program pricing rule.

The **Customer Information** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Parent Customer Information	Indicates the information about the parent customer.	Not applicable
Pricing Rule Type	Indicates the pricing rule type.	Not applicable
Status	Indicates the status of the parent customer for the minimum premium program pricing rule. The valid values are: • Active • Inactive • Pending **Note:** By default, the pricing rule is set to **Pending** status.	Yes

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item for the minimum premium program pricing rule. **Note:** The list includes only those price items which are already defined in the respective pricing rule type.	Yes
Parent SSL Pricing Rule	Used to indicate the pricing date range derived from the parent customer's specific stoploss pricing rule. **Note:** The list includes only those pricing date range which are already defined in the system. The list appears only when an option is selected from the **Price Item** list.	Yes
Pricing Start Date	Displays the date from when the minimum premium program pricing rule is effective. **Note:** The pricing start date cannot be later than the pricing end date. The pricing start date appears only when the pricing date range is selected from the **Parent SSL Pricing Rule** list.	Not applicable
Pricing End Date	Displays the date till when the minimum premium program pricing rule is effective.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The pricing end date cannot be earlier than the pricing start date. The pricing end date appears only when the pricing date range is selected from the **Parent SSL Pricing Rule** list.	
Rate Option	Used to indicate the rate option to define the minimum premium program pricing rule for the price item. The valid value is: • Minimum Premium Program **Note:** The list includes only those rate options which are already defined in the respective price item of the pricing rule type. The list appears only when an option is selected from the **Price Item** list.	Yes
Settlement Frequency	Used to indicate the settlement frequency which helps to determine the bill after date. The valid values are: • **Immediately** - If you select this option from the list, the bill after date is not calculated. The minimum premium program settlement billable charge is billed immediately in the next bill cycle. • **Manually (At Regular Intervals)** - If you select this option from the list, the bill after date which is specified in the **Manual Settlement Bill After Date** parameter while executing the **C1-BCLF** batch is stamped on the minimum premium program settlement billable charge. • **Monthly** - If you select this option from the list, the bill after date is set to the last day of the month. • **On Settlement** - If you select this option from the list, the bill after date is set to the settlement date in the minimum premium program settlement billable charge. • **Yearly** - If you select this option from the list, the bill after date in the credit billable charge is set to the pricing end date in the minimum premium program settlement billable charge. **Note:** By default, on selecting the **Parent SSL Pricing Rule**, the value of this option type is set to **Monthly**.	Yes
Underwriter Review	Used to indicate whether the underwriter settlement review flag is on or off. The valid values are: • Yes • No **Note:** By default the value of this option type is set to **Yes**.	No

Copyright © 2026, Oracle and/or its affiliates.

> **Note:** The **Accumulation Parameters** and **Settlement Rules** sections appears only when you specify a price item in the **Main** section.

5. Enter the required details in the **Main** section.
6. Define the accumulation parameters in the minimum premium program pricing rule.
7. Define the settlement rules in the minimum premium program pricing rule.
8. Define characteristics for a minimum premium program pricing rule, if required.
9. Click **Save**.
   The minimum premium program pricing rule for a parent customer is defined.

Defining Accumulation Parameter in a Minimum Premium Program Pricing Rule

Prerequisites

To define the accumulation parameter in a minimum premium program pricing rule, you should have:

- Settlement days defined in the application.
- Settlement account ID and minimum premium attachment point defined in the application.

Procedure

To define the accumulation parameter in a minimum premium program pricing rule:

1. Ensure that the **Accumulation Parameters** section is expanded when you have selected an option from the **Price Item** field of the **Main** section while defining a minimum premium program pricing rule.

   The **Accumulation Parameters** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Accumulation Group ID	Displays a blank field. An accumulation group ID is generated when accumulation parameter values are defined for a minimum premium program pricing rule.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: It is a read-only field.	
Incurred Start Date	Displays the incurred start date (inherited from parent customer's specific stop-loss pricing rule) based on which you want to accumulate the minimum premium program pricing rule. **Note:** It is a read-only field. The incurred start date appears only when the pricing date range is selected from the **Parent SSL Pricing Rule** list in the **Main** section.	Not applicable
Incurred End Date	Displays the incurred end date (inherited from parent customer's specific stop-loss pricing rule) based on which you want to accumulate the level funded pricing. **Note:** It is a read-only field. The incurred end date appears only when the pricing date range is selected from the **Parent SSL Pricing Rule** list in the **Main** section.	Not applicable
Paid Start Date	Displays the paid start date (inherited from parent customer's specific stop-loss pricing rule) based on which you want to accumulate the level funded pricing. **Note:** It is a read-only field. The paid start date appears only when the pricing date range is selected from the **Parent SSL Pricing Rule** list in the **Main** section.	Not applicable
Paid End Date	Displays the paid end date (inherited from parent customer's specific stop-loss pricing rule) based on which you want to accumulate the level funded pricing. **Note:** It is a read-only field. The paid end date appears only when the pricing date range is selected from the **Parent SSL Pricing Rule** list in the **Main** section.	Not applicable
Settlement Days	Used to indicate the number of days as the settlement days which help in calculating the settlement date. The valid values are: • 30 Days	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• 60 Days • 90 Days • 120 Days • 150 Days • 180 Days **Note:** On selecting the **Parent SSL Pricing Rule**, the value of this option type is set to **30 Days**. Settlement date is calculated as the pricing end date, incurred end date, or paid end date whichever is later plus the settlement days.	
Settlement Account ID	Used to indicate the account ID to whom the settlement amount is credited.	Yes
Minimum Premium Attachment Point	Used to indicate the minimum premium attachment point using which the effective MPP limit is calculated.	Yes
Minimum Premium Attachment Point Value	Used to specify the minimum premium attachment point value using which the effective MPP limit is calculated.	Yes

2. Enter the required details in the **Accumulation Parameters** section.
3. Click **Save**.
   The accumulation parameters are defined in the minimum premium program pricing rule.

Defining the Settlement Rules in a Minimum Premium Program Pricing Rule

Prerequisites

To define the settlement rules in a minimum premium program pricing rule, you should have:

- Fund types defined in the application.

Procedure

To define the settlement rules in a minimum premium program pricing rule:

1. Ensure that the **Settlement Rules** section is expanded when you are defining or editing a minimum premium program pricing rule.

   The **Settlement Rules** section contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
Fund Type	Indicates the fund type in which the minimum premium program pricing rule is applicable. The valid value is: • MPP Adjusment	Not applicable
Customer Action	Used to indicate the customer action whether you want to either close or roll forward the surplus or deficit claim or run out fund. The valid values are: • Cancel • Renew	No
Mode	Used to indicate how to settle any mode when the customer decides to cancel or renew the policy. The valid values are: • Deficit • Surplus	No
Settlement Option	Used to indicate the settlement option when the customer decides to cancel or renew the policy. The valid values are: • Close Out • Roll Forward	No
Arrangement	Used to indicate the type of arrangement when the customer decides to cancel or renew the policy. The valid values are: • Flat • Percentage	No
Arrangement Value	Used to specify the arrangement value for the respective type of arrangement.	No
Successive Pricing Rule	Used to indicate the successive pricing rule.	No

In addition, the **Settlement Rules** section contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Renewal Decision	Used to indicate the upcoming status of the minimum premium program contract. The valid values are: • Cancelled • Renewed **Note:** This field appears when the minimum premium program current contract date is exceeded.	Not applicable

Note: This section appears when you select an option from the **Price Item** list.

2. Enter the required details in the **Settlement Rules** section.
3. Click **Save**.
   The settlement rules are defined in the minimum premium program pricing rule.

Defining a Characteristic for a Minimum Premium Program Pricing Rule

Prerequisites

To define a characteristic for a minimum premium program pricing rule, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule**).

Procedure

To define a characteristic for a minimum premium program pricing rule:

1. Ensure that the **Characteristics** section is expanded when you are defining or editing a minimum premium program pricing rule.

   The **Characteristics** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Effective Date	Used to specify the date from when the characteristic is effective for the minimum premium program pricing rule.	Yes (Conditional)
	Note: You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	**Note:** This field is required when you are defining a characteristic for the minimum premium program pricing rule.
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule**.	**Note:** This field is required when you are defining a characteristic for the minimum premium program pricing rule.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for the minimum premium program pricing rule.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the minimum premium program pricing rule, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove a characteristic from the minimum premium program pricing rule, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristics are defined for the minimum premium program pricing rule.

Editing a Minimum Premium Program Pricing Rule Type

Prerequisites

To edit a minimum premium program pricing rule type, you should have:

- Minimum premium program pricing rule business objects defined in the application.

Procedure

To edit a minimum premium program pricing rule type:

1. Click the **Menu** (☰) icon in the **Application** toolbar.
   A list appears.
2. Click the **Admin Menu** option from the list.
   A sub menu appears.
3. Select **P** and then click the **Pricing Rule Type** option from the sub menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding *t*o the pricing rule type whose details you want to edit.

   The **Minimum Premium Program Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify the basic details for the minimum premium program pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

- **Algorithms** - Used to define the algorithms used for the minimum premium program pricing rule type.
- **Additional Data** - Used to specify the additional information about the minimum premium program pricing rule type.
- **Price Items** - Used to define the price items assigned to the minimum premium program pricing rule type.
- **Price Item Parameters** - Used to define the price item parameters in the minimum premium program pricing rule type.
- **Characteristics** - Used to define the characteristics for the minimum premium program pricing rule type.
- **Minimum Premium Program - Specific Additional Data** - Used to define the minimum premium program-specific additional data in the minimum premium program pricing rule type.
- **Minimum Attachment Arrangement Detail** - Used to define the minimum attachment arrangement details that are used while defining the minimum premium program pricing rule type.
- **Settlement Rules** - Used to define the settlement rules for the minimum premium program pricing rule type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to specify the minimum premium program pricing rule type.	Yes
Description	Used to specify the description for the minimum premium program pricing rule type.	Yes
Detailed Description	Used to specify additional information about the minimum premium program pricing rule type. **Note:** You can resize the text box depending on your requirement by clicking the **Resize Handle** (⇲) icon at the bottom right corner of the text box.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the respective pricing rule type. The valid values are: • Additional Charge Pricing Rule • Age Based Pricing Rule • Aggregate Stop-Loss (ASL) Pricing Rule • Ancillary Pricing Rule • Benefit Pricing Rule • Capitation Fee Pricing Rule • Claim Pricing Rule • Discount Arrangement Pricing Rule • Discount Charge Pricing Rule • Flat Fee Pricing Rule • Level Funded (LF) Pricing Rule • Minimum Premium Program Pricing Rule • Pass-Through Billable Charge • Retention Type Claim Based Pricing Rule • Retention Type Enrollment Based Pricing Rule • Retention Type Enrollment Tier Based Pricing Rule • Specific Stop-Loss (SSL) Pricing Rule • Tier Based Pricing Rule	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The above mentioned business objects are shipped with the product. The list includes those business objects which are created using the **Pricing Rule** (i.e., **C1-PRCRULE**) maintenance object.	
Business Object	Indicates the business object which is used while defining the minimum premium program pricing rule type.	Not applicable
Status	Used to indicate the status of the minimum premium program pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to indicate whether the minimum premium program pricing rule type is primary pricing rule type. **Note:** A minimum premium program pricing rule type is not a primary pricing rule type.	No
Pricing Rule Type Category	Used to indicate the pricing rule type category for the minimum premium program pricing rule type. The valid value is: • Minimum Premium Program **Note:** The list includes only those values which are defined in the **PRC_RULE_TYPE_CAT** lookup field.	Yes

Tip: Alternatively, you can click the **Edit** button in the **Pricing Rule Type** zone to edit the details of the minimum premium program pricing rule type.

5. Modify the required details in the **Main** section.
6. Associate algorithms with the pricing rule type, if required.
7. Define additional data for the pricing rule type, if required.
8. Add pricing items in the pricing rule type, if required.
9. Add price item parameters in the pricing rule type, if required.
10. Define characteristics for the pricing rule type, if required.
11. Add the minimum premium program specific additional data in the pricing rule type, if required.
12. Add minimum attachment arrangement detail in the minimum premium program pricing rule type, if required.
13. Define settlement rules in the minimum premium program pricing rule type, if required.
14. Click **Save**.
    The changes made to the minimum premium program pricing rule type are saved.

Editing a Minimum Premium Program Pricing Rule of a Parent Customer

Prerequisites

To edit a minimum premium program pricing rule of a parent customer, you should have:

- Price items defined in the application.
- Rate options defined in the rate option extendable lookup.

Procedure

To edit a minimum premium program pricing rule of a parent customer:

1. Search for the parent customer in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the parent customer whose pricing details you want to view.
   The **Policy** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing Information** tab.
   The **Pricing Information** tab appears.
4. In the **Parent Customer Pricing Rules** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the minimum premium program pricing rule, whose details you want to edit.

   The **Minimum Premium Program Rule** screen appears. It contains the following sections:

   - **Customer Information** - Displays the information about the parent customer while defining the minimum premium program pricing rule.
   - **Main** - Used to specify the basic details for the minimum premium program pricing rule.
   - **Accumulation Parameters** - Used to define the accumulation parameters in a minimum premium program pricing rule.
   - **Settlement Rules** - Used to define the settlement rules for the minimum premium program pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

- **Characteristics** - Used to define the characteristics for the minimum premium program pricing rule.

The **Customer Information** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Parent Customer Information	Indicates the information about the parent customer.	Not applicable
Pricing Rule Type	Indicates the pricing rule type.	Not applicable
Status	Indicates the status of the parent customer for the minimum premium program pricing rule. The valid values are: • Active • Inactive • Pending **Note:** By default, the pricing rule is set to **Pending** status.	Yes

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item for the minimum premium program pricing rule. **Note:** The list includes only those price items which are already defined in the respective pricing rule type.	Yes
Parent SSL Pricing Rule	Displays the pricing date range derived from the parent customer's specific stoploss pricing rule. **Note:** The list includes only those pricing date range which are already defined in the system. The list appears only when an option is selected from the **Price Item** list.	Yes
Pricing Start Date	Displays the specific stop-loss pricing rule start date. **Note:** The pricing start date appears only when the pricing date range is selected from the **Parent SSL Pricing Rule** list.	Not applicable
Pricing End Date	Displays the specific stop-loss pricing rule end date. **Note:** The pricing end date appears only when the pricing date range is selected from the **Parent SSL Pricing Rule** list.	Not applicable
Rate Option	Used to indicate the rate option to define the minimum premium program pricing rule for the price item.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The list includes only those rate options which are already defined in the respective price item of the pricing rule type. The list appears only when an option is selected from the **Price Item** list.	
Settlement Frequency	Used to indicate the settlement frequency which helps to determine the bill after date. The valid values are: • **Immediately** - If you select this option from the list, the bill after date is not calculated. The minimum premium program settlement billable charge is billed immediately in the next bill cycle. • **Manually (At Regular Intervals)** - If you select this option from the list, the bill after date which is specified in the **Manual Settlement Bill After Date** parameter while executing the **C1-BCLF** batch is stamped on the minimum premium program settlement billable charge. • **Monthly** - If you select this option from the list, the bill after date is set to the last day of the month. • **On Settlement** - If you select this option from the list, the bill after date is set to the settlement date in the minimum premium program settlement billable charge. • **Yearly** - If you select this option from the list, the bill after date in the credit billable charge is set to the pricing end date in the minimum premium program settlement billable charge. **Note:** By default, on selecting the **Parent SSL Pricing Rule**, the value of this option type is set to **Monthly**.	Yes
Underwriter Review	Used to indicate whether the underwriter settlement review flag is on or off. The valid values are: • Yes • No **Note:** By default the value of this option type is set to **Yes**.	No

Note: The **Accumulation Parameters** and **Final Settlement Rules** section appears only when you specify a price item in the **Main** section.

5. Modify the required details in the **Main** section.
6. Modify the required accumulation parameters in the minimum premium program pricing rule.
7. Modify the final settlement rules in the minimum premium program pricing rule.
8. Define, edit, or remove characteristics of the minimum premium program pricing rule, if required.
9. Click **Save**.
   The changes made to the minimum premium program pricing rule are saved.

Defining a Minimum Premium Program Pricing Rule for a Bill Group

Prerequisites

To define a minimum premium program pricing rule for a bill group, you should have:

- Pricing rule type where the category is set to **Minimum Premium Program**.
- Price items associated with the minimum premium program pricing rule type.
- Specific stop-loss pricing rule of the parent customer, whose accumulation parameters you want to inherit for minimum premium program.
- Policy status defined in the application.

Procedure

Copyright © 2026, Oracle and/or its affiliates.

To define a minimum premium program pricing rule for a bill group:

1. Search for the Administrative Services Only (ASO) person, whose person type is set to **Bill Group**, in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the person *w*hose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing Information** tab.
   The **Pricing Information** tab appears.
4. Click the **Broadcast** (📡) icon in the **Self-Funded Policy Information** zone, corresponding to the **Bill Group Information** column, whose bill group details *y*ou want to view.
   The **Self-Funded Pricing Rule Summary** zone is displayed.
5. Click the **Add** link in the upper right corner of the **Self-Funded Pricing Rule Summary** zone.

   The **Pricing Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Person Name	Indicates the name of the parent customer.	Not applicable
Person Type	Indicates the type of the parent customer. **Note:** If you are defining the pricing rule type for the parent customer, then the person type will be **Parent Customer**.	Not applicable
Pricing Rule Type	Used to indicate the pricing rule type using which you want to create a minimum premium program pricing rule. **Note:** The list includes only those pricing rule types which are already defined in the system.	Yes
Pricing Group	Used to indicate the pricing group for the bill group.	No
Policy Status	Used to indicate the policy status for the pricing rule. The valid values are: • In Force/Active • Runout **Note:** The list appears only when an option is selected from the **Pricing Rule Type** list.	Yes (Conditional) **Note:** Policy status is required once the pricing rule type is selected.

6. Click **OK**.

   The **Minimum Premium Program Rule** screen appears. It contains the following sections:

   - **Customer Information** - Displays the information about the bill group.
   - **Main** - Used to specify the basic details for the minimum premium program pricing rule.
   - **Accumulation Criteria** - Used to define the accumulation criteria in a minimum premium program pricing rule.
   - **Pricing Information for rule types-Claim** - Used to define the line items in a particular claim pricing rule or those which are associated with the minimum premium program rule type category.
   - **Pricing Information for rule type:Ancillary** - Used to define the line items in a particular ancillary pricing rule or those which are associated with the minimum premium program rule type category.
   - **Pricing Information for rule type-Discount** - Used to define the discount arrangement pricing rule which is effective for minimum premium program calculations.
   - **Pricing Information for rule type:Retention** - Used to define the retention pricing rule which is effective for minimum premium program calculations.
   - **Characteristics** - Used to define the characteristics for the minimum premium program pricing rule.

Copyright © 2026, Oracle and/or its affiliates.

The **Customer Information** section contains the following fields:

Field Name	Field Description
Bill Group Information	Displays the bill group information.
Policy Start Date	Displays the date from when the policy is effective.
Policy End Date	Displays the date till when the policy is effective.
Policy Status	Indicates the policy status for the pricing rule. The valid values are: • In Force/Active • Post Runout • Runout
Pricing Rule Type	Indicates the pricing rule type for whom the minimum premium program pricing rule is created.
Status	Indicates the status for the pricing rule. **Note:** By default, the pricing rule is set to **Pending** status.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item for the minimum premium program pricing rule. **Note:** The list includes only those price items which are already defined in the respective pricing rule type.	Yes
Parent Customer's Pricing Rule	Used to indicate the date range of each specific stop-loss pricing rule, defined for the parent customer. **Note:** The list includes only those pricing date range which are already defined in the system. The list appears only when an option is selected from the **Price Item** list. On selecting the specific stop-loss pricing rule of the parent customer, the minimum premium program **Pricing Start Date** and **Pricing End Date** field is set automatically.	Yes
Pricing Start Date	Displays the date from when the minimum premium program pricing rule is effective. **Note:** The pricing start date cannot be later than the pricing end date. The pricing start date appears only when the pricing date range is selected from the **Parent Customer's Pricing Rule** list.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Pricing End Date	Displays the date till when the minimum premium program pricing rule is effective. **Note:** The pricing end date cannot be earlier than the pricing start date. The pricing end date appears only when the pricing date range is selected from the **Parent Customer's Pricing Rule** list.	Not applicable
Rate Option	Used to indicate the rate option to define the minimum premium program pricing rule for the price item. The valid value is: • Minimum Premium Program **Note:** The list includes only those rate options which are already defined in the respective price item of the pricing rule type. The list appears only when an option is selected from the **Price Item** list.	Yes

Note: The **Accumulation Parameters**, **Pricing Information for rule types-Claim**, **Pricing Information for rule type:Ancillary**, **Pricing Information for rule type-Discount** and, **Pricing Information for rule type: Retention** sections appears only when you specify a price item in the **Main** section.

7. Enter the required details in the **Main** section.
8. Define the accumulation criteria in the minimum premium program pricing rule for a bill group.
9. Define the pricing information for the claim rule type category for a bill group.
10. Define the pricing information for the ancillary rule type category for a bill group, if required.
11. Define the pricing information for the discount rule type category for a bill group, if required.
12. Define the pricing information for the retention rule type category for a bill group, if required.
13. Define characteristics for the minimum premium program pricing rule, if required.
14. Click **Save**.
    The minimum premium program pricing rule is defined for a bill group.

Defining Accumulation Criteria in a Minimum Premium Program Pricing Rule

Prerequisites

To define the accumulation criteria in a minimum premium program pricing rule, you should have:

- Price items and price item parameters defined in the application.

Procedure

To define accumulation criteria in a minimum premium program pricing rule:

1. Ensure that the **Accumulation Criteria** section is expanded when you have selected an option from the **Price Item** field of the **Main** section while defining a minimum premium program pricing rule.

   The **Accumulation Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Accumulation Group ID	Displays a blank field. An accumulation group ID is generated when accumulation parameter values are defined for a minimum premium program pricing rule. **Note:** It is a read-only field.	Not applicable
Price Items	Used to indicate the price item that you want to include in the accumulation criteria for a bill group.	Not applicable

   The price items field contains the following field in a grid:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item which is eligible for minimum premium program. **Note:** The **Search** (🔍) icon appears corresponding to the **Price Item** field. On clicking the **Search** icon, the **Price Item Search** window appears. On specifying the price item, the description of the price item appears corresponding to the **Price Item** field.	Not applicable
Price Item Parameters	Used to indicate the price item parameters that you want to include in the accumulation criteria for a bill group.	Not applicable

Note:

If you want to add more than one price item in a minimum premium program pricing rule, click the **Add** (+) icon.

However, if you want to remove a price item from a minimum premium program pricing rule, click the **Delete** (🗑) icon corresponding to the price item.

The price item parameters field contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item Parameter	Used to indicate the price item parameter which is eligible for minimum premium program. **Note:** The **Search** (🔍) icon appears corresponding to the **Price Item Parameter** field. On clicking the **Search** icon, the **Price Item Parameter Search** window appears. On specifying the price item parameter, the description of the price item parameter appears corresponding to the **Parameter Value** field.	Not applicable
Parameter Value	Used to indicate the parameter values which is eligible for minimum premium program.	Not applicable

Note:

If you want to add more than one price item parameter in the accumulation criteria, click the **Add** (+) icon.

However, if you want to remove a price item parameter from the accumulation criteria, click the **Delete** (🗑) icon corresponding to the price item parameter.

2. Enter the required details in the **Accumulation Criteria** section.
3. Click **Save**.
   The accumulation criteria is defined in the minimum premium program pricing rule.

Defining Claim Pricing Information in a Minimum Premium Program Pricing Rule

Prerequisites

To define the claim pricing information in a minimum premium program pricing rule, you should have:

- Pricing rule types defined in the application.
- Values defined in the **PRICING_DERIVE_USING**, **APPLY_MARK_UP_DOWN_FLG**, and **MARK_UP_DOWN_ARR_FLG** lookup fields.
- Line items defined in the application.

Procedure

To define the claim pricing information in a minimum premium program pricing rule:

1. Ensure that the **Pricing Information for rule types-Claim** section is expanded when you have selected an option from the **Price Item** field of the **Main** section while defining or editing a minimum premium program pricing rule for a bill group.

   The **Pricing Information for rule types-Claim** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to indicate the claim pricing rule type effective for minimum premium program pricing rule. **Note:** The list includes only those pricing rule types which are already defined in the system.	Yes
Derive Using	Used to indicate the method through which the claim pricing rule information is derived. The valid values are: • MPP Line Items • Pricing Rules **Note:** The list includes only those values which are defined in the **PRICING_DERIVE_USING** lookup field.	Yes

   If **MPP Line Items** option is selected from the **Derive Using** field, the following sub-sections appear:

   - **Domestic Provider Claims** - Used to specify the domestic provider claims while calculating the minimum premium program line items.
   - **Markup or Markdown Values** - Used to define the markup or markdown values for minimum premium program line items.
   - **Line Items** - Used to associate the line items which are eligible for billing.

Copyright © 2026, Oracle and/or its affiliates.

The **Domestic Provider Claims** section contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Exclude MPP (Percentage)	Used to specify the billable charge line excluding the minimum premium program charge in the percentage to create the domestic provider claim calculation lines.	No

The **Markup or Markdown Values** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Strategy	Used to indicate the pricing strategy for the claim line items. The valid values are: • Markdown • Markup • None **Note:** The list includes only those values which are defined in the **APPLY_MARK_UP_DOWN_FLG** lookup field.	Yes
Markup or Markdown Type	Used to indicate the markup or markdown value type for the claim line items. The valid values are: • Flat Amount • Percentage **Note:** The list includes only those values which are defined in the **MARK_UP_DOWN_ARR_FLG** lookup field.	Yes
Markup or Markdown Amount	Used to specify the markup or markdown amount for the claim line items. **Note:** This field gets disabled when the **Percentage** option is selected from the **Markup or Markdown Type** list.	Yes (Conditional) **Note:** This field is required when **Flat Amount** option is selected from the **Markup or Markdown Type** field.
Markup / Markdown Included in Settlement?	Used to specify whether markup or markdown amount should be included in the minimum premium program settlement. The valid values are: • Yes • No **Note:** This field gets disabled when the **Percentage** option is selected from the **Markup or Markdown Type** list.	Yes (Conditional) **Note:** This field is required when **Flat Amount** option is selected from the **Markup or Markdown Type** field.

The **Line Items** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Line Item	Used to indicate the line item which is eligible for minimum premium program pricing.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Line Item** field. On clicking the **Search** (🔍) icon, the **Pricing Rule Line Item Search** window appears. On specifying the pricing rule line item, the description of the pricing rule line item appears corresponding to the **Line Item** field.	
Markup / Markdown Included in Settlement?	Used to indicate whether the markup or markdown amount should be included in the minimum premium program settlement. **Note:** This field appears when **Percentage** option is selected from the **Markup or Markdown Type** field in the **Markup or Markdown Values** section.	Yes (Conditional) **Note:** This field is required when **Percentage** option is selected from the **Markup or Markdown Type** field in the **Markup or Markdown Values** section.
Markup or Markdown Percentage	Used to specify the percentage for markup or markdown value.	No

If **Pricing Rules** option is selected from the **Derive Using** field, following sub-section appear:

- **Claim Pricing Rule** - Used to indicate the claim pricing rule. It further contains the following sub-section:
  - **Domestic Provider Claims** - Used to specify the domestic provider claims while calculating the minimum premium program pricing rule.

The **Claim Pricing Rule** section contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Effective Claim Pricing Rule	Used to indicate the claim pricing rule effective for minimum premium program pricing.	No

The **Domestic Provider Claims** section contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Exclude MPP (Percentage)	Used to specify the billable charge line excluding the minimum premium program charge in the percentage to create the domestic provider claim calculation lines.	No

2. Enter the required details in the respective sections, based on the option that is selected from the **Derive Using** field.
3. If you want to add more than one claim pricing rule type to the minimum premium program pricing rule, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a claim pricing rule type from the minimum premium program pricing rule, click the **Delete** (🗑) icon corresponding to the pricing rule type field.

4. Click **Save**.
   The pricing information for the claim pricing rule type is defined in the minimum premium program pricing rule.

Defining Ancillary Pricing Information in a Minimum Premium Program Pricing Rule

Prerequisites

To define the ancillary pricing information in a minimum premium program pricing rule, you should have:

- Pricing rule types defined in the application.
- Billable charge line types defined in the application.
- Values defined in the **PRICING_DERIVE_USING**, **APPLY_MARK_UP_DOWN_FLG**, and **MARK_UP_DOWN_ARR_FLG** lookup fields.

Procedure

To define the ancillary pricing information in the minimum premium program pricing rule:

1. Ensure that the **Pricing Information for rule type:Ancillary** section is expanded only *w*hen you have selected an option from the **Price Item** field of the **Main** section while defining or editing a minimum premium program pricing rule for a bill group.

   The **Pricing Information for rule type:Ancillary** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to indicate the ancillary pricing rule type effective for minimum premium program pricing. **Note:** The list includes only those pricing rule types which are already defined in the system.	Yes
Derive Using	Used to indicate the method through which the ancillary pricing rule information is derived. The valid values are: • Ancillary Billable Charge Line Type • Pricing Rules **Note:** The list includes only those values which are defined in the **PRICING_DERIVE_USING** lookup field.	Yes

   If **Ancillary Billable Charge Line Type** option is selected from the **Derive Using** field, the following sub-section appears:

   - **Billable Charge Line Types** - Used to associate the billable charge line items which are eligible for billing. It contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Billable Charge Line Type	Used to indicate the billable charge line type using which you want to create the calculation line for the charge (i.e. line item). **Note:** The **Search** (🔍) icon appears corresponding to the **Billable Charge Line Type** field. On clicking the **Search** icon, the **Billable Charge Line Type Search** window appears. On specifying the billable charge line type, the description of the billable charge line type appears corresponding to the **Billable Charge Line Type** field.	Yes
Pricing Arrangements	Used to define the pricing arrangements for the billable charge line items. The valid values are: • Pass Through (Markup or Markdown Optional) • Pass Through Without Markup or Markdown • Rate Based (Markup or Markdown Optional) **Note:** The list appears only when the billable charge line type is specified in the **Billable Charge Line Type** field.	Yes (Conditional) **Note:** Pricing arrangements is required once the **Billable Charge Line Type** option is selected.
Rate	Used to specify the rate for the billable charge line type. **Note:** This field is enabled when the **Rate Based (Markup or Markdown Optional)** option is selected from the **Pricing Arrangements** field.	Yes (Conditional) **Note:** This field is required when the **Rate Based (Markup or Markdown Optional)** option is selected from the **Pricing Arrangements** field.
Markup / Markdown Included in Settlement?	Used to indicate whether the markup or markdown amount must be included in the minimum premium program settlement.	No
Pricing Strategy	Used to indicate the pricing strategy for the billable charge line items. The valid values are: • Markdown • Markup • None **Note:** The list includes only those values which are defined in the **APPLY_MARK_UP_DOWN_FLG** lookup field. This field gets disabled when the **Pass Through Without Markup or Markdown** option is selected from the **Pricing Arrangements** list.	Yes (Conditional) **Note:** This field is required when the **Pricing Arrangements** option is selected either as **Pass Through (Markup or Markdown Optional)** or **Rate Based (Markup or Markdown Optional)**.

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Markup or Markdown Type	Used to indicate the markup or markdown type for the billable line items. The valid values are: • Flat Amount • Percentage **Note:** This field is enabled when the **Pricing Strategy** option is selected either as **Markup** or **Markdown**. The list includes only those values which are defined in the **MARK_UP_DOWN_ARR_FLG** lookup field.	Yes (Conditional) **Note:** This field is required when the **Rate Based** option is selected either as **Markup** or **Markdown**.
Amount/Percentage	Used to specify the amount or percentage for markup or markdown value. **Note:** This field enabled when an option is selected from the **Markup or Markdown Type** field.	Yes (Conditional) **Note:** This field is required when an option is selected from the **Markup or Markdown Type**field.

If **Pricing Rules** option is selected from the **Derive Using** field, the following sub-section appears:

- **Ancillary Pricing Rule** - This sub-section provides information about the ancillary pricing rule. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Effective Ancillary Pricing Rule	Used to indicate the ancillary pricing rule effective for minimum premium program pricing.	No

2. Enter the required details in the respective sections, based on the option selected from the **Derive Using** field.
3. If you want to add more than one ancillary pricing rule type to the minimum premium program pricing rule, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove an ancillary pricing rule type from the minimum premium program pricing rule, click the **Delete** (🗑) icon corresponding to the pricing rule type field.

4. Click **Save**.
The pricing information for the ancillary pricing rule type is defined in the minimum premium program pricing rule.

Defining the Discount Arrangement Pricing Information in a Minimum Premium Program Pricing Rule

Prerequisites

To define the discount arrangement pricing information in a minimum premium program pricing rule, you should have:

- Pricing rule types defined in the application.

Procedure

To define the discount arrangement pricing information in the minimum premium program pricing rule:

1. Ensure that the **Pricing Information for rule type-Discount** section is expanded only *w*hen you have selected an option from the **Price Item** field of the **Main** section while defining or editing a minimum premium program pricing rule for a bill group.

   The **Pricing Information for rule type-Discount** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to indicate the discount arrangement pricing rule type which is effective for minimum premium program. **Note:** The list includes only those pricing rule types which are already defined in the system.	Yes
Derive Using	Used to indicate the method through which the discount arrangement pricing rule information is derived. The valid values is: • Pricing Rules **Note:** The list includes only those values which are defined in the **PRICING_DERIVE_USING** lookup field.	Yes

   On selecting the **Pricing Rules** option from the **Derive Using** field, the following sub-section appears:

   - **Discount Pricing Rule** - This sub-section provides information about the discount arrangement pricing rule. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Discount Pricing Rule	Used to indicate the discount arrangement pricing rule which is effective for minimum premium program.	Yes

2. Select the appropriate discount arrangement pricing rule from the **Discount Pricing Rule** section.

Note: On selecting the discount arrangement pricing rule, the system does not generate any line items for the discount arrangement pricing information. This discount arrangement pricing rule is used at the time of minimum premium program calculations in the TFM module.

3. If you want to add more than one discount pricing rule type to the minimum premium program pricing rule, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a discount pricing rule type from the minimum premium program pricing rule, click the **Delete** (🗑) icon corresponding to the pricing rule type field.

Copyright © 2026, Oracle and/or its affiliates.

4. Click **Save**.
   The pricing information for the discount arrangement pricing rule type is defined in the minimum premium program pricing rule.

Defining the Retention Type Claim Based and/or Retention Type Enrollment Based Pricing Information in a Minimum Premium Program Pricing Rule

Prerequisites

To define the retention type claim based and/or retention type enrollment based pricing information in a minimum premium program pricing rule, you should have:

- Retention rule types defined in the application.

Procedure

To define the retention type claim based and/or retention type enrollment based pricing information in a minimum premium program pricing rule:

1. Ensure that the **Pricing Information for rule type:Retention** section is expanded when you have selected an option from the **Price Item** field of the **Main** section while defining or editing a minimum premium program pricing rule for a bill group.

   The **Pricing Information for rule type:Retention** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Retention Rule Type	Used to indicate the retention type claim based and/or retention type enrollment based pricing rule type for the minimum premium program pricing rule.	Yes
Price Item	Used to indicate the price item for the minimum premium program pricing rule. **Note:** The **Search** (🔍) icon appears corresponding to the **Price Item** field. On clicking the **Search** (🔍) icon, the **Get Retention Type Pricing Rules** window appears. On specifying the retention type pricing rule, the description of the retention type pricing rule appears corresponding to the **Price Item** field.	Yes

Copyright © 2026, Oracle and/or its affiliates.

2. Select the appropriate **Retention Rule Type** and **Price Item** from the **Pricing Information for rule type:Retention** section.

   Note:

   Once the retention type claim based and/or retention type enrollment based pricing rule type is selected along with the price item, the system does not generate line items for the retention type claim/enrollment based pricing rule. This retention type claim/enrollment based pricing rule is used at the time of minimum premium program calculations in the TFM module.

3. If you want to add more than one retention type claim based and/or retention type enrollment based pricing rule type to minimum premium program pricing rule, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove more than one retention type claim based and/or retention type enrollment based pricing rule type from the minimum premium program pricing rule, click the **Delete** (🗑) icon corresponding to the retention rule type.

4. Click **Save**.
   The retention type claim based and/or retention type enrollment based pricing rules eligible for minimum premium program are defined in the minimum premium program pricing rule.

Editing a Minimum Premium Program Pricing Rule of a Bill Group

Prerequisites

To edit a minimum premium program pricing rule of a bill group, you should have:

- Pricing rule types defined in the application.

Procedure

To edit a minimum premium program pricing rule of a bill group:

1. Search for a parent customer in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the parent customer whose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing Information** tab.
   The **Pricing Information** tab appears.
4. Click the Broadcast (📡) icon in the **Self-Funded Policy Information** zone, corresponding to the **Bill Group Information** column, whose bill group details you want to view.
   The **Self-Funded Pricing Rule Summary** zone is displayed.
5. Click the **Edit** (✎) icon in the **Self-Funded Pricing Rule Summary** zone, corresponding to the **Pricing Rule Type** column, whose details you want to edit.
   The **Minimum Premium Program Rule** screen appears. It contains the following sections:

   - **Customer Information** - Displays the information about the bill group.

Copyright © 2026, Oracle and/or its affiliates.

- **Main** - Used to specify the basic details for the minimum premium program pricing rule.
- **Accumulation Criteria** - Used to define the accumulation criteria in a minimum premium program pricing rule.
- **Pricing Information for rule type: Claim** - Used to define the line items in a particular claim pricing rule or those which are associated with the minimum premium program rule type category.
- **Pricing Information for rule type: Ancillary** - Used to define the line items in a particular ancillary pricing rule or those which are associated with the minimum premium program rule type category.
- **Pricing Information for rule type: Discount** - Used to define the discount arrangement pricing rule which is effective for minimum premium program calculations.
- **Pricing Information for rule type: Retention** - Used to define the retention pricing rule which is effective for minimum premium program calculations.
- **Characteristics** - Used to define the characteristics for the minimum premium program pricing rule.

The **Customer Information** section contains the following fields:

Field Name	Field Description
Bill Group Information	Displays the bill group information.
Policy Start Date	Displays the date from when the policy is effective.
Policy End Date	Displays the date till when the policy is effective.
Policy Status	Indicates the policy status for the pricing rule. The valid values are: • In Force/Active • Post Runout • Runout
Pricing Rule Type	Indicates the pricing rule type for whom the minimum premium program pricing rule is created.
Status	Indicates the status for the pricing rule.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item for the minimum premium program pricing rule. **Note:** The list includes only those price items which are already defined in the respective pricing rule type.	Not applicable
Parent Customer's Pricing Rule	Used to indicate the date range of each specific stop-loss pricing rule, defined for the parent customer.	Not applicable
Pricing Start Date	Displays the date from when the minimum premium program pricing rule is effective.	Not applicable
Pricing End Date	Displays the date till when the minimum premium program pricing rule is effective.	Not applicable
Rate Option	Used to indicate the rate option to define the minimum premium program pricing rule for the price item. The valid value is: • Minimum Premium Program	Not applicable

6. Modify the required details in the **Main** section.
7. Modify the accumulation criteria in the minimum premium program pricing rule for a bill group.

Copyright © 2026, Oracle and/or its affiliates.

8. Modify the pricing information for the claim rule type category for a bill group.
9. Modify the pricing information for the ancillary rule type category for a bill group, if required.
10. Modify the pricing information for the discount rule type category for a bill group, if required.
11. Modify the pricing information for the retention rule type category for a bill group, if required.
12. Define, edit, or remove characteristics for the minimum premium program pricing rule for a bill group, if required.
13. Click **Save**.
    The changes made to the minimum premium program pricing rule for a bill group are saved.

Viewing a Minimum Premium Program Pricing Rule of a Bill Group

Procedure

To view a minimum premium program pricing rule of a bill group:

1. Search for the bill group in the **Customer 360° View** screen.
2. In the **Search Results** section, click the **View** (🔗) icon corresponding to the bill group whose pricing details you want to view.
   The **Person** tab appears in the **Customer 360° Information** screen.
3. Click the **Pricing Information** tab.
   The **Pricing Information** tab appears.

Copyright © 2026, Oracle and/or its affiliates.

4. Click the **Broadcast** (ᯤ) icon in the **Self-Funded Policy Information** zone, corresponding to the **Bill Group Information** column, whose bill group details you want to view.
   The **Self-Funded Pricing Rule Summary** zone appears.
5. In the **Self-Funded Pricing Rule Summary** zone, click the link in the **Pricing Rule Information** column corresponding to the pricing rule type whose details you want to view.
   The **Pricing Rule** screen appears. It contains the following zone:
   - **Minimum Premium Program Pricing Rule** - Displays the minimum premium program pricing rule of a bill group. It contains the following sections:
     - **Main** - Displays the basic details for the minimum premium program pricing rule.
     - **Accumulation Criteria** - Displays the accumulation criteria defined for a bill group in the minimum premium program pricing rule.
     - **Run-In Parameters** - Displays the Run-In Parameters for the minimum premium program pricing rule.
     - **Third Party Parameters** - Displays the Third Party Parameters for the minimum premium program pricing rule.
     - **Settlement Rules** - Displays the settlement rules defined for the minimum premium program pricing rule.
     - **Characteristics** - Displays the characteristics defined for the minimum premium program pricing rule.
6. View the basic details of the minimum premium program pricing rule in the **Main** section.
7. View the accumulation criteria defined for a bill group in the **Accumulation Criteria** section.
8. View the Run-In Parameters for the minimum premium program pricing rule in the **Run-In Parameters** section.
9. View the Third Party Parameters for the minimum premium program pricing rule in the **Third Party Parameters** section.
10. View the settlement rules defined for the minimum premium program pricing rule in the **Settlement Rules** section.
11. View the characteristics of the minimum premium program pricing rule in the **Characteristics** section.

Self-Funded Pricing Rule Versioning

Until now, the system enabled you to edit a self-funded pricing rule when it is not referred for any transaction in the system. If you wanted to edit a referred pricing rule, you had to manually cancel bill segments of the accounts and create the disaggregation and/or reseeding requests for the accounts. Once the transactions are disaggregated, the system allowed you to edit the self-funded pricing rule.

Now, the system enables you to edit a self-funded pricing rule even when it is referred for a transaction in the system. On editing a referred self-funded pricing rule, the system will do the following:

- Automatically cancel the bill segments of the accounts and create the disaggregation and/or reseeding requests for the accounts
- Increment the version of the referred self-funded pricing rule in the system

Now, the system maintains version numbers for a self-funded pricing rule. On creating a self-funded pricing rule, the version number of the self-funded pricing rule is set to 1. Also, when a self-funded policy is renewed, the version number of each self-funded pricing rule is set to 1.

If a self-funded pricing rule is referred for a transaction, the system creates a new version of the self-funded pricing rule when you edit it. The system does versioning of a self-funded pricing rule when a set of pre-defined fields are edited. For more information about the fields for which versioning is configured, refer to *Oracle Revenue Management and Billing Insurance User Guide*. The system will automatically cancel the bill segments and create the disaggregation and/or reseeding requests for the accounts when you implement the **Entity Audit** feature for the self-funded pricing rules. The entity audit framework is configured for the following business objects in this release:

- C1-PricingRuleAncillary
- C1-PricingRuleClaim
- C1-PricingRuleRetEnroll
- C1-PricingRuleRetTypeClaim
- C1-PricingRuleASL
- C1-PricingRuleSSL
- C1-PricingRuleLevelFunded
- C1-PricingRuleDiscArrangement

The **Eligible for Audit Event** option type in all the above listed business objects is set to **Y** and the **C1-PRVERSION** algorithm is attached to the **Audit** system event of the above listed business objects.

To implement the **Entity Audit** feature, you need to create an active audit event type for the above listed business objects where the audit usage is set to **Disaggregation/Reseeding**. Here, you need to specify a list of fields from the respective business object which you want to audit or monitor. The following audit event types are shipped for the respective pricing rule business object:

Copyright © 2026, Oracle and/or its affiliates.

Business Object	Audit Event Type
C1-PricingRuleAncillary	ANCIL_DISAGG_AUD
C1-PricingRuleClaim	CLAIM_DISAGG_AUD
C1-PricingRuleRetEnroll	ENROL_RETEN_DISAGG_AUD
C1-PricingRuleRetTypeClaim	CLAIM_RETEN_DISAGG_AUD
C1-PricingRuleASL	ASL_DISAGG_AUD
C1-PricingRuleSSL	SSL_DISAGG_AUD
C1-PricingRuleLevelFunded	LF_DISAGG_AUD
C1-PricingRuleDiscArrangement	DISC_DISAGG_AUD

You can use the above audit event types or create a custom audit event type for the required business object. On editing a referred self-funded pricing rule, the system does the following:

If…	Then…
The approval workflow process is configured for the respective pricing rule and you edit a field which is: • Listed in the active audit event type of the respective business object • Configured for versioning	The system creates an approval transaction for the self-funded pricing rule. On approving the approval transaction, the system creates a new version of the self-funded pricing rule where the version number is incremented by 1. The status of the new version of the self-funded pricing rule is set to **Disaggregation Initiated**. In addition, the system creates an audit event using the active audit event type for the new version of the self-funded pricing rule. The status of the audit event is set to **Pending**.
The approval workflow process is not configured for the respective pricing rule and you edit a field which is: • Listed in the active audit event type of the respective business object • Configured for versioning	The system creates a new version of the self-funded pricing rule where the version number is incremented by 1. The status of the new version of the self-funded pricing rule is set to **Disaggregation Initiated**. In addition, the system creates an audit event using the active audit event type for the new version of the self-funded pricing rule. The status of the audit event is set to **Pending**.
The approval workflow process is configured for the respective pricing rule and you edit a field which is: • Not listed in the active audit event type of the respective business object • Configured for versioning	The system creates an approval transaction for the self-funded pricing rule. On approving the approval transaction, the system creates a new version of the self-funded pricing rule where the version number is incremented by 1. The status of the new version of the self-funded pricing rule is set to **Active** and the status of the old version of the self-funded pricing rule is changed to **Inactive**.
The approval workflow process is not configured for the respective pricing rule and you edit a field which is: • Not listed in the active audit event type of the respective business object • Configured for versioning	The system creates a new version of the self-funded pricing rule where the version number is incremented by 1. The status of the new version of the self-funded pricing rule is set to **Active** and the status of the old version of the self-funded pricing rule is changed to **Inactive**.
The approval workflow process is configured for the respective pricing rule and you edit the end date of a self-funded pricing rule which is referred for a transaction after the pricing rule end date	The system creates an approval transaction for the self-funded pricing rule. On approving the approval transaction, the changes are reflected in the existing version of the self-funded pricing rule. Note that the system does not create a new version

Copyright © 2026, Oracle and/or its affiliates.

If…	Then…
	of the self-funded pricing rule. The system creates an audit event using the active audit event type for the existing version of the self-funded pricing rule. The status of the audit event is set to **Pending**.
The approval workflow process is not configured for the respective pricing rule and you edit the end date of a self-funded pricing rule which is referred for a transaction after the pricing rule end date	The system does not create a new version of the self-funded pricing rule. The changes are reflected in the existing version of the self-funded pricing rule. The system creates an audit event using the active audit event type for the existing version of the self-funded pricing rule. The status of the audit event is set to **Pending**.

Note that the new version of the self-funded pricing rule will have the same pricing rule ID. However, on editing a self-funded pricing rule which is not referred for a transaction, the system edits the existing version of the self-funded pricing rule and does not create a new version of the self-funded pricing rule with incremental version number.

A new batch named **C1-DISTA** is introduced in this release. The **C1-DISTA** batch checks whether there are any audit events for the self-funded pricing rules in the **Pending** status. If an audit event for a self-funded pricing rule is in the **Pending** status, the system checks whether the self-funded pricing rule is created using a primary pricing rule type. If so, the system derives the person for whom the self-funded pricing rule is created. If the person type of the derived person is **Parent Customer**, the system fetches all accounts of the parent customer and its bill groups. However, if the person type of the derived person is **Bill Group**, the system fetches all accounts of the bill group. Once the accounts are derived, the system cancels the bill segments of the accounts and creates a disaggregation request for these accounts. The system then confirms whether you want to create reseeding requests for the related pricing rule types (if any). If you click the **OK** button, the system creates the reseeding requests. While creating a reseeding request for a related pricing rule type, the system derives all accounts from the accumulation group and then creates a reseeding request for each such account. Finally, the batch changes the status of the audit event to **Complete**.

Once the disaggregation and reseeding requests are created for the accounts, you need to disaggregate the transactions using the disaggregation batches. On executing the **C1-DRSUA** batch, the system changes the status of the disaggregation or reseeding request to **Complete** and then executes the **C1-UPDAUDEVE** algorithm attached to the **Post-Processing** system event of the batch control. This algorithm changes the status of the new version of the self-funded pricing rule (for which disaggregation is completed) to **Active** and changes the status of the old version of the self-funded pricing rule to **Inactive**.

Note that you cannot edit a self-funded pricing rule in the **Active** status when an audit event for the self-funded pricing rule is in the **Pending** status. You cannot edit or delete a self-funded pricing rule which is in the **Disaggregation Initiated** status. Also, you cannot edit the related self-funded pricing rule in the **Active** status when the new version of the primary self-funded pricing rule is in the **Disaggregation Initiated** status.

Retention Type Enrollment Tier Based Pricing

Until now, you were able to calculate certain charges, such as stop-loss premium, administrative fees, etc. based on number of enrollments using the retention type enrollment based pricing. While defining a retention type enrollment based pricing rule, you were able to define different fees for different set of pricing parameters. There are certain services (i.e., price items) for which business needs to define a complex pricing model wherein several pricing variations are offered based on certain mandatory and non-mandatory pricing parameters. While defining, editing, or copying a retention type enrollment based pricing rule with a complex pricing model, the system performance was deteriorated, thereby affecting the system reliability and usability over time.

To handle the above business scenario, a multi-tiered retention type enrollment based pricing model is offered in this release. The system enables you to define the following two types of retention type enrollment based pricing rules in the system:

- Retention Type Enrollment Based Pricing Rule without Tier (Traditional method)
- Retention Type Enrollment Based Pricing Rule with Tier

Copyright © 2026, Oracle and/or its affiliates.

To implement this feature, the following changes are made to the system:

- The **tieredSw** tag is newly added in the **C1-PrcRuleTypRetEnrollBased** business object schema.
- A new business object named **C1-PricingRuleRetTypeEnrolTier** is introduced in this release.
- A new option type named **Approval Workflow Group for Retention Type Enrollment Tier** is added in the **C1-ASOBLLNG** feature configuration.

A new field named **Tiered Switch** is available in the **Enrollment-Specific Additional Data** section while defining a retention type enrollment based pricing rule type. It enables the system to determine whether the retention type enrollment based pricing rule will be tier or non-tier based. If you select the **Tiered Switch** option, you need to set the pricing rule business object to **C1-PricingRuleRetTypeEnrolTier** in the retention type enrollment based pricing rule type. However, if you do not select the **Tiered Switch** option, you need to set the pricing rule business object to **C1-PricingRuleRetTypeEnroll** in the retention type enrollment based pricing rule type. In this way, you can maintain two separate retention type enrollment based pricing rule types in the system – one without tier and another with tier.

Before you create multi-tiered retention type enrollment based pricing rule, you need to create the following:

- Required parameters including the **Tier** parameter where all the possible business tiers (for example, Spouse + 1 Dependent, Spouse + 2 Dependents, Family, etc.), are set as the predefined values.
- Associate the required parameter (for example, Healthcare Coverage Class) as the mandatory parameter with the price item

> **Note:** (The system will then, by default, select the mandatory parameter while defining the pricing (i.e., fee) in the pricing rule.)

- Associate the **Tier** parameter as the non-mandatory parameter with the price item.

While defining a pricing rule using the multi-tiered retention type enrollment based pricing rule type, the **Tier** button appears in the **Pricing Parameters** grid. Once you click the **Tier** button, all the business tiers set as the predefined values (for example, Spouse + 1 Dependent, Spouse + 2 Dependents, Family, etc.) are listed in the **Pricing Parameters** grid. You can then specify different fee for each mandatory pricing parameter and tier combination. Until the pricing rule is referred, you can anytime remove the tiers by clicking the **Remove Tier** button and define a non-tier based pricing, if required.

The system creates one price assignment for each mandatory pricing parameter and tier combination. You can define a multi-tiered retention type enrollment based pricing rule at the parent customer and bill group levels. You can also configure the approval workflow process for a multi-tiered retention type enrollment based pricing rule.

Chapter 37

Stop-Loss

Topics:

- Accumulation Data

Oracle Revenue Management and Billing enables you to accumulate the specific stop-loss and aggregate stop-loss and create billable charges for them. Once the transaction calculation lines for specific stop-loss and aggregate stop-loss are created using the transaction aggregation process, you need to execute the following batches in the specified sequence:

1. Stamp Accumulate After Date (C1-STAAD)
2. Accumulate Specific Stop-Loss (C1-ACSSL)
3. Create Billable Charge for Specific Stop Loss (C1-BCSSL)
4. Accumulate Aggregate Stop-Loss (C1-ACASL)
5. Create Billable Charge for Aggregate Stop Loss (C1-BCASL)

For more information about these batches, see *Oracle Revenue Management and Billing Batch Guide*.

Accumulation Data

The **Accumulation Data** screen enables you to view the aggregate stop-loss, discount, level funded, minimum premium program, and specific stop-loss accumulation details. It contains the following zones:

- **Search Parent Accumulation Group** - Enables you to search for a parent accumulation group whose accumulation details you want to view. You can search a parent accumulation group which is created for either of the following accumulation category:
  - **Aggregate Stop-Loss**
  - **Discount Arrangement**
  - **Level Funded**
  - **Minimum Premium Program**
  - **Specific Stop-Loss**
- **Aggregate Stop-Loss Accumulation Amount** - Enables you to view how the aggregate stop-loss is calculated in each accumulation run. In addition, you can view the aggregate stop-loss billable charge which is created in each accumulation run.
- **Discount Arrangement Accumulation Amount** - Enables you to view how the discount is calculated in each accumulation run. In addition, you can view the discount billable charge which is created in each accumulation run.
- **Level Funded Accumulation Amount** - Enables you to view how the charges eligible for level funding are calculated in each accumulation run. In addition, you can view the level funded billable charge which is created in each accumulation run.
- **Minimum Premium Program Amount** - Enables you to view how the charges eligible for minimum premium program are calculated in each accumulation run. In addition, you can view the minimum premium program billable charge which is created in each accumulation run.
- **Specific Stop-Loss Accumulation Amount** - Enables you to view how the specific stop-loss is calculated in each accumulation run. In addition, you can view the specific stop-loss billable charge which is created in each accumulation run.
- **Off-Process Adjustment/Billable Charges** - Enables you to view the adjustments or billable charges created through an off-process request which are used in the accumulation run.
- **Transaction Information** - Enables you to view the claim transactions for which the specific stop-loss, aggregate stop-loss, discount, or charges eligible for level funding are accumulated.
- **Transaction Leg Calculation Lines** - Enables you to view calculation lines of all legs of the transaction which are rated before billing.
- **Transaction Leg Calculation Line Characteristics** - Enables you to view the characteristics of a calculation line.

You can navigate to the **Accumulation Data** screen from the **Transaction and Audit Event Management** menu.

Search Accumulation Data

The **Search Accumulation Data** zone allows you to search for the accumulation data using various search criteria. This zone contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Search By	Used to indicate whether you want to search for an accumulation data using the accumulation or billable charge details. The valid values are: • **Accumulation Details** - Used when you want to search for an accumulation data using the accumulation details. • **Billable Charge Details** - Used when you want to search for an accumulation data using the billable charge details. **Note:** By default, the **Accumulation Details** option is selected.	Yes
Billable Charge ID	Used to search an accumulation data for a particular billable charge. **Note:** This field appears when you select the **Billable Charge Details** option from the **Search By** field.	Yes
Accumulation Category	Used to search an accumulation data for a particular accumulation category. The valid values are: • All • Aggregate Stop-Loss • Discount Arrangement • Level Funded • Minimum Premium Program • Specific Stop-Loss **Note:** By default, the **All** option is selected.	Yes (Conditional) **Note:** This field is required when the **Accumulation Details** option is selected from the **Search By** list.
Parent Person ID	Used to search an accumulation data for a particular parent person ID. **Note:** The **Search** (🔍) icon appears corresponding to this field. On clicking the **Search** icon, the **Person Search** window appears.	Yes (Conditional) **Note:** This field is required when: • The **All** option is selected from the **Accumulation Category** list. • The **Active** or **Completed** option is selected from the **Parent Accumulation Group Status** list.
Parent Person Name	Used to specify the parent person name based on which you want to search an accumulation data.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
		Note: This field is required when: • The **All** option is selected from the **Accumulation Category** list. • The **Active** or **Completed** option is selected from the **Parent Accumulation Group Status** list.
Account ID	Used to search an accumulation data for a particular account. **Note:** The **Search** (🔍) icon appears corresponding to this field. On clicking the **Search** icon, the **Account Search** window appears.	Yes (Conditional) **Note:** This field is required when: • The **All** option is selected from the **Accumulation Category** list. • The **Active** or **Completed** option is selected from the **Parent Accumulation Group Status** list.
Parent Accumulation Group ID	Used to search an accumulation data for a particular parent accumulation group. **Note:** The **Search** (🔍) icon appears corresponding to this field. On clicking the **Search** icon, the **Accumulation Group Search** window appears.	Yes (Conditional) **Note:** This field is required when: • The **All** option is selected from the **Accumulation Category** list. • The **Active** or **Completed** option is selected from the **Parent Accumulation Group Status** list.
Parent Accumulation Group Status	Used to search an accumulation data for a particular parent accumulation group status. The valid values are: • Active • Completed	No

Note: You must specify at least one search criterion while searching for the accumulation data.

Copyright © 2026, Oracle and/or its affiliates.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Parent Accumulation Group ID	Indicates the parent accumulation group for which the accumulation data exists.
Status	Indicates the parent accumulation group status. The valid values are: • Active • Completed
Parent Person Information	Indicates the information about the parent person. In addition, this column has a context menu which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Person** screen appears where you can view the details of the respective parent person.
Accumulation Category	Indicates the category for which the accumulation data exists. The valid values are: • Aggregate Stop-Loss • Discount Arrangement • Level Funded • Minimum Premium Program • Specific Stop-Loss
Pricing Rule Information	Displays information about the pricing rule used in the accumulation.

On clicking the **Broadcast** (ᯤ) icon corresponding to the parent accumulation group ID column, the **Accumulation Amount** zone appears with the details of the respective accumulation category.

How to search for an accumulation data	Searching for an Accumulation Data on page 3455

Searching for an Accumulation Data

Procedure

To search for an accumulation data:

1. Click the **Menu** link in the **Application** toolbar.
   A list appears.
2. From the **Main** menu, select **Transaction and Audit Event Management** and then click **Accumulation Data**.
   The **Accumulation Data** screen appears.
3. Enter the search criteria in the **Accumulation Data** zone.

Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

Copyright © 2026, Oracle and/or its affiliates.

4. Click **Search**.
   A list of accumulation data that meets the search criteria appears in the **Search Results** section.

Search Accumulation Data zone	Search Accumulation Data on page 3452

Minimum Premium Program Accumulation Amount

The **Minimum Premium Program Accumulation Amount** zone lists the accumulated value of charges eligible for minimum premium program. It contains the following columns:

Column Name	Column Description
Accumulation Run Date	Displays the date on which the accumulation batch processed the member or account and calculated the accumulated premium amounts.
Aggregated Amount	Displays the total premium amount accumulated for the accumulation group before any adjustments were deployed.
SSL Credits	Displays the credits (or negative adjustments) that are applied to the accumulated premium amount.
Net Aggregated Amount	Displays the effective accumulated amount after applying the SSL credits.
Previous Cumulative Max Liability	Displays the cumulative maximum liability carried forward from the previous accumulation cycle.
Max Liability	Displays the incremental liability calculated during the current accumulation cycle.
Cumulative Maximum Liability	Displays the updated cumulative liability after applying the current cycle's maximum liability to the previous cumulative liability.
Original Cumulative Limit	Displays the original cumulative liability limit configured for the minimum premium program before any adjustments or recalculations are applied.
Limit Type	Indicates the type or category of limit used for calculation purposes.
Minimum Attachment Point	Displays the minimum premium threshold defined for the accumulation level.
Cumulative Delta	Displays the cumulative adjustment amount required when the Minimum Attachment Point (MAP) exceeds the calculated MPP limit.
Monthly Limit	Displays the maximum amount allowed to accumulate during the current billing month.
Cumulative Monthly Limit	Displays the cumulative sum of the monthly accumulation limits configured up to and including the current attachment point.
Effective MPP Limit	Displays the final MPP limit applicable for billing after all configurations and adjustments have been applied.
Cumulative Surplus/Deficit Amount	Displays the cumulative difference between the accumulated premium amount and the required minimum premium, where the positive values indicate a surplus and negative values indicate a deficit.
Roll Forward Charges	Displays the charges carried forward from the previous billing periods for inclusion in the current billing period.
Billable Charge Amount	Displays the amount to be billed for the current accumulation level. The value may be positive for a charge or negative for a credit.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Billable Charge Information	Displays the billable charge details.
	Note: It contains a link. On clicking the link, the **Billable Charge** screen appears where you can view the details of the respective related object.
Accumulation Group ID	Displays the unique identifier used to associate the accumulation record with its corresponding accumulation group.

On clicking the **Broadcast** (📡) icon corresponding to the **Accumulation Run Date** column, the **Off-Process Adjustments/Billable Charges** and **Transaction Calculation Information** zone appear.

- SSL Accumulation across Bill Groups
- Trigger Repricing on Deleting Derivation and Pricing Parameters of a Bill Group

Administrative Services Only (ASO) is an arrangement in which an organization funds its own employee benefit plan such as a health plan but hires an outside firm to perform specific administrative services. For example, an organization may hire an insurance company to evaluate and process claims under its employee health plan, while maintaining the responsibility to pay the claims itself.

Self-Funded plan specifics vary depending on the agreement a company establishes with insurance companies and third-party administrators (TPA). In the self-funded plan, the insurance company may provide little to no degree of insurance protection. ASO services are gaining popularity because many employers, particularly larger ones, explore that the self-funded plan provides the potential financial advantages at an acceptable cost.

Oracle Revenue Management and Billing (ORMB) provides a complete solution in terms of pricing, billing, and revenue management to support the self-funded plans. It also provides risk coverage for offering self-funded plans through the stop-loss services, such as specific stop-loss and aggregate stop-loss. The specific stop-loss solution in ORMB helps the employer in mitigating high-cost claims for individual members. And, the aggregate stop-loss helps the employer in mitigating risk against high-volume claims.

The **Transaction Feed Management (TFM)** module is enhanced to support the self-funded billing. You can upload the claim, enrollment, and ancillary transactions in the system using the **File Upload Interface** feature. You can use the **File Upload Interface** feature to upload transaction data files in the following formats:

- Comma Separated Values
- JavaScript Object Notation
- Fixed Position
- Pipe Separated Values
- Tilde Separated Values
- Extensible Markup Language

Once the claim, enrollment, and ancillary transaction data files are uploaded in the system, you need to:

- Validate Header Details
- Validate Transaction Details and Determine Initial Price Item
- Verify Price Item Pricing
- Rate Transactions Before Billing (if required)
- Create and Update Billable Charge with the SQI values
- Clean-up Unwanted Data

The system provides the flexibility to rate the claim, enrollment, and ancillary transactions either prior to billing or during billing. Based on the business

requirements, you can configure the system such that transactions mapped to a price item can be rated at a frequency which is different from the account's billing frequency. For example, daily, weekly, etc.

A new pricing model is introduced for the self-funded health insurance business which enables you to create pricing rules for:

- Claim
- Specific Stop-Loss
- Aggregate Stop-Loss
- Claim Based Fees
- Enrollment Based Fees
- One-time and Recurring Flat Fees
- Ancillary Charges

Once you create the required pricing structure, you can bill for the claim, enrollment, and ancillary transactions. Once the billable charges for claims, claim based fees, enrollment based fees, and ancillary are created through the transaction aggregation process, you can accumulate the specific stop-loss and aggregate stop-loss and create billable charges for them. Once the required billable charges are created, you can bill them using the charge-based billing batches.

Copyright © 2026, Oracle and/or its affiliates.

Pre-requisites

To setup the Self-Funded Billing feature, you need to do the following:

- Define the parent customers and bill groups in the system.
- Define the required pricing rule types for different pricing rule type categories, such as **Claim**, **Specific Stop-Loss**, **Aggregate Stop-Loss**, **Retention Type Claim Based**, **Retention Type Enrollment Based**, **Flat Fees**, and **Ancillary**.
- Map the transaction fields appropriately in the primary pricing rule types.
- Attach an algorithm created using the **C1_TXNBGDRV** algorithm type to the **Bill Group Derivation** system event of the pricing rule type where the pricing rule type category is set to **Claim** or **Retention Type Enrollment Based**.
- Attach an algorithm created using the **C1_ACCPRIDRV** algorithm type to the **Account and Price Item Derivation** system event of the pricing rule type where the pricing rule type category is set to **Claim**, **Retention Type Claim Based**, **Retention Type Enrollment Based**, or **Ancillary**.
- Attach an algorithm created using the **C1_ACCPRISL** algorithm type to the **Account and Price Item Derivation** system event of the pricing rule type where the pricing rule type category is set to **Specific Stop-Loss** or **Aggregate Stop-Loss**.
- Attach an algorithm created using the **C1_BAFTDRV** algorithm type to the **Bill After Date Determination** system event of the pricing rule type where the pricing rule type category is set to **Claim**, **Retention Type Claim Based**, **Retention Type Enrollment Based**, or **Ancillary**.
- Attach an algorithm created using the **SA_DERV_POPC** algorithm type to the **TFM - Contract Derivation** algorithm spot of the required divisions.
- Attach an algorithm created using the **C1-VRPR_POPC** algorithm type to the **TFM - Verify Pricing Post-Processing** algorithm spot of the required divisions.
- Attach an algorithm created using the **C1_BCHG_POPC** algorithm type to the **TFM - Billable Charge Post-Processing** algorithm spot of the required divisions.
- Map each transaction record type to either the required rule type or primary pricing rule type.
- Define the pricing groups for the required bill groups.
- Define the required pricing rules for the parent customer and bill groups.
- Define the rate schedules with the following calculation algorithms for different price items:

Price item related to....	**Calculation Algorithm**
Claim	C1-CLAIMCALC
Specific Stop-Loss	C1-SSLRTCALC
Aggregate Stop-Loss	C1-ASLRTCALC
Retention Type Enrollment Based	None
Flat Fees	None
Ancillary	C1-ANCICALC

- Attach an algorithm created using the **C1-RETFLAT** algorithm type to the **TFM - Rate Pre-Processing** algorithm spot of the required divisions.
- Define the TFM information in the rating option for different price items in the following manner:

  The following table lists the TFM information which must be defined in the rating option for the respective type of price items:

Copyright © 2026, Oracle and/or its affiliates.

Price item related to....	Rate Option			
	Aggregate Transaction	**Aggregation Schedule**	**Ignore Transaction**	**Rating Criteria**
Claim	Yes	As Required	No	RITA
Specific Stop-Loss	No	-	Yes	RITX
Aggregate Stop-Loss	No	-	Yes	RITX
Retention Type Claim Based	Yes	As Required	No	RITA
Retention Type Enrollment Based	Yes	As Required	No	RITA
Ancillary	Yes	As Required	No	RITA

- Define the derivation and pricing parameters for each bill group.
- Set the following option types in the **C1-ASOBLLNG** feature configuration:
  - Person Relationship Type
  - Bill Group Policy Person Role
  - Invoice Type Characteristic Type
  - Pricing Group Rule Parameter
  - Billable Charge Line Type Parameter
  - Pricing Arrangement Parameter

Related Topics

For more information on...	See...
How to set up the **C1-ASOBLLNG** feature configuration	Setting the C1-ASOBLLNG Feature Configuration on page 4639

Bill Group Derivation and Pricing Parameters

An employer may have different bill groups. Each bill group will handle the claim, enrollment, and ancillary transactions of employees based on the employee attributes, such as location, employment status, employment department, and so on.

Oracle Revenue Management and Billing allows you to define the derivation and pricing parameters, such as source system, parameter 1, parameter 2, parameter 3, and parameter 4 for the bill group. These parameters are used to derive the bill group against which the billable charges created for the claim, enrollment, and ancillary transactions should be billed in the system. The derived bill group is also used for billing the claim based fees, one-time or recurring fees, specific stop-loss credits, and aggregate stop-loss credits. You can define multiple derivation and pricing parameters for a bill group, but the derivation and pricing parameter combination must be unique for a particular duration.

For example, if you want bill group 1 to handle the claim, enrollment, and ancillary transactions of employees:

- Who reside in the Western location of the city
- Who belong to Grade A
- Whose transactions are received from the X system

Then, you need to define the following derivation and pricing parameters for bill group 1:

Bill Group Name	Sort ID	Source System	Parameter 1	Parameter 2	Parameter 3	Parameter 4
Bill Group 1	111	X	Western	Grade A	-	-

Example 1: Derivation and Pricing Parameters for Bill Group 1

Copyright © 2026, Oracle and/or its affiliates.

Similarly, if you want bill group 2 to handle the claim, enrollment, and ancillary transactions of employees:

- Who reside in the Eastern location of Mumbai
- Who are the person of Indian origin
- Who belong to Grade A
- Whose transactions are received from the X system

Then, you need to define the following derivation and pricing parameters for bill group 2:

Bill Group Name	Sort ID	Source System	Parameter 1	Parameter 2	Parameter 3	Parameter 4
Bill Group 2	123	X	Eastern	Grade A	Mumbai	India

Example 2: Derivation and Pricing Parameters for Bill Group 2

In the example 1 and 2, the bill group is derived based on the specified employee attributes when the source system, parameter 1, parameter 2, parameter 3, and parameter 4 are mapped to the appropriate transaction fields in the primary pricing rule type using which the pricing rules are defined for the bill group. For example,

Pricing Rule Type	Source System	Parameter 1	Parameter 2	Parameter 3	Parameter 4
PR1	External System	Location	Designation	City	Country

Example 3: Transaction Field Mapping in Primary Pricing Rule Type

You can also define criteria for a rule in a pricing group using the parameters, such as source system, parameter 1, parameter 2, parameter 3, and parameter 4.

For example, the following table illustrates how you can define a rule criteria in a pricing group:

Pricing Group	Rule	Source System	Parameter 1	Parameter 2	Parameter 3	Parameter 4
PG1	R1	X	Eastern	Grade A	Mumbai	India
	R2	X	Western	Grade A	-	-

Example 4: Rules Defined in a Pricing Group

If a pricing rule is defined for a bill group using a pricing group, you can define more than one price in the pricing rule which is offered based on the attributes of the employees.

For example, the following table illustrates how you can use a pricing group to derive a pricing strategy in a pricing rule:

Pricing Rule	Pricing Group	Rule	Rule Criteria	Pricing Strategy	Markup or Markdown Type	Markup or Markdown Amount
PRRR1	PG1	R1	Source System = X, Parameter 1 = Eastern, Parameter 2 = Grade A, Parameter 3 = Mumbai, Parameter 4 = India	Markup	Flat Amount	$20
		R2	Source System = X, Parameter 1 = Western, Parameter 2 = Grade A	Markdown	Flat Amount	$10

Example 5: Defining a Pricing Rule Using a Pricing Group

In the example 5, the system will use the markup strategy on the claim line items for the employees who satisfy the criteria specified in R1. On the other hand, the system will use the markdown strategy on the claim line items for the employees who satisfy the criteria specified in R2.

The derivation and pricing parameters for the bill group and sort ID combination are effective from a particular date. However, the effective date must fall within the date range defined for the sort ID of the bill group. The source system and parameter 1 are mandatory while defining the derivation and pricing parameters for a bill group.

Copyright © 2026, Oracle and/or its affiliates.

You can define and edit the derivation and pricing parameters for the bill group and sort ID combination from the **Customer 360° Information** screen. You can also upload the derivation and pricing parameters for one or more bill group and sort ID combinations at the same time using the **Upload Request** feature. You can upload the derivation and pricing parameters for the bill group and sort ID combinations from the **Customer 360° Information** or **Upload Request** screen. Note that you can upload the derivation and pricing parameters for the bill group and sort ID only using the CSV file format.

Related Pricing Rule Type Eligibility

Oracle Revenue Management and Billing enables you to define eligibility rule type for a related pricing rule type in a primary pricing rule type. If the eligibility rule type is defined of a related pricing rule type, the system checks whether the related pricing rule type is eligible for deriving the transaction legs when it is called during the **Validate Transaction and Derive Price Item (C1-TXNIP)** batch execution. The system searches for all rules which are created using the respective rule type and then executes them one by one in the specified priority until the following conditions are met in a rule:

- The eligibility criteria defined in the rule is satisfied.
- The satisfied rule returns the output parameter and its value as specified in the **Rule Based Related Pricing Rule Type Eligibility Field** and **Rule Based Eligibility Value** fields, respectively, of the primary pricing rule type.
- The **Rule True Action** field in the satisfied rule returns **Success**.

Note: At present, the system considers all rules created using the respective rule type irrespective of whether it is effective on the transaction date or not.

If all the above conditions are met in a rule, the system calls the respective related pricing rule type for deriving the transaction legs. If none of the rules created using the rule type are satisfied, the system does not call the respective related pricing rule type for deriving the transaction legs. Let us understand this with the help of an example. If the claim transaction is received with the following details:

- UDF_CHAR_1 is set to Western
- UDF_CHAR_15 is set Employee
- UDF_DATE_1 is set to 11-05-2018
- Transaction Record Type is set to TR1

The following table illustrates how the eligibility rules can be defined for a related pricing rule type:

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Eligibility Rule Type	Rule	Rule's Effective Start Date	Rule's Effective End Date	Priority	Rule Criteria	Output Parameter	Output Parameter Value
TR1	CLAIM	CLAIM BASED FEES	RT1	R1	01-01-2018	31-03-2018	1	UDF_CHAR_1 = Western	UDF_CHAR_15	Director
				R2	01-01-2018	31-03-2018	2	UDF_CHAR_1 = Western	UDF_CHAR_15	Employee
				R3	01-04-2018	30-06-2018	3	UDF_CHAR_1 = Western	UDF_CHAR_15	Employee
				R4	01-07-2018	31-12-2018	4	UDF_CHAR_1 = Western	UDF_CHAR_15	Director
		SPECIFIC STOP-LOSS	RT2	R5	01-01-2018	31-03-2018	1	UDF_CHAR_1 = Western	UDF_CHAR_15	Director
				R6	01-01-2018	31-03-2018	2	UDF_CHAR_1 = Eastern	UDF_CHAR_15	Employee
				R7	01-04-2018	31-12-2018	3	UDF_CHAR_1 = Western	UDF_CHAR_15	Employee
		AGGREGATE STOP-LOSS	RT3	R8	01-04-2018	31-12-2018	1	UDF_CHAR_1 = Eastern	UDF_CHAR_15	Employee
				R9	01-04-2018	31-12-2018	2	UDF_CHAR_1 = Western	UDF_CHAR_15	Director

Note: Here, the paid date is mapped to the **UDF_DATE_1** field in the CLAIM pricing rule type. In addition, the **Rule Based Related Pricing Rule Type Eligibility Field** field is set to **UDF_CHAR_15** and the **Rule Based Eligibility Value** field is set to **Employee** in the CLAIM pricing rule type.

Example 1: Related Pricing Rule Type Eligibility Rules

In the example 1, the rules which are created using the RT1 rule type are invoked for the CLAIM BASED FEES pricing rule type in the specified priority. The claim transaction meets the eligibility criteria defined in the R1 rule. But, the output parameter's value specified in the R1 rule does not match the value specified in the **Rule Based Eligibility Value** field. Therefore, the system executes the rule with the next priority (i.e. R2). The claim transaction meets the eligibility criteria defined in the R2 rule. In addition, the output parameter and its value specified in the R2 rule match the values specified in the **Rule Based Related Pricing Rule Type Eligibility Field** and **Rule Based Eligibility Value** fields, respectively. Therefore, the system considers the CLAIM BASED FEES pricing rule type for deriving the transaction legs.

The rules which are created using the RT2 rule type are invoked for the SPECIFIC STOP-LOSS pricing rule type in the specified priority. The claim transaction meets the eligibility criteria defined in the R5 rule. But, the output parameter's value specified in the R5 rule does not match the value specified in the **Rule Based Eligibility Value** field. Therefore, the system executes the rule with the next priority (i.e. R6). Here, the claim transaction does not meet the eligibility criteria defined in the R6 rule. The system then executes the rule with the next priority (i.e. R7). The claim transaction meets the eligibility criteria defined in the R7 rule. In addition, the output parameter and its value specified in the R7 rule match the values specified in the **Rule Based Related Pricing Rule Type Eligibility Field** and **Rule Based Eligibility Value** fields, respectively. Therefore, the system considers the SPECIFIC STOP-LOSS pricing rule type for deriving the transaction legs.

Similarly, the rules which are created using the RT3 rule type are invoked for the AGGREGATE STOP-LOSS pricing rule type in the specified priority. The claim transaction does not meet the eligibility criteria defined in the R8 rule. Therefore, the system executes the rule with the next priority (i.e. R9). The claim transaction meets the eligibility criteria defined in the R9 rule. But, the output parameter's value specified in the R9 rule does not match the value specified in the **Rule Based Eligibility Value** field. As none of the rules created using the rule type met the criteria, the system does not consider the AGGREGATE STOP-LOSS pricing rule type for deriving the transaction legs.

Price Item Eligibility

Oracle Revenue Management and Billing enables you to define eligibility rule type for a price item in a pricing rule type. If the eligibility rule type is defined of a price item, the system checks whether the price item is eligible for billing when the pricing rule type is called during the **Validate Transaction and Derive Price Item (C1-TXNIP)** batch execution.

Copyright © 2026, Oracle and/or its affiliates.

The system searches for all rules which are created using the respective rule type and then executes them one by one in the specified priority until the following conditions are met in a rule:

- The eligibility criteria defined in the rule is satisfied.
- The satisfied rule returns the output parameter and its value as specified in the **Rule Based Price Item Eligibility Field** and **Rule Based Eligibility Value** fields, respectively, of the pricing rule type.
- The **Rule True Action** field in the satisfied rule returns **Success**.

Note: At present, the system considers all rules created using the respective rule type irrespective of whether it is effective on the transaction date or not.

If all the above conditions are met, the system searches for an effective pricing rule for the respective price item. If none of the rules created using the rule type are satisfied, the system does not map the transaction to the price item. Let us understand this with the help of an example. If the claim transaction is received with the following details:

- UDF_CHAR_1 is set to Western
- UDF_CHAR_20 is set to Employee
- UDF_DATE_1 is set to 05-03-2018
- Transaction Record Type is set to TR1

The following table illustrates how the eligibility rules can be defined for a price item in a pricing rule type:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Eligibility Rule Type	Rule	Rule's Effective Start Date	Rule's Effective End Date	Priority	Rule Criteria	Output Parameter	Output Parameter Value
TR1	CLAIM	P1	RT1	R1	01-01-2018	31-03-2018	1	UDF_CHAR_1 = Western	UDF_CHAR_20	Director
				R2	01-01-2018	31-03-2018	2	UDF_CHAR_1 = Western	UDF_CHAR_20	Employee
				R3	01-04-2018	30-06-2018	3	UDF_CHAR_1 = Western	UDF_CHAR_20	Employee
				R4	01-07-2018	31-12-2018	4	UDF_CHAR_1 = Western	UDF_CHAR_20	Director
		P2	RT2	R5	01-01-2018	31-03-2018	1	UDF_CHAR_1 = Western	UDF_CHAR_20	Director
				R6	01-01-2018	31-03-2018	2	UDF_CHAR_1 = Eastern	UDF_CHAR_20	Employee
				R7	01-04-2018	31-12-2018	3	UDF_CHAR_1 = Western	UDF_CHAR_20	Employee

Note: Here, the paid date is mapped to the **UDF_DATE_1** field in the CLAIM pricing rule type. In addition, the **Rule Based Related Pricing Rule Type Eligibility Field** field is set to **UDF_CHAR_20** and the **Rule Based Eligibility Value** field is set to **Employee** in the CLAIM pricing rule type.

Example 1: Price Item Eligibility Rules

In the example 1, the rules which are created using the RT1 rule type are invoked for P1 in the specified priority. The claim transaction meets the eligibility criteria defined in the R1 rule. But, the output parameter's value specified in the R1 rule does not match the value specified in the **Rule Based Eligibility Value** field. Therefore, the system executes the rule with the next priority (i.e. R2). The claim transaction meets the eligibility criteria defined in the R2 rule. In addition, the output parameter and its value specified in the R2 rule match the values specified in the **Rule Based Price Item Eligibility Field** and **Rule Based Eligibility Value** fields, respectively. Therefore, the system considers P1 for billing and maps the claim transaction to P1 if an effective pricing rule, account, and active contract are available for P1.

Similarly, the rules which are created using the RT2 rule type are invoked for P2 in the specified priority. The claim transaction meets the eligibility criteria defined in the R5 rule. But, the output parameter's value specified in the R5 rule does not match the value specified in the **Rule Based Eligibility Value** field. Therefore, the system executes the rule with the next priority (i.e. R6). Here, the claim transaction does not meet the eligibility criteria defined in the R6 rule. The system then executes the rule with the next priority (i.e. R7). The claim transaction meets the eligibility criteria defined in the R7 rule. In addition, the output parameter and its value specified in the R7 rule match the values specified in the **Rule Based Price Item Eligibility Field** and **Rule Based Eligibility Value** fields, respectively. Therefore, the

Copyright © 2026, Oracle and/or its affiliates.

system considers P2 for billing and maps the claim transaction to P2 if an effective pricing rule, account, and active contract are available for P2.

Self-Funded Billing Process

The **Self-Funded Billing** process consists of the following sub-processes:

- Transaction Aggregation on page 3467
- Stop Loss Calculation on page 3472
- Bill Generation on page 3472

Transaction Aggregation

Once the claim, enrollment, and ancillary transactions are uploaded, you can create billable charges for the following using the **Transaction Aggregation** process in the **Transaction Feed Management (TFM)** module:

- Claim
- Claim Based Fees
- Retroactive Enrollment Fees
- Non-retroactive Enrollment Fees
- Ancillary

The transaction calculation lines for specific stop-loss and aggregate stop-loss are created during the **Transaction Aggregation** process. Earlier, the **Transaction Aggregation** process was designed to meet the requirements of the **Payments** and **Financial Services** industries. Now, in addition, it is tuned slightly to meet the requirements of the self-funded health insurance business. The changes are made in the following batches which are executed in the **Transaction Aggregation** process:

- **Validate Transaction and Derive Price Item (C1-TXNIP)** - During this batch execution, the system validates the transaction. If the transaction validation fails due to any reason, the status of the transaction is changed to **Error**. If the transaction validation is successful, the system checks whether a primary pricing rule type is specified in the respective transaction record type. If a primary pricing rule type is not specified in the transaction record type, the system maps the transaction to one or more price item, price item parameters, and account combinations using the rules which are invoked through the rule type. However, if a primary pricing rule type is specified in the transaction record type, the system calls the primary pricing rule type and invokes the algorithms which are attached to the following system events of the primary pricing rule type in the specified sequence:

  1. **Transaction Validation** - At present, the product has not shipped an algorithm type for the **Transaction Validation** system event. If required, you can create a custom algorithm type which validates the transaction before deriving the transaction legs.
  2. **Bill Group Derivation** - For more information, refer to the Bill Group Derivation on page 3473 section.
  3. **Account and Price Item Derivation** - Depending on the category to which the pricing rule type belongs, you need to attach different algorithm to the **Account and Price Item Derivation** system event. The following table lists the algorithms that you can attach to a primary pricing rule types with different category:

Pricing Rule Type Category	Algorithm	For more information on how the system derives the transaction legs, refer to...
Claim	C1_ACCPRIDRV	Account and Price Item Derivation (for the Claim Pricing Rule Type Category) on page 3475
Retention Type Enrollment Based	C1_ACCPRIDRV	Account and Price Item Derivation (for the Retention Type Enrollment Based Pricing Rule Type Category) on page 3498

Copyright © 2026, Oracle and/or its affiliates.

Pricing Rule Type Category	Algorithm	For more information on how the system derives the transaction legs, refer to...
Ancillary	C1_ACCPRIDRV	Account and Price Item Derivation (for the Ancillary Pricing Rule Type Category) on page 3506

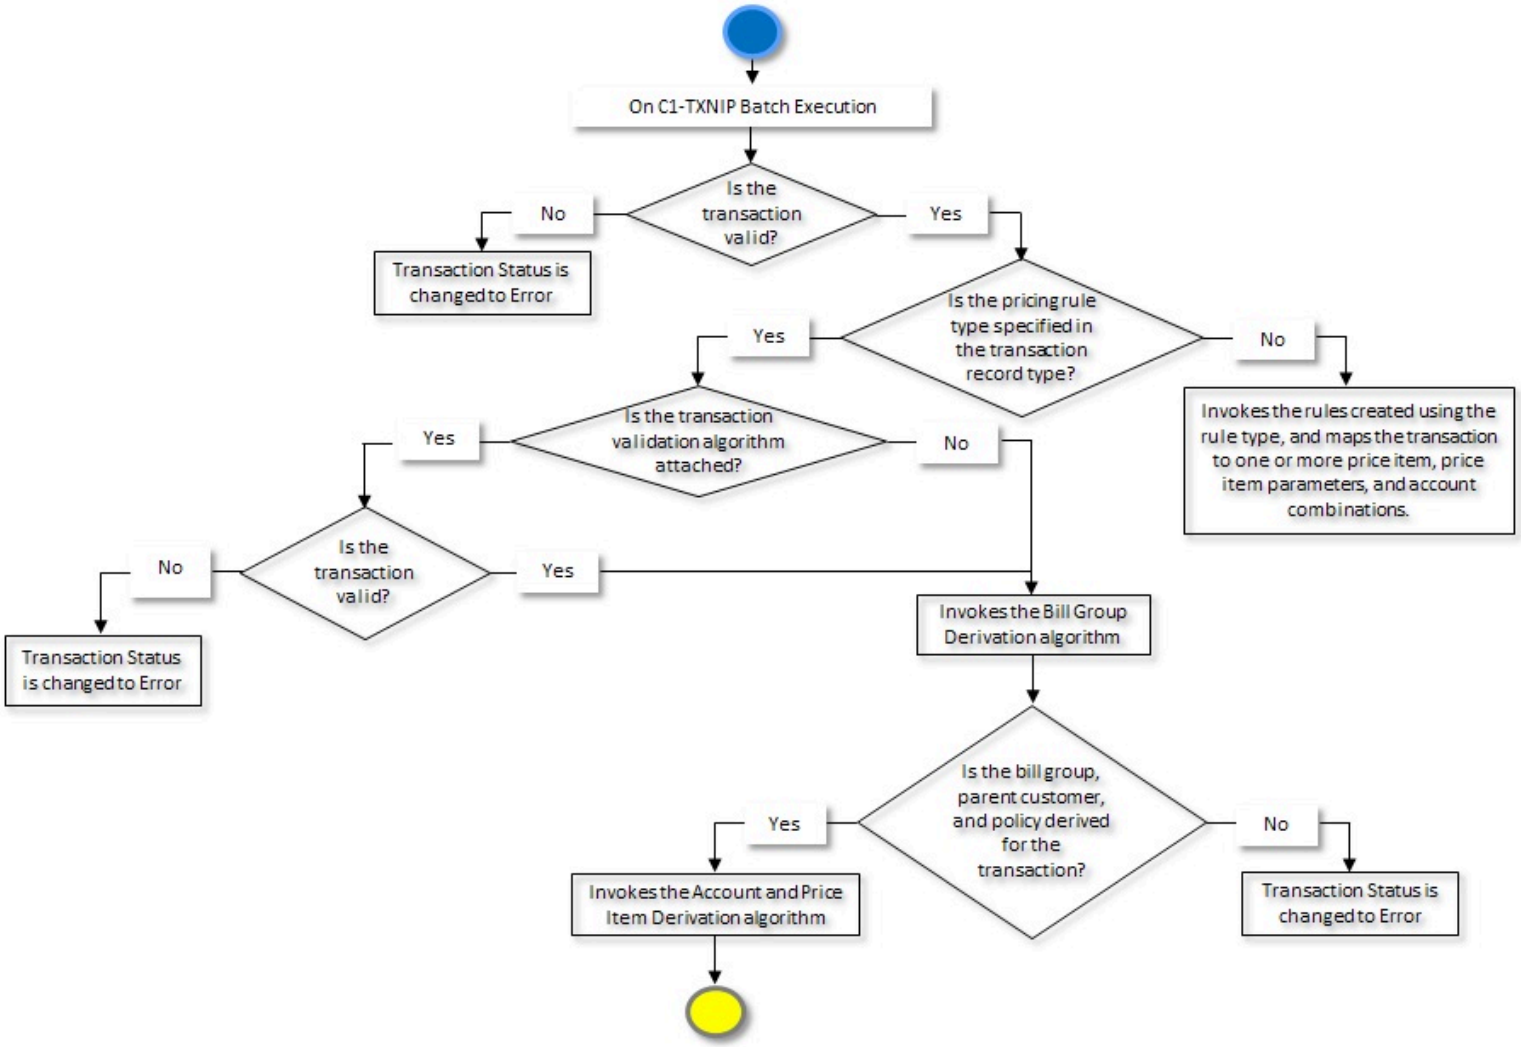
This batch then calls the eligible related pricing rule types (if any) defined in the primary pricing rule type. Note that the related pricing rule types are called one by one in the specified sequence. The system invokes the algorithms which are attached to the following system events of the related pricing rule type in the specified sequence:

1. **Transaction Validation** - At present, the product has not shipped an algorithm type for the **Transaction Validation** system event. If required, you can create a custom algorithm type which validates the transaction before deriving the transaction legs.
2. **Account and Price Item Derivation** - Depending on the category to which the pricing rule type belongs, you need to attach different algorithm to the **Account and Price Item Derivation** system event. The following table lists the algorithms that you can attach to a related pricing rule type with different category:

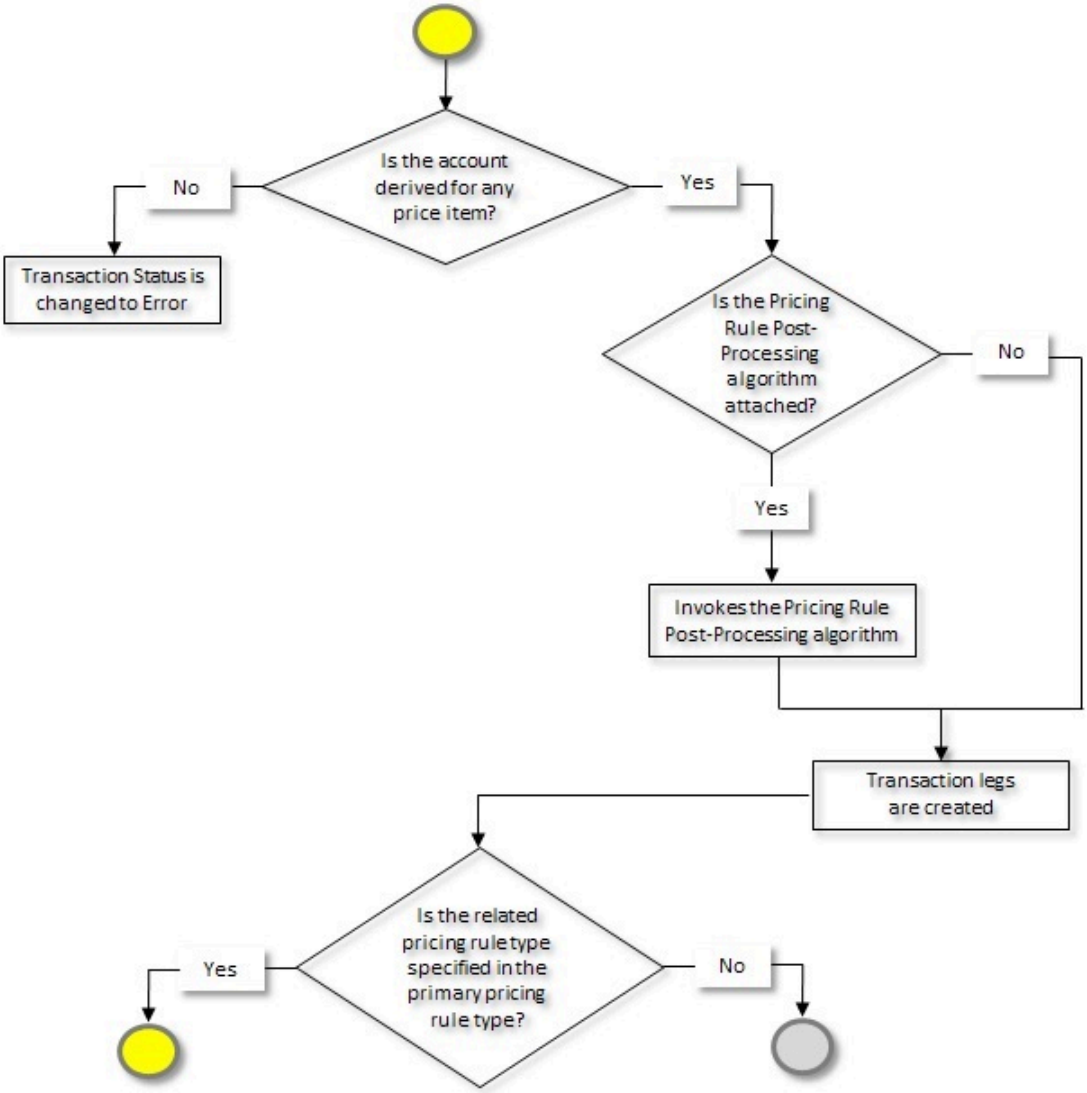
Pricing Rule Type Category	Algorithm	For more information on how the system derives the transaction legs, refer to...
Specific Stop-Loss	C1_ACCPRISL	Account and Price Item Derivation (for the Specific Stop-Loss and Aggregate Stop-Loss Pricing Rule Type Categories) on page 3480
Aggregate Stop-Loss	C1_ACCPRISL	Account and Price Item Derivation (for the Specific Stop-Loss and Aggregate Stop-Loss Pricing Rule Type Categories) on page 3480
Retention Type Claim Based	C1_ACCPRIDRV	Account and Price Item Derivation (for the Retention Type Claim Based Pricing Rule Type Category) on page 3489

The following figure graphically explains the execution process of the **Validate Transaction and Derive Price Item (C1-TXNIP)** batch:

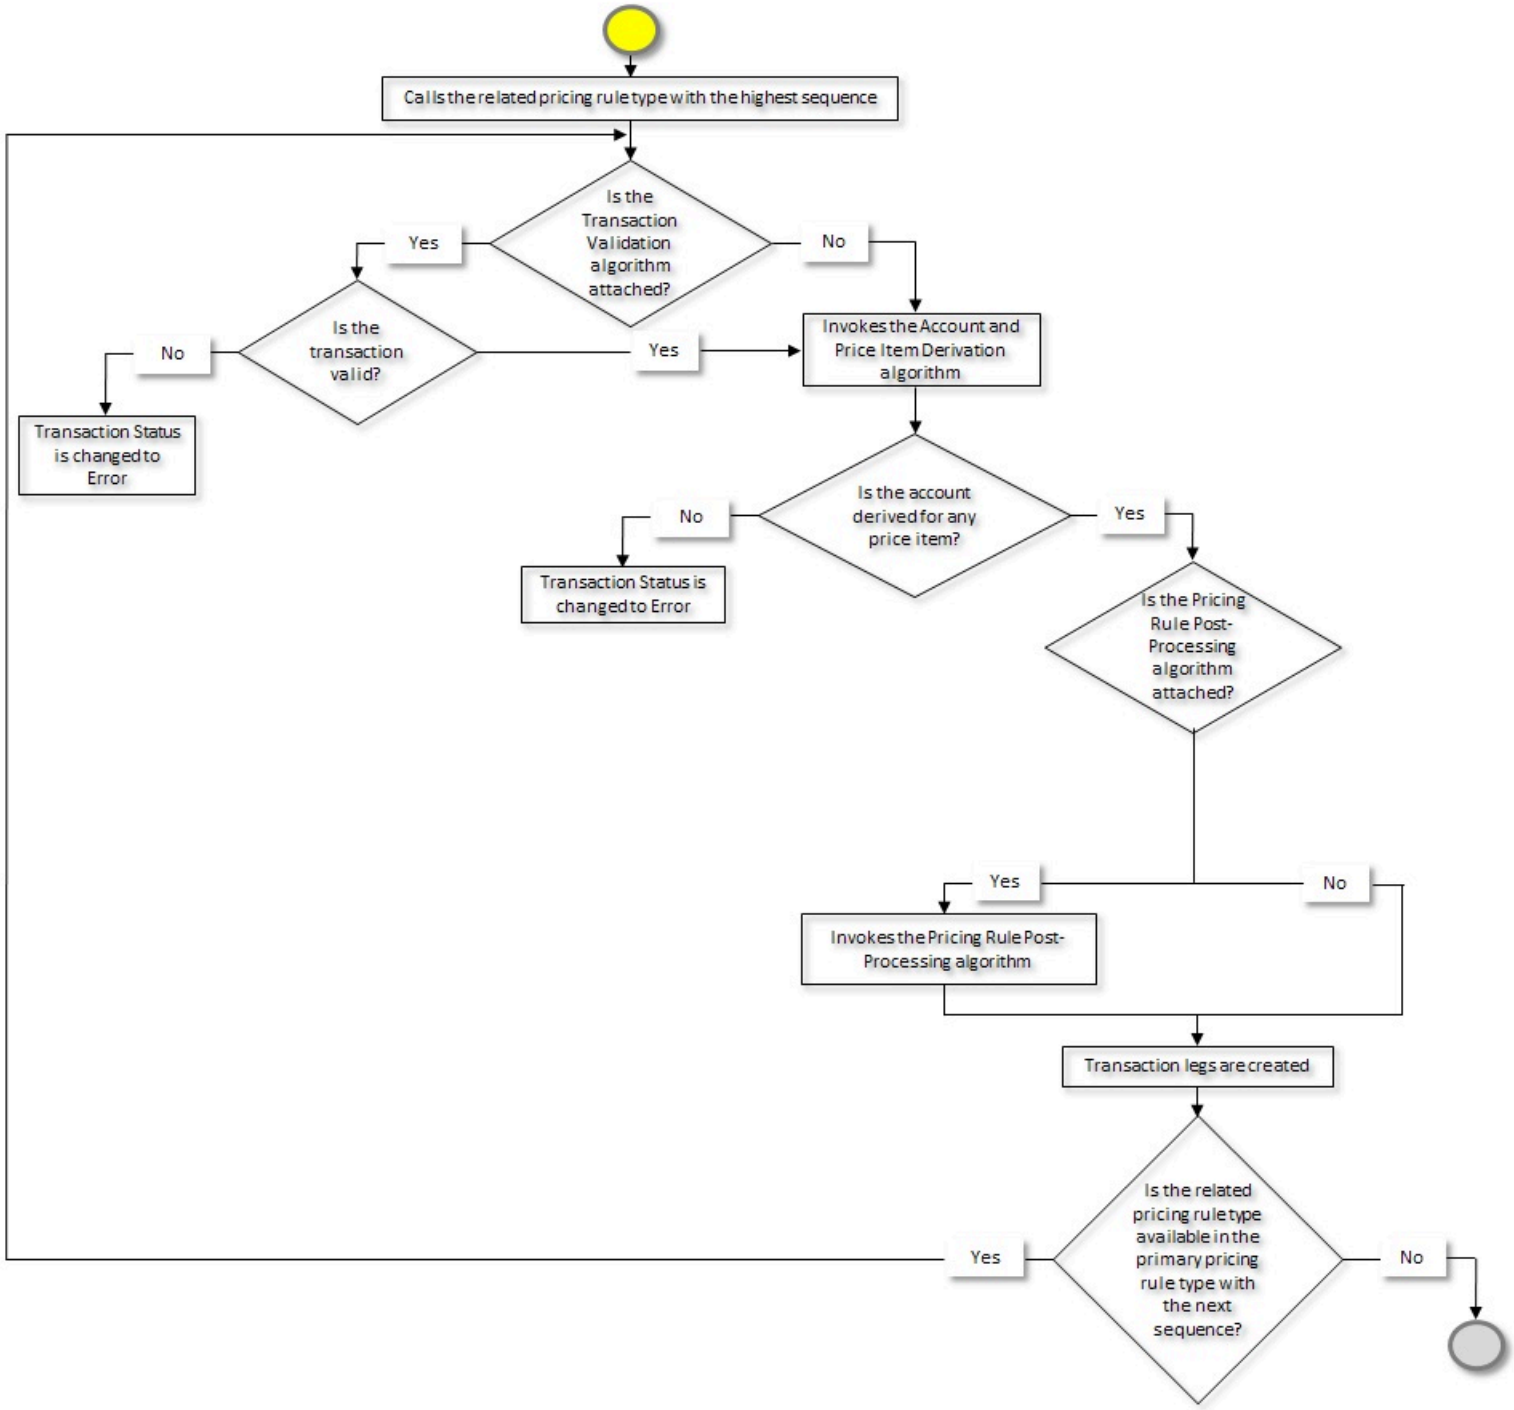
Copyright © 2026, Oracle and/or its affiliates.



Copyright © 2026, Oracle and/or its affiliates.



Copyright © 2026, Oracle and/or its affiliates.



- **Price Item Pricing Verification (C1-TXNVP)** - During this batch execution, the system derives an effective pricing for each transaction leg on the processing date. For more information, refer to the Price Item Pricing Verification on page 1230 section. In addition, the system invokes the algorithms attached to the following algorithm spots of the derived account's division in the specified sequence for the self-funded health insurance business:

  1. **TFM - Contract Derivation** - You can attach an algorithm created using the **SA_DERV_POPC** algorithm type to this algorithm spot. If the account has multiple active contracts of the contract type which is associated with the price item, this algorithm derives the contract which is associated with the policy and maps it to the transaction leg. The manner in which the system derives the active contract for the account differs in the following scenarios:

Copyright © 2026, Oracle and/or its affiliates.

If the effective pricing rule stamped against the transaction leg is defined at ...	Then...
The bill group level	The system first fetches the policy derived for the transaction and then derives the active contract which is associated with the policy.
The parent customer level	The system first fetches the bill group to which the account belongs and then the policy where the bill group is associated with the policy using the policy person role which is specified in the **Bill Group Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration. Once the policy is derived, the system derives the active contract which is associated with the policy.

2. **TFM - Verify Pricing Post-Processing** - You can attach an algorithm created using the **C1-VRPR_POPC** algorithm type to this algorithm spot. This algorithm removes the price assignment ID and price item parameter group ID from the summary ID column of each transaction leg.

- **Service Quantity Calculation (C1-TXNSQ)** - During this batch execution, the system aggregates the transaction legs, creates a billable charge, and updates the SQI values in the billable charge. For more information, refer to the Aggregation on page 1235 section. In addition, the system invokes the algorithm attached to the following algorithm spot of the derived account's division for the self-funded health insurance business:
  - **TFM - Billable Charge Post Processing** - You can attach an algorithm created using the **C1_BCHG_POPC** algorithm type to this algorithm spot. This algorithm invokes the algorithm which is attached to the **Bill After Date Determination** system event of the respective pricing rule type. For more information, refer to the Bill After Date Determination on page 3512 section.

Stop Loss Calculation

Oracle Revenue Management and Billing enables you to accumulate the specific stop-loss and aggregate stop-loss and create billable charges for them. Once the transaction calculation lines for specific stop-loss and aggregate stop-loss are created using the transaction aggregation process, you need to execute the following batches in the specified sequence:

1. Stamp Accumulate After Date Batch (C1-STAAD)
2. Accumulate Specific Stop Loss (C1-ACSSL)
3. Create Specific Stop-Loss Billable Charge (C1-BCSSL)
4. Accumulate Aggregate Stop Loss (C1-ACASL)
5. Create Aggregate Stop-Loss Billable Charge (C1-BCASL)

For more information about these batches, see *Oracle Revenue Management and Billing Batch Guide*.

Bill Generation

Once the billable charges are created for claim, claim based fees, specific stop-loss credits, aggregate stop-loss credits, enrollment based fees, and ancillary, you need to execute the following charge-based billing batches in the specified sequence to generate bills for the self-funded employer:

1. Pending Bill Generation (C1-PNDBL)
2. Bill Segment Generation (C1-BLGEN)
3. Bill Completion (C1-BLPPR)

For more information about these batches, see *Oracle Revenue Management and Billing Batch Guide*.

Copyright © 2026, Oracle and/or its affiliates.

Bill Group Derivation

The **Validate Transaction and Derive Price Item (C1-TXNIP)** batch derives the bill group, parent customer, and policy for the claim, enrollment, and ancillary transactions. This is possible only when an algorithm created using the **C1_TXNBGDRV** algorithm type is attached to the **Bill Group Derivation** system event of the primary pricing rule type. The derived bill group is used for billing the following (if any):

- Claim Charges
- Claim Based Fees
- Specific Stop-Loss (SSL) Credits
- Aggregate Stop-Loss (ASL) Credits
- Retroactive Enrollment Fees
- Non-retroactive Enrollment Fees
- One-time or Recurring Fees
- Ancillary Charges

To derive a bill group, the system first determines the derivation date. The paid date is considered as the derivation date while processing the claim transactions. The coverage end date is considered as the derivation date while processing the retroactive enrollment transactions. And, the coverage start date is considered as the derivation date while processing the non-retroactive enrollment transactions. If the system cannot determine the derivation date, the status of the transaction is changed to **Error**.

Depending on the transaction fields which are mapped to source system, parameter 1, parameter 2, parameter 3, and parameter 4 in the primary pricing rule type, the system derives the data from the transaction. For example, if the source system is mapped to the **External System** field, parameter 1 is mapped to the **Location** field, parameter 2 is mapped to the **Designation** field, parameter 3 is mapped to the **Employee Group** field, and parameter 4 is mapped to the **Nationality** field, the system derives these details from the transaction. Based on the data available in the transaction, the system derives a bill group using the derivation and pricing parameters which are defined for the bill group. Note that the system considers the derivation and pricing parameters which are effective on the derivation date. For example, if the following derivation and pricing parameters are defined for the Bill Group 1 and Bill Group 2:

Bill Group Name	Sort ID	Effective Date	Source System	Parameter 1	Parameter 2	Parameter 3	Parameter 4
Bill Group 1	123	01-01-2018	X	Eastern	Senior Manager	BG1	Indian
Bill Group 1	132	01-04-2018	X	Western	Senior Manager	-	-
Bill Group 1	156	01-07-2018	Y	Eastern	Senior Manager	BG1	Indian
Bill Group 1	163	01-10-2018	Y	Western	Senior Manager	-	-
Bill Group 2	172	01-01-2018	Y	Eastern	-	-	-
Bill Group 2	181	01-04-2018	Y	Western	-	-	-
Bill Group 2	122	01-07-2018	X	Eastern	-	-	-
Bill Group 2	112	01-10-2018	X	Western	-	-	-

Now, if the system receives a claim transaction with the following details:

- External System is set to X
- Location is set to Western

Copyright © 2026, Oracle and/or its affiliates.

- Designation is set to Senior Manager
- Paid Date is set to 12-05-2018

In this example, the derivation and pricing parameters defined for the Bill Group 1 and 132 (sort ID) combination are effective on the paid date, and therefore the system derives Bill Group 1 for billing the claim transaction. Let us take another example where the system receives a retroactive enrollment transaction with the following details:

- External System is set to X
- Location is set to Eastern
- Designation is set to Senior Manager
- Employee Group is set to BG1
- Nationality is set to Indian
- Coverage Start Date is set to 01-01-2018
- Coverage End Date is set to 31-03-2018

In this example, the derivation and pricing parameters defined for the Bill Group 1 and 123 (sort ID) combination are effective on the coverage end date, and therefore the system derives Bill Group 1 for billing the retroactive enrollment transaction.

In the above two examples, the system could find the exact match for the bill group in the system. However, if the exact match is not available, the system finds the bill group using the best fit match. For example, if the system receives a claim transaction with the following details:

- External System is set to Y
- Location is set to Western
- Designation is set to Senior Manager
- Employee Group is set to BG2
- Nationality is set to Indian
- Paid Date is set to 01-06-2018

In this example, the system could not find the effective derivation and pricing parameters with exact match (i.e. Source System = Y, Location = Western, Designation = Senior Manager, Employee Group = BG2, and Nationality = Indian) on the paid date. Therefore, it searches for the best fit match.

While searching for the best fit match, the system first rules out the optional parameter 4 (i.e. Nationality = Indian) and then checks whether the effective derivation and pricing parameters, where Source System = Y, Location = Western, Designation = Senior Manager, and Employee Group = BG2, are available on the paid date. If so, it considers the derivation and pricing parameters and accordingly derives the bill group. If not, the system then rules out the optional parameter 3 (i.e. Employee Group = BG2) and then checks whether the effective derivation and pricing parameters, where Source System = Y, Location = Western, and Designation = Senior Manager, are available on the paid date. If so, it considers the derivation and pricing parameters and accordingly derives the bill group. If not, the system then rules out the optional parameter 2 (i.e. Designation = Senior Manager) and then checks whether the effective derivation and pricing parameters, where Source System = Y and Location = Western, are available on the paid date. If so, it considers the derivation and pricing parameters and accordingly derives the bill group. If not, the status of the transaction is changed to **Error**.

In this example, the derivation and pricing parameters, where Source System = Y and Location = Western, defined for the Bill Group 2 and 181 (sort ID) combination are considered as the best fit match. Therefore, the system derives Bill Group 2 for billing the claim transaction. Let us take another example where the system receives a non-retroactive enrollment transaction with the following details:

- External System is set to Y
- Location is set to Eastern
- Designation is set to Senior Manager
- Employee Group is set to BG1
- Nationality is set to Indian
- Coverage Start Date is set to 01-01-2018
- Coverage End Date is set to 31-03-2018

Copyright © 2026, Oracle and/or its affiliates.

In this example, the system could not find the effective derivation and pricing parameters with exact match (i.e. Source System = Y, Location = Eastern, Designation = Senior Manager, Employee Group = BG1, and Nationality = Indian) on the coverage start date. Therefore, it searches for the best fit match. The derivation and pricing parameters, where Source System = Y and Location = Eastern, defined for the Bill Group 2 and 172 (sort ID) combination are considered as the best fit match. Therefore, the system derives Bill Group 2 for billing the non-retroactive enrollment transaction.

Once the bill group is derived, the system derives the parent customer of the bill group. Once the parent customer is derived, the system derives the policy for the transaction in the following manner:

If the transaction is a...	**Then...**

Claim Transaction	The system checks whether the paid date of the claim transaction falls within the policy start date and runout end date of any policy where:
	• The bill group is associated with the policy using the policy person role which is specified in the **Bill Group Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration.
	• The status of the policy is set to either of the following:
	  • In Force/Active
	  • Runout
	  • Post Runout

Retroactive Enrollment Transaction	The system checks whether the coverage end date falls within the policy start date and policy end date of any policy where: • The bill group is associated with the policy using the policy person role which is specified in the **Bill Group Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration. • The status of the policy is set to **In Force/Active**.
Non-retroactive Enrollment Transaction	The system checks whether the coverage start date falls within the policy start date and policy end date of any policy where: • The bill group is associated with the policy using the policy person role which is specified in the **Bill Group Policy Person Role** option type of the **C1-ASOBLLNG** feature configuration. • The status of the policy is set to **In Force/Active**.

If the system cannot derive the policy for the transaction, the status of the transaction is changed to **Error**.

Account and Price Item Derivation (for the Claim Pricing Rule Type Category)

The **Validate Transaction and Derive Price Item (C1-TXNIP)** batch maps a claim transaction to one or more price item and price item parameters which are defined in the respective primary pricing rule type. This is possible when an algorithm created using the **C1_ACCPRIDRV** algorithm type is attached to the **Account and Price Item Derivation** system event of the primary pricing rule type.

Note: If you have specified the price item parameters (for which the parameter usage is set to **Pricing**) in the pricing rule types where the pricing rule type category is set to **Claim**, the system does not use these price item parameters while searching for an effective pricing rule for the respective price items. However, you can use these price item parameters while defining the accumulation criteria in the related pricing rule types where the pricing rule type category is set to **Specific Stop-Loss** or **Aggregate Stop-Loss**.

This algorithm fetches the effective pricing rule for each price item specified in the primary pricing rule type on the derivation date. The system considers the paid date as the derivation date while fetching the effective pricing rules for

Copyright © 2026, Oracle and/or its affiliates.

the claim transactions. This algorithm first searches for the effective pricing rule for a price item which is defined for the policy at the bill group level. If the system does not find any effective pricing rule for a price item which is defined for the policy at the bill group level, it inherits the effective pricing rule for a price item from the parent customer level.

For example, if the system receives a claim transaction with the following details:

- UDF_DATE_1 is set to 15-01-2018
- Transaction Record Type is set to TR1

The following table illustrates how the pricing rules are defined for the claim transactions at different assignment levels:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Pricing Rule	Pricing Start Date	Pricing End Date	Assignment Level
			C1P1	01-01-2018	31-12-2018	Parent Customer
			C2P1	01-01-2018	31-12-2018	Bill Group
			C3P1	01-01-2019	30-06-2019	Bill Group
			C1P2	01-06-2017	31-12-2017	Bill Group
			C2P2	01-01-2018	31-12-2018	Parent Customer
			C3P2	01-01-2019	30-06-2019	Bill Group

Note: Here, the paid date is mapped to the **UDF_DATE_1** field in the CLAIM pricing rule type.

Example 1: Effective Pricing Rule Derivation

In the example 1, the system fetches C2P1 and C2P2 pricing rules for P1 and P2, respectively, which are effective on the paid date. Note that the effective pricing rule for P1 is derived at the bill group level, whereas the effective pricing rule for P2 is derived from the parent customer level.

The system then derives the account with a particular invoice type (to which a price item must be billed) based on the priority which is defined for the respective price item in the pricing rule type.

For example, the following table illustrates the accounts to which the charges of P1 and P2 should be billed based on the given priority:

Price Item	Priority	Invoice Type	Account
	10	Standard	A1
	20	Retention	A2
	10	Retention	A2
	20	Standard	A1

Example 2: Priority Based Account Derivation

In the example 2, while mapping the claim transaction to P1, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** exists for the bill group. If so, it considers the standard account (A1) of the bill group for billing. However, if an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** does not exist for the bill group, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Retention** exists for the bill group. If so, it considers the retention account (A2) of the bill group for billing. If an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Retention** does not exist for the bill group, the status of the transaction is changed to **Error**.

Similarly, while mapping the claim transaction to P2, the system considers the account of the bill group which is available based on the priority. The system derives the billing account for only those price items for which the effective pricing rule is derived.

Note: The characteristic type which indicates the type of account (for example, **C1INVTYP**) must be specified in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration. Otherwise, erroneous results might occur.

Copyright © 2026, Oracle and/or its affiliates.

Once the account is derived, the system then checks whether the account has one active contract of the contract type which is associated with the price item. If so, it fetches the contract for further processing. Once the effective pricing rule, account, and active contract are derived, the transaction is mapped to the respective price item, price item parameters, and account. A transaction leg is created for each price item, price item parameters, and account combination. For example, if the claim transaction is mapped to the following price item and account combinations:

Price Item	Effective Pricing Rule	Account	Active Contract	Transaction Leg
P1	PR1	A1	C1	TL1
P2	PR2	A2	C2	TL2
P3	PR3	A3	C3	TL3

Example 3: Transaction Leg Derivation

In the example 3, the system creates three transaction legs - TL1, TL2, and TL3 for the transaction. Once a transaction leg is created, the respective effective pricing rule is stamped against the transaction leg. Usually, once a transaction leg is created in the **Validate Transaction and Derive Price Item (C1-TXNIP)** batch, the price item parameters (for which the parameter usage is set to **Pricing**) of the transaction leg are grouped. The system does not support multiple parameter based pricing for the pricing rule types where the pricing rule type category is set to **Claim**. Therefore, when the price item parameters are not specified, the price item parameter group ID is set to 1 corresponding to each transaction leg - TL1, TL2, and TL3.

Note: A price item parameter group is used to determine the price item pricing. A unique group ID is generated for each group. If a group with a set of price item parameters already exists in the system, a new group is not created. Instead, the existing group is used for determining the price item pricing.

If a pricing group is used while defining a pricing rule for a bill group, the system fetches the pricing rule for a claim transaction when the following conditions are met:

- The paid date of the claim transaction falls within the pricing rule's date range.
- The employee attributes specified in the claim transaction match the criteria defined in any one of the pricing group rule.

Let us understand this with the help of an example. A claim transaction is received with the following details:

- UDF_CHAR_1 is set to X
- UDF_CHAR_2 is set to Western
- UDF_CHAR_3 is set to Indian
- UDF_CHAR_4 is set to HR
- UDF_CHAR_5 is set to Permanent
- UDF_DATE_1 is set to 04-06-2018
- Transaction Record Type is set to TR1

For example, the following table illustrates an effective pricing rule which is defined using a claim pricing rule type and where a pricing group is used:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Rule 1	Rule 2
TR1	CLAIM	PP1	PR1	01-01-2018	31-12-2018	PG1	Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent	Source System = X, Parameter 1 = Eastern, and Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent

Copyright © 2026, Oracle and/or its affiliates.

Note: Here, the source system is mapped to the **UDF_CHAR_1** field, the parameter 1 is mapped to the **UDF_CHAR_2** field, the parameter 2 is mapped to the **UDF_CHAR_3** field, the parameter 3 is mapped to the **UDF_CHAR_4** field, the parameter 4 is mapped to the **UDF_CHAR_5** field, and the paid date is mapped to the **UDF_DATE_1** field in the CLAIM pricing rule type.

Example 4: Effective Pricing Rule is Defined Using a Pricing Group

In the example 4, the system considers the PR1 pricing rule for PP1 because of the following reasons:

- The paid date (i.e. 04-06-2018) of the claim transaction falls within the PR1 pricing rule's date range (i.e. 01-01-2018 to 31-12-2018).
- The employee attributes specified in the claim transaction match the criteria defined in the Rule 1 (i.e. Source System = X, Location = Western, Nationality = Indian, Employee Department = HR, and Employee Status = Permanent)

The system then stores the pricing group rule which is satisfied against a parameter which is defined in the **Pricing Group Rule Parameter** option type of the **C1-ASOBLLNG** feature configuration. In the example 4, the price item parameter group is created and it contains the pricing group rule parameter. For example, Group A contains Pricing Group Rule Parameter = Rule 1.

In the example 4, the system could find the exact match for pricing parameters defined in the pricing group rule. However, if the exact match is not available, the system finds the effective pricing rule using the best fit match for the pricing parameters defined in the pricing group rule. Note that the system searches for the exact match in the effective pricing rules at both the bill group and parent customer levels. If the exact match is not available at both the levels, the system finds the effective pricing rule using the best fit match for the pricing parameters (defined in the pricing group rule) first at the bill group level and then at the parent customer level.

Let us understand this with the help of an example. A claim transaction is received with the following details:

- UDF_CHAR_1 is set to X
- UDF_CHAR_2 is set to Western
- UDF_CHAR_3 is set to Indian
- UDF_CHAR_4 is set to HR
- UDF_CHAR_5 is set to Permanent
- UDF_DATE_1 is set to 04-06-2018
- Transaction Record Type is set to TR2

For example, the following table illustrates the effective pricing rules which are available during the best fit match:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Rule 1	Rule 2
TR2	CLM	PP1	PR1	01-01-2018	31-12-2018	PG1	Source System = X and Parameter 1 = Western	Source System = X and Parameter 1 = Eastern
		PP2	PR2	01-01-2018	31-12-2018	PG2	Source System = X, Parameter 1 = Eastern, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent	Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent

Copyright © 2026, Oracle and/or its affiliates.

Note: Here, the source system is mapped to the **UDF_CHAR_1** field, the parameter 1 is mapped to the **UDF_CHAR_2** field, the parameter 2 is mapped to the **UDF_CHAR_3** field, the parameter 3 is mapped to the **UDF_CHAR_4** field, the parameter 4 is mapped to the **UDF_CHAR_5** field, and the paid date is mapped to the **UDF_DATE_1** field in the CLM pricing rule type.

Example 5: Effective Pricing Rule Derivation Using Best Fit Match for Pricing Parameters

In the example 5, the system could not find the exact match for the pricing parameters (i.e. Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent) in the effective pricing rule for PP1. Therefore, the system searches for the best fit match. While searching for the best fit match, the system rules out the optional parameter 4 (i.e. Parameter 4 = Permanent) and then checks whether the pricing group rule where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, and Parameter 3 = HR exists in the effective pricing rule. If so, it considers PR1 as the effective pricing rule for PP1. If not, the system then rules out the optional parameter 3 (i.e. Parameter 3 = HR) and then checks whether the pricing group rule where Source System = X, Parameter 1 = Western, and Parameter 2 = Indian exists in the effective pricing rule. If so, it considers PR1 as the effective pricing rule for PP1. If not, the system then rules out the optional parameter 2 (i.e. Parameter 2 = Indian) and then checks whether the pricing group rule where Source System = X and Parameter 1 = Western exists in the effective pricing rule. If so, it considers PR1 as the effective pricing rule for PP1. If not, the status of the transaction is changed to **Error**.

In the example 5, the system considers Rule 1 where Source System = X and Parameter 1 = Western as the best fit match, and therefore fetches PR1 as the effective pricing rule for PP1. In addition, the system fetches PR2 as the effective pricing rule for PP2. The system creates two price item parameter groups - One contains Pricing Group Rule Parameter = Rule 1 and another contains Pricing Group Rule Parameter = Rule 2. Once the price item parameter group is created, the system creates the aggregation parameter group. An aggregation parameter group contains all price item parameters included in the pricing rule type for which the parameter usage is set to **Aggregation**.

Note: We recommend that you should only include the optional aggregation price item parameters in the pricing rule types where the pricing rule type category is set to **Claim**. Otherwise, erroneous results might occur.

If the effective pricing rule is not derived for a price item or if the account or active contract for the account is not derived, the system does not create a transaction leg for the respective price item. Let us understand this with the help of an example:

Price Item	Effective Pricing Rule	Account	Active Contract	Transaction Leg
PP1	-	-	-	-
PP2	PR2	-	-	-
PP3	PR3	A3	C3	TL1
PP4	-	-	-	-
PP5	PR5	A2	C1	TL2
PP6	PR6	A1	-	-

Example 6: No. of Transaction Legs Derived

In the example 6, the system could not find the effective pricing rule for PP1 and PP4, the required account for PP2, and the active contract for PP6 on A1. Therefore, in this case, the system creates two transaction legs - TL1 and TL2 for the claim transaction.

If the eligibility rule type is defined of a price item, the system maps the claim transaction to the price item when the eligibility rule is satisfied. If the eligibility rule is not satisfied, the system does not consider the price item for billing. For example,

Price Item	Eligibility Criteria Met	Effective Pricing Rule	Account	Active Contract	Transaction Leg
PE1	Yes	PR1	A1	C1	TL1

Copyright © 2026, Oracle and/or its affiliates.

Price Item	Eligibility Criteria Met	Effective Pricing Rule	Account	Active Contract	Transaction Leg
PE2	-	PR2	-	-	-
PE3	No	-	-	-	-
PE4	Yes	-	-	-	-
PE5	Yes	PR3	A2	-	-
PE6	Yes	PR4	-	-	-

Example 7: Price Item Eligibility for Transaction Leg Derivation

In the example 7, the eligibility criteria was defined for PE1, PE3, PE4, PE5, and PE6. The eligibility criteria was satisfied for PE1, PE4, PE5, and PE6, but not for PE3. Further, the system could not find the effective pricing rule for PE4, the required account for PE2 and PE6, and the active contract for PE5 on A2. Therefore, in this case, the system creates one transaction leg (i.e. TL1) for the claim transaction. For more information, refer to the Price Item Eligibility on page 3465 section.

Once a transaction leg is created, the derivation date is set as the processing date corresponding to the transaction leg.

Account and Price Item Derivation (for the Specific Stop-Loss and Aggregate Stop-Loss Pricing Rule Type Categories)

Once the **Validate Transaction and Derive Price Item (C1-TXNIP)** batch calls the primary pricing rule type specified in the transaction record type, it calls the related pricing rule types (if any) defined in the primary pricing rule type. Note that the related pricing rule types are called one by one in the specified sequence. Let us understand this with the help of an example.

The following table illustrates how related pricing rule types can be sequenced in a claim pricing rule type:

Primary Pricing Rule Type	Sequence	Related Pricing Rule Type
CLAIM	10	SPECIFIC STOP-LOSS
	20	AGGREGATE STOP-LOSS

Example 1: Related Pricing Rule Type Sequence

In the example 1, the system first calls the related pricing rule type with the highest sequence (i.e. 10) once the CLAIM pricing rule type is called. The system calls the related pricing rule type irrespective of whether the transaction legs are derived using the primary pricing rule type. Once the SPECIFIC STOP-LOSS pricing rule type is called, the system calls the related pricing rule type with the next sequence (i.e. 20). This process continues until all related pricing rule types defined in the primary pricing rule type are called one by one in the specified sequence.

If the eligibility rule type is defined for a related pricing rule type, the system considers the related pricing rule type for deriving the transaction legs when the eligibility rule is satisfied. If the eligibility rule is not satisfied, the system does not consider the related pricing rule type for deriving the transaction legs. Let us understand this with the help of an example.

The following table illustrates a claim pricing rule type where eligibility criteria is considered while deriving transaction legs for the related pricing rule types:

Primary Pricing Rule Type	Sequence	Related Pricing Rule Type	Eligibility Criteria Met
CLAIM	10	SPECIFIC STOP-LOSS	Yes
	20	AGGREGATE STOP-LOSS	No

Copyright © 2026, Oracle and/or its affiliates.

Example 2: Related Pricing Rule Type Eligibility Criteria

In the example 2, the eligibility criteria is defined for the SPECIFIC STOP-LOSS and AGGREGATE STOP-LOSS pricing rule types. However, the eligibility criteria for the AGGREGATE STOP-LOSS pricing rule type was not satisfied, and therefore it is not used for deriving the transaction legs.

The **Validate Transaction and Derive Price Item (C1-TXNIP)** batch maps a claim transaction to one or more price item and price item parameters which are defined in the eligible related pricing rule type. This is possible when you attach an algorithm created using the **C1_ACCPRISL** algorithm type to the **Account and Price Item Derivation** system event of the related pricing rule type.

Note: Ideally, the pricing rule types where the pricing rule type category is set to **Specific Stop-Loss** or **Aggregate Stop-Loss** should not have price item parameters for which the parameter usage is set to **Pricing**. This is because the system will not use these price item parameters while searching for an effective pricing rule for the respective price items.

This algorithm fetches an effective pricing rule for each price item specified in the related pricing rule type. It searches for an effective pricing rule for a price item at the bill group level. It derives an effective pricing rule for each price item using the incurred and paid dates specified in the claim transaction. It fetches an effective pricing rule where the following conditions are met:

- The incurred and paid dates of the claim transaction fall within the incurred and paid date ranges defined in the parent accumulation group (which is derived through the parent customer's pricing rule).
- A transaction leg is already created for at least one price item and price item parameters combination which is specified in the accumulation criteria.

For run-in claim transactions, this algorithm fetches an effective pricing rule where the following conditions are met:

- The run-in incurred and paid dates of the claim transaction fall within the run-in incurred and paid date ranges defined in the run-in accumulation group (which is derived through the parent customer's pricing rule).
- The effective pricing rule exists for at least one price item and price item parameters combination which is specified in the accumulation criteria.

For example, if the system receives a claim transaction with the following details:

- UDF_CHAR_1 is set to Western
- UDF_CHAR_2 is set to BG1
- UDF_DATE_1 is set to 18-02-2018
- UDF_DATE_2 is set to 28-02-2018
- Transaction Record Type is set to TR1

For example, the following table illustrates the pricing structure defined for various related pricing rules:

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Pricing Rule	Incurred Date Range in Associated Parent Customer's Pricing Rule (i.e. in Parent Accumulation Group)	Paid Date Range in Associated Parent Customer's Pricing Rule (i.e. in Parent Accumulation Group)	Accumulation Criteria
TR1	CLAIM	SPECIFIC STOP-LOSS	S1	C1S1	01-01-2017 - 31-12-2017	01-01-2017 - 28-02-2018	Price Item: CLAIM, Price Item Parameters: Location = Western, Employee Group = BG1
				C2S1	01-01-2018 - 31-12-2018	01-01-2018 - 28-02-2019	Price Item: CLAIM, Price Item Parameters: Location = Western, Employee Group = BG1
							Price Item: CLM, Price Item Parameters: Location = Western, Employee Group = BG1
			S2	C1S2	01-01-2017 - 31-12-2017	01-01-2017 - 28-02-2018	Price Item: CLM, Price Item

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Pricing Rule	Incurred Date Range in Associated Parent Customer's Pricing Rule (i.e. in Parent Accumulation Group)	Paid Date Range in Associated Parent Customer's Pricing Rule (i.e. in Parent Accumulation Group)	Accumulation Criteria
							Parameters: Location = Western, Employee Group = BG1
				C2S2	01-01-2018 - 31-12-2018	01-01-2018 - 28-02-2019	Price Item: CLM, Price Item Parameters: Location = Western, Employee Group = BG1

Note:

Price Item in Primary Pricing Rule Type: CLM; Price Item Parameters in Primary Pricing Rule Type where the Eligible for Stop-Loss option is selected: Location = UDF_CHAR_1 and Employee Group = UDF_CHAR_2.

Here, the incurred date is mapped to the **UDF_DATE_1** field and the paid date is mapped to the **UDF_DATE_2** field in the CLAIM pricing rule type.

Example 3: SSL and ASL Effective Pricing Rule Derivation for Claim Transaction

In the example 3, the system fetches the C2S1 and C2S2 pricing rules for S1 and S2, respectively, because of the following reasons:

- Incurred date mentioned in the claim transaction falls within the incurred date range (i.e. 01-01-2018 - 31-12-2018) defined in the parent accumulation group.
- Paid date mentioned in the claim transaction falls within the paid date range (i.e. 01-01-2018 - 28-02-2019) defined in the parent accumulation group.
- A transaction leg already exists for the following price item and price item parameters combination which is specified in the accumulation criteria of the C2S1 and C2S2 pricing rules:
    - Price Item: CLM, Price Item Parameters: Location = Western and Employee Group = BG1

Let us take another example where the system receives a run-in claim transaction with the following details:

- UDF_CHAR_1 is set to Eastern
- UDF_CHAR_3 is set to Active
- UDF_DATE_3 is set to 18-06-2017
- UDF_DATE_4 is set to 01-07-2017
- Transaction Record Type is set to TR2

For example, the following table illustrates the pricing structure defined for various related pricing rules:

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Pricing Rule	Run-in Incurred Date Range in Associated Parent Customer's Pricing Rule (i.e. in Run-in Accumulation Group)	Run-in Paid Date Range in Associated Parent Customer's Pricing Rule (i.e. in Run-in Accumulation Group)	Accumulation Criteria
TR2	CLAIM	AGGREGATE STOP-LOSS	AS1	C1AS1	01-01-2017 - 31-12-2017	01-01-2017 - 28-02-2018	Price Item: CLAIM, Price Item Parameters: Location = Eastern, Employee Status = Active
				C2AS1	01-01-2018 - 31-12-2018	01-01-2018 - 28-02-2019	Price Item: CLAIM, Price Item Parameters: Location = Eastern, Employee Status = Active
							Price Item: CLM, Price Item Parameters: Location = Eastern,

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Pricing Rule	Run-in Incurred Date Range in Associated Parent Customer's Pricing Rule (i.e. in Run-in Accumulation Group)	Run-in Paid Date Range in Associated Parent Customer's Pricing Rule	Accumulation Criteria
							Employee Status = Active
			AS2	C1AS2	01-01-2017 - 31-12-2017	01-01-2017 - 28-02-2018	Price Item: CLM, Price Item Parameters: Location = Eastern, Employee Status = Active
				C2AS2	01-01-2018 - 31-12-2018	01-01-2018 - 28-02-2019	Price Item: CLM, Price Item Parameters: Location = Eastern, Employee Status = Active

Note:

Price Items in Primary Pricing Rule Type: CLAIM and CLM; Price Item Parameters in Primary Pricing Rule Type where the Eligible for Stop-Loss option is selected: Location = UDF_CHAR_1 and Employee Status = UDF_CHAR_3.

Here, the run-in incurred date is mapped to the **UDF_DATE_3** field and the run-in paid date is mapped to the **UDF_DATE_4** field in the CLAIM pricing rule type.

Example 4: SSL and ASL Effective Pricing Rule Derivation for Run-in Claim Transaction

In the example 4, the system fetches the C1AS1 and C1AS2 pricing rules for AS1 and AS2, respectively, because of the following reasons:

- Run-in incurred date mentioned in the claim transaction falls within the run-in incurred date range (i.e. 01-01-2017 - 31-12-2017) defined in the run-in accumulation group.
- Run-in paid date mentioned in the claim transaction falls within the run-in paid date range (i.e. 01-01-2017 - 28-02-2018) defined in the run-in accumulation group.
- An effective pricing rule exists for the following price item and price item parameters combination which is specified in the accumulation criteria of the C1AS1 and C1AS2 pricing rules:
  - Price Item: CLAIM, Price Item Parameters: Location = Eastern, Employee Status = Active
  - Price Item: CLM, Price Item Parameters: Location = Eastern, Employee Status = Active

The system then checks whether the ASSL Credit Account (in case of specific stop-loss pricing rule) and ASL Credit Account (in case of aggregate stop-loss pricing rule) is specified in the associated parent customer's pricing rule. If so, the system considers the respective account for billing. Otherwise, the system derives the account with a particular invoice type (to which a price item must be billed) based on the priority which is defined for the respective price item in the related pricing rule type.

For example, the following table illustrates the accounts to which the charges of S1 and S2 should be billed based on the given priority:

Related Pricing Rule Type	Price Item	Priority	Invoice Type	Account
SPECIFIC STOP-LOSS	S1	10	Standard	A1
		20	Retention	A2
	S2	10	Retention	A2
		20	Standard	A1

Example 5: Priority Based Account Derivation

Copyright © 2026, Oracle and/or its affiliates.

In the example 5, while mapping the claim transaction to S1, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** exists for the bill group. If so, it considers the standard account (A1) of the bill group for billing. However, if an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** does not exist for the bill group, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Retention** exists for the bill group. If so, it considers the retention account (A2) of the bill group for billing. If an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Retention** does not exist for the bill group, the status of the transaction is changed to **Error**.

Similarly, while mapping the claim transaction to S2, the system considers the account of the bill group which is available based on the priority. The system derives the billing account for only those price items for which the effective pricing rule is derived.

Note: The characteristic type which indicates the type of account (for example, **C1INVTYP**) must be specified in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration. Otherwise, erroneous results might occur.

Once the account is derived, the system then checks whether the account has one active contract of the contract type which is associated with the price item. If so, it fetches the contract for further processing. Once the effective pricing rule, account, and active contract are derived, the transaction is mapped to the respective price item, price item parameters, and account. A transaction leg is created for each price item, price item parameters, and account combination.

For example, the following table illustrates how the related transaction legs are created for each price item, price item parameters, and account combination:

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Effective Pricing Rule	Account	Active Contract	Transaction Leg
TR1	CLAIM	SPECIFIC STOP-LOSS	S3	PRS3	A1	C3	TL3
			S4	PRS4	A2	C4	TL4

Example 6: Transaction Leg Derivation

In the example 6, the system creates two transaction legs - TL3 and TL4 for the claim transaction. Once a transaction leg is created, the respective effective pricing rule is stamped against the transaction leg. Usually, once a transaction leg is created in the **Validate Transaction and Derive Price Item (C1-TXNIP)** batch, the price item parameters (for which the parameter usage is set to **Pricing**) of the transaction leg are grouped. The system does not support multiple parameter based pricing for the pricing rule types where the pricing rule type category is set to **Specific Stop-Loss** and **Aggregate Stop-Loss**. Therefore, when the price item parameters are not specified, the price item parameter group ID is set to 1 corresponding to each transaction leg - TL3 and TL4.

Note: A price item parameter group is used to determine the price item pricing. A unique group ID is generated for each group. If a group with a set of price item parameters already exists in the system, a new group is not created. Instead, the existing group is used for determining the price item pricing.

If a pricing group is used while defining a pricing rule for a bill group, the system fetches the pricing rule for a claim transaction when the following conditions are met:

- The incurred and paid dates of the claim transaction fall within the incurred and paid date ranges defined in the parent accumulation group (which is derived through the parent customer's pricing rule).
- A transaction leg is already created for at least one price item and price item parameters combination which is specified in the accumulation criteria.
- The employee attributes specified in the claim transaction match the criteria defined in any one of the pricing group rule.

Similarly, the system will fetch the pricing rule for a run-in claim transaction when the following conditions are met:

Copyright © 2026, Oracle and/or its affiliates.

- The run-in incurred and paid dates of the claim transaction fall within the run-in incurred and paid date ranges defined in the run-in accumulation group (which is derived through the parent customer's pricing rule).
- The effective pricing rule exists for at least one price item and price item parameters combination which is specified in the accumulation criteria.
- The employee attributes specified in the run-in claim transaction match the criteria defined in any one of the pricing group rule.

Let us understand this with the help of an example. A claim transaction is received with the following details:

- UDF_CHAR_1 is set to X
- UDF_CHAR_2 is set to Western
- UDF_CHAR_3 is set to Indian
- UDF_CHAR_4 is set to HR
- UDF_CHAR_5 is set to Permanent
- UDF_CHAR_6 is set to Senior Manager
- UDF_CHAR_7 is set to BG1
- UDF_DATE_1 is set to 31-12-2018
- UDF_DATE_2 is set to 28-02-2019
- Transaction Record Type is set to TR1

For example, the following table illustrates an effective related pricing rule which is defined using a specific stop-loss pricing rule type and where a pricing group is used:

Transaction Record Type	**Primary Pricing Rule Type**	**Related Pricing Rule Type**	**Price Item in Related Pricing Rule Type**	**Pricing Rule**	**Incurred Date Range in Associated Parent Customer's Pricing Rule**	**Paid Date Range in Associated Parent Customer's Pricing Rule**	**Pricing Group**	**Pricing Group Rule**	**Accumulation Criteria**
					(i.e. in Parent Accumulation Group)				
TR1	CLAIM	SPECIFIC STOP-LOSS	S1	PR1	01-01-2018 - 31-12-2018	01-01-2018 - 28-02-2019	PG1	Rule 1 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Price Item: CLM; Price Item Parameters: Designation = Senior Manager and Employee Group = BG1
								Rule 1 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Price Item: CLM; Price Item Parameters: Designation = Senior Manager and Employee Group = BG2
								Rule 2 (where Source System = X, Parameter 1 = Eastern, and Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Price Item: CLM; Price Item Parameters: Designation = Senior Manager and Employee Group = BG1
								Rule 2 (where Source System = X, Parameter 1	Price Item: CLM; Price Item Parameters: Designation =

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Pricing Rule	Incurred Date Range in Associated Parent Customer's Pricing Rule (i.e. in Parent Accumulation Group)	Paid Date Range in Associated Parent Customer's Pricing Rule	Pricing Group	Pricing Group Rule	Accumulation Criteria
								= Eastern, and Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Senior Manager and Employee Group = BG2

Note:

Price Item in Primary Pricing Rule Type: CLM; Price Item Parameters in Primary Pricing Rule Type where the Eligible for Stop-Loss option is selected: Designation = UDF_CHAR_6 and Employee Group = UDF_CHAR_7.

Here, the source system is mapped to the **UDF_CHAR_1** field, the parameter 1 is mapped to the **UDF_CHAR_2** field, the parameter 2 is mapped to the **UDF_CHAR_3** field, the parameter 3 is mapped to the **UDF_CHAR_4** field, the parameter 4 is mapped to the **UDF_CHAR_5** field, the incurred date is mapped to the **UDF_DATE_1** field, and the paid date is mapped to the **UDF_DATE_2** field in the CLAIM pricing rule type.

Example 7: Effective Pricing Rule is Defined Using a Pricing Group

In the example 7, the system considers the PR1 pricing rule for S1 because of the following reasons:

- Incurred date mentioned in the claim transaction falls within the incurred date range (i.e. 01-01-2018 - 31-12-2018) defined in the parent accumulation group.
- Paid date mentioned in the claim transaction falls within the paid date range (i.e. 01-01-2018 - 28-02-2019) defined in the parent accumulation group.
- The employee attributes specified in the claim transaction match the criteria defined in the Rule 1 (i.e. Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent).
- A transaction leg already exists for the following price item and price item parameters combination which is specified in the accumulation criteria of the PR1 pricing rule:
    - Price Item: CLM; Price Item Parameters: Designation = Senior Manager and Employee Group = BG1

The system then stores the pricing group rule which is satisfied against a parameter which is defined in the **Pricing Group Rule Parameter** option type of the **C1-ASOBLLNG** feature configuration. In the example 7, the price item parameter group is created and it contains the pricing group rule parameter. For example, Group A contains Pricing Group Rule Parameter = Rule 1.

In the example 7, the system could find the exact match for pricing parameters defined in the pricing group rule. However, if the exact match is not available, the system finds the effective pricing rule using the best fit match for the pricing parameters defined in the pricing group rule. Let us understand this with the help of an example. A claim transaction is received with the following details:

- UDF_CHAR_1 is set to X
- UDF_CHAR_2 is set to Western
- UDF_CHAR_3 is set to Indian
- UDF_CHAR_4 is set to HR
- UDF_CHAR_5 is set to Permanent
- UDF_CHAR_6 is set to Senior Manager
- UDF_CHAR_7 is set to BG1
- UDF_DATE_1 is set to 06-06-2018
- UDF_DATE_2 is set to 27-06-2018
- Transaction Record Type is set to TR2

For example, the following table illustrates the effective related pricing rules which are available during the best fit match:

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Pricing Rule	Incurred Date Range in Associated Parent Customer's Pricing Rule (i.e. in Parent Accumulation Group)	Paid Date Range in Associated Parent Customer's Pricing Rule	Pricing Group	Pricing Group Rule	Accumulation Criteria
TR2	CLAIM	SPECIFIC STOP-LOSS	S1	PR1	01-01-2018 - 31-12-2018	01-01-2018 - 28-02-2019	PG1	Rule 1 (where Source System = X and Parameter 1 = Western)	Price Item: CLAIM; Price Item Parameters: Designation = Senior Manager; Employee Group = BG1
								Rule 1 (where Source System = X and Parameter 1 = Western)	Price Item: CLAIM; Price Item Parameters: Designation = Senior Manager; Employee Group = BG2
								Rule 2 (where Source System = X and Parameter 1 = Eastern)	Price Item: CLAIM; Price Item Parameters: Designation = Senior Manager; Employee Group = BG1
								Rule 2 (where Source System = X and Parameter 1 = Eastern)	Price Item: CLAIM; Price Item Parameters: Designation = Senior Manager; Employee Group = BG2
			S2	PR2	01-01-2018 - 31-12-2018	01-01-2018 - 28-02-2019	PG2	Rule 1 (where Source System = X, Parameter 1 = Eastern, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Price Item: CLAIM; Price Item Parameters: Designation = Senior Manager; Employee Group = BG2
								Rule 1 (where Source System = X, Parameter 1 = Eastern, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Price Item: CLAIM; Price Item Parameters: Designation = Senior Manager; Employee Group = BG1
								Rule 2 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Price Item: CLAIM; Price Item Parameters: Designation = Senior Manager; Employee Group = BG2
								Rule 2 (where Source System = X,	Price Item: CLAIM; Price Item Parameters:

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Pricing Rule	Incurred Date Range in Associated Parent Customer's Pricing Rule (i.e. in Parent Accumulation Group)	Paid Date Range in Associated Parent Customer's Pricing Rule	Pricing Group	Pricing Group Rule	Accumulation Criteria
								Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager; Employee Group = BG1

Note:

Price Item in Primary Pricing Rule Type: CLAIM; Price Item Parameters in Primary Pricing Rule Type where the Eligible for Stop-Loss option is selected: Designation = UDF_CHAR_6 and Employee Group = UDF_CHAR_7.

Here, the source system is mapped to the **UDF_CHAR_1** field, the parameter 1 is mapped to the **UDF_CHAR_2** field, the parameter 2 is mapped to the **UDF_CHAR_3** field, the parameter 3 is mapped to the **UDF_CHAR_4** field, the parameter 4 is mapped to the **UDF_CHAR_5** field, the incurred date is mapped to the **UDF_DATE_1** field, and the paid date is mapped to the **UDF_DATE_2** field in the CLAIM pricing rule type.

Example 8: Effective Pricing Rule Derivation Using Best Fit Match for Pricing Parameters

In the example 8, the system could not find the exact match for the pricing parameters (i.e. Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent) in the effective pricing rule for S1. Therefore, the system searches for the best fit match. While searching for the best fit match, the system rules out the optional parameter 4 (i.e. Parameter 4 = Permanent) and then checks whether the pricing group rule where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, and Parameter 3 = HR exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the system then rules out the optional parameter 3 (i.e. Parameter 3 = HR) and then checks whether the pricing group rule where Source System = X, Parameter 1 = Western, and Parameter 2 = Indian exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the system then rules out the optional parameter 2 (i.e. Parameter 2 = Indian) and then checks whether the pricing group rule where Source System = X and Parameter 1 = Western exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the status of the transaction is changed to **Error**.

In the example 8, the system considers Rule 1 where Source System = X and Parameter 1 = Western as the best fit match in the PR1 pricing rule for S1. In addition, a transaction leg already exists for the following price item and price item parameters combination which is specified in the accumulation criteria of the PR1 pricing rule:

- Price Item: CLAIM; Price Item Parameters: Designation = Senior Manager; Employee Group = BG1

Therefore, the system fetches PR1 as the effective pricing rule for S1. In addition, the system fetches PR2 as the effective pricing rule for S2. The system creates two price item parameter groups - One contains Pricing Group Rule Parameter = Rule 1 and another contains Pricing Group Rule Parameter = Rule 2. Once the price item parameter group is created, the system creates the aggregation parameter group. An aggregation parameter group contains all price item parameters included in the related pricing rule type for which the parameter usage is set to **Aggregation**.

If the effective pricing rule is not derived for a price item or if the account or active contract for the account is not derived, the system does not create a transaction leg for the respective price item.

For example, the following table illustrates that transaction legs are created only when effective pricing rule and account with an active contract are derived for a price item and price item parameters combination:

Related Pricing Rule Type	Price Item	Effective Pricing Rule	Account	Active Contract	Transaction Leg
AGGREGATE STOP-LOSS	AS11	-	-	-	-
	AS12	PR12	A1	C1	TL11

Copyright © 2026, Oracle and/or its affiliates.

Related Pricing Rule Type	Price Item	Effective Pricing Rule	Account	Active Contract	Transaction Leg
	AS13	PR13	-	-	-
	AS14	PR14	A2	-	-
	AS15	PR15	-	-	-
	AS16	-	-	-	-
	AS17	PR17	A2	C2	TL12

Example 9: No. of Transaction Legs Derived

In the example 9, the system could not find the effective pricing rule for AS11 and AS16, the required account for AS13 and AS15, and the active contract for AS14 on A2. Therefore, in this case, the system creates two transaction legs - TL11 and TL12 for the transaction.

If the eligibility rule type is defined for a price item, the system maps the transaction to the price item when the eligibility rule is satisfied. If the eligibility rule is not satisfied, the system does not consider the price item for billing.

For example, the following table illustrates the related pricing rule types where eligibility criteria is considered while deriving transaction legs for the price items:

Sequence	Related Pricing Rule Type	Rule Type Eligibility Criteria Met	Price Item	Price Item Eligibility Criteria Met	Effective Pricing Rule	Account	Active Contract	Transaction Leg
10	SPECIFIC STOP-LOSS	Yes	SS1	Yes	PR1	A1	C1	TL1
			SS2	-	PR2	A2	C2	TL2
			SS3	No	-	-	-	-
20	AGGREGATE STOP-LOSS	No	AS4	-	-	-	-	-
			AS5	-	-	-	-	-
			AS6	-	-	-	-	-

Example 10: Price Item Eligibility for Transaction Leg Derivation

In the example 10, the eligibility criteria is defined for the SPECIFIC STOP-LOSS and AGGREGATE STOP-LOSS pricing rule types. However, the eligibility criteria for the AGGREGATE STOP-LOSS pricing rule type was not satisfied, and therefore it is not used for deriving the transaction legs. The eligibility criteria for SS1 was satisfied, but the eligibility criteria for SS3 was not satisfied. Therefore, in this case, the system creates two transaction legs (i.e. TL1 and TL2) for the claim transaction. For more information about the related pricing rule type eligibility and price item eligibility features, refer to the Related Pricing Rule Type Eligibility on page 3464 and Price Item Eligibility on page 3465 sections, respectively.

Once a transaction leg is created, the effective pricing rule's start date is set as the processing date corresponding to the transaction leg.

Account and Price Item Derivation (for the Retention Type Claim Based Pricing Rule Type Category)

Once the **Validate Transaction and Derive Price Item (C1-TXNIP)** batch calls the primary pricing rule type specified in the transaction record type, it calls the related pricing rule types (if any) defined in the primary pricing rule type. Note that the related pricing rule types are called one by one in the specified sequence. Let us understand this with the help of an example.

The following table illustrates how related pricing rule types can be sequenced in a claim pricing rule type:

Copyright © 2026, Oracle and/or its affiliates.

Primary Pricing Rule Type	Sequence	Related Pricing Rule Type
CLAIM	10	RETENTION TYPE CLAIM BASED
	20	SPECIFIC STOP-LOSS
	30	AGGREGATE STOP-LOSS

Example 1: Related Pricing Rule Type Sequence

In the example 1, the system first calls the related pricing rule type with the highest sequence (i.e. 10) once the CLAIM pricing rule type is called. The system calls the related pricing rule type irrespective of whether the transaction legs are derived using the primary pricing rule type. Once the RETENTION TYPE CLAIM BASED pricing rule type is called, the system calls the related pricing rule type with the next sequence (i.e. 20). This process continues until all related pricing rule types defined in the primary pricing rule type are called one by one in the specified sequence.

If the eligibility rule type is defined for a related pricing rule type, the system considers the related pricing rule type for deriving the transaction legs when the eligibility rule is satisfied. If the eligibility rule is not satisfied, the system does not consider the related pricing rule type for deriving the transaction legs. Let us understand this with the help of an example.

The following table illustrates a claim pricing rule type where eligibility criteria is considered while deriving transaction legs for the related pricing rule types:

Primary Pricing Rule Type	Sequence	Related Pricing Rule Type	Eligibility Criteria Met
CLAIM	10	RETENTION TYPE CLAIM BASED	Yes
	20	CLAIM BASED FEES	-
	30	CLAIM FEE CHARGES	No

Example 2: Related Pricing Rule Type Eligibility Criteria

In the example 2, the eligibility criteria is defined for the RETENTION TYPE CLAIM BASED and CLAIM FEE CHARGES pricing rule types. However, the eligibility criteria for the CLAIM FEE CHARGES pricing rule type was not satisfied, and therefore it is not used for deriving the transaction legs.

The **Validate Transaction and Derive Price Item (C1-TXNIP)** batch maps a claim transaction to one or more price item and price item parameters which are defined in the eligible related pricing rule type. This is possible when you attach an algorithm created using the **C1_ACCPRIDRV** algorithm type to the **Account and Price Item Derivation** system event of the related pricing rule type.

This algorithm fetches the effective pricing rule for each price item and price item parameters combination specified in the related pricing rule type on the derivation date. The system considers the paid date as the derivation date. This algorithm first searches for the effective pricing rule for a price item and price item parameters combination which is defined for the policy at the bill group level. If the system does not find any effective pricing rule for a price item and price item parameters combination which is defined for the policy at the bill group level, it inherits the effective pricing rule for a price item and price item parameters combination from the parent customer level.

For example, if the system receives a claim transaction with the following details:

- UDF_DATE_1 is set to 15-01-2018
- Transaction Record Type is set to TR1

The following table illustrates how the related pricing rules are defined for the claim transactions at different assignment levels:

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Pricing Rule	Pricing Start Date	Pricing End Date	Assignment Level
TR1	CLAIM	RETENTION TYPE CLAIM BASED	P3	C1P3	01-01-2018	31-12-2018	Parent Customer
				C2P3	01-01-2018	31-12-2018	Bill Group

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Pricing Rule	Pricing Start Date	Pricing End Date	Assignment Level
			P4	C1P4	01-01-2018	31-12-2018	Parent Customer
				C2P4	01-01-2019	30-06-2019	Bill Group

Note: Here, the paid date is mapped to the **UDF_DATE_1** field in the CLAIM pricing rule type.

Example 3: Effective Pricing Rule Derivation

In the example 3, the system fetches C2P3 and C1P4 pricing rules for P3 and P4 respectively, which are effective on the paid date. Note that the effective pricing rule for P3 is derived at the bill group level, whereas the effective pricing rule for P4 is derived from the parent customer level.

While fetching the effective pricing rule, the system first searches for the exact match for the price item parameters at both the levels. For example, if the system receives a claim transaction with the following details:

- UDF_CHAR_1 is set to Western
- UDF_CHAR_2 is set to Active
- UDF_DATE_1 is set to 20-03-2018
- Transaction Record Type is set to TR4

The following table illustrates an example where the system fetches the effective related pricing rules for a claim transaction at different assignment levels using the exact match option:

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Price Item Parameters in Related Pricing Rule Type	Pricing Rule	Pricing Start Date	Pricing End Date	Price Item Parameters in Pricing Rule	Fees	Assignment Level
TR4	CLAIM	CLAIM BASED CHARGES	P1	Location = UDF_CHAR_1 and Employee Status = UDF_CHAR_2	C1P1	01-01-2018	31-12-2018	Location = Western and Employee Status = Active	$10	Parent Customer
								Location = Eastern and Employee Status = Active	$12	
								Location = Eastern and Employee Status = Retired	$11	
								Location = Western and Employee Status = Retired	$9	
					C2P1	01-01-2018	31-12-2018	Location = Western and Employee Status = Active	$8	Bill Group
								Location = Eastern and Employee Status = Active	$9	
								Location = Eastern and Employee Status = Retired	$10	
								Location = Western and Employee Status = Retired	$9	

Note: Here, the paid date is mapped to the **UDF_DATE_1** field in the CLAIM pricing rule type.

Example 4: Exact Match for Price Item Parameters

In the example 4, the system fetches the C2P1 pricing rule for P1 because of the following reasons:

- The paid date (i.e. 20-03-2018) of the claim transaction falls within the date range (i.e. 01-01-2018 to 31-12-2018) of the C2P1 pricing rule which is defined at the bill group level.
- It contains the exact match for the price item parameters which are received in the transaction.

Copyright © 2026, Oracle and/or its affiliates.

If the system cannot find the exact match for the price item parameters at both the levels, it searches for the best fit match for the price item parameters first at the bill group level and then at the parent customer level. For example, if the system receives a claim transaction with the following details:

- UDF_CHAR_1 is set to Western
- UDF_CHAR_2 is set to Active
- UDF_CHAR_3 is set to HR
- UDF_CHAR_4 is set to Indian
- UDF_DATE_1 is set to 07-06-2018
- Transaction Record Type is set to TR5

For example, the following table illustrates the effective related pricing rules which are available during the best fit match:

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Price Item Parameters in Related Pricing Rule Type	Pricing Rule	Pricing Start Date	Pricing End Date	Price Item Parameters in Pricing Rule	Fees	Assignment Level
TR5	CLAIM	RETENTION CLAIM BASED FEES	P3	Location = UDF_CHAR_1, Employee Status = UDF_CHAR_2, Employee Department = UDF_CHAR_3, and Nationality = UDF_CHAR_4	C1P3	01-01-2018	31-12-2018	Location = Western and Employee Status = Active	$10	Bill Group
								Location = Eastern and Employee Status = Active	$12	
								Location = Eastern and Employee Status = Retired	$11	
								Location = Western and Employee Status = Retired	$9	

Note: Here, the paid date is mapped to the **UDF_DATE_1** field in the CLAIM pricing rule type.

Example 5: Best Fit Match for Price Item Parameters

Note: The **Location** and **Employee Status** parameters are mandatory for P3. However, the **Employee Department** and **Nationality** parameters are optional with the priority set to 1 and 2, respectively.

In the example 5, the system could not find the exact match for the price item parameters (i.e. Location = Western, Employee Status = Active, Employee Department = HR, and Nationality = Indian) in the effective pricing rule for P3. Therefore, the system searches for the best fit match. While searching for the best fit match, the system rules out the optional parameter with lowest priority (i.e. Nationality = Indian) and checks whether pricing is defined for the price item parameters (i.e. Location = Western, Employee Status = Active, and Employee Department = HR) in the effective pricing rule. If so, it considers C1P3 as the effective pricing rule for P3. If not, the system rules out the optional parameter with the next lowest priority (i.e. Employee Department = HR) and checks whether pricing is defined for the price item parameters (i.e. Location = Western and Employee Status = Active) in the effective pricing rule. If so, it considers C1P3 as the effective pricing rule for P3. If not, the status of the transaction is changed to **Error**.

In the example 5, the system considers pricing defined for the price item parameters (i.e. Location = Western and Employee Status = Active) as the best fit match, and therefore fetches C1P3 as the effective pricing rule for P3. While fetching the effective pricing rule, the system considers only those price item parameters specified in the related pricing rule type for which the parameter usage is set to **Pricing**.

The system then derives the account with a particular invoice type (to which a price item must be billed) based on the priority which is defined for the respective price item in the related pricing rule type.

For example, the following table illustrates the accounts to which the charges of P3 and P4 should be billed based on the given priority:

Copyright © 2026, Oracle and/or its affiliates.

Related Pricing Rule Type	Price Item	Priority	Invoice Type	Account
RETENTION TYPE CLAIM BASED	P3	10	Standard	A1
	P4	10	Retention	A2
		20	Standard	A1

Example 6: Priority Based Account Derivation

In the example 6, while mapping the claim transaction to P3, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** exists for the bill group. If so, it considers the standard account (A1) of the bill group for billing. However, if an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** does not exist for the bill group, the status of the transaction is changed to **Error**.

Similarly, while mapping the claim transaction to P4, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Retention** exists for the bill group. If so, it considers the retention account (A2) of the bill group for billing. However, if an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Retention** does not exist for the bill group, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** exists for the bill group. If so, it considers the standard account (A1) of the bill group for billing. If an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** does not exist for the bill group, the status of the transaction is changed to **Error**.

Note: The characteristic type which indicates the type of account (for example, **C1INVTYP**) must be specified in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration. Otherwise, erroneous results might occur.

Once the account is derived, the system then checks whether the account has one active contract of the contract type which is associated with the price item. If so, it fetches the contract for further processing. Once the effective pricing rule, account, and active contract are derived, the transaction is mapped to the respective price item, price item parameters, and account. A transaction leg is created for each price item, price item parameters, and account combination. For example, if the system receives a claim transaction with the following details:

- UDF_CHAR_1 is set to Western
- UDF_CHAR_2 is set to Active
- UDF_CHAR_3 is set to HR
- UDF_DATE_1 is set to 03-01-2018
- Transaction Record Type is set to TR5

For example, the following table illustrates how the related transaction legs are created for each price item, price item parameters, and account combination:

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Price Item Parameters in Related Pricing Rule Type	Effective Pricing Rule	Best Fit Match for Price Item Parameters in Effective Pricing Rule	Account	Active Contract	Transaction Leg
TR5	CLAIM	CLAIM BASED FEES	P1	Location = UDF_CHAR_1, Employee Status = UDF_CHAR_2, Employee Department = UDF_CHAR_3, and Nationality = UDF_CHAR_4	PR1	Location = Western and Employee Status = Active	A1	C1	TL1
			P2		PR2	Location = Western and Employee Status = Active	A2	C2	TL2
			P3		PR3	Location = Western and Employee Status = Active	A3	C3	TL3

Note: Here, the paid date is mapped to the **UDF_DATE_1** field in the CLAIM pricing rule type.

Example 7: Transaction Leg Derivation

In the example 7, the system maps the claim transaction to the following price item, price item parameters, and account combinations:

Copyright © 2026, Oracle and/or its affiliates.

- Price Item: P1; Price Item Parameter: Location = Western, Employee Status = Active, and Employee Department = HR; and Account: A1
- Price Item: P2; Price Item Parameter: Location = Western, Employee Status = Active, and Employee Department = HR; and Account: A2
- Price Item: P3; Price Item Parameter: Location = Western, Employee Status = Active, and Employee Department = HR; and Account: A3

Note: The nationality information of an employee is not received in the **UDF_CHAR_4** field, and therefore the claim transaction is not mapped to the **Nationality** price item parameter.

In the example 7, the system creates three transaction legs - TL1, TL2, and TL3 for the claim transaction. Once a transaction leg is created, the respective effective pricing rule is stamped against the transaction leg. In addition, the price item parameters of the transaction leg are grouped. In the example 7, the system creates one price item parameter group which contains the following price item parameters:

- Location = Western
- Employee Status = Active
- Employee Department = HR

A group is used to determine the price item pricing. A unique group ID is generated for each group. If a group with a set of price item parameters already exists in the system, a new group is not created. Instead, the existing group is used for determining the price item pricing.

Note: The price item parameter group contains only those price item parameters included in the related pricing rule type for which the parameter usage is set to **Pricing**.

If a pricing group is used while defining a pricing rule for a bill group, the system fetches the pricing rule for a claim transaction when the following conditions are met:

- The paid date of the claim transaction falls within the pricing rule's date range.
- The employee attributes specified in the claim transaction match the criteria defined in any one of the pricing group rule.
- The employee attributes specified in the claim transaction match the price item parameters defined within the satisfied rule.

Let us understand this with the help of an example. A claim transaction is received with the following details:

- UDF_CHAR_1 is set to X
- UDF_CHAR_2 is set to Western
- UDF_CHAR_3 is set to Indian
- UDF_CHAR_4 is set to HR
- UDF_CHAR_5 is set to Permanent
- UDF_CHAR_6 is set to Senior Manager
- UDF_CHAR_7 s set to BG1
- UDF_DATE_1 03-01-2018
- Transaction Record Type is set to TR6

For example, the following table illustrates an effective related pricing rule which is defined using a retention type claim based pricing rule type and where a pricing group is used:

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Price Item Parameters in Related Pricing Rule Type	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Pricing Group Rule	Price Item Parameters	Fees
TR6	CLAIM	CLAIM BASED FEES	PP1	Designation = UDF_CHAR_6; Employee Group = UDF_CHAR_7	PR1	01-01-2018	31-12-2018	PG1	Rule 1 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager and Employee Group = BG1	$10

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Price Item Parameters in Related Pricing Rule Type	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Pricing Group Rule	Price Item Parameters	Fees
									Rule 1 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager and Employee Group = BG2	$12
									Rule 2 (where Source System = X, Parameter 1 = Eastern, and Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager and Employee Group = BG1	$8
									Rule 2 (where Source System = X, Parameter 1 = Eastern, and Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager and Employee Group = BG2	$9

Note: Here, the source system is mapped to the **UDF_CHAR_1** field, the parameter 1 is mapped to the **UDF_CHAR_2** field, the parameter 2 is mapped to the **UDF_CHAR_3** field, the parameter 3 is mapped to the **UDF_CHAR_4** field, the parameter 4 is mapped to the **UDF_CHAR_5** field, and the paid date is mapped to the **UDF_DATE_1** field in the CLAIM pricing rule type.

Example 8: Effective Pricing Rule is Defined Using a Pricing Group

In the example 8, the system considers the PR1 pricing rule for PP1 because of the following reasons:

- The paid date (i.e. 03-01-2018) of the claim transaction falls within the PR1 pricing rule's date range (i.e. 01-01-2018 to 31-12-2018).
- The employee attributes specified in the claim transaction match the criteria defined in the Rule 1 (i.e. Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent).
- The employee attributes specified in the claim transaction match the price item parameters defined within the Rule 1.

The system then stores the pricing group rule which is satisfied against a parameter which is defined in the **Pricing Group Rule Parameter** option type of the **C1-ASOBLLNG** feature configuration. In such case, the price item parameter group contains the price item parameters and the pricing group rule parameter. For example, Group A contains Designation = Senior Manager, Employee Group = BG1, and Pricing Group Rule Parameter = Rule 1.

In the example 8, the system could find the exact match for pricing parameters defined in the pricing group rule. However, if the exact match is not available, the system finds the effective pricing rule using the best fit match for the pricing parameters defined in the pricing group rule. Note that the system searches for the exact match in the effective pricing rules at both the bill group and parent customer levels. If the exact match is not available at both the levels, the system finds the effective pricing rule using the best fit match for the pricing parameters (defined in the pricing group rule) first at the bill group level and then at the parent customer level.

Let us understand this with the help of an example. A claim transaction is received with the following details:

- UDF_CHAR_1 is set to X
- UDF_CHAR_2 is set to Western
- UDF_CHAR_3 is set to Indian
- UDF_CHAR_4 is set to HR
- UDF_CHAR_5 is set to Permanent

Copyright © 2026, Oracle and/or its affiliates.

- UDF_CHAR_6 is set to Senior Manager
- UDF_CHAR_7 is set to BG1
- UDF_DATE_1 is set to 31-05-2018
- Transaction Record Type is set to TR6

For example, the following table illustrates the effective related pricing rules which are available during the best fit match:

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Price Item Parameters in Related Pricing Rule Type	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Pricing Group Rule	Price Item Parameters in Pricing Rule	Fees
TR6	CLAIM	CLAIM BASED FEES	PP1	Designation = UDF_CHAR_6, Employee Group = UDF_CHAR_7	PR1	01-01-2018	31-12-2018	PG1	Rule 1 (where Source System = X and Parameter 1 = Western)	Designation = Senior Manager; Employee Group = BG1	$20
									Rule 1 (where Source System = X and Parameter 1 = Western)	Designation = Senior Manager; Employee Group = BG2	$21
									Rule 2 (where Source System = X and Parameter 1 = Eastern)	Designation = Senior Manager; Employee Group = BG1	$18
									Rule 2 (where Source System = X and Parameter 1 = Eastern)	Designation = Senior Manager; Employee Group = BG2	$19
			PP2		PR2	01-01-2018	31-12-2018	PG2	Rule 1 (where Source System = X, Parameter 1 = Eastern, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager; Employee Group = BG2	$5
									Rule 1 (where Source System = X, Parameter 1 = Eastern, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager; Employee Group = BG1	$5
									Rule 2 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager; Employee Group = BG2	$6

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Related Pricing Rule Type	Price Item in Related Pricing Rule Type	Price Item Parameters in Related Pricing Rule Type	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Pricing Group Rule	Price Item Parameters in Pricing Rule	Fees
									Rule 2 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager; Employee Group = BG1	$9

Note: Here, the source system is mapped to the **UDF_CHAR_1** field, the parameter 1 is mapped to the **UDF_CHAR_2** field, the parameter 2 is mapped to the **UDF_CHAR_3** field, the parameter 3 is mapped to the **UDF_CHAR_4** field, the parameter 4 is mapped to the **UDF_CHAR_5** field, and the paid date is mapped to the **UDF_DATE_1** field in the CLAIM pricing rule type.

Example 9: Effective Pricing Rule Derivation Using Best Fit Match for Pricing Parameters

In the example 9, the system could not find the exact match for the pricing parameters (i.e. Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent) in the effective pricing rule for PP1. Therefore, the system searches for the best fit match. While searching for the best fit match, the system rules out the optional parameter 4 (i.e. Parameter 4 = Permanent) and then checks whether the pricing group rule where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, and Parameter 3 = HR exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the system then rules out the optional parameter 3 (i.e. Parameter 3 = HR) and then checks whether the pricing group rule where Source System = X, Parameter 1 = Western, and Parameter 2 = Indian exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the system then rules out the optional parameter 2 (i.e. Parameter 2 = Indian) and then checks whether the pricing group rule where Source System = X and Parameter 1 = Western exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the status of the transaction is changed to **Error**.

In the example 9, the system considers Rule 1 where Source System = X and Parameter 1 = Western as the best fit match in the PR1 pricing rule for PP1. In addition, the employee attributes in the claim transaction satisfy the price item parameters (i.e. Designation = Senior Manager and Employee Group = BG1) defined within the Rule 1. Therefore, the system fetches PR1 as the effective pricing rule for PP1. In addition, the system fetches PR2 as the effective pricing rule for PP2. The system creates two price item parameter groups - One contains Designation = Senior Manager, Employee Group = BG1, and Pricing Group Rule Parameter = Rule 1 and another contains Designation = Senior Manager, Employee Group = BG1, and Pricing Group Rule Parameter = Rule 2. Once the price item parameter group is created, the system creates the aggregation parameter group. An aggregation parameter group contains all price item parameters included in the related pricing rule type for which the parameter usage is set to **Aggregation**.

If the effective pricing rule is not derived for a price item and price item parameters combination or if the account or active contract for the account is not derived, the system does not create a transaction leg for the respective price item.

For example, the following table illustrates that transaction legs are created only when effective pricing rule and account with an active contract are derived for a price item and price item parameters combination:

Related Pricing Rule Type	Price Item	Price Item Parameters	Effective Pricing Rule	Account	Active Contract	Transaction Leg
RETENTION TYPE CLAIM BASED	PP11	Designation = UDF_CHAR_6, Employee Status = UDF_CHAR_7	-	-	-	-
	PP12		PR12	A1	C1	TL11
	PP13		PR13	-	-	-
	PP14		PR14	A2	-	-
	PP15		PR15	-	-	-
	PP16		-	-	-	-
	PP17		PR17	A2	C2	TL12

Copyright © 2026, Oracle and/or its affiliates.

Example 10: No. of Transaction Legs Derived

In the example 10, the system could not find the effective pricing rule for PP11 and PP16, the required account for PP13 and PP15, and the active contract for PP14 on A2. Therefore, in this case, the system creates two transaction legs - TL11 and TL12 for the transaction.

If the eligibility rule type is defined for a price item, the system maps the transaction to the price item when the eligibility rule is satisfied. If the eligibility rule is not satisfied, the system does not consider the price item for billing.

For example, the following table illustrates a claim pricing rule type where eligibility criteria is considered while deriving transaction legs for the related pricing rule types:

Sequence	Related Pricing Rule Type	Rule Type Eligibility Criteria Met	Price Item	Price Item Eligibility Criteria Met	Effective Pricing Rule	Account	Active Contract	Transaction Leg
10	RETENTION TYPE CLAIM BASED	Yes	PE1	Yes	PR1	A1	C1	TL1
			PE2	-	PR2	A2	-	-
			PE3	No	-	-	-	-
20	CLAIM BASED FEES	-	PE4	-	PR3	A1	C2	TL2
			PE5	Yes	PR4	-	-	-
			PE6	No	-	-	-	-
30	CLAIM FEE CHARGES	No	PE7	-	-	-	-	-
			PE8	-	-	-	-	-
			PE9	-	-	-	-	-

Example 11: Price Item Eligibility for Transaction Leg Derivation

In the example 11, the eligibility criteria is defined for the RETENTION TYPE CLAIM BASED and CLAIM FEE CHARGES pricing rule types. However, the eligibility criteria for the CLAIM FEE CHARGES pricing rule type was not satisfied, and therefore it is not used for deriving the transaction legs. The eligibility criteria for PE1 and PE5 was satisfied, but the eligibility criteria for PE3 and PE6 was not satisfied. Further, the system could not find the required account for PE5 and the active contract for PE2 on A2. Therefore, in this case, the system creates two transaction legs (i.e. TL1 and TL2) for the claim transaction. For more information about the related pricing rule type eligibility and price item eligibility features, refer to the Related Pricing Rule Type Eligibility on page 3464 and Price Item Eligibility on page 3465 sections, respectively.

Once a transaction leg is created, the derivation date is set as the processing date corresponding to the transaction leg.

Account and Price Item Derivation (for the Retention Type Enrollment Based Pricing Rule Type Category)

The **Validate Transaction and Derive Price Item (C1-TXNIP)** batch maps the retroactive and non-retroactive enrollment transactions to one or more price item and price item parameters which are defined in the respective primary pricing rule type. This is possible only when an algorithm created using the **C1_ACCPRIDRV** algorithm type is attached to the **Account and Price Item Derivation** system event of the primary pricing rule type.

This algorithm fetches the effective pricing rule for each price item and price item parameters combination specified in the primary pricing rule type on the derivation date. The system considers the coverage end date and coverage start date as the derivation date while fetching the effective pricing rules for the retroactive and non-retroactive enrollment transactions, respectively. This algorithm first searches for the effective pricing rule for a price item and price item parameters combination which is defined for the policy at the bill group level. If the system does not find any effective pricing rule for a price item and price item parameters combination which is defined for the policy at the bill group level, it inherits the effective pricing rule for a price item and price item parameters combination from the parent customer level.

For example, if the system receives a non-retroactive enrollment transaction with the following details:

- UDF_DATE_1 is set to 01-02-2018

Copyright © 2026, Oracle and/or its affiliates.

- UDF_DATE_2 is set to 28-02-2018
- Transaction Record Type is set to TR3

The following table illustrates how the pricing rules are defined for the enrollment transactions at different assignment levels:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Pricing Rule	Pricing Start Date	Pricing End Date	Assignment Level
TR3	RETENTION TYPE ENROLLMENT BASED	P1	C1P1	01-01-2018	31-12-2018	Parent Customer
			C2P1	01-01-2018	31-12-2018	Bill Group
			C3P1	01-01-2019	30-06-2019	Bill Group
		P2	C1P2	01-06-2017	31-12-2017	Bill Group
			C2P2	01-01-2018	31-12-2018	Parent Customer
			C3P2	01-01-2019	30-06-2019	Bill Group

Note: Here, the coverage start date is mapped to the **UDF_DATE_1** field and the coverage end date is mapped to the **UDF_DATE_2** field in the RETENTION TYPE ENROLLMENT BASED pricing rule type.

Example 1: Effective Pricing Rule Derivation

In the example 1, the system fetches C2P1 and C2P2 pricing rules for P1 and P2, respectively, which are effective on the coverage start date. Note that the effective pricing rule for P1 is derived at the bill group level, whereas the effective pricing rule for P2 is derived from the parent customer level.

While fetching the effective pricing rule, the system first searches for exact match for the price item parameters at both the levels. For example, if the system receives a retroactive enrollment transaction with the following details:

- UDF_CHAR_1 is set to Western
- UDF_CHAR_2 is set to Active
- UDF_DATE_1 is set to 01-03-2018
- UDF_DATE_2 is set to 31-03-2018
- Transaction Record Type is set to TR4

The following table illustrates the effective pricing rules which are available at different assignment levels for an enrollment transaction during the exact match:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Pricing Rule	Pricing Start Date	Pricing End Date	Price Item Parameters in Pricing Rule	Fees	Assignment Level
TR4	ENROLLMENT BASED FEES	P1	Location = UDF_CHAR_1 and Employee Status = UDF_CHAR_2	C1P1	01-01-2018	31-12-2018	Location = Western and Employee Status = Active	$10	Parent Customer
							Location = Eastern and Employee Status = Active	$12	
							Location = Eastern and Employee Status = Retired	$11	
							Location = Western and Employee Status = Retired	$9	
				C2P1	01-01-2018	31-12-2018	Location = Western and Employee Status = Active	$8	Bill Group
							Location = Eastern and Employee Status = Active	$9	
							Location = Eastern and Employee Status = Retired	$10	
							Location = Western and Employee Status = Retired	$9	

Copyright © 2026, Oracle and/or its affiliates.

Note: Here, the coverage start date is mapped to the **UDF_DATE_1** field and the coverage end date is mapped to the **UDF_DATE_2** field in the ENROLLMENT BASED FEES pricing rule type.

Example 2: Exact Match for Price Item Parameters

In the example 2, the system fetches the C2P1 pricing rule for P1 because of the following reasons:

- The coverage end date (i.e. 31-03-2018) of the retroactive enrollment transaction falls within the date range (i.e. 01-01-2018 to 31-12-2018) of the C2P1 pricing rule which is defined at the bill group level.
- It contains the exact match for the price item parameters which are received in the transaction.

If the system cannot find the exact match for the price item parameters at both the levels, the system searches for the best fit match for the price item parameters first at the bill group level and then at the parent customer level. For example, if the system receives a retroactive enrollment transaction with the following details:

- UDF_CHAR_1 is set to Western
- UDF_CHAR_2 is set to Active
- UDF_CHAR_3 is set to HR
- UDF_CHAR_4 is set to Indian
- UDF_DATE_1 is set to 01-03-2018
- UDF_DATE_2 is set to 31-03-2018
- Transaction Record Type is set to TR5

For example, the following table illustrates the effective pricing rules which are available during the best fit match:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Pricing Rule	Pricing Start Date	Pricing End Date	Price Item Parameters in Pricing Rule	Fees	Assignment Level
TR5	ENROLLMENT BASED CHARGES	P3	Location = UDF_CHAR_1, Employee Status = UDF_CHAR_2, Employee Department = UDF_CHAR_3, and Nationality = UDF_CHAR_4	C1P3	01-01-2018	31-12-2018	Location = Western and Employee Status = Active	$10	Bill Group
							Location = Eastern and Employee Status = Active	$12	
							Location = Eastern and Employee Status = Retired	$11	
							Location = Western and Employee Status = Retired	$9	

Note:

Here, the coverage start date is mapped to the **UDF_DATE_1** field and the coverage end date is mapped to the **UDF_DATE_2** field in the ENROLLMENT BASED CHARGES pricing rule type.

Here, the **Location** and **Employee Status** parameters are mandatory for P3. However, the **Employee Department** and **Nationality** parameters are optional with the priority set to 1 and 2, respectively.

Example 3: Best Fit Match for Price Item Parameters

In the example 3, the system could not find the exact match for the price item parameters (i.e. Location = Western, Employee Status = Active, Employee Department = HR, and Nationality = Indian) in the effective pricing rule for P3. Therefore, the system searches for the best fit match. While searching for the best fit match, the system rules out the optional parameter with lowest priority (i.e. Nationality = Indian) and checks whether pricing is defined for the price item parameters (i.e. Location = Western, Employee Status = Active, and Employee Department = HR) in the effective pricing rule. If so, it considers C1P3 as the effective pricing rule for P3. If not, the system rules out the optional parameter with the next lowest priority (i.e. Employee Department = HR) and checks whether pricing is defined for the price item parameters (i.e. Location = Western and Employee Status = Active) in the effective pricing rule. If so, it considers C1P3 as the effective pricing rule for P3. If not, the status of the transaction is changed to **Error**.

In the example 3, the system considers pricing defined for the price item parameters (i.e. Location = Western and Employee Status = Active) as the best fit match, and therefore fetches C1P3 as the effective pricing rule for P3. While

Copyright © 2026, Oracle and/or its affiliates.

fetching the effective pricing rule, the system considers only those price item parameters specified in the primary pricing rule type for which the parameter usage is set to **Pricing**. For retroactive enrollment transactions, the system considers only those effective pricing rules where the **Exempt Retro Transactions** option is not selected.

The system then derives the account with a particular invoice type (to which a price item must be billed) based on the priority which is defined for the respective price item in the pricing rule type.

For example, the following table illustrates the accounts to which the charges of P1 and P2 should be billed based on the given priority:

Price Item	Priority	Invoice Type	Account
P1	10	Standard	A1
	20	Retention	A2
P2	10	Retention	A2
	20	Standard	A1

Example 4: Priority Based Account Derivation

In the example 4, while mapping the enrollment transaction to P1, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** exists for the bill group. If so, it considers the standard account (A1) of the bill group for billing. However, if an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** does not exist for the bill group, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Retention** exists for the bill group. If so, it considers the retention account (A2) of the bill group for billing. If an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Retention** does not exist for the bill group, the status of the transaction is changed to **Error**.

Similarly, while mapping the enrollment transaction to P2, the system considers the account of the bill group which is available based on the priority. The system derives the billing account for only those price items for which the effective pricing rule is derived.

Note: The characteristic type which indicates the type of account (for example, **C1INVTYP**) must be specified in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration. Otherwise, erroneous results might occur.

Once the account is derived, the system then checks whether the account has one active contract of the contract type which is associated with the price item. If so, it fetches the contract for further processing. Once the effective pricing rule, account, and active contract are derived, the transaction is mapped to the respective price item, price item parameters, and account. A transaction leg is created for each price item, price item parameters, and account combination. For example, if the system receives a non-retroactive enrollment transaction with the following details:

- UDF_CHAR_1 is set to Western
- UDF_CHAR_2 is set to Active
- UDF_CHAR_3 is set to HR
- UDF_DATE_1 is set to 01-03-2018
- UDF_DATE_2 is set to 31-03-2018
- Transaction Record Type is set to TR5

For example, the following table illustrates that transaction legs are created only when effective pricing rule and account with an active contract are derived for a price item and price item parameters combination:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Effective Pricing Rule	Best Fit Match for Price Item Parameters in Effective Pricing Rule	Account	Active Contract	Transaction Leg
TR5	ENROLLMENT BASED FEES	P1	Location = UDF_CHAR_1, Employee Status = UDF_CHAR_2, Employee Department = UDF_CHAR_3, and Nationality = UDF_CHAR_4	PR1	Location = Western and Employee Status = Active	A1	C1	TL1
		P2		PR2	Location = Western and Employee Status = Active	A2	C2	TL2

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Effective Pricing Rule	Best Fit Match for Price Item Parameters in Effective Pricing Rule	Account	Active Contract	Transaction Leg
		P3		PR3	Location = Western and Employee Status = Active	A3	C3	TL3

Note: Here, the coverage start date is mapped to the **UDF_DATE_1** field and the coverage end date is mapped to the **UDF_DATE_2** field in the ENROLLMENT BASED FEES pricing rule type.

Example 5: Transaction Leg Derivation

In the example 5, the system maps the non-retroactive enrollment transaction to the following price item, price item parameters, and account combinations:

- Price Item: P1; Price Item Parameter: Location = Western, Employee Status = Active, and Employee Department = HR; and Account: A1
- Price Item: P2; Price Item Parameter: Location = Western, Employee Status = Active, and Employee Department = HR; and Account: A2
- Price Item: P3; Price Item Parameter: Location = Western, Employee Status = Active, and Employee Department = HR; and Account: A3

Note: The nationality information of an employee is not received in the **UDF_CHAR_4** field, and therefore the non-retroactive enrollment transaction is not mapped to the **Nationality** price item parameter.

In the example 5, the system creates three transaction legs - TL1, TL2, and TL3 for the non-retroactive enrollment transaction. Once a transaction leg is created, the respective effective pricing rule is stamped against the transaction leg. In addition, the price item parameters of the transaction leg are grouped. In the example 5, the system creates one price item parameter group which contains the following price item parameters:

- Location = Western
- Employee Status = Active
- Employee Department = HR

A group is used to determine the price item pricing. A unique group ID is generated for each group. If a group with a set of price item parameters already exists in the system, a new group is not created. Instead, the existing group is used for determining the price item pricing.

Note: The price item parameter group contains only those price item parameters included in the pricing rule type for which the parameter usage is set to **Pricing**.

The following table describes how the system fetches a pricing rule when a pricing group is used while defining the pricing rule for a bill group:

If the transaction is a...	Then the system fetches the pricing rule when the following conditions are met...
Retroactive enrollment transaction	• The coverage end date of the retroactive enrollment transaction falls within the pricing rule's date range. • The exact or best fit match is available for the price item parameters in the effective pricing rule. • The retroactive enrollment transaction satisfies the criteria defined in any one of the pricing group rule.
Non-retroactive enrollment transaction	• The coverage start date of the non-retroactive enrollment transaction falls within the pricing rule's date range. • The exact or best fit match is available for the price item parameters in the effective pricing rule.

Copyright © 2026, Oracle and/or its affiliates.

If the transaction is a...	Then the system fetches the pricing rule when the following conditions are met...
	• The non-retroactive enrollment transaction satisfies the criteria defined in any one of the pricing group rule.

Let us understand this with the help of an example. A retroactive enrollment transaction is received with the following details:

- UDF_CHAR_1 is set to X
- UDF_CHAR_2 is set to Western
- UDF_CHAR_3 is set to Indian
- UDF_CHAR_4 is set to HR
- UDF_CHAR_5 is set to Permanent
- UDF_CHAR_6 is set to Senior Manager
- UDF_CHAR_7 is set to BG1
- UDF_DATE_1 is set to 01-03-2018
- UDF_DATE_2 is set to 31-03-2018
- Transaction Record Type is set to TR6

For example, the following table illustrates an effective pricing rule which is defined using a retention type enrollment based pricing rule type and where a pricing group is used:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Pricing Group Rule	Price Item Parameters	Fees
TR6	ENROLLMENT BASED FEES	PP1	Designation = UDF_CHAR_6; Employee Group = UDF_CHAR_7	PR1	01-01-2018	31-12-2018	PG1	Rule 1 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager and Employee Group = BG1	$10
								Rule 1 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager and Employee Group = BG2	$12
								Rule 2 (where Source System = X, Parameter 1 = Eastern, and Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager and Employee Group = BG1	$8
								Rule 2 (where Source System = X, Parameter 1 = Eastern, and Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager and Employee Group = BG2	$9

Note: Here, the source system is mapped to the **UDF_CHAR_1** field, the parameter 1 is mapped to the **UDF_CHAR_2** field, the parameter 2 is mapped to the **UDF_CHAR_3** field, the parameter 3 is mapped to the **UDF_CHAR_4** field, the parameter 4 is mapped to the **UDF_CHAR_5** field, the coverage start date is mapped to the **UDF_DATE_1** field, and the coverage end date is mapped to the **UDF_DATE_2** field in the ENROLLMENT BASED FEES pricing rule type.

Example 6: Effective Pricing Rule is Defined Using a Pricing Group

Copyright © 2026, Oracle and/or its affiliates.

In the example 6, the system considers the PR1 pricing rule for PP1 because of the following reasons:

- The coverage end date (i.e. 31-03-2018) of the retroactive enrollment transaction falls within the PR1 pricing rule's date range (i.e. 01-01-2018 to 31-12-2018).
- The employee attributes specified in the retroactive enrollment transaction match the criteria defined in the Rule 1 (i.e. Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)
- The employee attributes specified in the retroactive enrollment transaction match the price item parameters defined within the Rule 1.

The system then stores the pricing group rule which is satisfied against a parameter which is defined in the **Pricing Group Rule Parameter** option type of the **C1-ASOBLLNG** feature configuration. In such case, the price item parameter group contains the price item parameters and the pricing group rule parameter. For example, Group A contains Designation = Senior Manager, Employee Group = BG1, and Pricing Group Rule Parameter = Rule 1.

In the example 6, the system could find the exact match for pricing parameters defined in the pricing group rule. However, if the exact match is not available, the system finds the effective pricing rule using the best fit match for the pricing parameters defined in the pricing group rule. Note that the system searches for the exact match in the effective pricing rules at both the bill group and parent customer levels. If the exact match is not available at both the levels, the system finds the effective pricing rule using the best fit match for the pricing parameters (defined in the pricing group rule) first at the bill group level and then at the parent customer level.

Let us understand this with the help of an example. A non-retroactive enrollment transaction is received with the following details:

- UDF_CHAR_1 is set to X
- UDF_CHAR_2 is set to Western
- UDF_CHAR_3 is set to Indian
- UDF_CHAR_4 is set to HR
- UDF_CHAR_5 is set to Permanent
- UDF_CHAR_6 is set to Senior Manager
- UDF_CHAR_7 is set to BG1
- UDF_DATE_1 is set to 01-05-2018
- UDF_DATE_2 is set to 31-05-2018
- Transaction Record Type is set to TR6

For example, the following table illustrates the effective pricing rules which are available during the best fit match:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Pricing Group Rule	Price Item Parameters in Pricing Rule	Fees
TR6	ENROLLMENT BASED FEES	PP1	Designation = UDF_CHAR_6, Employee Group = UDF_CHAR_7	PR1	01-01-2018	31-12-2018	PG1	Rule 1 (where Source System = X and Parameter 1 = Western)	Designation = Senior Manager; Employee Group = BG1	$20
								Rule 1 (where Source System = X and Parameter 1 = Western)	Designation = Senior Manager; Employee Group = BG2	$21
								Rule 2 (where Source System = X and Parameter 1 = Eastern)	Designation = Senior Manager; Employee Group = BG1	$18
								Rule 2 (where Source System = X and Parameter 1 = Eastern)	Designation = Senior Manager; Employee Group = BG2	$19
		PP2		PR2	01-01-2018	31-12-2018	PG2	Rule 1 (where Source System = X, Parameter 1 = Eastern, Parameter 2 = Indian, Parameter 3 = HR, and	Designation = Senior Manager; Employee Group = BG2	$5

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Pricing Group Rule	Price Item Parameters in Pricing Rule	Fees
								Parameter 4 = Permanent)		
								Rule 1 (where Source System = X, Parameter 1 = Eastern, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager; Employee Group = BG1	$5
								Rule 2 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager; Employee Group = BG2	$6
								Rule 2 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Designation = Senior Manager; Employee Group = BG1	$9

Note: Here, the source system is mapped to the **UDF_CHAR_1** field, the parameter 1 is mapped to the **UDF_CHAR_2** field, the parameter 2 is mapped to the **UDF_CHAR_3** field, the parameter 3 is mapped to the **UDF_CHAR_4** field, the parameter 4 is mapped to the **UDF_CHAR_5** field, the coverage start date is mapped to the **UDF_DATE_1** field, and the coverage end date is mapped to the **UDF_DATE_2** field in the ENROLLMENT BASED FEES pricing rule type.

Example 7: Effective Pricing Rule Derivation Using Best Fit Match for Pricing Parameters

In the example 7, the system could not find exact match for the pricing parameters (i.e. Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent) in the effective pricing rule for PP1. Therefore, the system searches for the best fit match. While searching for the best fit match, the system rules out the optional parameter 4 (i.e. Parameter 4 = Permanent) and then checks whether the pricing group rule where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, and Parameter 3 = HR exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the system then rules out the optional parameter 3 (i.e. Parameter 3 = HR) and then checks whether the pricing group rule where Source System = X, Parameter 1 = Western, and Parameter 2 = Indian exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the system then rules out the optional parameter 2 (i.e. Parameter 2 = Indian) and then checks whether the pricing group rule where Source System = X and Parameter 1 = Western exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the status of the transaction is changed to **Error**.

In the example 7, the system considers Rule 1 where Source System = X and Parameter 1 = Western as the best fit match in the PR1 pricing rule for PP1. In addition, the employee attributes in the non-retroactive enrollment transaction satisfy the price item parameters (i.e. Designation = Senior Manager and Employee Group = BG1) defined within Rule 1. Therefore, the system fetches PR1 as the effective pricing rule for PP1. In addition, the system fetches PR2 as the effective pricing rule for PP2. The system creates two price item parameter groups - One contains Designation = Senior Manager, Employee Group = BG1, and Pricing Group Rule Parameter = Rule 1 and another contains Designation = Senior Manager, Employee Group = BG1, and Pricing Group Rule Parameter = Rule 2. Once the price item parameter group is created, the system creates the aggregation parameter group. An aggregation parameter group contains all price item parameters included in the pricing rule type for which the parameter usage is set to **Aggregation**.

If the effective pricing rule is not derived for a price item and price item parameters combination or if the account or active contract for the account is not derived, the system does not create a transaction leg for the respective price item.

For example, the following table illustrates that transaction legs are created only when effective pricing rule and account with an active contract are derived for a price item and price item parameters combination:

Copyright © 2026, Oracle and/or its affiliates.

Primary Pricing Rule Type	Price Item	Price Item Parameters	Effective Pricing Rule	Account	Active Contract	Transaction Leg
ENROLLMENT BASED FEES	PP1	Designation = UDF_CHAR_6, Employee Status = UDF_CHAR_7	-	-	-	-
	PP2		PR2	-	-	-
	PP3		PR3	A3	C3	TL1
	PP4		-	-	-	-
	PP5		PR5	A2	C1	TL2
	PP6		PR6	A1	-	-

Example 8: No. of Transaction Legs Derived

In the example 8, the system could not find the effective pricing rule for PP1 and PP4, the required account for PP2, and the active contract for PP6 on A1. Therefore, in this case, the system creates two transaction legs - TL1 and TL2 for the enrollment transaction.

If the eligibility rule type is defined of a price item, the system maps the enrollment transaction to the price item when the eligibility rule is satisfied. If the eligibility rule is not satisfied, the system does not consider the price item for billing. For example,

Price Item	Eligibility Criteria Met	Effective Pricing Rule	Account	Active Contract	Transaction Leg
PE1	Yes	PR1	A1	C1	TL1
PE2	-	PR2	-	-	-
PE3	No	-	-	-	-
PE4	Yes	-	-	-	-
PE5	Yes	PR3	A2	-	-
PE6	Yes	PR4	-	-	-

Example 9: Price Item Eligibility for Transaction Leg Derivation

In the example 9, the eligibility criteria was defined for PE1, PE3, PE4, PE5, and PE6. The eligibility criteria was satisfied for PE1, PE4, PE5, and PE6, but not for PE3. Further, the system could not find the effective pricing rule for PE4, the required account for PE2 and PE6, and the active contract for PE5 on A2. Therefore, in this case, the system creates one transaction leg (i.e. TL1) for the enrollment transaction. For more information, refer to the Price Item Eligibility on page 3465 section.

Once a transaction leg is created, the derivation date is set as the processing date corresponding to the transaction leg.

Account and Price Item Derivation (for the Ancillary Pricing Rule Type Category)

The **Validate Transaction and Derive Price Item (C1-TXNIP)** batch maps an ancillary transaction to one or more price item and price item parameters which are defined in the respective primary pricing rule type. This is possible when an algorithm created using the **C1_ACCPRIDRV** algorithm type is attached to the **Account and Price Item Derivation** system event of the primary pricing rule type.

This algorithm fetches the effective pricing rule for each price item and price item parameters combination specified in the primary pricing rule type on the derivation date. The system considers the paid date as the derivation date. This algorithm first searches for the effective pricing rule for a price item and price item parameters combination which is defined for the policy at the bill group level. If the system does not find any effective pricing rule for a price item and

Copyright © 2026, Oracle and/or its affiliates.

price item parameters combination which is defined for the policy at the bill group level, it inherits the effective pricing rule for a price item and price item parameters combination from the parent customer level.

For example, if the system receives an ancillary transaction with the following details:

- UDF_CHAR_6 is set to BC1
- UDF_CHAR_7 is set to PASS
- UDF_DATE_1 is set to 15-03-2018
- Transaction Record Type is set to TR1

The following table illustrates how the pricing rules are defined for the ancillary transactions at different assignment levels:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Arrangement	Assignment Level
TR1	ANCILLARY	P1	BCHGLINETYPE = UDF_CHAR_6 and PRICINGARRANGEMENT = UDF_CHAR_7	C1P1	01-01-2018	31-12-2018	Pass Through without Markup or Markdown	Parent Customer
				C2P1	01-01-2018	31-12-2018	Pass Through without Markup or Markdown	Bill Group
				C3P1	01-01-2018	31-12-2018	Pass Through without Markup or Markdown	Bill Group
		P2		C1P2	01-06-2017	31-12-2017	Pass Through without Markup or Markdown	Bill Group
				C2P2	01-01-2018	31-12-2018	Pass Through without Markup or Markdown	Parent Customer
				C3P2	01-01-2019	30-06-2019	Pass Through without Markup or Markdown	Bill Group

Note:

Here, the **Pass Through without Markup or Markdown** pricing arrangement identifier is set to **PASS** in the ANCILLARY pricing rule type. This means that the system will consider only effective pricing rules where the pricing arrangement is set to **Pass Through without Markup or Markdown** when the ancillary transaction is received where **UDF_CHAR_7** is set to **PASS**.

Here, the paid date is mapped to the **UDF_DATE_1** field in the ANCILLARY pricing rule type.

Example 1: Effective Pricing Rule Derivation

In the example 1, the system fetches C2P1 and C2P2 pricing rules for P1 and P2, respectively, because of the following reasons:

- The paid date (i.e. 15-03-2018) of the ancillary transaction falls within the C2P1 and C2P2 pricing rules' date range (i.e. 01-01-2018 to 31-12-2018).
- The pricing arrangement is set to **Pass Through without Markup or Markdown** in the C2P1 and C2P2 pricing rules.

Note that the effective pricing rule for P1 is derived at the bill group level, whereas the effective pricing rule for P2 is derived from the parent customer level.

Note: The price item parameters (i.e. BCHGLINETYPE and PRICINGARRANGEMENT) must be defined in the **Billable Charge Line Type Parameter** and **Pricing Arrangement Parameter** option types of the **C1-ASOBLLNG** feature configuration, respectively. Otherwise, erroneous results might occur.

The system then derives the account with a particular invoice type (to which a price item must be billed) based on the priority which is defined for the respective price item in the pricing rule type.

For example, the following table illustrates the accounts to which the charges of P1 and P2 should be billed based on the given priority:

Copyright © 2026, Oracle and/or its affiliates.

Price Item	Priority	Invoice Type	Account
P1	10	Standard	A1
	20	Retention	A2
P2	10	Retention	A2
	20	Standard	A1

Example 2: Priority Based Account Derivation

In the example 2, while mapping the claim transaction to P1, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** exists for the bill group. If so, it considers the standard account (A1) of the bill group for billing. However, if an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Standard** does not exist for the bill group, the system checks whether an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Retention** exists for the bill group. If so, it considers the retention account (A2) of the bill group for billing. If an account where the **Invoice Type (C1INVTYP)** characteristic is set to **Retention** does not exist for the bill group, the status of the transaction is changed to **Error**.

Similarly, while mapping the claim transaction to P2, the system considers the account of the bill group which is available based on the priority. The system derives the billing account for only those price items for which the effective pricing rule is derived.

Note: The characteristic type which indicates the type of account (for example, **C1INVTYP**) must be specified in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration. Otherwise, erroneous results might occur.

Once the account is derived, the system then checks whether the account has one active contract of the contract type which is associated with the price item. If so, it fetches the contract for further processing. Once the effective pricing rule, account, and active contract are derived, the transaction is mapped to the respective price item, price item parameters, and account. A transaction leg is created for each price item, price item parameters, and account combination. For example, if the system receives an ancillary transaction with the following details:

- UDF_CHAR_6 is set to BC1
- UDF_CHAR_7 is set to PASS
- UDF_DATE_1 is set to 15-03-2018
- Transaction Record Type is set to TR1

For example, the following table illustrates how the ancillary transaction legs are created for each price item, price item parameters, and account combination:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Effective Pricing Rule	Pricing Arrangement	Account	Active Contract	Transaction Leg
TR1	ANCILLARY	P1	BCHGLINETYPE = UDF_CHAR_6 and PRICINGARRANGEMENT = UDF_CHAR_7	PR1	Pass Through without Markup or Markdown	A1	C1	TL1
		P2		PR2	Pass Through without Markup or Markdown	A2	C2	TL2
		P3		PR3	Pass Through without Markup or Markdown	A3	C3	TL3

Note: Here, the paid date is mapped to the **UDF_DATE_1** field and the **Pass Through without Markup or Markdown** pricing arrangement identifier is set to **PASS** in the ANCILLARY pricing rule type.

Example 3: Transaction Leg Derivation

In the example 3, the system maps the ancillary transaction to the following price item, price item parameters, and account combinations:

Copyright © 2026, Oracle and/or its affiliates.

- Price Item: P1; Price Item Parameter: BCHGLINETYPE = BC1 and PRICINGARRANGEMENT = Pass Through without Markup or Markdown; and Account: A1
- Price Item: P2; Price Item Parameter: BCHGLINETYPE = BC1 and PRICINGARRANGEMENT = Pass Through without Markup or Markdown; and Account: A2
- Price Item: P3; Price Item Parameter: BCHGLINETYPE = BC1 and PRICINGARRANGEMENT = Pass Through without Markup or Markdown; and Account: A3

In the example 3, the system creates three transaction legs - TL1, TL2, and TL3 for the ancillary transaction. Once a transaction leg is created, the respective effective pricing rule is stamped against the transaction leg. In addition, the price item parameters of the transaction leg are grouped. In the example 3, the system creates one price item parameter group which contains the following price item parameters:

- BCHGLINETYPE = BC1
- PRICINGARRANGEMENT = PASS

A group is used to determine the price item pricing. A unique group ID is generated for each group. If a group with a set of price item parameters already exists in the system, a new group is not created. Instead, the existing group is used for determining the price item pricing.

Note: The price item parameter group contains only those price item parameters included in the primary pricing rule type for which the parameter usage is set to **Pricing**.

If a pricing group is used while defining a pricing rule for a bill group, the system fetches the pricing rule for an ancillary transaction when the following conditions are met:

- The paid date of the ancillary transaction falls within the pricing rule's date range.
- The employee attributes specified in the ancillary transaction match the criteria defined in any one of the pricing group rule.
- The pricing arrangement specified in the ancillary transaction matches the pricing arrangement specified in the pricing rule.

Let us understand this with the help of an example. An ancillary transaction is received with the following details:

- UDF_CHAR_1 is set to X
- UDF_CHAR_2 is set to Western
- UDF_CHAR_3 is set to Indian
- UDF_CHAR_4 is set to HR
- UDF_CHAR_5 is set to Permanent
- UDF_CHAR_6 is set to BC1
- UDF_CHAR_7 is set to PASS
- UDF_DATE_1 is set to 26-01-2018
- Transaction Record Type is set to TR6

For example, the following table illustrates an effective pricing rule which is defined using an ancillary pricing rule type and where a pricing group is used:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Pricing Group Rule	Pricing Arrangement
TR6	ANCILLARY	P1	BCHGLINETYPE = UDF_CHAR_6 and PRICINGARRANGEMENT = UDF_CHAR_7	PR1	01-01-2018	31-12-2018	PG1	Rule 1 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Pass Through without Markup or Markdown
								Rule 2 (where Source System = X, Parameter 1 = Eastern, and Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Pass Through without Markup or Markdown

Copyright © 2026, Oracle and/or its affiliates.

Note: Here, the source system is mapped to the **UDF_CHAR_1** field, the parameter 1 is mapped to the **UDF_CHAR_2** field, the parameter 2 is mapped to the **UDF_CHAR_3** field, the parameter 3 is mapped to the **UDF_CHAR_4** field, the parameter 4 is mapped to the **UDF_CHAR_5** field, the paid date is mapped to the **UDF_DATE_1** field, and the **Pass Through without Markup or Markdown** pricing arrangement identifier is set to **PASS** in the ANCILLARY pricing rule type.

Example 4: Effective Pricing Rule is Defined Using a Pricing Group

In the example 4, the system considers the PR1 pricing rule for P1 because of the following reasons:

- The paid date (i.e. 26-01-2018) of the ancillary transaction falls within the PR1 pricing rule's date range (i.e. 01-01-2018 to 31-12-2018).
- The employee attributes specified in the ancillary transaction match the criteria defined in the Rule 1 (i.e. Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent).
- The pricing arrangement is set to **Pass Through without Markup or Markdown** within Rule 1 of the PR1 pricing rule.

The system then stores the pricing group rule which is satisfied against a parameter which is defined in the **Pricing Group Rule Parameter** option type of the **C1-ASOBLLNG** feature configuration. In such case, the price item parameter group contains the price item parameters and the pricing group rule parameter. For example, Group A contains BCHGLINETYPE = BC1, PRICINGARRANGEMENT = PASS, and Pricing Group Rule Parameter = Rule 1.

In the example 4, the system could find the exact match for pricing parameters defined in the pricing group rule. However, if the exact match is not available, the system finds the effective pricing rule using the best fit match for the pricing parameters defined in the pricing group rule. Note that the system searches for the exact match in the effective pricing rules at both the bill group and parent customer levels. If the exact match is not available at both the levels, the system finds the effective pricing rule using the best fit match for the pricing parameters (defined in the pricing group rule) first at the bill group level and then at the parent customer level.

Let us understand this with the help of an example. An ancillary transaction is received with the following details:

- UDF_CHAR_1 is set to X
- UDF_CHAR_2 is set to Western
- UDF_CHAR_3 is set to Indian
- UDF_CHAR_4 is set to HR
- UDF_CHAR_5 is set to Permanent
- UDF_CHAR_6 is set to BC1
- UDF_CHAR_7 is set to PASS
- UDF_DATE_1 is set to 31-05-2018
- Transaction Record Type is set to TR6

For example, the following table illustrates the effective pricing rules which are available during the best fit match:

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Pricing Group Rule	Pricing Arrangement
TR6	ANCILLARY	PP1	BCHGLINETYPE = UDF_CHAR_6 and PRICINGARRANGEMENT = UDF_CHAR_7	PR1	01-01-2018	31-12-2018	PG1	Rule 1 (where Source System = X and Parameter 1= Western)	Pass Through without Markup or Markdown
								Rule 1 (where Source System = X and Parameter 1 = Western)	Pass Through without Markup or Markdown
								Rule 2 (where Source System = X and Parameter 1 = Eastern)	Pass Through without Markup or Markdown
								Rule 2 (where Source System = X and Parameter 1 = Eastern)	Pass Through without Markup or Markdown

Copyright © 2026, Oracle and/or its affiliates.

Transaction Record Type	Primary Pricing Rule Type	Price Item	Price Item Parameters	Pricing Rule	Pricing Start Date	Pricing End Date	Pricing Group	Pricing Group Rule	Pricing Arrangement
		PP2		PR2	01-01-2018	31-12-2018	PG2	Rule 1 (where Source System = X, Parameter 1 = Eastern, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Pass Through without Markup or Markdown
								Rule 1 (where Source System = X, Parameter 1 = Eastern, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Pass Through without Markup or Markdown
								Rule 2 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Pass Through without Markup or Markdown
								Rule 2 (where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent)	Pass Through without Markup or Markdown

Note: Here, the source system is mapped to the **UDF_CHAR_1** field, the parameter 1 is mapped to the **UDF_CHAR_2** field, the parameter 2 is mapped to the **UDF_CHAR_3** field, the parameter 3 is mapped to the **UDF_CHAR_4** field, the parameter 4 is mapped to the **UDF_CHAR_5** field, the paid date is mapped to the **UDF_DATE_1** field, and the **Pass Through without Markup or Markdown** pricing arrangement identifier is set to **PASS** in the ANCILLARY pricing rule type.

Example 5: Effective Pricing Rule Derivation Using Best Fit Match for Pricing Parameters

In the example 5, the system could not find the exact match for the pricing parameters (i.e. Source System = X, Parameter 1 = Western, Parameter 2 = Indian, Parameter 3 = HR, and Parameter 4 = Permanent) in the effective pricing rule for PP1. Therefore, the system searches for the best fit match. While searching for the best fit match, the system rules out the optional parameter 4 (i.e. Parameter 4 = Permanent) and then checks whether the pricing group rule where Source System = X, Parameter 1 = Western, Parameter 2 = Indian, and Parameter 3 = HR exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the system then rules out the optional parameter 3 (i.e. Parameter 3 = HR) and then checks whether the pricing group rule where Source System = X, Parameter 1 = Western, and Parameter 2 = Indian exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the system then rules out the optional parameter 2 (i.e. Parameter 2 = Indian) and then checks whether the pricing group rule where Source System = X and Parameter 1 = Western exists in the effective pricing rule. If so, it considers the pricing group rule for further processing. If not, the status of the transaction is changed to **Error**.

In the example 5, the system considers Rule 1 where Source System = X and Parameter 1 = Western as the best fit match in the PR1 pricing rule for PP1. In addition, the pricing arrangement is set to **Pass Through without Markup or Markdown** within Rule 1 of the PR1 pricing rule. Therefore, the system fetches PR1 as the effective pricing rule for PP1. In addition, the system fetches PR2 as the effective pricing rule for PP2. The system creates two price item parameter groups - One contains BCHGLINETYPE = BC1, PRICINGARRANGEMENT = PASS, and Pricing Group Rule Parameter = Rule 1 and another contains BCHGLINETYPE = BC1, PRICINGARRANGEMENT = PASS, and Pricing Group Rule Parameter = Rule 2. Once the price item parameter group is created, the system creates the

Copyright © 2026, Oracle and/or its affiliates.

aggregation parameter group. An aggregation parameter group contains all price item parameters included in the related pricing rule type for which the parameter usage is set to **Aggregation**.

If the effective pricing rule is not derived for a price item and price item parameters combination or if the account or active contract for the account is not derived, the system does not create a transaction leg for the respective price item.

For example, the following table illustrates that transaction legs are created only when effective pricing rule and account with an active contract are derived for a price item and price item parameters combination:

Primary Pricing Rule Type	Price Item	Price Item Parameters	Effective Pricing Rule	Account	Active Contract	Transaction Leg
ANCILLARY	PP11	BCHGLINETYPE = UDF_CHAR_6 and PRICINGARRANGEMENT = UDF_CHAR_7	-	-	-	-
	PP12		PR12	A1	C1	TL11
	PP13		PR13	-	-	-
	PP14		PR14	A2	-	-
	PP15		PR15	-	-	-
	PP16		-	-	-	-
	PP17		PR17	A2	C2	TL12

Example 6: No. of Transaction Legs Derived

In the example 6, the system could not find the effective pricing rule for PP11 and PP16, the required account for PP13 and PP15, and the active contract for PP14 on A2. Therefore, in this case, the system creates two transaction legs - TL11 and TL12 for the transaction.

If the eligibility rule type is defined of a price item, the system maps the ancillary transaction to the price item when the eligibility rule is satisfied. If the eligibility rule is not satisfied, the system does not consider the price item for billing. For example,

Price Item	Eligibility Criteria Met	Effective Pricing Rule	Account	Active Contract	Transaction Leg
PE1	Yes	PR1	A1	C1	TL1
PE2	-	PR2	-	-	-
PE3	No	-	-	-	-
PE4	Yes	-	-	-	-
PE5	Yes	PR3	A2	-	-
PE6	Yes	PR4	-	-	-

Example 7: Price Item Eligibility for Transaction Leg Derivation

In the example 7, the eligibility criteria was defined for PE1, PE3, PE4, PE5, and PE6. The eligibility criteria was satisfied for PE1, PE4, PE5, and PE6, but not for PE3. Further, the system could not find the effective pricing rule for PE4, the required account for PE2 and PE6, and the active contract for PE5 on A2. Therefore, in this case, the system creates one transaction leg (i.e. TL1) for the ancillary transaction. For more information, refer to the Price Item Eligibility on page 3465 section.

Once a transaction leg is created, the derivation date is set as the processing date corresponding to the transaction leg.

Bill After Date Determination

Once the billable charges are created for claim, claim based fees, enrollment based fees, and ancillary, the system enables you to automatically stamp the bill after date in these billable charges. The system can automatically stamp the bill after date in these billable charges when an algorithm created using the **C1_BAFTDRV** algorithm type is attached to the

Copyright © 2026, Oracle and/or its affiliates.

Bill After Date Determination system event of the respective pricing rule type. This algorithm sets the bill after date to the end date of the aggregation schedule period in which the transaction date falls. Note that the system considers the aggregation schedule specified in the rate option which is defined for the respective price item. Let us understand this with the help of an example. If the claim transaction with the transaction date set to 25-06-2018 is mapped to the following price item and account combinations:

The following table illustrates the schedule periods defined in an aggregation schedule which is specified in the rate option of a price item:

Pricing Rule Type	Price Item	Rate Option	Aggregate Transaction	Aggregation Schedule	Schedule Period	Account	Billable Charge
CLAIM	P1	R01	Yes	Monthly	01-01-2018 - 31-01-2018	A1	BC1
					01-02-2018 - 28-02-2018		
					01-03-2018 - 31-03-2018		
					01-04-2018 - 30-04-2018		
					01-05-2018 - 31-05-2018		
					01-06-2018 - 30-06-2018		
					01-07-2018 - 31-07-2018		
					01-08-2018 - 31-08-2018		
	P2	R01			01-09-2018 - 30-09-2018	A2	BC2
					01-10-2018 - 31-10-2018		
					01-11-2018 - 30-11-2018		
					01-12-2018 - 31-12-2018		
	P3	R02	Yes	Yearly	01-01-2018 - 31-12-2018	A3	BC3

Example 1: Bill After Date Determination Using the Aggregation Schedule

In the example 1, the system stamps 30-06-2018 as the bill after date in the BC1 and BC2 billable charges. This is because the transaction date (i.e. 25-06-2018) falls in the 01-06-2018 - 30-06-2018 period of the R01 aggregation schedule.

However, the system stamps 31-12-2018 as the bill after date in the BC3 billable charge. This is because the transaction date (i.e. 25-06-2018) falls in the 01-01-2018 - 31-12-2018 period of the R02 aggregation schedule.

Note: The bill after date for the specific stop-loss and aggregate stop-loss billable charges is calculated using the settlement frequency in the **Create Specific Stop-Loss Billable Charge (C1-BCSSL)** and **Create Aggregate Stop-Loss Billable Charge (C1-BCASL)** batches, respectively.

Advance Billing for Claim Fund Charge

Until now, the system enabled you to configure the pricing for level funding and generate the claim fund charges for a self-funded employer using either of the following approach:

- Flat level funding
- Enrollment based level funding

Copyright © 2026, Oracle and/or its affiliates.

Now, the system enables you to bill the claim fund charges to a self-funded employer in advance. In case of enrollment based level funding, the system can receive the enrollment transactions for the month of January in the month of December. Once the January enrollment transactions are received in December, the system can create claim fund charges based on the January enrollment in the month of December and accordingly bill the self-funded employer. However, the claim fund charges which are billed in the month of December will be adjusted against the claim, ancillary, or other charges which are eligible for level funding only in the month of January.

To enable this feature, you need to do the following:

- **Set the Advance Level Funding Eligibility Option** - A new field named **Advance Level Funding Eligibility** is available while defining a self-funded policy. You can set the value of the **Advance Level Funding Eligibility** field to either **Yes** or **No**. You can define the **Advance Level Funding Eligibility** field only through a health care inbound message and not from the user interface. When you create a self-funded policy from the user interface, the **Advance Level Funding Eligibility** field is non-editable. By default, the value is set to **No**. You can then change the value through a health care inbound message.
- **Set the Advance Billing Option** - A new field named **Advance Billing** is available while defining a retention type enrollment based pricing rule. You can set the value of the **Advance Billing** field to either **Yes** or **No**.
- **Create a Prospective Bill Period** - You need to create a prospective bill period wherein the bill date falls in a month prior to the month of bill segment end date. For example, if the bill segment end date is 01-31-2021, then you can set the bill date to 12-31-2020. You must use the prospective bill period in the recurring flat fee pricing rule using which you want to create the flat claim fund charge which should be billed in advance.

If the **Advance Level Funding Eligibility** field is set to **Y** through a health care inbound message, the system activates the self-funded policy even if the policy start date is later than the inbound processing date. Accordingly, a log is maintained for the self-funded policy.

On renewing a self-funded policy, the system provides the ability to copy the advance level funding eligibility value of the base policy to the renewed policy. A new field named **Copy Advance Level Funding Eligibility** is available while renewing a self-funded policy. If you select the **Copy Advance Level Funding Eligibility** option, the value is copied from the base policy to the renewed policy. If the **Advance Level Funding Eligibility** field is set to **Y** in the base policy, the system activates the renewed self-funded policy on the policy renewal even if the renewed policy's start date is later than the system date.

To implement this business requirement, the following changes are made in the system:

- While accumulating the charges which are eligible for level funding, the system behaves in the following manner:
  - In case of advance flat level funding, the system considers only those claim fund bill segments where the end date is earlier than or equal to the accumulation run date and then adjusts the accumulation amount against those claim fund charges which were billed in the previous bill period.
  - In case of advance enrollment based level funding, the system considers the enrollment transactions based on their coverage end date. Only those enrollment transactions where coverage end date is earlier than or equal to the accumulation run date are accumulated and then adjusted against the claim fund charges which were billed earlier.
- If the **Advance Level Funding Eligibility** field is set to **Y** for a self-funded policy and the inbound processing date is earlier than the policy start date, the system sets the contract start date to the first day of the month in which the inbound message is processed. Otherwise, the contract start date is set to policy start date.
- The system determines the bill after date depending on the value set for the **Advance Billing** field in the retention type enrollment based pricing rule. If the **Advance Billing** field is set to **Yes**, then the bill after date is set to accounting date - 1. Here, the accounting date is fetched from the schedule of the account's bill cycle where the transaction date falls. However, if the **Advance Billing** field is set to **No**, then the bill after date is set to accounting date - 1. Here, the accounting date is fetched from the schedule of the account's bill cycle where the transaction's coverage end date falls.

SSL Accumulation across Bill Groups

Specific Stop-Loss (SSL) protects the self-funded employers against the excess claims from a single individual who is a member in the self-funded policy. Oracle Revenue Management and Billing enables the customers to configure the SSL pricing rules wherein the SSL Limit and SSL Payout Limit are defined. For the excess claims from a member,

Copyright © 2026, Oracle and/or its affiliates.

arising on top of the SSL Limit defined for the bill group, the insurer will provide the SSL credits (capped with the SSL Payout Limit) to the self-funded employer.

There can be scenarios in which a member moves from one bill group to another. For example, an employee changes the department or work location. ORMB provides the ability to continue the accumulation of the transaction amount across the bill groups, if both bill groups have the same SSL limit and their accounts have same bill cycle. If the SSL Limits of the bill groups are different or if the bill groups' accounts have different bill cycles, the accumulation is calculated individually for each bill group based on the respective SSL Limit.

To enable the SSL Accumulation across Bill Groups feature, you need to set the **SSL Member Movement Configuration** option type in the **C1-ASOBLLNG** feature configuration to either of the following:

- INDIVIDUAL
- PROPORTIONATE
- CURRENTBG

If you do not set the value for the **SSL Member Movement Configuration** option type in the **C1-ASOBLLNG** feature configuration, by default, it is set to **INDIVIDUAL**.

While accumulating the SSL charges for a member, the system checks whether the member is associated with more than one bill group. If so, the system derives the value from the **SSL Member Movement Configuration** option type of the **C1-ASOBLLNG** feature configuration to determine the manner in which the SSL credits should be given to the bill groups. If the value of the **SSL Member Movement Configuration** option type is set to **PROPORTIONATE**, the system does weighted distribution of the total SSL credits across the associated bill groups based on the cumulative aggregation amount of each bill group. If the value of the **SSL Member Movement Configuration** option type is set to **CURRENTBG**, the system gives the remaining SSL credits to the present bill group irrespective of the bill group for which the transaction is received. If the value of the **SSL Member Movement Configuration** option type is set to **INDIVIDUAL**, the system accumulates the charges which are eligible for SSL and calculates the SSL credits individually for each bill group based on the respective SSL Limit.

Note: In case of a member who has opted for lasering, the system considers the lasered amount instead of the SSL limit during SSL credit calculation.

Trigger Repricing on Deleting Derivation and Pricing Parameters of a Bill Group

Until now, you were able to delete the derivation and pricing parameters of a bill group from the user interface. But repricing was not triggered on the deletion. Now, on deleting a derivation and pricing parameters combination of a bill group, the system changes the status of the derivation and pricing parameters combination to **Inactive**. In addition, if the audit event process is configured for the **C1-BillLevel** business object, the system creates an audit event with the audit action set to **Change Row**.

On executing the **C1-CBIPR** batch, the system creates a repricing entity detail record for the audit event in the **CI_REPRC_ENTITY_DTL** table. While repricing, you need to execute the following batches in the specified sequence:

1. C1-FIBLR
2. C1-FIMRE
3. C1-CBIPR
4. C1-FIMRC
5. C1-REPC1
6. C1-REPC2
7. C1-REPC3
8. C1-FIBCR

Once the repricing entity detail record is created for the audit event, you need to execute the **C1-FIMRC** batch. It will delete the inactivated derivation and pricing parameters combination (that was earlier deleted from the user interface)

Copyright © 2026, Oracle and/or its affiliates.

from the system. If the deleted derivation and pricing parameters combination was referred for billing any memberships in the system, you need to ensure that those memberships are appropriately billed to a new bill group and do not remain unbilled in the system.

Note: The **C1-CBIPR** and **C1-FIMRC** batches and **C1-REAUDEVNT** algorithm are enhanced to implement this feature.

Chapter 39

Fully-Insured Pricing

Topics:

- Algorithms for Pricing Rule Types
- Age Based Pricing
- Tier Based Pricing
- Pass-Through Billable Charge
- Additional Fee Pricing for COBRA Membership
- Membership Benefit Pricing
- Medicare Part A, Part B, and Part D Pricing
- Discount Charge Pricing for Retiree Membership
- Pricing Rule Inactivation

A new pricing model is introduced for the fully-insured group and individual businesses. In this pricing model, you can define pricing rules using the pricing rule types. At present, you can define the following pricing rule types for the fully-insured group and individual businesses:

- Age Based
- Tier Based

Note: You cannot define pricing rules using the pass-through billable charge pricing rule types. However, you can directly create SQI based billable charges using a pass-through billable charge pricing rule type. For more information, refer to Pass-Through

- Additional Fee
- Membership Benefit
- Discount Charge

Parent Topic: Fully-Insured Pricing on page 3517

C1_ACCPRIMEM

This algorithm should be configured on Fully-Insured Pricing Rule Types.

Copyright © 2026, Oracle and/or its affiliates.

- **For Group** - Based on Price Items and parameters configured on the Pricing Rule Type , available pricing rules for the policy are searched at parent person, policy, plan, state level. If processing Benefit record for benefit sub type has Value Type = 'Flat' and Price = 'N', Get the respective price items from the Benefit Pricing Rule Type based on the eligibility rule evaluation and derive the account of the bill group derived based on Invoice Type provided on Pricing Rule Type Price Item. Account of the bill group is searched with active contract of contract type corresponding to the price item and invoice type characteristic on the account matching the invoice type with priority as mentioned on the Pricing Rule Type for the Price Item.
- **For Individual** - Based on Price Items and parameters configured on the Pricing Rule Type , available pricing rules are searched at health plan level. If processing Benefit record for benefit sub type has Value Type = 'Flat' and Price = 'N', Get the respective price items from the Benefit Pricing Rule Type based on the eligibility rule evaluation and derive the account of the financial responsible person derived based on Invoice Type provided on Pricing Rule Type Price Item. Account of the financial responsible person is searched with active contract of contract type corresponding to the price item and invoice type characteristic on the account matching the invoice type with priority as mentioned on the Pricing Rule Type for the Price Item.
- **For Group and Individual** - If processing Benefit Sub Type is also having Reconciliation Required = Y, then for additional entry, get Reconciliation account id from Benefit Sub Type admin configuration.

  1. Price Item will be used which is provided on Benefit Sub Type in Reconciliation Price Item Code field.
  2. If not provided use then derived price item based on eligibility rule as per existing logic.

C1-BILLPDRV

This algorithm should be attached to the **Account and Price Item Derivation Post-Processing** system event of the pricing rule type. If the billing preference characteristic is defined for the account, this algorithm checks whether the value specified for the billing preference characteristic type is already defined in the system. If so, this algorithm derives the bill period from the **Bill Period** attribute of the billing preference. It then sets the **RECURRING_FLG** column to **BP** (i.e., Bill Period) and **RECURRING_VAL** column to the bill period derived from the billing preference corresponding to the record in the **CI_REPRC_REQ_DTL** table.

Note:

The system considers the characteristic type which is specified in the **Bill Cycle Rule Code** option type of the **C1-ASOBLLNG** feature configuration.

This algorithm is applicable for both fully insured group and fully insured individual lines of business.

Related Topics

For more information on...	See...
Tightly Coupled Bill Cycle and Bill Period through Billing Preference	Tightly Coupled Bill Cycle and Bill Period through Billing Preference on page 3642
How to setup the **C1-ASOBLLNG** feature configuration	Setting the C1-ASOBLLNG Feature Configuration on page 4639

C1-BILLRPCR

This algorithm should be attached to the **Account and Price Item Derivation Post-Processing** system event of the pricing rule type. It creates a timeline for each month of the membership coverage period based on the repricing effective date in the **CI_REPRC_REQ_DTL** table. It refers the derived bill period while creating the timelines for the repricing record.

Before executing the **C1-BILLRPCR** algorithm, the system should execute the **C1-BILLPDRV** algorithm to derive the bill period for the account. Therefore, you should ensure that the **C1-BILLPDRV** algorithm should have higher precedence (i.e., sequence) than the **C1-BILLRPCR** algorithm in the respective pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

Note: This algorithm is applicable for both fully insured group and fully insured individual lines of business.

Related Topics

For more information on...	See...
Bill Period Timeline	Bill Period Timeline on page 3643

C1_MEMBGDRV

This algorithm is responsible:

For Group

1. **Deriving Bill Group** - The algorithm soft parameter for bill levels signifies the bill level characteristic type that should be defined on the membership. The algorithm soft parameter for source system signifies the source system characteristic type that should be defined either on the membership or on policy plan or on policy. The source system characteristic value is determined in following sequence, a) Membership b) Policy plan c) Policy Based on the characteristic values on the membership for bill level 1 to bill level 4 and characteristic value of source system, the bill group and parent customer corresponding to the membership is derived
2. **Deriving Policy** - Policy is derived from the plan to which the membership is linked.

For Individual - For membership of type Individual, Health plan will be populated for membership. When membership status is Pending effectuation or Active, this algorithm derives the Financial Responsible person as bill group person.

C1_AGEPREM

This Algorithm should be configured on Pricing Rule Types for Age based.

Premium is calculated for all the eligible members under the membership. It builds the membership timeline considering the membership dates, member person dates and the effective dates for the repricing request raised for the membership. For each valid timeline, it computes the membership premium for each eligible member based on the base fee and modifiers applicable as per the pricing rule definition.

C1_AGEBDELG

This algorithm returns a list of eligible members for a membership for age based pricing rule type. It uses the relation matrix to identify the main subscriber , spouse and children, after which the main subscriber and spouse are added to the eligible list while the eligible children to be added are identified based on max age of dependent, max number of dependents and order priority i.e. whether to consider the eldest or the youngest children if the max number of dependents exceeds. And if one of the dependent is a new born and the gift days is applicable then after retrieving the no of gift days, the start date is pushed back by the no of gift days.

- **For Group Membership** - The required values will be be fetched from the Characteristics attached on the Pricing Rule Type.
- **For Individual Membership**
  1. The required values like MAX_NUM_OF_DEP, MAX_AGE_LIMIT_OF_DEP, DEP_ORDER_PRIORITY_FLG etc. will be fetched from C1_BUS_RULE_PRC table for that business rule id.
  2. The new born related values like GIFT_DAYS_APPL_SW, GIFT_DAYS will be fetched from C1_BUS_RULE_NEW_BORN table for that business rule id.

C1-FICRETBC

This creates SQI based charges for fully insured services.

Copyright © 2026, Oracle and/or its affiliates.

This algorithm is invoked to create charges for both pre-calculated(i.e through inbound) and calculated ones(i.e those calculated based on pricing rules present at plan level). It allows creation of new billable charges(BC) , cancellation of existing charges and modification of end_date of existing charges. If there does exists any BC in billable status for date range under process with same start_date, priceItem, Amount and Membership, only end date of that BC is modified. BC for particular membership and priceItem are deemed to be cancelled if they fall in proposed date range and either have different amount or different start_date. Billable Charges created or updated for calculated charges are updated accordingly in entity 'PriceCalculationDetail' (Table: CI_PRCE_CALC) table and hence allowing those entries to be marked as completed. Pricing Rule Type corresponding to priceItem during inbound billable charge data processing is fetched from entity 'PricingRuleTypePriceitem' (Table: C1_PRC_RULE_TYPE_PRICEITEM) on first found basis.

Inbound billable charge data are processed as per latest billable charge data.

During online invocation from inbound message processing main program, it assumes following: i.BillableChargeLineCharacteristics are not available. j. Each of the BillableChargeLines have same currency code. In case of existing billable charge modification or cancellation, corresponding bill segments(In Case of BC end_date updation, only those bill segments whose date range surpasses billable charge end_date and in case of BC cancellation, all bill segments are covered) are cancelled or deleted based on bill segment status. Billable charge are stamped with priceItem , SQI (fetched from Feature config) and pass through lines in MEMO ONLY state along with other info. Aggregated amount are stamped as service quantity.

Parameter: I. Bill To Type Flg - This is used during insertion of Contract ID in MEMBERSHIP_SA table.

Pre-Requisite: I. Values for option types 'CTME' (Characteristic Type For Membership Id) and 'PRSQ' (Proration SQI) in Feature Configuration 'C1-ASOBLLNG' is required. II. For inbound billable charge data - price Item, Pricing Rule Type of type 'Pass-Through Billable Charge' should be present on Plan.

C1-AGEPRFC

For Group Membership - This algorithm will calculate proration factor and amount for Age based pricing rule based on the configurations done on policy plan.

For Individual Membership - The proration factor and amount will be calculated by considering Proration Type as Daily.

C1-SKPMNTHPC

This algorithm will be used for an fully-insured group account which is configured for skip months using Field Mapping Admin configuration.

The premium amount will get distributed for each month based on the number of skip months configured. When a month is a skip month, the distributed amount for that month is zero. The calculated premium of skip month is divided amongst the remaining non-skip months and the distributed amount for non-skip month is calculated.

C1-DERSUBTR

This algorithm stamps the eligible subscription tier on the membership. It uses the Subscription Tier Structure Attribute defined in the Policy Plan in Group or Health Plan in Individual membership to identify the details to be stamped based on the relation: self, spouse, children and/or dependents identified from the Member Person Relationship. It would derive subscription tier for membership based on bill period configured on the account.

C1_TIERPREM

This Algorithm is to be configured on Pricing Rule Types for Tier based. It builds the membership timeline considering the membership dates and the effective dates for the repricing request raised for the membership. For each valid timeline, it computes the membership premium based on the applicable base fee as per the pricing rule definition.

Copyright © 2026, Oracle and/or its affiliates.

C1-TIERPRFC

For Group Membership - This algorithm will calculate proration factor and amount for Tier based pricing rule based on the configurations done on policy plan.

For Individual Membership - The proration factor and amount will be calculated by considering Proration Type as Daily.

C1-FIBCBP

This algorithm takes hard parameters as Account Id and Derivation Date and soft parameters as Char Type to fetch Bill Period for recurring Billable Charge.

Invoice Day Characteristic Type - This characteristic Type is expected to be present to get number of invoice days which in turn find corresponding bill period through LookUp C1_INVOICE_DAY_BILL_PERIOD_FLG.

C1_MEDIPREM

This algorithm is to be configured on Pricing Rule Type for Benefits. It builds the membership timeline considering the membership dates and the effective dates for the repricing request raised for the membership. For each valid timeline, it computes the membership premium based on the applicable base fee as per the Benefit Sub Type admin setup.

The following negotiation logic will be applied to calculate premium amount for Group and individual membership:

1. If the processing is for benefit sub type having Value Type = Flat and Price = N , get the respective effective pre-calculated amounts from the Benefit table.
2. If 'Negate' = Y for this benefit sub type and 'RECON_SW' = N then multiply the amount by -1.
3. If 'Negate' = Y for this benefit sub type and 'RECON_SW' = Y then DO NOT multiply.
4. If 'Negate' = N for this benefit sub type and 'RECON_SW' = N then DO NOT multiply by -1.
5. If 'Negate' = N for this benefit sub type and 'RECON_SW' = Y then multiply the amount by -1.

C1-PRLBCVLD

This algorithm will validate the calculated charge with received pre calculated charge. It will compare the benefit records of the membership with Billable charges created for the membership and validate charge mount with received amount(Here threshold is used for calculation)

If any mismatch found then TO DO is created using provided To Do Type and To Do Role. In invoke() method of this algorithm we will perform following logic:

1. Fetch the benefit records of the Membership using benefit sub type which is having Price = Y and Validate = Y.
2. Fetch billable charges created for the membership.
3. Then compare record by executing below logic:

    a. If mismatch is there for the amount and start date and end date then create a To Do using provided To Do Type and To Do Role with message 'Received Pre Calculated charges for Membership Id % not matches with calculated charges for Price Item % and benefit id % then add the To Do Id on Membership Log.

    b. If start date and end date are matched then:

    - Calculated charge range is receivedMinAmount = Received charge - Threshold amount
    - receivedMaxAmount = Received charge + Threshold Amount

    Check the billable charge Amount outside of receivedMinAmount and receivedMaxAmount then create a To Do using provided To Do Type and To Do Role with message 'Received Pre Calculated charges for Membership Id % not matches with calculated charges for Price Item % and benefit id % then add the To Do Id on Membership Log.

Age Based Pricing

In the Fully-Insured Pricing, the base rate for premium and fees depend upon the age, member attributes (such as employee type, employee status, etc.) and modifiers (such as tobacco usage, gender, alcohol usage, etc.). Oracle Revenue Management and Billing enables you to offer an age based pricing to a fully-insured group and individual customers. In the Age Based pricing, the premium is calculated for each eligible member based on age, member attributes and modifiers, and then aggregated to derive the total premium for the membership. An age based pricing can be defined using the age based pricing rule. You can define an age based pricing rule for a price item on the policy plan. If the age based pricing rule is defined for a price item on a policy plan, all memberships which belong to the policy plan will inherit the age based pricing from the policy plan. If the system does not find any effective pricing rule for a price item on the policy plan, it inherits the effective pricing rule for the price item from the parent customer level.

You can define an age based pricing rule using an age based pricing rule type. It is the age based pricing rule type which helps the system to determine:

- **C1-PricingRuleAgeBased** Business object using which the age based pricing rule should be created in the system.
- Algorithm which should be triggered for deriving the account and price item for a membership.

  Note: You must create an algorithm using the **C1_ACCPRIMEM** algorithm type and attach it to the **Account and Price Item Derivation** system event.
- Algorithm which should be triggered for deriving the bill period for a membership.

  Note: You must create an algorithm using the **C1-BILLPDRV** algorithm type and attach it to the **Account and Price Item Derivation Post-Processing** system event.
- Algorithm which should be triggered for creating the bill period timeline (based on the derived bill period) for a membership.

  Note: You must create an algorithm using the **C1-BILLRPCR** algorithm type and attach it to the **Account and Price Item Derivation Post-Processing** system event.
- Algorithm which should be triggered for deriving the bill group, parent customer, and policy for a membership.

  Note: You must create an algorithm using the **C1_MEMBGDRV** algorithm type and attach it to the **Bill Group Derivation** system event.
- Algorithm which should be triggered for calculating the age based premium for a membership.

  Note: You must create an algorithm using the **C1_AGEPREM** algorithm type and attach it to the **Premium Calculation** system event.
- Algorithm which should be triggered for identifying eligible member persons for premium calculation.

  Note: You must create an algorithm using the **C1_AGEBDELG** algorithm type and attach it to the **Pricing Rule Pre-Processing** system event.
- Algorithm which should be triggered for calculating the premium for each eligible member person.

  Note: You must create an algorithm using the **C1-FICRETBC** algorithm type and attach it to the **Billable Charge Creation Post Processing** system event.
- Algorithm which should be triggered for deriving the bill period for the account.

  Note: You must create an algorithm using the **C1-AGEPRFC** algorithm type and attach it to the **Pricing Rule Proration Amount Calculation** system event.
- Algorithm which should be triggered to configure skip months for an account.

Copyright © 2026, Oracle and/or its affiliates.

> **Note:** You must create an algorithm using the **C1-SKPMNTHPC** algorithm type and attach it to the **Skip Month Premium Calculation (in case you want to use the 9/10 Billing feature)** system event.

- Price items for which you can define age based pricing rules using the age based pricing rule type.
- Rate options that you can use while defining the pricing for the respective price item.
- Type of account to which the respective price item should be billed based on the specified priority.
- Rule type which indicates the rules that should be executed to determine whether the price item is eligible for billing.
- Audit event types of the C1-Membership and C1-PERSON business objects using which the audit event should be created whenever a membership or member person is added, updated, or removed from the policy plan.
- Elements of the C1-Membership and C1-PERSON business objects for which audit event should be created.

> **Note:** You must ensure that either the **Update All** option is selected or the elements listed in the age based pricing rule type are already present in the respective audit event type. Otherwise, erroneous results might occur.

- Members, such as main subscriber, spouse, or children in a membership are eligible for premium calculation.
- Following are the additional dependents attributes which can affect the premium calculation if they are considered as part of pricing rules. These additional attributes are defined as characteristics for the policy plan. You must specify the following characteristic types in the age based pricing rule type:
  - **Maximum Number of Dependents** - This characteristic type stores the maximum number of children which are eligible for premium calculation. You must specify a characteristic type where the characteristic entity is set to **Member Person**, **Membership**, **Policy Plan**, **Policy**, and **State**.
  - **Maximum Age Limit for Maximum Dependent Count** - This characteristic type stores the maximum age limit for children which are eligible for premium calculation. You must specify a characteristic type where the characteristic entity is set to **Member Person**, **Membership**, **Policy Plan**, **Policy**, and **State**.
  - **Maximum Number of Dependents Order Priority** - This characteristic type indicates whether the youngest or eldest children should be considered during premium calculation. Each plan may set a limit to consider the number of dependents, either the eldest or youngest one for premium calculation. You must specify a characteristic type where the characteristic entity is set to **Member Person**, **Membership**, **Policy Plan**, **Policy**, and **State**.
  - **Age Calculation Date Basis** - This characteristic type indicates whether the member person's age should be calculated using the member person's enrollment date or policy's start or renewal date. You must specify a characteristic type where the characteristic entity is set to **Member Person**, **Membership**, **Policy Plan**, **Policy**, and **State**.
  - **Newborn Gift Days** - This characteristic type stores the number of days you want to offer as gift days from the new born child's enrollment date. You must specify a characteristic type where the characteristic entity is set to **Member Person**, **Membership**, **Policy Plan**, **Policy**, and **State**.
  - **Newborn Gift Days Applicability** - This characteristic type indicates whether the gift days should be offered in case of a new born. You must specify a characteristic type where the characteristic entity is set to **Member Person**, **Membership**, **Policy Plan**, **Policy**, and **State**.
  - **Young Adult Max Age Limit** - This characteristic type stores the maximum age limit for young adults which are eligible for premium calculation. You must specify a characteristic type where the characteristic entity is set to **Member Person**, **Membership**, **Policy Plan**, **Policy**, and **State**.
  - **Young Adult Inclusion Applicability** - This characteristic type indicates whether the young adults should be considered during the premium calculation. You must specify a characteristic type where the characteristic entity is set to **Member Person**, **Membership**, **Policy Plan**, **Policy**, and **State**.

Once an age based pricing rule type is defined, you can define age based pricing rules using the age based pricing rule type. Note that, at present, you can define age based pricing rules only through a health care inbound message and not from the user interface. However, you can view the age based pricing rules defined for a policy plan from the **Customer 360° Information** screen. While creating an age based pricing rule through a health care inbound message, you need to specify the following information:

- Entity type (i.e. Policy Plan) and entity ID (i.e. policy plan ID) for which you want to define the age based pricing rule
- Start and end dates of the age based pricing rule
- Age based pricing rule type using which you want to create the age based pricing rule

Copyright © 2026, Oracle and/or its affiliates.

- Price Item for which you want to define age based pricing
- Rate option using which the price assignment should be created for the age based pricing rule

> **Note:** If the rate option is not given in the pricing rule data, by default, it is set to a value specified in the **Default Rate Option - Flat** or **Default Rate Option - Percentage** option type of the **C1-ASOBLLNG** feature configuration depending on whether the modifier method is set to **FLAT**, **EXPT** or **INPT**.

- Whether you want to increase or decrease the premium of an eligible member by a flat amount or in percentage based on some modifier attributes (such as tobacco usage, alcohol usage, and so on).
- Age limit and employee attributes for which the base fee is applicable

> **Note:**
>
> The system defines the lower age limit and upper age limit pricing eligibility criteria using the parameter which is specified in the **Age Based Parameter** option type of the **C1-ASOBLLNG** feature configuration.
>
> The employee attributes can be defined as the parameters in the system. These parameters can then be used to define eligibility criteria in the age based pricing. Here, you can use only those parameters where the parameter usage is set to **Pricing Eligibility**.

- Modifiers based on which you want to charge additional or offer discount to an eligible member

> **Note:** The modifiers can be defined as the parameters in the system. These parameters can then be used to define eligibility criteria in the age based pricing. Here, you can use only those parameters where the parameter usage is set to **Pricing Eligibility**.

Once the age based pricing rule is defined for a policy plan, the system creates a price item pricing and price list and then assigns the price item pricing to the price list.

Defining an Age Based Pricing Rule Type

Prerequisites

To define an age based pricing rule type, you should have:

- Age based pricing rule type business object defined in the application.
- Age based pricing rule business object defined in the application.
- Pricing rule type category for the age based defined in the application.

Procedure

To define an age based pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Pricing Rule Type** sub-menu.

   The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type Business Object	Used to indicate the business object using which you want to create an age based pricing rule type. **Note:** You can create an age based pricing rule type using the **Age Based Pricing Rule Type** business object.	Yes

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Pricing Rule Type** screen.

4. Select the **Age Based Pricing Rule Type** option from the **Pricing Rule Type Business Object** list.
5. Click **OK**.

   The **Age Based Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about an age based pricing rule type.
   - **Related Pricing Rule Type** - Used to define the pricing rule types which are related to the age based pricing rule type.

     Note: The **Related Pricing Rule Type** section appears when the **Primary** check-box is selected.
   - **Algorithms** - Used to associate the algorithms with an age based pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the age based pricing rules using the age based pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for an age based pricing rule type.
   - **Event Management** - Used to configure the audit in an age based pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

- **Age Based Specific Additional Data** - Used to define the age based specific additional data in an age based pricing rule type.
- **Attribute Characteristic Mapping** - Used to map a characteristic attribute in an age based pricing rule type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to specify an age based pricing rule type.	Yes
Description	Used to specify the description for an age based pricing rule type.	Yes
Detailed Description	Used to specify additional information about an age based pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create an age based pricing rule type. The valid value is: • Age Based Pricing Rule	Yes
Business Object	Indicates the business object using which you are defining an age based pricing rule type.	Not applicable
Status	Used to indicate the status of an age based pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to select the checkbox if the pricing rule type is primary.	No
Skip Non-Members	Used to select the checkbox when you want the system to only consider the eligible members and not non-members of the active employee coverage membership during age based premium calculation.	No
Pricing Rule Type Category	Used to indicate the category to which the pricing rule type belongs. The valid value is: • Age Based	Yes

6. Enter the required details in the **Main** section.
7. Add the related pricing rule types in the age based pricing rule type, if required.

Note: The **Related Pricing Rule Type** section appears when the **Primary** check-box is selected.

8. Associate the required algorithms with the age based pricing rule type.
9. Add the required price items in an age based pricing rule type.
10. Add the price item parameters in an age based pricing rule type, if required.
11. Define characteristics for an age based pricing rule type, if required.
12. Configure the audit in an age based pricing rule type.
13. Define an age based specific additional data in an age based pricing rule type.
14. Map a characteristic attribute in an age based pricing rule type
15. Click **Save**.
    The age based pricing rule type is defined.

Adding the Related Pricing Rule Types in an Age Based Pricing Rule Type

Prerequisites

To add related pricing rule types in an age based pricing rule type, you should have:

- Additional fee pricing rule type defined in the application.
- Eligibility rule type defined in the application.

Procedure

To add related pricing rule types in an age based pricing rule type:

1. Ensure that the **Related Pricing Rule Types** section is expanded when you are defining or editing an age based pricing rule type.

   Note: This section appears when the **Primary** option is selected in the **Main** section.

   The **Related Pricing Rule Types** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)
Sequence	Used to specify the order in which the related pricing rule type should be invoked.	Yes (Conditional) **Note:** This field is required when you are defining a pricing rule type for the related pricing rule type.
Pricing Rule Type	Used to specify the pricing rule type which should be executed to determine whether the related pricing rule type is eligible for deriving the transaction legs.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
	Note: On clicking the **Search** (🔍) icon that appears corresponding to the **Pricing Rule Type** field, the **Pricing Rule Type Search** window appears. On specifying the related pricing rule type, the description of the pricing rule type appears corresponding to the **Pricing Rule Type** field.	**Note:** This field is required when the corresponding **Sequence** and **Eligibility Rule Type** field is specified for the related pricing rule type.
Eligibility Rule Type	Used to indicate the rule type eligibility for the related pricing rule type. **Note:** The **Eligibility Rule Type** list includes only those rule-types where the rule type eligibility is **Related Pricing Rule Type Eligibility**.	No

2. Enter the required details in the **Related Pricing Rule Types** section.
3. If you want to define more than one related pricing rule type for the age based pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a related pricing rule type from the age based pricing rule type, click the **Delete** (🗑) icon corresponding to the related pricing rule type.

4. Click **Save**.
   The related pricing rule types are added for the age based pricing rule type.

Associating an Algorithm with an Age Based Pricing Rule Type

Prerequisites

To associate algorithm with an age based pricing rule type, you should have:

- An algorithm defined using the **C1_ACCPRIMEM** algorithm type.
- An algorithm defined using the **C1-BILLPDRV** algorithm type.
- An algorithm defined using the **C1-BILLRPCR** algorithm type.
- An algorithm defined using the **C1_MEMBGDRV** algorithm type.
- An algorithm defined using the **C1_AGEPREM** algorithm type.
- An algorithm defined using the **C1_AGEBDELG** algorithm type.

Copyright © 2026, Oracle and/or its affiliates.

- An algorithm defined using the **C1-FICRETBC** algorithm type.
- An algorithm defined using the **C1-AGEPRFC** algorithm type.
- An algorithm defined using the **C1-SKPMNTHPC** algorithm type.

Procedure

To associate algorithms with an age based pricing rule type:

1. Ensure that the **Algorithms** section is expanded when you are defining or editing the age based pricing rule type.

   The **Algorithms** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to invoke the algorithm. The valid values are: • **Account and Price Item Derivation** - Used to derive the account and price item for a membership. • **Account and Price Item Derivation Post-Processing** - Used to derive the bill period for the account. • **Account and Price Item Derivation Post-Processing** - Used to create the bill period timeline for the account. • **Bill Group Derivation** - Used to derive the bill group, parent customer, and policy for a membership. • **Premium Calculation** - Used to calculate the premium for each eligible member person. • **Pricing Rule Pre-Processing** - Used to identify the eligible member persons for premium calculation. • **Billable Charge Creation Post Processing** - Used to create new billable charges for both pre-calculated and post-calculated charges. • **Pricing Rule Proration Amount Calculation** - Used to calculate proration factor and amount for age based pricing rule based on the policy plan configurations. • **Skip Month Premium Calculation (in case you want to use the 9/10 Billing feature)** - Used to distribute the total premium in the non-skip months of the coverage period.	Yes **Note:** This field is required when you are associating an algorithm with the age based pricing rule type.
Sequence	Used to specify the order in which the algorithms for each system event must be executed.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the age based pricing rule type.
Algorithm	Used to specify the algorithm.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
	Note: Once you select the system event, the **Search** (🔍) icon appears corresponding to the **Algorithm** field. On clicking the **Search** (🔍) icon, the **Algorithm Search** window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the **Algorithm** field.	**Note:** This field is required when you are associating an algorithm with the age based pricing rule type.

2. Enter the following details in the **Algorithms** section:

System Event	Algorithm	Algorithm Type	Description
Account and Price Item Derivation	C1_ACCPRIMEM	C1_ACCPRIMEM	Account and Price Item Derivation for Membership
Account and Price Item Derivation Post-Processing	C1-BILLPDRV	C1-BILLPDRV	Bill Period Derivation
Account and Price Item Derivation Post-Processing	C1-BILLRPCR	C1-BILLRPCR	Bill Period Time Line Creation
Bill Group Derivation	C1_MEMBGDRV	C1_MEMBGDRV	Bill Group Derivation for Membership
Premium Calculation	C1_AGEPREM	C1_AGEPREM	Age Based Premium Calculation
Pricing Rule Pre-Processing	C1_AGEBDELG	C1_AGEBDELG	Get Eligible Member Details from Membership
Billable Charge Creation Post Processing	C1-FICRETBC	C1-FICRETBC	Fully Insured Pass through Billable Charge Creation
Pricing Rule Proration Amount Calculation	C1-AGEPRFC	C1-AGEPRFC	Calculate Proration Factor for Age Based Pricing Rule
Skip Month Premium Calculation (in case you want to use the 9/10 Billing feature)	C1-SKPMNTHPC	C1-SKPMNTHPC	Skip Month Premium Calculation

3. If you want to associate more than one algorithm with the age based pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to disassociate an algorithm from the age based pricing rule type, click the **Delete** (🗑) icon corresponding to the algorithm.

4. Click **Save**.
   The algorithms are associated with the age based pricing rule type.

Adding a Price Item in an Age Based Pricing Rule Type

Prerequisites

To add a price item in an age based pricing rule type, you should have:

- Price item defined in the application
- Rate option defined in the **Rate Option (C1-ExtLookRetTypeRateOpt)** extendable lookup
- Values defined for the **Invoice Type (C1INVTYP)** characteristic type
- The **C1INVTYP** characteristic type set in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration
- Rule types defined in the application (where the rule type usage is set to **Price Item Eligibility**)

Procedure

To add a price item in an age based pricing rule type:

1. Ensure that the **Price Items** section is expanded when you are defining or editing an age based pricing rule type.

   The **Price Items** section contains the following fields in a grid:

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td rowspan="3">Price Item</td><td>Used to indicate the price item that you want to include in the age based pricing rule type.</td><td>Yes (Conditional)</td></tr>
<tr><td>Note:
The Search (🔍) icon appears corresponding to the Price Item field. On clicking the Search icon, the Price Item Search window appears.
On specifying the price item, the description of the price item appears corresponding to the Price Item field.</td><td>Note: This field is required when you are adding a rate option and bill to account in an age based pricing rule type.</td></tr>
<tr><td></td><td></td></tr>
<tr><td>Rate Option</td><td>Used to indicate one or more rate options which are valid for a price item.
On clicking the Add (➕) icon, the following field appears in a grid:
<table>

<tr><td>Rate Option</td><td>Used to indicate the rate option that you want to use while defining pricing for the price item.</td><td>Yes</td></tr>
</table>
Note:
If you want to define more than one rate option to the price item in an age based pricing rule type, click the Add (+) icon.
However, if you want to remove a price item from an age based pricing rule type, click the Delete (🗑) icon corresponding to the Rate Option field.</td><td>Not applicable</td></tr>
<tr><td>Bill To Account</td><td>Used to indicate a order in which the account should be considered while deriving a transaction leg.</td><td>Not applicable</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td></td><td>On clicking the Add (+) icon, the following fields appear in a grid:
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Priority</td><td>Used to specify the order in which the invoice type is considered for a price item.</td><td>Yes</td></tr>
<tr><td>Invoice Type</td><td>Used to indicate the type which is considered for billing. For more information, refer to the Bill Group's Account on page 13 section.

Note: The Search (search) icon appears corresponding to the Invoice Type field. On clicking the Search icon, the Invoice Type Search window appears.</td><td>Yes</td></tr>
</table>
Note:
If you want to define more than one invoice type to the price item in an age based pricing rule type, click the Add (+) icon.
However, if you want to remove a invoice type from the price item in an age based pricing rule type, click the Delete (delete) icon corresponding to the Priority field.</td><td></td></tr>
<tr><td>Eligibility Rule Type</td><td>Used to indicate the rule type (which indicates the rules) that should be executed to determine whether the price item is eligible for billing.</td><td>No</td></tr>
</table>

2. Enter the required details in the **Price Items** section.
3. If you want to define more than one price item in an age based pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a price item from an age based pricing rule type, click the **Delete** (delete) icon corresponding to the **Price Item** field.

4. Click **Save**.
   The price items are added for an age based pricing rule type.

Adding a Price Item Parameter in an Age Based Pricing Rule Type

Prerequisites

To add a price item parameter in an age based pricing rule type, you should have:

- Parameter defined in the application where parameter usage is set to **Price Item**.
- Parameter associated with the price item.

Procedure

To add a price item parameter in an age based pricing rule type:

1. Ensure that the **Price Item Parameters** section is expanded when you are defining *o*r editing an age based pricing rule type.

   The **Price Item Parameters** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item Parameter	Used to specify the parameter which you can use while defining an age based pricing for the price item.	Yes (Conditional)
	Note: The **Search** (🔍) icon appears corresponding to the **Price Item Parameter** field. On clicking the **Search** (🔍) icon corresponding to the **Price Item Parameter** field, the **Parameter Search** window appears. On specifying the parameter, the description of the price item parameter appears corresponding to the **Price Item Parameter** field.	**Note:** This field is required when you are adding a price item parameter in an age based pricing rule type.

2. Enter the required details in the **Price Item Parameters** section.
3. If you want to add more than one price item parameter in an age based pricing rule type, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove a price item parameter from an age based pricing rule type, click the **Delete** (🗑) icon corresponding to the price item parameter.

4. Click **Save**.
   The price item parameter is added for an age based pricing rule type.

Defining a Characteristic for an Age Based Pricing Rule Type

Prerequisites

To define a characteristic for an age based pricing rule type, you should have:

Copyright © 2026, Oracle and/or its affiliates.

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule Type**)

Procedure

To define a characteristic for an age based pricing rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining *or* editing an age based pricing rule type.

   The **Characteristics** section contains the following columns in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule Type**.	**Note:** This field is required when you are defining a characteristic for an age based pricing rule type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for an age based pricing rule type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for an age based pricing rule type, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove a characteristic from an age based pricing rule type, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristics are defined for an age based pricing rule type.

Adding Elements for Audit in an Age Based Pricing Rule Type

Prerequisites

To add elements for audit in an age based pricing rule type, you should have:

- Business Object **C1-AuditEventType** defined for the pricing rule type.
- Audit Event Type defined in the application.

Copyright © 2026, Oracle and/or its affiliates.

Procedure

To add elements for audit in an age based pricing rule type:

1. Ensure that the **Event Management** section is expanded when you are defining *o*r editing an age based pricing rule type.

   The **Event Management** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Audit Event Type	Used to specify the audit event type which you can use while adding elements for audit in an age based pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Audit Event Type** field. On clicking the **Search** (🔍) icon corresponding to the **Audit Event Type** field, the **Audit Event Type Search** window appears. On specifying the audit event type, the description of the audit event type appears corresponding to the **Audit Event Type** field.	Yes
Element Type	Used to indicate the type of audit element for an age based pricing rule type. The valid values are: • Business Object Status • Characteristic • Field	Not applicable
Element Name	Used to specify the element name for an age based pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Element Name** field. On clicking the **Search** (🔍) icon corresponding to the **Element Name** field, the **Audit Event Type Element Name Search** window appears.	Yes
Element Value	Used to specify the value for an element name.	Not applicable

2. Enter the required details in the **Price Item Parameters** section.
3. If you want to add more than one element for audit in an age based pricing rule type, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove an element for audit from an age based pricing rule type, click the **Delete** (🗑) icon corresponding to the price item parameter.

4. Click **Save**.
   The elements for audit are added for an age based pricing rule type.

Defining an Age Based Specific Additional Data in an Age Based Pricing Rule Type

Procedure

To define an age based specific additional data in an age based pricing rule type:

1. Ensure that the **Age Based Specific Additional Data** section is expanded when you are defining or editing an age based pricing rule type.

   The **Age Based Specific Additional Data** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Relation	Used to indicate the relation of the member in an age based pricing rule type. The valid values are: • Children • Main Subscriber • Spouse	No
Relationship Type	Used to indicate the type of relationship for an age based pricing rule type.	No

2. Enter the required details in the **Age Based Specific Additional Data** section.
3. If you want to add more than one age based specific data in an age based pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove an age based specific data from an age based pricing rule type, click the **Delete** (🗑) icon corresponding to the **Relation** field.

4. Click **Save**.
   The age based specific additional data is defined for the age based pricing rule type.

Mapping Characteristic Attributes in an Age Based Pricing Rule Type

Prerequisites

To map the characteristic attributes in an age based pricing rule type:

- Characteristic type defined in the application

Procedure

Copyright © 2026, Oracle and/or its affiliates.

To map the characteristic attributes in an age based pricing rule type:

1. Ensure that the **Attribute Characteristic Mapping** section is expanded when you are defining an age based pricing rule type.

   The **Attribute Characteristic Mapping** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Maximum Number of Dependents	Used to indicate the maximum number of children which are eligible for premium calculation.	No
Maximum Age Limit for Maximum Dependent Count	Used to indicate the maximum age limit for children which are eligible for premium calculation.	No
Maximum Number of Dependents Order Priority	Used to indicate whether you want to consider the youngest or eldest children during premium calculation. The valid values are: • **YOUNGEST** • **ELDEST**	No
Age Calculation Based On	Used to indicate whether the member person's age should be calculated using the member person's enrollment date or policy's renewal date.	No
Age Recalculation Based On	Used to indicate whether the member person's age should be re-calculated when you add a membership to a policy plan or a member person to a membership.	No
Newborn Gift Days	Used to indicate the number of days you want to offer as gift days from the new born child's enrollment date. As a result, no premium will be calculated for this period.	No
Newborn Gift Days Applicability	Used to indicate whether you want to offer gift days in case of a new born. The valid values are: • **Y** • **N**	No
Young Adult Maximum Age Limit	Used to indicate the maximum age limit for young adults who are eligible for premium calculation.	No
Young Adult Inclusion Applicability	Used to indicate whether you want to consider the young adults during the premium calculation.	No

   Note:

   The **Search** (🔍) icon appears corresponding to each field. On clicking the **Search** icon, the **Characteristic Type Search** window appears.

   On specifying the characteristic type, the description of the characteristic type appears corresponding to the respective field.

2. Enter the required details in the **Attributes Characteristic Mapping** section.
3. Click **Save**.
   The characteristic types are mapped to the appropriate fields in the age based pricing rule type.

Editing an Age Based Pricing Rule Type

Prerequisites

To edit an age based pricing rule type, you should have:

- Age based pricing rule type business object defined in the application.
- Age based pricing rule business object defined in the application.

Procedure

To edit an age based pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the age based pricing rule type whose details you want to edit.

   The **Age Based Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about an age based pricing rule type.
   - **Related Pricing Rule Type** - Used to specify the pricing rule types which are related to the age based pricing rule type.

     Note: The **Related Pricing Rule Type** section appears when the **Primary** check-box is selected.
   - **Algorithms** - Used to associate the algorithms with an age based pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the age based pricing rules using the age based pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for an age based pricing rule type.
   - **Event Management** - Used to configure the audit in an age based pricing rule type.
   - **Age Based-Specific Additional Data** - Used to define an age based specific additional data in an age based pricing rule type.
   - **Attributes Characteristic Mapping** - Used to map a characteristic attribute in an age based pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Displays the age based pricing rule type.	Not applicable
Description	Used to specify the description for an age based pricing rule type.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Detailed Description	Used to specify additional information about an age based pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create an age based pricing rule type. The valid value is: • Age Based Pricing Rule	Yes
Business Object	Indicates the business object using which you are defining an age based pricing rule type.	Not applicable
Status	Used to indicate the status of an age based pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to select the checkbox if the pricing rule type is primary. **Note:** The checkbox appears selected, if you have already selected the **Primary** option while defining an age based pricing rule type.	No
Skip Non-Members	Used to select the checkbox when you want the system to only consider the eligible members and not non-members of the active employee coverage membership during the age based premium calculation. **Note:** The checkbox appears selected, if you have already selected the **Non-Covered Subscriber Eligible** option while defining an age based pricing rule type.	No
Pricing Rule Type Category	Indicates the pricing rule type category for an age based pricing rule type. The valid values is: • Age Based **Note:** It is a read-only field.	No

Tip: Alternatively, you can edit the details of an age based pricing rule type by clicking the **Edit** button in the **Pricing Rule Type** zone.

5. Modify the details in the **Main** section.
6. Add, edit, or remove the related pricing rule types in the age based pricing rule type, if required.

Note: The **Related Pricing Rule Type** section appears when the **Primary** check-box is selected.

7. Associate the required algorithms in an age based pricing rule type.
8. Add, edit, or remove the required price items in an age based pricing rule type.
9. Add, edit, or remove the price item parameters in an age based pricing rule type, if required.
10. Add, edit, or remove characteristics for an age based pricing rule type, if required.
11. Add, edit, or remove the configuration details of the audit in an age based pricing rule type.
12. Add, edit, or remove the age based specific additional data in an age based pricing rule type.
13. Add, edit, or remove a characteristic attribute in an age based pricing rule type

Copyright © 2026, Oracle and/or its affiliates.

14. Click **Save**.
    The changes made to the age based pricing rule type are saved.

Deleting an Age Based Pricing Rule Type

Procedure

To delete an age based pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the age based pricing rule type that you want to delete.
   A message appears confirming whether you want to delete the age based pricing rule type.

> **Note:** You can delete an age based pricing rule type when it is not yet used in the system.

> **Tip:** Alternatively, you can delete an age based pricing rule type by clicking the **Delete** button in the **Pricing Rule Type** zone.

5. Click **OK**.
   The age based pricing rule type is deleted.

Tier Based Pricing

The standard tier based pricing structure contains different tiers, such as Employee Only (E), Employee + Spouse (ES), Family (F), Employee + Children (EC). A main subscriber can subscribe his/her dependents to a policy plan and may fall in one of the tier. The fee for a price item can vary based on the membership tier level and employee attributes (such as employee type, employee status, etc.). Oracle Revenue Management and Billing enables you to offer a tier based pricing to a fully-insured group customer. In the Tier Based pricing, the premium for the membership is derived based on tier level and employee attributes.

A tier based pricing can be defined using the tier based pricing rule. You can define a tier based pricing rule for a price item on the policy plan. If the tier based pricing rule is defined for a price item on a policy plan, all memberships which belong to the policy plan will inherit the tier based pricing from the policy plan. If the system does not find any effective pricing rule for a price item on the policy plan, it inherits the effective pricing rule for the price item from the parent customer level.

You can define a tier based pricing rule using a tier based pricing rule type. It is the tier based pricing rule type which helps the system to determine:

- Business object using which the tier based pricing rule should be created in the system.
- Algorithm which should be triggered for deriving the account and price item for a membership.

Copyright © 2026, Oracle and/or its affiliates.

> **Note:** You must create an algorithm using the **C1_ACCPRIMEM** algorithm type and attach it to the **Account and Price Item Derivation** system event.

- Algorithm which should be triggered for deriving the bill period for a membership.

> **Note:** You must create an algorithm using the **C1-BILLPDRV** algorithm type and attach it to the **Account and Price Item Derivation Post-Processing** system event.

- Algorithm which should be triggered for creating the bill period timeline (based on the derived bill period) for a membership.

> **Note:** You must create an algorithm using the **C1-BILLRPCR** algorithm type and attach it to the **Account and Price Item Derivation Post-Processing** system event.

- Algorithm which should be triggered for deriving the subscription tier for membership, based on the bill period configured on the account..

> **Note:** You must create an algorithm using the **C1-DERSUBTR** algorithm type and attach it to the **Account and Price Item Derivation Post-Processing** system event.

- Algorithm which should be triggered for deriving the bill group, parent customer, and policy for a membership.

> **Note:** You must create an algorithm using the **C1_MEMBGDRV** algorithm type and attach it to the **Bill Group Derivation** system event.

- Algorithm which should be triggered for calculating the premium for membership.

> **Note:** You must create an algorithm using the **C1_TIERPREM** algorithm type and attach it to the **Pricing Rule Premium Calculation** system event.

- Algorithm which should be triggered for creating the SQI based billable charges for each membership and price item combination.

> **Note:** You must create an algorithm using the **C1-FICRETBC** algorithm type and attach it to the **Pricing Rule Billable Charge Creation** system event.

- Algorithm which should be triggered for calculating the proration factor and amount for fully insured tier based pricing rule based on the policy plan configurations.

> **Note:** You must create an algorithm using the **C1-TIERPRFC** algorithm type and attach it to the **Pricing Rule Proration Amount Calculation** system event.

- Algorithm which should be triggered for distributing the total premium in the non-skip months of the coverage period.

> **Note:** You must create an algorithm using the **C1-SKPMNTHPC** algorithm type and attach it to the **Skip Month Premium Calculation (in case you want to use the 9/10 Billing feature)** system event.

- Price items for which you can define tier based pricing rules using the tier based pricing rule type.
- Rate options that you can use while defining the pricing for the respective price item.
- Type of account to which the respective price item should be billed based on the specified priority.
- Rule type which indicates the rules that should be executed to determine whether the price item is eligible for billing.
- Audit event types of the C1-Membership business object using which the audit event should be created whenever a membership is added, updated, or removed from the policy plan.
- Elements of the C1-Membership business object for which audit event should be created.

> **Note:** You must ensure that either the **Update All** option is selected or the elements listed in the tier based pricing rule type are already present in the respective audit event type. Otherwise, erroneous results might occur.

Once a tier based pricing rule type is defined, you can define tier based pricing rules using the tier based pricing rule type. Note that, at present, you can define tier based pricing rules only through a health care inbound message and not from the user interface. However, you can view the tier based pricing rules defined for a policy plan from the **Customer**

Copyright © 2026, Oracle and/or its affiliates.

360° Information screen. While creating a tier based pricing rule through a health care inbound message, you need to specify the following information:

- Entity type (i.e. Policy Plan) and entity ID (i.e. policy plan ID) for which you want to define the tier based pricing rule
- Start and end dates of the tier based pricing rule
- Tier based pricing rule type using which you want to create the tier based pricing rule
- Price Item for which you want to define tier based pricing
- Rate option using which the price assignment should be created for the tier based pricing rule

> **Note:** If the rate option is not given in the pricing rule data, by default, it is set to a value specified in the **Default Rate Option - Flat** option type of the **C1-ASOBLLNG** feature configuration when the modifier method is set to **FLAT** or **NULL**.

- Tier level and employee attributes for which the fee is applicable

> **Note:** The tier level and employee attributes can be defined as the parameters in the system. These parameters can then be used to define eligibility criteria in the tier based pricing. Here, you can use only those parameters where the parameter usage is set to **Pricing Eligibility**.

Once the tier based pricing rule is defined for a policy plan, the system creates a price item pricing and price list and then assigns the price item pricing to the price list.

Defining a Tier Based Pricing Rule Type

Prerequisites

To define a tier based pricing rule type, you should have:

- Tier based pricing rule type business object defined in the application.
- Tier based pricing rule business object defined in the application.

Copyright © 2026, Oracle and/or its affiliates.

- Pricing rule type category for the tier based defined in the application.

Procedure

To define a tier based pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Pricing Rule Type** sub-menu.

   The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type Business Object	Used to indicate the business object using which you want to create a tier based pricing rule type. **Note:** You can create a tier based pricing rule type using the **Tier Based Pricing Rule Type (C1-PricingRuleTierBased)** business object.	Yes

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Pricing Rule Type** screen.

4. Select the **Tier Based Pricing Rule Type** option from the **Pricing Rule Type Business Object** list.
5. Click **OK**.

   The **Tier Based Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about a tier based pricing rule type.
   - **Related Pricing Rule Type** - Used to define the pricing rule types which are related to the tier based pricing rule type.

     Note: The **Related Pricing Rule Type** section appears when the **Primary** check-box is selected.
   - **Algorithms** - Used to associate the algorithms with a tier based pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the tier pricing rules using the tier based pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for a tier based pricing rule type.
   - **Event Management** - Used to configure the audit in a tier based pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to specify the tier based pricing rule type.	Yes
Description	Used to specify the description for the tier based pricing rule type.	Yes
Detailed Description	Used to specify additional information about the tier based pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the tier based pricing rule type. The valid value is: • Tier Based Pricing Rule	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Business Object	Indicates the business object using which you are defining the tier based pricing rule type.	Not applicable
Status	Used to indicate the status of a tier based pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to select the checkbox if the pricing rule type is primary.	No
Skip Non-Members	Used to select the checkbox when you want the system to only consider the eligible members and not non-members of the active employee coverage membership during tier based premium calculation.	No
Pricing Rule Type Category	Used to indicate the category to which the pricing rule type belongs. The valid value is: • Tier Based	Yes

6. Enter the required details in the **Main** section.
7. Add the related pricing rule types in the tier based pricing rule type, if required.

Note: The **Related Pricing Rule Type** section appears when the **Primary** check-box is selected.

8. Associate the required algorithms with the tier based pricing rule type:
9. Add the required price items in the tier based pricing rule type.
10. Add the price item parameters in the tier based pricing rule type, if required.
11. Define characteristics for the tier based pricing rule type, if required.
12. Configure the audit in the tier based pricing rule type.
13. Click **Save**.
    The tier based pricing rule type is defined.

Adding the Related Pricing Rule Types in a Tier Based Pricing Rule Type

Prerequisites

To add related pricing rule types in a tier based pricing rule type, you should have:

- Additional fee pricing rule type defined in the application.
- Eligibility rule type defined in the application.

Procedure

To add related pricing rule types in a tier based pricing rule type:

1. Ensure that the **Related Pricing Rule Types** section is expanded when you are defining or editing a tier based pricing rule type.

   Note: This section appears when the **Primary** option is selected in the **Main** section.

   The **Related Pricing Rule Types** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)
Sequence	Used to specify the order in which the related pricing rule type should be invoked.	Yes (Conditional) **Note:** This field is required when you are defining a pricing rule type for the related pricing rule type.
Pricing Rule Type	Used to specify the pricing rule type which should be executed to determine whether the related pricing rule type is eligible for deriving the transaction legs. **Note:** On clicking the **Search** (🔍) icon that appears corresponding to the **Pricing Rule Type** field, the **Pricing Rule Type Search** window appears. On specifying the related pricing rule type, the description of the pricing rule type appears corresponding to the **Pricing Rule Type** field.	Yes (Conditional) **Note:** This field is required when the corresponding **Sequence** and **Eligibility Rule Type** field is specified for the related pricing rule type.
Eligibility Rule Type	Used to indicate the rule type eligibility for the related pricing rule type. **Note:** The **Eligibility Rule Type** list includes only those rule-types where the rule type eligibility is **Related Pricing Rule Type Eligibility**.	No

2. Enter the required details in the **Related Pricing Rule Types** section.
3. If you want to define more than one related pricing rule type for the tier based pricing rule type, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove a related pricing rule type from the tier based pricing rule type, click the **Delete** (🗑) icon corresponding to the related pricing rule type.

4. Click **Save**.

Copyright © 2026, Oracle and/or its affiliates.

The related pricing rule types are added for the tier based pricing rule type.

Associating an Algorithm with a Tier Based Pricing Rule Type

Prerequisites

To associate an algorithm with a tier based pricing rule type, you should have:

- An algorithm defined using the **C1_ACCPRIMEM** algorithm type.
- An algorithm defined using the **C1-BILLPDRV** algorithm type.
- An algorithm defined using the **C1-BILLRPCR** algorithm type.
- An algorithm defined using the **C1-DERSUBTR** algorithm type.
- An algorithm defined using the **C1_MEMBGDRV** algorithm type.
- An algorithm defined using the **C1_TIERPREM** algorithm type.
- An algorithm defined using the **C1-FICRETBC** algorithm type.
- An algorithm defined using the **C1-TIERPRFC** algorithm type.
- An algorithm defined using the **C1-SKPMNTHPC** algorithm type.

Procedure

To associate an algorithm with a tier based pricing rule type:

1. Ensure that the **Algorithms** section is expanded when you are defining *or* editing the tier based pricing rule type.

   The **Algorithms** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to invoke the algorithm. The valid values are: • **Account and Price Item Derivation** - Used to derive the account and price item for a membership. • **Account and Price Item Derivation Post-Processing** - Used to derive the bill period for the account. • **Account and Price Item Derivation Post-Processing** - Used to create the bill period timeline for the account. • **Account and Price Item Derivation Post-Processing** - Used to derive subscription tier for membership, based on the bill period configured on the account. • **Bill Group Derivation** - Used to derive the bill group, parent customer, and policy for a membership.	Yes **Note:** This field is required when you are associating an algorithm with the tier based pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
	• **Premium Calculation** - Used to calculate the premium for each eligible member person. • **Billable Charge Creation Post Processing** - Used to create new billable charges for both pre-calculated and post-calculated charges. • **Pricing Rule Proration Amount Calculation** - Used to calculate proration factor and amount for tier based pricing rule based on the policy plan configurations. • **Skip Month Premium Calculation** - Used to distribute the total premium in the non-skip months of the coverage period.	
Sequence	Used to specify the order in which the algorithms for each system event must be executed.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the tier based pricing rule type.
Algorithm	Used to specify the algorithm.	Yes (Conditional)
	Note: Once you select the system event, the **Search** (🔍) icon appears corresponding to the **Algorithm** field. On clicking the **Search** (🔍) icon, the **Algorithm Search** window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the **Algorithm** field.	**Note:** This field is required when you are associating an algorithm with the tier based pricing rule type.

2. Enter the following details in the **Algorithms** section:

System Event	Algorithm	Algorithm Type	Description
Account and Price Item Derivation	C1_ACCPRIMEM	C1_ACCPRIMEM	Account and PriceItem Derivation for Membership
Account and Price Item Derivation Post-Processing	C1-BILLPDRV	C1-BILLPDRV	Bill Period Derivation
Account and Price Item Derivation Post-Processing	C1-BILLRPCR	C1-BILLRPCR	Bill Period Time Line Creation
Account and Price Item Derivation Post-Processing	C1-DERSUBTR	C1-DERSUBTR	Derive Subscription Tier for Membership
Bill Group Derivation	C1_MEMBGDRV	C1_MEMBGDRV	Bill Group Derivation for Membership
Premium Calculation	C1_TIERPREM	C1_TIERPREM	Tier Based Premium Calculation
Billable Charge Creation Post Processing	C1-FICRETBC	C1-FICRETBC	Fully Insured Charge Creation for Memberships
Pricing Rule Proration Amount Calculation	C1-TIERPRFC	C1-TIERPRFC	Calculate Proration Factor for Tier Based Pricing Rule

Copyright © 2026, Oracle and/or its affiliates.

System Event	Algorithm	Algorithm Type	Description
Skip Month Premium Calculation	C1-SKPMNTHPC	C1-SKPMNTHPC	Skip Month Premium Calculation

3. If you want to associate more than one algorithm with the tier based pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to disassociate an algorithm from the tier based pricing rule type, click the **Delete** ( ) icon corresponding to the algorithm.

4. Click **Save**.
   The algorithms are associated with the tier based pricing rule type.

Adding a Price Item in a Tier Based Pricing Rule Type

Prerequisites

To add a price item in a tier based pricing rule type, you should have:

- Price item defined in the application
- Rate option defined in the **Rate Option (C1-ExtLookRetTypeRateOpt)** extendable lookup
- Values defined for the **Invoice Type (C1INVTYP)** characteristic type
- The **C1INVTYP** characteristic type set in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration
- Rule types defined in the application (where the rule type usage is set to **Price Item Eligibility**)

Procedure

To add a price item in a tier based pricing rule type:

1. Ensure that the **Price Items** section is expanded when you are defining or editing a tier based pricing rule type.

   The **Price Items** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to indicate the price item that you want to include in a tier based pricing rule type. **Note:** The **Search** ( ) icon appears corresponding to the **Price Item** field. On clicking the **Search** icon, the **Price Item Search** window appears. On specifying the price item, the description of the price item appears corresponding to the **Price Item** field.	Yes (Conditional) **Note:** This field is required when you are adding a rate option and bill to account in a tier based pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Rate Option</td><td>Used to indicate one or more rate options which are valid for a price item.

On clicking the Add (+) icon, the following field appears in a grid:

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Rate Option</td><td>Used to indicate the rate option that you want to use while defining pricing for the price item.</td><td>Yes</td></tr>
</table>

Note:

If you want to define more than one rate option to the price item in a fully-insured tier based pricing rule type, click the Add (+) icon.

However, if you want to remove a price item from a fully-insured tier based pricing rule type, click the Delete (🗑) icon corresponding to the Rate Option field.</td><td>Not applicable</td></tr>
<tr><td>Bill To Account</td><td>Used to indicate a order in which the account should be considered while deriving a transaction leg.

On clicking the Add (+) icon, the following fields appear in a grid:

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Priority</td><td>Used to specify the order in which the invoice type is considered for a price item.</td><td>Yes</td></tr>
<tr><td>Invoice Type</td><td>Used to indicate the type which is considered for billing. For more information, refer to the Bill Group's Account on page 13 section.

Note: The Search (🔍) icon appears corresponding to the Invoice Type field. On clicking the Search icon, the Invoice Type Search window appears.</td><td>Yes</td></tr>
</table>

Note:

If you want to define more than one invoice type to the price item in a tier based pricing rule type, click the Add (+) icon.

However, if you want to remove a invoice type from the price item in a tier based pricing rule type, click the Delete (🗑) icon corresponding to the Priority field.</td><td>Not applicable</td></tr>
<tr><td>Eligibility Rule Type</td><td>Used to indicate the rule type (which indicates the rules) that should be executed to determine whether the price item is eligible for billing.</td><td>No</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

2. Enter the required details in the **Price Items** section.
3. If you want to define more than one price item in a tier based pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove a price item from a tier based pricing rule type, click the **Delete** (🗑) icon corresponding to the **Price Item** field.

4. Click **Save**.
   The price items are added for a tier based pricing rule type.

Adding a Price Item Parameter in a Tier Based Pricing Rule Type

Prerequisites

To add a price item parameter in a tier based pricing rule type, you should have:

- Parameter defined in the application where parameter usage is set to **Price Item**.
- Parameter associated with the price item.

Procedure

To add a price item parameter in a tier based pricing rule type:

1. Ensure that the **Price Item Parameters** section is expanded when you are defining *or* editing a tier based pricing rule type.

   The **Price Item Parameters** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item Parameter	Used to specify the parameter which you can use while defining a tier based pricing for the price item. **Note:** The **Search** (🔍) icon appears corresponding to the **Price Item Parameter** field. On clicking the **Search** (🔍) icon corresponding to the **Price Item Parameter** field, the **Parameter Search** window appears. On specifying the parameter, the description of the price item parameter appears corresponding to the **Price Item Parameter** field.	Yes (Conditional) **Note:** This field is required when you are adding a price item parameter in a tier based pricing rule type.

2. Enter the required details in the **Price Item Parameters** section.
3. If you want to add more than one price item parameter in a tier based pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove a price item parameter from a tier based pricing rule type, click the **Delete** (🗑) icon corresponding to the price item parameter.

Copyright © 2026, Oracle and/or its affiliates.

4. Click **Save**.
   The price item parameter is added for a tier based pricing rule type.

Defining a Characteristic for a Tier Based Pricing Rule Type

Prerequisites

To define a characteristic for a tier based pricing rule type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule Type**)

Procedure

To define a characteristic for a tier based pricing rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining *or* editing a tier based pricing rule type.

   The **Characteristics** section contains the following columns in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule Type**.	**Note:** This field is required when you are defining a characteristic for a tier based pricing rule type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for a tier based pricing rule type.

2. Enter the required details in the **Characteristics** section.

> **Note:** If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, you can search for a predefined characteristic value.

3. If you want to define more than one characteristic for a tier based pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove a characteristic from a tier based pricing rule type, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristics are defined for a tier based pricing rule type.

Adding Elements for Audit in a Tier Based Pricing Rule Type

Prerequisites

To add elements for audit in a tier based pricing rule type, you should have:

- Business Object **C1-AuditEventType** defined for the pricing rule type.
- Audit Event Type defined in the application.

Procedure

To add elements for audit in a tier based pricing rule type:

1. Ensure that the **Event Management** section is expanded when you are defining *or* editing a tier based pricing rule type.

   The **Event Management** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Audit Event Type	Used to specify the audit event type which you can use while adding elements for audit in tier based pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Audit Event Type** field. On clicking the **Search** (🔍) icon corresponding to the **Audit Event Type** field, the **Audit Event Type Search** window appears. On specifying the audit event type, the description of the audit event type appears corresponding to the **Audit Event Type** field.	Yes
Element Type	Used to indicate the type of audit element for a tier based pricing rule type. The valid values are: • Business Object Status • Characteristic • Field	Not applicable
Element Name	Used to specify the element name for a tier based pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Element Name** field. On clicking the **Search** (🔍) icon corresponding to the **Element Name** field, the **Audit Event Type Element Name Search** window appears.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Element Value	Used to specify the value for an element name.	Not applicable

2. Enter the required details in the **Price Item Parameters** section.
3. If you want to add more than one element for audit in a tier based pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove an element for audit from a tier based pricing rule type, click the **Delete** ( ) icon corresponding to the price item parameter.

4. Click **Save**.
   The elements for audit are added for a tier based pricing rule type.

Editing a Tier Based Pricing Rule Type

Prerequisites

To edit a tier based pricing rule type, you should have:

- Tier Based pricing rule type business object defined in the application.
- Tier Based pricing rule business object defined in the application.

Procedure

To edit a tier based pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Edit** ( ) icon in the **Edit** column corresponding *t*o the pricing rule type whose details you want to edit.

   The **Tier Based Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about a tier based pricing rule type.
   - **Related Pricing Rule Type** - Used to specify the pricing rule types which are related to the tier based pricing rule type.

     > **Note:** The **Related Pricing Rule Type** section appears when the **Primary** check-box is selected.

   - **Algorithms** - Used to associate the algorithms with a ier based pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the tier based pricing rules using the tier based pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.

Copyright © 2026, Oracle and/or its affiliates.

- **Characteristics** - Used to define the characteristics for a tier based pricing rule type.
- **Event Management** - Used to configure the audit in a tier based pricing rule type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Displays the tier based pricing rule type.	Not applicable
Description	Used to specify the description for a tier based pricing rule type.	Yes
Detailed Description	Used to specify additional information about a tier based pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create a tier based pricing rule type. The valid value is: • Tier Based Pricing Rule	Yes
Business Object	Indicates the business object using which you are defining a tier based pricing rule type.	Not applicable
Status	Used to indicate the status of a tier based pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to select the checkbox if the pricing rule type is primary. **Note:** The checkbox appears selected, if you have already selected the **Primary** option while defining a tier based pricing rule type.	No
Skip Non-Members	Used to select the checkbox when you want the system to only consider the eligible members and not non-members of the active employee coverage membership during tier based premium calculation. **Note:** The checkbox appears selected, if you have already selected the **Non-Covered Subscriber Eligible** option while defining a tier based pricing rule type.	No
Pricing Rule Type Category	Indicates the pricing rule type category for a tier based pricing rule type. The valid values is: • Tier Based	No

Tip: Alternatively, you can edit the details of a tier based pricing rule type by clicking the **Edit** button in the **Pricing Rule Type** zone.

5. Modify the details in the **Main** section.
6. Add, edit, or remove the related pricing rule types in the tier based pricing rule type, if required.

Note: The **Related Pricing Rule Type** section appears when the **Primary** check-box is selected.

7. Associate the required algorithms in a tier based pricing rule type.
8. Add, edit, or remove the required price items in a tier based pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

9. Add, edit, or remove the price item parameters in a tier based pricing rule type, if required.
10. Add, edit, or remove characteristics for a tier based pricing rule type, if required.
11. Add, edit, or remove the configuration details of the audit in a tier based pricing rule type.
12. Click **Save**.
    The changes made to the tier based pricing rule type are saved.

Deleting a Tier Based Pricing Rule Type

Procedure

To delete a tier based pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the tier based pricing rule type that you want to delete.
   A message appears confirming whether you want to delete the tier based pricing rule type.

   Note: You can delete a tier based pricing rule type when it is not yet used in the system.

   Tip: Alternatively, you can delete a tier based pricing rule type by clicking the **Delete** button in the **Pricing Rule Type** zone.
5. Click **OK**.
   The tier based pricing rule type is deleted.

Pass-Through Billable Charge

At times, the system might receive pre-calculated premium for the membership through a health care inbound message. If the price item, account identifier type, and account identifier are given in the billable charge information of a health care inbound message, the system directly creates an SQI based billable charge when you process the health care inbound message. The pre-calculated premium amount is stored as a pass through line in the SQI based billable charge. But, if only the price item is given in the billable charge information, the system checks whether the price item is included in any pricing rule type where the pricing rule type category is set to **Pass-Through Billable Charge**. If so, the system checks whether the pass-through billable charge pricing rule type is associated with the policy plan to which the membership belongs (for which the billable charge information is received). It is the pass-through billable charge pricing rule type which helps the system to determine:

- Algorithm which should be triggered for deriving the bill group, parent customer, and policy for a membership.

  Note: You must create an algorithm using the **C1_MEMBGDRV** algorithm type and attach it to the **Bill Group Derivation** system event.
- Algorithm which should be triggered for deriving the account and price item for a membership.

  Note: You must create an algorithm using the **C1_ACCPRIMEM** algorithm type and attach it to the **Account and Price Item Derivation** system event.
- Algorithm which should be triggered for deriving the bill period for the account.

Copyright © 2026, Oracle and/or its affiliates.

> **Note:**
>
> You must create an algorithm using the **C1-FIBCBP** algorithm type and attach it to the **Pricing Rule BC Creation Pre Processing** system event.
>
> If the bill period or frequency is given in the billable charge information of the health care inbound message, the system does not derive the bill period for the account.

- Algorithm which should be triggered for creating the SQI based billable charges for each membership and price item combination.

> **Note:** You must create an algorithm using the **C1-FICRETBC** algorithm type and attach it to the **Pricing Rule Billable Charge Creation** system event.

- Price items for which you can create the SQI based billable charges using the pass-through billable charge pricing rule type.

> **Note:** You can add multiple price items in a pass-through billable charge pricing rule type. But, you cannot add the same price item in multiple pass-through billable charge pricing rule types.

- Type of account to which the respective price item should be billed based on the specified priority.

Defining a Pass-Through Billable Charge Pricing Rule Type

Prerequisites

To define a pass-through billable charge pricing rule type, you should have:

- Pass-through billable charge pricing rule type business object defined in the application.
- Pass-through billable charge pricing rule business object defined in the application.

Procedure

To define a pass-through billable charge pricing rule type:

Copyright © 2026, Oracle and/or its affiliates.

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Pricing Rule Type** sub-menu.

   The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type Business Object	Used to indicate the business object using which you want to create a pass-through billable charge pricing rule type. **Note:** You can create a pass-through billable charge pricing rule type using the **Pass-Through Billable Charge Pricing Rule Type (C1-FIPassthroughBcRuleType)** business object.	Yes

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Pricing Rule Type** screen.

4. Select the **Pass-Through Billable Charge Pricing Rule Type** option from the **Pricing Rule Type Business Object** list.
5. Click **OK**.

   The **Pass-Through Billable Charge Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the pass-through billable charge pricing rule type.
   - **Algorithms** - Used to associate the algorithms with the pass-through billable charge pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the pass-through billable charge pricing rules using the age based pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for the pass-through billable charge pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to specify the pass-through billable charge pricing rule type.	Yes
Description	Used to specify the description for the pass-through billable charge pricing rule type.	Yes
Detailed Description	Used to specify additional information about the pass-through billable charge pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the pass-through billable charge pricing rule type. The valid value is: • Pass-Through Billable Charge Pricing Rule	Yes
Business Object	Indicates the business object using which you are defining the pass-through billable charge pricing rule type.	Not applicable
Status	Used to indicate the status of the pass-through billable charge pricing rule type. The valid values are: • Active	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• Inactive	
Pricing Rule Type Category	Used to indicate the category to which the pricing rule type belongs. The valid value is: • Pass-Through Billable Charge	Yes

6. Enter the required details in the **Main** section.
7. Associate the required algorithms with the pass-through billable charge pricing rule type.
8. Add the required price items in the pass-through billable charge pricing rule type.
9. Add the price item parameters in the pass-through billable charge pricing rule type, if required.
10. Define characteristics for the pass-through billable charge pricing rule type, if required.
11. Click **Save**.
    The pass-through billable charge pricing rule type is defined.

Associating an Algorithm with a Pass-Through Billable Charge Pricing Rule Type

Prerequisites

To associate an algorithm with a pass-through billable charge pricing rule type, you should have:

- An algorithm defined using the **C1_MEMBGDRV** algorithm type.
- An algorithm defined using the **C1_ACCPRIMEM** algorithm type.
- An algorithm defined using the **C1-FIBCBP** algorithm type.
- An algorithm defined using the **C1-FICRETBC** algorithm type.

Procedure

To associate an algorithm with a pass-through billable charge pricing rule type:

1. Ensure that the **Algorithms** section is expanded when you are defining or editing the *p*ass-through billable charge pricing rule type.

   The **Algorithms** section contains the following columns in a grid:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to invoke the algorithm. The valid values are: • **Bill Group Derivation** - Used to derive the bill group, parent customer, and policy for a membership. • **Account and Price Item Derivation** - Used to derive the account and price item for a membership. • **Pricing Rule BC Creation Pre Processing** - Used to derive the bill period for the account. • **Pricing Rule Billable Charge Creation** - Used to derive the price items for which you can create the SQI based billable charges using the pass-through billable charge pricing rule type.	Yes **Note:** This field is required when you are associating an algorithm with a pass-through billable charge pricing rule type.
Sequence	Used to specify the order in which the algorithms for each system event must be executed.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with a pass-through billable charge pricing rule type.
Algorithm	Used to specify the algorithm. **Note:** Once you select the system event, the **Search** (🔍) icon appears corresponding to the **Algorithm** field. On clicking the **Search** (🔍) icon, the **Algorithm Search** window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the **Algorithm** field.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with a pass-through billable charge pricing rule type.

2. Enter the following details in the **Algorithms** section:

System Event	Algorithm	Algorithm Type	Description
Bill Group Derivation	C1_MEMBGDRV	C1_MEMBGDRV	Bill Group Derivation for Membership
Account and Price Item Derivation	C1_ACCPRIMEM	C1_ACCPRIMEM	Account and PriceItem Derivation for Membership
Pricing Rule BC Creation Pre Processing	C1-FIBCBP	C1-FIBCBP	Fetch Bill Period of Billable Charge of Membership
Pricing Rule Billable Charge Creation	C1-FICRETBC	C1-FICRETBC	Fully-Insured Charge creation for Memberships

3. If you want to associate more than one algorithm with a pass-through billable charge pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to disassociate an algorithm from a pass-through billable charge pricing rule type, click the **Delete** (🗑) icon corresponding to the algorithm.

4. Click **Save**.
The algorithms are associated with a pass-through billable charge pricing rule type.

Adding a Price Item in a Pass-Through Billable Charge Pricing Rule Type

Prerequisites

To add a price item in a pass-through billable charge pricing rule type, you should have:

- Price item defined in the application
- Rate option defined in the **Rate Option (C1-ExtLookRetTypeRateOpt)** extendable lookup
- Values defined for the **Invoice Type (C1INVTYP)** characteristic type
- The **C1INVTYP** characteristic type set in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration
- Rule types defined in the application (where the rule type usage is set to **Price Item Eligibility**)

Procedure

To add a price item in a pass-through billable charge pricing rule type:

1. Ensure that the **Price Items** section is expanded when you are defining or editing a *p*ass-through billable charge pricing rule type.

   The **Price Items** section contains the following fields in a grid:

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td rowspan="3">Price Item</td><td>Used to indicate the price item that you want to include in a pass-through billable charge pricing rule type.</td><td>Yes (Conditional)</td></tr>
<tr><td>Note:
The Search (🔍) icon appears corresponding to the Price Item field. On clicking the Search icon, the Price Item Search window appears.
On specifying the price item, the description of the price item appears corresponding to the Price Item field.</td><td rowspan="2">Note: This field is required when you are adding a rate option and bill to account in a pass-through billable charge pricing rule type.</td></tr>
<tr><td></td></tr>
<tr><td>Rate Option</td><td>Used to indicate one or more rate options which are valid for a price item.
On clicking the Add (📄) icon, the following field appears in a grid:
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Rate Option</td><td>Used to indicate the rate option that you want to use while defining pricing for the price item.</td><td>Yes</td></tr>
</table></td><td>Not applicable</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td></td><td>Note:
If you want to define more than one rate option to the price item in a pass-through billable charge pricing rule type, click the Add (+) icon.
However, if you want to remove a price item from a pass-through billable charge pricing rule type, click the Delete (🗑) icon corresponding to the Rate Option field.</td><td></td></tr>
<tr><td>Bill To Account</td><td>Used to indicate a order in which the account should be considered while deriving a transaction leg.
On clicking the Add (📄) icon, the following fields appear in a grid:
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Priority</td><td>Used to specify the order in which the invoice type is considered for a price item.</td><td>Yes</td></tr>
<tr><td>Invoice Type</td><td>Used to indicate the type which is considered for billing. For more information, refer to the Bill Group's Account on page 13 section.
Note: The Search (🔍) icon appears corresponding to the Invoice Type field. On clicking the Search icon, the Invoice Type Search window appears.</td><td>Yes</td></tr>
</table>
Note:
If you want to define more than one invoice type to the price item in a pass-through billable charge pricing rule type, click the Add (+) icon.
However, if you want to remove a invoice type from the price item in a pass-through billable charge pricing rule type, click the Delete (🗑) icon corresponding to the Priority field.</td><td>Not applicable</td></tr>
<tr><td>Eligibility Rule Type</td><td>Used to indicate the rule type (which indicates the rules) that should be executed to determine whether the price item is eligible for billing.</td><td>No</td></tr>
</table>

2. Enter the required details in the **Price Items** section.
3. If you want to define more than one price item in a pass-through billable charge pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a price item from a pass-through billable charge pricing rule type, click the **Delete** (🗑) icon corresponding to the **Price Item** field.

4. Click **Save**.
   The price items are added for a pass-through billable charge pricing rule type.

Adding a Price Item Parameter in a Pass-Through Billable Charge Pricing Rule Type

Prerequisites

To add a price item parameter in a pass-through billable charge pricing rule type, you should have:

- Parameter defined in the application where parameter usage is set to **Price Item**.
- Parameter associated with the price item.

Procedure

To add a price item parameter in a pass-through billable charge pricing rule type:

1. Ensure that the **Price Item Parameters** section is expanded when you are defining or editing a pass-through billable charge pricing rule type.

   The **Price Item Parameters** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item Parameter	Used to specify the parameter which you can use while defining a pass-through billable charge pricing for the price item. **Note:** The **Search** (🔍) icon appears corresponding to the **Price Item Parameter** field. On clicking the **Search** (🔍) icon corresponding to the **Price Item Parameter** field, the **Parameter Search** window appears. On specifying the parameter, the description of the price item parameter appears corresponding to the **Price Item Parameter** field.	Yes (Conditional) **Note:** This field is required when you are adding a price item parameter in a pass-through billable charge pricing rule type.
Eligible for Specific Stop-Loss	Used to indicate whether the price item parameter can be used in accumulation criteria.	No
Eligible for Level Funding	Used to specify whether the price item parameter can be used in level funding.	No
Eligible for Minimum Premium Program	Used to specify whether the price item parameter can be used in minimum premium program.	No

2. Enter the required details in the **Price Item Parameters** section.
3. If you want to add more than one price item parameter in a pass-through billable charge pricing rule type, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove a price item parameter from a pass-through billable charge pricing rule type, click the **Delete** (🗑) icon corresponding to the price item parameter.

4. Click **Save**.
   The price item parameter is added for a pass-through billable charge pricing rule type.

Defining a Characteristic for a Pass-Through Billable Charge Pricing Rule Type

Prerequisites

To define a characteristic for a pass-through billable charge pricing rule type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule Type**)

Procedure

To define a characteristic for a pass-through billable charge pricing rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining or editing a pass-through billable charge pricing rule type.

   The **Characteristics** section contains the following columns in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule Type**.	**Note:** This field is required when you are defining a characteristic for a pass-through billable charge pricing rule type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for a pass-through billable charge pricing rule type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for a pass-through billable charge pricing rule type, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove a characteristic from a pass-through billable charge pricing rule type, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristics are defined for a pass-through billable charge pricing rule type.

Editing a Pass-Through Billable Charge Pricing Rule Type

Prerequisites

To edit a pass-through billable charge pricing rule type, you should have:

- Pass-Through Billable Charge pricing rule type business object defined in the application.
- Pass-Through Billable Charge pricing rule business object defined in the application.

Procedure

To edit a pass-through Billable Charge pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding *t*o the pricing rule type whose details you want to edit.

   The **Pass-Through Billable Charge Age Based Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about a pass-through billable charge pricing rule type.
   - **Algorithms** - Used to associate the algorithms with a pass-through billable charge pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the pass-through billable charge pricing rules using the pass-through billable charge pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for a pass-through billable charge pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Displays the pass-through billable charge pricing rule type.	Not applicable
Description	Used to specify the description for a pass-through billable charge pricing rule type.	Yes
Detailed Description	Used to specify additional information about a pass-through billable charge pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create a pass-through billable charge pricing rule type. The valid value is:	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• Pass-Through Billable Charge	
Business Object	Indicates the business object using which you are defining a pass-through billable charge pricing rule type.	Not applicable
Status	Used to indicate the status of a pass-through billable charge pricing rule type. The valid values are: • Active • Inactive	Yes
Pricing Rule Type Category	Indicates the pricing rule type category for a pass-through billable charge pricing rule type. The valid value is: • Pass-Through Billable Charge **Note:** It is a read-only field, and cannot be edited.	No

Tip: Alternatively, you can edit the details of a pass-through billable charge pricing rule type by clicking the **Edit** button in the **Pricing Rule Type** zone.

5. Modify the details in the **Main** section.
6. Associate the following algorithms with the pass-through billable charge pricing rule type:

System Event	Algorithm	Algorithm Type	Description
Bill Group Derivation	C1_MEMBGDRV	C1_MEMBGDRV	Bill Group Derivation for Membership
Account and Price Item Derivation	C1_ACCPRIMEM	C1_ACCPRIMEM	Account and PriceItem Derivation for Membership
Pricing Rule BC Creation Pre Processing	C1-FIBCBP	C1-FIBCBP	Fetch Bill Period of Billable Charge of Membership
Pricing Rule Billable Charge Creation	C1-FICRETBC	C1-FICRETBC	Fully-Insured Charge creation for Memberships

7. Add, edit, or remove the required price items in a pass-through billable charge pricing rule type.
8. Add, edit, or remove the price item parameters in a pass-through billable charge pricing rule type, if required.
9. Add, edit, or remove characteristics for a pass-through billable charge pricing rule type, if required.
10. Click **Save**.
    The changes made to the a pass-through billable charge pricing rule type are saved.

Deleting a Pass-Through Billable Charge Pricing Rule Type

Procedure

To delete a pass-through billable charge pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Delete** ( ) icon in the **Delete** column corresponding *t*o the pass-through billable charge pricing rule type that you want to delete.
   A message appears confirming whether you want to delete the pass-through billable charge pricing rule type.

   Note: You can delete a pass-through billable charge pricing rule type when it is not yet used in the system.

   Tip: Alternatively, you can delete a pass-through billable charge pricing rule type by clicking the **Delete** button in the **Pricing Rule Type** zone.
5. Click **OK**.
   The pass-through billable charge pricing rule type is deleted.

Additional Fee Pricing for COBRA Membership

In the Fully-Insured Pricing, the base premium for COBRA memberships is calculated either using the **Age Based Pricing Rule Type** or **Tier Based Pricing Rule Type**. In addition to the premium, COBRA membership is also charged with additional fee which can be either defined as flat charges or premium percentage. You can configure the COBRA additional fee by creating an additional fee pricing rule using an additional fee pricing rule type. You must include an additional fee pricing rule type as a related pricing rule type (in the age based or tier based pricing rule type) of the premium pricing rule type defined for the plan with a conditional rule that additional charges are only applicable for those memberships where the membership type is defined as COBRA.

The COBRA additional fee rates are generally not customer specific but remain common across different states or regions. The system provides you with an ability to define the additional fees at a higher level and if required override them at a lower level. You can define the COBRA additional fee at plan, policy, parent customer, and state level. The system checks whether the COBRA additional fee pricing rule definition is defined at the policy plan level. If an effective dated pricing rule does not exist at the policy plan level, the system further checks the additional fee pricing rule definition at policy, parent customer, and state level.

Group health insurance plans, such as High deductible Health Plans, have the Health Savings Account (HSA) linked to it. Every HSA is charged a flat administrative fee per coverage per month. The system enables you to create a flat charge per subscriber per month to facilitate this business requirement using an additional fee pricing rule.

You can define an additional fee pricing rule using an additional fee pricing rule type. It is the additional fee pricing rule type which helps the system to determine:

- **C1-PrcRuleTypeCapitationFee** Business object using which the additional charges pricing rule should be created in the system.
- Algorithm which should be triggered for deriving the bill group, parent customer, and policy for a membership.
- Algorithm which should be triggered for deriving the account and price item for a membership.
- Algorithm which should be triggered for calculating the COBRA additional fees for each eligible member person.
- Algorithm which should be triggered for creating the SQI based billable charges for each membership and price item combination.
- Algorithm which should be triggered for prorating the calculated COBRA additional fees as per the proration factor.
- Algorithm which should be triggered for creating the SQI based billable charges for each membership and price item combination.
- Price items for which you can define pricing rules for COBRA additional fee using the additional charges pricing rule type.
- Rate options that you can use while defining the pricing for the respective price item.
- Type of account to which the respective price item should be billed based on the specified priority.
- Rule type which indicates the rules that should be executed to determine whether the price item is eligible for billing.

Copyright © 2026, Oracle and/or its affiliates.

- Audit event types of the **C1-Membership** and **C1-PERSON** business objects using which the audit event should be created whenever a membership or member person is added, updated, or removed from the policy plan.
- Elements of the **C1-Membership** and **C1-PERSON** business objects for which audit event should be created.

  Note: You must ensure that either the **Update All** option is selected or the elements listed in the age based pricing rule type are already present in the respective audit event type. Otherwise, erroneous results might occur.
- Members, such as main subscriber, spouse, or children in a membership which are eligible for premium calculation. The system will only consider the member with the specified relationship type during premium calculation.

Once an additional fee pricing rule type is defined, you can then define the additional fee pricing rule using the additional fee pricing rule type.

Note: At present, you can define the additional fee pricing rule type only through the healthcare inbound message and not from the user interface. However, you can view the additional fee pricing rule defined for a policy plan or policy, parent customer or state from the **Customer 360° Information** screen.

The system enables you to create:

- A primary flat charge pricing rule type
- A related pricing rule type which depends on the premium amount for calculation of an additional charge

While defining a primary or related additional charge pricing rule type, you must attach the following algorithms to the respective system event:

System Event	Algorithm
Account and Price Item Derivation	C1_ACCPRIMEM
Bill Group Derivation	C1_MEMBGDRV
Premium Calculation	C1_TIERPREM
Account and Price Item Derivation Post-Processing	C1-BILLPDRV
Account and Price Item Derivation Post-Processing	C1-BILLRPCR
Pricing Rule Proration Amount Calculation	C1-TIERPRFC
Billable Charge Creation Post-Processing	C1-FICRETBC

While creating COBRA Admin Fees Pricing rule through a healthcare inbound message, you need to specify the following information:

- Entity type and Entity ID (i.e. Policy Plan and Policy Plan ID, or Policy and Policy ID, or Parent Customer and Parent Customer ID, or State and State Level) for which you want to define the COBRA additional fee pricing rule.
- Pricing Type - Flat or Percentage
- Start and end dates of the COBRA additional fee pricing rule.
- Additional fee pricing rule type using which you want to create the age based pricing rule
- Price Item for which you want to define the COBRA additional fee pricing rule.
- Rate option using which the price assignment should be created for the COBRA additional fees.

  Note: In case you want flat based COBRA additional fees, use the **HC_FRTSC** rate schedule. In case of percentage based pricing, use the **HC_CAPRS** rate schedule.

Defining an Additional Fee Pricing Rule Type

Prerequisites

To define an additional fee pricing rule type, you should have:

Copyright © 2026, Oracle and/or its affiliates.

- Additional fee pricing rule type business object defined in the application.

Procedure

To define an additional fee pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Pricing Rule Type** sub-menu.

   The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type Business Object	Used to indicate the business object using which you want to create the additional fee pricing rule type. **Note:** You can create an additional fee pricing rule type using the **Additional Charge Pricing Rule Type (C1-PrcRuleTypeCapitationFee)** business object.	Yes

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Pricing Rule Type** screen.

4. Select the **Additional Fee Pricing Rule Type** business object.
5. Click **OK**.

   The **Additional Fee Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the additional fee pricing rule type.
   - **Algorithms** - Used to associate the algorithms with the additional fee pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the pricing rules using the additional fee pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for an additional fee pricing rule type.
   - **Event Management** - Used to define the audit event type details for an additional fee pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to specify the additional fee pricing rule type.	Yes
Description	Used to specify the description for the additional fee pricing rule type.	Yes
Detailed Description	Used to specify the additional information about the additional fee pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the additional fee pricing rule type. The valid value is: • Additional Fee Pricing Rule	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Business Object	Indicates the business object using which you are defining the additional fee pricing rule type.	Not applicable
Status	Used to indicate the status of the additional fee pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to indicate whether the pricing rule type is a primary pricing rule type. **Note:** You must not select the **Primary** option while defining the additional fee pricing rule type.	Not applicable
Skip Non-Members	Used to indicate whether the non-member membership persons should be used for the age based calculations. **Note:** This field is not applicable for additional fee pricing rule type.	Not applicable
Pricing Rule Type Category	Used to indicate the category to which the additional fee pricing rule type belongs. The valid value is: • Additional Fee	Yes
Pricing Rule Type Sub Category	Used to indicate the pricing rule type sub category for the additional fee pricing rule type. The valid value are: • Per Member • Per Subscriber **Note:** You must select the **Per Subscriber** option while defining the additional fee pricing rule type.	Not applicable

6. Enter the required details in the **Main** section.
7. Associate the required algorithms with the additional fee pricing rule type:
8. Add the required price items for the additional fee pricing rule type.
9. Add price item parameters for the additional fee pricing rule type, if required.
10. Define characteristics for the additional fee pricing rule type, if required.
11. Configure the audit in the additional fee pricing rule type.
12. Click **Save**.
    The additional fee pricing rule type is defined.

Associating an Algorithm with an Additional Fee Pricing Rule Type

Prerequisites

To associate an algorithm with an additional fee pricing rule type, you should have:

- An algorithm defined using the **C1_ACCPRIMEM** algorithm type.
- An algorithm defined using the **C1_MEMBGDRV** algorithm type.
- An algorithm defined using the **C1-DERSUBTR** algorithm type.
- An algorithm defined using the **C1_TIERPREM** algorithm type.
- An algorithm defined using the **C1-FIBCBP** algorithm type.
- An algorithm defined using the **C1-BILLRPCR** algorithm type.
- An algorithm defined using the **C1-TIERPRFC** algorithm type.
- An algorithm defined using the **C1-FICRETBC** algorithm type.

Procedure

To associate an algorithm with an additional fee pricing rule type:

1. Ensure that the **Algorithms** section is expanded when you are defining *or* editing the additional fee pricing rule type.

   The **Algorithms** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to invoke the algorithm. The valid values are: • **Account and Price Item Derivation** - Used to derive the account and price item for a membership. • **Bill Group Derivation** - Used to derive the bill group, parent customer, and policy for a membership. • **Create Subscription Tier** - Used to derive the subscription tier for a membership • **Tier Based Premium Calculation** - Used to calculate the COBRA administrative fees for each eligible member person. • **Fetch Bill Period of Billable Charge of Membership** - Used to derive the bill period for an account. • **Bill Period Time Line Creation** - Used to create the SQI based billable charges for each membership and price item combination. • **Calculate Proration Factor for Tier Based Pricing Rule** - Used to prorate the calculated COBRA administrative fees as per the proration factor.	Yes **Note:** This field is required when you are associating an algorithm with the additional fee pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
	• **Fully Insured Charge Creation for Memberships** - Used to create the SQI based billable charges for each membership and price item combination.	
Sequence	Used to specify the order in which the algorithms for each system event must be executed.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the additional fee pricing rule type.
Algorithm	Used to specify the algorithm. **Note:** Once you select the system event, the **Search** (🔍) icon appears corresponding to the **Algorithm** field. On clicking the **Search** (🔍) icon, the **Algorithm Search** window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the **Algorithm** field.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the additional fee pricing rule type.

2. Enter the following details in the **Algorithms** section:

System Event	Algorithm	Algorithm Type	Description
Account and Price Item Derivation	C1_ACCPRIMEM	C1_ACCPRIMEM	Account and PriceItem Derivation for Membership
Bill Group Derivation	C1_MEMBGDRV	C1_MEMBGDRV	Bill Group Derivation for Membership
Derive Subscription Tier for Membership	C1-DERSUBTR	C1-DERSUBTR	Create Subscription Tier
Pricing Rule Type Premium Calculation	C1_TIERPREM	C1_TIERPREM	Tier Based Premium Calculation
Pricing Rule BC Creation Pre Processing	C1-FIBCBP	C1-FIBCBP	Fetch Bill Period of Billable Charge of Membership
Account and Price Item Derivation Post-Processing	C1-BILLRPCR	C1-BILLRPCR	Bill Period Time Line Creation
Calculate Proration Factor for Tier Based Pricing Rule	C1-TIERPRFC	C1-TIERPRFC	Calculate Proration Factor for Tier Based Pricing Rule
Pricing Rule Billable Charge Creation	C1-FICRETBC	C1-FICRETBC	Pass Through Billable Charge Creation

3. If you want to associate more than one algorithm with the additional fee pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to disassociate an algorithm from the additional fee pricing rule type, click the **Delete** (🗑) icon corresponding to the algorithm.

4. Click **Save**.
The algorithms are associated with the additional fee pricing rule type.

Adding a Price Item in an Additional Fee Pricing Rule Type

Prerequisites

To add a price item in an additional fee pricing rule type, you should have:

- Price item defined in the application
- Rate option defined in the **Rate Option (C1-ExtLookRetTypeRateOpt)** extendable lookup
- Values defined for the **Invoice Type (C1INVTYP)** characteristic type
- The **C1INVTYP** characteristic type set in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration
- Rule types defined in the application (where the rule type usage is set to **Price Item Eligibility**)

Procedure

To add a price item in an additional fee pricing rule type:

1. Ensure that the **Price Items** section is expanded when you are defining or editing an additional fee pricing rule type.

   The **Price Items** section contains the following fields in a grid:

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td rowspan="3">Price Item</td><td>Used to indicate the price item that you want to include in the additional fee pricing rule type.</td><td>Yes (Conditional)</td></tr>
<tr><td>Note:
The Search (🔍) icon appears corresponding to the Price Item field. On clicking the Search icon, the Price Item Search window appears.
On specifying the price item, the description of the price item appears corresponding to the Price Item field.</td><td>Note: This field is required when you are adding a rate option and bill to account in an additional fee pricing rule type.</td></tr>
<tr><td></td><td></td></tr>
<tr><td>Rate Option</td><td>Used to indicate one or more rate options which are valid for a price item.
On clicking the Add (📄) icon, the following field appears in a grid:
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Rate Option</td><td>Used to indicate the rate option that you want to use while defining pricing for the price item.</td><td>Yes</td></tr>
</table></td><td>Not applicable</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td></td><td>Note:
If you want to define more than one rate option to the price item in an additional fee pricing rule type, click the Add (+) icon.
However, if you want to remove a price item from an additional fee pricing rule type, click the Delete icon corresponding to the Rate Option field.</td><td></td></tr>
<tr><td>Bill To Account</td><td>Used to indicate a order in which the account should be considered while deriving a transaction leg.
On clicking the Add icon, the following fields appear in a grid:
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Priority</td><td>Used to specify the order in which the invoice type is considered for a price item.</td><td>Yes</td></tr>
<tr><td>Invoice Type</td><td>Used to indicate the type which is considered for billing. For more information, refer to the Bill Group's Account on page 13 section.
Note: The Search icon appears corresponding to the Invoice Type field. On clicking the Search icon, the Invoice Type Search window appears.</td><td>Yes</td></tr>
</table>
Note:
If you want to define more than one invoice type to the price item in an additional fee pricing rule type, click the Add (+) icon.
However, if you want to remove a invoice type from the price item in an additional fee pricing rule type, click the Delete icon corresponding to the Priority field.</td><td>Not applicable</td></tr>
<tr><td>Eligibility Rule Type</td><td>Used to indicate the rule type (which indicates the rules) that should be executed to determine whether the price item is eligible for billing.</td><td>No</td></tr>
</table>

2. Enter the required details in the **Price Items** section.
3. If you want to define more than one price item in an additional fee pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a price item from an additional fee pricing rule type, click the **Delete** icon corresponding to the **Price Item** field.

Copyright © 2026, Oracle and/or its affiliates.

4. Click **Save**.
   The price items are added for an additional fee pricing rule type.

Adding a Price Item Parameter in an Additional Fee Pricing Rule Type

Prerequisites

To add a price item parameter in an additional fee pricing rule type, you should have:

- Parameter defined in the application where parameter usage is set to **Price Item**.
- Parameter associated with the price item.

Procedure

To add a price item parameter in an additional fee pricing rule type:

1. Ensure that the **Price Item Parameters** section is expanded when you are defining *o*r editing an additional fee pricing rule type.

   The **Price Item Parameters** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item Parameter	Used to specify the parameter which you can use while defining an additional fee pricing for the price item.	Yes (Conditional)
	Note: The **Search** (🔍) icon appears corresponding to the **Price Item Parameter** field. On clicking the **Search** (🔍) icon corresponding to the **Price Item Parameter** field, the **Parameter Search** window appears. On specifying the parameter, the description of the price item parameter appears corresponding to the **Price Item Parameter** field.	**Note:** This field is required when you are adding a price item parameter in an additional fee pricing rule type.

2. Enter the required details in the **Price Item Parameters** section.
3. If you want to add more than one price item parameter in an additional fee pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove a price item parameter from an additional fee pricing rule type, click the **Delete** (🗑) icon corresponding to the price item parameter.

4. Click **Save**.
   The price item parameter is added for an additional fee pricing rule type.

Defining a Characteristic for an Additional Fee Pricing Rule Type

Prerequisites

To define a characteristic for an additional fee pricing rule type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule Type**)

Procedure

To define a characteristic for an additional fee pricing rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining *or* editing an additional fee pricing rule type.

   The **Characteristics** section contains the following columns in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule Type**.	**Note:** This field is required when you are defining a characteristic for an additional fee pricing rule type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for an additional fee pricing rule type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for an additional fee pricing rule type, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove a characteristic from an additional fee pricing rule type, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristics are defined for an additional fee pricing rule type.

Adding Elements for Audit in an Additional Fee Pricing Rule Type

Prerequisites

To add elements for audit in an additional fee pricing rule type, you should have:

- Business Object **C1-AuditEventType** defined for the pricing rule type.
- Audit event type defined in the application.

Procedure

To add elements for audit in an additional fee pricing rule type:

1. Ensure that the **Event Management** section is expanded when you are defining *o*r editing an additional fee pricing rule type.

   The **Event Management** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Audit Event Type	Used to specify the audit event type which you can use while adding elements for audit in an additional fee pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Audit Event Type** field. On clicking the **Search** (🔍) icon corresponding to the **Audit Event Type** field, the **Audit Event Type Search** window appears. On specifying the audit event type, the description of the audit event type appears corresponding to the **Audit Event Type** field.	Yes
Element Type	Used to indicate the type of audit element for an additional fee pricing rule type. The valid values are: • Business Object Status • Characteristic • Field	Not applicable
Element Name	Used to specify the element name for an additional fee pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Element Name** field. On clicking the **Search** (🔍) icon corresponding to the **Element Name** field, the **Audit Event Type Element Name Search** window appears.	Yes
Element Value	Used to specify the value for an element name.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

2. Enter the required details in the **Event Management** section.
3. If you want to add more than one element for audit in an additional fee pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove an element for audit from an additional fee pricing rule type, click the **Delete** (🗑) icon corresponding to the **Audit Event Type** field.

4. Click **Save**.
   The elements for audit are added for an additional fee pricing rule type.

Editing an Additional Fee Pricing Rule Type

Prerequisites

To edit an additional fee pricing rule type, you should have:

- Additional fee pricing rule type business object defined in the application.
- Additional fee pricing rule business object defined in the application.

Procedure

To edit an additional fee pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding *t*o the pricing rule type whose details you want to edit.

   The **Tier Based Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about an additional fee pricing rule type.
   - **Algorithms** - Used to associate the algorithms with an additional fee pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the pricing rules using the additional fee pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for an additional fee based pricing rule type.
   - **Event Management** - Used to configure the audit in an additional fee based pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Displays the additional fee pricing rule type.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Description	Used to specify the description for the additional fee pricing rule type.	Yes
Detailed Description	Used to specify the additional information about the additional fee pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the additional fee pricing rule type. The valid value is: • Additional Fee Pricing Rule	Yes
Business Object	Indicates the business object using which you are defining the additional fee pricing rule type.	Not applicable
Status	Used to indicate the status of additional fee pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to select the checkbox if the pricing rule type is primary. **Note:** The checkbox appears selected, if you have already selected the **Primary** option while defining an additional fee pricing rule type.	No
Pricing Rule Type Category	Indicates the pricing rule type category for an additional fee pricing rule type. The valid values is: • Additional Fee	No

Tip: Alternatively, you can edit the details of an additional fee pricing rule type by clicking the **Edit** button in the **Pricing Rule Type** zone.

5. Modify the details in the **Main** section.
6. Associate the required algorithms in an additional fee pricing rule type.
7. Add, edit, or remove the required price items in an additional fee pricing rule type.
8. Add, edit, or remove the price item parameters in an additional fee pricing rule type, if required.
9. Add, edit, or remove characteristics for an additional fee pricing rule type, if required.
10. Add, edit, or remove the configuration details of the audit in an additional fee pricing rule type.
11. Click **Save**.
    The changes made to the an additional fee pricing rule type are saved.

Deleting an Additional Fee Pricing Rule Type

Procedure

To delete an additional fee based pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Delete** ( ) icon in the **Delete** column *c*orresponding to the additional fee pricing rule type that you want to delete.
   A message appears confirming whether you want to delete the additional fee pricing rule type.

   Note: You can delete an additional fee pricing rule type when it is not yet used in the system.

   Tip: Alternatively, you can delete an additional fee pricing rule type by clicking the **Delete** button in the **Pricing Rule Type** zone.
5. Click **OK**.
   The additional fee pricing rule type is deleted.

Membership Benefit Pricing

Oracle Revenue Management and Billing offers a benefit pricing rule type using which you can determine the following:

- Price items that should be used to create charges for different membership benefits, such as Medicare Part D LIS, Medicare Part D LEP, APTC benefit, etc.
- Eligibility rule type for the respective price item.
- Active audit event type of the **C1-Benefits** business object using which the system should create an audit event whenever the listed elements (such as benefit end date, benefit amount) are updated or when the status of the membership benefit is set to **ACTIVE** (during creation), **INACTIVE** (during modification), or **DISCARD** (when it is discontinued).

Note: The fields and statuses of a membership benefit which you specify in the **Event Management** section of a benefit pricing rule type should also exits as audit elements for update in the selected audit event type.

The **Benefit Pricing Rule Type (C1-PrcRuleTypeBenefit)** business object is shipped with the product. You need to create a benefit pricing rule type using the **Benefit Pricing Rule Type** business object. You can create the benefit charges for Medicare Part D LIS, Medicare Part D LEP, APTC benefit using the benefit pricing rule type. In this way, you can create a benefit charge for the low income subsidy (LIS) and late enrollment penalty (LEP) along with the Medicare Part D premium charge (which is calculated using the age-based or tier based pricing rule).

While creating a benefit charge for the membership, the system considers the benefit pricing rule type which is associated with the health plan or policy plan. The associated benefit pricing rule type should be added as a related pricing rule type in the age-based or tier-based pricing rule type which is associated with the health plan or policy plan. Therefore, while creating a benefit pricing rule type, you need to ensure that the **Primary** option is not selected and the pricing rule type category is set to **Benefit**. You need to then add the benefit pricing rule type as a related pricing rule type in the required age-based or tier-based pricing rule type.

While specifying an eligibility rule type for a price item, you need to ensure that the rule type usage of the rule type is set to **Price Item Eligibility**. Before creating rules for the eligibility rule type, you need to create a parameter where the source entity is set to **Benefit**, source type is set to **Field**, source type code is set to **Benefit Sub Type**, and the **Rule Eligibility Criteria** option is selected. While creating rules for the eligibility rule type, you need to ensure that the benefit sub type parameter is set to the required benefit sub type. While creating a benefit charge for the membership, the system executes the effective rules of the eligibility rule type in the order of priority. If the rule criteria is met by the group or individual membership (i.e. benefit sub type of the group or individual membership benefit matches with the rule criteria), the system considers the respective price item to create the charge for the membership benefit.

While creating a benefit pricing rule type, you must attach the following algorithms to the respective system events:

Copyright © 2026, Oracle and/or its affiliates.

System Event	Sequence	Algorithm
Account and Price Item Derivation	1	C1_ACCPRIMEM
Account and Price Item Derivation Post-Processing	1	C1-BILLPDRV
Account and Price Item Derivation Post-Processing	2	C1-BILLRPCR
Bill Group Derivation	1	C1_MEMBGDRV
Billable Charge Creation Post-Processing	1	C1-FICRETBC
Premium Calculation	1	C1_MEDIPREM
Billable Charge Creation Post-Processing	2	C1-PRLBCVLD

Note:

The system requires the **C1-PRLBCVLD** algorithm only when the **Validate External Price** option is selected in the benefit sub type of a membership benefit for which the benefit charge is created.

If you attach the **C1-PRLBCVLD** algorithm in a benefit pricing rule type, you need to ensure that it is also attached in the primary pricing rule type (i.e. age-based or tier-based) through the membership premium is calculated.

Defining a Benefit Pricing Rule Type

Procedure

To define a benefit pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Pricing Rule Type** sub-menu.

   The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type Business Object	Used to indicate the business object using which you want to create the benefit pricing rule type. **Note:** You can create a benefit pricing rule type using the **Benefit Pricing Rule Type (C1-PrcRuleTypeBenefit)** business object.	Yes

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Pricing Rule Type** screen.

4. Select the **Benefit Pricing Rule Type** business object.
5. Click **OK**.

   The **Benefit Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the benefit pricing rule type.
   - **Algorithms** - Used to associate the algorithms with the benefit pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

- **Price Items** - Used to add the price items using which you want to create charges for different membership benefits.
- **Price Item Parameters** - This section is not applicable for the benefit pricing rule type.
- **Characteristics** - Used to define the characteristics for the benefit pricing rule type.
- **Event Management** - Used to list the elements from the **Benefit (C1-Benefits)** business object which you want to monitor for auditing while updating a membership benefit.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to specify the benefit pricing rule type.	Yes
Description	Used to specify the description for the benefit pricing rule type.	Yes
Detailed Description	Used to specify the additional information about the benefit pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the benefit pricing rule. The valid value is: • **Benefit Pricing Rule** **Note:** You can create a benefit pricing rule type using the age based or tier based pricing rule business object.	Yes
Business Object	Indicates the business object using which you are defining the benefit pricing rule type.	Not applicable
Status	Used to indicate the status of the benefit pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to indicate whether the pricing rule type is a primary pricing rule type. **Note:** You must not select the **Primary** option while defining the benefit pricing rule type.	Not applicable
Pricing Rule Type Category	Used to indicate the category to which the pricing rule type belongs. The valid value is: • Benefit	Yes

6. Enter the required details in the **Main** section.
7. Ensure that **Primary** option is not selected when you are defining a benefit pricing rule type.
8. Associate the required algorithms with the benefit pricing rule type.
9. Add the required price items for the benefit pricing rule type.
10. Add price item parameters for the benefit pricing rule type.
11. Define characteristics for the benefit pricing rule type.
12. Configure the audit in the benefit pricing rule type.
13. Click **Save**.
    The benefit pricing rule type is defined.

Associating Algorithms with a Benefit Pricing Rule Type

Prerequisites

To associate algorithms with a benefit pricing rule type, you should have:

- Required algorithms should be defined in the application

Procedure

To associate algorithms with a benefit pricing rule type:

1. Ensure that the **Algorithms** section is expanded when you are defining the benefit pricing rule type.

   The **Algorithms** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to invoke the algorithm. The valid values are: • Account and Price Item Derivation • Account and Price Item Derivation Post-Processing • Bill Group Derivation • Billable Charge Creation Pre-Processing • Billable Charge Creation Post-Processing • New Born Waiver Calculation • Premium Calculation • Pricing Rule Derivation • Pricing Rule Pre-Processing • Pricing Rule Post-Processing • Pricing Rule Proration Amount Calculation • Skip Month Premium Calculation	Yes **Note:** This field is required when you want to associate an algorithm with the benefit pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
	Note: The remaining system events are not applicable for the fully-insured group and individual businesses. The **New Born Waiver Calculation**, **Pricing Rule Derivation**, **Pricing Rule Pre-Processing**, **Pricing Rule Post-Processing**, **Pricing Rule Proration Amount Calculation**, **Skip Month Premium Calculation** system events are not applicable for the **Benefit** pricing rule type category.	
Sequence	Used to specify the order in which the algorithms for each system event must be executed.	Yes (Conditional) **Note:** This field is required when you want to associate an algorithm with the benefit pricing rule type.
Algorithm	Used to specify the algorithm.	Yes (Conditional)
	Note: If you select the system event option, the **Search** (🔍) icon appears corresponding to the **Algorithm** field. On clicking the **Search** (🔍) icon, the **Algorithm Search** window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the **Algorithm** field.	**Note:** This field is required when you want to associate an algorithm with the benefit pricing rule type.

2. Enter the required details in the **Algorithms** section:

System Event	Sequence	Algorithm Type
Account and Price Item Derivation	1	C1_ACCPRIMEM
Account and Price Item Derivation Post-Processing	1	C1-BILLPDRV
Account and Price Item Derivation Post-Processing	2	C1-BILLRPCR
Bill Group Derivation	1	C1_MEMBGDRV
Billable Charge Creation Post-Processing	1	C1-FICRETBC
Premium Calculation	1	C1_MEDIPREM
Billable Charge Creation Post Processing	2	C1-PRLBCVLD

3. If you want to associate more than one algorithm for the benefit pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to disassociate an algorithm from the benefit pricing rule type, click the **Delete** (🗑) icon corresponding to the algorithm.

4. Click **Save**.
The algorithms are associated with the benefit pricing rule type.

Adding a Price Item in a Benefit Pricing Rule Type

Prerequisites

To add a price item in a benefit pricing rule type, you should have:

- Price item defined in the application
- Values defined for the **Invoice Type (C1INVTYP)** characteristic type
- The **C1INVTYP** characteristic type set in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration
- Rule types defined in the application (where the rule type usage is set to **Price Item Eligibility**)

Procedure

To add a price item in a benefit pricing rule type:

1. Ensure that the **Price Items** section is expanded when you are defining or editing a benefit based pricing rule type.

   The **Price Items** section contains the following fields in a grid:

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Price Item</td><td>Used to indicate the price item that you want to include in a benefit pricing rule type.

Note:
The Search (🔍) icon appears corresponding to the Price Item field. On clicking the Search icon, the Price Item Search window appears.
On specifying the price item, the description of the price item appears corresponding to the Price Item field.</td><td>Yes</td></tr>
<tr><td>Bill To Account</td><td>Used to indicate the priority in which the account should be considered while creating a benefit charge using the price item.
On clicking the Add (➕) icon, the following fields appear in a grid:
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Priority</td><td>Used to indicate the order in which the system should consider the account with the respective invoice type.</td><td>Yes</td></tr>
</table></td><td>Not applicable</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td></td><td>
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Invoice Type</td><td>Used to indicate the invoice account type. The system will then consider the available invoice account type of the customer to bill the benefit charges based on the given priority. For more information, refer to the Bill Group's Account on page 13 section.

Note:
The Search (🔍) icon appears corresponding to the Invoice Type field. On clicking the Search icon, the Invoice Type Search window appears.
Here, you can only specify a predefined value of the C1INVTYP characteristic type.</td><td>Yes</td></tr>
</table>
Note:
If you want to define more than one invoice account types for a price item in the benefit pricing rule type, click the Add (+) icon.
However, if you want to remove an invoice account type from a price item in the benefit pricing rule type, clickDelete (🗑) icon corresponding to the Priority field.
</td><td></td></tr>
<tr><td>Eligibility Rule Type</td><td>Used to indicate the rule type using which you want to determine whether the price item is eligible for billing.

Note: Here, you can only specify a rule type where the rule type usage is set to Price Item Eligibility.</td><td>No</td></tr>
</table>

2. Enter the required details in the **Price Items** section.
3. If you want to define more than one price item in a benefit pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a price item from a benefit pricing rule type, click the **Delete** (🗑) icon corresponding to the **Price Item** field.

4. Click **Save**.
   The price items are added for a benefit pricing rule type.

Defining a Characteristic for a Benefit Pricing Rule Type

Prerequisites

To define a characteristic for a benefit pricing rule type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule Type**)

Procedure

To define a characteristic for a benefit pricing rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining *or* editing a benefit pricing rule type.

   The **Characteristics** section contains the following columns in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule Type**.	**Note:** This field is required when you are defining a characteristic for a benefit pricing rule type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for a benefit pricing rule type.

2. Enter the required details in the **Characteristics** section.

   Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, you can search for a predefined characteristic value.

3. If you want to define more than one characteristic for a benefit pricing rule type, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove a characteristic from a benefit pricing rule type, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristics are defined for a benefit pricing rule type.

Adding Elements for Audit in a Benefit Pricing Rule Type

Prerequisites

To add elements for audit in a benefit pricing rule type, you should have:

- Business Object **C1-AuditEventType** defined for the pricing rule type.
- Audit event type defined in the application.

Procedure

To add elements for audit in a benefit pricing rule type:

1. Ensure that the **Event Management** section is expanded when you are defining *o*r editing a benefit pricing rule type.

   The **Event Management** section contains the following fields in a grid:

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Audit Event Type</td><td>Used to indicate an active audit event type using which you want to create an audit event when the specified element of a membership benefit is updated.

Note:
The Search (🔍) icon appears corresponding to the Audit Event Type field. On clicking the Search (🔍) icon corresponding to the Audit Event Type field, the Audit Event Type Search window appears.
On specifying the audit event type, the description of the audit event type appears corresponding to the Audit Event Type field.
You must specify an active audit event type which is created for the C1-Benefits business object.</td><td>Yes</td></tr>
<tr><td>Element Type</td><td>Used to indicate the type of element. The valid values are:
• Business Object Status
• Characteristic
• Field</td><td>Not applicable</td></tr>
<tr><td>Element Name</td><td>Used to specify the element that you want to monitor while updating a membership benefit. The following table lists the elements which you can select for the respective element type:
<table><tr><th>Element Type</th><th>Element Name</th></tr><tr><td>Business Object Status</td><td>boStatus</td></tr><tr><td>Characteristic</td><td>characteristics/characteristicsList/characteristicType</td></tr><tr><td>Field</td><td>Any field from the C1-Benefits business object schema.
Note: Here, you must not specify an element whose type is set to group or list.</td></tr></table></td><td>Yes</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td></td><td>Note:
The Search (🔍) icon appears corresponding to the Element Name field. On clicking the Search (🔍) icon corresponding to the Element Name field, the Audit Event Type Element Name Search window appears.</td><td></td></tr>
<tr><td>Element Value</td><td>Used to specify the element value depending on the element type. The following table lists the element value that you must specify depending on the element type:<table><tr><th>Element Type</th><th>Element Value</th></tr><tr><td>Business Object Status</td><td>Used to indicate the status of the membership benefit business object which you want to monitor for auditing. The system then creates an audit event whenever the membership benefit is transitioned to the specified status.</td></tr><tr><td>Characteristic</td><td>Used to indicate the characteristic type which you want to monitor for auditing
Note: Here, you must specify a characteristic type where the characteristic entity is set to Benefits. The system then creates an audit event whenever the specified characteristic is defined, edited, or removed from the membership benefit.</td></tr><tr><td>Field</td><td>Used to indicate the field which you want to monitor for auditing.
Note: Here, you must specify a field from the C1-Benefits business object schema.</td></tr></table></td><td>Not applicable</td></tr>
</table>

2. Enter the required details in the **Event Management** section.
3. If you want to add more than one element for audit in a benefit pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove an element for audit in a benefit pricing rule type, click the **Delete** (🗑) icon corresponding to the audit event type.

4. Click **Save**.
   The elements for audit are added for a benefit pricing rule type

Editing a Benefit Pricing Rule Type

Prerequisites

To edit a benefit pricing rule type, you should have:

- Benefit pricing rule type business object defined in the application.

Procedure

To define a benefit pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the pricing rule type whose details you want to edit.

   The **Benefit Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the benefit pricing rule type.
   - **Algorithms** - Used to associate the algorithms with the benefit pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the benefit pricing rules using the benefit pricing rule type.
   - **Price Item Parameters** - This section is not applicable for the benefit pricing rule type.
   - **Characteristics** - Used to define the characteristics for the benefit pricing rule type.
   - **Event Management** - Used to define the audit event type details for the benefit pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Displays the benefit pricing rule type.	Not applicable
Description	Used to specify the description for the benefit pricing rule type.	Yes
Detailed Description	Used to specify the additional information about the benefit pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the benefit pricing rule type. The valid values are: • Age Based Pricing Rule • Tier Based Pricing Rule **Note:** You can create a benefit pricing rule type using the age based or tier based pricing rule business object.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Business Object	Indicates the business object using which you are defining the benefit charge pricing rule type.	Not applicable
Status	Used to indicate the status of the benefit pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to indicate whether the pricing rule type is a primary pricing rule type. **Note:** You must not select the **Primary** option while defining the benefit pricing rule type.	Not applicable
Pricing Rule Type Category	Indicates the category to which the pricing rule type belongs. The valid value is: • Benefit	Not applicable

5. Enter the required details in the **Main** section.
6. Ensure that **Primary** option is not selected when you are editing a benefit pricing rule type.
7. Associate the required algorithms with the benefit pricing rule type:
8. Add, edit, or remove the required price items for the benefit pricing rule type.
9. Add, edit, or remove the price item parameters for the benefit pricing rule type.
10. Add, edit, or remove the characteristics for the benefit pricing rule type.
11. Add, edit, or remove the event management details for the benefit pricing rule type.
12. Click **Save**.
    The changes made to the benefit pricing rule type are saved.

Deleting a Benefit Pricing Rule Type

Procedure

Copyright © 2026, Oracle and/or its affiliates.

To delete a benefit pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Delete** (🗑) icon in the **Delete** column *c*orresponding to the benefit pricing rule type that you want to delete.
   A message appears confirming whether you want to delete the benefit pricing rule type.

   Note: You can delete a benefit pricing rule type when it is not yet used in the system.

   Tip: Alternatively, you can delete a benefit pricing rule type by clicking the **Delete** button in the **Pricing Rule Type** zone.
5. Click **OK**.
   The benefit pricing rule type is deleted.

Viewing the Benefit Pricing Rule Type Details

Procedure

To view the details of a benefit pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Broadcast** (📡) icon corresponding to the benefit pricing rule type whose details you want to view.
   The **Pricing Rule Type** zone appears.
5. View the details of the benefit pricing rule type in the **Pricing Rule Type** zone.

Medicare Part A, Part B, and Part D Pricing

The system enables you to calculate premium for the Medicare Part A, Part B, and Part D membership benefits using the age-based or tier-based pricing rule. You can use the Medicare plan benefit package and membership benefit as the pricing parameters in the age-based or tier-based pricing rule. The system enables you to restrict the billing of a membership benefit using a parameter where the source entity is set to **Algorithm** and source type code is set to **Get benefit coverage for the given date (C1-PPRAMCOV)** in the age-based or tier-based pricing rule. In the **C1-PPRAMCOV** algorithm, you can specify the following:

- **Benefit Sub Type** - Used to indicate that the pricing for the Medicare Part A, Part B, and Part D membership benefits should be determined based on the specified value. Here, you can specify the parameter values as **A**, **B**, and/or **D** separated by a comma. For example, if the parameter is set to A, B, the system will derive the base fee where the parameter is set to AB even though the membership has availed Medicare Part D benefit. This is because you have configured the system such that Medicare Part D membership benefit should not be considered for billing.

Discount Charge Pricing for Retiree Membership

Oracle Revenue Management and Billing enables you to maintain a flat or percentage based contribution of employer or sponsor for a retiree membership through a discount charge pricing rule. A new pricing rule type category named **Discount Charge** and the new business objects named **Discount Charge Pricing Rule Type (C1-PrcRuleTypeDisChg)** and **Discount Charge Pricing Rule (C1-PricingRuleDiscount)** are introduced in this release. This enables you to create the discount charge pricing rules where you can define different base and modifier fees based on the following pricing parameters:

- Membership attributes
- Member person attributes

For the fully-insured group and individual businesses, you can create or edit a flat or percentage based discount charge pricing rule through a health care inbound message. You can define a discount charge pricing rule at the policy plan, policy, or parent customer level. The following table describes the information that you need to provide in a health care inbound message while defining or editing a discount charge pricing rule on a policy plan, policy, or parent customer:

Entity Type	**Entity Identifiers**
Policy Plan	Policy, Plan, and Source System
Policy	Policy and Source System
Parent Customer	Person Identifier Type and Person Identifier Value

For the fully-insured individual business, you can create or edit a flat or percentage based discount charge pricing rule through a health product and plan inbound message. You can define a discount charge pricing rule at the health plan level. The following table describes the information that you need to provide in a health product and plan inbound message while defining or editing a discount charge pricing rule on a health plan:

Entity Type	**Entity Identifiers**
Health Plan	Health Plan

You can view a discount charge pricing rule defined for the fully-insured group business through the **Customer 360° View** screen. However, at present, you cannot view a discount charge pricing rule defined for the fully-insured individual business from the user interface.

You can create a discount charge pricing rule using a discount charge pricing rule type. You can create a discount charge pricing rule type from the user interface and not through an inbound message. While creating a discount charge pricing

Copyright © 2026, Oracle and/or its affiliates.

rule type, you must the select the **Discount Charge Pricing Rule Type** business object and set the pricing rule type category to **Discount Charge**. The discount is always charged per subscriber and not per member, and therefore you must set the pricing rule type sub category to **Per Subscriber**. Here, you must specify the algorithms for the following system events:

System Event	Algorithm
Account and Price Item Derivation	C1_ACCPRIMEM
Account and Price Item Derivation Post-Processing	C1-BILLPDRV
Account and Price Item Derivation Post-Processing	C1-BILLRPCR
Billable Charge Creation Post-Processing	C1-FICRETBC
Bill Group Derivation	C1_MEMBGDRV
Premium Calculation	C1_TIERPREM

In addition, you must specify the price items for which you can create discount charge pricing rules using the discount charge pricing rule type. A discount charge pricing rule type is not a primary pricing rule type. You must include a discount charge pricing rule type as a related pricing rule type in the age-based or tier based pricing rule types which are used for calculating the retiree membership premium. This is because the discount is offered on the retiree membership premium.

If the pricing type in the discount charge pricing rule is set to **Flat**, the system offers a flat discount on the retiree membership. But, if pricing type in the discount charge pricing rule is set to **Percent**, the system calculates and offers the percentage based discount on the retiree membership premium.

Prerequisites

To setup the discount charge pricing for retiree membership, you need to do the following:

- Define the **Discount Charge Pricing Rule Type (C1-PrcRuleTypeDisChg)** business object in the system.
- Define the **Discount Charge Pricing Rule (C1-PricingRuleDiscount)** business object in the system.
- Define the **Discount Charge** pricing rule type category in the system.
- Define the required algorithms in the system.
- Define the required price items and price item parameters in the system.
- Define the required rate options in the **Rate Option (C1-ExtLookRetTypeRateOpt)** extendable lookup.
- Define the required rule types (where the rule type usage is set to **Price Item Eligibility**).
- Define the required policy, policy plan, and persons in the system.
- Define the **Healthcare Product (C1-HealthcareProduct)** business object in the system.
- Define the **Health Plan (C1-HealthPlan)** business object in the system.
- Define the **Audit Event Type (C1-AuditEventType)** business object in the system.
- Define the required audit event type in the system.
- Define the required characteristic types (where the characteristic entity is set to **Pricing Rule Type**) in the system.

Defining a Discount Charge Pricing Rule Type

Prerequisites

To define a discount charge pricing rule type, you should have:

- Discount charge pricing rule type business object defined in the application.
- Discount charge pricing rule business object defined in the application.
- Pricing rule type category for the discount charge defined in the application.

Copyright © 2026, Oracle and/or its affiliates.

Procedure

To define a discount charge pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Pricing Rule Type** sub-menu.

   The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type Business Object	Used to indicate the business object using which you want to create a discount charge pricing rule type. **Note:** You can create a discount charge pricing rule type using the **Discount Charge Pricing Rule Type** business object.	Yes

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Pricing Rule Type** screen.

4. Select the **Discount Charge Pricing Rule Type** option from the **Pricing Rule Type Business Object** list.
5. Click **OK**.

   The **Discount Charge Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the discount charge pricing rule type.
   - **Algorithms** - Used to associate the algorithms with a discount charge pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the discount charge pricing rules using the discount charge pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for a discount charge pricing rule type.
   - **Event Management** - Used to configure the audit in a discount charge pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Used to specify the discount charge pricing rule type.	Yes
Description	Used to specify the description for the discount charge pricing rule type.	Yes
Detailed Description	Used to specify additional information about the discount charge pricing rule type.	No
Pricing Rule Business Object	Used to indicate the business object using which you want to create the discount charge pricing rule type. The valid value is: • Discount Charge Pricing Rule	Yes
Business Object	Indicates the business object using which you are defining the discount charge pricing rule type.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Status	Used to indicate the status of the discount charge pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to indicate whether the discount charge pricing rule type is a primary pricing rule type. **Note:** You must not select the **Primary** option while defining the discount charge pricing rule type.	No
Pricing Rule Type Category	Used to indicate the category to which the discount charge pricing rule type belongs. The valid value is: • Discount Charge	Yes
Pricing Rule Type Sub Category	Used to indicate the pricing rule type sub category for the discount charge pricing rule type. The valid values are: • Per Member • Per Subscriber **Note:** You must select the **Per Subscriber** option while defining the discount charge pricing rule type.	No

6. Enter the required details in the **Main** section.
7. Associate the required algorithms with the discount charge pricing rule type.
8. Add the required price items in the discount charge pricing rule type.
9. Add the price item parameters in the discount charge pricing rule type, if required.
10. Define characteristics for the discount charge pricing rule type, if required.
11. Configure the audit in the discount charge pricing rule type.
12. Click **Save**.
    The the discount charge pricing rule type is defined.

Associating an Algorithm with a Discount Charge Pricing Rule Type

Prerequisites

To associate an algorithm with a discount charge pricing rule type, you should have:

- An algorithm defined using the **C1_ACCPRIMEM** algorithm type.
- An algorithm defined using the **C1-BILLPDRV** algorithm type.
- An algorithm defined using the **C1-BILLRPCR** algorithm type.
- An algorithm defined using the **C1_MEMBGDRV** algorithm type.
- An algorithm defined using the **C1_TIERPREM** algorithm type.
- An algorithm defined using the **C1-FICRETBC** algorithm type.

Procedure

To associate an algorithm with a discount charge pricing rule type:

1. Ensure that the **Algorithms** section is expanded when you are defining *o*r editing the discount charge pricing rule type.

   The **Algorithms** section contains the following columns in a grid:

Column Name	Column Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to invoke the algorithm. The valid values are: • **Account and Price Item Derivation** - Used to derive the account and price item for a membership. • **Account and Price Item Derivation Post-Processing** - Used to derive the bill period for the account. • **Account and Price Item Derivation Post-Processing** - Used to create the bill period timeline for the account. • **Account and Price Item Derivation Post-Processing** - Used to derive subscription tier for membership, based on the bill period configured on the account. • **Bill Group Derivation** - Used to derive the bill group, parent customer, and policy for a membership. • **Premium Calculation** - Used to calculate the premium for each eligible member person. • **Pricing Rule Billable Charge Creation** - Used to derive the price items for which you can create the SQI based billable charges using the discount charge pricing rule type.	Yes **Note:** This field is required when you are associating an algorithm with the discount charge pricing rule type.
Sequence	Used to specify the order in which the algorithms for each system event must be executed.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the discount charge pricing rule type.
Algorithm	Used to specify the algorithm.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description	Mandatory (Yes or No)
	Note: Once you select the system event, the **Search** (🔍) icon appears corresponding to the **Algorithm** field. On clicking the **Search** (🔍) icon, the **Algorithm Search** window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the **Algorithm** field.	**Note:** This field is required when you are associating an algorithm with the discount charge pricing rule type.

2. Enter the following details in the **Algorithms** section:

System Event	Algorithm	Algorithm Type	Description
Account and Price Item Derivation	C1_ACCPRIMEM	C1_ACCPRIMEM	Account and PriceItem Derivation for Membership
Account and Price Item Derivation Post-Processing	C1-BILLPDRV	C1-BILLPDRV	Bill Period Derivation
Account and Price Item Derivation Post-Processing	C1-BILLRPCR	C1-BILLRPCR	Bill Period Time Line Creation
Account and Price Item Derivation Post-Processing	C1-DERSUBTR	C1-DERSUBTR	Derive Subscription Tier for Membership
Bill Group Derivation	C1_MEMBGDRV	C1_MEMBGDRV	Bill Group Derivation for Membership
Premium Calculation	C1_TIERPREM	C1_TIERPREM	Tier Based Premium Calculation
Pricing Rule Billable Charge Creation	C1-FICRETBC	C1-FICRETBC	Fully-Insured Charge creation for Memberships

3. If you want to associate more than one algorithm with the discount charge pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to disassociate an algorithm from the discount charge pricing rule type, click the **Delete** (🗑) icon corresponding to the algorithm.

4. Click **Save**.
The algorithms are associated with the discount charge pricing rule type.

Adding a Price Item in a Discount Charge Pricing Rule Type

Prerequisites

Copyright © 2026, Oracle and/or its affiliates.

To add a price item in a discount charge pricing rule type, you should have:

- Price item defined in the application
- Rate option defined in the **Rate Option (C1-ExtLookRetTypeRateOpt)** extendable lookup
- Values defined for the **Invoice Type (C1INVTYP)** characteristic type
- The **C1INVTYP** characteristic type set in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration
- Rule types defined in the application (where the rule type usage is set to **Price Item Eligibility**)

Procedure

To add a price item in a discount charge pricing rule type:

1. Ensure that the **Price Items** section is expanded when you are defining or editing a discount charge pricing rule type.

   The **Price Items** section contains the following fields in a grid:

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td rowspan="3">Price Item</td><td>Used to indicate the price item that you want to include in the discount charge pricing rule type.</td><td>Yes (Conditional)</td></tr>
<tr><td>Note:
The Search (🔍) icon appears corresponding to the Price Item field. On clicking the Search icon, the Price Item Search window appears.
On specifying the price item, the description of the price item appears corresponding to the Price Item field.</td><td rowspan="2">Note: This field is required when you are adding a rate option and bill to account in a discount charge pricing rule type.</td></tr>
<tr><td></td></tr>
<tr><td>Rate Option</td><td>Used to indicate one or more rate options which are valid for a price item.
On clicking the Add (➕) icon, the following field appears in a grid:
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Rate Option</td><td>Used to indicate the rate option that you want to use while defining pricing for the price item.</td><td>Yes</td></tr>
</table>
Note:
If you want to define more than one rate option to the price item in a discount charge pricing rule type, click the Add (+) icon.
However, if you want to remove a price item from a discount charge pricing rule type, click the Delete (🗑) icon corresponding to the Rate Option field.</td><td>Not applicable</td></tr>
<tr><td>Bill To Account</td><td>Used to indicate a order in which the account should be considered while deriving a transaction leg.
On clicking the Add (➕) icon, the following fields appear in a grid:</td><td>Not applicable</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td></td><td>
<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Priority</td><td>Used to specify the order in which the invoice type is considered for a price item.</td><td>Yes</td></tr>
<tr><td>Invoice Type</td><td>Used to indicate the type which is considered for billing. For more information, refer to the Bill Group's Account on page 13 section.

Note: The Search (🔍) icon appears corresponding to the Invoice Type field. On clicking the Search icon, the Invoice Type Search window appears.</td><td>Yes</td></tr>
</table>
Note:
If you want to define more than one invoice type to the price item in a discount charge pricing rule type, click the Add (+) icon.
However, if you want to remove a invoice type from the price item in a discount charge pricing rule type, click the Delete (🗑) icon corresponding to the Priority field.
</td><td></td></tr>
<tr><td>Eligibility Rule Type</td><td>Used to indicate the rule type (which indicates the rules) that should be executed to determine whether the price item is eligible for billing.</td><td>No</td></tr>
<tr><td>Sponsored</td><td>Used to indicate that the system should consider the sponsor billing arrangement while creating and billing the charge for the price item.

Note: If the Sponsored option is not selected, the system considers retiree billing arrangement while creating and billing the charge for the price item.</td><td>No</td></tr>
</table>

2. Enter the required details in the **Price Items** section.
3. If you want to define more than one price item in a discount charge pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove a price item from a discount charge pricing rule type, click the **Delete** (🗑) icon corresponding to the **Price Item** field.

4. Click **Save**.
   The price items are added for a discount charge pricing rule type.

Adding a Price Item Parameter in a Discount Charge Pricing Rule Type

Prerequisites

To add a price item parameter in a discount charge pricing rule type, you should have:

- Parameter defined in the application where parameter usage is set to **Price Item**.
- Parameter associated with the price item.

Procedure

To add a price item parameter in a discount charge pricing rule type:

1. Ensure that the **Price Item Parameters** section is expanded when you are defining *o*r editing a discount charge pricing rule type.

   The **Price Item Parameters** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Price Item Parameter	Used to specify the parameter which you can use while defining a discount charge pricing for the price item. **Note:** The **Search** (🔍) icon appears corresponding to the **Price Item Parameter** field. On clicking the **Search** (🔍) icon corresponding to the **Price Item Parameter** field, the **Parameter Search** window appears. On specifying the parameter, the description of the price item parameter appears corresponding to the **Price Item Parameter** field.	Yes (Conditional) **Note:** This field is required when you are adding a price item parameter in a discount charge pricing rule type.

2. Enter the required details in the **Price Item Parameters** section.
3. If you want to add more than one price item parameter in a discount charge pricing rule type, click the **Add** (+) icon and then repeat step 2.

> **Note:** However, if you want to remove a price item parameter from a discount charge pricing rule type, click the **Delete** (🗑) icon corresponding to the price item parameter.

4. Click **Save**.
   The price item parameter is added for a discount charge pricing rule type.

Defining a Characteristic for a Discount Charge Pricing Rule Type

Prerequisites

To define a characteristic for a discount charge pricing rule type, you should have:

Copyright © 2026, Oracle and/or its affiliates.

- Characteristic types defined in the application (where the characteristic entity is set to **Pricing Rule Type**)

Procedure

To define a characteristic for a discount charge pricing rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining *o*r editing a discount charge pricing rule type.

   The **Characteristics** section contains the following columns in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Pricing Rule Type**.	**Note:** This field is required when you are defining a characteristic for a discount charge pricing rule type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for a discount charge pricing rule type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for a discount charge pricing rule type, click the **Add** (+) icon and then repeat step 2.

   Note: However, if you want to remove a characteristic from a discount charge pricing rule type, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristics are defined for a discount charge pricing rule type.

Adding Elements for Audit in a Discount Charge Pricing Rule Type

Prerequisites

To add elements for audit in a discount charge pricing rule type, you should have:

- Business Object **C1-AuditEventType** defined for the pricing rule type.

Copyright © 2026, Oracle and/or its affiliates.

- Audit event type defined in the application.

Procedure

To add elements for audit in a discount charge pricing rule type:

1. Ensure that the **Event Management** section is expanded when you are defining *o*r editing a discount charge pricing rule type.

   The **Event Management** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Audit Event Type	Used to specify the audit event type which you can use while adding elements for audit in a discount charge pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Audit Event Type** field. On clicking the **Search** (🔍) icon corresponding to the **Audit Event Type** field, the **Audit Event Type Search** window appears. On specifying the audit event type, the description of the audit event type appears corresponding to the **Audit Event Type** field.	Yes
Element Type	Used to indicate the type of audit element for a discount charge pricing rule type. The valid values are: • Business Object Status • Characteristic • Field	Not applicable
Element Name	Used to specify the element name for a discount charge pricing rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Element Name** field. On clicking the **Search** (🔍) icon corresponding to the **Element Name** field, the **Audit Event Type Element Name Search** window appears.	Yes
Element Value	Used to specify the value for an element name. **Note:** If you select either **Business Object Status** or **Characteristic** option from the **Element Type** list, the **Search** (🔍) icon appears corresponding to the **Element Value** field. On clicking the **Search** (🔍) icon corresponding to the **Element Value** field, the **Audit Event Type Element Value Search** window appears.	Yes

2. Enter the required details in the **Event Management** section.
3. If you want to add more than one element for audit in a discount charge pricing rule type, click the **Add** (+) icon and then repeat step 2.

Note: However, if you want to remove an element for audit from a discount charge pricing rule type, click the **Delete** (🗑) icon corresponding to the **Audit Event Type** field.

Copyright © 2026, Oracle and/or its affiliates.

4. Click **Save**.
   The elements for audit are added for a discount charge pricing rule type.

Editing a Discount Charge Pricing Rule Type

Prerequisites

To edit a discount charge pricing rule type, you should have:

- Discount charge pricing rule type business object defined in the application.
- Discount charge pricing rule business object defined in the application.

Procedure

To edit a discount charge pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding *t*o the pricing rule type whose details you want to edit.

   The **Discount Charge Pricing Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about a discount charge pricing rule type.
   - **Algorithms** - Used to associate the algorithms with a discount charge pricing rule type.
   - **Price Items** - Used to add the price items for which you can define the pricing rules using the discount charge pricing rule type.
   - **Price Item Parameters** - Used to add the price item parameters based on which you want to define the price item pricing.
   - **Characteristics** - Used to define the characteristics for a discount charge based pricing rule type.
   - **Event Management** - Used to configure the audit in a discount charge based pricing rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Type	Displays the discount charge pricing rule type.	Not applicable
Description	Used to specify the description for the discount charge pricing rule type.	Yes
Detailed Description	Used to specify the additional information about the discount charge pricing rule type.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Pricing Rule Business Object	Used to indicate the business object using which you want to create the discount charge pricing rule type. The valid value is: • Discount Charge Pricing Rule	Yes
Business Object	Indicates the business object using which you are defining the discount charge pricing rule type.	Not applicable
Status	Used to indicate the status of discount charge pricing rule type. The valid values are: • Active • Inactive	Yes
Primary	Used to select whether the discount charge pricing rule type is a primary pricing rule type. **Note:** You must not select the **Primary** option while editing the discount charge pricing rule type.	No
Pricing Rule Type Category	Indicates the pricing rule type category for a discount charge pricing rule type. The valid value is: • Discount Charge	No
Pricing Rule Type Sub Category	Used to indicate the pricing rule type sub category for the discount charge pricing rule type. The valid values are: • Per Member • Per Subscriber **Note:** You must select the **Per Subscriber** option while defining the discount charge pricing rule type.	No

Tip: Alternatively, you can edit the details of a discount charge pricing rule type by clicking the **Edit** button in the **Pricing Rule Type** zone.

5. Modify the details in the **Main** section.
6. Associate the required algorithms in a discount charge pricing rule type.
7. Add, edit, or remove the required price items in a discount charge pricing rule type.
8. Add, edit, or remove the price item parameters in a discount charge pricing rule type, if required.
9. Add, edit, or remove characteristics for a discount charge pricing rule type, if required.
10. Add, edit, or remove the configuration details of the audit in a discount charge pricing rule type.
11. Click **Save**.
    The changes made to the discount charge pricing rule type are saved.

Deleting a Discount Charge Pricing Rule Type

Procedure

To delete a discount charge pricing rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **P** and then click **Pricing Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Pricing Rule Type** sub-menu.
   The **Pricing Rule Type** screen appears.
4. In the **Pricing Rule Type List** zone, click the **Delete** (🗑) icon in the **Delete** column *c*orresponding to the discount charge pricing rule type that you want to delete.
   A message appears confirming whether you want to delete the discount charge pricing rule type.

   Note: You can delete a discount charge pricing rule type when it is not yet used in the system.

   Tip: Alternatively, you can delete a discount charge pricing rule type by clicking the **Delete** button in the **Pricing Rule Type** zone.
5. Click **OK**.
   The discount charge pricing rule type is deleted.

Pricing Rule Inactivation

Earlier, you were not able to inactivate a pricing rule which is referred by a group or individual membership for the charge calculation. Now, the system enables you to change the status of the age based, tier based, additional fee, and discount charge pricing rules from **Active** to **Inactive** even when it is referred by a membership for the charge calculation. On inactivating a pricing rule, the system creates an audit event in the system.

A new batch named **Process Inactivated Fully-Insured Pricing Rule (C1-CBIPR)** is introduced in this release. You must execute the **Process Inactivated Fully-Insured Pricing Rule (C1-CBIPR)** batch in between the following batches - **Audit Event Process Monitor (C1-AUDEV)** and **Identify Entities for Repricing (C1-REPC1)**. The **Process Inactivated Fully-Insured Pricing Rule (C1-CBIPR)** batch considers the repricing entity details records from the **CI_REPRC_ENTITY_DTL** table which are in the **Discard** status due to pricing rule inactivation. It then cancels the billable charges and bill segments (if any) which are created using the pricing rule which you have inactivated. In addition, it changes the status of the records in the **CI_PRCE_CALC** table to **I** where the inactivated pricing rule is referred.

If you inactivate a primary pricing rule, the system will cancel the billable charges and bill segments (if any) which are created using the related pricing rules. If you inactivate a rate guarantee pricing rule, the system will cancel the billable charges and bill segments (if any) which are created using the rate guarantee pricing rule.

Chapter 40

Fully-Insured Billing

Topics:

- Audit Framework for Fully-Insured Billing
- Premium Proration Rules
- Age Monitoring
- State of Issue
- Membership Premium Calculation
- Bill Group Derivation for Membership
- Account and Price Item Derivation for Membership
- Tightly Coupled Bill Cycle and Bill Period through Billing Preference
- Bill Period Timeline
- Bill Enquiry with Rate-to-Amount Traceability
- 9/10 Billing (Skip Months)
- Repricing
- Fully-Insured Billable Charge Creation
- New Born Credit Waiver
- Membership Benefit Billing
- Additional Repricing Entity Detail Records
- Rounding Premium at the Member Level
- Support Open Ended Policies, Plans, Pricing Rules, and Memberships
- Hold Repricing
- Prorate Membership Benefit and Corresponding Sponsor Charges
- Zero-Amount Membership Benefit Charges
- Benefit Passthrough Charges vs. Calculated Charges

This chapter explains how the billing is done for fully-insured business in Oracle Revenue Management and Billing. It contains the following topics:

- Audit Framework for Fully-Insured Billing
- Premium Proration Rules
- Age Monitoring
- State of Issue
- Membership Premium Calculation
- Bill Group Derivation for Membership
- Account and Price Item Derivation for Membership
- Tightly Coupled Bill Cycle and Bill Period through Billing Preference
- Bill Period Timeline
- Bill Enquiry with Rate-to-Amount Traceability
- 9/10 Billing (Skip Months)
- Repricing
- Fully-Insured Billable Charge Creation
- New Born Credit Waiver
- Membership Benefit Billing
- Additional Repricing Entity Detail Records
- Rounding Premium at the Member Level
- Support Open Ended Policies, Plans, Pricing Rules, and Memberships
- Hold Repricing
- Prorate Membership Benefit and Corresponding Sponsor Charges
- Zero-Amount Membership Benefit Charges
- Benefit Passthrough Charges vs. Calculated Charges
- Repricing Request
- Membership Repricing through Inbound Web Service
- Pricing Vs Passthrough Charges
- Billable Charge Creation or Cancellation through File Upload Interface
- Trigger Repricing on Deleting Derivation and Pricing Parameters of a Bill Group
- Health Check
- Split Dependent Person Coverage
- Automatic Hold Request Creation Via File Upload Interface
- Display Non-Eligible Members' Premium Calculation Lines
- Adoption Premium Waiver
- Newborn Enrollment Time Limit
- Billing Preference
- Hold Request Preference

Audit Framework for Fully-Insured Billing

Oracle Revenue Management and Billing calculates the membership premium when you add a membership to a policy plan. It also enables you to recalculate the membership premium in the following scenarios:

- A member person is added or removed from the membership.
- The fields, characteristics, or statuses which are monitored for the auditing purposes are updated at the membership, member person, or pricing rule level.
- A pricing rule is added or updated for the policy plan.
- The derivation and pricing parameters are defined or updated for a bill group.

The membership premium calculation and recalculation (i.e. repricing) is implemented using the **Entity Audit** feature. The entity audit framework is already configured for the following business objects:

- C1-Membership
- C1_PERSON_BO
- C1-PricingRuleTierBased
- C1-PricingRuleAgeBased
- C1-BillLevel

To configure the entity audit framework for the above listed business objects, the following changes are made to these business objects:

- The **Eligible for Audit Event** option type is set to **Y** in
- An algorithm created using the **C1-REAUDEVNT** algorithm type is already attached to the **Audit** system event of the **C1-PricingRuleTierBased**, **C1-PricingRuleAgeBased**, and **C1-BillLevel** business objects.
- An algorithm created using the **C1-FIAUDEV** algorithm type is already attached to the **Audit** system event of the **C1-Membership** and **C1_PERSON_BO** business objects.

But, the entity audit framework will work when you define an active audit event type for the above listed business objects. For more information on how to create an audit event type, see Defining an Audit Event Type on page 3940. While creating an audit event type for the **C1-PricingRuleTierBased** and **C1-PricingRuleAgeBased** business objects, you need to attach an algorithm created using the **C1-AUDEVMPR** algorithm type to the **Audit Event Processing** system event of the respective audit event type. And, while creating an audit event type for the **C1-BillLevel** business object, you need to attach an algorithm created using the **C1-AUDBILLVL** algorithm type to the **Audit Event Processing** system event of the audit event type.

In addition, you need to list the following in the pricing rule types where the category is set to **Age Based** and **Tier Based**:

- Audit event types of the **C1-Membership** and **C1_PERSON_BO** business objects using which the audit event should be created whenever a membership and member person is added, updated, or removed from the policy plan, respectively.
- Elements of the **C1-Membership** and **C1_PERSON_BO** business objects for which auditing is required.

Note:

At present, you cannot use an audit event type of the **C1-Membership** and **C1_PERSON_BO** business objects in the **Age Based** and **Tier Based** pricing rule types when the **Update All** option is selected in the audit event type. Therefore, we recommend you to select an audit event type of the **C1-Membership** and **C1_PERSON_BO** business objects where the **Update All** option is not selected.

The system creates an audit event whenever the membership start and end dates and member person's start and end dates are changed in the system irrespective of whether these fields are listed for auditing or not in the age based or tier based pricing rule types.

You can also configure the entity audit feature for any custom membership or person business objects.

Copyright © 2026, Oracle and/or its affiliates.

The way in which the audit events are created and processed for a pricing rule, membership, and member person is different. While creating an audit event, the system checks whether an audit event for the entity with the same effective date already exists in the **Pending** status. If so, the system does not create a new audit event for the entity. Instead, the system adds a log in the existing audit event.

Age Based and Tier Based Pricing Rules Audit Process

If you add or edit an age based or tier based pricing rule, the system checks whether an active audit event type exists for the **C1-PricingRuleAgeBased** or **C1-PricingRuleTierBased** business object, respectively. If an active audit event type exists for the business object, the system creates an audit event for the pricing rule using the audit event type. The audit event is created in the **Pending** status. Note that the system creates one audit event for the pricing rule irrespective of the number of changes made to the pricing rule. In addition, an effective date is stamped corresponding to the audit event which later helps in deriving the timeline during premium calculation. Note that the effective date is set to the pricing rule's start date.

On executing the **Audit Event Process Monitor (C1-AUDEV)** batch, the system considers the audit events in the **Pending** or **Error** status. By default, it considers the audit events in the **Pending** status. The system checks whether the **C1-AUDEVMPR** algorithm is attached to the respective audit event type. If the **C1-AUDEVMPR** algorithm is attached to the audit event type, it identifies the policy plan where the pricing rule is defined. Once the policy plan is identified, it extracts a list of membership defined on the policy plan and the pricing rule type using which the pricing rule is created. Then, the system creates a repricing entity detail record for each membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of the repricing entity detail record is set to **P**.

Let us understand this with the help of an example.

The following table illustrates the audit events that are created while adding the PR1 and PR2 pricing rules:

Audit Event	AE1	AE2
Pricing Rule	PR1	PR2
Pricing Rule Type Using which the Pricing Rule is Created	PRT1	PRT3
Pricing Rule Start Date	01-01-2019	01-01-2019
Policy Plan for which the Pricing Rule is Defined	PP1	PP2
Pricing Rule Types Associated with the Policy Plan	PRT1, PRT2, PRT3	PRT3
Memberships which Belong to the Policy Plan	M1, M2, M3, and M4	M11 and M12

For the AE1 audit event, the system creates four repricing entity detail records with the following combinations in the **CI_REPRC_ENTITY_DTL** table:

Copyright © 2026, Oracle and/or its affiliates.

- M1, PRT1, 01-01-2019
- M2, PRT1, 01-01-2019
- M3, PRT1, 01-01-2019
- M4, PRT1, 01-01-2019

And, for the AE2 audit event, the system creates two repricing entity detail records with the following combinations in the **CI_REPRC_ENTITY_DTL** table:

- M11, PRT3, 01-01-2019
- M12, PRT3, 01-01-2019

Once the repricing entity detail records are created successfully, the status of the audit event is set to **Complete**. However, if an error occurs while creating the repricing entity detail records for an audit event, the status of the audit event is set to **Error**.

Membership Audit Process

If you add or edit a membership, the system checks whether an active audit event type exists for the **C1-Membership** business object. If an active audit event type exists for the business object, the creates the audit event using the audit event type. The system creates the audit event whenever a membership is added to a policy plan and dependent member person is added to a membership. It also creates the audit event whenever the membership and member person details are updated. However, note that the audit events are created in the update scenario when the element listed for auditing in the age based or tier based pricing rule types is updated. The system considers only those pricing rule types whose pricing rules are effective during the respective entity (i.e. membership or member person whichever is updated) date range.

The audit event is created in the **Pending** status. An effective date is stamped corresponding to the audit event which later helps in deriving the timeline during premium calculation. Note that the system creates distinct audit events in the following scenarios:

Scenario	**System Behavior**
A membership is added to a policy plan	One audit event is created for the membership. Here, the effective date in the audit event is set to the membership's start date. For example, two memberships named M1 (with the start date as 01-01-2020) and M2 (with the start date as 01-15-2020) are added to a policy plan named PP1. In such case, the system will create two audit events - one for M1 with the effective date as 01-01-2020 and another for M2 with the effective date as 01-15-2020.
A dependent member person is added to a membership	One audit event is created for the membership. Here, the effective date in the audit event is set to the dependent member person's start date. For example, one dependent member person named MP1 (with the start date as 06-05-2020) is added to the M1 membership and another dependent member person named MP2 (with the start date as 06-10-2020) is added to the M2 membership. In such case, the system will create two audit events - one for M1 with the effective date as 06-05-2020 and another for M2 with the effective date as 06-10-2020.
A dependent member person is removed from a membership	One audit event is created for the membership. Here, the effective date in the audit event is set to the dependent member person's start date. For example, one dependent member person named MP4 (with the start date as 9-15-2020) is removed from the M1 membership. In such case, the system will create one audit event for M1 with the effective date as 9-15-2020.

<table>
<tr><th>Scenario</th><th>System Behavior</th></tr>
<tr><td>A membership is added to a policy plan along with a dependent member person</td><td>Multiple audit events are created for the membership - one where the effective date is set to membership's start date, another where the effective date is set to dependent member person's start date, and third where the effective date is set to dependent member person's end date +1 Day. Note that the second audit event is created when the dependent member person's start date is later than membership's start date. And, the third audit event is created when the dependent member person's end date is earlier than membership's end date.

For example, one membership named M1 (with the start date as 01-01-2020 and end date as 12-31-2020) is added with two member persons - MP1 who is a main subscriber and MP2 (with the start date as 03-01-2020 and end date as 10-31-2020) who is a dependent member person. In such case, the system will create three audit events for M1 - one with the effective date as 01-01-2020, another with the effective date as 03-01-2020, and third with the effective date as 11-01-2020 (i.e. 10-31-2020 + 1 Day).</td></tr>
<tr><td>Membership characteristics are added or updated in the system</td><td>Multiple audit events are created for the membership - one for each set of membership characteristics with the same effective date. Here, the effective date in the audit event is set to the date from when the membership's characteristic is effective.

For example, the following characteristics are added or updated for the M1 membership:

<table>
<tr><th>Characteristic</th><th>Effective Date</th><th>Action</th></tr>
<tr><td>Maximum Number of Dependents</td><td>9-15-2020</td><td>Add</td></tr>
<tr><td>Age Calculation Date Basis</td><td>9-20-2020</td><td>Edit</td></tr>
<tr><td>Young Adult Max Age Limit</td><td>9-15-2020</td><td>Add</td></tr>
<tr><td>Young Adult Inclusion Applicability</td><td>9-20-2020</td><td>Edit</td></tr>
</table>

In such case, the system will create two audit events for M1 - one with the effective date as 9-15-2020 and another with the effective date as 9-20-2020.</td></tr>
<tr><td>Member person characteristics are added or updated in the system</td><td>Multiple audit events are created for the membership - one for each set of member person's characteristics with the same effective date. Here, the effective date in the audit event is set to the date from when the member person's characteristic is effective.

For example, the following characteristics are added or updated for the member persons in the M1 membership:

<table>
<tr><th>Member Person</th><th>Characteristic</th><th>Effective Date</th><th>Action</th></tr>
<tr><td>MP1</td><td>Maximum Number of Dependents</td><td>9-15-2020</td><td>Add</td></tr>
<tr><td>MP1</td><td>Age Calculation Date Basis</td><td>9-20-2020</td><td>Edit</td></tr>
</table>
</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Scenario</th><th>System Behavior</th></tr>
<tr><td></td><td>
<table>
<tr><th>Member Person</th><th>Characteristic</th><th>Effective Date</th><th>Action</th></tr>
<tr><td>MP2</td><td>Young Adult Max Age Limit</td><td>9-15-2020</td><td>Add</td></tr>
<tr><td>MP2</td><td>Young Adult Inclusion Applicability</td><td>9-20-2020</td><td>Edit</td></tr>
</table>

In such case, the system will create two audit events for M1 - one with the effective date as 9-15-2020 and another with the effective date as 9-20-2020.</td></tr>
<tr><td>A set of membership fields except membership start and end dates is updated in the system</td><td>One audit event is created for the membership. Here, the effective date in the audit event is set to the membership's start date.

For example, the external membership ID of the M1 membership (with the start date as 9-15-2020) is changed. In such case, the system will create one audit event for M1 with the effective date as 9-15-2020.</td></tr>
<tr><td>The membership start date is updated in the system</td><td>One audit event is created for the membership. Here, the effective date in the audit event is set to the membership's new start date.

For example, the start date of the M1 membership is changed from 9-15-2020 to 9-20-2020. In such case, the system will create one audit event for M1 with the effective date as 9-20-2020.</td></tr>
<tr><td>The membership end date is updated in the system</td><td>One audit event is created for the membership. Here, the effective date in the audit event is set to membership's new end date.

For example, the end date of the M1 membership is changed from 12-31-2020 to 11-30-2020. In such case, the system will create one audit event for M1 with the effective date as 11-30-2020.</td></tr>
<tr><td>A set of member person's fields except member person start and end dates is updated in the system</td><td>One audit event is created for the membership. Here, the effective date in the audit event is set to the member person's start date.

For example, the relationship type and status of the MP1 member person (with the start date as 01-01-2020) in the M1 membership is changed. In such case, the system will create one audit event for M1 with the effective date as 01-01-2020.</td></tr>
<tr><td>The dependent member person's start date is updated in the system</td><td>Three audit events are created for the membership - one where the effective date is set to the dependent member person's previous start date, another where the effective date is set to the dependent member person's new start date, and third where the effective date is set to dependent member person's end date + 1 Day. However, if the derived effective date is later than the membership end date, the system does not create the third audit event for the membership. In such scenario, it simply creates first two audit events.

For example, the Mike's effective date range is changed from 04-01-2019 - 09-30-2019 to 01-15-2019 - 09-30-2019 in the M1 membership which is effective from 01-01-2019 to 12-31-2019. In such case, the system will create three audit events for M1 - one with effective date as 04-01-2019, another with effective date as 01-15-2019, and third with effective date as 10-01-2019 (i.e. 09-30-2019 + 1 Day).

In addition, if there is a characteristic for the person whose effective date falls with the new enrollment date range, the system creates an audit event for the person where the effective date is set to characteristic's effective date. Note that</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

Scenario	System Behavior
	the system considers those effective characteristics where the characteristic entity is set to **Person**. Let us assume that in the above example a characteristic for Mike was effective from 02-01-2019. In such case, the system creates three audit events for the M1 membership (with the effective dates as mentioned above) and one audit event for the person (i.e. Mike) where the effective date is set to 02-01-2019.
The dependent member person's end date is updated in the system	Two audit events are created for the membership - one where the effective date is set to dependent member person's previous end date + 1 Day and another where the effective date is set to dependent member person's new end date + 1 Day. However, if the derived effective date is later than the membership end date, the system does not create the second audit event for the membership. In such scenario, it simply creates the first audit event. For example, the Garry's effective date range is changed from 04-01-2019 - 09-30-2019 to 04-01-2019 - 12-31-2019 in the M1 membership which is effective from 01-01-2019 to 12-31-2019. In such case, the system will create one audit event for M1 with the effective date as 10-01-2019 (i.e. 09-30-2019 + 1 Day). It will not create another audit event for M1 because the derived effective date (i.e. 12-31-2019 + 1 Day = 01-01-2020) is later than membership end date (i.e. 12-31-2019). In addition, if there is a characteristic for the person whose effective date falls with the new enrollment date range, the system creates an audit event for the person where the effective date is set to characteristic's effective date. Note that the system considers those effective characteristics where the characteristic entity is set to **Person**. Let us assume that in the above example a characteristic for Garry was effective from 11-01-2019. In such case, the system creates one audit event for M1 membership (with the effective date as mentioned above) and another audit event for the person (i.e. Garry) where the effective date is set to 11-01-2019.
The dependent member person's start and end dates are updated in the system	Four audit events are created for the membership - one where the effective date is set to the dependent member person's previous start date, another where the effective date is set to the dependent member person's new start date, third where the effective date is set to dependent member person's previous end date + 1 Day, and fourth where the effective date is set to dependent member person's new end date + 1 Day. However, if the derived effective date is later than the membership end date, the system does not create the fourth audit event for the membership. In such scenario, it simply creates the first three audit events. For example, the Juliet's effective date range is changed from 04-01-2019 - 09-30-2019 to 01-01-2019 - 11-30-2019 in the M1 membership which is effective from 01-01-2019 to 12-31-2019. In such case, the system will create four audit events for M1 - one with effective date as 04-01-2019, another with effective date as 01-01-2019, third with effective date as 10-01-2019 (i.e. 09-30-2019 + 1 Day), and fourth with effective date as 12-01-2019 (i.e. 11-30-2019 + 1 Day). In addition, if there is a characteristic for the person whose effective date falls with the new enrollment date range, the system creates an audit event for the person where the effective date is set to characteristic's effective date. Note that the system considers those effective characteristics where the characteristic entity is set to **Person**. Let us assume that in the above example two characteristics of Juliet were effective from 03-01-2019 and 10-01-2019, respectively. In such case, the system creates four audit events

Copyright © 2026, Oracle and/or its affiliates.

Scenario	System Behavior
	for M1 membership (with the effective dates as mentioned above), fifth audit event for the person (i.e. Juliet) where the effective date is set to 03-01-2019, and sixth audit event for the person (i.e. Juliet) where the effective date is set to 10-01-2019.

For each audit event, the system identifies the policy plan to which the membership belongs and the active pricing rules defined on the policy plan. It then identifies the pricing rule types using which these active pricing rules are created in the system. A repricing entity detail record is created for each membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of the repricing entity detail record is set to **P**.

Let us understand this with the help of an example.

The following table illustrates the audit events that are created while adding the M1 and M2 memberships:

Entity	**Entity Detail**	
Audit Event	AE11	AE12
Membership	M1	M2
Membership Start Date	01-03-2019	01-02-2019
Policy Plan to which Membership Belongs	PP11	PP12
Pricing Rules Defined on the Policy Plan	PR1 (Using PRT1), PR2 (Using PRT2), PR3 (Using PRT3)	PR11 (Using PRT1), PR13 (Using PRT2)
Pricing Rule Types Associated with the Policy Plan	PRT1, PRT2, PRT3	PRT1, PRT2

For the AE11 audit event, the system creates three repricing entity detail records with the following combinations in the **CI_REPRC_ENTITY_DTL** table:

- M1, PRT1, 01-03-2019
- M1, PRT2, 01-03-2019
- M1, PRT3, 01-03-2019

And, for the AE12 audit event, the system creates two repricing entity detail records with the following combinations in the **CI_REPRC_ENTITY_DTL** table:

- M2, PRT1, 01-02-2019
- M2, PRT2, 01-02-2019

Note: If the audit event's effective date is earlier than the member person's start date, the system sets the effective date in the repricing entity detail record to the member person's start date. Therefore, in such scenarios, the effective date of the audit event and repricing entity detail records will be different.

Once the repricing entity detail records are created successfully, the status of the audit event is set to **Complete**. However, if an error occurs while creating the repricing entity detail records for an audit event, the status of the audit event is set to **Error**.

Person Audit Process

If you add or edit a person, the system checks whether an active audit event type exists for the **C1_PERSON_BO** business object. If an active audit event type exists for the business object, the system creates an audit event for the person using the audit event type. The audit event is created in the **Pending** status. An effective date is stamped corresponding

Copyright © 2026, Oracle and/or its affiliates.

to the audit event which later helps in deriving the timeline during premium calculation. Note that the system creates distinct audit events in the following scenarios:

<table>
<tr><th>Scenario</th><th>System Behavior</th></tr>
<tr><td>Person fields are updated in the system.</td><td>One audit event is created for the person. Here, the effective date in the audit event is set to the member person's start date.

For example, the following person identifier type is defined for MP1, MP2, and MP3 who are members of the M1 membership:

<table>
<tr><th>Member Person</th><th>Member Person Start Date</th><th>Person Identifier Type</th><th>Person Identifier</th></tr>
<tr><td>MP1</td><td>03-10-2020</td><td>Social Security Number</td><td>987-65-4320</td></tr>
<tr><td>MP2</td><td>03-15-2020</td><td>Social Security Number</td><td>987-65-4321</td></tr>
<tr><td>MP3</td><td>03-25-2020</td><td>Social Security Number</td><td>987-65-4322</td></tr>
</table>

In such case, the system will create three audit events - one for MP1 with the effective date as 03-10-2020, another for MP2 with the effective date as 03-15-2020, and third for MP3 with the effective date as 03-25-2020.</td></tr>
<tr><td>Person characteristics are added or updated in the system.</td><td>Multiple audit events are created for the person - one for each set of person characteristics with the same effective date. Here, the effective date in the audit event is set to the date from when the person's characteristic is effective.

For example, the following characteristics are added or updated for the persons who are members of the M1 membership:

<table>
<tr><th>Member Person</th><th>Characteristic</th><th>Effective Date</th><th>Action</th></tr>
<tr><td>MP1</td><td>Marital Status</td><td>09-15-2020</td><td>Add</td></tr>
<tr><td>MP1</td><td>Garble Data</td><td>09-20-2020</td><td>Edit</td></tr>
<tr><td>MP2</td><td>Marital Status</td><td>09-15-2020</td><td>Add</td></tr>
<tr><td>MP2</td><td>Garble Data</td><td>09-20-2020</td><td>Edit</td></tr>
</table>

In such case, the system will create four audit events - one for MP1 with the effective date as 09-15-2020, another for MP1 with the effective date as 09-20-2020, third for MP2 with the effective date as 09-15-2020, and fourth for MP2 with the effective date as 09-20-2020.</td></tr>
</table>

For each audit event, the system identifies the memberships in which the person is added as a member person. It identifies the policy plan to which each membership belongs and the active pricing rules defined on the policy plan. It then identifies the pricing rule types using which these active pricing rules are created in the system. A repricing entity detail record is created for each membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of the repricing entity detail record is set to **P**.

Let us understand this with the help of an example.

The following table illustrates the audit event that is created while updating the MP1 person:

Audit Event	AE1

Copyright © 2026, Oracle and/or its affiliates.

Membership to which MP1 belongs	M1	M2	M3
Member Person's Start Date	01-01-2019	01-01-2019	01-07-2019
Policy Plan to which Membership Belongs	PP1	PP2	PP3
Pricing Rules Defined on the Policy Plan	PR1 (Using PRT1), PR2 (Using PRT2)	PR3 (Using PRT3), PR4 (Using PRT3)	PR5 (Using PRT5), PR6 (Using PRT6)
Pricing Rule Types Associated with the Policy Plan	PRT1, PRT2	PRT3, PRT4	PRT5, PRT6

For the AE1 audit event, the system creates five repricing entity detail records with the following combinations in the **CI_REPRC_ENTITY_DTL** table:

- M1, PRT1, 01-01-2019
- M1, PRT2, 01-01-2019
- M2, PRT3, 01-01-2019
- M3, PRT5, 01-07-2019
- M3, PRT6, 01-07-2019

Note: If the audit event's effective date is earlier than the member person's start date, the system sets the effective date in the repricing entity detail record to the member person's start date. Therefore, in such scenarios, the effective date of the audit event and repricing entity detail records will be different.

Once the repricing entity detail records are created successfully, the status of the audit event is set to **Complete**. However, if an error occurs while creating the repricing entity detail records for an audit event, the status of the audit event is set to **Error**.

Membership Benefit Audit Process

Oracle Revenue Management and Billing enables you to calculate the charges for the availed Medicare Part D LIS, Medicare Part D LEP, or APTC benefit for the group or individual membership. The benefit charges are calculated and recalculated (whenever the benefit end date, amount, or status changes) using the **Entity Audit** framework. The entity audit framework is already configured for the **C1-Benefits** business object by:

- Setting the **Eligible for Audit Event** option type to **Y**
- Attaching the **C1-FIAUDEV** algorithm to the **Audit** system event

You need to create an active audit event type for the **Benefits** business object. While creating an active audit event type for the **Benefits** business object, you need to ensure the following:

- Set the status of the audit event type to **Active**
- Set the entity business object of the audit event type to **Benefit**
- Set the audit usage of the audit event type to **Premium Calculation**
- Ensure that the **Update All** option is not selected and the **Add Action** and **Delete Action** options are selected
- Add the fields (such as, benefitAmount and endDate) of the **C1-Benefits** business object for which you want to enable the audit process
- Add the statuses (such as, **ACTIVE**, **INACTIVE**, and **DISCARD**) of the **C1-Benefits** business object for which you want to enable the audit process

While creating or editing a membership benefit from the user interface, through a health care inbound message, or through the membership repricing inbound web service, the system derives the policy or health plan of the group or individual membership for which the benefit is created or updated. It then checks whether a benefit pricing rule type is

Copyright © 2026, Oracle and/or its affiliates.

associated with the policy or health plan. If so, the system refers the benefit pricing rule type associated with the policy or health plan. If the listed elements (such as benefit end date, benefit amount) are updated or when the status of the membership benefit is set to **ACTIVE** (during creation), **INACTIVE** (during modification), or **DISCARD** (when it is discontinued), the system creates an audit event for the membership benefit using the audit event type given in the benefit pricing rule type. Note that the system considers only the active audit event type given in the benefit pricing rule type.

The audit event is created in the **Pending** status. Note that the system creates one audit event for a membership benefit irrespective of the number of changes made to the membership benefit. In addition, an effective date is stamped corresponding to the audit event which later helps in deriving the timeline. Note that the effective date is set to the membership benefit's start date.

The system then creates a repricing entity detail record for each group or individual membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of the repricing entity detail record is set to **P**.

For example, an audit event is created while adding the following group and individual membership benefits:

Audit Event	AE1	AE2
Membership	GRPMEM	INDMEM
Membership Start Date	01-Jan-2024	01-Jan-2024
Membership Benefit	Medicare Part D LIS	APTC
Policy Plan to which Membership Belongs	PP1	-
Health Plan to which Membership Belongs	-	HP1
Pricing Rules Defined on the Policy Plan	AGE_BASED_1, ADDITIONAL_FEE_1	-
Pricing Rules Defined on the Health Plan	-	AGE_BASED_1, ADDITIONAL_FEE_1
Pricing Rule Types Associated with the Policy Plan	AGE-BASED_01, ADDITIONAL_FEE_01, BENEFIT_01	-
Pricing Rule Types Associated with the Health Plan	-	AGE-BASED_01, ADDITIONAL_FEE_01, BENEFIT_01

For the AE1 audit event, the system creates three repricing entity detail records with the following combinations in the **CI_REPRC_ENTITY_DTL** table:

- GRPMEM, AGE-BASED_01, 01-Jan-2024
- GRPMEM, ADDITIONAL_FEE_01, 01-Jan-2024
- GRPMEM, BENEFIT_01, 01-Jan-2024

Similarly, for the AE2 audit event, the system creates three repricing entity detail records with the following combinations in the **CI_REPRC_ENTITY_DTL** table:

- INDMEM, AGE-BASED_01, 01-Jan-2024
- INDMEM, ADDITIONAL_FEE_01, 01-Jan-2024
- INDMEM, BENEFIT_01, 01-Jan-2024

Once the repricing entity detail records are created successfully, the status of the audit event is set to **Complete**. However, if an error occurs while creating the repricing entity detail records for an audit event, the status of the audit event is set to **Error**.

Copyright © 2026, Oracle and/or its affiliates.

Bill Group Derivation and Pricing Parameters Audit Process

If you add or edit the derivation and pricing parameters for a bill group, the system checks whether an active audit event type exists for the **C1-BillLevel** business object. If an active audit event type exists for the business object, the system creates an audit event for the bill level ID (i.e. bill group and sort ID combination) using the audit event type. The audit event is created in the **Pending** status. Note that the system creates one audit event for a bill group and sort ID combination irrespective of the number of changes made to the bill group and sort ID combination. In addition, an effective date is stamped corresponding to the audit event which later helps in deriving the timeline during premium calculation. Note that the effective date is set to the date from when the derivation and pricing parameters are effective for the bill group and sort ID combination.

For example, a parent customer named PC1 has two bill groups - BG1 and BG2 and the derivation and pricing parameters are edited for the following combinations:

Bill Group	Sort ID	Effective Date	Action
BG1	10	01-01-2019	Edit
BG1	20	07-01-2019	Add
BG2	10	01-01-2019	Edit
BG2	20	05-01-2019	Add

In such case, the system will create four audit events - one for BG1 and 10 combination with the effective date as 01-01-2019, another for BG1 and 20 combination with the effective date as 07-01-2019, third for BG2 and 10 combination with the effective date as 01-01-2019, and fourth for BG2 and 20 combination with the effective date as 05-01-2019.

On executing the **Audit Event Process Monitor (C1-AUDEV)** batch, the system considers the audit events in the **Pending** or **Error** status. By default, it considers the audit events in the **Pending** status. The system checks whether the **C1-AUDBILLVL** algorithm is attached to the respective audit event type. If the **C1-AUDBILLVL** algorithm is attached to the audit event type, it identifies the parent customer of the bill group for whom the derivation and pricing parameters are defined or edited. It then considers all policies of the parent customer and its bill groups and extracts a list of memberships defined on the respective policy plans. It also identifies the active pricing rules on these policy plans and the pricing rule types using which these active pricing rules are created in the system. The system then checks whether the characteristic types specified in the bill group derivation algorithm on each pricing rule type are defined on any extracted list of membership. If so, the system then checks whether the characteristic values match the derivation and pricing parameters of the bill group. If one or more characteristic values do not match the derivation and pricing parameters of the bill group, the system creates a repricing entity detail record for each membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of the repricing entity detail record is set to **P**.

Let us understand this with the help of an example.

The following table illustrates the changes made to the derivation and pricing parameters of various bill groups which belong to the PC1 parent customer:

Bill Group	Sort ID	Effective Date	Derivation and Pricing Parameter	From	To
BG1	10	01-01-2019	Parameter 1	Western	Western
			Parameter 2	Active	Active
			Parameter 3	Grade A	IC01
			Parameter 4	-	-

Copyright © 2026, Oracle and/or its affiliates.

Bill Group	Sort ID	Effective Date	Derivation and Pricing Parameter	From	To
			Source System	X	X
BG1	20	01-01-2019	Parameter 1	Western	Western
			Parameter 2	Active	Active
			Parameter 3	Grade B	IC02
			Parameter 4	-	-
			Source System	X	X
BG2	10	01-01-2019	Parameter 1	Western	Western
			Parameter 2	Active	Active
			Parameter 3	IC01	Grade A
			Parameter 4	-	-
			Source System	X	X
BG2	20	01-01-2019	Parameter 1	Western	Western
			Parameter 2	Active	Active
			Parameter 3	IC02	Grade B
			Parameter 4	-	-
			Source System	X	X

In such case, the system creates four audit events - AE1 for BG1 and 10 combination with the effective date as 01-01-2019, AE2 for BG1 and 20 combination with the effective date as 01-01-2019, AE3 for BG2 and 10 combination with the effective date as 01-01-2019, and AE4 for BG2 and 20 combination with the effective date as 01-01-2019.

Now, let us assume that...

- PC1 has two policies - P1 (where no bill group is associated) and P2 (where BG1 is associated)
- BG1 has one policy named P2 (where PC1 is the policy holder)
- P1 has one plan named PP1 and P2 has one plan named PP2
- PP1 has two memberships - M1 and M2,
- PP2 has three memberships - M3, M4, and M5
- PRT1 and PRT2 are associated with PP1
- PRT3 is associated with PP2
- PP1 has two active pricing rules - PR1 (which is created using PRT1) and PR2 (which is created using PRT2)
- PP2 has one active pricing rule - PR3 (which is created using PRT3)

The following table illustrates the characteristics which are defined for the M1, M2, M3, M4, and M5 memberships:

Membership	Effective Date	Characteristic Type	Characteristic Value
M1	03-01-2019	Location	Western
		Employee Status	Active
		Job Code	Grade A
		Source System	X
M2	05-10-2019	Location	Western

Copyright © 2026, Oracle and/or its affiliates.

Membership	Effective Date	Characteristic Type	Characteristic Value
		Employee Status	Active
		Job Code	IC01
		Source System	X
M3	05-20-2019	Location	Western
		Employee Status	Active
		Job Code	Grade B
		Source System	X
M4	07-20-2019	Location	Western
		Employee Status	Active
		Job Code	IC02
		Source System	X
M5	08-01-2019	Location	Western
		Employee Status	Active
		Job Code	Grade A
		Source System	X

In such case, the system will create the repricing entity detail records for each audit event in the **CI_REPRC_ENTITY_DTL** table.

The following table illustrates the repricing entity detail records that will be created for the respective audit event:

Audit Event	The system will create the repricing entity detail records with the following combinations...
AE1	• M2, PRT1, 01-01-2019 • M2, PRT2, 01-01-2019
AE2	• M4, PRT3, 01-01-2019
AE3	• M1, PRT1, 01-01-2019 • M1, PRT2, 01-01-2019 • M5, PRT3, 01-01-2019
AE4	• M3, PRT3, 01-01-201

Once the repricing entity detail records are created successfully, the status of the audit event is set to **Complete**. However, if an error occurs while creating the repricing entity detail records for an audit event, the status of the audit event is set to **Error**.

Audit Account's Bill Cycle Rule Characteristic and Trigger Repricing

Oracle Revenue Management and Billing provides the ability to audit an account whenever the billing preference characteristic type (specified in the **Bill Cycle Rule Code** option type of the **C1-ASOBLLNG** feature configuration) is

Copyright © 2026, Oracle and/or its affiliates.

defined or updated for the account. Note that the audit process is triggered only when the bill period derived from the billing preference is changed for the account. To enable this feature, you need to do the following:

- Attach the **C1-FIAUDEV** or **C1-REAUDEVNT** algorithm to the **Audit** system event of the **C1-AccountBO** business object.

  Note: If you want to enable this feature for the fully insured individual business, you need to attach the **C1-FIAUDEV** algorithm. However, if you want to enable this feature for the fully insured group business, you need to attach the **C1-REAUDEVNT** algorithm.

- Create an audit event type for the **C1-AccountBO** business object where the following element of the account is audited:

Element Type	Element Name	Element Value
Characteristic	accountCharacteristic/characteristicType	Bill Cycle Rule Code

- Include the audit event type in the required primary pricing rule type.

Note: The audit process is not applicable when you to directly update the bill cycle from the user interface or through an inbound web service. It is applicable only when the billing preference characteristic is added or updated for an account.

When the billing preference characteristic type is defined or updated for an account either from the user interface or through an inbound web service, the system derives the bill period from the billing preference. If the bill period is changed for the account, the system creates an audit event and sets its status to **Pending**. An effective date is stamped corresponding to the audit event which later helps in deriving the timeline during premium calculation.

The system sets the effective date of an audit event in the following manner:

- If you add or update the billing preference characteristic type of an account from a period for which billing is yet pending, the system sets the effective date of the audit event to the characteristic effective date.
- If you add or update the billing preference characteristic type of an account from a period for which billing is already completed, the system sets the effective date of the audit event to the Latest Bill Segment End Date + 1.
- If you add or update the billing preference characteristic type of an account from any date other than the start of the bill period, the system sets the effective date of the audit event to the start date of the next bill period.
- If you add or update the membership details along with the billing preference characteristic type of the respective account, the system sets the effective date of the audit event to the membership audit effective date or characteristic effective date whichever is earliest.

Note: Before creating an audit event, the system checks whether an audit event for the account ID with the same effective date already exists in the **Pending** or **Error** status for the respective action. If so, the system does not create a new audit event for the account. Instead, the system adds a new log entry in the existing audit event.

Once the audit event is created, the system does the following for the respective business:

- **Fully Insured Individual Business** – The system derives the membership that is billed through the account. If the category of the membership is set to **INDV**, the system identifies the health plan to which the membership belongs. It then derives the pricing rule types whose active pricing rules are defined on the respective health plan. A repricing entity detail record is then created for each membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of the repricing entity detail record is set to **Pending**. Once the repricing entity detail records are created successfully, the status of the audit event is changed to **Complete**. However, if an error occurs while creating the repricing entity detail records for an audit event, the status of the audit event is set to **Error**.
- **Fully Insured Group Business** – The system derives the main customer of the account. If the main customer of the account is **Bill Group**, the system leaves the audit event in the **Pending** status. You need to then execute a new batch named **C1-FIACT**. This batch checks whether there is any audit event created for an account in the **Pending** status. If so, it extracts the list of group memberships which are billed to the account and identifies the policy plan to which these memberships belong. It then derives the pricing rule types whose active pricing rules are defined on the respective policy plan. A repricing entity detail record is created for each membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of the repricing entity detail record

Copyright © 2026, Oracle and/or its affiliates.

is set to **Pending**. Once the repricing entity detail records are created successfully, the status of the audit event is changed to **Complete**. However, if an error occurs while creating the repricing entity detail records for an audit event, the status of the audit event is set to **Error**.

Note: The following batches should be executed in the specified sequence – **C1-FIBLR**, **C1-FIMRE**, **C1-FIACT**, **C1-CBIPR**, **C1-FIMRC**.

To recalculate the membership premium, you need to then execute the following batches in the specified order – **C1-REPC1**, **C1-REPC2**, **C1-REPC3**, **C1-FIBCR**.

Note: This feature is tested and certified for the fully insured group and individual lines of health insurance business.

Premium Proration Rules

Until now, the system used the service quantity rule named **PR** attached to the **HCPREMPS** rate schedule to calculate the proration factor for the membership premium. Now, Oracle Revenue Management and Billing enables you to prorate the membership premium using the proration rules defined on the fully-insured group policy plan. A proration rule indicates how you want to prorate the membership premium on various events, such as enrollment, termination, etc. In a proration rule, you need to specify the following:

- **Effective Date** - Used to specify the date from when the proration rule is effective. However, the system considers the latest proration rule and not the effective proration rule while prorating the membership premium.
- **Proration Event Type** - Used to indicate the event when the membership premium should be prorated. The valid values are:
  - **Enrollment** - Used to indicate that you want to prorate the membership premium on enrollment based on the specified proration type.
  - **Termination** - Used to indicate that you want to prorate the membership premium on termination based on the specified proration type.
  - **New Born** - Used to indicate that you want to prorate the membership premium on new born enrollment based on the specified proration type.
  - **Same Month Enrollment and Termination** - Used to indicate that you want to prorate the membership premium when the member person enrolls and terminates in the same month based on the specified proration type.
- **Proration Type** - Used to indicate how you want to prorate the membership premium. The valid values are:
  - **Daily** - Used to indicate that you want to prorate the membership premium from the day the proration event has occurred.
  - **Mid-Month** - Used to indicate that you want to prorate the membership premium based on the proration date. The system calculates the proration date using the following formula: Bill Period Start Date - Specified Number of Days. For example, if the bill period start date is 1st of every month and number of days is 15, then the proration date would be 15th of every month. If a member person is enrolled to the membership on or before the proration date, the system will charge the premium for the member person. However, if a member person is enrolled to the membership after the proration date, the system will not charge the premium for the member person. And, if a member person is terminated from the membership on or after the proration date, the system will charge the premium for the member person. However, if a member person is terminated from the membership before the proration date, the system will not charge the premium for the member person.
  - **Full Month** - Used to indicate that the premium for a member person should be charged when the member person is enrolled or terminated on the coverage start date or coverage end date, respectively. If a member person is enrolled or terminated within the coverage period, the system will not charge the premium for the member person.
  - **Waiver** - Used to indicate that the premium for a member person should be waived off completely for the month when the member person is enrolled or terminated from the membership.
  - **Coverage Days**- Used to indicate that you want to prorate the premium for a member person based on the coverage days. If a member person is covered in the membership for a period less than the specified number of days, the system will not charge the premium for the member person. However, if a member person is covered in the membership for a period equal to or more than the specified number of days, the system will charge the

Copyright © 2026, Oracle and/or its affiliates.

premium for the member person. You can use this proration type when the proration event is set to **Same Month Enrollment and Termination**.

- **Enrollment** - Used to indicate that you want to prorate the premium for a member person using the proration type of the enrollment event. You can use this proration type only when the proration event is set to **Same Month Enrollment and Termination**.
- **Termination** - Used to indicate that you want to prorate the premium for a member person using the proration type of the termination event. You can use this proration type only when the proration event is set to **Same Month Enrollment and Termination**.

- **Number of Days** - Used to specify the number of days to determine the cutoff date when the proration type is set to Mid-Month or Coverage Days.

The following table indicates the proration types which are applicable for a particular proration event:

Proration Event	**Proration Type**
Enrollment	Daily, Mid-Month, Full Month, Waiver
Termination	Daily, Mid-Month, Full Month, Waiver
New Born	Daily, Mid-Month, Full Month, Waiver
Same Month Enrollment and Termination	Coverage Days, Enrollment, Termination, Waiver

Note that if the proration rule is not defined for the **New Born** event, the system uses the proration rule of the **Enrollment** event. The system enables you to define and edit the proration rules for a policy plan from the user interface or through a health care inbound message.

Once the membership premium is calculated either using an age based or tier based pricing rule, the system checks whether the proration rules are defined for the respective policy plan. If so, the system sets the base amount of the corresponding record in the **CI_PRCE_CALC_LN** table to the calculated premium amount. However, if the proration rules are not defined for the respective policy plan, the system sets the base amount of the corresponding record in the **CI_PRCE_CALC_LN** table to the calculated premium amount and proration factor is set to 1.

The system then executes the **C1-AGEPRFC** or **C1-TIERPRFC** algorithm attached to the **Pricing Rule Proration Amount Calculation** system event in the respective age based or tier based pricing rule type. The system invokes these algorithms in the **C1-REPC2** batch. These algorithms derive the proration event for a bill period timeline and accordingly updates the proration factor of the bill period timeline to 1 or 0 for all proration types except Daily. The proration factor is set to 1 when the premium for eligible member person (in case of age based pricing) and the premium for the membership (in case of tier based pricing) should be charged for the bill period timeline. And, proration factor is set to 0 when the premium for eligible member person (in case of age based pricing) and the premium for the membership (in case of tier based pricing) should not be charged for the bill period timeline. In case of the Daily proration type, the proration factor is calculated using the following formula: Number of Days Covered in the Coverage Period/Coverage Period

In case of tier based pricing, the system uses the subscription tier characteristic of the membership to determine the proration event.

Age Monitoring

Age is one of the most critical factor in determining health insurance premium. Therefore, Oracle Revenue Management and Billing enables you to monitor age for premium calculation.

In the age based pricing, the premium is calculated for each eligible member person based on age, employee attributes and modifiers, and then aggregated to derive the total premium for the membership. Until now, the age of a member person was calculated using the member enrollment date, plan start date, or policy renewal or start date. Now, in addition, a new predefined value named **MEMNRAGE (Member Enrollment Nearest Age)** is added to the **Age Calculation Date Basis (C1-AGCAL)** characteristic type. If you set the **C1-AGCAL** characteristic type to **MEMNRAGE**, the system considers the number of days specified in the **C1-PPRAMAGE** algorithm to calculate the nearest age of a

Copyright © 2026, Oracle and/or its affiliates.

member person. The system then derives the rate using the nearest age of the member person and accordingly calculates the premium for the member person. For example, a member person with the date of birth as 02-15-1980 has enrolled to the HMO Med Bronze plan from 01-01-2020 to 12-31-2020. And, the **C1-AGCAL** characteristic type is set to **MEMNRAGE** on the HMO Med Bronze plan where the following age based pricing is defined:

Age Group	**Rate Value**
0-15	$100.00
16-18	$120.00
19-20	$140.00
21-40	$160.00
41-60	$180.00
61-65	$200.00
66-99	$250.00

Let us assume that the **No. of Days** parameter in the **C1-PPRAMAGE** algorithm is set to **90**. The system will calculate the nearest age of the member person through a cutoff date which is calculated using the following formula: Member Enrollment Date + No. of Days. In this case, the cutoff date is 03-30-2020 (01-01-2020 + 90). If the birthday of the member person falls within the cutoff date, the system charges the premium based on the nearest age. However, if the birthday of the member person does not fall within the cutoff date, the system charges the premium based on the actual age. In this case, the birthday falls within the cutoff date, and therefore the premium will be charged using the rate defined for the 41-60 age group (i.e. $180) and not using the rate defined for the 21-40 age group (i.e. $160).

Oracle Revenue Management and Billing enables you to recalculate the age of a member person in a membership in the following scenarios:

- When the policy is renewed
- When the age changes
- From the next month when the age changes

A new characteristic type named **Age Recalculation Date Basis (C1-AGREC)** is introduced in this release. We support the following predefined list of values:

- AGECHNG (Age Changes)
- CHGAGNTMNT (Next Month)
- RENEWAL (Policy Renewal)

If you want to recalculate the membership premium for a plan based on the recalculated age of a member person, you need to do the following:

- Define the **Age Recalculation Date Basis (C1-AGREC)** characteristic for the policy plan or for the policy to which the plan belongs
- Set the **Age Re-Calculation Date Basis** attribute to **Age Recalculation Date Basis (C1-AGREC)** in the age based pricing rule type which is associated with the policy plan

The system does the following when you add a membership to a policy plan or a member person to a membership:

If the Age Recalculation Date Basis characteristic type is set to…	**Then,**
AGECHNG	The system creates an audit event for a member person when the birthday falls within the enrollment date range. Here, the effective date of the audit event is set to the birth date of the member person.
CHGAGNTMNT	The system creates an audit event for a member person when the birthday falls within the enrollment date range. Here, the effective date of the audit event is set

Copyright © 2026, Oracle and/or its affiliates.

If the Age Recalculation Date Basis characteristic type is set to…	Then,
	to the billing date of the next month. For example, if the bill date in a bill period starts 1st of every month and the date of birth of a member person is 05-10-2020, the effective date of the audit event is set to 01-11-2020.
RENEWAL	The system creates an audit event for a member person when the birthday falls within the new enrollment date range (i.e. from original policy end date+1 to new policy end date). Here, the effective date of the audit event is set to the birth date of the member person.

Apart from the membership premium recalculation, the **Age Recalculation Date Basis (C1-AGREC)** characteristic is used to evaluate the member relationship characteristic of each member person and subscription tier characteristic of the membership when the **Young Adult Applicability** characteristic is set to **Y** and the child or dependent enrolling to the membership becomes young adult in the enrollment period.

The **C1-FIAUDEV** algorithm is enhanced to support the age recalculation feature. It creates audit events in the C1_AUDIT_EVENT table and repricing entity detail records in the CI_REPRC_ENTITY_DTL table when the age of a member person changes within the enrollment period.

State of Issue

The State of Issue feature enables you to search for the following characteristics on a state:

- Maximum Number of Dependents
- Maximum Age Limit for Maximum Dependent Count
- Maximum Number of Dependents Order Priority
- Age Calculation Date Basis
- Newborn Gift Days
- Newborn Gift Days Applicability
- Young Adult Max Age Limit
- Young Adult Inclusion Applicability

It helps in identifying a list of eligible children in a membership. To enable the State of Issue feature, you need to do the following:

1. Define a predefined characteristic type named **State of Issue** where the characteristic entity is set to **Membership**, **Policy Plan** and **Policy**.
2. Define the required states as the predefined values for the **State of Issue** characteristic type.
3. Set the **State of Issue** characteristic type in the **State of Issue Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration.

If the State of Issue feature is enabled, the system checks whether the **State of Issue** characteristic is defined for the membership when any of the above required characteristic is not defined at the membership person and membership levels. If the **State of Issue** characteristic is defined for the membership, the system checks whether the above required characteristic is defined on the state where the membership is issued. For example, if the **State of Issue** characteristic on the M1 membership is set to **California**, then the system will search for any of the above required characteristic on the **California** state. If the required characteristic is defined for the state, the system considers it while identifying a list of eligible children in the membership.

If the required characteristic is not defined at the membership person, membership, state where the membership is issued and policy plan levels, the system checks whether the **State of Issue** characteristic is defined for the policy plan. If the **State of Issue** characteristic is defined for the policy plan, the system checks whether the above required characteristic is defined on the state where the policy plan is issued. If the required characteristic is defined for the state, the system considers it while identifying a list of eligible children in the membership.

Copyright © 2026, Oracle and/or its affiliates.

However, if the required characteristic is not defined at the membership person, membership, state where membership is issued, policy plan, state where the policy plan is issued, and policy levels, the system checks whether the **State of Issue** characteristic is defined for the policy. If the **State of Issue** characteristic is defined for the policy, the system checks whether the above required characteristic is defined on the state where the policy is issued. If the required characteristic is defined for the state, the system considers it while identifying a list of eligible children in the membership.

Membership Premium Calculation

The membership premium is calculated differently using the following pricing:

- **Age-Based Pricing** - The system first identifies a list of members which are eligible for premium calculation in a membership. It derives the main subscriber and member persons (i.e. Spouse and Children) which are related to the main subscriber using the relationship type specified in the **Age Based** pricing rule type. To identify a list of eligible children for premium calculation, the system uses the following characteristics:
  - **Maximum Number of Dependents** - Used to indicate the maximum number of children which are eligible for premium calculation.
  - **Maximum Age Limit for Maximum Dependent Count** - Used to indicate the maximum age limit for children which are eligible for premium calculation.
  - **Maximum Number of Dependents Order Priority** - Used to indicate whether you want to consider the youngest or eldest children during premium calculation. The valid values are - **YOUNGEST** and **ELDEST**.
  - **Age Calculation Date Basis** - Used to indicate whether the member person's age should be calculated using the member person's enrollment date or policy's start or renewal date.
  - **Newborn Gift Days** - Used to indicate the number of days you want to offer as gift days from the new born child's birth date. As a result, no premium will be calculated for this period.
  - **Newborn Gift Days Applicability** - Used to indicate whether you want to offer gift days in case of a new born. The valid values are - **Y** and **N**.
  - **Young Adult Max Age Limit** - Used to indicate the maximum age limit for young adults which are eligible for premium calculation.
  - **Young Adult Inclusion Applicability** - Used to indicate whether you want to consider the young adults during the premium calculation. The valid values are - **Y** and **N**.

Note: Only the **Age Calculation Date Basis (C1-AGCAL)** characteristic type is shipped with the product. You need to create the remaining characteristic types in the system and set their characteristic entity to the following - **Membership Person**, **Membership**, **Policy Plan**, **Policy**, and/or **State**.

The system searches for these characteristics on the following entities in the specified sequence:

Copyright © 2026, Oracle and/or its affiliates.

1. Membership Person
2. Membership
3. State where the Membership is issued
4. Policy Plan
5. State where the Policy Plan is Issued
6. Policy
7. State where the Policy is Issued

For example, if the **Maximum Number of Dependents** characteristic is defined for all entities, the system considers the characteristic which is defined at the Member Person level because it is the lowest level. However, if the **Newborn Gift Days Applicability** characteristic is defined at the Policy Plan and Policy levels, the system considers the characteristic which is defined at the Policy Plan level because it is the lowest level. In other words, the system crawls from the lowest to the highest level while searching for the above characteristics. You can also define the above characteristics on the state where the membership, policy plan and/or policy are issued. For more information, refer to the State of Issue section.

Once the eligible members for premium are identified, the system derives the base fee and applicable modifier fee which are defined in the pricing rules. The system then calculates the timeline for each membership and price item combination. The timeline is basically calculated to understand the period for which the premium is applicable. For example, if a policy plan named **P1** has the following membership:

Membership	M1
Member Persons	P1 and P2
Membership Start Date	01-01-2019
Membership End Date	31-12-2019
P0 Main Subscriber's Start Date	01-01-2019
P0 Main Subscriber's End Date	31-12-2019
P1 Member's Start Date	01-01-2019
P1 Member's End Date	30-06-2019
P2 Member's Start Date	01-10-2019
P2 Member's End Date	31-12-2019

The **P1** policy plan is associated with an Age Based pricing rule type which contains the **Premium Fee** price item. The Age Based pricing rule for the **Premium Fee** price item is effective from 01-01-2019 to 31-12-2019.

In this case, the system will create the following timelines when you add **P2** member person in the **M1** membership:

Membership	**Price Item**	**Timeline Start Date (Effective Date)**	**Timeline End Date**
M1	Premium Fee	01-01-2019	30-06-2019 (i.e. P1 Member's End Date)
M1	Premium Fee	01-07-2019	30-09-2019
M1	Premium Fee	01-10-2019 (i.e. P2 Member's Start Date)	31-12-2019

It creates timelines using the membership's start and end dates, member person's start and end dates, and effective date. For each timeline, the system calculates the premium for all eligible member persons in the membership. Let us assume that the effective pricing rule is configured in the following manner:

Copyright © 2026, Oracle and/or its affiliates.

Age Band	Fee
0-21	$50
21-65	$100
>65	$150

P0 belongs to the 21-65 age band and P1 and P2 belongs to the 0-21 age band. Therefore, the premium is calculated using the following base fee:

Membership	Price Item	Timeline Start Date (Effective Date)	Timeline End Date	Base Fee
M1	Premium Fee	01-01-2019	30-06-2019 (i.e. P1 Member's End Date)	P0: $100 P1: $50
M1	Premium Fee	01-07-2019	30-09-2019	P0: $100
M1	Premium Fee	01-10-2019 (i.e. P2 Member's Start Date)	31-12-2019	P0: $100 P2: $50

Now, let us assume the following characteristics are defined on the **P1** policy plan which offers gift days to a new born child:

Effective Date	Characteristic Type	Characteristic Value
01-01-2019	Newborn Gift Days Applicability	Y
01-01-2019	Newborn Gift Days	30

Now, if the main subscriber adds his child named **C1** who is born on 05-03-2019, the system will create the following timelines:

Membership	Price Item	Timeline Start Date (Effective Date)	Timeline End Date
M1	Premium Fee	01-01-2019	03-04-2019 (i.e. 05-03-2019 +30 Days)
M1	Premium Fee	04-04-2019 (New Born Considered for Premium Calculation)	30-06-2019 (i.e. P1 Member's End Date)
M1	Premium Fee	01-07-2019	30-09-2019
M1	Premium Fee	01-10-2019 (i.e. P2 Member's Start Date)	31-12-2019

It creates timelines using the membership's start and end dates, member person's start and end dates, and effective date. For each timeline, the system calculates the premium for all eligible member persons in the membership. In this case, the premium is calculated using the following base fee:

Copyright © 2026, Oracle and/or its affiliates.

Membership	Price Item	Timeline Start Date (Effective Date)	Timeline End Date	Base Fee
M1	Premium Fee	01-01-2019	03-04-2019 (i.e. 05-03-2019 +30 Days)	P0: $100 P1: $50
M1	Premium Fee	04-04-2019 (New Born Considered for Premium Calculation)	30-06-2019 (i.e. P1 Member's End Date)	P0: $100 P1: $50 C1: $50
M1	Premium Fee	01-07-2019	30-09-2019	P0: $100 C1: $50
M1	Premium Fee	01-10-2019 (i.e. P2 Member's Start Date)	31-12-2019	P0: $100 P2: $50 C1: $50

- **Tier Based Pricing** - The system first derives the base fee which is defined in the pricing rules. It then calculates the timeline for each membership and price item combination. The timeline is basically calculated to understand the period for which the premium is applicable. For example, if a policy plan named **P2** has the following membership:

Membership	M1
Member Persons	P1 and P2
Membership Start Date	01-01-2019
Membership End Date	31-12-2019
Membership Tier	ES (Employee + Spouse)

The **P2** policy plan is associated with a Tier Based pricing rule type which contains the **Premium Fee** price item. The Tier Based pricing rule for the **Premium Fee** price item is effective from 01-01-2019 to 31-12-2019.

The system will create the following timeline when the **M1** membership is added to the **P2** policy plan:

Membership	Price Item	Timeline Start Date (Effective date)	Timeline End Date
M1	Premium Fee	01-01-2019	31-12-2019

It creates timelines using the membership's start and end dates and effective date. For each timeline, the system calculates premium for the membership. Let us assume that the effective pricing rule is configured in the following manner:

Tier Level	Fee
E (Employee Only)	$100
ES (Employee + Spouse)	$200
F (Family)	$350
EC (Employee+ Children)	$150

Copyright © 2026, Oracle and/or its affiliates.

The **M1** membership belongs to the **ES (Employee + Spouse)** tier. Therefore, the premium is calculated using the following base fee:

Membership	Price Item	Timeline Start Date (Effective Date)	Timeline End Date	Base Fee
M1	Premium Fee	01-01-2019	31-12-2019	$200

Now, let us assume the following characteristics are defined on the **P2** policy plan which offers gift days to a new born child:

Effective date	Characteristic Type	Characteristic value
01-01-2019	Newborn Gift Days Applicability	Y
01-01-2019	Newborn Gift Days	30

Now, if the main subscriber adds his child named **C1** who is born on 05-03-2019, the system will create the following timelines:

Membership	Price Item	Timeline Start Date (Effective date)	Timeline End Date
M1	Premium Fee	01-01-2019	03-04-2019 (i.e. 05-03-2019 +30 Days)
M1	Premium Fee	04-04-2019 (New Born Considered for Premium Calculation)	31-12-2019

In this case, the premium is calculated using the following base fee considering the membership tier has changed from **ES (Employee + Spouse)** to **F (Family)**:

Membership	Price Item	Timeline Start Date (Effective Date)	Timeline End Date	Base Fee
M1	Premium Fee	01-01-2019	03-04-2019 (i.e. 05-03-2019 +30 Days)	200
M1	Premium Fee	04-04-2019 (New Born Considered for Premium Calculation)	31-12-2019	350

The tasks performed through **Membership Repricing (C1-MEMBREPRICE)** inbound web service are described below:

- **Adding a Membership** - Whenever you are creating a membership for a policy or health plan, you need to specify the plan for which you want to create the membership, a person who is the main subscriber of the membership, and the way in which the main subscriber is related to the membership. Once the membership is created, you can add more members (i.e.persons) to the membership.
- **Editing a Membership** - Once the membership is created for a policy or health plan, you can edit the membership information such as start date, end date, and characteristics.
- **Viewing the Membership Details** - On the **Membership** page, you can view the membership details, member persons which are added to a membership, and the additional plans of the main subscriber.
- **Adding a Member Person to a Membership** - While adding a person to a membership, you need to specify whether the person is the main subscriber of the membership, whether the person is financially responsible for the

Copyright © 2026, Oracle and/or its affiliates.

membership, and how the person is related to the main subscriber. At a time, only one person can be the main subscriber of the membership.

- **Removing a Member Person from a Membership** - You cannot remove a member person, who is the main subscriber, from the membership. You can inactivate a member person whenever required. If you inactivate a member person who is the main subscriber of the membership, the system automatically inactivates the membership and all other member persons which are included in the membership.
- **Simulating Membership Premium Calculation**

  - You can simulate add and update operations carried-out for a membership, and can also calculate the premium derived from the simulation process. Any set of changes conducted as a part of the simulation process would not impact the actual membership and premium calculation process.

Bill Group Derivation for Membership

While deriving a bill group for a membership, the system first checks whether the characteristics specified in the following option types of the **C1-ASOBLLNG** feature configuration are defined for the membership:

- **Account Identifier Type Char Type** - Used to specify the characteristic type which stores the identifier type of the account to which the membership should be billed. Here, you must specify a characteristic type where the characteristic entity is set to **Membership**.
- **Account Identifier Value Char Type** - Used to specify the characteristic type which stores the corresponding identifier of the account to which the membership should be billed. Here, you must specify a characteristic type where the characteristic entity is set to **Membership**.

If the above two characteristics are defined for the membership, the system derives the account and then the person (i.e. bill group or parent customer) to which the account belongs. However, if the above two characteristics are not defined for the membership, the system then checks whether the characteristics specified in the following option types of the **C1-ASOBLLNG** feature configuration are defined for the membership:

- **Person Identifier Type Char Type** - Used to specify the characteristic type which stores the identifier type of the person to which the membership should be billed. Here, you must specify a characteristic type where the characteristic entity is set to **Membership**.
- **Person Identifier Value Char Type** - Used to specify the characteristic type which stores the corresponding identifier of the person to which the membership should be billed. Here, you must specify a characteristic type where the characteristic entity is set to **Membership**.

If the above two characteristics are defined for the membership, the system derives the person (i.e. bill group or parent customer) to which the membership should be billed. However, if the above two characteristics are not defined for the membership, the system checks whether the characteristics specified in the following parameters of the **C1_MEMBGDRV** algorithm are defined for the membership:

- **Characteristic Type for Bill level 1** - Used to specify the characteristic type which stores the bill group derivation and pricing parameter 1 for the membership. Here, you must specify a characteristic type where the characteristic entity is set to **Membership**.
- **Characteristic Type for Bill level 2** - Used to specify the characteristic type which stores the bill group derivation and pricing parameter 2 for the membership. Here, you must specify a characteristic type where the characteristic entity is set to **Membership**.
- **Characteristic Type for Bill level 3** - Used to specify the characteristic type which stores the bill group derivation and pricing parameter 3 for the membership. Here, you must specify a characteristic type where the characteristic entity is set to **Membership**.
- **Characteristic Type for Bill level 4** - Used to specify the characteristic type which stores the bill group derivation and pricing parameter 4 for the membership. Here, you must specify a characteristic type where the characteristic entity is set to **Membership**.
- **Characteristic Type for Source system** - Used to specify the characteristic type which stores the external system from where the fully-insured policy is received for billing. Here, you must specify a characteristic type where the

Copyright © 2026, Oracle and/or its affiliates.

characteristic entity is set to **Membership**, **Policy Plan**, or **Policy**. The system searches for the characteristic on the following entity in the specified order:

1. Membership
2. Policy Plan
3. Policy

If the characteristic is defined at first level (i.e. membership), the system will not search for the characteristic at the subsequent levels. However, if the characteristic is not defined at first level, the system will search for the characteristic at the second level (i.e. policy plan). If the characteristic is defined at second level, the system will not search for the characteristic at the subsequent level. However, if the characteristic is not defined at second level, the system will search for the characteristic at the third level (i.e. policy).

To derive the source system from the membership, policy plan, or policy, the system first derives the policy plan to which membership belongs and then the policy to which the policy plan belongs. The above characteristics indicate the Source System, Parameter 1, Parameter 2, Parameter 3, and Parameter 4. The system derives a bill group using the derivation and pricing parameters (i.e. Source System, Parameter 1, Parameter 2, Parameter 3, and Parameter 4) which are defined for the bill group. Note that the system considers the derivation and pricing parameters which are effective on the effective date (which is available corresponding to the record in the **CI_REPRC_ENTITY_DTL** table). It first searches for the bill group using the exact match. Let us understand this with the help of an example.

The following table illustrates the derivation and pricing parameters defined for various bill groups which belong to the PC1 parent customer:

Bill Group	**Derivation and Pricing Parameters**				
	Source System	**Parameter 1**	**Parameter 2**	**Parameter 3**	**Parameter 4**
BG1	X	Western	Grade A	Active	-
BG2	X	Western	Grade A	Retiree	-
BG3	Y	Western	-	-	-

And, the following characteristics are defined for the M1 membership which belongs to the PP1 policy plan:

Entity	**Characteristic Type**	**Characteristic Value**
M1	Location	Western
M1	Grade	Grade A
PP1	External System	X

Now, if the **Location**, **Grade**, and **External System** characteristic types are specified in **Characteristic Type for Bill level 1**, **Characteristic Type for Bill level 2**, and **Characteristic Type for Source system** parameters of the **C1_MEMBGDRV** algorithm, the system searches for a bill group where the following derivation and

If the exact match is not available, the system finds the bill group using the best fit match.

Once the policy and policy plan is derived, the system

Based on the characteristic values on the membership for bill level 1 to bill level 4 and characteristic value of source system, the bill group and parent customer corresponding to the membership is derived. 2. Deriving policy : Policy is derived from the plan to which the membership is linked.

To derive the bill group for a membership to which its premium and other pass-through charges should be billed, you need to attach an algorithm created using the **C1_MEMBGDRV** algorithm type to the **Bill Group Derivation** system event in a pricing rule type where the category is set to **Age Based**, **Tier Based**, or **Pass-Through Billable Charge**.

Note that while searching for a bill group, the source system and Parameter 1 (i.e. Bill Level 1) are mandatory.

This algorithm contains the following parameters:

Copyright © 2026, Oracle and/or its affiliates.

- **Characteristic Type for Bill Level 1** - Used to indicate the characteristic type. This characteristic type must be defined on the membership. It is used to store the derivation and pricing parameter 1 for the membership.
- **Characteristic Type for Bill Level 2** - Used to indicate the characteristic type. This characteristic type must be defined on the membership. It is used to store the derivation and pricing parameter 2 for the membership.
- **Characteristic Type for Bill Level 3** - Used to indicate the characteristic type. This characteristic type must be defined on the membership. It is used to store the derivation and pricing parameter 3 for the membership.
- **Characteristic Type for Bill Level 4** - Used to indicate the characteristic type. This characteristic type must be defined on the membership. It is used to store the derivation and pricing parameter 4 for the membership.

Once the bill group is derived, the system derives the parent customer of the bill group. If the system could not derive the policy, bill group, or parent customer, the status of the record is changed to **Error (E)** in the CI_REPRC_ENTITY_DTL table.

Account and Price Item Derivation for Membership

A new algorithm type named **C1_ACCPRIMEM** is added in this release. You need to attach an algorithm created using the **C1_ACCPRIMEM** algorithm type to the **Account and Price Item Derivation** system event in a pricing rule type where the category is set to **Age Based**, **Tier Based**, or **Pass-Through Billable Charge**.

This algorithm fetches the effective pricing rule for each price item specified in the pricing rule type on the effective date. It first searches for effective pricing rules on the policy plan to which the membership belongs. If the system does not find any effective pricing rule for a price item on the policy plan, it inherits the effective pricing rule for the price item from the parent customer level. The system then derives the account with a particular invoice type (to which a price item must be billed) based on the priority which is defined for the respective price item in the pricing rule type. Once the account is derived, the system then checks whether the account has one active contract of the contract type which is associated with the price item. If so, it fetches the contract for further processing. If the system could not derive the effective pricing rule for any price item or if the account or active contract for the account could not be derived, the status of the record is changed to **Error (E)** in the CI_REPRC_ENTITY_DTL table.

Tightly Coupled Bill Cycle and Bill Period through Billing Preference

Oracle Revenue Management and Billing uses the bill cycle of an account to generate the bills for the account and the bill period of an account to create the billable charges for the account. If the bill cycle and bill period used for an account are not in sync, the system will not give the desired output. To handle this issue, a new feature is introduced wherein the bill cycle and bill period can be tightly coupled with each other.

Note:

This feature is designed, developed, and tested only for the health insurance domain and not for the financial services domain.

This feature is tested and certified for the fully insured group and fully insured individual lines of business.

You can define a billing preference wherein you can pair the bill cycle and bill period. The system then derives the bill cycle and bill period for an account from the billing preference. You can set the billing preference for an account through a characteristic type that is specified in the **Bill Cycle Rule Code** option type of the **C1-ASOBLLNG** feature configuration. You can define this characteristic for an account from the user interface or through a health care inbound message.

Note: We have not shipped a billing preference characteristic type with the product. You must create a billing preference characteristic type where the characteristic entity is set to **Account**.

Bill Cycle Derivation

Whenever you create or edit an account from the user interface or through a health care inbound message, the system checks whether the characteristic type specified in the **Bill Cycle Rule Code** option type of the **C1-ASOBLLNG** feature configuration is defined for the account. If so, the system checks whether the value specified for the billing preference characteristic type is already defined in the system. If so, the system derives the bill cycle from the **Bill Cycle** attribute of the billing preference. In such case, the system ignores the bill cycle if explicitly provided for the account from the user interface or through the inbound message.

However, if the **Bill Cycle Rule Code** option type is not defined in the **C1-ASOBLLNG** feature configuration or if the billing preference characteristic type is not defined for an account, the system considers the bill cycle which is explicitly provided for the account. In addition, when the billing preference characteristic is updated for an account from the user interface or through a health care inbound message, the system derives the new bill cycle from the respective billing preference in the system.

Note:

The bill cycle is derived from the billing preference while creating or editing an account only when the **C1-DERIVEBLC** algorithm is attached to the **Post-Processing** system event of the business object using which the account is created in the system.

If the billing preference specified for the account does not exist in the system, an appropriate To Do is created for the user indicating that the specified billing preference is invalid.

Bill Period Derivation

Copyright © 2026, Oracle and/or its affiliates.

Until now, the system derived the bill period for an account using the **Invoice Day (C1OFFRST)** characteristic of the account. Now, alternatively, the system also allows you to derive the bill period for an account from the billing preference which is defined using the billing preference characteristic type. The system considers the billing preference characteristic type specified in the **Bill Cycle Rule Code** option type of the **C1-ASOBLLNG** feature configuration.

To derive the bill period from the billing preference, you need to attach the **Bill Period Derivation (C1-BILLPDRV)** algorithm to the **Account and Price Item Derivation Post-Processing** system event of the age based, tier based, additional fee, benefit, and/or discount charge pricing rule types. The system invokes the **C1-BILLPDRV** algorithm in the **C1-REPC1** batch. This algorithm derives the bill period for the account from the billing preference. It sets the **RECURRING_FLG** column to **BP** (i.e., Bill Period) and **RECURRING_VAL** column to the bill period derived from the billing preference corresponding to the record in the **CI_REPRC_REQ_DTL** table. For more information, see C1-BILLPDRV on page 3519.

Note: If the **Bill Cycle Rule Code** option type is not defined in the **C1-ASOBLLNG** feature configuration, or if the billing preference characteristic type is not defined for an account, or if the **C1-BILLPDRV** algorithm is not attached to the pricing rule type, the system derives the bill period for the account using the traditional manner (i.e., using the **C1-FIBCBP** algorithm attached to the **Billable Charge Creation Pre-Processing** system event of the respective pricing rule type).

Bill Period Timeline

Prerequisites

To create a bill period timeline, you need to ensure the following:

- Bill period is defined in the system.
- Derived bill period is monthly where the bill dates start from 1st of every month.

On enrolling a group or individual membership, the system creates a timeline for each month of the membership coverage period in the **CI_REPRC_REQ_DTL** table. It refers the derived bill period while creating the timelines for the repricing record. For example, when a membership is enrolled for the coverage period 01-Jan-2025 to 31-Dec-2025, the system creates a timeline for each month starting from 1st Jan 2025 using the bill period (as shown in the below table).

Bill Period	Bill Period Timeline with Effective Date
01-01-2025 to 01-31-2025	TL1 with 01-01-2025
02-01-2025 to 02-29-2025	TL2 with 02-01-2025
03-01-2025 to 03-31-2025	TL3 with 03-01-2025
04-01-2025 to 04-30-2025	TL4 with 04-01-2025
05-01-2025 to 05-31-2025	TL5 with 05-01-2025
06-01-2025 to 06-30-2025	TL6 with 06-01-2025
07-01-2025 to 07-31-2025	TL7 with 07-01-2025

Copyright © 2026, Oracle and/or its affiliates.

Bill Period	Bill Period Timeline with Effective Date
08-01-2025 to 08-31-2025	TL8 with 08-01-2025
09-01-2025 to 09-30-2025	TL9 with 09-01-2025
10-01-2025 to 10-31-2025	TL10 with 10-01-2025
11-01-2025 to 11-30-2025	TL11 with 11-01-2025
12-01-2025 to 12-31-2025	TL12 with 12-01-2025

However, if a repricing is triggered for a membership due to any change (for example, a newborn entry) effective from 01-Jun-2025, then the system creates a timeline for each month starting from 1st June 2025 using the bill period (as shown in the below table).

Bill Period	Bill Period Timeline with Effective Date
06-01-2025 to 06-30-2025	TL1 with 01-01-2025
07-01-2025 to 07-31-2025	TL2 with 02-01-2025
08-01-2025 to 08-31-2025	TL3 with 03-01-2025
09-01-2025 to 09-30-2025	TL4 with 04-01-2025
10-01-2025 to 10-31-2025	TL5 with 05-01-2025
11-01-2025 to 11-30-2025	TL6 with 06-01-2025
12-01-2025 to 12-31-2025	TL7 with 07-01-2025

To create timelines for a repricing record, you need to attach the **Bill Period Timeline Creation** (**C1-BILLRPCR**) algorithm to the **Account and Price Item Derivation Post-Processing** system event of the age based, tier based, additional fee, benefit, and/or discount charge pricing rule types. The system invokes the **C1-BILLRPCR** algorithm in the **C1-REPC1** batch. This algorithm creates a bill period timeline for the membership. For more information, see C1-BILLRPCR on page 3519.

Bill Enquiry with Rate-to-Amount Traceability

Bill analysts often need to explain not only what was billed, but also how a charge was priced and which business change caused it. This enhancement turns bill information into a connected traceability experience. Starting from a bill segment, users can follow the calculation path through pricing timeline entries, pricing calculations, audit events, inbound messages, and audit reason that explains the premium change. This enhancement supports regular and retro-correction billable charges, including active and cancelled charges, while keeping the user in the existing **Bill Information** portal rather than introducing a separate inquiry page.

Configuration and Operating Prerequisites

The following configurations and prerequisites must be in place for this enhancement:

- The **Pricing Rule Type** must be configured with an **Audit Reason** when premium change reason derivation is expected.
- Plugin the **Bill Segment Post Processing For Req Ref Id (C1-BSEGREFID)** algorithm on the **Contract Type - Bill Segment Post Processing** spot to stamp the **Request Reference ID** on the **Bill Segment Calculation-line** characteristic so that bill segment can be connected to the pricing calculation chain.
- For **Fully-Insured Group**, in case of a benefit full snapshot, a new benefit record is created whenever the amount changes or end date is updated.

End-to-End Traceability Journey

Copyright © 2026, Oracle and/or its affiliates.

The journey begins from the **Bill** screen where you search for a bill and navigate to the **Bill Information** screen to view the end-to-end traceability of the respective bill. In the **Bill Information** screen, if you click the **Broadcast** icon corresponding to the respective bill segment detail record in the **Bill Segment Details** zone, dependent zones like **SQ Details**, **Bill Segment Calculation Lines**, and **Pricing Timeline** appear. Now, when you broadcast a record from the **Pricing Timeline** zone, **Pricing Calculation Details** and **Audit Events Details** zones appear.

When you further broadcast a record from the **Audit Event Details** zone, the **Audit Reason** zone appears. Within the **Audit Event Details** zone, you can review the event status, action, effective date, entity, and inbound message information. Finally, on broadcasting an audit event detail record, the **Audit Reason** zone appears which displays the associated audit reason details, including the reason description, audited element, and the prior and updated values.

Note:

The bill traceability design is applicable for **Fully-Insured Individual** and **Fully-Insured Group** line of business.

The **Audit Event Details** and **Audit Reason** is a shared zone between **Bill Information** and **Bill Drill Down** screen.

Audit Reason Derivation

Audit reasons are derived from audit event data. When several premium-impacting events contribute to an outcome, the values are concatenated in the order in which those events were triggered. In the audit reason, when an auditable attribute is modified within the same effective-dated record, both the prior and current values are captured. So, when a new effective-dated record is created, only the current value is captured in the audit reason.

Group Level Audit Coverage

For Fully-Insured Group line of business, this enhancement supports audit reason capture at person, billing account, membership, member-person, benefit, and bill levels. This enhancement also establishes guardrails so that routine enrollment activity does not create misleading audit records, such as:

- Enrolling a member person or an account does not generate an audit entry.
- An account enrollment that includes a bill-cycle update does not generate an audit entry. The solution maintains a membership pricing audit mapping that connects the relevant audit event and repricing request to the affected membership.

9/10 Billing (Skip Months)

In the health insurance domain, for a yearly coverage, the membership premium is calculated and billed every month. The fully-insured large groups such as school districts have two-three months of holiday every year. Usually, they prefer to distribute the off months' premium in the remaining months of the coverage period. Oracle Revenue Management and Billing enables you to handle this requirement through the **9/10 Billing (Skip Months)** feature. Note that, in this feature, only the recurring charges for membership premium and administration fees will be considered for distribution in the non-skip months of the coverage period.

You can set the skip months in a billing preference through the **Field Mapping** screen. You can specify one or more skip months in a billing preference which may be continuous or non-continuous. However, you cannot skip all 12 months in a billing preference. The system derives the skip months for an account using the billing preference. You can set the billing preference for an account through a characteristic type which is specified in the **Bill Cycle Rule Code** option type of the **C1-ASOBLLNG** feature configuration. Note that you must specify a characteristic type where the characteristic entity is set to **Account** in the **Bill Cycle Rule Code** option type. You can define this characteristic for an account from the user interface or through a health care inbound message. You can view a list of accounts for which skip months are defined in the billing preference using the **Skip Months** field in the **360° Search** zone.

A new column named **DIS_AMT** is added to the **CI_PRCE_CALC** and **CI_PRCE_CALC_LN** tables. While calculating the membership premium using the age based or tier based pricing rule, the system checks whether the skip months are defined for the account. If the skip months are not defined for the account, the system stores the calculated premium in the **DIS_AMT** column.

Copyright © 2026, Oracle and/or its affiliates.

A new algorithm type named **C1-SKPMNTHPC** is introduced in this release. To setup the **9/10 billing** feature, you need to create an algorithm using the **C1-SKPMNTHPC** algorithm type and attach it to the **Skip Month Premium Calculation** system event of the required age based and tier based pricing rule types. The system invokes this algorithm in the **C1-REPC3** batch. This algorithm distributes the total premium in the non-skip months of the coverage period. In case of an age based pricing, the system calculates the distributed amount for each eligible member in the membership. And, in case of a tier based pricing, the system calculates the distributed amount for the membership. When a billable charge is created for a non-skip month through the **C1-FIBCR** batch, the distributed amount is stored through an SQI on the billable charge.

Repricing

Oracle Revenue Management and Billing extends the Repricing feature for the insurance domain. To enable this feature for fully-insured line of business, you need to setup the audit framework for membership and age based and tier based pricing rules. For more information, refer to the Audit Framework for Membership and Fully-Insured Pricing Rules section.

To recalculate the membership premium, you need to execute the following batches in the specified order:

1. **Identify Entities for Repricing (C1-REPC1)** - Until now, this batch identified a set of accounts which were impacted due to change in a price list and then created a repricing request for such accounts. In this release, new parameters named **Repricing Mode** and **Membership ID** are added in this batch. If the **Repricing Mode** parameter is set to **ACCT**, this batch identifies a set of accounts which were impacted due to change in a price list and then creates a repricing request for such account. However, if the **Repricing Mode** parameter is set to **MEMB**, this batch considers the records in the **Pending (P)** and **Error (E)** status from the CI_REPRC_ENTITY_DTL table. For each record, the system invokes the algorithms attached to the following system events of the pricing rule type in the specified order:

   a. **Bill Group Derivation** - Used to derives the policy, bill group, and parent customer of the bill group.
   b. **Account and Price Item Derivation** - Used to derive the pricing rules for the price items (which are present in the pricing rule type) on the policy plan (to which the membership belongs).

   Once the pricing rules are derived, the system creates a repricing request for the membership, pricing rule, and effective date combination. Finally, the status of the corresponding record is set to **Complete (C)** in the CI_REPRC_ENTITY_DTL table. If any error occurs while creating a repricing request, the status of the corresponding record is set to **Error (E)** in the CI_REPRC_ENTITY_DTL table.

   This batch is a multi-threaded batch. For more information about the batch, refer to *Oracle Revenue Management and Billing Batch Guide*.
2. **Process Repricing Request (C1-REPC2)** - Until now, this batch calculated and persisted the rate for the account, price item, and effective date combination in the CI_PRCE_CALC table. In this release, new parameters named **Repricing Mode** and **Membership ID** are added in this batch. If the **Repricing Mode** parameter is set to **ACCT**, this batch calculates and persist the rate for the account, price item, and effective date combination in the CI_PRCE_CALC table. However, if the **Repricing Mode** parameter is set to **MEMB**, this batch considers the records in the **Pending (P)** and **Error (E)** status from the CI_REPRC_REQ_DTL table. If the pricing rule in the record is **Age Based**, the system invokes the algorithms attached to the following system events of the pricing rule type in the specified order:

   a. **Pricing Rule Pre Processing** - Used to identify the eligible member persons for premium calculation.
   b. **Pricing Rule Premium Calculation** - Used to calculate the premium for the membership.

   Once these algorithms are executed, the premium is calculated for each eligible member person and stored in the CI_PRCE_CALC_LN table and the total premium for the membership is stored in the CI_PRCE_CALC table. Finally, the status of the corresponding record is set to **Complete (C)** in the CI_REPRC_REQ_DTL table.

   However, if the pricing rule in the record is **Tier Based**, the system invokes the algorithm attached to the following system event of the pricing rule type:

   - **Pricing Rule Premium Calculation** - Used to calculate the premium for the membership.

Copyright © 2026, Oracle and/or its affiliates.

Once the algorithm is executed, the premium is calculated for the membership and stored in the CI_PRCE_CALC table. Finally, the status of the corresponding record is set to **Complete (C)** in the CI_REPRC_REQ_DTL table.

This batch is a multi-threaded batch. For more information about the batch, refer to *Oracle Revenue Management and Billing Batch Guide*.

Fully-Insured Billable Charge Creation

Oracle Revenue Management and Billing enables you to create billable charges for pre-calculated premium amount (which is received through a health care inbound message) and calculated premium amount (which is derived using a pricing rule defined at the policy plan level). Before creating an SQI based billable charge, the system derives the bill period for the account using the **Invoice Day (C1OFFRST)** characteristic defined on the account.

While creating a billable charge for the pre-calculated premium amount through a health care inbound message, the system creates an SQI based billable charge for the membership and price item combination. Note that if the bill period or frequency is given in the billable charge information in the health care inbound message, the system does not derive the bill period for the account.

However, for creating a billable charge for the calculated premium amount, you need to execute the **Fully-Insured Group Billable Charge Creation (C1-FIBCR)** batch. It creates an SQI based billable charge for calculated premium amount. It considers the timelines in the **Pending (P)** and **Error (E)** status from the **CI_PRCE_CALC** table. Note that it considers only those timelines where the entity type is set to **Membership**. For each timeline, membership and price item combination, the system does the following:

1. Derives the bill period for the account using the **Invoice Day (C1OFFRST)** characteristic defined on the account.
2. Creates an SQI based billable charge. Here, the start and end dates on the billable charge are set to the timeline start and end dates.

If the premium amount of the two consecutive timelines of a membership and price item combination is same, this algorithm does not create a new billable charge. Instead, it extends the end date of the previous timeline's billable charge. If the membership end date is set to a date which is earlier than the previous date (for example, Old Membership End Date: 31-12-2019 and New Membership End Date: 31-10-2019) and a billable charge exists for the membership and price item combination with the same start date and amount, then the system behaves in the following manner:

If...	Then...
Bill segments for the 01-01-2019 to 31-12-2019 period are not yet generated in the system	The end date in the existing billable charge is updated to 31-10-2019.

Copyright © 2026, Oracle and/or its affiliates.

If...	Then...
Bill segments for the 01-01-2019 to 31-12-2019 period are in the **Freezable** status	The bill segments for the 01-11-2019 to 31-12-2019 period are deleted and the end date in the existing billable charge is updated to 31-10-2019.
Bill segments for the 01-01-2019 to 31-12-2019 period are in the **Frozen** or **Pending Cancel** status	The bill segments for the 01-11-2019 to 31-12-2019 period are canceled and the end date in the existing billable charge is updated to 31-10-2019.

However, if the membership end date is set to a date which is earlier than the previous date (for example, Old Membership End Date: 31-12-2019 and New Membership End Date: 31-10-2019) and a billable charge exists for the membership and price item combination with the same start date, but different amount, then the system behaves in the following manner:

If...	Then...
Bill segments for the 01-01-2019 to 31-12-2019 period are not yet generated in the system	The existing billable charge is canceled and a new billable charge is created for the 01-01-2019 to 31-10-2019 period.
Bill segments for the 01-01-2019 to 31-12-2019 period are in the **Freezable** status	The bill segments for the 01-01-2019 to 31-12-2019 period are deleted. The existing billable charge is canceled and a new billable charge is created for the 01-01-2019 to 31-10-2019 period.
Bill segments for the 01-01-2019 to 31-12-2019 period are in the **Frozen** or**Pending Cancel** status	The bill segments for the 01-01-2019 to 31-12-2019 period are canceled. The existing billable charge is canceled and a new billable charge is created for the 01-01-2019 to 31-10-2019 period.

And, if the membership end date is set to a date which is earlier than the previous date (for example, Old Membership End Date: 31-12-2019 and New Membership End Date: 31-10-2019) and a billable charge does not exist for the membership and price item combination with the same start date, then a billable charge is created for the 01-01-2019 to 31-10-2019 period. Note that if there are billable charges for the membership and price item combination whose date range is within the timeline, such billable charges are canceled and their corresponding bill segments (if any) are either deleted or canceled in the system.

The pre-calculated or calculated premium amount is stored as a pass through line in the SQI based billable charge. Note that these pass through lines are memo only and no general ledger entries will be created for these pass through lines. This algorithm fetches SQI from the **Proration SQI** option type of the **C1-ASOBLLNG** feature configuration. The SQI value is set to the total amount of the pass through lines in the billable charge. The system prorates the amount when the SQ rule specified in the rate schedule attached to the active contract contains the SQI which is specified in the **Proration SQI** option type of the **C1-ASOBLLNG** feature configuration.

Once the billable charge is created, the membership ID is stamped as characteristic on the billable charge. This indicates that the billable charge is created for the respective membership. This algorithm fetches the characteristic type, which must be defined on the billable charge, from the **Characteristic Type For Membership Id** option type of the **C1-ASOBLLNG** feature configuration.

Finally, the status of the corresponding timeline is set to **Complete (C)** in the **CI_PRCE_CALC** table. If any error occurs while creating a billable charge, the status of the corresponding timeline is set to **Error (E)** in the **CI_PRCE_CALC** table. In addition, if an error occurs, a To Do is created using the **C1-FIBCR** To Do type and assigned to all users with a To Do role which is specified as characteristic on the parent customer. The system considers the characteristic on the parent customer which is specified in the **To Do Role Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration. Note that the system does not create a To Do for each error record. Instead, the system creates distinct To Do for each membership and pricing rule combination.

This batch is a multi-threaded batch. For more information about the batch, refer to *Oracle Revenue Management and Billing Batch Guide*.

New Born Credit Waiver

Oracle Revenue Management and Billing enables you to waive off premium for a newborn while calculating the health insurance premium for the group and individual memberships. However, the newborn premium waiver benefit for the group and individual memberships was not recorded and maintained in ORMB for the General Ledger (GL) posting.

Now, the system calculates the premium for the newborn credit waiver period and stores the amount in the billable charge when a newborn member exists in the group and individual memberships and the newborn applicability for the membership is set to **Yes**. The system stamps two SQIs in the billable charge - one SQI stores the newborn premium (i.e. debit amount) and another SQI stores the newborn premium waiver benefit (i.e. credit amount). This mechanism ensures that the system records the newborn premium in the system, but at the same time does not charge the newborn premium for the membership. It helps to maintain GL entries for the newborn premium which is waived off during premium calculation. To enable this feature, you need to set the **New Born Waiver Credit Calculation** option type of the **C1-ASOBLLNG** feature configuration to **Y**.

To implement this business requirement, the following changes are made in the system:

- While deriving the eligible members for a membership, while deriving the member relationship for a member person, and while deriving the subscription tier for a membership, the system checks whether the **New Born Waiver Credit Calculation** option type is set to **Y** or **N**. If the **New Born Waiver Credit Calculation** option type is set to **Y**, the system derives the list of eligible members for the membership, member relationship for a member person, or subscription tier for the membership considering with and without newborn gift days.

  If you are using an age based pricing rule wherein the member relationship derivation algorithm is attached, the system will set the following characteristics for each member person in the membership:

  - **Member Relationship** - Stores the member relationship for the member person considering newborn gift days
  - **Member Role Without New Born Gift Days** - Stores the member relationship for the member person without considering newborn gift days

  However, if you are using a tier based pricing rule, the system will set the following characteristics for the membership:

  - **Subscription Tier** - Stores the subscription tier for the membership considering newborn gift days
  - **Subscription Tier without Gift Days** - Stores the subscription tier for the membership without considering newborn gift days
- While calculating premium for a membership, the system checks whether there is a newborn member person in the membership and whether the **New Born Gift Days Applicability** option is set to **Yes** for the membership. If so, the system checks whether the **New Born Waiver Credit Calculation** option type in the **C1-ASOBLLNG** feature configuration is set to **Y**. If so, the system calculates the newborn gift period start and end dates. While deriving the timeline during premium calculation, the system checks whether the timeline is within the newborn gift days period. If so, the system calculates the premium for the newborn and creates a record in the **CI_PRCE_CALC_LN** table where the **NEW_BORN_CMT_FLG** column is set to **Without Gift Days**. In addition, the system creates a reverse

Copyright © 2026, Oracle and/or its affiliates.

entry record in the **CI_PRCE_CALC_LN** table where the **NEW_BORN_CMT_FLG** column is set to **Reversal**. If the amount calculated with and without gift days do not match, the system stamps two SQIs in the billable charge - one SQI stores the newborn premium (i.e. debit amount) and another SQI stores the newborn premium waiver benefit (i.e. credit amount). The system considers the SQIs specified in the **New Born Waiver SQI** and **New Born Waiver Credit SQI** option types of the **C1-ASOBLLNG** feature configuration, respectively.

- During premium proration, the system stores the distributed amount for the newborn member person in an SQI which is specified in the **New Born Distributed SQI** option type of the **C1-ASOBLLNG** feature configuration.

Membership Benefit Billing

Once the repricing entity detail records are created for the membership benefits which are added or updated, you need to execute the following batches in the given sequence:

- Identify Entities for Repricing (C1-REPC1)
- Process Repricing Request (C1-REPC2)
- Fully Insured Billable Charge Creation (C1-FIBCR)

Before executing the above batches, you need to set the **Medicare** preference in the Medicare option type of the **C1-ASOBLLNG** feature configuration. This preference is used to derive the membership benefit pricing while creating charges for Medicare Part D LIS and Medicare Part D LEP. You can define a **Medicare** preference using the Medicare preference category through the **Field Mapping** screen. While defining a Medicare preference, you must set the following attributes in a Medicare preference:

- **Late Enrollment Penalty** - Used to indicate the benefit sub type for Medicare Part D LEP.
- **Low Income Subsidy** - Used to indicate the benefit sub type for Medicare Part D LIS.
- **Medicare Prescription Drug Coverage** - Used to indicate the benefit sub type for Medicare Part D.

For more information about the Medicare preference, refer to Medicare Preference on page 125

If the reverse charge is to be created for a membership benefit on the benefit sponsor account, the system does the following during the respective batch execution:

- **C1-REPC1** - This batch checks whether the benefit sponsor account or sponsor account derivation algorithm is specified in the benefit sub type. If the sponsor account derivation algorithm is specified in the benefit sub type, the **C1-REPC1** batch invokes the sponsor account derivation algorithm which derives the benefit sponsor account for the individual membership. It then creates two repricing requests - one for benefit price item and another for benefit sponsored price item.
- **C1-REPC2** - This batch derives the amount for the benefit repricing request and benefit sponsored repricing request from the **C1_BENEFITS** table.
- **C1-FIBCR** - This batch creates the billable charges for benefit price item as well as benefit sponsored price item. A characteristic is stamped on the benefit charge which is created using the benefit sponsored price item on the benefit sponsor account. This characteristic indicates that the benefit charge is a reverse charge on the benefit sponsor account. While defining the characteristic, the system fetches the characteristic type which is specified in the **Sponsored Switch Characteristic for Billable Charge** option type of the **C1-ASOBLLNG** feature configuration.

If the **Validate External Price** option is selected in the benefit sub type of a membership benefit, the system invokes the **C1-PRLBCVLD** algorithm which is attached to the **Billable Charge Creation Post-Processing** system event of the respective benefit pricing rule type. It is used to calculate the benefit charge using the validate price item and then compare it against the externally priced benefit charge. If there is a mismatch in the benefit start date, benefit end date, and benefit amount, the system creates a To Do using the given To Do type and then adds the To Do in the respective membership log. However, if the benefit start date and end dates match, but the benefit amount does not match, the system uses the threshold amount to determine whether the To Do should be created for the membership. If the calculated benefit amount is within the minimum amount (i.e. received benefit amount - threshold amount) and maximum amount (i.e. received benefit amount + threshold amount) range, the system will not create a To Do for the membership when there is mismatch in the calculated benefit amount (priced in ORMB) and received pre-calculated benefit amount (i.e. priced externally). However, if the calculated benefit amount is not within the minimum amount (i.e. received benefit

Copyright © 2026, Oracle and/or its affiliates.

amount - threshold amount) and maximum amount (i.e. received benefit amount + threshold amount) range, the system creates a To Do using the given To Do type and then adds the To Do in the respective membership log.

The **C1-PRLBCVLD** algorithm contains the following parameters:

- **To Do Type** - Used to indicate the To Do type using which you want to create a To Do. The **C1-PRBCV** To Do type is shipped with the product. This parameter is mandatory.
- **To Do Role** - Used to indicate that users with the specified To Do role must receive the To Do notification. This parameter is optional. If you do not specify this parameter, the system considers the default To Do role associated with the To Do type.
- **Threshold Amount** - Used to specify the threshold amount which is used to calculate the minimum and maximum amount range for benefit amount comparison. This parameter is mandatory.

You can view the benefit price item billable charges generated for a membership benefit from the **Billable Charges** zone of the **Contracts and Charges** tab in the **Membership** screen. Similarly, you can view the benefit sponsored price item billable charges (i.e. reverse charges which are created for a membership benefit on the benefit sponsor account) from the **Sponsor Billable Charges** zone of the **Contracts and Charges** tab in the **Membership** screen. In the **Sponsor Billable Charges** zone, the system displays the billable charges where the characteristic type specified in the **Sponsored Switch Characteristic for Billable Charge** option type of the **C1-ASOBLLNG** feature configuration is defined. Therefore, if you want to create a reverse charge for a membership benefit on the benefit sponsor account, it is mandatory to set the **Sponsored Switch Characteristic for Billable Charge** option type of the **C1-ASOBLLNG** feature configuration.

Additional Repricing Entity Detail Records

Until now, while creating repricing entity detail records for an audit event, the system used to create two repricing entity detail records for each membership and pricing rule type combination – one with the effective date as the membership start date and another with the effective date as the auditable element effective date. In addition, the system used to set the **Message_PARAM4** column to **Y** corresponding to the latter repricing entity detail record (with the effective date as the auditable element effective date) so that the system creates a repricing request only for the latter repricing entity detail record and not for the former repricing entity detail record.

A new option type named **Additional Repricing** is added in the **C1-ASOBLLNG** feature configuration. It enables the system to determine whether you want to create repricing entity detail records for all auditable elements (such as fields, business statuses, and characteristics) of the membership, member person, or person that are updated within the membership period. You can set the **Additional Repricing** option type to either of the following:

- **Y** – Used when you want to create repricing entity detail records for all auditable elements (such as fields, business statuses, and characteristics) of the membership, member person, or person that are updated within the membership period.
- **N** – Used when you want to create repricing entity detail records in the traditional manner (i.e. one with the effective date as the membership start date and another with the effective date as the auditable element effective date).

If you do not specify the value for this option type, the system, by default, sets it to **N**. Note that this option type is only applicable for the fully insured individual business.

Let us assume the following:

- M1 membership is effective from 01-Jan-2023 to 31-Dec-2023 on the HP1 health plan
- AGE_BASED1 and BENEFIT_1 pricing rule types are associated with the HP1 health plan
- The following auditable elements at the membership or member person level are already updated till 01-08-2023:

Element Name	Element Value	Modified On
benefitAmount	Field	10-Jan-2023
billLevel1	Field	20-Feb-2023
emailAddress	Field	22-Mar-2023

Copyright © 2026, Oracle and/or its affiliates.

Element Name	Element Value	Modified On
C1SMOKER	Characteristic	04-Apr-2023
C1TOBCC	Characteristic	05-May-2023
INACTVAL	Characteristic	01-Aug-2023

Now, if the **Additional Repricing** option type is set to **Y** and you update the **INACTVAL** characteristic of the M1 membership on 01-Aug-2023, the system will create the following repricing entity detail records for the audit event:

- M1, AGE_BASED1, 01-Jan-2023 (Message_PARAM4 = N)
- M1, BENEFIT_1, 01-Jan-2023 (Message_PARAM4 = N)
- M1, AGE_BASED1, 10-Jan-2023 (Message_PARAM4 = N)
- M1, BENEFIT_1, 10-Jan-2023 (Message_PARAM4 = N)
- M1, AGE_BASED1, 20-Feb-2023 (Message_PARAM4 = N)
- M1, BENEFIT_1, 20-Feb-2023 (Message_PARAM4 = N)
- M1, AGE_BASED1, 22-Mar-2023 (Message_PARAM4 = N)
- M1, BENEFIT_1, 22-Mar-2023 (Message_PARAM4 = N)
- M1, AGE_BASED1, 04-Apr-2023 (Message_PARAM4 = N)
- M1, BENEFIT_1, 04-Apr-2023 (Message_PARAM4 = N)
- M1, AGE_BASED1, 05-May-2023 (Message_PARAM4 = N)
- M1, BENEFIT_1, 05-May-2023 (Message_PARAM4 = N)
- M1, AGE_BASED1, 01-Aug-2023 (Message_PARAM4 = Y)
- M1, BENEFIT_1, 01-Aug-2023 (Message_PARAM4 = Y)

Note: The system will create repricing requests only for the repricing entity detail records where the **Message_PARAM4** column is set to **Y**.

Rounding Premium at the Member Level

Until now, the system rounded off the amount at the billable charge level and not at the member level in the billable charge. The business had observed rounding discrepancy in certain cases, such as premium proration, etc. To resolve the rounding issue, a new option type named **Round Member Premium** is added in the **C1-ASOBLLNG** feature configuration. It is used to determine whether the system should round off the amount at the member level in the billable charge or at the billable charge level. The valid values are **Y** or **N**. Note that this option type is applicable for the fully insured group and fully insured individual lines of business.

Support Open Ended Policies, Plans, Pricing Rules, and Memberships

Oracle Revenue Management and Billing enables you to maintain open-ended policies, policy or health plans, pricing rules, and group and individual memberships wherein you can specify far-fetched end dates for them. To support the open-ended group and individual memberships, the following changes are made to the system:

- All the group and individual memberships would be auto renewed by the system based on the given renewal period.
- Two new option types are added in the **C1-ASOBLLNG** feature configuration:
  - **Number of months in advance for Open-Ended Renewal** - Used to indicate the number of months in advance you want to automatically renew the group and individual memberships. You must specify a positive value for this option type.
  - **Renewal period for Open-Ended Membership** – Used to indicate the period (i.e. number of months) for which you want to automatically renew the group and individual memberships. You must specify a positive value for

Copyright © 2026, Oracle and/or its affiliates.

this option type. The system will then set the end date of the group memberships to the policy start date + renewal period – number of months in advance for open-ended renewal. Similarly, the system will then set the end date of the individual memberships to the membership start date + renewal period – number of months in advance for open-ended renewal.

- A new column named **ENRL_END_DT** is introduced in the **CI_MEMBERSHIP**, **CI_MEMBERSHIP_PER**, and **C1_BENEFITS** tables.
- A new column named **OPEN_ENDED_SW** is introduced in the **CI_MEMBERSHIP_PROCESS** table.
- The **enrlEndDate** tag is added for membership and membership person in the **C1-Membership** business object schema.
- The **autoRenew** and **contractPeriod** tags are added for membership in the **C1-Membership** business object schema.
- The **enrlEndDate** tag is added for membership and membership person in the **C1-IndMembership** business object schema.
- The **enrlEndDate** tag is added for benefit in the **C1-Benefits** business object schema.
- A new parameter named **Open Ended Membership** is added in the **C1-MEPRC** batch. It is optional. It is used when you want to process only open-ended memberships and automatically renew them for the given renewal period.

From now onwards, the end date of the group or individual membership received from the source system through an inbound message will be stored in the **ENRL_END_DT** column. The system will stamp the auto renewal end date in the **END_DT** column and will use it for the membership premium calculation. The system will display the date from the **ENRL_END_DT** column for the membership and membership person in the **Membership** screen.

Now, when a group or individual membership is created through a health care inbound message, the system checks whether the renewal period for open-ended membership (specified in the **C1-ASOBLLNG** feature configuration) is less than the membership period. If so, the system does the following:

- Sets the end date of the membership and membership person to policy start date or individual membership start date + renewal period – number of months in advance for open-ended renewal.
- Sets the enrolment end date to the date specified in the **endDate** tag of the inbound message.
- Sets the **AUTO_RENEW_SW** field to **Y** and the **CONTRACT_PERIOD** field to the renewal period.
- Sets the **PROCESS_DT** column of the **CI_MEMBERSHIP_PROCESS** table to the end date of the membership.
- Sets the **OPEN_ENDED_SW** column of the **CI_MEMBERSHIP_PROCESS** table to **Y**.

On executing the **C1-MEPRC** batch, the system considers the membership records whose the **OPEN_ENDED_SW** column is set to **Y** and whose the processing date is earlier than the batch business date. It then recalculates the end date of the membership and membership person and accordingly updates the processing date of the corresponding record in the **CI_MEMBERSHIP_PROCESS** table.

However, if the renewal period for open-ended membership (specified in the **C1-ASOBLLNG** feature configuration) is equal to or greater than the membership period, the system sets the end date of the membership and membership person to the enrolment end date.

Hold Repricing

Until now, the system calculated the premium and benefit (if applicable) charges immediately through the **Repricing** feature whenever an individual membership is added, updated, canceled, terminated, or reinstated in ORMB. In the individual health insurance business, there might be situations wherein approved premium rates are not available for the future enrollment period, frequent updates are received for the memberships, or the data flow is delayed due to some maintenance activity in the source system. In all such situations, you may want to hold the repricing for the membership for a particular period.

Oracle Revenue Management and Billing enables you to capture the repricing after date for a membership. This helps you to hold the repricing for the membership until the specified date. Note that the hold repricing feature is offered and certified only for the fully insured individual business and not for the fully insured group business. To implement the hold repricing feature, the following changes are made in the system:

- A new field named **REPRC_AFTER_DT** is added in the **CI_MEMBERSHIP** table.

Copyright © 2026, Oracle and/or its affiliates.

- A new tag named **repriceAfterDate** is introduced in the **C1-IndMembership** and **C1-HCInboundMessage** business object schema.
- A new tag named **repriceAfterDate** is introduced in the **C1-MembershipRepricing** business service schema.
- The **C1-HCINPROC** and **C1-INVRDTCIM** algorithm types are enhanced to support the hold repricing feature.

You can specify the repricing after date for an individual membership only through a health care inbound message or through the membership repricing inbound web service and not from the user interface (i.e. through the **Membership** screen). The **repriceAfterDate** tag is not mandatory. If the value for the **repriceAfterDate** tag is received while creating an individual membership, the system checks whether the repricing after date of the individual membership is earlier than the inbound message processing date. If so, the system throws an appropriate message indicating that the repricing after date of the individual membership cannot be earlier than the inbound message processing date. However, if the repricing after date of an individual membership is equal to or later than the inbound message processing date, the system checks whether the repricing after date of an individual membership is later than the membership end date. If so, the system throws an appropriate message indicating that the repricing after date of the individual membership cannot be later than the membership end date. However, if the repricing after date of an individual membership is earlier than the membership end date, the system adds the individual membership to the health plan. The repricing after date (if any) is then shown in the **Main** section of the **Membership** screen. In addition, a log entry is created for the individual membership indicating that the repricing for the membership is on hold till a particular date. You can view the log entry in the **Log** tab of the **Membership** screen.

If the value for the **repriceAfterDate** tag is received while updating a membership, the system checks whether the repricing after date of the individual membership is earlier than the inbound message processing date. If so, the system throws an appropriate message indicating that the repricing after date of the individual membership cannot be earlier than the inbound message processing date. However, if the repricing after date of an individual membership is equal to or later than the inbound message processing date, the system checks the status of the individual membership. If the status of the individual membership is not set to **Canceled**, the system checks whether there is any invoice request created for the respective account in the non-final status (i.e. in a status other than **Processed** or **Canceled**). If so, the system checks whether the repricing after date is later than the invoice request processing date. If so, the system sets the invoice request processing date to repricing after date + 1. In addition, a log entry is created for the invoice request indicating that the invoice request is on hold till a particular date. You can view the log entry in the **Log** tab of the **Invoice Request** screen.

However, if the repricing after date is earlier than or equal to the invoice request processing date, the system does not override the invoice request processing date.

On executing the **C1-REPC1** batch, the system considers the repricing after date specified for the individual membership while processing the respective repricing entity detail records. If the repricing after date is equal to or later than the batch business date, the system considers only those repricing entity detail records of the individual membership where the category of the pricing rule types is set to **Benefit** and accordingly creates the repricing requests for the benefit specific price items. Only when the repricing after date is earlier than the batch business date, the system considers all the repricing entity detail records of the respective individual membership which are in the **Pending** status and accordingly creates a repricing request for each individual membership, pricing rule, and effective date combination.

Prorate Membership Benefit and Corresponding Sponsor Charges

Until now, the system prorated the group and individual membership premium charges when the membership was enrolled or terminated in middle of the billing cycle. For the fully insured group business, the system prorated the membership premium using the proration rules defined on the fully insured policy plan. However, for the fully insured individual business, the system prorated the membership premium using the daily proration mechanism.

Now, Oracle Revenue Management and Billing also enables you to prorate the membership benefit charges on the eligible account and their corresponding benefit sponsor charges on the sponsor account. For the fully insured group business, the system allows you to prorate the membership premium benefit charges using the proration rules defined on the fully insured policy plan and prorate the membership non-premium benefit charges using the daily proration mechanism. A new option named **Premium Benefit** is introduced while defining and editing a benefit sub type. If the **Premium Benefit** option is selected in a benefit sub type, the system will consider the benefits created using the benefit

Copyright © 2026, Oracle and/or its affiliates.

sub type as the membership premium benefits and will prorate the membership premium benefits (if required) using the proration rules defined on the fully insured policy plan. Note that if the proration rules are not defined on the fully insured policy plan, the system will prorate the membership premium benefits using the daily proration mechanism.

However, if the **Premium Benefit** option is not selected in a benefit sub type, the system will consider the benefits created using the benefit sub type as the membership non-premium benefits and will prorate the membership non-premium benefits (if required) using the daily proration mechanism. While defining a benefit sub type, by default, the **Premium Benefit** option is not selected. If you select the **Premium Benefit** option, then the **Charge Benefit Sponsor** option is removed from the user interface. This is because the group membership premium benefits are not sponsored by a health insurance exchange. If the **Premium Benefit** option is not selected and the **Charge Benefit Sponsor** option is selected, the system will prorate the benefit sponsor charges using the daily proration mechanism.

For the fully insured individual business, the system will prorate the membership benefit charges and their corresponding benefit sponsor changers using the daily proration mechanism.

Note:

The **Premium Benefit** option in the **Benefit Sub Type** screen is applicable only for the fully insured group business.

The end date of benefit should be sent through a health care inbound message or through a membership repricing request whenever the group or individual membership is terminated.

The system decides whether to prorate the membership premium or non-premium benefit charges of a price item using the **Proration Required** option defined corresponding to the price item in the respective benefit pricing rule type. If the **Proration Required** option is selected corresponding to a price item, the system will prorate the charges of the respective price item whenever required during membership enrolment or termination. However, if the **Proration Required** option is not selected corresponding to a price item, the system will not prorate the charges of the respective price item during membership enrolment or termination.

Note that if you select the **Proration Required** option corresponding to any price item in a benefit pricing rule type, you need to attach an algorithm created using the **C1-BNFTPRCF** algorithm type to the **Pricing Rule Proration Amount Calculation** system event of the benefit pricing rule type.

Zero-Amount Membership Benefit Charges

Oracle Revenue Management and Billing enables you to receive the full or partial snapshot of benefit charges for a group or individual membership through a health care inbound message or through a membership repricing request. A new option type named **Benefit Full Snapshot Upload** is introduced in the **C1-ASOBLLNG** feature configuration. It enables the system to determine whether the full or partial snapshot of benefit charges is received for a group or individual membership through a health care inbound message or through a membership repricing request. You can set the **Benefit Full Snapshot Upload** option type to **Y** or **N**. If you set the **Benefit Full Snapshot Upload** option type to **Y**, the system behaves in the following manner in the respective scenarios:

Scenario	**Existing Benefit Data**			**New Snapshot (Received through an Inbound Message)**			**Comments**
	Benefit Record	**Benefit Coverage**	**Benefit Amount**	**Benefit Record**	**Benefit Coverage**	**Benefit Amount**	
S1	B1	Jan – Mar	100	B1	Jan – Mar	90	The system will update the B1 (Jan-Mar), B2 (Apr-Jun), and B3 (Jul-Dec) benefit records of the membership.
	B2	Apr – Jun	100	B2	Apr – Jun	110	
	B3	Jul – Dec	200	B3	Jul – Dec	120	
S2	B1	Jan – Mar	50	B1	Jan – Mar	50	The system will update the B1 (Jan-Mar) and B3 (Jul-Dec) benefit records of the membership. In addition, it
	B2	Apr – Jun	90	B3	Jul – Dec	120	

Copyright © 2026, Oracle and/or its affiliates.

Scenario	Existing Benefit Data			New Snapshot (Received through an Inbound Message)			Comments
	Benefit Record	**Benefit Coverage**	**Benefit Amount**	**Benefit Record**	**Benefit Coverage**	**Benefit Amount**	
	B3	Jul – Dec	150				will change the status of the B2 (Apr-Jun) benefit record to **Inactive**.
S3	B1	Jan – Mar	100	B1	Jan – Mar	100	The system will update the B1 (Jan-Mar), B2 (Apr-Jun), and B3 (Jul-Dec) benefit records of the membership.
	B2	Apr – Jun	100	B2	Apr – Jun	0	
	B3	Jul – Dec	200	B3	Jul – Dec	200	
S4	B1	Jan – Mar	100	B11	Jan – Feb	90	The system will update the B3 (Jul-Dec) benefit record of the membership. However, the system will change the status of B1 (Jan-Mar) and B2 (Apr-Jun) benefit records to **Inactive** and will create two new benefit records – B11 (Jan-Feb) and B12 (Mar-Jun) with the **Active** status.
	B2	Apr – Jun	100	B12	Mar – Jun	110	
	B3	Jul – Dec	200	B3	Jul – Dec	120	

Note: If you set the **Benefit Full Snapshot Upload** option type to **Y**, the system will update the existing benefit records when the benefit coverage period matches.

However, if you set the **Benefit Full Snapshot Upload** option type to **N**, the system behaves in the following manner in the respective scenarios:

Scenario	Existing Benefit Data			New Snapshot (Received through an Inbound Message)			Comments
	Benefit Record	**Benefit Coverage**	**Benefit Amount**	**Benefit Record**	**Benefit Coverage**	**Benefit Amount**	
S1	B1	Jan – Mar	100	B1	Jan – Mar	90	The system will change the status of the B1 (Jan-Mar), B2 (Apr-Jun), and B3 (Jul-Dec) benefit records to **Inactive**. The system will then create three new benefit records - B1 (Jan-Mar), B2 (Apr-Jun), and B3 (Jul-Dec) with the **Active** status.
	B2	Apr – Jun	100	B2	Apr – Jun	110	
	B3	Jul – Dec	200	B3	Jul – Dec	120	
S2	B1	Jan – Mar	100	B1	Jan - Dec	300	The system will change the status of the B1 (Jan-Mar), B2 (Apr-Jun), and B3 (Jul-Dec) benefit records to **Inactive**. The system will then create one new benefit record – B1
	B2	Apr – Jun	100				
	B3	Jul – Dec	200				

Copyright © 2026, Oracle and/or its affiliates.

Scenario	Existing Benefit Data			New Snapshot (Received through an Inbound Message)			Comments
	Benefit Record	**Benefit Coverage**	**Benefit Amount**	**Benefit Record**	**Benefit Coverage**	**Benefit Amount**	
							(Jan-Dec) with the **Active** status.
S2	B1	Jan – Mar	100	B1	Jan - Jun	300	The system will change the status of the B1 (Jan-Mar), B2 (Apr-Jun), and B3 (Jul-Dec) benefit records to **Inactive**. The system will then create two new benefit records – B1 (Jan-Jun) and B2 (Jul-Dec) with the **Active** status.
	B2	Apr – Jun	100	B2	Jul-Dec	0	
	B3	Jul – Dec	200				

Note: If you set the **Benefit Full Snapshot Upload** option type to **N**, the system will always inactivate all the existing benefit records of the membership and will create the new benefit records for the membership in the **Active** status.

A new option type named **Zero Dollar Benefit Charge** is introduced in the **C1-ASOBLLNG** feature configuration. It enables the system to determine whether the billable charge for zero benefit amount should be created or not. You can set the **Zero Dollar Benefit Charge** option type to **Y** or **N**. If you set the **Zero Dollar Benefit Charge** option type to **Y**, the system will create a zero-amount benefit charge for the membership. However, if you set the **Zero Dollar Benefit Charge** option type to **N**, the system will not create a zero-amount benefit charge for the membership.

Benefit Passthrough Charges vs. Calculated Charges

Until now, the system enabled you to compare the calculated benefit amount against the externally priced (i.e. passthrough) benefit amount. And, if the calculated benefit amount was not within the minimum amount (i.e. received benefit amount – threshold amount) and maximum amount (i.e. received benefit amount + threshold amount) range, the system created a To Do using the given To Do type and then added the To Do in the respective membership log.

Now, the system enables you to bill either the calculated benefit amount or passthrough benefit amount for a membership depending upon the business requirements. To implement this feature, the following changes are made to the system:

- A new option named **Compare Premium** is introduced while defining or editing a benefit sub type.
- A new characteristic type named **C1BILLMD** is introduced in this release.
- A new algorithm named **C1-BNFTENTY** is attached to the **Audit** system event of the **C1-IndMembership** and **C1-Benefits** business objects.

To bill either the calculated benefit amount or passthrough benefit amount for a membership, you need to do the following:

- Select the **Compare Premium** option in the respective benefit sub type.
- Specify the price item (i.e. validate price item) in the respective benefit sub type. Here, you must specify the price item that is added in the primary pricing rule type (associated with the health plan) using which the premium is calculated for the membership.
- Define the **C1BILLMD** characteristic type for the validate price item. You can set it to either of the following:
  - **PREMIUM** – Used when you want to bill the calculated benefit amount for the membership.
  - **PASSTHROUGH** - Used when you want to bill the passthrough benefit amount for the membership.

If the repricing entity detail record is created for the primary pricing rule type (used for calculating membership premium) and the repricing entity detail record does not exist for the benefit pricing rule type with the same effective date, then the **C1-BNFTENTY** algorithm creates the repricing entity detail record for the benefit pricing rule type,

Copyright © 2026, Oracle and/or its affiliates.

individual membership, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of the benefit repricing entity detail record is set to **Pending**. This happens whenever the membership is audited, and the **Compare Premium** option is selected in the respective benefit sub type. Similarly, if the repricing entity detail record is created for the benefit pricing rule type (used for calculating membership benefit) and the repricing entity detail record does not exist for the primary pricing rule type with the same effective date, then the **C1-BNFTENTY** algorithm creates the repricing entity detail record for the primary pricing rule type, individual membership, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of the premium repricing entity detail record is set to **Pending**. This happens whenever the membership benefit is audited, and the **Compare Premium** option is selected in the respective benefit sub type.

On executing the **C1-REPC2** batch, the system updates the status of the following:

- Premium repricing entity detail record to **Invalid** when the **C1BILLMD** characteristic on the validate price item is set to **PASSTHROUGH**
- Benefit repricing entity detail record to **Invalid** when the **C1BILLMD** characteristic on the validate price item is set to **PREMIUM**

A new screen named **Pricing Vs Passthrough Charges** is introduced in this release. It is accessible from the **Report and Inquiry** menu. It enables you to view the difference (if any) between the calculated and passthrough benefit amount of a membership.

Repricing Request

The **Repricing Request** screen enables you to search for a repricing entity detail record using various search criteria. It contains the following zones:

- Search Repricing Entity Detail Record on page 3658
- Repricing Requests on page 3660
- Timeline and Billable Charge Details on page 3662
- Pricing Calculation Details on page 3662

There are two ways in which you can navigate to this screen:

- One from the **Audit Event** screen - In this case, the system automatically uses the audit event ID for searching and then lists the repricing entity detail records which are created for the respective audit event in the **Search Repricing Entity Detail Record** zone.
- Another from the **Pricing Management** menu - In this case, the system enables you to search for repricing entity detail records of a particular audit event or for all audit events of a particular membership.

Note: At present, the **Repricing Request** screen is only designed to meet the business requirements of the Fully-Insured Group Health Insurance domain.

Search Repricing Entity Detail Record

The **Search Repricing Entity Detail Record** zone enables you to search for repricing entity detail records which are:

- Created for a particular audit event
- Created for all audit events of a particular membership

It contains the following sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Search By	Used to indicate whether you want to search for a repricing entity detail record using the membership details. The valid value is: • Membership **Note:** By default, the **Membership** option is selected.	Yes
Created From	Used to search repricing entity detail records which are created for a membership from a particular date.	No
From Effective Date	Used to search repricing entity detail records which are effective from a particular date onwards.	No
Created To	Used to search repricing entity detail records for a membership which are created till a particular date.	No
To Effective Date	Used to search repricing entity detail records which are effective till a particular date.	No
Audit Event ID	Used to search repricing entity detail records of a particular audit event.	Yes (Conditional) **Note:** This field is required when you want to search for a repricing entity detail records using the audit event details.
Status	Used to search repricing entity detail records with a particular status. The valid values are: • Completed • Error • Invalid • Pending	No
Membership ID	Used to search repricing entity detail records of a particular membership. **Note:** The **Search** ( ) icon appears corresponding to this field. On clicking the **Search** icon, the **Membership Search** window appears.	Yes (Conditional) **Note:** This field is required when you want to search for a repricing entity detail records using the membership details.
Pricing Rule Type	Used to search repricing entity detail records which are created using a particular type of pricing rule.	No

Note: You must specify at least one search criterion while searching for a price list.

- **Search Results** - On clicking the **Search** button, a list of repricing request detail records appear based on the specified search criteria. The **Search Results** section contains the following columns:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Membership Information	Displays information about the membership. **Note:** It has a link. On clicking the link, the **Membership** screen appears where you can view the details of the respective membership.
Creation Date Time	Displays the date and time when the repricing entity detail record is created in the system.
Effective Date	Displays the date from when the repricing entity detail record is effective for the membership.
Pricing Rule Type	Displays the pricing rule type using which the pricing is defined for the entity. **Note:** It has a link. On clicking the link, the **Pricing Rule Type** screen appears where you can view the details of the respective pricing rule type.
Status	Displays the status of the reprising entity detail record. The valid values are: • Completed • Error • Invalid • Pending
Error Message	Displays the error message if any error occurs when the audit event is created for the membership. **Note:** The status of the corresponding membership is set to **Error**.
Pre processing Request ID	Displays the pre processing request Id.

Note: Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

By default, the **Filter** area is visible. You can hide the **Filter** area by clicking the **Filters** ( ) icon in the upper right corner of this zone. You can also hide the **Filter** area by clicking the **Hide Filters** button in the lower left corner of this zone.

On clicking the **Broadcast** ( ) icon corresponding to the **Membership Information** field, the **Repricing Requests** zone appears where you can view a list of repricing requests created for a specific repricing entity detail record.

Repricing Requests

The **Repricing Requests** zone allows you to view the repricing requests which are created for a particular repricing entity detail record. It contains the following columns:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Pricing Rule Information	Displays information about the pricing rule using which the repricing request is created for the price item. **Note:** It has a link. On clicking the link, the **Pricing Rule** screen appears where you can view the details of the respective pricing rule.
Price Item Information	Displays information about the price item for which the repricing request is created in the system. **Note:** It has a link. On clicking the link, the **Price Item** screen appears where you can view the details of the respective price item.
Account Information	Displays the concatenated string consisting of account information which are separated by a comma (,). **Note:** It has a link. On clicking the link, the **Account** screen appears where you can view the details of the respective account.
Status	Displays the status of the repricing request. The valid values are: • Completed • Error • Invalid • Pending
Creation Date Time	Displays the date and time when the repricing request was created in the system.
Effective Date	Displays the date from when the reprising is effective for the price item.
Error Message	Displays the error message if any error occurs when the repricing entity detail record is created for the membership.
Request Reference Id	Displays the repricing request reference Id.

Note: Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

By default, the **Repricing Requests** zone does not appear in the **Repricing Request** screen. It appears when you click the **Broadcast** (📡) icon corresponding to a repricing entity detail record in the **Search Repricing Entity Detail Record** zone.

You can filter the list using various search criteria (such as, **Created From**, **From Effective Date**, **Created To**, **To Effective Date**, **Account ID**, **Status**, and **Pricing Rule**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (▽) icon in the upper right corner of this zone.

On clicking the **Broadcast** (📡) icon corresponding to a particular repricing request, the **Timeline and Billable Charge Details** zone appears where you can view a list of timeline and billable charge details created for a specific repricing request.

Timeline and Billable Charge Details

The **Timeline and Billable Charge Details** zone enables you to view the timelines and billable charges generated for a repricing request. It contains the following columns:

Column Name	Column Description
Start Date	Displays the start date of the timeline.
End Date	Displays the end date of the timeline.
Amount	Displays the premium amount calculated for the timeline.
Billable Charge Information	Displays information about the billable charge for the timeline.
	Note: It has a link. On clicking the link, the **Billable Charge ID** screen appears where you can view the details of the respective billable charge.
Status	Displays the status of the timeline and billable charge details.
Error Message	Displays the error message if any error occurs when the repricing request is created for the price item in the system.

Note: Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

By default, the **Timeline and Billable Charge Details** zone does not appear in the **Repricing Request** screen. It appears when you click the **Broadcast** (📡) icon corresponding to a repricing request in the **Repricing Requests** zone.

You can filter the list using various search criteria (such as, **Start Date**, **Billable Charge ID**, **End Date**, and **Status**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (▽) icon in the upper right corner of this zone.

On clicking the **Broadcast** (📡) icon corresponding to a timeline, the **Pricing Calculation Details** zone appears where you can view a list of pricing details of the entity.

Pricing Calculation Details

The **Pricing Calculation Details** zone enables you to view how the premium is calculated for the membership (in case of tier-based pricing) and how the premium is calculated for each eligible member in the membership (in case of age-based pricing). It contains the following columns:

Column Name	Column Description
Entity Information	If the age based pricing is used during the membership premium calculation, this column indicates the eligible member for whom the premium amount is calculated. However, if the tier based pricing is used during the membership premium calculation, this column indicates the main subscriber of the membership.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Description on Bill	Displays the description of the rate component for which the price component is created in the age based or tier based pricing.
Pricing Parameter	Indicates the pricing eligibility criteria which is satisfied while deriving the base fee.
Amount	Displays the base fee or applicable modifier fee.
Total Amount	If the age based pricing is used during the membership premium calculation, this column displays the sum total of the base fee and modifier fee (if any) for the eligible member. However, if the tier based pricing is used during the membership premium calculation, this column displays the base fee applicable for the membership.

By default, the **Pricing Calculation Details** zone does not appear in the **Repricing Request** screen. It appears when you click the **Broadcast** (📡) icon corresponding to a **Billable Charge Information** field in the **Timeline and Billable Charge Details** zone.

Searching for a Repricing Entity Detail Record

Prerequisites

To search for a repricing entity detail record, you should have:

- Repricing entity detail records created in the system.

Procedure

To search for a repricing entity detail record:

1. Click the **Menu** link in the **Application** toolbar.
   A list appears.
2. From the **Main** menu, select **Pricing Management** and then click **Repricing Request**.
   The **Repricing Request** screen appears.
3. Enter the search criteria in the **Search Repricing Entity Detail Record** zone.
4. Click **Search**.
   A list of repricing entity detail records that meets the search criteria appears in the **Search Results** section.

> **Note:** Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Membership Premium Calculation Through Inbound Web Service

Oracle Revenue Management and Billing enables you to calculate membership premium through an inbound web service. The following business service is shipped with the product to support the premium calculation operations:

Business Service	Description
C1-MembershipRepricing	Used to create, update, simulate, and trigger membership repricing. For more information, see C1-MembershipRepricing Business Service on page 3665

If you want to send the request in the XML format, you can create a SOAP based inbound web service. For more information on how to setup the **Membership Premium Calculation Through Inbound Web Service** feature, see Prerequisites.

C1-MembershipRepricing Business Service

Oracle Revenue Management and Billing enables you to do the following through the **C1-MembershipRepricing** business service:

- Define and edit the following types of membership:
  - Active Employee Coverage Membership
  - Employer Sponsored Group Medicare Membership (800 Series Plans)
  - COBRA Membership
- Add a member person to the membership

Copyright © 2026, Oracle and/or its affiliates.

- Edit the existing member person details of the membership
- Create a person whom you want to add to the membership
- Edit the details of a person who is added to the membership
- Define and edit a benefit of a member person in a medicare membership

> **Note:** While editing a benefit of a member person, the system inactivates the old record and creates a new record in the system. The status of the old benefit record is set to **Inactive** and the status of the new benefit record is set to **Active**.

- Recalculate the membership premium (i.e. trigger repricing) in the following scenarios:
  - A membership is added or edited in the policy or health plan.
  - A member person is added to the membership.
  - The fields, characteristics, or statuses which are monitored for the auditing purposes are updated at the membership or member person level.
- Recalculate the membership premium in the simulation mode and not in real time

> **Note:** You can use the simulation mode as the What-If Analysis tool. In the simulation mode, you can evaluate the membership premium when a new membership will be added or the existing membership will be updated. However, in the simulation mode, the system neither adds or edits the membership in the system nor creates the billable charge for the membership premium. It only recalculates the membership premium and sends the premium calculation details in the response. Note that membership premium recalculation happens only in the above three listed scenarios.

- View the information of the memberships whose start and end dates fall within the specified date range. The information includes:
  - Details of the membership
  - Details of each member person in the membership
  - Benefit details of a member person in a medicare membership
  - Details of the billable charges created for the membership premium for different price items
  - Pricing rule and price assignment used during the membership premium billable charge creation
  - Account for which the membership premium billable charge is created
  - How premium is calculated for each timeline of the billable charge

> **Note:**
>
> If the age based pricing is used during the membership premium calculation, the premium is calculated for each eligible member of the membership. Here, the premium amount is the sum of the base fee and modifier fee (if any) for the eligible member.
>
> However, if the tier based pricing is used during the membership premium calculation, the premium is calculated at the membership level. Here, the premium amount is the base fee applicable for the membership.
>
> You can also filter the list of membership premium billable charges by specifying price items whose billable charges you want to view.

- View the last billed amount and current balance of the account on which the membership premium is billed.

You can define or edit only one membership at a time through the **C1-MembershipRepricing** business service. You can only create or edit a member person and not a bill group or parent customer through the **C1-MembershipRepricing** business service.

We have shipped a SOAP based inbound web service named **C1-MembershipRepricing** with the product. You can send the membership repricing request from the external system in the XML format through the **C1-MembershipRepricing** inbound web service. If you want to send the request in the XML and/or JSON format, you need to create a REST based inbound web service.

Membership Repricing Request and Response - Tags in XML Format

Note: We recommend you to refer the **C1-MembershipRepricing** inbound web service schema in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the schema.

Copyright © 2026, Oracle and/or its affiliates.

Before calling the **C1-MembershipRepricing** inbound web service, you need to ensure that the membership repricing service contains the following tags:

Tag Name	Tag Description	Mandatory (Yes or No)
schema	Used to specify the tags of a membership repricing inbound web service.	Yes

simulationSw	Used to specify whether the simulation switch should be set as enabled or disabled in the membership repricing web service based on the following conditions:
	• If the simulation switch is set as **Y**, then the system behaves in the following manner:
	  • Any changes made to the entities like membership, member-person, and billable-charges are not saved in the ORMB application.
	  • The billable charge event is not triggered in the ORMB application, and hence the **Billable Charge** tag is not displayed in the response received from the membership repricing inbound web service.
	• If the simulation switch is set as **N**, then the system behaves in the following manner:
	  • The billable charge event is triggered in the ORMB application, and the **Billable Charge** tag is displayed in the response received from the membership repricing inbound web service.
	Note: If you do not specify the value for the simulation switch, by default, it is set to **N**.
		Yes

action	Used to indicate the execution mode of the membership repricing inbound web service when you want to receive the existing premium calculations in response. **Note:** If you specify the value for the action flag as **READ** the system retrieves the membership, pricing, and billable charge details for the membership. The membership information is not updated even if the simulation switch is set to **N** and the action flag is set as **READ**.	Yes (Conditional) **Note:** This data is required when you want to receive the existing premium calculations in the response from the membership repricing inbound web service.
readFilters	Used to specify the filter when you want to view the premium calculations for a particular set of price-items or for a timeline. **Note:** The execution mode of the membership inbound web service should be set to**read-only**.	Yes (Conditional) **Note:** This data is required while viewing the premium calculations for particular set of price-items or for a timeline.
dateFilter	Used to specify the filter when you want to view the premium calculations for a timeline.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: The execution mode of the membership inbound web service should be set to**read-only**.	**Note:** This data is required while viewing the premium calculations for a particular timeline.
startDate	You can use this tag within the following tags: • **dateFilter** - Here, the **startDate** tag is used to indicate the date from when the timeline is effective for premium calculations. **Note:** The start date cannot be later than the end date. The start date cannot be earlier than the membership start date or later than the membership end date. • **related persons** - Here, the **startDate** tag is used to specify the date from when the person is related to the parent customer. • **membership** - Here, the **startDate** tag is used to indicate the date from when the membership is effective. • **benefitDataList** - Here, the **startDate** tag is used to indicate the date from when the benefit is effective.	Yes (Conditional) **Note:** This data is required while viewing the premium calculations for a particular timeline.
endDate	You can use this tag within the following tags: • **dateFilter** - Here, the **endDate** tag is used to specify the date till when the timeline is effective for premium calculations. **Note:** The end date cannot be earlier than the start date. The end date cannot be earlier than the membership start date or later than the membership end date. • **related persons** - Here, the **endDate** tag is used to specify the date till when the person is related to the parent customer. • **membership** - Here, the **endDate** tag is used to indicate the date till when the membership is effective. • **benefitDataList** - Here, the **endDate** tag is used to indicate the date till when the benefit is effective.	Yes (Conditional) **Note:** This data is required while viewing the premium calculations for a particular timeline.
priceItemFilter	Used to specify the filter when you want to view the premium calculations for a particular set of timeline. **Note:** The execution mode of the membership inbound web service should be set to**read-only**.	Yes (Conditional) **Note:** This data is required while viewing the premium calculations for a particular set of price-items.
priceItemList	Used to specify the price items in the pricing list.	No
priceItemCode	Used to specify the price item code.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
person	Used to specify information about the person.	Yes
personData	Used to specify the details of the parent customer, bill group, or member person.	Yes (Conditional) **Note:** This data is required while defining or editing a person.
sequence	You can use this tag within the following tags: • **personData** - Here, the **sequence** tag is used to indicate the order in which the person information should be created in the system. **Note:** You must specify the data in this field even though the information for a single person exists. • **personName** - Here, the **sequence** tag is used to indicate the order in which the person name should be created in the system. **Note:** You must specify the data in this field only when the information for multiple persons exists. • **benefitDataList** - Here, the **sequence** tag is used to indicate the order in which the benefit information should be created in the system.	Yes (Conditional) **Note:** This data is required while defining or editing a person.
personType	Used to indicate the type of person. The valid values are: • **B** - Indicates that the person is a business owner. • **BG** - Indicates that the person is a bill group. • **G** - Indicates that the person is a group owner. • **K** - Indicates that the person is a broker. • **P** - Indicates that the person is an individual • **PG** - Indicates that the person is a parent customer. **Note:** You must specify a value which is already defined in the **PER_OR_BUS_FLG** lookup field. It must be in the **Active** status.	Yes (Conditional) **Note:** This data is required while defining or editing a person.
personName	Used to specify a list of names for the person.	Yes (Conditional) **Note:** This data is required while defining or editing a person.
entityName	Used to specify the name of the person.	Yes (Conditional) **Note:** This data is required while defining or editing a person.
nameType	Used to indicate the type of name. The valid values are: • **AL** - Indicates that the type of name is Alias.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	• **ALT** - Indicates that the type of name is Alternate Representation. • **DBA** - Indicates that the type of name is Doing Business As. • **FORM** - Indicates that the type of name is Former. • **LGAL** - Indicates that the type of name is Legal. • **PRIM** - Indicates that the type of name is Primary. **Note:** You must specify a value which is already defined in the **NAME_TYPE_FLG** lookup field. It must be in the **Active** status.	**Note:** This data is required while defining or editing a person.
identifiers	Used to specify the identification details for the person. **Note:** You must specify the data in this field even though the information for a single person exists.	Yes (Conditional) **Note:** This data is required while defining or editing a person.
idType	You can use this tag within the following tags: • **identifiers** - Here, the **idType** tag is used to specify the person identifier type. • **related persons** - Here, the **idType** tag is used to specify the related persons identifier type. • **accountIdentifiers** - Here, the **idType** tag is used to specify the account identifier type.	Yes (Conditional) **Note:** This data is required while defining or editing a person, related persons, or account details.
idValue	You can use this tag within the following tags: • **identifiers** - Here, the **idValue** tag is used to specify the person identifier type. • **related persons** - Here, the **idValue** tag is used to specify the person identifier type. • **accountIdentifiers** - Here, the **idValue** tag is used to specify the account identifier type.	Yes (Conditional) **Note:** This data is required while defining or editing a person, related persons or account details.

isPrimary	You can use this tag within the following tags:
	• **identifiers** - Here, the **isPrimary** tag is used to indicate whether the person identifier is a primary identifier. The valid values are:
	  • **Y**
	  • **N**
	• **accountIdentifiers** - Here, the **isPrimary** tag is used to indicate whether the account identifier is a primary identifier. The valid values are:
	  • **Y**
	  • **N**
		No

division	You can use this tag within the following tags: • **personData** - Here, the **division** tag is used to indicate the division to which the person belongs.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	• **accountBalanceData** - Here, the **division** tag is used to indicate the division to which the account belongs.	
birthDate	Used to specify the date when the person was born. **Note:** You must specify the date in the `YYYY-MM-DD` format.	No
sinceDate	Used to specify the date when the person's record is created in the system. This is purely informational. **Note:** You must specify the date in the `YYYY-MM-DD` format.	No
address	Used to specify the address of the person.	Yes (Conditional) **Note:** This data is required while defining or editing the address of the person.
addressEffDate	Used to specify the date from when the address is effective. **Note:** You must specify the date in the `YYYY-MM-DD` format. If you do not specify the date, by default, the system sets the effective date to the date when the address is created in the system through the health care inbound message.	Yes (Conditional) **Note:** This data is required while editing the address of a person.
addressType	Used to indicate the type of address. The valid values are: • **MAIN** - Indicates that the address is the person's mailing address. You can use this address type while specifying the address for the person and account. • **SEAS** - Indicates that the address is the person's seasonal address. You can use this address type while specifying the address for the person. • **OVRD** - Indicates that the address is the account's override address. You can use this address type while specifying the address for the account. **Note:** If you do not specify the address type, by default, it is set to **MAIN**. You must specify an address type which is already defined in the **ADDRESS_TYPE_FLG** lookup field. It must be in the **Active** status.	Yes (Conditional) **Note:** This data is required while editing the address of a person or account.
mailingName	Used to specify the name using which the person should be addressed in the mail communication. The system also uses the mailing name in the bills, letters, quotes, and statements.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
address1	Used to specify the first line of the address. It may contain details, such as the house number.	Yes (Conditional) **Note:** This data is required while defining and editing the address of a person.
address2	Used to specify the second line of the address. It may contain details, such as the apartment name.	No
address3	Used to specify the third line of the address. It may contain details, such as the street name.	No
address4	Used to specify the fourth line of the address. It may contain the landmark details.	No
city	Used to specify the city name.	No
state	Used to indicate the state where the city is located.	No
zip	Used to specify the zip code of the address.	No
country	Used to indicate the country where the person or account is located.	No
houseType	Used to indicate the type of the house. The valid values are: • **AB** - Indicates that the type of house is a House Boat Reference. • **WW** - Indicates that the type of house is a House Trailer Reference. **Note:** You must specify a value which is already defined in the **HOUSE_TYPE** lookup field. It must be in the **Active** status.	No
streetNumber1	Used to specify the numeric information, if any, related to the address.	No
streetNumber2	Used to specify the numeric information, if any, related to the address.	No
inCityLimit	Used to indicate whether the address is within the city limit. The valid values are: • **Y** • **N**	No
taxVendorGeographicalCode	Used to specify the geographic code of the address.	No
county	Used to specify the county name.	No
email	Used to specify the e-mail ID of the person.	No
overrideMailingName1	Used to specify the name using which you want to override the person's mailing name.	No
overrideMailingName2	Used to specify the name using which you want to override the person's override mailing name 1.	No
overrideMailingName3	Used to specify the name using which you want to override the person's override mailing name 2.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
phones	Used to specify the phone details of the person.	Yes (Conditional) **Note:** This data is required while defining or editing the phone details of a person.
phoneType	Used to indicate the type of phone. **Note:** You must specify a phone type which is already defined in the system.	Yes (Conditional) **Note:** This data is required while defining or editing the phone details of a person.
phoneValue	Used to specify the phone number of the person.	Yes (Conditional) **Note:** This data is required while defining or editing the phone details of a person.
extension	Used to specify the extension value of the phone number.	Yes (Conditional) **Note:** This data is required while defining or editing the phone details of a person.
relatedPersons	Used to list other persons with whom you want to establish the person's relationship.	Yes (Conditional) **Note:** This data is required while defining or editing a person to person relationship.
personRelationshipType	Used to indicate how the other person is related to the person. **Note:** You must specify a person relationship type which is already defined in the system. If you have specified a parent customer as the related person for a bill group, the system, by default, uses the person relationship type which is specified in the **Person Relationship Type** option type of the **C1-ASOBLLNG** feature configuration. It does not considers the value specified in this tag.	Yes (Conditional) **Note:** This data is required while creating relationship between a bill group and person whose the person type is not **Parent Customer**.
financialRelationshipSw	Used to indicate whether the other person is financially responsible for the person. The valid values are: • **True** • **False** **Note:** If you do not specify the value, by default, it is set to **False**.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
parentOrChild	Used to indicate whether the other person is parent or child. The valid values are: • **C** • **P** **Note:** You must specify a value which is already defined in the **PARENT_OR_CHILD_FLG** lookup field. It must be in the **Active** status.	Yes (Conditional) **Note:** This data is required while creating a person to person relationship.
relatedPersonsCharacteristicsList	Used to specify the characteristic details for the related person.	Yes (Conditional) **Note:** This data is required while defining or editing a characteristic of the respective entity.
characteristic	You can use this tag within the following tags: • **relatedPersonsCharacteristicsList** - Here, the **characteristic** tag is used to specify the characteristic details for the related person. • **personCharacteristicList** - Here, the **characteristic** tag is used to specify the characteristic details for the person. • **membershipCharacteristicList** - Here, the **characteristic** tag is used to specify the characteristic for the membership. **Note:** The characteristic tag (along with its elements) can be used more than once within the schema when the **Type** attribute of the characteristic is set to **List**. • **memberCharacteristicList** - Here, the **characteristic** tag is used to specify the characteristic for the membership. • **benefitCharacteristicsList** - Here, the **characteristic** tag is used to specify the characteristic details for the benefit.	Yes (Conditional) **Note:** This data is required while defining or editing a characteristic of the respective entity.
characteristicType	You can use this tag within the following tags: • **characteristic** - Here, the **characteristicType** tag is used to specify the characteristic type. • **characteristicList** - Here, the **characteristicType** tag is used to specify the characteristic type.	Yes (Conditional) **Note:** This data is required while defining or editing a characteristic of the respective entity.
characteristicValue	You can use this tag within the following tags: • **characteristic** - Here, the **characteristicValue** tag is used to specify the value for the predefined characteristic type. • **characteristicList** - Here, the **characteristicValue** tag is used to specify the value for the predefined characteristic type.	Yes (Conditional) **Note:** This data is required while defining or editing a characteristic of the respective entity.
effectiveDate	You can use this tag within the following tags:	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	• **characteristic** - Here, the **effectiveDate** tag is used to specify the date from when the characteristic is effective. • **characteristicList** - Here, the **effectiveDate** tag is used to specify the date from when the characteristic details are effective for the account.	
personCharacteristicList	Used to specify the characteristic details for the related person.	Yes (Conditional) **Note:** This data is required while defining or editing a characteristic of the respective entity.
accountData	Used to specify the account details of a person.	Yes (Conditional) **Note:** This data is required while defining or editing an account.
accountType	Used to indicate the type of account. This information is stored as a characteristic for the account. **Note:** The value is stored in the characteristic type which is specified in the **Invoice Type Characteristic Type** option type of the **C1-ASOBLLNG** feature configuration. You must specify a value which is already defined in the predefined characteristic type.	Yes (Conditional) **Note:** This data is required while defining or editing an account.
customerClass	Used to indicate the customer class to which the account belongs.	Yes (Conditional) **Note:** This data is required while defining or editing an account.
postponeCreditReviewUnti	Used when you want to review the person's debt after a particular date. The system will consider the person for monitoring the delinquency only after the specified date. You can specify the postpone credit review until date for a person through a health care inbound message.	Yes (Conditional) **Note:** This data is required while defining or editing a person.
lastCreditReviewDate	Used to indicate the date when the person's debt was last reviewed. The system stamps the last credit review date against a person when a delinquency process is initiated for the person through the **C1-PRDLQ** batch.	Yes (Conditional) **Note:** This data is required while defining or editing a person.
dragDays	Used to specify additional grace days (if any) offered at the person level. These drag days are considered while calculating the grace end date when the trigger date calculation mode (in the respective delinquency process type) is set to **Latest Bill Due Date with Grace Period**.	Yes (Conditional) **Note:** This data is required while defining or editing a person.

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
advanceDepositAmount	Used to specify the advance deposit amount that will be parked at the parent customer level. It is required when the advance deposit level of the respective policy holder (i.e., parent customer) is set to **PG**. **Note:** You must specify a positive value in this field. This tag is applicable only for the fully-insured group business. For more information about the feature, see Allocate Advance Deposit for Delinquent Customers.	Yes (Conditional) **Note:** This data is required when you want to allocate advance deposit for delinquent customers.
advanceDepositGraceDays	Used to specify the grace days. The system then uses the grace days to derive the grace period within which the advance deposit should be received from the group customer. While calculating the grace period, the system derives the earliest start date among all the polices where the parent customer is the policy holder and considers it as the grace start date. Once the grace start date is derived, the system calculates the grace end date (i.e. grace start date + grace days). For example, if a parent customer is the policy holder of two policies - P1 (01-Jan-2022 to 31-Dec-2022) and P2 (01-Jun-2022 to 31-Dec-2022) and advance deposit grace days is set to 6 days, then the system considers 01-Jan-2022 as the grace start date (as it is the earliest start date) and sets the grace end date to 07-Jan-2022. The advance deposit grace days is required when the advance deposit level of the respective policy holder (i.e., parent customer) is set to **PG**. **Note:** You must specify an integer value in this field. This tag is applicable only for the fully-insured group business. For more information about the feature, see Allocate Advance Deposit for Delinquent Customers.	Yes (Conditional) **Note:** This data is required when you want to allocate advance deposit for delinquent customers.
advanceDepositLevel	Used to indicate whether you want to park the advance deposit received from the group customer at the parent customer or policy level. The valid values are: • **PG** - Used when you want to park the advance deposit at the parent customer level. • **POLI** - Used when you want to park the advance deposit at the policy level.	Yes (Conditional) **Note:** This data is required when you want to allocate advance deposit for delinquent customers.

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: The advance deposit level is only applicable for the person whose person type is set to **Parent Customer**. If you do not specify the advance deposit level, then the parent customer is not eligible for the advance deposit either at the parent customer or policy level. You must specify a value which is already defined in the **ADV_DEP_LVL_FLG** lookup field. This tag is applicable only for the fully-insured group business. For more information about the feature, see Allocate Advance Deposit for Delinquent Customers on page 4362.	
addressStatus	Used to indicate the status of the address. The valid values are: • C1AC • C1IN **Note:** • You must specify a value which is already defined in the **ADDR_STATUS_FLG** lookup field. It must be in the **Active** status. • While creating an address for an entity, the status of the address should always be set to **C1AC** (i.e. Active). • The **addressStatus** tag is not mandatory. Therefore, if you do not specify the value for the **addressStatus** tag while creating an address, the system, by default, sets it to **C1AC** (i.e. Active).	No
repriceAfterDate	Used to indicate whether you want to hold the repricing for the membership until the specified date.	No
billCycle	Used to indicate the bill cycle for the account. **Note:** You must specify a bill cycle which is already defined in the system.	No
billLeadDays	Used to indicate whether you want to bill the account in advance. Here, you need to specify the number of days which is used to derive the cut-off date for advance billing. If you do not want to bill the account in advance, you must specify the value as zero(0).	No
currency	Used to indicate the currency in which you want to bill the account. **Note:** You must specify a currency which is already defined in the system.	Yes (Conditional) **Note:** This data is required while defining an account.

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
setUpDate	Used to specify the date when the account was first created. This is purely informational. **Note:** You must specify the date in the `YYYY-MM-DD` format. If you do not specify the value, by default, it is set to the current date.	No
acctUsageFlg	Used to indicate the category to which the account belongs. The valid values are: • **INVC** - Indicates that the account will be used to bill charges of the usage accounts. • **SETL** - Indicates that the account will be used only for settlement purposes. • **USAG** - Indicates that the account will have its own charges. If the usage account is linked to any construct, the usage account's charges are billed through an invoice account. Otherwise, the usage account is billed individually. **Note:** You must specify a value which is already defined in the **ACCT_USAGE_FLG** lookup field. It must be in the **Active** status.	No
comments	Used to specify additional information about the account.	No
deferAutoPayDt	Used to specify the date till when you want to hold the automatic payment process for the account.	No
collectionClass	Used to control how the person's debt is compared against collection criteria (i.e. tolerance limit) to determine whether a collection process (such as delinquency process) should be initiated for the person. A new collection method named **Self-Control Delinquency** is available while defining a collection class. It is used to create a distinct or separate delinquency process for the persons who belong to the collection class. If you want to evaluate the debt of the person's accounts, its child persons, and the child persons' accounts while monitoring the person's delinquency, you must set the collection method of their respective collection class to **Parental Delinquency**. If you set the collection method of the collection class for any of the person's account, any of its child person, or child persons' accounts to **Self-Control Delinquency**, the system does not consider the debt of the respective entity while monitoring the delinquency of the parent person.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: If you do not want to initiate delinquency process for a child person or an account, ensure that the person or account belongs to a collection class where the collection method is set to **Not Eligible for Collection**. If the collection class is not defined for a person, the system skips the person while monitoring the delinquency.	
billRouteType	Used to indicate how the account's bill must be sent to the main customer.	Yes (Conditional) **Note:** This data is required while defining the respective information.
billAddressSource	Used to indicate whether the account's bill must be sent to the main customer's mailing address or to the main customer's account override address. The valid values are: • **ACCT** • **ACOV** • **BILL** • **MAIN** • **PER** • **TEST** **Note:** You must specify a value which is already defined in the **BILL_ADDR_SRCE_FLG** lookup field. It must be in the **Active** status.	Yes (Conditional) **Note:** This data is required while defining the respective information.
accountIdentifiers	Used to specify the account identifiers for the account.	Yes
characteristics	Used to specify the characteristics for the account.	No
characteristicsList	Used to specify the characteristics information for the account.	No
membership	Used to specify information about the membership.	Yes
sourceSystem	Used to specify the external system from where the membership information is received for repricing. **Note:** You must specify a source system which is already defined in the **C1-SourceSystemLookup** extendable lookup. It must be in the **Active** status.	Yes
policyNumber	Used to specify the policy number.	Yes (Conditional) **Note:** This data is required while defining or editing the respective information.
planNumber	Used to specify the plan number.	Yes
healthPlanCode	Used to specify the health plan code.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
boStatusCd	Used to indicate the status of the membership.	No

membershipType	You can use this tag within the following tags:
	• **membership** - Here, the **membershipType** tag is used to indicate the type of membership. The valid values are:
	  • **COBR**
	  • **MDCR**
	  • **RETR**
	Note: If you want to define an active employee coverage membership, you must leave this field blank.
	• **mainSubscriber** - Here, the **membershipType** tag is used to indicate the type of membership for the main subscriber.
	Note: You must specify a value which is already defined in the **MEMBERSHIP_TYPE_FLG** lookup field. It must be in the **Active** status.
		Yes

mainSubscriber	Used to indicate whether the person is the main subscriber of the membership. The valid values are: • **Yes** • **No**	Yes (Conditional) **Note:** This data is required only while defining the membership details of a person.
mainSubsIdType	Used to specify the type of main subscriber.	Yes (Conditional) **Note:** This data is required only while defining the membership details of a person.
mainSubsIdValue	Used to specify the value for the main subscriber.	Yes (Conditional) **Note:** This data is required only while defining the membership details of a person.
autoRenew	Used to indicate whether the individual membership should be automatically renewed.	No
associatedMemberIdentifierType	Used to specify the identifier type of the member who is associated with another individual membership.	No
associatedMemberIdentifier	Used to specify the identification of the member who is associated with another individual membership.	Yes (Conditional) **Note:** This data is required while defining or editing the individual membership.
exchangeFlag	Used to indicate whether the individual membership is purchased from the exchange. The valid values are:	Yes

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	• **OFF** • **ON** **Note:** You must specify a value which is already defined in the **EXCHANGE_FLG** lookup field. It must be in the **Active** status.	
exchangeId	Used to specify the identification number of the exchange from where the individual membership is purchased.	Yes (Conditional) **Note:** This data is required when the exchangeFlag is set to **ON**.
binderLiabilityAmount	Used to specify the binder liability amount. **Note:** This data is required when the **Consider Binder Liability Amount** attribute is set to **Y** in the binder payment preference.	Yes (Conditional) **Note:** This data is required while defining or editing the individual membership.
binderPayApplicability	Used to indicate that the system should monitor whether the binder payment is received before activating the individual membership. The valid values are: • **Y** • **N**	No
binderPayGraceDays	Used to calculate the grace date for the individual membership.	Yes (Conditional) **Note:** This data is required when the binderPayApplicability is set to **Y**.
binderPayThreshold	Used to specify the threshold percentage using which the threshold amount should be calculated.	Yes (Conditional) **Note:** This data is required when the binderPayApplicability is set to **Y**.
holdBilling	Used to indicate whether you want to hold the bill generation process for the individual membership until the binder payment is received.	Yes (Conditional) **Note:** This data is required when you have selected the binderPayApplicability to **Y**.
membershipRenewalDate	Used to indicate the date when the individual membership should be renewed. **Note:** You must specify the renewal date when you are manually renewing the individual membership.	Yes (Conditional) **Note:** This data is required while defining or editing the individual membership.
contractPeriod	Used to indicate the period (in months) for which the individual membership should be automatically renewed.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
		Note: This data is required while defining or editing the individual membership.
membershipIdentifierList	Used to specify the identification details for the membership.	Yes (Conditional) **Note:** This data is required while defining or editing the membership identifier details for the individual or group membership.
membershipIdentifier	Used to specify the identification for the membership.	Yes (Conditional) **Note:** This data is required while defining or editing the membership identifier details for the individual or group membership.
membershipIdentifierType	Used to specify the membership identifier type.	Yes (Conditional) **Note:** This data is required while defining or editing the membership identifier details for the individual or group membership.
membershipIdentifierValue	Used to specify the value for the predefined membership identifier type.	Yes (Conditional) **Note:** This data is required while defining or editing the membership identifier details for the individual or group membership.
membershipCharacteristicList	Used to specify the characteristic details for the membership.	Yes (Conditional) **Note:** This data is required only while defining the membership details of a person.
membershipRateGuarantee	Used to specify the rate guarantee information for each individual membership. **Note:** The rate guarantee information can be specified only while defining or editing the individual membership.	Yes (Conditional) **Note:** This data is required while defining or editing the respective information.
membershipRateGuaranteeList	Used to specify the rate guarantee details for the individual membership.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: The rate guarantee details can be specified only while defining or editing the individual membership.	**Note:** This data is required while defining or editing the respective information.
rateGuaranteeStartDate	Used to specify the date from when the rate guarantee is available for the individual membership. **Note:** You can specify the rate guarantee start date only while defining or editing the individual membership. The rate guarantee start date cannot be later than rate guarantee end date. The rate guarantee start date cannot be earlier than the membership start date or later than membership end date.	Yes
rateGuaranteeEndDate	Used to specify the date till when the rate guarantee is available for the individual membership. The valid values are: • ACTV • INAC **Note:** You can specify the rate guarantee start date only while defining or editing the individual membership. The rate guarantee end date cannot be earlier than rate guarantee start date. The rate guarantee start end cannot be earlier than the membership start date or later than membership end date. You must specify a value which is already defined in the **RATE_GRNT_STATUS_FLG** lookup field. It must be in the **Active** status.	Yes (Conditional) **Note:** This data is required if you have specified the rateGuaranteeStartDate while defining or editing the individual membership.
rateGuaranteeStatus	Used to indicate the status of the rate guarantee period. The valid values are: • **Active** • **Inactive**	Yes
memberDataList	Used to specify basic information about the membership.	Yes (Conditional) **Note:** This data is required while defining or editing the membership details of a person.
memberData	Used to specify the details of the main subscriber or dependent person.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: The member data information must be provided along with the enrollment dates whenever a new membership is created. The memberData tag (along with its elements) can only be used once within the schema, when the **Type** attribute of the memberData is set to **Group**.	**Note:** This data is required while defining the membership details of a person.
memberIdType	Used to specify the external membership ID.	Yes
memberIdValue	Used to specify the value for the external membership ID.	Yes
enrollmentStartDate	Used to specify the date from when you want to add the member person to the membership. **Note:** The enrollment start date cannot be later than the enrollment end date. The enrollment start date cannot be earlier than the membership start date or later than the membership end date.	Yes (Conditional) **Note:** This data is required while defining the membership details of a person.
enrollmentEndDate	Used to specify the date till when you want to add the member person to the membership. **Note:** The enrollment end date cannot be earlier than the enrollment start date. The enrollment end date cannot be earlier than the membership start date or later than the membership end date.	Yes (Conditional) **Note:** This data is required while defining the membership details of a person.
memberRelationship	Used to indicate how the main subscriber is related to the membership.	Yes (Conditional) **Note:** This data is required while defining or editing the membership details of a person.
membershipPersonStatus	Used to indicate the status of the person in the membership. The valid values are: • **ACTV** • **CNCL** • **INAC** • **PNEF** **Note:** You must specify a value which is already defined in the **MEMBER_PER_STATUS_FLG** lookup field. It must be in the **Active** status.	Yes
membershipPersonstatusReason	Used to indicate the reason why you want to change the status of the member person. The valid values are:	Yes

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	• **ZZAB** • **ZZBN** • **ZZBR** • **ZZBS** • **ZZCN** • **ZZEL** • **ZZNW** • **ZZRE** • **ZZSP** • **ZZTM** **Note:** You must specify a value which is already defined in the **MEMB_PERS_STAT_RSN_FLG** lookup field. It must be in the **Active** status.	
memberId	Used to specify the external membership ID. **Note:** Here, you need to specify a membership ID which is maintained in the external source system.	No
financeRespFlag	Used to indicate whether the person is financially responsible for the membership. The valid values are: • **Yes** • **No**	No
isMemberSw	Used to indicate whether the person is a member or a non-member in the membership. The valid values are: • **Yes** • **No**	No
externalMedicareBeneficiaryId	Used to specify the Medicare beneficiary identifier of the person who has availed the Medicare benefit.	No
benefitData	Used to specify information about the membership benefit.	Yes (Conditional) **Note:** This data is required while defining or editing a membership benefit.
benefitDataList	Used to specify the details of a membership benefit.	Yes (Conditional) **Note:** This data is required while defining or editing a membership benefit.
benefitStatus	Used to indicate the status of the membership benefit. The valid values are: • **ACTIVE** • **DISCARD**	Yes (Conditional) **Note:** This data is required while defining or editing a benefit.

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: While defining a membership benefit, by default, the status is set to **Active**. On editing a membership benefit, the system inactivates the old record and creates a new record in the system. The status of the old benefit record is set to **Inactive** and the status of the new benefit record is set to **Active**. You can discard an active or inactive membership benefit whenever required.	
benefitSourceFlag	Used to indicate the source (i.e. health insurance exchange) from where the benefit is received for the membership. The valid values are: • **CMS** • **ST** **Note:** You must specify a value which is already defined in the **BENEFIT_SRC_FLG** lookup field. It must be in the **Active** status.	No
benefitSubTypeFlag	Used to indicate whether the membership benefit is a Medicare Part A, Part B, or Part D benefit, Medicare Part D LIS, Medicare Part D LEP, APTC benefit, or any other membership benefit. **Note:** You can only specify a benefit sub type which is already defined in the system.	No
planBenefitPackageId	Used to indicate the Medicare plan benefit package (i.e. 800 series plan) which is applicable for the membership benefit. **Note:** You can only specify a Medicare plan benefit package which is already defined in the system.	Yes (Conditional) **Note:** This data is required while creating the Medicare Part A, Part B, or Part D membership benefit.
benefitAmount	Used to specify the pass-through amount for the availed membership benefit.	Yes (Conditional) **Note:** This data is required while creating the Medicare Part D LIS, Medicare Part D LEP, APTC, or other membership benefits.

The following table provides information about the response tags in the membership repricing inbound web service:

Tag	Tag Description
responseDetails	Displays the information whether the membership repricing inbound web service was successfully processed or not.
membershipId	Indicates the membershipID for which the repricing should take place.

Copyright © 2026, Oracle and/or its affiliates.

Tag	Tag Description
responseStatus	Indicates the status of the response received from the membership repricing inbound web service. • If an error occurs while processing the membership repricing inbound web service, then the **responseStatus** tag contains **ERROR** as a response message received from the membership repricing inbound web service, and the error message is displayed in the **message** tag. • If the membership repricing inbound web service is correctly processed, then the **responseStatus** tag contains **SUCCESS** as a response message received from the membership repricing inbound web service. • If a transaction results in an error, then the changes requested as a part of the transaction are not processed and a rollback is performed.
message	Indicates the reason why the membership repricing inbound web service failed.
responseType	Indicates the type of response received from the inbound web service. The valid values are: • **DT** - Indicates that the response contains detailed information. • **SMRY** - Indicates that the response contains summary information.
paidThroughDate	Indicates the term end date of the last fully or partially paid term. For more information about the paid through date, refer to Policy on page 312.
premiumCalculationDetails	Displays the premium calculation details for the membership.
	Note: The premiumCalculationDetails tag (along with its elements) can be used only once within the schema when the **Type** attribute of the premiumCalculationDetails is set to **Group**.
premiumCalculation	Displays the total premium of all the members for the timeline.
	Note: The premiumCalculation tag (along with its elements) can be used more than once within the schema when the **Type** attribute of the premiumCalculation is set to **List**.
priceItemCd	Indicates the price item for which the billable charge is created.
startDt	Displays the start date of the timeline.
	Note: The startDt cannot be later than the endDt. The startDt cannot be earlier than the membership start date or later than the membership end date.
endDt	Displays the end date of the timeline.
	Note: The endDt cannot be earlier than the startDt. The endDt cannot be earlier than the membership start date or later than the membership end date.

Tag	Tag Description
calcAmt	You can use this tag within the following tags: • **premiumCalculation** - Here, the **calcAmt** tag is used to display the premium amount calculated for the timeline. • **premiumCalcLines** - Here, the **calcAmt** tag is used to display the premium amount calculated for each eligible member in the membership.
distAmt	You can use this tag within the following tags: • **premiumCalculation** - Here, the **distAmt** tag is used to display the discount amount calculated for the timeline. • **premiumCalcLines** - Here, the **distAmt** tag is used to display the discount amount calculated for each eligible member in the membership.
currencyCd	You can use this tag within the following tags: • **premiumCalculation** - Here, the **currencyCd** tag is used to indicate the currency in which the premium is calculated for the timeline. • **premiumCalcLines** - Here, the **currencyCd** tag is used to indicates the currency in which the premium is calculated for each eligible member in the membership. **Note:** Here, the system chooses those currencies in which the bills added to the membership are created.
acctIdType	Indicates the account identifier type.
acctIdVal	Indicates the value of the account identifier type.
accountId	Indicates the account to which the membership is billed.
billableChgId	Indicates the billable charge ID.
pricingRuleId	Indicates the pricing rule using which the premium amount is calculated.
priceAsgnId	Indicates the price item pricing which is assigned to a membership.
premiumCalc LineDetails	Displays the premium calculated line details for each eligible member in the membership.
premiumCalcLines	Displays the premium calculated line information for each eligible member in the membership.
proFactor	Indicates the proration factor used to calculate the billable charges for the membership contract.
month	Displays the month of the premium calculation.
totalCalcAmt	Displays the total calculated amount for premium calculation.
entityTypeFlg	Indicates the type of entity created for premium calculation.
entityId	Indicates the entity ID.
referenceIdType	Indicates the reference type used for premium calculation.
referenceIdValue	Indicates the value of the reference identifier type.
pricingParameters	Indicates the pricing eligibility criteria which is satisfied while deriving the premium for the membership.

Copyright © 2026, Oracle and/or its affiliates.

Tag	Tag Description
description	Displays the description of the rate component for which the price component is created in the age based or tier based pricing.
accountBalance	Displays the amount balance in the account.
accountBalanceData	Displays the account balance data information.
accountIdentifierType	Indicates the account identifier type for the account.
accountNumber	Indicates the bank account through which automatic payment is made.
accountId	Indicates the account which made the payment.
division	You can use this tag within the following tags: • **personData** - Here, the **division** tag is used to display the division to which the person belongs • **accountBalanceData** - Here, the **division** tag is used to display the division to which the account belongs
sourceSystem	Indicates the external system from where the membership information is received for repricing.
c1External TransactionId	Indicates the transaction in the external source system which resulted in the customer inbound message.
externalSourceId	Displays the external source system ID.
accountInfoDtls	Displays the account information details of an account.
currentBalance	Displays the total amount of funds in the account.
lastBillAmount	Indicates the last bill amount generated for the membership.
statusCd	Indicates whether the membership repricing incoming message is successfully processed or not. The valid values are: • **Success** • **Fail**
messageText	Indicates the reason for an error occurrence.

Note: We have given the above sample to illustrate how the tags should be nested while sending an individual membership creation request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Sample Group Membership Creation Request and Response in XML Format

Using the below example, you can do the following:

- Create a group membership

Entity Name	Person Type	Policy Number	Plan Number	Main Subscriber
REPRC_ SD001_001_P1	Person	REPRC_SD001_ BG1_POL1	REPRC_SD001_ BG1_POL01_P1	Yes

```

Note: We have given the above sample to illustrate how the tags should be nested while sending a group membership creation request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Sample Group Membership Read Request and Response in XML Format

Using the below example, you can do the following:

- View the details of the group membership with the membership Id as **147113405729021**

Person Name	Person Type	Membership ID	Policy Number	Main Subscriber
FINS_GRP013_ SEAN, FINS_GRP013_ BLIGNAUT	PERSON	147113405729021	FINS_GRP013_ POL1	Yes

```

        </accountBalanceData>
    </accountBalance>
</schema>
```

Note: We have given the above sample to illustrate how the tags should be nested while sending a group membership read request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Sample Individual Membership Read Request and Response in XML Format

Using the below example, you can do the following:

- View the details of an individual membership with the membership Id is **018627581362534**

Person Name	Person Type	Membership ID	Policy Number	Main Subscriber
REPC_BEN, REPC_WOAKES	PERSON	018627581362534	REPC_BEN_POL1	Yes

```
<schema>
    <responseDetails>

```

Note: We have given the above sample to illustrate how the tags should be nested while sending an individual membership read request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Sample Member Person Creation Read Request and Response in XML Format

Using the below example, you can do the following:

- Create a member person for a membership

Person Name	Person Type	Membership ID	Policy Number	Main Subscriber
REPC_ANDY, REPC_WILLIAMS	PERSON	998162301690408	REPC_ANDY_POL1	Yes

```
<schema>
    <responseDetails>
        <membershipId>998162301690408</membershipId>
        <responseStatus>SUCCESS</responseStatus>
        <message></message>
    </responseDetails>

Note: We have given the above sample to illustrate how the tags should be nested while sending an individual membership premium simulation request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Sample Group Membership Premium Simulation Request and Response in XML Format

Using the below example, you can do the following:

- Simulate the premium calculation process for a group membership.

Person Name	Person Type	Policy Number	Plan Number	Main Subscriber
FINS_COBRA_ LOC0098_P1	PERSON	FINS_COBRA_ LOC0098_BG1_POL1	FINS_COBRA_ LOC0098_BG1_ POL1_P1	YES

```

Note: We have given the above sample to illustrate how the tags should be nested while sending a group membership premium simulation request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Sample Account Balance Read Request and Response in XML Format

Using the below example, you can do the following:

- View the account balance for the membership.

Entity Name	Membership Id	Policy Number	Plan Number	Main Subscriber
REPRC1000, MAIN_SUB	229160661076798	REPRC1000_ Policy	REPRC1000_ DENTAL_PLAN	Yes

```
<schema>

Note: We have given the above sample to illustrate how the tags should be nested while sending an account balance read request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Sample Maintaining Advance Deposit at Parent Customer Level in XML Format

Using the below example, you can do the following:

- Maintain the advance deposit at parent customer level

The following table provides sample data where advance deposit is maintained at the parent customer level:

Advance Deposit Level	Person Type	Person Name	Policy Number	Plan Number	Advance Amount	Bill 1 Amount	Bill 2 Amount
PG	PARENT CUSTOMER	PETER_ INGRAM	REPRC_ IN_POL1	REPRC_ IN_POL1_ PLN1	2000	1500	500

```

Note: We have given the above sample to illustrate how the tags should be nested while sending an advance deposit creation request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Pricing Vs Passthrough Charges

Oracle Revenue Management and Billing enables you to view the difference (if any) between the calculated and passthrough benefit amount for a membership. It contains the following zone:

- Pricing Vs Passthrough Charges on page 3739

Note: For more information on how either the calculated benefit amount or passthrough benefit amount is billed for a membership, see Benefit Passthrough Charges vs. Calculated Charges on page 3657.

Pricing Vs Passthrough Charges

The**Pricing Vs Passthrough Charges** zone allows you to view the difference (if any) between the calculated and passthrough benefit amount of the membership for a coverage period. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Membership ID	Used to search for coverage periods of a particular membership where the calculated and passthrough benefit amount is different. **Note:** The **Search** (🔍) icon appears corresponding to the **Membership ID** field. On clicking the **Search** icon, the **Search Membership** window appears. This field is applicable for both fully insured group and fully insured individual lines of business.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
External Membership ID	Used to search for coverage periods of a membership with a particular external membership ID where the calculated and passthrough benefit amount is different. **Note:** This field is applicable for both fully insured group and fully insured individual lines of business.	No
Health Plan	Used to search for coverage periods of all memberships belonging to a particular health plan where the calculated and passthrough benefit amount is different. **Note:** The **Search** (🔍) icon appears corresponding to the **Health Plan** field. On clicking the **Search** icon, the **Health Plan Search** window appears. This field is applicable only for fully insured individual line of business.	No
Coverage Start Date	Used to search for coverage periods that begin on or after the specified date. **Note:** The coverage start date cannot be later than the coverage end date. You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	Yes
Coverage End Date	Used to search for coverage periods that end on or before the specified date. **Note:** The coverage end date cannot be earlier than the coverage start date. You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	Yes

Note:

You must specify at least the membership ID, external membership ID, or health plan while searching for discrepancies within the coverage period.

The coverage date range should neither be less than one month nor exceed beyond one year.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Membership	Indicates the membership where there is difference between the calculated and passthrough benefit amount for the coverage period. **Note:** It has a link. On clicking the link, the **Membership** screen appears where you can view the details of the respective membership.
External Membership ID	Displays the corresponding membership ID which is maintained in the external source system.
Price Item	Indicates the price item using which the membership benefit charge is created for comparison.
Coverage Start Date	Displays the date from when the membership benefit coverage is effective.
Coverage End Date	Displays the date till when the membership benefit coverage is effective.
ORMB Calculated Amount	Displays the benefit amount calculated for the membership in the system.
Passthrough Amount	Displays the passthrough benefit amount received for the membership from the external system.
Difference	Displays the difference between the calculated and passthrough benefit amount.
Billable Charge Source	Indicates whether the billable charge is created using the calculated or passthrough benefit amount. The valid values are: • ORMB Calculated • Passthrough Charge
Billed Status	Indicates whether the billable charge is billed to the respective account. The valid values are: • Billed • Not Billed
Billable Charge	Indicates the billable charge created for the membership benefit. **Note:** It has a link. On clicking the link, the **Billable Charge** screen appears where you can view the details of the respective billable charge.

Note: Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

How to view the discrepancy between the calculated and passthrough benefit amount for a membership	Viewing the Discrepancy between the Calculated and Passthrough Benefit Amount for a Membership on page 3741

Viewing the Discrepancy between the Calculated and Passthrough Benefit Amount for a Membership

Procedure

Copyright © 2026, Oracle and/or its affiliates.

To view the discrepancy between the calculated and passthrough benefit amount for a membership:

1. Click the **Menu** link in the **Application** toolbar.
   A list appears.
2. From the **Main** menu, select **Report and Inquiry** and then click **Pricing Vs Passthrough Charges**.
   The **Pricing Vs Passthrough Charges** screen appears.
3. Enter the search criteria in the **Pricing Vs Passthrough Charges** zone.

> **Note:** ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

4. Click **Search**.
   The search results appear based on the specified search criteria.
5. View the difference between the calculated and passthrough benefit amount for the membership in the **Search Results** section.

Billable Charge Creation or Cancellation through File Upload Interface

Until now, the system enabled you to create mass billable charges at once for the fully insured group and individual lines of business through the **Upload Request** feature. Now, in addition, the system enables you to create or cancel mass billable charges at once for the fully insured group and individual lines of business through the **File Upload Interface** feature.

A new file request type named **BCUPLD** is shipped with the product. It enables you do the following:

- Create a pass through or SQI based billable charge for an account for a particular coverage period. You can create the billable charges for the group and individual memberships.
- Cancel an existing billable charge of an account, thereby supporting billable charge reversal for a particular coverage period. You can then send the billable charge record with the appropriate corrections, if required.

> **Note:** At present, the **BCUPLD** file request type supports maximum five billable charge characteristics by default. However, you can update the **BCUPLD** file request type to support more than five billable charge characteristics based on the requirement.

You can upload and process a billable charge creation/reversal file in the CSV format using the **BCUPLD** file request type. The billable charge creation/reversal file should contain records with the following additional information apart from the basic details – Source System, Policy Number, Plan Number, Health Plan Code, Subscriber Identifier Type, Subscriber Identifier, Membership Type, External Membership ID.

When the contract ID is not specified, the system uses the source system, policy number, plan number, and price item combination to derive the contract against which the billable charge should be created for the group membership. Similarly, the system uses the health plan code and price item to derive the contract against which the billable charge

Copyright © 2026, Oracle and/or its affiliates.

should be created for the individual membership. And, when the **C1MMBRSH** characteristic is not specified in the billable charge record, the system uses either of the following to derive the group or individual membership:

- Subscriber Identifier Type and Subscriber Identifier
- External Membership ID
- Membership Type, External Membership ID, Subscriber Identifier Type and Subscriber Identifier

If you want to cancel an existing billable charge, you need to set the **C1REVIND** characteristic type to **Y** corresponding to the billable charge record in the file. The system will then check whether a billable charge with the specified details already exist in the system. If so, the system will accordingly cancel the respective billable charge. Note that the billable charge reversal record should be sent with reversed amount (i.e., if the original charge amount was positive, then the reversal charge amount should be negative and vice-versa). To find a pass-through billable charge, the system uses the Coverage Period, Membership ID, Bill Line Level Sequence, Bill Line Level Amount, Billable Charge Status, Price Item, and Contract ID combination.

However, to find an SQI based billable charge, the system uses the Coverage Period, Membership ID, SQI Level Sequence, SQI Amount, Billable Charge Status, Price Item, and Contract ID combination. The system also enables you to specify reasons while creating or cancelling a billable charge. The reason indicates why you want to create or cancel a billable charge. Along with each reason, you can specify the following details:

- Sequence
- Priority
- Effective Date

The former two are mandatory whereas the latter one is non-mandatory. A new table named **CI_BILL_CHG_RSN** is introduced in this release to store the reasons for a billable charge. This reason is stored only for reporting purposes and is not displayed anywhere in the system. You can specify maximum 10 reasons for each billable charge record in the file.

On executing the **C1-FTRAN** batch, the system does the following:

- Creates a billable charge for the membership. It also stamps the respective membership ID as a characteristic on the billable charge.
- Cancels a billable charge where the **C1REVIND** characteristic type is set to **Y**.

Trigger Repricing on Deleting Derivation and Pricing Parameters of a Bill Group

Until now, you were able to delete the derivation and pricing parameters of a bill group from the user interface. But repricing was not triggered on the deletion. Now, on deleting a derivation and pricing parameters combination of a bill group, the system changes the status of the derivation and pricing parameters combination to **Inactive**. In addition, if the audit event process is configured for the **C1-BillLevel** business object, the system creates an audit event with the audit action set to **Change Row**.

On executing the **C1-CBIPR** batch, the system creates a repricing entity detail record for the audit event in the **CI_REPRC_ENTITY_DTL** table. While repricing, you need to execute the following batches in the specified sequence:

1. C1-FIBLR
2. C1-FIMRE
3. C1-CBIPR
4. C1-FIMRC
5. C1-REPC1
6. C1-REPC2
7. C1-REPC3
8. C1-FIBCR

Once the repricing entity detail record is created for the audit event, you need to execute the **C1-FIMRC** batch. It will delete the inactivated derivation and pricing parameters combination (that was earlier deleted from the user interface)

Copyright © 2026, Oracle and/or its affiliates.

from the system. If the deleted derivation and pricing parameters combination was referred for billing any memberships in the system, you need to ensure that those memberships are appropriately billed to a new bill group and do not remain unbilled in the system.

Note: The **C1-CBIPR** and **C1-FIMRC** batches and **C1-REAUDEVNT** algorithm are enhanced to implement this feature.

Health Check

Oracle Revenue Management and Billing facilitates the system health check for insurance companies. It enables you to do the following through the **Health Check** screen:

- Perform duplicate data integrity check
- View the errors generated while creating or processing the inbound messages
- View the non-billed memberships
- View the memberships with non-billed sponsor charges
- View the bill segments generated beyond charge end date
- View the canceled memberships with one-day billable charge

At present, the system supports duplicate data integrity check for the following entities through the **Health Check** screen - **Policy**, **Policy Plan**, **Membership**, **Membership Person**, **Billable Charge**, and **Bill Segment**. The **Health Check** screen is tested and certified for the fully insured group and fully insured individual lines of business. It contains the following zones:

- Duplicate Entity on page 3744
- Membership without Sponsor Billable Charge on page 3752
- Bill Segments beyond Billable Charge End Date on page 3755
- Membership Not Billed on page 3756
- Error Messages Count in Inbound Message on page 3758
- Inbound Message List on page 3759
- Cancelled Memberships with One Day Billable Charge on page 3760
- Error Messages in Inbound Message on page 3762

Duplicate Entity

The **Duplicate Entity** zone allows you to view the duplicate records of various entities within the given date range. It contains the following sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Entity	Used to indicate the entity for which you want to view duplicate records within the given date range. The valid values are: • Bill Segment • Billable Charges • Membership • Membership Person • Policy • Policy Plan	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Start Date	Used to specify the date from when you want to search the duplicate records. **Note:** The start date cannot be later than the end date. You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	Yes
End Date	Used to specify the date till when you want to search the duplicate records. **Note:** The end date cannot be earlier than the start date. You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	Yes

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The columns in the **Search Results** section vary depending on the selected entity. For more information about the columns, you can refer to the respective section listed in **Related Topics**.

Searching for Duplicate Bill Segments

Duplicate bill segments are those bill segments which meet the following conditions:

- The status of the bill segments is set to **Frozen**.
- The **Show on Bill** flag on the bill segments is set to **True**.
- The membership and price item combination for which the bill segments are created is same.
- The bill segments have either same or overlapping date range.

Procedure

Copyright © 2026, Oracle and/or its affiliates.

To search for duplicate bill segments:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, click **H** and then click **Health Check**.
   The **Health Check** screen appears.
3. Expand the **Duplicate Entity** zone.
4. Select the **Bill Segment** option from the **Entity** list.
5. Select the date range to retrieve the bill segments which are duplicate within the given period.

> **Note:** The specified date range should not exceed one year. For example, if the start date is 01-01-2025, then the end date cannot be later than 12-31-2025.

6. Click **Search**.

   The search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Bill Segment	Displays information about the bill segment. In addition, a context menu (⊙) icon appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Bill Segment** screen appears where you can view the details of the respective bill segment.
Membership	Indicates the group or individual membership for which the bill segment is created.
	Note: It has a link. On clicking the link, the **Membership** screen appears where you can view the details of the respective membership.
Start Date	Displays the start date of the bill segment.
End Date	Displays the end date of the bill segment.
Price Item	Indicates the price item for which the respective billable charge is created.
	Note: It has a link. On clicking the link, the **Price Item** screen appears where you can view the details of the respective price item.
Current Amount	Displays the bill segment amount.

> **Note:** Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages. Note that the navigation links appear in the **Search Results** section only when the records in the search results exceed 20.

Searching for Duplicate Billable Charges

Duplicate billable charges are those billable charges which meet the following conditions:

- The status of the billable charges is set to **Billable**.

Copyright © 2026, Oracle and/or its affiliates.

- The membership and price item combination for which the billable charges are created is same.
- The billable charges have either same or overlapping date range.

Procedure

To search for duplicate billable charges:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, click **H** and then click **Health Check**.
   The **Health Check** screen appears.
3. Expand the **Duplicate Entity** zone.
4. Select the **Billable Charges** option from the **Entity** list.
5. Select the date range to retrieve the bill charges which are duplicate within the given period.

Note: The specified date range should not exceed one year. For example, if the start date is 01-01-2025, then the end date cannot be later than 12-31-2025.

6. Click **Search**

   The search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Billable Charge	Displays information about the billable charge.
	Note: It has a link. On clicking the link, the **Billable Charge** screen appears where you can view the details of the respective billable charge.
Membership	Indicates the group or individual membership for which the billable charge is created.
	Note: It has a link. On clicking the link, the **Membership** screen appears where you can view the details of the respective membership.
Start Date	Displays the start date of the billable charge.
End Date	Displays the end date of the billable charge.
Price Item	Indicates the price item for which the billable charge is created.
	Note: It has a link. On clicking the link, the **Price Item** screen appears where you can view the details of the respective price item.
Creation Date	Displays the date when the billable charge is created.

Note: Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages. Note that the navigation links appear in the **Search Results** section only when the records in the search results exceed 20.

Searching for Duplicate Memberships

Copyright © 2026, Oracle and/or its affiliates.

Duplicate memberships are those memberships which meet the following conditions:

- The status of the memberships is set to **Active**.
- The external membership ID, membership type, and health plan are same for the individual memberships, or the external membership ID, membership type, policy, and policy plan are same for the group memberships, respectively.
- The member persons included in the memberships are identical.
- The memberships have either same or overlapping date range.

Procedure

To search for duplicate memberships:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, click **H** and then click **Health Check**.
   The **Health Check** screen appears.
3. Expand the **Duplicate Entity** zone.
4. Select the **Membership** option from the **Entity** list.
5. Select the date range to retrieve the memberships which are duplicate within the given period.

   Note: The specified date range should not exceed one year. For example, if the start date is 01-01-2025, then the end date cannot be later than 12-31-2025.
6. Click **Search**.

   The search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Membership	Displays information about the group or individual membership. **Note:** It has a link. On clicking the link, the **Membership** screen appears where you can view the details of the respective membership.
Start Date	Displays the date from when the group or individual membership is effective.
End Date	Displays the date till when the group or individual membership is effective.
Create Date/Time	Displays the date when the group or individual membership is created.
Policy	Indicates the policy in which group membership is covered. **Note:** It has a link. On clicking the link, the **Policy** screen appears where you can view the details of the respective policy.
Policy Plan	Indicates the policy plan for which the group membership is created. **Note:** It has a link. On clicking the link, the **Policy Plan** screen appears where you can view the details of the respective policy plan.
Health Plan	Indicates the health plan for which the individual membership is created. **Note:** It has a link. On clicking the link, the **Health Plan 360° Information** screen appears where you can view the details of the respective health plan.
Person	Indicates the main subscriber of the group or individual membership. In addition, a context menu (⊙) icon appears corresponding to this field which helps in navigating to other screens in the application.

Membership without Sponsor Billable Charge

The **Membership without Sponsor Billable Charge** zone enables you to view all the memberships for which the benefit sponsor charges are not yet created in the system. It contains the following sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Price Item	Used to specify the price item. **Note:** The system derives the billable charges which are created for the specified price item. Once the billable charges are derived, the system determines the memberships for which these billable charges are created in the system. The **Search** (🔍) icon appears corresponding to the **Price Item** field. On clicking the **Search** icon, the **Price Item Search** window appears.	Yes
Benefit Sponsor Price Item	Used to specify the price item using which a billable charge is created for the membership benefit on the sponsor account.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: Once the memberships are derived using the price item (as mentioned in the above note), the system then checks whether the given benefit sponsor price item is specified in the respective membership benefit sub type to create membership benefit billable charges on the sponsor account. If so, the system then checks whether the membership benefit sponsor charges are created for the respective memberships on the sponsor account. If the membership benefit charges are not yet created for the memberships on the sponsor account, the system will list such memberships in this zone. The **Search** (🔍) icon appears corresponding to the **Benefit Sponsor Price Item** field. On clicking the **Search** icon, the **Price Item Search** window appears.	
Membership Category	Used to filter the memberships based on its category. The valid values are: • Group Membership • Individual Membership	No
Start Date	Used to search the membership billable charges whose start date is on or after the specified date. **Note:** The start date cannot be later than the end date. You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	No
End Date	Used to search the membership billable charges whose end date is on or before the specified date. **Note:** The end date cannot be earlier than the start date. You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	No

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Membership	Indicates the group or individual membership for which the billable charge is created. **Note:** It has a link. On clicking the link, the **Membership** screen appears where you can view the details of the respective membership.
Billable Charge	Indicates the billable charge which is created using the given price item.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
	Note: It has a link. On clicking the link, the **Billable Charge** screen appears where you can view the details of the respective billable charge.
Start Date	Displays the start date of the billable charge.
End Date	Displays the end date of the billable charge.
Price Item	Displays the information about the price item.
	Note: It has a link. On clicking the link, the **Price Item** screen appears where you can view the details of the respective price item.
Creation Date	Displays the date when the billable charge is created.

3. Expand the **Cancelled Memberships with One Day Billable Charge** zone.
4. Enter the search criteria in the **Cancelled Memberships with One Day Billable Charge** zone.

> **Note:** The specified date range should not exceed one year. For example, if the start date is 01-01-2025, then the end date cannot be later than 12-31-2025.

5. Click **Search**.
   A list of cancelled memberships which have one-day billable charge appears in the **Search Results** section.

> **Note:** Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages. Note that the navigation links appear in the **Search Results** section only when the records in the search results exceed 20.

Error Messages in Inbound Message

The **Error Messages in Inbound Message** zone enables you to view the errors that occurred while creating or processing the inbound messages. Note that you can view the errors of the inbound messages which are in the **Pending** or **Rejected** status. It contains the following sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Inbound Message Status	Used to search the errors of the inbound messages which are in a particular status. The valid values are: • Pending • Rejected	No
External Source ID	Used to search the errors of the inbound messages which are received from a particular external source system.	No
Creation From Date	Used to search the errors of the inbound messages which are created from a particular date onwards. **Note:** The creation from date cannot be later than the creation to date. You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	Yes
Created To	Used to search the errors of the inbound messages which are created till a particular date.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The creation to date cannot be earlier than the creation from date. You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Create Date/Time	Displays the date and time when the inbound message is created in the system.
Status	Indicates the status of the inbound message. The valid values are: • Pending • Rejected
Inbound Message Information	Displays information about the inbound message.
	Note: It has a link. On clicking the link, the **Inbound Message** screen appears where you can view the details of the respective inbound message.
Details	Indicates the error that occurred while creating or processing the inbound message.
Message Category	Indicates the message category to which the error message belongs.
Message Number	Displays the message number of the error message.
External Source ID	Indicates the external source system from where the inbound message is received.
External Batch ID	Indicates the batch job of the external source system through which the inbound message is created.

Viewing the Errors of the Inbound Messages

Procedure

To view the errors of the inbound messages:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, click **H** and then click **Health Check**.
   The **Health Check** screen appears.
3. Expand the **Error Messages in Inbound Message** zone.
4. Enter the search criteria in the **Error Messages in Inbound Message** zone.

Copyright © 2026, Oracle and/or its affiliates.

> **Note:** The specified date range should not exceed one year. For example, if the start date is 01-01-2025, then the end date cannot be later than 12-31-2025.

5. Click **Search**.
   A list of inbound messages with errors appears in the **Search Results** section.

> **Note:** Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages. Note that the navigation links appear in the **Search Results** section only when the records in the search results exceed 20.

Split Dependent Person Coverage

Until now, when a member person data was received on reinstating a membership, the system created a new record for the dependent person with the **Active** status instead of updating the old inactive record. However, if a dependent person was active for a particular coverage period (for example, Jan 2025 to Mar 2025) and then reenrolled in the same membership for a different coverage period (for example, Jun 2025 to Dec 2025), the system did not allow to create a new record for the dependent person with the **Active** status. Instead, the system tried to update the existing record and thereby failed as the start date of coverage period was different.

To support multiple coverage period scenarios for a dependent person, the upstream system needs to send the full coverage snapshot for the dependent person. For example, if DP1 was enrolled in M1 from Jan 2025 to Mar 2025 and then reenrolled in M1 from Jun 2025 to Dec 2025, you need to send two records on reenrolment for the same member person in the **Active** status – one with the coverage period Jan 2025 to Mar 2025 and another with the coverage period Jun 2025 to Dec 2025.

Note that if the newborn is end dated and then reenrolled within the gift days period, then the newborn will still be eligible for original gift days discount on reenrolment. For example, let's assume that a newborn is enrolled on 1st May with gift days 31. This means his gift days period is from 1st May to 31st May. Now, if the newborn enrolment is ended on 5th May and then reenrolled from 15th May, the newborn would still be eligible for the gift days till 31st May.

Similarly, if you want to cancel a particular coverage period record of a member person (for example Jun 2025 to Dec 2025) and enroll the member person for a new coverage period (i.e. May 2025 to Dec2025), you need to send the full coverage snapshot of the dependent person along with the cancellation record. For example, if DP1 was enrolled in M1 for two coverage periods - Jan 2025 to Mar 2025 and Jun 2025 to Dec 2025 and if you want to change the coverage period Jun 2025 to Dec 2025 to May 2025 to Dec 2025, you need to send three records for the same member person in the specified sequence through the same inbound message:

1. One record in the **Active** status with the coverage period Jan 2025 to Mar 2025
2. Another record in the **Canceled** status with the coverage period Jun 2025
3. Third record in the **Active** status with the coverage period May 2025 to Dec 2025

The specified sequence helps to address any erroneous results. Note that the split dependent person coverage feature is applicable for the fully insured group and fully insured individual lines of business.

Automatic Hold Request Creation Via File Upload Interface

Oracle Revenue Management and Billing provides the ability to automatically create a hold request when a billable charge creation or cancelation fails for an account through the **File Upload Interface** feature. Note that an automatic hold request is created only when the **Create Premium Hold Request** attribute of the hold request preference is set to **Yes**. The system considers the hold request preference which is specified in the **Hold Request Field Mapping** option type of the **C1-HOLDSRCH** feature configuration.

To enable the automatic hold request creation via file upload interface, you need to attach an algorithm created using the **C1-HRFRT** algorithm type to the **Post-Processing** system event of the **C1-FTRAN** batch control. If an error occurs while creating or canceling a billable charge for an account, the system automatically holds only the bill generation process of the account by creating a hold request.

While creating an automatic hold request, the system uses the following attributes of the hold request preference:

- Default Automatic Hold Reason
- Default Automatic End Date
- Default Automatic Hold Request Type Code

The system sets the hold request start date to the system date. The hold request is created in the **Active** status. The hold process in the hold request is set to **Bill Generation** and the hold process and hold entity start and end dates are set to the hold request start and end dates, respectively. The bill after date is set for the accounts on the **C1-HLMON** batch execution.

Note that the system creates one hold request for all the accounts of a file for which billable charge creation or cancelation failed on executing the **C1-FTRAN** batch.

Note:

You can manually release an automatic hold request from the user interface or through an inbound message.

The approval process for hold request is not supported in this feature. Therefore, we recommend you to use a hold request type where the **Activation Approval** option is not selected.

This feature is tested and certified for both the fully insured group and fully insured individual lines of business.

Consider Zero or Negative Bills for Paid Through Date

There might be scenarios where the zero or negative amount bills may be generated for an account to which an individual membership is billed and no payments are expected from such accounts. In such case, until now, the system did not update paid through date when zero or negative amount bill was created for an individual membership. Now, when the zero or negative amount bill is created for an account to which an individual membership is billed, the system also creates an entry for such account in the **F1_GEN_PROC** table and stamps the **PTDIND** batch control against it. The **C1-CLCPTDIND** algorithm is enhanced to consider zero or negative amount bill for the accounts. It then accordingly determines last billed coverage end date and calculates the paid through date of the account. Therefore, now, on executing the **PTDIND** batch, the system accordingly updates the paid through date of the account considering its zero or negative amount bills.

Copyright © 2026, Oracle and/or its affiliates.

Display Non-Eligible Members' Premium Calculation Lines

Until now, the system did not consider members who are beyond maximum allowed dependent limit for age based premium calculation and therefore no calculation lines were created for such non-eligible members. Now, the system allows you configure whether you want to create calculation lines for such non-eligible members and display them in the **Pricing Calculation Details** zone of the **Charges** tab on the **Membership** screen. To implement this business requirement, the following changes are made to the system:

- A new option type named **Display non-eligible members beyond max dependent count** is introduced in the **C1-ASOBLLNG** feature configuration.
- A new value named **DEMD** (i.e., Dependent is exceeding the max dependent count) is added in the **NEW_BORN_CMT_FLG** lookup field.
- The **C1_AGEPREM** algorithm is enhanced to consider the **Display non-eligible members beyond max dependent count** option type of the **C1-ASOBLLNG** feature configuration and accordingly create calculation lines for non-eligible members who are beyond maximum allowed dependent count.

If the **Display non-eligible members beyond max dependent count** option type of the **C1-ASOBLLNG** feature configuration is set to **Y**, the system will create calculation lines for non-eligible members who are beyond maximum allowed dependent count. The amount of such calculation lines will be zero.

These calculation lines will then be shown in the **Pricing Calculation Details** zone of the **Charges** tab on the **Membership** screen. However, to differentiate between calculation lines of eligible and non-eligible members, the following string will be added in the **Comments** column corresponding to non-eligible members' calculation lines - **Dependent is exceeding the max dependent count**.

In case of skip months scenario, the system will display calculation lines (with zero amount) for non-eligible members too but will add the **Dependent is exceeding the max dependent count** comment instead of the **Skip Month** comment against it. Similarly, if a newborn is not an eligible dependent member, the system will display a calculation line (with zero amount) for the newborn too but will add the **Dependent is exceeding the max dependent count** comment against it.

Note: This feature is tested and certified for the fully insured group and fully insured individual lines of business.

Adoption Premium Waiver

Some states have regulations requiring health insurance companies to waive off premium for a specified period on adoption of a child or adult. Oracle Revenue Management and Billing enables you to offer gift days or a gift period in case of an adoption. The gift period refers to a specific window immediately following adoption date during which an adopted child or adult is covered without an additional premium. The premium of an adopted person is waived off for a specific period and the individual is not charged for the adopted person during that period. This feature is tested and certified only for the fully insured individual business.

The system enables you to add a person with the adoption date through a health care inbound message. The adoption date indicates that the person is an adopted child or adult. If a newborn is adopted, the system will offer the adoption gift days and not newborn gift days to the adopted newborn. The system enables you to indicate whether the adopted person enrolled to an individual membership is eligible for adoption gift days. In the fully insured individual business, different individuals may be offered different adoption gift days based on their state, health product, health plan, membership, or member person attributes. Hence, the system enables you to derive the following information for an eligible adopted person through an adoption business rule:

- **Gift Days Applicability** – Used to indicate whether you want to offer gift days for an adopted child or adult.
- **Gift Days** – Used to indicate the number of days you want to offer as gift days from the adoption date. As a result, no premium will be calculated for the gift period.

Copyright © 2026, Oracle and/or its affiliates.

You need to define the business rules where the category is set to Adoption Business Rule. While creating or editing an individual membership, the system determines the adoption business rule that is applicable for the individual membership if it includes a member person with the adoption date. The system then refers this adoption business rule during the age-based and tier-based premium calculation of the individual membership. For more information, see Adoption Business Rule on page 3769.

Adoption Premium Calculation

Enrolling an adopted child or adult in an individual membership is generally treated as a qualifying life event, allowing for mid-term inclusion outside of standard open enrollment. On enrolling an adopted person to an individual membership at any time within its coverage period, the system triggers the repricing process and calculates premium for the adopted person using the effective pricing rule attached to the health plan.

Adoption Premium Calculation Using Age-based Pricing

If the age-based pricing rule is effective for the health plan, the system identifies a list of members which are eligible for premium calculation in an individual membership using the fully insured pricing business rule. To identify whether the eligible adopted person should be offered adoption gift days, the system refers the adoption business rule stamped against the individual membership to derive the following parameters:

- Gift Days Applicability
- Gift Days

Once the eligible members for premium are identified, the system derives the base fee and applicable modifier fee for each eligible member based on its age from the age-based pricing rule. The system creates a timeline for each month from the month the adopted person is enrolled to the individual membership. For example, if the adopted person is enrolled on 01-Jun-2026 in an individual membership which is effective from 01-Jan-2026 to 31-Dec-2026, the system creates one timeline for each month starting from 01-Jun-2026 to 31-Dec-2026. The system then checks whether any adoption business rule is derived for the individual membership. If so, the system checks whether the **Gift Days Applicability** parameter in the adoption business rule is set to **Y**. If the **Gift Days Applicability** parameter in the adoption business rule is set to **Y**, the system derives the adoption gift days from the adoption business rule and does not calculate the premium for the gift period.

For example, if the adopted person with the adoption date set to 01-Jun-2026 is enrolled to an individual membership on 15-Jun-2026 and the adoption gift days is set to 30, the system considers 01-Jun-2026 to 30-Jun-2026 as the gift period (i.e., adoption date + gift days) and does not calculate premium for the eligible adopted person. In this case, the adopted person's premium is not charged for 15 days starting from 15-Jun-2026 to 30-Jun-2026. This is because the adopted person gift days are offered from the adoption date and not from the enrollment start date. However, the premium will be charged for the adopted person from July 2026 onwards for each timeline.

Adoption Premium Calculation Using Tier-based Pricing

If the tier-based pricing rule is effective for the health plan, the system creates a timeline for each month from the month the adopted person is enrolled to the individual membership. For example, if the adopted person is enrolled on 01-Jun-2026 in an individual membership which is effective from 01-Jan-2026 to 31-Dec-2026, the system creates one timeline for each month starting from 01-Jun-2026 to 31-Dec-2026. The system then checks whether any adoption business rule is derived for the individual membership. If so, the system checks whether the **Gift Days Applicability** parameter in the adoption business rule is set to **Y**. If the **Gift Days Applicability** parameter in the adoption business rule is set to **Y**, the system derives the adoption gift days from the adoption business rule. If the adopted person is eligible for gift days, the system accordingly derives the base fee for the individual membership based on its tier from the tier-based pricing rule.

For example, if the adopted person with the adoption date set to 01-Jun-2026 is enrolled to an individual membership on 15-Jun-2026 and the adoption gift days is set to 30, the system considers 01-Jun-2026 to 30-Jun-2026 as the gift period (i.e., adoption date + gift days) and does not calculate premium for the eligible adopted person. In this case, the adopted person's premium is not charged for 15 days starting from 15-Jun-2026 to 30-Jun-2026. This is because the adopted

Copyright © 2026, Oracle and/or its affiliates.

person gift days are offered from the adoption date and not from the enrollment start date. However, the premium will be charged for the adopted person from July 2026 onwards for each timeline.

Adoption Premium Proration

If an adopted child or adult is enrolled to an individual membership in the mid-term on or after the adoption date, the system uses the daily proration method to prorate the premium of the adopted child or adult. This method ensures that the premium is calculated based on the actual number of days of coverage, rather than charging for a full coverage period.

Adoption Premium Benefit Waiver

Oracle Revenue Management and Billing enables you to waive off premium of an adopted child or adult while billing the individual memberships. However, the adoption waived off premium is not recorded and maintained in ORMB for the General Ledger (GL) posting unless you do the following:

- Set the **Adoption Waiver Credit Calculation Applicability** option type of the **C1-ASOBLLNG** feature configuration to **Y**.
- Set the required SQIs in the **New Born Waiver SQI**, **New Born Waiver Credit SQI**, and **New Born Distributed SQI** option types of the **C1-ASOBLLNG** feature configuration.

Note: The SQIs given in the **New Born Waiver SQI**, **New Born Waiver Credit SQI**, and **New Born Distributed SQI** option types are used for both newborn and adoption premium benefit waiver.

The system calculates the premium for the adoption premium waiver period and stores the amount in the billable charge when an adopted member person exists in the individual membership and the adoption gift days applicability for the individual membership is set to **Yes**. The system stamps two SQIs in the billable charge - one SQI stores the adoption premium (i.e., debit amount) and another SQI stores the adoption premium waiver benefit (i.e., credit amount). This mechanism ensures that the system records the adoption premium in the system, but at the same time does not charge the adoption premium for the membership. It helps to maintain GL entries for the adoption premium which is waived off during premium calculation.

While deriving the eligible members for an individual membership or while deriving the subscription tier for an individual membership, the system derives the list of eligible members for the membership or subscription tier for the membership, respectively, considering with and without adoption gift days. If a tier-based pricing rule is referred for an individual membership, the system will set the following characteristics for the individual membership:

- **Subscription Tier** – Stores the subscription tier for the membership considering adoption or newborn gift days.
- **Subscription Tier without Gift Days** – Stores the subscription tier for the membership without considering adoption or newborn gift days.

While calculating premium for an individual membership, the system checks whether there is an adopted member person in the individual membership and the **Gift Days Applicability** parameter in the adoption business rule is set to **Y**. If the **Gift Days Applicability** parameter in the adoption business rule is set to **Y**, the system derives the adoption gift days from the adoption business rule and calculates the adoption gift period start and end dates.

While deriving the timeline during premium calculation, the system checks whether the timeline is within the adoption gift days period. If the timeline is within the adoption gift days period, the system calculates the premium for the adopted person and creates a record in the **CI_PRCE_CALC_LN** table where the **NEW_BORN_CMT_FLG** column is set to **Without Gift Days**. In addition, the system creates a reverse entry record in the **CI_PRCE_CALC_LN** table where the **NEW_BORN_CMT_FLG** column is set to **Reversal**. If the amount calculated with and without gift days do not match, the system stamps two SQIs in the billable charge - one SQI stores the adoption premium (i.e. debit amount) and another SQI stores the adoption premium waiver benefit (i.e. credit amount). The system considers the SQIs specified in the **New Born Waiver SQI** and **New Born Waiver Credit SQI** option types of the **C1-ASOBLLNG** feature configuration, respectively.

During premium proration, the system stores the distributed amount for the adopted member person in an SQI that is specified in the **New Born Distributed SQI** option type of the **C1-ASOBLLNG** feature configuration.

Copyright © 2026, Oracle and/or its affiliates.

Adoption Enrollment Time Limit

Some states have regulations stating the time limit within which an adopted child or adult should be enrolled to an individual membership. If you violate the state enrollment timeline regulations, the individual membership will not be able to avail the adoption premium waiver benefit for an adopted child or adult.

The system enables you to add an enrollment received date for each adopted member person through a health care inbound message. The enrollment received date indicates that the adopted person is enrolled to the individual membership (in the upstream system) on that date. If the enrollment received date is within the adoption enrollment notice period, the system will allow you to waive off premium for an adopted child or adult when the **Gift Days Applicability** parameter in the adoption business rule is set to **Y**. However, if the enrollment received date is not within the adoption enrollment notice period, the system will not allow you to waive off premium for an adopted child or adult even when the **Gift Days Applicability** parameter in the adoption business rule is set to **Y**. The enrollment received date is validated against the adoption enrollment notice period only when the **Notice Rule Applicability** parameter in the adoption business rule is set to **Y**. The system derives the adoption enrollment notice period using the following parameters of the adoption business rule:

- **Adoption Notice Rule Calculation** – Used to indicate whether you want to calculate the adoption enrollment notice period starting from the adoption date or member person start date. The system will then derive the adoption enrollment notice period using the given date and notice rule days.
- **Notice Rule Days** – Used to indicate the number of days you want to offer to determine the adoption enrollment notice period.

If the **Notice Rule Applicability** parameter in the adoption business rule is set to **Y**, the system derives the values from the **Adoption Notice Rule Calculation** and **Notice Rule Days** parameters of the adoption business rule. The system then calculates the cutoff date using the derived values. For example, let us assume the following:

Parameter	**Value**
Gift Days Applicability	Y
Gift Days	30
Notice Rule Applicability	Y
Adoption Notice Rule Calculation	Adoption Date
Notice Rule Days	45

Now, if an adopted newborn is enrolled to an individual membership with the adoption date as 01-Jan-2026 and enrollment received date as 10-Jan-2026, the system will calculate the adoption enrollment notice period (i.e., 01-Jan-2026 to 14-Feb-2026). As, the adopted newborn is enrolled on 10-Jan-2026 which is before the cutoff date (i.e., 14-Feb-2026), the system will waive off premium for the adopted child or adult. But, if an adopted newborn is enrolled to an individual membership with the adoption date as 01-Jan-2026 and enrollment received date as 16-Feb-2026, the system will not waive off premium for the adopted child or adult. This is because the enrollment received date is after the cutoff date (i.e., 14-Feb-2026).

Note: The **enrlRecvDt** field should be audited. Hence, you should include it in the **Audit Elements** list of an audit event type which is defined for the **C1-IndMembership** business object and in the **Event Management** list of the required pricing rule types.

Adoption Business Rule

Oracle Revenue Management and Billing enables you to define business rules to determine whether gift ways should be offered to an adopted child or adult. The insurance company may offer different adoption gift days to different individuals based on certain parameters, such as health plan, division, membership, or member person characteristic,

Copyright © 2026, Oracle and/or its affiliates.

etc. The system will then accordingly derive the adoption gift days for the individual membership and waive off the premium of an adopted child or adult for the gift period. In addition, the adoption business rule enables you to determine whether adoption enrollment timeline regulations should be enforced on the individual memberships. If so, the system will calculate the adoption enrollment notice period and allow to waive off premium for the adopted child or adult only when the enrollment received date is within the cutoff date.

On enrolling an adopted child or adult to an individual membership, the system derives the business rules with the **Adoption Business Rule** category that are effective on the processing date. Note that the system considers only those effective business rules which are in the **Active** status. The system then executes the criteria of each effective business rule and considers the business rule that meet the criteria. If two or more business rules meet the criteria, the system considers the business rule with the highest priority. The system stamps the adoption business rule against the individual membership in the **C1_ENT_BUS_RULE** table.

While defining criteria for an adoption business rule, you can use the parameters that are defined on the following source entities:

Source Entity	**Supported Source Type**
Account	Field, Characteristic
Customer Class	Field
Division	Field
Health Plan	Field, Characteristic
Health Product	Field, Characteristic
Membership	Field, Characteristic
Membership Person	Field, Characteristic

You can define, edit, and delete an adoption business rule through the **Business Rule** screen. While defining an adoption business rule, you need to set the category to **Adoption Business Rule**. The adoption business rule enables you to define the following parameters:

- **Gift Days Applicability** – Used to indicate whether you want to offer gift days for an adopted child or adult.
- **Gift Days** –Used to specify the number of days you want to offer as gift days from the adoption date.
- **Notice Rule Applicability** – Used to indicate whether you want to enforce enrollment timeline regulations for an adopted person.
- **Notice Rule Days** – Used to indicate the number of days you want to offer to determine the adoption enrollment notice period.
- **Adoption Notice Rule Calculation** – Used to indicate whether you want to calculate the adoption enrollment notice period starting from the adoption date or member person start date. The system will then derive the adoption enrollment notice period using the given date and notice rule days.

Note: The **Notice Rule Applicability** option is enabled only when the **Gift Days Applicability** option is selected in the adoption business rule.

Once the business rule is created, the business rule ID is generated. While creating a business rule, the status is, by default, non-editable and set to **Active**. While editing a business rule, you can change its status from **Active** to **Inactive** and vice-versa. Note that you cannot edit or delete a business rule if it is referred in the system. You can use the same criteria in multiple business rules with a different effective date to derive different gift days. You can view the adoption business rules through the **Business Rule** screen.

Copyright © 2026, Oracle and/or its affiliates.

Newborn Enrollment Time Limit

Some states have regulations stating the time limit within which a newborn child should be enrolled to an individual membership. If you violate the state enrollment timeline regulations, the individual membership will not be able to avail the newborn premium waiver benefit for a newborn child.

The system enables you to add an enrollment received date for each newborn child through a health care inbound message. The enrollment received date indicates that the newborn child is enrolled to the individual membership (in the upstream system) on that date. If the enrollment received date is within the newborn enrollment notice period, the system will allow you to waive off premium for a newborn child when the **Gift Days Applicability** parameter in the newborn business rule is set to **Y**. However, if the enrollment received date is not within the newborn enrollment notice period, the system will not allow you to waive off premium for a newborn child even when the **Gift Days Applicability** parameter in the newborn business rule is set to **Y**. The enrollment received date is validated against the newborn enrollment notice period only when the **Notice Rule Applicability** parameter in the newborn business rule is set to **Y**. The system derives the newborn enrollment notice period using the following parameters of the newborn business rule:

- **New Born Notice Rule Calculation** – Used to indicate whether you want to calculate the newborn enrollment notice period starting from the birth date or member person start date. The system will then derive the newborn enrollment notice period using the given date and notice rule days.
- **Notice Rule Days** – Used to indicate the number of days you want to offer to determine the newborn enrollment notice period.

If the **Notice Rule Applicability** parameter in the newborn business rule is set to **Y**, the system derives the values from the **New Born Notice Rule Calculation** and **Notice Rule Days** parameters of the newborn business rule. The system then calculates the cutoff date using the derived values. For example, let us assume the following:

Parameter	**Value**
Gift Days Applicability	Y
Gift Days	30
Notice Rule Applicability	Y
New Born Notice Rule Calculation	Birth Date
Notice Rule Days	45

Now, if a newborn is enrolled to an individual membership with the birth date as 01-Jan-2026 and enrollment received date as 10-Jan-2026, the system will calculate the newborn enrollment notice period (i.e., 01-Jan-2026 to 14-Feb-2026). As, the newborn is enrolled on 10-Jan-2026 which is before the cutoff date (i.e., 14-Feb-2026), the system will waive off premium for the newborn child. But, if a newborn is enrolled to an individual membership with the birth date as 01-Jan-2026 and enrollment received date as 16-Feb-2026, the system will not waive off premium for the newborn child. This is because the enrollment received date is after the cutoff date (i.e., 14-Feb-2026).

Billing Preference

The Billing Preference enables you to set the attributes that are used during:

- **Account Creation and Modification Via Inbound Message** – While creating or editing an account from the user interface or through a health care inbound message, the system enables you to define a billing preference characteristic for the account. Through the billing preference characteristic of an account, the system derives the bill cycle for the account from the **Bill Cycle** attribute of the billing preference.
- **Repricing** – While creating billable charges for an account, the system derives the bill period for the account from the billing preference. Note that the bill period is derived from the billing preference only when the **Bill Period**

Copyright © 2026, Oracle and/or its affiliates.

Derivation (C1-BILLPDRV) algorithm is attached to the **Account and Price Item Derivation Post-Processing** system event of the age based, tier based, additional fee, benefit, and/or discount charge pricing rule types.

- **9/10 Billing (Skip Months)** – While billing membership premium to an account, the system determines whether any month of coverage period should be skipped for billing using the **Skip Months** attribute from the billing preference. If so, the system distributes the off months' (i.e., skipped months) premium in the remaining months (i.e., non-skipped months) of the coverage period. You can specify one or more skip months in a billing preference which may be continuous or non-continuous. However, note that, you cannot skip all 12 months in a billing preference.

For more information about these attributes, see Defining a Billing Preference on page 3773.

The system considers the billing preference defined using the characteristic type specified in the **Bill Cycle Rule Code** option type of the **C1-ASOBLLNG** feature configuration. You can define, edit, delete, and copy a billing preference using the **C1-FieldMapping** business object through the **Field Mapping** screen. While creating a billing preference, you must set the preference category to **Billing**.

Searching for a Billing Preference

Procedure

To search for a billing preference:

1. Click the **Menu** (☰) icon in the **Application** toolbar.
   A list appears.
2. Click the **Admin Menu** option from the list.
   A sub-menu appears.
3. Select **F** and then click **Field Mapping**.
   The **Field Mapping** screen appears.
4. Select the **Billing** option from the **Preference Category** list.
5. Enter the additional search criteria in the **Search Field Mapping** zone.

> **Note:** ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

6. Click **Search**.
   A list of billing preferences that meet the search criteria appears in the **Search Results** section.

Viewing the Billing Preference Details

Procedure

To view the details of a billing preference:

Copyright © 2026, Oracle and/or its affiliates.

1. Search for the billing preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Broadcast** (((•))) icon corresponding to the billing preference whose details you want to view.
   The **Field Mapping** zone appears.
3. View the details of the billing preference in the **Field Mapping** zone.

Defining a Billing Preference

Prerequisites

To define a billing preference, you should have:

- Field mapping business objects defined in the application.
- Bill cycles and bill periods defined in the application.

Procedure

To define a billing preference:

1. Click the **Menu** (☰) icon in the **Application** toolbar.
   A list appears.
2. Click the **Admin Menu** option from the list.
   A sub-menu appears.
3. Select **F** and then click the **Add** button corresponding to the **Field Mapping** option from the sub-menu.

   The **Select Business Object** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)

Field Mapping Business Object	Used to indicate the business object using which you want to create a billing preference. The valid values are:
	• **Bill Route Method - Contact Method Mapping (i.e., C1_BillRouteCntMethMap)** - Enables you to maintain a routing method - contact method mapping preference.
	• **Field Mapping (i.e., C1-FieldMapping)** - Enables you to maintain the following:
	  • Automatic Refund/Write-Off Preference
	  • Billing Preference
	  • Binder Payment Preference
	  • Configuration for Match Type - Handling Overpayment Preference
	  • Delinquency Process Preference
	  • Delinquency Process Type Preference
	  • Geographic Rating Area Preference
	  • Hold Request Preference
	  • Individual Membership Preference
	  • Medicare Preference
	  • Member Reconciliation Preference
		Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• Member Relationship and Subscription Tier Preference • Membership Repricing Reasons Preference • MNI Derivation Input Preference • Statement Construct Preference • Transaction Paid Status Count Preference • **Group Membership Status Reason Mapping (i.e., C1-MemStatusReasonMapGroup)** - Enables you to maintain a group membership status reason preference. • **Medicare Plan Benefit Package (i.e., C1-BenefitPackage)** - Enables you to maintain a Medicare plan benefit package. • **Membership Status Reason Mapping (i.e., C1-MemStatusReasonMapping)** - Enables you to maintain an individual membership status reason preference. **Note:** The above business objects are shipped with the product. The list includes those business objects which are created using the **Field Mapping** (i.e., **C1-FIELDMAP**) maintenance object.	

Note: Alternatively, you can access the **Select Business Object** screen by clicking the **Add** button in the **Page Title** area of the **Field Mapping** screen.

4. Select the **Field Mapping** option from the **Field Mapping Business Object** list.
5. Click **OK**.

The **Field Mapping** screen appears. It contains the following sections:

- **Main** - Used to specify basic details for the billing preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the billing preference.	Yes
Description	Used to specify the description for the billing preference.	Yes
Detailed Description	Used to specify additional information about the billing preference.	No
Status	Used to indicate the status of the billing preference. The valid values are: • Active • Inactive	Yes

- **Preference Category** - Used to specify the preference category. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Preference Category	Used to indicate the category to which the preference belongs. The valid values are: • Automatic Refund/Write-Off • Billing • Binder Payment	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• Configuration for Match Type - Handling Overpayment • Delinquency Process • Delinquency Process Type • Geographic Rating Area • Hold Request • Individual Membership • Medicare • Medicare Plan Benefit • Member Reconciliation • Member Relationship and Subscription Tier • Membership Repricing Reasons • Membership Status Reason • MNI Derivation Input • Routing Method - Contact Method Mapping • Statement Construct • Transaction Paid Status Count	
	Note: The list includes only those values which are defined in the **FIELD_CAT_FLG** lookup field. You must select the **Billing** option from the list while creating a billing preference.	

- **Preference Settings** - Used to set the attributes in the billing preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the billing preference. **Note:** The attribute list appears only when the preference category is selected from the respective list.	Yes
Value	Used to specify the attribute value. **Note:** The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the billing preference.	Yes
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: • Account • Adjustment • Billable Charge • Membership • Payment	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• Policy **Note:** At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types in the **MAP_ENTITY_FLG** lookup field.	

The following table lists and describes the attributes available while defining, editing, or copying the billing preference:

Attribute	Description	Mandatory (Yes or No)
Bill Cycle	Used to specify the bill cycle. The system derives the bill cycle for an account from the billing preference when the billing preference characteristic is specified while creating or editing the account from the user interface or through a health care inbound message. **Note:** The list includes only those bill cycles which are already defined in the system.	Yes (Conditional) **Note:** This data is required when you want to derive the bill cycle for an account from the billing preference.
Bill Period	Used to specify the bill period. The system derives the bill period for an account from the billing preference while creating billable charges for the account when: • The billing preference characteristic is defined for the account. • The **C1-BILLPDRV** algorithm is invoked from the age based, tier based, additional fee, benefit, and/or discount charge pricing rule types. **Note:** The list includes only those bill periods which are already defined in the system.	Yes (Conditional) **Note:** This data is required when you want to derive the bill period for an account from the billing preference.
Skip Months	Used to specify the month for which you want to skip billing for the account. The valid values are: • January • February • March • April • May • June • July • August • September • October • November • December	Yes (Conditional) **Note:** This data is required when you want to use the **9/10 Billing (Skip Months)** feature for an account.

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
	Note: You can define this attribute multiple times in the billing preference when you want to skip more than one month for billing. The skip months can be continuous or noncontinuous. However, note that, you cannot skip all 12 months in the billing preference.	

Note: While defining a billing preference, you must set at least one attribute in the billing preference.

6. Select the **Billing** option from the **Preference Category** list.
   The **Preference Category** section disappears and the **Preference Category** field appears in the **Main** section.
7. Enter the required details in the **Main** section.
8. Set the required attributes in the billing preference.
9. If you want to set more than one attribute in the billing preference, click the **Add** (+) icon and then repeat step 8.

Note: However, if you want to remove an attribute from the billing preference, click the **Delete** (🗑) icon corresponding to the attribute.

10. Click **Save**.
    The billing preference is defined.

Editing a Billing Preference

Prerequisites

To edit a billing preference, you should have:

- Bill cycles and bill periods defined in the application.

Procedure

To edit a billing preference:

1. Search for the billing preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Edit** (✎) icon in the **Edit** column corresponding to the billing preference whose details you want to edit.

   The **Field Mapping** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details for the billing preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Displays the billing preference.	Not applicable
Description	Used to specify the description for the billing preference.	Yes
Detailed Description	Used to specify additional information about the billing preference.	No
Status	Used to indicate the status of the billing preference. The valid values are: • Active • Inactive	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Preference Category	Indicates the category to which the preference belongs. The valid value is: • Billing	Not applicable

- **Preference Settings** - Used to set the attributes in the billing preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the billing preference.	Yes
Value	Used to specify the attribute value. **Note:** The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the billing preference.	Yes
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: • Account • Adjustment • Billable Charge • Membership • Payment • Policy **Note:** At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types in the **MAP_ENTITY_FLG** lookup field.	No

The following table lists and describes the attributes available while defining, editing, or copying the billing preference:

Attribute	Description	Mandatory (Yes or No)
Bill Cycle	Used to specify the bill cycle. The system derives the bill cycle for an account from the billing preference when the billing preference characteristic is specified while creating or editing the account from the user interface or through a health care inbound message. **Note:** The list includes only those bill cycles which are already defined in the system.	Yes (Conditional) **Note:** This data is required when you want to derive the bill cycle for an account from the billing preference.
Bill Period	Used to specify the bill period. The system derives the bill period for an account from the billing preference while creating billable charges for the account when:	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
	• The billing preference characteristic is defined for the account. • The **C1-BILLPDRV** algorithm is invoked from the age based, tier based, additional fee, benefit, and/or discount charge pricing rule types.	**Note:** This data is required when you want to derive the bill period for an account from the billing preference.
	Note: The list includes only those bill periods which are already defined in the system.	
Skip Months	Used to specify the month for which you want to skip billing for the account. The valid values are: • January • February • March • April • May • June • July • August • September • October • November • December	Yes (Conditional)
	Note: You can define this attribute multiple times in the billing preference when you want to skip more than one month for billing. The skip months can be continuous or noncontinuous. However, note that, you cannot skip all 12 months in the billing preference.	**Note:** This data is required when you want to use the **9/10 Billing (Skip Months)** feature for an account.

Tip: Alternatively, you can click the **Edit** button in the **Field Mapping** zone to edit the details of the billing preference.

3. Modify the required details in the **Main** section.
4. Define, edit, or remove the attribute from the billing preference, if required.

Note: You must set at least one attribute in the billing preference.

5. Click **Save**.
   The changes made to the billing preference are saved.

Copying a Billing Preference

Instead of creating a billing preference from scratch, you can create a new billing preference using an existing billing preference. This is possible through copying a billing preference. On copying a billing preference, the details including the attributes are copied to the new billing preference. You can then edit the details, if required.

Prerequisites

To copy a billing preference, you should have:

- Billing preference (whose copy you want to create) defined in the application
- Bill cycles and bill periods defined in the application

Procedure

To copy a billing preference:

1. Search for the billing preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Duplicate** (⧉) icon in the **Duplicate** column *c*orresponding to the billing preference whose copy you want to create.

   The **Field Mapping** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details for the billing preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the billing preference.	Yes
Description	Used to specify the description for the billing preference.	Yes
Detailed Description	Used to specify additional information about the billing preference.	No
Status	Used to indicate the status of the billing preference. The valid values are: • Active • Inactive	Yes
Preference Category	Indicates the category to which the preference belongs. The valid value is: • Billing	Not applicable

   - **Preference Settings** - Used to set the attributes in the billing preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the billing preference.	Yes
Value	Used to specify the attribute value. **Note:** The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the billing preference.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: • Account • Adjustment • Billable Charge • Membership • Payment • Policy **Note:** At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types in the **MAP_ENTITY_FLG** lookup field.	No

The following table lists and describes the attributes available while defining, editing, or copying the billing preference:

Attribute	Description	Mandatory (Yes or No)
Bill Cycle	Used to specify the bill cycle. The system derives the bill cycle for an account from the billing preference when the billing preference characteristic is specified while creating or editing the account from the user interface or through a health care inbound message. **Note:** The list includes only those bill cycles which are already defined in the system.	Yes (Conditional) **Note:** This data is required when you want to derive the bill cycle for an account from the billing preference.
Bill Period	Used to specify the bill period. The system derives the bill period for an account from the billing preference while creating billable charges for the account when: • The billing preference characteristic is defined for the account. • The **C1-BILLPDRV** algorithm is invoked from the age based, tier based, additional fee, benefit, and/or discount charge pricing rule types. **Note:** The list includes only those bill periods which are already defined in the system.	Yes (Conditional) **Note:** This data is required when you want to derive the bill period for an account from the billing preference.
Skip Months	Used to specify the month for which you want to skip billing for the account. The valid values are: • January • February • March • April • May • June • July • August • September	Yes (Conditional) **Note:** This data is required when you want to use the **9/10 Billing (Skip Months)** feature for an account.

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
	• October • November • December	
	Note: You can define this attribute multiple times in the billing preference when you want to skip more than one month for billing. The skip months can be continuous or noncontinuous. However, note that, you cannot skip all 12 months in the billing preference.	

Note: While defining a billing preference, you must set at least one attribute in the billing preference.

Tip: Alternatively, you can click the **Duplicate** button in the **Field Mapping** zone to create a copy of the billing preference.

3. Enter the required details in the **Main** section.
4. Define, edit, or remove the attribute from the billing preference, if required.
5. Click **Save**.
   The new billing preference is defined.

Deleting a Billing Preference

Procedure

To delete a billing preference:

1. Search for the billing preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Delete** (🗑) icon in the **Delete** column *c*orresponding to the billing preference that you want to delete.
   A message appears confirming whether you want to delete the billing preference.

Tip: Alternatively, you can click the **Delete** button in the **Field Mapping** zone to delete the billing preference.

3. Click **OK**.
   The billing preference is deleted.

Hold Request Preference

The Hold Request Preference enables you to set the attributes that are used during:

- **Manual Hold Request Creation Via Inbound Message** - While manually creating or releasing a hold request via an inbound message, the system uses the following attributes from the hold request preference:
  - Default Manual Hold Reason
  - Default Manual End Date
  - Default Manual Hold Request Type Code
  - Default Manual Release Reason
  - Default Manual Discard Reason
- **Automatic Hold Request Creation Via Inbound Message** - While automatically creating a hold request when the status of an inbound message is changed to **Rejected**, the system uses the following attributes from the hold request preference:
  - Create Automatic Hold Request
  - Default Automatic Hold Reason
  - Default Automatic End Date
  - Default Automatic Hold Request Type Code
  - Characteristic Type for Bill Level 1
  - Characteristic Type for Bill Level 2
  - Characteristic Type for Bill Level 3
  - Characteristic Type for Bill Level 4
- **Automatic Hold Request Creation Via File Upload Interface** – While automatically creating a hold request when a billable charge creation or cancelation fails for an account through the **File Upload Interface** feature, the system uses the following attributes from the hold request preference:
  - Create Premium Hold Request
  - Default Automatic Hold Reason
  - Default Automatic End Date
  - Default Automatic Hold Request Type Code

For more information about these attributes, see Defining a Hold Request Preference.

The system considers the hold request preference which is specified in the **Hold Request Field Mapping** option type of the **C1-HOLDSRCH** feature configuration. You can define, edit, delete, and copy a hold request preference using the **C1-FieldMapping** business object through the **Field Mapping** screen. While creating a hold request preference, you must set the preference category to **Hold Request**.

Searching for a Hold Request Preference

Procedure

To search for a hold request preference:

1. Click the **Menu** (☰) icon in the **Application** toolbar.
   A list appears.
2. Click the **Admin Menu** option from the list.
   A sub-menu appears.
3. Select **F** and then click **Field Mapping**.
   The **Field Mapping** screen appears.
4. Select the **Hold Request** option from the **Preference Category** list.

Copyright © 2026, Oracle and/or its affiliates.

5. Enter the additional search criteria in the **Search Field Mapping** zone.

> **Note:** ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

6. Click **Search**.
   A list of hold request preferences that meet the search criteria appears in the **Search Results** section.

Viewing the Hold Request Preference Details

Procedure

To view the details of a hold request preference:

1. Search for the hold request preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Broadcast** (📡) icon corresponding to the hold request preference whose details you want to view.
   The **Field Mapping** zone appears.
3. View the details of the hold request preference in the **Field Mapping** zone.

Defining a Hold Request Preference

Prerequisites

To define a hold request preference, you should have:

- Field mapping business objects defined in the application.
- Required characteristic types defined in the application (where the characteristic entity is set to **Membership**)
- Values defined in the **HOLD_REASON_FLG** lookup field.
- Required hold request types defined in the application.
- Required reasons defined for the **Discarded** and **Released** statuses of the **C1-HoldRequest** business object in the **Status Reason** screen.

Procedure

To define a hold request preference:

1. Click the **Menu** (☰) icon in the **Application** toolbar.
   A list appears.
2. Click the **Admin Menu** option from the list.
   A sub-menu appears.
3. Select **F** and then click the **Add** button corresponding to the **Field Mapping** option from the sub-menu.

   The **Select Business Object** screen appears. It contains the following field:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)

Field Mapping Business Object	Used to indicate the business object using which you want to create a hold request preference. The valid values are:
	• **Bill Route Method - Contact Method Mapping (i.e., C1_BillRouteCntMethMap)** - Enables you to maintain a routing method - contact method mapping preference.
	• **Field Mapping (i.e., C1-FieldMapping)** - Enables you to maintain the following:
	  • Automatic Refund/Write-Off Preference
	  • Billing Preference
	  • Binder Payment Preference
	  • Configuration for Match Type - Handling Overpayment Preference
	  • Delinquency Process Preference
	  • Delinquency Process Type Preference
	  • Geographic Rating Area Preference
	  • Hold Request Preference
	  • Individual Membership Preference
	  • Medicare Preference
	  • Member Reconciliation Preference
	  • Member Relationship and Subscription Tier Preference
	  • Membership Repricing Reasons Preference
	  • MNI Derivation Input Preference
	  • Statement Construct Preference
	  • Transaction Paid Status Count Preference
	• **Group Membership Status Reason Mapping (i.e., C1-MemStatusReasonMapGroup)** - Enables you to maintain a group membership status reason preference.
	• **Medicare Plan Benefit Package (i.e., C1-BenefitPackage)** - Enables you to maintain a Medicare plan benefit package.
	• **Membership Status Reason Mapping (i.e., C1-MemStatusReasonMapping)** - Enables you to maintain an individual membership status reason preference.
	Note: The above business objects are shipped with the product. The list includes those business objects which are created using the **Field Mapping** (i.e., **C1-FIELDMAP**) maintenance object.
		Yes

Note: Alternatively, you can access the **Select Business Object** screen by clicking the **Add** button in the **Page Title** area of the **Field Mapping** screen.

4. Select the **Field Mapping** option from the **Field Mapping Business Object** list.
5. Click **OK**.

The **Field Mapping** screen appears. It contains the following sections:

- **Main** - Used to specify basic details for the hold request preference. It contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the hold request preference.	Yes
Description	Used to specify the description for the hold request preference.	Yes
Detailed Description	Used to specify additional information about the hold request preference. **Note:** You can resize the text box depending on your requirement by clicking the **Resize Handle** ( ) icon at the bottom right corner of the text box.	No
Status	Used to indicate the status of the hold request preference. The valid values are: • Active • Inactive	Yes

- **Preference Category** - Used to specify the preference category. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Preference Category	Used to indicate the category to which the preference belongs. The valid values are: • Automatic Refund/Write-Off • Billing • Binder Payment • Configuration for Match Type - Handling Overpayment • Delinquency Process • Delinquency Process Type • Geographic Rating Area • Hold Request • Individual Membership • Medicare • Medicare Plan Benefit • Member Reconciliation • Member Relationship and Subscription Tier • Membership Repricing Reasons • Membership Status Reason • MNI Derivation Input • Routing Method - Contact Method Mapping • Statement Construct • Transaction Paid Status Count **Note:** The list includes only those values which are defined in the **FIELD_CAT_FLG** lookup field. You must select the **Hold Request** option from the list while creating a hold request preference.	Yes

Copyright © 2026, Oracle and/or its affiliates.

- **Preference Settings** - Used to set the attributes in the hold request preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the hold request preference. **Note:** The attribute list appears only when the preference category is selected from the respective list.	Yes
Value	Used to specify the attribute value. **Note:** The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the hold request preference.	Yes
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: • Account • Adjustment • Billable Charge • Membership • Payment • Policy **Note:** At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types in the **MAP_ENTITY_FLG** lookup field.	No

The following table lists and describes the attributes available while defining, editing, or copying the hold request preference:

Attribute	Description	Mandatory (Yes or No)
Characteristic Type for Bill Level 1	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 1 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes
Characteristic Type for Bill Level 2	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 2 for the membership. The system considers this characteristic type to determine the account to which the group membership is	Yes

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
	billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	
Characteristic Type for Bill Level 3	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 3 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes
Characteristic Type for Bill Level 4	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 4 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes
Create Automatic Hold Request	Used to indicate whether the system should automatically create a hold request whenever the status of an inbound message (with person or account data) is changed to **Rejected**. The valid values are: • Yes • No	Yes
Create Premium Hold Request	Used to indicate whether the system should automatically create a hold request when a billable charge creation or cancelation fails for an account through the **File Upload Interface** feature. The valid values are: • Yes • No	Yes
Default Automatic End Date	Used to specify the date till when you want an automatic hold request to be effective. **Note:** The specified date should be later than the date when the automatic hold request is created via an inbound message or file upload interface. You must specify the date in the **YYYY-MM-DD** format.	Yes
Default Automatic Hold Reason	Used to indicate the reason why you want to hold the entity via an automatic hold request.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
	Note: The list includes only those values which are defined in the **HOLD_REASON_FLG** lookup field.	
Default Automatic Hold Request Type Code	Used to indicate the hold request type using which you want to create an automatic hold request via an inbound message or file upload interface. **Note:** The list includes only those hold request types which are already defined in the system.	Yes
Default Manual Discard Reason	Used to indicate the reason why you want to discard the hold request via an inbound message. The system considers the default manual discard reason when the **action** tag is set to **R** within the **billHold** tag in an inbound message and the derived hold request's start data is a future date. **Note:** You must specify a reason which is already defined for the **Discarded** status of the **C1-HoldRequest** business object through the **Status Reason** screen.	Yes
Default Manual End Date	Used to specify the date till when you want a manual hold request to be effective. The system considers the default manual end date when the **action** tag is set to **H** or **R** and other hold details are not received within the **billHold** tag in an inbound message. **Note:** The specified date should be later than the date when the manual hold request is created via an inbound message. You must specify the date in the **YYYY-MM-DD** format.	Yes
Default Manual Hold Reason	Used to indicate the reason why you want to hold the entity via a manual hold request. The system considers the default manual hold reason when the **action** tag is set to **H** or **R** and other hold details are not received within the **billHold** tag in an inbound message. **Note:** The list includes only those values which are defined in the **HOLD_REASON_FLG** lookup field.	Yes
Default Manual Hold Request Type Code	Used to indicate the hold request type using which you want to create a manual hold request via an inbound message. The system considers the default manual hold request type when the **action** tag is set to **H** or **R** and other hold details are not received within the **billHold** tag in an inbound message. **Note:** The list includes only those hold request types which are already defined in the system.	Yes
Default Manual Release Reason	Used to indicate the reason why you want to release the hold request via an inbound message. The system considers the	Yes

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
	default manual release reason when the **action** tag is set to **R** within the **billHold** tag in an inbound message. **Note:** You must specify a reason which is already defined for the **Released** status of the **C1-HoldRequest** business object through the **Status Reason** screen.	

Note: While defining a hold request preference, you must set at least one attribute in the hold request preference.

6. Select the **Hold Request** option from the **Preference Category** list.
   The **Preference Category** section disappears and the **Preference Category** field appears in the **Main** section.
7. Enter the required details in the **Main** section.
8. Set the required attributes in the hold request preference.
9. If you want to set more than one attribute in the hold request preference, click the **Add** (+) icon and then repeat step 8.

Note: However, if you want to remove an attribute from the hold request preference, click the **Delete** (🗑) icon corresponding to the attribute.

10. Click **Save**.
    The hold request preference is defined.

Editing a Hold Request Preference

Prerequisites

To edit a hold request preference, you should have:

- Required characteristic types defined in the application (where the characteristic entity is set to **Membership**)
- Values defined in the **HOLD_REASON_FLG** lookup field.
- Required hold request types defined in the application.
- Required reasons defined for the **Discarded** and **Released** statuses of the **C1-HoldRequest** business object in the **Status Reason** screen.

Procedure

To edit a hold request preference:

1. Search for the hold request preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Edit** (✎) icon in the **Edit** column corresponding to the hold request preference whose details you want to edit.

   The **Field Mapping** screen appears. It contains the following sections:

Copyright © 2026, Oracle and/or its affiliates.

- **Main** - Used to specify basic details for the hold request preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Displays the hold request preference.	Not applicable
Description	Used to specify the description for the hold request preference.	Yes
Detailed Description	Used to specify additional information about the hold request preference. **Note:** You can resize the text box depending on your requirement by clicking the **Resize Handle** (⇲) icon at the bottom right corner of the text box.	No
Status	Used to indicate the status of the hold request preference. The valid values are: • Active • Inactive	Yes
Preference Category	Indicates the category to which the preference belongs. The valid value is: • Hold Request	Not applicable

- **Preference Settings** - Used to set the attributes in the hold request preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the hold request preference.	Yes
Value	Used to specify the attribute value. **Note:** The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the hold request preference.	Yes
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: • Account • Adjustment • Billable Charge • Membership • Payment • Policy	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types in the **MAP_ENTITY_FLG** lookup field.	

The following table lists and describes the attributes available while defining, editing, or copying the hold request preference:

Attribute	Description	Mandatory (Yes or No)
Characteristic Type for Bill Level 1	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 1 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes
Characteristic Type for Bill Level 2	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 2 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes
Characteristic Type for Bill Level 3	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 3 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes
Characteristic Type for Bill Level 4	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 4 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
Create Automatic Hold Request	Used to indicate whether the system should automatically create a hold request whenever the status of an inbound message (with person or account data) is changed to **Rejected**. The valid values are: • Yes • No	Yes
Create Premium Hold Request	Used to indicate whether the system should automatically create a hold request when a billable charge creation or cancelation fails for an account through the **File Upload Interface** feature. The valid values are: • Yes • No	Yes
Default Automatic End Date	Used to specify the date till when you want an automatic hold request to be effective. **Note:** The specified date should be later than the date when the automatic hold request is created via an inbound message or file upload interface. You must specify the date in the **YYYY-MM-DD** format.	Yes
Default Automatic Hold Reason	Used to indicate the reason why you want to hold the entity via an automatic hold request. **Note:** The list includes only those values which are defined in the **HOLD_REASON_FLG** lookup field.	Yes
Default Automatic Hold Request Type Code	Used to indicate the hold request type using which you want to create an automatic hold request via an inbound message or file upload interface. **Note:** The list includes only those hold request types which are already defined in the system.	Yes
Default Manual Discard Reason	Used to indicate the reason why you want to discard the hold request via an inbound message. The system considers the default manual discard reason when the **action** tag is set to **R** within the **billHold** tag in an inbound message and the derived hold request's start data is a future date. **Note:** You must specify a reason which is already defined for the **Discarded** status of the **C1-HoldRequest** business object through the **Status Reason** screen.	Yes
Default Manual End Date	Used to specify the date till when you want a manual hold request to be effective. The system considers the default manual end date when the **action** tag is set to **H** or **R** and other hold details are not received within the **billHold** tag in an inbound message.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
	Note: The specified date should be later than the date when the manual hold request is created via an inbound message. You must specify the date in the **YYYY-MM-DD** format.	
Default Manual Hold Reason	Used to indicate the reason why you want to hold the entity via a manual hold request. The system considers the default manual hold reason when the **action** tag is set to **H** or **R** and other hold details are not received within the **billHold** tag in an inbound message. **Note:** The list includes only those values which are defined in the **HOLD_REASON_FLG** lookup field.	Yes
Default Manual Hold Request Type Code	Used to indicate the hold request type using which you want to create a manual hold request via an inbound message. The system considers the default manual hold request type when the **action** tag is set to **H** or **R** and other hold details are not received within the **billHold** tag in an inbound message. **Note:** The list includes only those hold request types which are already defined in the system.	Yes
Default Manual Release Reason	Used to indicate the reason why you want to release the hold request via an inbound message. The system considers the default manual release reason when the **action** tag is set to **R** within the **billHold** tag in an inbound message. **Note:** You must specify a reason which is already defined for the **Released** status of the **C1-HoldRequest** business object through the **Status Reason** screen.	Yes

Tip: Alternatively, you can click the **Edit** button in the **Field Mapping** zone to edit the details of the hold request preference.

3. Modify the required details in the **Main** section.
4. Define, edit, or remove the attribute from the hold request preference, if required.

Note: You must set at least one attribute in the hold request preference.

5. Click **Save**.
   The changes made to the hold request preference are saved.

Copying a Hold Request Preference

Instead of creating a hold request preference from scratch, you can create a new hold request preference using an existing hold request preference. This is possible through copying a hold request preference. On copying a hold request preference, the details including the attributes are copied to the new hold request preference. You can then edit the details, if required.

Prerequisites

To copy a hold request preference, you should have:

- Hold request preference (whose copy you want to create) defined in the application
- Required characteristic types defined in the application (where the characteristic entity is set to **Membership**)
- Values defined in the **HOLD_REASON_FLG** lookup field.
- Required hold request types defined in the application.
- Required reasons defined for the **Discarded** and **Released** statuses of the **C1-HoldRequest** business object in the **Status Reason** screen.

Procedure

To copy a hold request preference:

1. Search for the hold request preference in the **Field Mapping** screen.
2. In the **Search Results** section, click the **Duplicate** (⧉) icon in the **Duplicate** column *c*orresponding to the hold request preference whose copy you want to create.

   The **Field Mapping** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details for the hold request preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Preference	Used to specify the hold request preference.	Yes
Description	Used to specify the description for the hold request preference.	Yes
Detailed Description	Used to specify additional information about the hold request preference. **Note:** You can resize the text box depending on your requirement by clicking the **Resize Handle** (⇲) icon at the bottom right corner of the text box.	No
Status	Used to indicate the status of the hold request preference. The valid values are: • Active • Inactive	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Preference Category	Indicates the category to which the preference belongs. The valid value is: • Hold Request	Not applicable

- **Preference Settings** - Used to set the attributes in the hold request preference. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Attribute	Used to indicate the attribute that you want to set in the hold request preference.	Yes
Value	Used to specify the attribute value. **Note:** The attribute value list appears only when the attribute is selected from the respective list. The attribute value list varies depending on the attribute that you want to set in the hold request preference.	Yes
Entity Type	Used to indicate the type of entity for which the attribute is applicable. The valid values are: • Account • Adjustment • Billable Charge • Membership • Payment • Policy **Note:** At present, this data is stored for informational purposes only and is not considered in the business logic. If required, you can add more entity types in the **MAP_ENTITY_FLG** lookup field.	No

The following table lists and describes the attributes available while defining, editing, or copying the hold request preference:

Attribute	Description	Mandatory (Yes or No)
Characteristic Type for Bill Level 1	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 1 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
Characteristic Type for Bill Level 2	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 2 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes
Characteristic Type for Bill Level 3	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 3 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes
Characteristic Type for Bill Level 4	Used to specify the characteristic type which stores the bill group derivation and pricing parameter 4 for the membership. The system considers this characteristic type to determine the account to which the group membership is billed. The system then creates an automatic hold request for the respective billing account via the inbound message. **Note:** You must specify a characteristic type where the characteristic entity is set to **Membership**.	Yes
Create Automatic Hold Request	Used to indicate whether the system should automatically create a hold request whenever the status of an inbound message (with person or account data) is changed to **Rejected**. The valid values are: • Yes • No	Yes
Create Premium Hold Request	Used to indicate whether the system should automatically create a hold request when a billable charge creation or cancelation fails for an account through the **File Upload Interface** feature. The valid values are: • Yes • No	Yes
Default Automatic End Date	Used to specify the date till when you want an automatic hold request to be effective.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
	Note: The specified date should be later than the date when the automatic hold request is created via an inbound message or file upload interface. You must specify the date in the **YYYY-MM-DD** format.	
Default Automatic Hold Reason	Used to indicate the reason why you want to hold the entity via an automatic hold request. **Note:** The list includes only those values which are defined in the **HOLD_REASON_FLG** lookup field.	Yes
Default Automatic Hold Request Type Code	Used to indicate the hold request type using which you want to create an automatic hold request via an inbound message or file upload interface. **Note:** The list includes only those hold request types which are already defined in the system.	Yes
Default Manual Discard Reason	Used to indicate the reason why you want to discard the hold request via an inbound message. The system considers the default manual discard reason when the **action** tag is set to **R** within the **billHold** tag in an inbound message and the derived hold request's start data is a future date. **Note:** You must specify a reason which is already defined for the **Discarded** status of the **C1-HoldRequest** business object through the **Status Reason** screen.	Yes
Default Manual End Date	Used to specify the date till when you want a manual hold request to be effective. The system considers the default manual end date when the **action** tag is set to **H** or **R** and other hold details are not received within the **billHold** tag in an inbound message. **Note:** The specified date should be later than the date when the manual hold request is created via an inbound message. You must specify the date in the **YYYY-MM-DD** format.	Yes
Default Manual Hold Reason	Used to indicate the reason why you want to hold the entity via a manual hold request. The system considers the default manual hold reason when the **action** tag is set to **H** or **R** and other hold details are not received within the **billHold** tag in an inbound message. **Note:** The list includes only those values which are defined in the **HOLD_REASON_FLG** lookup field.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Attribute	Description	Mandatory (Yes or No)
Default Manual Hold Request Type Code	Used to indicate the hold request type using which you want to create a manual hold request via an inbound message. The system considers the default manual hold request type when the **action** tag is set to **H** or **R** and other hold details are not received within the **billHold** tag in an inbound message. **Note:** The list includes only those hold request types which are already defined in the system.	Yes
Default Manual Release Reason	Used to indicate the reason why you want to release the hold request via an inbound message. The system considers the default manual release reason when the **action** tag is set to **R** within the **billHold** tag in an inbound message. **Note:** You must specify a reason which is already defined for the **Released** status of the **C1-HoldRequest** business object through the **Status Reason** screen.	Yes

Note: While defining a hold request preference, you must set at least one attribute in the hold request preference.

Tip: Alternatively, you can click the **Duplicate** button in the **Field Mapping** zone to create a copy of the hold request preference.

3. Enter the required details in the **Main** section.
4. Define, edit, or remove the attribute from the hold request preference, if required.
5. Click **Save**.
   The new hold request preference is defined.

Chapter 41

Off-Process Request

Topics:

- Prerequisites
- Off-Process Request (Without Approval) Status Transition
- Off-Process Request (With Approval) Status Transition
- Algorithms Used in C1-OffProcessRequest
- Off-Process Request Type
- Off-Process Request (Used for Searching)
- Off-Process Request (Used for Viewing)

There might be situations in the Administrative Services Only (ASO) business wherein the insurance company or health insurance customer (i.e. Employer) would like to change agreed limits or funds within the policy period. For example, a need may arise to change the ASL limit, minimum or maximum discount limit, or settlement or runout funds. This will impact the stop-loss, discount arrangement, and level funding calculation, respectively. In addition, there might be situations wherein the aggregated amount might require a change due to corrections in the claim transactions or due to migration of customers for whom the stop-loss is pre-accumulated and billed in the legacy system.

Oracle Revenue Management and Billing provides a mechanism through which the agreed limits, funds, or calculated amounts can be amended within the policy period.

The following table lists a set of fields used during the respective accumulation that can be amended through an off-process request:

Accumulation Category	Field Value
Specific Stop-Loss (SSL)	Aggregated Amount
Aggregate Stop-Loss (ASL)	Aggregated Amount
	ASL Limit
	SSL Cumulative Credits
Level Funded	Aggregated Amount
	Settlement Fund
	SSL Cumulative Credits
	ASL Cumulative Credits
	Runout Fund
Discount Arrangement	Aggregated Amount
	Minimum Discount Limit
	Maximum Discount Limit

The system enables you to amend the above mentioned accumulation field values through an off-process request. As its name suggests, an off-process request is an adhoc request to create an adjustment or billable charge through which the system can amend the above mentioned accumulation field values.

While creating an off-process request, you need to specify an off-process request type using which you want to create the off-process request. It is the off-process request type which helps the system to determine:

- The business object using which the off-process request should be created in the system
- Whether the system should create an adjustment or billable charge to amend the above mentioned accumulation field values
- Whether the approval is required for the off-process request
- The accumulation categories whose field values can be amended through the respective off-process requests
- The accumulation fields whose values can be amended through the respective off-process requests
- The default adjustment type using which the adjustment should be created when the amendment mode is set to **Adjustment**
- The default billable charge line type using which the billable charge should be created when the amendment mode is set to **Billable Charge**
- The type of contract against which the adjustment or billable charge should be created for the account

Once you specify the off-process request type, you need to specify the following:

- The parent customer (i.e. person whose person type is set to **Parent Customer**) for which you want to create an off-process request
- The accumulation category whose field value you want to amend through the off-process request
- The accumulation field whose value you want to amend through the off-process request

> **Note:** Here, you can select only those accumulation categories and fields for which the contract type and adjustment type or billable charge line type information is available in the respective off-process request type.

- The accumulation group for which the changes should be reflected in the system

> **Note:** If the accumulation category is set to **Specific Stop-Loss**, you can only select the accumulation group defined at the bill group level. However, if the accumulation category is set to **Aggregate Stop-Loss**, **Discount Arrangement**, or **Level Funded**, you can only select the accumulation group defined at the parent customer level.

- The account for which the adjustment or billable charge should be created in the system
- The amount which you want amend through the off-process request
- The adjustment type using which the adjustment should be created when the amendment mode is set to **Adjustment** in the respective off-process request type
- The billable charge line type using which the billable charge should be created when the amendment mode is set to **Billable Charge** in the respective off-process request type
- The member or main subscriber for whom the field value should be amended in the system

> **Note:** You need to specify the member or main subscriber when the accumulation category is set to **Specific Stop-Loss**.

- The date (i.e. effective date) when the field value should be amended in the system

Copyright © 2026, Oracle and/or its affiliates.

> **Note:** If the amendment mode is set to **Adjustment**, the above date is stamped as the accounting date. However, if the amendment mode is set to **Billable Charge**, the above date is stamped as the billable charge start and end dates.

- The coverage period for which the amendment is applicable

> **Note:** The coverage period is stored for the informational purposes only and is not considered during accumulation.

Once an off-process request is created in the **Draft** status, you can edit, delete, or submit the off-process request. On submitting an off-process request, the system creates the adjustments or billable charges to amend the accumulation field values. Finally, the status of the off-process request is changed to **Processed**.

> **Note:** The off-process request through which the adjustment is created is stored in the **Comments** field. And, the off-process request through which the billable charge is created is stored in the **GRP_REF_VAL** column.

You can optionally configure the approval process for the off-process request. If the **Approval Required** flag is set to **Yes** in the off-process request type, the status of the off-process request is changed to **Approval In Progress** when you submit the off-process request. Once the approver approves the off-process request, the status of the off-process request is changed to **Approved**. The system then creates the adjustments or billable charges to amend the accumulation field values. Finally, the status of the off-process request is changed to **Processed**. However, if the approver rejects an off-process request, the status of the off-process request is changed to **Rejected**.

These adjustments or billable charges are then considered in the accumulation run when the adjustment date or billable charge start and end dates fall within the accumulation cycle. Depending on the accumulation category, the adjustment or billable charge is considered when the **C1-ACSSL**, **C1-ACASL**, **C1-ACDA**, or **C1-ACLF** batch is executed.

For more information on how to setup the off-process request feature, see Prerequisites on page 3804.

Algorithms Used in C1-OffProcessRequest

Information will be available soon...

Off-Process Request Type

Oracle Revenue Management and Billing allows you to define an off-process request type using which you can create an off-process request. It is the off-process request type which helps the system to determine the following:

- The business object using which the off-process request should be created in the system.
- Whether the system should create the adjustment or billable charge to amend the accumulation field values.
- Whether approval is required for an off-process request.
- The accumulation categories and their respective amendment fields whose field values can be amended through the off-process requests.

Copyright © 2026, Oracle and/or its affiliates.

- The default adjustment type or the billable charge line type using which the adjustment should be created in the system.
- The type of contract against which the adjustment or billable charge should be created for the account.

The **Off-Process Request Type** screen allows you to define, edit, delete, and copy an off-process request type. It contains the following zones:

- Off-Process Request Type List on page 3806
- Off-Process Request Type on page 3806

Off-Process Request Type List

The **Off-Process Request Type List** zone lists the off-process request types that are already defined in the system. It contains the following columns:

Column Name	Column Description
Off-Process Request Type	Displays the off-process request type.
Description	Displays the description of the off-process request type.
Edit	On clicking the **Edit** (✎) icon, the **Off-Process Request Type** screen appears where you can edit the details of the off-process request type.
Duplicate	On clicking the **Duplicate** (⧉) icon, the **Off-Process Request Type** screen appears where you can define a new off-process request type using an existing off-process request type.
Delete	On clicking the **Delete** (🗑) icon, you can delete the off-process request type.
	Note: You can delete an off-process request type when you have not created an off-process request using the off-process request type.

On clicking the **Broadcast** (📡) icon corresponding to an off-process request type, the **Off-Process Request Type** zone appears with the details of the respective off-process request type.

Off-Process Request Type

The **Off-Process Request Type** zone displays the details of the off-process request type. It contains of the following sections:

- **Main** - Displays the basic information about the off-process request type. It contains the following fields:

Column Name	Column Description
Off-Process Request Type	Displays the off-process request type.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Business Object	Indicates the business object using which the off-process request type is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.
Description	Displays the description of the off-process request type.
Detailed Description	Displays additional information about the off-process request type.
Off-Process Request Business Object	Indicates the business object using which an off-process request should be created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.
Status	Indicates the status of the off-process request type. The valid values are: • Active • Inactive
Amendment Mode	Indicates whether adjustments or billable charges should be created using the off-process request type.
Approval Required	Indicates whether approval is required while creating the adjustments or billable charges using the off-process request type.
Approval Profile	Indicates the approval profile which must be used to define approval hierarchy for the off-process request type. **Note:** The **Approval Profile** field appears when the **Approval Required** check box is selected. It has a link. On clicking the link, the **Approval Profile** screen appears where you can view the details of the respective approval profile.
Approval To Do Type	Indicates that the To Do entry of the specified To Do type must be created when an off-process request is submit for approval. **Note:** It has a link. On clicking the link, the **To Do Type** screen appears where you can view the details of the respective To Do type. This field appears when the **Approval Required** option is selected.
Approval To Do Role	Indicates that users with the specified To Do role can only approve an off-process request which is submitted for approval.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
	Note: It has a link. On clicking the link, the **To Do Role** screen appears where you can view the details of the respective To Do role. This field appears when the **Approval Required** option is selected.

- **Accumulation Amendment Details** - Lists the types of accumulation defined for the off-process type. It contains the following columns:

Column Name	Column Description
Accumulation Category	Indicates the category for which the adjustment or billable charge is created.
Amendment Field	Indicates the field for which the adjustment or billable charge is created.
Contract Type	Indicates the contract type which is associated while defining the off-process request type.
Adjustment Type/Billable Charge Line Type	Indicates the adjustment or billable charge line type using which the adjustment or billable charge should be created through the off-process request.

- **Characteristics** - The **Characteristics** section lists the characteristics of the off-process request type. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - The **Record Actions** section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the off-process request type.
Delete	Used to delete the off-process request type. **Note:** You can delete a off-process request type when you have not created a off-process request using the off-process request type.
Duplicate	Used to create a new off-process request type using an existing off-process request type.

- **Record Information** - The **Record Information** section contains the following fields:

Field Name	Field Description
Business Object	Indicates the business object using which the off-process request type is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.

By default, the **Off-Process Request Type** zone does not appear in the **Off-Process Request Type** screen. It appears when you click the **Broadcast** (📡) icon corresponding to the off-process request type in the **Off-Process Request Type List** zone.

Defining an Off-Process Request Type

Prerequisites

To define an off-process request type, you should have:

- Off-process request type business objects defined in the application
- Off-process request business objects defined in the application
- Required approval profiles defined in the application
- Required To Do role assigned to the **C1-OFPAP** To Do type in the application
- Accumulation category defined in the application
- Amendment field and amendment mode defined in the application
- Contract type defined in the application
- Adjustment type and billable charge line type defined in the application
- Off-process request type status defined in the application

Procedure

To define an off-process request type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **O** and then click **Off-Process Request Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Off-Process Request Type** sub-menu.

   The **Off-Process Request Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the off-process request type.
   - **Accumulation Amendment Details** - Used to specify the accumulation amendment details for the off-process request type.
   - **Characteristics** - Used to define the characteristics for the off-process request type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Type	Used to specify the off-process request type.	Yes
Business Object	Indicates the business object using which you are defining the off-process request type.	Not applicable
Description	Used to specify the description for the off-process request type.	Yes
Detailed Description	Used to specify additional information about the off-process request type.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Business Object	Used to indicate the business object using which you want to create the off-process request.	Yes
Status	Used to indicate the status of the off-process request type. The valid values are: • Active • Inactive **Note:** You cannot change the status of an off-process request type to **Inactive** when the corresponding off-process request is in a status other than **Processed** or **Rejected**. By default, the **Active** option is selected.	Not applicable
Amendment Mode	Used to indicate the amendment mode selected for the off-process request type. The valid values are: • Adjustment • Billable Charge	Yes
Approval Required	Used to indicate whether the approval is required before generating adjustments or billable charges through an off-process request.	No
Approval To Do Type	Used to indicate that To Do entry of the specified To Do type must be created when an off-process request is submitted for approval. **Note:** The **Search** icon appears corresponding to the **Approval To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field. This field appears when the **Approval Required** option is selected.	Yes (Conditional) **Note:** This field is required when the **Approval Required** option is selected.
Approval To Do Role	Used to indicate that users with the specified To Do role can only approve an off-process request submitted for approval. **Note:** The list includes only those To Do roles which are associated to the specified approval To Do type. This field appears only when the **Approval Required** option is selected.	Yes (Conditional) **Note:** This field is required when the **Approval Required** option is selected.

4. Enter the required details in the **Main** section.
5. Define the accumulation amendment details for the off-process request type, if required.

Copyright © 2026, Oracle and/or its affiliates.

6. Define characteristics for the off-process request type, if required.
7. Click **Save**.
   The off-process request type is defined.

Adding the Accumulation Amendment Details in an Off-Process Request Type

Prerequisites

To add accumulation amendment details in an off-process request type, you should have:

- Accumulation categories defined in the application
- Amendment fields defined in the application
- Contract types defined in the application
- Adjustment type and billable charge line type defined in the application

Procedure

To add accumulation amendment details in an off-process request types:

1. Ensure that the **Accumulation Amendment Details** section is expanded when you are adding the accumulation amendment details in an off-process request type.

   The **Accumulation Amendment Details** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Accumulation Category	Used to indicate the category that you want to use for accumulation. The valid values are: • Aggregate Stop Loss • Discount Arrangement • Level Funded • Specific Stop-Loss	Yes
Amendment Field	Used to indicate the field that you want to use for accumulation purposes. The valid values are: • ASL Limit • Aggregated Amount • Cumulative ASL Credit • Cumulative SSL Credit • Maximum Limit • Minimum Limit • Run Out Fund • Settlement Fund	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Contract Type	Used to indicate the contract that you want to use for accumulation and amendment purposes. **Note:** The **Search** icon appears corresponding to the **Contract Type** field. On clicking the **Search** icon, the **Contract Type Search** window appears.	Yes (Conditional) **Note:** This field is required when you are defining accumulation amendment details in an off-process request type.
Adjustment Type/Billable Charge Line Type	Used to indicate the type of charge using which you want to create adjustments or billable charges. The **Search** (🔍) icon appears corresponding to the **Adjustment Type/Billable Charge Line Type** field. On clicking the **Search** icon, the **Adjustment Type/Billable Charge Line Type Search** window appears.	Yes (Conditional) **Note:** This field is required when you are defining accumulation amendment details in an off-process request type.

2. Enter the required details in the **Accumulation Amendment Details** section.
3. If you want to define more than one accumulation amendment details for the off-process request type, click the **Add** (+) icon and then *r*epeat step *2*.

Note: However, if you want to remove an accumulation amendment detail(s) from the off-process request type, click the **Delete** (🗑) icon corresponding to the accumulation amendment details.

Defining a Characteristic for an Off-Process Request Type

Prerequisites

To define a characteristic for an off-process request type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Off-Process Request**)

Procedure

To define a characteristic for an off-process request type:

1. Ensure that the **Characteristics** section is expanded when you are defining, editing, or copying an off-process request type.

   The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Off-Process Request**.	**Note:** This field is required when you are defining a characteristic for the off-process request type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for the off-process request type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the off-process request type, click the **Add** (+) icon and then *r*epeat step *2*.

Note: However, if you want to remove a characteristic from the off-process request type, click the **Delete** (🗑) icon corresponding to the characteristic.

Editing an Off-Process Request Type

Prerequisites

To edit an off-process request type, you should have:

- Off-process request business objects defined in the application
- Adjustment type and billable charge line type defined in the application
- Required approval profiles defined in the application
- A To Do role assigned to the **C1-OFPAP** To Do type in the application
- Accumulation category defined in the application
- Amendment field and amendment mode defined in the application
- Contract type defined in the application
- Off-process request type status defined in the application

Procedure

To edit an off-process request type:

1. Click the **Admin** link in the **Application** toolbar.

Copyright © 2026, Oracle and/or its affiliates.

A list appears.

2. From the **Admin** menu, select **O** and then click **Off-Process Request Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Off-Process Request Type** sub-menu.
   The **Off-Process Request Type** screen appears.
4. In the **Off-Process Request Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the *o*ff-process request type whose details you want to edit.

   The **Off-Process Request Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the off-process request type.
   - **Characteristics** - Used to define the characteristics for the off-process request type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Type	Displays the off-process request type.	Not applicable
Business Object	Indicates the business object using which you are defining the off-process request type.	Not applicable
Description	Used to specify the description for the off-process request type.	Yes
Off-Process Request Business Object	Used to indicate the business object using which you want to create the off-process request.	Yes
Detailed Description	Used to specify additional information about the off-process request type.	No
Status	Used to indicate the status of the off-process request type. The valid values are: • Active • Inactive **Note:** You cannot change the status of an off-process request type to **Inactive** when the corresponding off-process request is in a status other than **Processed** or **Rejected**. If you do not specify the status, by default, it is set to **Active**.	Yes
Amendment Mode	Used to indicate the amendment mode selected for the off-process request type. The valid values are: • Adjustment • Billable Charge	Yes
Approval Required	Used to indicate whether the approval is required before generating adjustments or billable charges through an off-process request.	No
Approval To Do Type	Used to indicate that To Do entry of the specified To Do type must be created when an off-process request is submitted for approval.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** icon appears corresponding to the **Approval To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field. This field appears when the **Approval Required** option is selected.	**Note:** This field is required when the **Approval Required** option is selected.
Approval To Do Role	Used to indicate that users with the specified To Do role can only approve an off-process request submitted for approval.	Yes (Conditional)
	Note: The list includes only those To Do roles which are associated to the specified approval To Do type. This field appears only when the **Approval Required** option is selected.	**Note:** This field is required when the **Approval Required** option is selected.

Tip: Alternatively, you can edit the details of a off-process request type by clicking the **Edit** button in the **Off-Process Request Type** zone.

5. Modify the details in the **Main** section, if required.
6. Define, edit, or remove accumulation amendment details from the off-process request type, if required.
7. Define, edit, or remove characteristics of the off-process request type, if required.
8. Click **Save**.
   The changes made to the off-process request type are saved.

Deleting an Off-Process Request Type

Procedure

To delete an off-process request type:

Copyright © 2026, Oracle and/or its affiliates.

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **O** and then click **Off-Process Request Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Off-Process Request Type** sub-menu.
   The **Off-Process Request Type** screen appears.
4. In the **Off-Process Request Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the *o*ff-process request type that you want to delete.

   A message appears confirming whether you want to delete the off-process request type.

   Note: You can delete an off-process request type when you have not created an off-process request using the off-process request type.

   Tip: Alternatively, you can delete an off-process request type by clicking the **Delete** button in the **Off-Process Request Type** zone.
5. Click **OK**.
   The off-process request type is deleted.

Copying an Off-Process Request Type

Instead of creating an off-process request type from scratch, you can create a new off-process request type using an existing off-process request type. This is possible through copying an off-process request type. On copying an off-process request type, the details including the characteristics are copied to the new off-process request type. You can then edit the details, if required.

Prerequisites

To copy an off-process request type, you should have:

- Off-process request type (whose copy you want to create) defined in the application
- Off-process request business objects defined in the application
- Required approval profiles defined in the application
- A To Do role assigned to the **C1-OFPAP** To Do type in the application
- Accumulation category defined in the application
- Amendment field and amendment mode defined in the application
- Contract type defined in the application
- Adjustment type and billable charge line type defined in the application
- Off-process request type status defined in the application

Procedure

To copy an off-process request type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **O** and then click **Off-Process Request Type**.

Copyright © 2026, Oracle and/or its affiliates.

A sub-menu appears.

3. Click the **Search** option from the **Off-Process Request Type** sub-menu.
   The **Off-Process Request Type** screen appears.
4. In the **Off-Process Request Type List** zone, click the **Duplicate** (⧉) icon in the **Duplicate** column corresponding to the off-process request type whose copy you want to create.

   The **Off-Process Request Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the off-process request type.
   - **Characteristics** - Used to define the characteristics for the off-process request type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Type	Used to specify the off-process request type.	Yes
Business Object	Indicates the business object using which you are defining the off-process request type.	Not applicable
Description	Used to specify the description for the off-process request type.	Yes
Off-Process Request Business Object	Used to indicate the business object using which you want to create the off-process request.	Yes
Detailed Description	Used to specify additional information about the off-process request type.	No
Off-Process Request Business Object	Used to indicate the business object using which you want to create the respective off-process request type.	Yes
Status	Used to indicate the status of the off-process request type. The valid values are: • Active • Inactive **Note:** You cannot change the status of an off-process request type to **Inactive** when the corresponding off-process request is in a status other than **Processed** or **Rejected**. If you do not specify the status, by default, it is set to **Active**.	Yes
Amendment Mode	Used to indicate the amendment mode selected for the off-process request type. The valid values are: • Adjustment • Billable Charge	Yes
Approval Required	Used to indicate whether the approval is required before generating adjustments or billable charges through an off-process request.	No
Approval To Do Type	Used to indicate that To Do entry of the specified To Do type must be created when an off-process request is submitted for approval.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** icon appears corresponding to the **Approval To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the Approval To Do Type field. This field appears when the **Approval Required** option is selected.	**Note:** This field is required when the **Approval Required** option is selected.
Approval To Do Role	Used to indicate that users with the specified To Do role can only approve an off-process request submitted for approval.	Yes (Conditional)
	Note: The list includes only those To Do roles which are associated to the specified approval To Do type. This field appears only when the **Approval Required** option is selected.	**Note:** This field is required when the **Approval Required** option is selected.

Tip: Alternatively, you can copy an off-process request type by clicking the **Duplicate** button in the **Off-Process Request Type** zone.

5. Enter the required details in the **Main** section.
6. Define, edit, or remove the accumulation amendment details from the off-process request type, if required.
7. Define, edit, or remove characteristics of the off-process request type, if required.
8. Click **Save**.
   The new off-process request type is defined.

Off-Process Request (Used for Searching)

The **Off-Process Request** screen allows you to search for an off-process request using various search criteria. It also allows you to define an off-process request. It contains the following zone:

- Search Off-Process Request on page 3819

Through this screen, you can navigate to the following screen:

- Off-Process Request (Used for Viewing) on page 3824

Search Off-Process Request

The **Search Off-Process Request** zone allows you to search for an off-process request using various search criteria. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	**Field Description**	**Mandatory (Yes or No)**
Search By	Used to indicate whether you want to search for an off-process request using the off-process request or adjustment/billable charge details. The valid values are: • Request Details • Adjustment/Billable Charge Details **Note:** By default, the **Request Details** option is selected.	Yes
Off-Process Request ID	Used to search a particular off-process request.	No
Created From	Used to search off-process requests which are created from a particular date onwards.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field appears when the **Request Details** option is selected from the **Search By** list.	
Created Until	Used to search off-process requests which are created till a particular date. **Note:** This field appears when the **Request Details** option is selected from the **Search By** list.	No
Off-Process Request Type	Used to search off-process requests using a particular off-process request type.	No
Status	Used to search off-process requests with a particular status. The valid values are: • Approval In Progress • Draft • Processed • Rejected **Note:** This field appears when the **Request Details** option is selected from the **Search By** list.	No
Parent Person ID	Used to search off-process requests which include adjustments or billable charges of a particular parent person. **Note:** The **Search** icon appears corresponding to the **Parent Person ID** field. On clicking the **Search** icon, the **Person Search** window appears. This field appears when the **Request Details** option is selected from the **Search By** list.	No
Creation Mode	Used to search off-process requests which are created using a particular mode. The valid values are: • Automatic • Manual **Note:** This field appears when the **Request Details** option is selected from the **Search By** list.	No

Note: You must specify at least one search criterion while searching for an off-process request.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Creation Date Time	Displays the date and time when the off-process request is created.
Off-Process Request Information	Indicates the information about the off-process request.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
	Note: It has a link. On clicking the link, the **Off-Process Request** screen appears where you can view the details of the respective off-process request.
Parent Person Information	Indicates the information about the parent person. In addition, this column has a context menu which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Person** screen appears where you can view the details of the respective person.
Created By	Indicates the user who has created the off-process request.
Status	Indicates the status of the off-process request. The valid values are: • Approval In Progress • Draft • Processed • Rejected
Creation Mode	Indicates how the off-process request is created. The valid values are: • Automatic • Manual

Note: Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Searching for an Off-Process Request

Prerequisites

To search for an off-process request, you should have:

- Off-process request types defined in the application

Procedure

To search for an off-process request:

1. Click the **Menu** link in the **Application** toolbar.
   A list appears.
2. From the **Main** menu, select **Transaction and Audit Event Management** and then click **Off-Process Request**.
   A sub-menu appears.
3. Click the **Search** option from the **Off-Process Request** sub-menu.
   The **Off-Process Request** screen appears.
4. Enter the search criteria in the **Search-Off Process Request** zone.

Copyright © 2026, Oracle and/or its affiliates.

> **Note:** ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
   A list of off-process requests that meet the search criteria appears in the **Search Results** section.

Defining an Off-Process Request

Prerequisites

To create an off-process request, you should have:

- Off-Process request types defined in the application
- Accumulation category and accumulation group defined in the application
- Amendment field defined in the application
- Persons defined in the application
- Account ID defined in the application
- Characteristic types defined in the application
- Adjustment types or billable charge line types defined in the application

Procedure

To create an off-process request:

1. Click the **Menu** link in the **Application** toolbar.
   A list appears.
2. From the **Main** menu, select **Transaction and Audit Event Management** and then click **Off-Process Request**.
   A sub-menu appears.
3. Click the **Add** option from the **Off-Process Request** sub-menu.

   The **Add Off-Process Request** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Type	Used to indicate the off-process request type using which you want to create the off-process request.	Yes

> **Tip:** Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Off-Process Request** screen.

4. Select the required off-process request type from the **Off-Process Request Type** field.
5. Click **OK**.
   The **Off-Process Request** screen appears. It contains the following sections:
   - **Main** - Used to specify basic details about the off-process request.
   - **Off-Process Request Information** - Used to specify the off-process request information.

Copyright © 2026, Oracle and/or its affiliates.

- **Characteristics** - Used to define the characteristics for the off-process request.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Type	Indicates the off-process request type using which you want to create the off-process request.	Not applicable
Creation Mode	Indicates the mode in which the offset request is created. The valid values are: • Automatic • Manual	Not applicable
Parent Person Id	Used to indicate the parent customer (.e. person whose person type is set to **Parent Customer**) for which you want to create an off-process request. **Note:** The **Search** (🔍) icon appears corresponding to the **Parent Person ID** field. On clicking the **Search** icon, the **Parent Customer Search** window appears. On specifying the parent person, the description of the parent person appears corresponding to the **Parent Person ID** field.	Yes
Comments	Used to specify the comments for an off-process request.	No

6. Enter the required details in the **Main** section.
7. Add the accumulation amendment details in the off-process request, if required.
8. Define characteristics for the off-process request, if required.
9. Click **Save**.
   The off-process request is created in the **Draft** status.

Off-Process Request (Used for Viewing)

The **Off-Process Request** screen allows you to:

- View the details of the off-process request
- Edit the details of the off-process request
- Delete the off-process request
- Submit the off-process request for processing
- Approve or reject the off-process request
- View the error message of the off-process request
- View the log of the off-process request
- Add a log entry for the off-process request

It consists of the following tabs:

- Off-Process Request - Main on page 3824
- Off-Process Request - Log on page 3828

Off-Process Request - Main

The **Main** tab displays information about the off-process request. It contains the following zones:

- Off-Process Request on page 3824
- Off-Process Request Details on page 3826
- Off-Process Request Error Message on page 3828

Related Topics

Off-Process Request

The **Off-Process Request** zone displays the details of the off-process request. It contains the following sections:

- **Main** - Displays basic information about the off-process request. It contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description
Off-Process Request Information	Displays information about the off-process request.
Off-Process Request Type	Indicates the off-process request type using which the off-process request is created. **Note:** It has a link. On clicking the link, the **Off-Process Request Type** screen appears where you can view the details of the respective off-process request type.
Parent Person	Indicates the parent person for whom the off-process request is created.
Status	Indicates the status of the off-process request. The valid values are: • Approval In Progress • Draft • Processed • Rejected
Creation Mode	Indicates whether the off-process request is created automatically or manually. The valid values are: • Automatic • Manual

- **Record Actions** - This section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the off-process request. **Note:** The **Edit** button appears when the off-process request is in the **Draft** status.
Delete	Used to delete the off-process request. **Note:** The **Delete** button appears when the off-process request is in the **Draft** status.
Submit	Used to submit the off-process request. **Note:** The **Submit** button appears when the off-process request is in the **Draft** status.
Approve	Used to approve the off-process request. **Note:** The **Approve** button appears when: • The off-process request is in the **Approval In Progress** status. • A user with the approval To Do role is reviewing the off-process request.
Reject	Used to reject the off-process request. **Note:** The **Reject** button appears when: • The off-process request is in the **Approval In Progress** status. • A user with the approval To Do role is reviewing the off-process request.

- **Record Information** - This section contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description
Business Object	Indicates the business object using which the off-process request is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.
Status Date/Time	Displays the date and time when the off-process request status is updated
Create Date/Time	Displays the date and time when the off-process request is created.

- **Characteristics** - Lists the characteristics defined for the off-process request. It contains the following columns:

Column Name	Column Description
Effective Date	Displays the date from when the characteristic is effective for the off-process request.
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

Off-Process Request Details

The **Off-Process Request Details** zone lists the accumulation and amendment details of the off-process request. This zone contains the following columns:

Column Name	Column Description
Accumulation Category	Displays the category whose field value is amended through an off-process request. The valid values are: • Aggregate Stop Loss • Discount Arrangement • Level Funded • Specific Stop-Loss
Accumulation Group ID	Indicates the accumulation group for which the (accumulation and amendment) changes are reflected in the system.
Amendment Field	Indicates the accumulation field whose value is amended through the off-process request. The valid values are: • ASL Limit • Aggregated Amount

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
	• Cumulative ASL Credit • Cumulative SSL Credit • Maximum Limit • Minimum Limit • Run Out Fund • Settlement Fund
Off-Process Amount	Displays the amount which is amended through the off-process request.
Member/Subscriber ID	Displays the member or the main subscriber for whom the field value is amended in the system.
Status	Displays the current status of the off-process request.
Account Information	Indicates the account for which the adjustment or billable charge is created in the system. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Account** screen appears where you can view the details of the respective account.
Effective Date	Indicates the date when the field value is amended in the system.
Coverage Start Date	Indicates the date from when the amendment is applicable for the off-process request.
Coverage End Date	Indicates the date till when the amendment is applicable for the off-process request.
Adjustment Type	Indicates the adjustment type using which the adjustment should be created when the amendment mode is set to **Adjustment** in the respective off-process request type.
Adjustment Information	Displays information about the adjustment. **Note:** It has a link. On clicking the link, the **Adjustment** screen appears where you can view the details of the respective adjustment.
Billable Charge Line Type	Indicates the billable charge line type using which the billable charge should be created when the amendment mode is set to **Billable Charge** in the respective off-process request type.
Billable Charge Information	Displays information about the billable charge. **Note:** It has a link. On clicking the link, the **Billable Charge** screen appears where you can view the details of the respective billable charge.

On clicking the **Broadcast** (ᯤ) icon corresponding to an off-process request detail record, the **Error Message** zone is displayed.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

You can filter the list using **Record Status** field as the search criteria available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (▽) icon in the upper right corner of this zone.

Adding the Off-Process Request Details in an Off-Process Request

Prerequisites

Copyright © 2026, Oracle and/or its affiliates.

To add the off-process request details in an off-process request, you should have:

- Off-process request types defined in the application
- Categories defined in the application (where the characteristic entity is set to **Off-Process Request**)
- Applicable adjustments and billable charge line types defined in the application.

Procedure

To add the off-process request details in an off-process request:

1. Ensure that the **Off-Process Request Details** section is expanded when you are editing an off-process request.

   The **Off-Process Request Details** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Accumulation Category	Used to indicate the accumulation category whose field value you want to amend through the off-process request. The valid values are: • Aggregate Stop Loss • Discount Arrangement • Level Funded • Specific Stop-Loss	Yes
Accumulation Group ID	Used to indicate the accumulation group for which the (accumulation and amendment) changes should be reflected in the system. **Note:** The **Search** (🔍) icon appears corresponding to the **Accumulation Group ID** field. On clicking the **Search** icon, the **Accumulation Group Search** window appears. On specifying the accumulation group Id, the description of the accumulation group Id appears corresponding to the **Accumulation Group ID** field. If the accumulation category is set to **Specific Stop-Loss**, you can only select the accumulation group defined at the bill group level. However, if the accumulation category is set to **Aggregate Stop-Loss**, **Discount Arrangement**, or **Level Funded**, you can only select the accumulation group defined at the parent customer level.	No
Amendment Field	Used to indicate the accumulation field whose value you want to amend through the off-process request. The valid values are: • ASL Limit • Aggregated Amount • Cumulative ASL Credit • Cumulative SSL Credit • Maximum Limit • Minimum Limit • Run Out Fund • Settlement Fund	Yes (Conditional) **Note:** This field is required when you select the **Accumulation Category** for the off-process request.

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: You can select only those accumulation categories and fields for which the contract type and adjustment type or billable charge line type information is available in the respective off-process request type.	
Account ID	Used to indicate the account for which the adjustment or billable charge should be created in the system. **Note:** The account ID and the account information appear automatically when you select the appropriate option from the **Amendment Field** field. The **Search** (🔍) icon appears corresponding to the **Account ID** field. On clicking the **Search** icon, the **Account Search** window appears. On specifying the account ID, the description of the account appears corresponding to the **Account ID** field.	Yes (Conditional) **Note:** This field is required when you select the **Accumulation Group ID** for the off-process request.
Off-Process Amount	Used to specify the amount which you want amend through the off-process request.	Yes (Conditional) **Note:** This field is required when you select the **Accumulation Category** for the off-process request.
Adjustment Type/ Billable Charge Line Type	Used to indicate the adjustment type or billable charge line type using which the adjustment or billable charge should be created when the amendment mode is set to **Adjustment** or **Billable Charge** in the respective off-process request type. **Note:** The **Search** (🔍) icon appears corresponding to the **Adjustment Type/Billable Charge Line Type** field. On clicking the **Search** icon, the **Adjustment Type/Billable Charge Line Type Search** window appears. On specifying the value for a predefined adjustment type or billable charge line type, the description of the adjustment type or billable charge line type appears corresponding to the **Adjustment Type/Billable Charge Line Type Search** field. Once the **Amendment Field** is selected, its respective adjustment type or billable charge line type appears in the **Adjustment Type/Billable Charge Line Type** field.	Yes (Conditional) **Note:** This field is required when you select the **Accumulation Category** for the off-process request.
Member/Subscriber ID	Used to specify member or the main subscriber for whom the field value should be amended in the system.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Effective Date	Used to indicate the date from when the field value should be amended in the system.	Yes (Conditional) **Note:** This field is required when you select the **Accumulation Category** for the off-process request.
Coverage Start Date	Used to indicate the date from when the amendment is applicable for the off-process request.	No
Coverage End Date	Used to indicate the date till when the amendment is applicable for the off-process request.	No

2. Enter the required details in the **Off-Process Request Details** section.
3. If you want to define more than one off-process request detail for the off-process request, click the **Add** (+) icon and then *r*epeat step *2*.

Note: However, if you want to remove an off-process request detail from the off-process request, click the **Delete** (🗑) icon corresponding to the off-process request detail.

Defining a Characteristic for an Off-Process Request

Prerequisites

To define a characteristic for an off-process request, you should have:

- Off-process request types defined in the application
- Characteristic types defined in the application (where the characteristic entity is set to **Off-Process Request**)

Procedure

To define a characteristic for an off-process request:

1. Ensure that the **Characteristics** section is expanded when you are defining, editing, or copying an off-process request.

   The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Effective Date	Used to specify the date from when the characteristic is effective for the off-process request.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for the off-process request.
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Off-Process Request**.	**Note:** This field is required when you are defining a characteristic for the off-process request.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for the off-process request.

2. Enter the required details in the **Characteristic** section.
3. If you want to define more than one characteristic for the off-process request, click the **Add** (+) icon and then *r*epeat step *2*.

Note: However, if you want to remove a characteristic from the off-process request, click the **Delete** (🗑) icon corresponding to the off-process request information.

Editing an Off-Process Request

Procedure

To edit an off-process request:

1. Search for the off-process request in the **Off-Process request** screen.
2. In the **Search Results** section, click the link in the **Off-Process Request Information** column corresponding to *t*he off-process request whose details you want to edit.
   The **Off-Process Request** screen appears.
3. Click the **Edit** button in the **Off-Process Request** zone.

Note: The **Edit** button appears only when the off-process request is in the **Draft** status.

The **Edit Off-Process Request** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the off-process request.
- **Off-Process Request Information** - Used to specify the off-process request information.
- **Characteristics** - Used to define the characteristics for the off-process request.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Off-Process Request Information	Displays information about the off-process request.	Not applicable
Off-Process Request Type	Indicates the off-process request type.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Creation Mode	Indicates the mode in which the offset request is created. The valid values are: • Automatic • Manual	Not applicable
Parent Person ID	Indicates the parent customer (.e. person whose person type is set to **Parent Customer**) whose off-process request you want to edit.	No
Comments	Used to specify the comments for an off-process request	No

4. Modify the details of the off-process request, if required.
5. Define, edit, or remove off-process request details from the off-process request, if required.
6. Define, edit, or remove characteristics of the off-process request, if required.
7. Click **Save**.
   The changes made to the off-process request are saved.

Submitting an Off-Process Request

Prerequisites

To submit an off-process request, you should have:

- Accumulation and amendment details defined in the off-process request
- Adjustment types or billable charge line types defined in the off-process request

Procedure

To submit an off-process request:

1. Search for the off-process request in the **Off-Process Request** screen.
2. In the **Search Results** section, click the link in the **Off-Process Request Information** column corresponding to *t*he off-process request that you want to submit.
   The **Off-Process Request** screen appears.
3. Click the **Submit** button in the **Off-Process Request** zone.

   The system behaves in the following manner:

If...	Then...
The **Approval Required** option is selected in the respective off-process request type	A To Do of the **C1-OFPAP** To Do type is created and sent to the approver. The status of the Off-Process Request is then changed to **Approval In Progress**. Once the approver approves the off-process request, the status of the off-process request is changed to **Approved**. The system then creates the adjustments or billable charges to amend the accumulation field values. Finally, the status of the off-process request is changed to **Processed**.
The **Approval Required** option is not selected in the respective off-process request type	The system creates the adjustments or billable charges to amend the accumulation field values. Finally, the status of the off-process request is changed to **Processed**.

Note: The **Submit** button appears when the off-process request is in the **Draft** status.

Approving an Off-Process Request

You can view the number of off-process requests which are pending for approval in the **Off-Process Request** screen. The approver can review, and accordingly approve, reject, or submit the off-process request based on the observations.

Note: The system will not allow you to approve, reject or submit an off-process request submitted by you.

Copyright © 2026, Oracle and/or its affiliates.

Procedure

To approve an off-process request:

1. Do either of the following:

If you want to...	Then...
Approve an off-process request through the **Off-Process Request** screen	**a.** Search for the off-process request in the **Off-Process Request** screen. **b.** In the **Search Results** section, click the link in the **Off-Process Request Information** column corresponding to the off-process request which you want to review.
Approve an off-process request from the **To Do List** screen	**a.** Click the **Menu** link in the **Application** toolbar. A list appears. **b.** From the **Main** menu, select **To Do** and then click **To Do List**. The **To Do Type for User Search** window appears. **c.** Enter **C1-OFPAP** in the **To Do Type** field. **d.** Click the **Search** button corresponding to the **To Do Type** field. The **To Do List** screen appears. **e.** Select the **Open** option from the **Filter by** list to view all unassigned To Dos. **f.** Click the link in the **Message** column corresponding to the To Do of the off-process request that you want to review.

   The **Off-Process Request** screen appears.
2. Review the off-process request details in the **Off-Process Request** screen.
3. If the information in the off-process request is accurate, click the **Approve** button in the **Off-Process Request** zone.

If you are...	Then...
Approving an off-process request	The status of the off-process request is changed to **Approved**. The system then creates the adjustments or billable charges to amend the accumulation field values. Finally, the status of the off-process request is changed to **Processed**.

Note: The **Approve** button appears when:

- The off-process request is in the **Approval In Progress** status.
- A user with the approval To Do role is reviewing the off-process request.

Rejecting an Off-Process Request

Prerequisites

To reject an off-process request, you should have:

- Reasons defined for the **Rejected** status of the **C1-OffProcessRequest** business object in the **Status Reason** screen

Note: The system will not allow you to approve, reject or submit an off-process request submitted by you.

Procedure

To reject an off-process request:

1. Do either of the following:

If you want to...	Then...
Reject an off-process request through the **Off-Process Request** screen	**a.** Search for the off-process request in the **Off-Process Request** screen. **b.** In the **Search Results** section, click the link in the **Off-Process Request Information** column corresponding to the off-process request which you want to review.
Reject an off-process request from the **To Do List** screen	**a.** Click the **Menu** link in the **Application** toolbar. A list appears. **b.** From the **Main** menu, select **To Do** and then click **To Do List**. The **To Do Type for User Search** window appears. **c.** Enter **C1-OFPAP** in the **To Do Type** field. **d.** Click the **Search** button corresponding to the **To Do Type** field. The **To Do List** screen appears. **e.** Select the **Open** option from the **Filter by** list to view all unassigned To Dos. **f.** Click the link in the **Message** column corresponding to the To Do of the off-process request that you want to review.

   The **Off-Process Request** screen appears.
2. Review the off-process request details in the **Off-Process Request** screen.
3. If the information in the off-process request is incorrect, then click the **Reject** button in the **Off-Process Request** zone.

   The **Reject Off-Process Request** window appears. It contains following fields:

Field Name	Field Description	Mandatory (Yes or No)
Status Reason	Used to indicate the reason why you want to reject the off-process request. **Note:** The list includes only those reasons which are defined for the **Rejected** status of the **C1-OffProcessRequest** business object in the **Status Reason** screen.	Yes
Comments	Used to specify additional information while rejecting the off-process request.	No

Copyright © 2026, Oracle and/or its affiliates.

> **Note:** The **Reject** button appears when:
>
> - The off-process request is in the **Approval In Progress** status.
> - A user with the approval To Do role is reviewing the off-process request.

4. Select the rejection reason from the **Status Reason** list.
5. Click **Save**.
   The status of the off-process request is changed to **Rejected**.

Viewing the Log of an Off-Process Request

Procedure

To view the log of an off-process request:

1. Search for the off-process request in the **Off-Process Request** screen.
2. In the **Search Results** section, click the link in the **Off-Process Request Information** column corresponding to *t*he off-process request whose log you want to view.
   The **Off-Process Request** screen appears.
3. Click the **Log** tab.
   The **Log** tab appears.
4. View the complete trail of actions performed on the off-process request in the **Off-Process Request Log** zone.

Chapter 42

Individual Health Insurance Pricing

Topics:

- Business Rules
- Young Adult Coverage in an Individual Membership
- Age Calculation During Continuous Individual Membership Coverage

Oracle Revenue Management and Billing enables you to define pricing for different services offered in a health plan. Each service offered in a health plan should be defined as a price item in the system. For example, services may include medical insurance, home care, hospital visits, etc.

You can define the age based, tier based, or additional fee pricing for a price item using the respective pricing rule. You can create an age based, tier based, and additional fee pricing rule using the respective pricing rule type. The following pricing rule type and pricing rule business objects are enhanced to support the fully-insured individual business:

- C1-PrcRuleTypeAgeBased
- C1-PricingRuleAgeBased
- C1-PrcRuleTypeTierBased
- C1-PricingRuleTierBased
- C1-PrcRuleTypeCapitationFee
- C1-PricingRuleCapitationFee
- C1-PrcRuleTypeBenefit

You can create a pricing rule for a health plan using a pricing rule type only when the pricing rule type is associated with the health plan. The system enables you to define pricing rules for various services offered in the health plan. You must add the required price items in a pricing rule type. The system then enables you to create a pricing rule for a price item using the respective pricing rule type. While defining an age based pricing rule for a price item, you can offer different rates to different member persons based on the age, member relationship, geographic rating area, member person attributes, etc. You can also charge additional fee or given discount to a member person based on modifier attributes. For example, you may charge more premium to an alcoholic person compared to a non-alcoholic person for the same service (i.e. price item). While defining a tier based pricing rule for a price item, you can offer different rates to different memberships based on the subscription tier, geographic rating area, member person attributes, etc.

You can associate one or more pricing rule types with a health plan through a health product and plan inbound message. You can define one or more pricing rules for a health plan through a health product and plan inbound message. The system creates the pricing rule for a price item using the business object which is specified in the pricing rule type. While creating a pricing rule for a health plan, you can define pricing eligibility rules for a pricing rule. The system considers the pricing rule for an individual membership when the pricing eligibility rule (i.e. eligibility criteria) is satisfied.

The system enables you to define a pricing rule for a price item without the pricing rule eligibility. Such pricing rule is considered as a default pricing rule for the price item. If an individual membership is not eligible for any pricing

rule, the system uses the default pricing rule of the price item for the individual membership.

Note: On inactivating a health plan, the system will not automatically inactivate the pricing rules defined for the health plan.

Copyright © 2026, Oracle and/or its affiliates.

Business Rules

Oracle Revenue Management and Billing facilitates you to calculate the premium for each individual membership differently based on various health product, health plan, membership, or member person attributes. You can define different set of business rules for the following categories:

- **Binder Payment** - If an individual membership meets the criteria of a binder payment business rule, the system derives the following information from the business rule:
  - Binder Payment Applicability
  - Threshold Percentage
  - Grace Days
  - Hold Billing
- **Fully-Insured Pricing** - If an individual membership meets the criteria of a fully-insured pricing business rule, the system derives the following information from the business rule:
  - Maximum Age Limit of Dependents
  - Dependent Order Priority
  - Age Calculation Date
  - Age Recalculation Date
  - Young Adult Applicability
  - Young Adult Max Age Limit
  - Member Relationship Derivation Date
- **Member Adoption** - If an individual membership meets the criteria of a member adoption business rule, the system derives the following information from the business rule:
  - Gift Days Applicability
  - Gift Days
  - Notice Rule Applicability
  - Notice Rule Days
  - Adoption Notice Rule Calculation
- **New Born** - If an individual membership meets the criteria of a new born business rule, the system derives the following information from the business rule:
  - Gift Days Applicability
  - Gift Days
  - Notice Rule Applicability
  - Notice Rule Days
  - New Born Notice Rule Calculation
- **Rate Guarantee** - If an individual membership meets the criteria of a rate guarantee business rule, the system derives the following information from the business rule:
  - Rate Guarantee Applicability
  - Rate Guarantee Period
- **Refund/Write Off** - If an individual membership meets the criteria of a refund/write-off business rule, the system derives the following information from the business rule:
  - Refund Threshold Amount
  - Defer Refund (in Days)
  - Write Off Threshold Amount
  - Defer Write Off (in Days)
- **Delinquency Grace Period** - If an individual membership meets the criteria of a delinquency grace period business rule, the system derives the following information from the business rule:
  - Criteria Description

Copyright © 2026, Oracle and/or its affiliates.

    - Effective Date
    - Status
    - Grace Period Type
    - Grace Period
- **Delinquency Event Attributes** - If an individual membership meets the criteria of a delinquency event attributes business rule, the system derives the following information from the business rule:
    - Criteria Description
    - Effective Date
    - Status
    - Wait Days
    - Wait Month
    - Wait Day of Month
    - Send Membership Level Notification
- **Delinquency Process Type Derivation** - If an individual membership meets the criteria of a delinquency process type derivation business rule, the system derives the following information from the business rule:
    - Criteria Description
    - Effective Date
    - Status
    - Delinquency Process Type
- **Delinquency Termination Date** - If an individual membership meets the criteria of a delinquency termination date business rule, the system derives the following information from the business rule:
    - Criteria Description
    - Effective Date
    - Status
    - Termination Date Rule
- **Delinquency Miscellaneous Options** - If an individual membership meets the criteria of a delinquency miscellaneous options business rule, the system derives the following information from the business rule:
    - Criteria Description
    - Effective Date
    - Status
    - Trigger Date Recalculation On Hold Release
    - Trigger Date Recalculation On Resume
    - Trigger Termination Process
    - Termination Wait Days
    - Allow Automatic Reinstatement
    - Maximum Automatic Reinstatement Count
    - Trigger Reinstatement Process
    - Reinstatement Wait Days
    - Reinstatement Threshold
    - Days Since Termination
    - Member Notification Days
    - Add Days to Date of Processing of Termination Request
    - Add Days to Grace End Date
    - Add Days to Coverage End Date
    - Add Days to Paid Through Date
    - Add Months to Paid Through Date
    - Minimum Days Before Customer Contact
    - Add Days to Bill Due Date

Copyright © 2026, Oracle and/or its affiliates.

A business rule contains a criteria. If the criteria of the business rule is met, the information is derived from the business rule. This information is used while deriving the member relationship for a member person, subscription tier for an individual membership, and while deriving eligible member persons for premium calculation.

You can define criteria for a business rule using a set of parameters which are associated with a business rule type. The system enables you to associate only those parameters in a business rule type where the parameter usage is set to **Business Rule Eligibility Criteria**.

To implement the business rule feature, the following new screens are introduced in this release:

- **Business Rule Type** - Used to specify a list of parameters where the parameter usage is set to **Business Rule Eligibility Criteria**. You can then use the parameter while defining a criteria in the business rule.
- **Business Rule** - Used to search business rules of a particular category (i.e. Fully-Insured Pricing or New Born).

Binder Payment Business Rules

Oracle Revenue Management and Billing enables you to define business rules for binder payment. A new category named **Binder Payment Business Rule** is introduced in this release. The binder payment business rules are used for used for monitoring and processing the binder payments of an individual membership.

The system derives the binder payment business rules for an individual membership while creating or editing an individual membership, or while adding, editing, or inactivating a member person in an individual membership. While deriving a business rule of the **Binder Payment Business Rule** category, the ORMB application considers the respective business rules which are effective on the membership start date. Once the effective business rules are identified, the ORMB application executes these business rules in the order of their priority.

Once the criteria of the business rule is met, the business rule is stamped against the individual membership. If two or more business rules have the same priority, the ORMB application sorts the business rules for execution, based on the business rule criteria sequence. The ORMB application derives the binder payment details for an individual membership through a binder payment business rule only when the binder payment details are not available for an individual membership in the respective table.

While defining the binder payment business rule criteria, you can use the parameters which are defined on the following entities:

- Health Plan
- Health Product
- Individual Membership
- Member Person of an Individual Membership

You can define, edit, and delete a binder payment business rule through the **Business Rule** screen. While defining a binder payment business rule, you need to set its category to **Binder Payment Business Rule**. The binder payment business rule enables you to define the following parameters:

- **Binder Payment Applicability** - Used to indicate that you want the system to monitor whether the binder payment is received or not before activating the individual membership.
- **Threshold Percentage** - Used to specify the threshold percentage using which the threshold amount should be calculated.
- **Grace Days** - Used to calculate the grace date for the individual membership.
- **Hold Billing** - Used to indicate whether you want to hold the bill generation process for the individual membership until the binder payment is received.

You can view the binder payment business rules through the **Business Rule** screen.

Copyright © 2026, Oracle and/or its affiliates.

Fully-Insured Pricing Business Rules

Oracle Revenue Management and Billing enables you to define business rules for fully-insured pricing. A new category named **Fully-Insured Pricing Business Rule** is introduced in this release. The premium calculation process for an individual membership is described as follows:

- If you want to calculate the premium for an individual membership using an **Age Based Pricing** rule, the system derives the rate for each eligible member person. Once the rate is derived, the system identifies members that are eligible for premium calculation using the fully-insured pricing business rules. On creating or editing an individual membership through a health care inbound message or membership repricing inbound web service, the system determines the fully-insured pricing business rules which are applicable for the individual membership. If an individual membership meets the criteria of the fully-insured pricing business rule, the system then stamps the fully-insured pricing business rule corresponding to the individual membership.
- If you want to calculate the premium for an individual membership using a **Tier Based Pricing** rule, the system derives the subscription tier using the fully-insured pricing business rules. Once the premium is calculated for an individual membership, the system creates a billable charge for the premium. If the account is defined for the individual membership using the characteristic types specified in the **Account Identifier Type Char Type** and **Account Identifier Value Char Type** option types of the **C1-ASOBLLNG** feature configuration, the system uses the account to bill the charge for the premium. However, if these characteristics are not defined for the individual membership, the system considers the account of the financially responsible member person to the charge for the premium.

Note: While deriving a business rule of the **Fully-Insured Pricing Business Rule** category, the system considers the respective business rules which are effective on the audit event's effective date.

You can define, edit, and delete a fully-insured pricing business rule through the **Business Rule** screen. While defining a fully-insured pricing business rule, you need to set its category to **Fully-Insured Pricing Business Rule**. The fully-insured pricing business rule enables you to define the following parameters:

- **Maximum Dependents** - Used to specify the maximum number of children which are eligible for premium calculation.
- **Dependent Max Age Limit** - Used to specify the maximum age limit for children eligible for premium calculation.
- **Dependent Order Priority** - Used to indicate the order priority of the dependent during premium calculation.
- **Age Calculation Date** - Used to indicate whether the member person's age should be calculated using the member person's enrollment date or policy's start or renewal date.
- **Age Recalculation Date** - Used to indicate whether the member person's age should be recalculated using the member person's enrollment date or policy's start or renewal date.
- **Young Adult Applicability** - Used to indicate that the child or dependent enrolling in the membership becomes the young adult in the enrollment period.
- **Young Adult Max Age Limit** - Used to specify the maximum age limit for young adults which are eligible for premium calculation.
- **Member Relationship Derivation Date** - Used to indicate the member relationship for a member person.

You can view the fully-insured pricing business rules through the **Business Rule** screen.

Member Adoption Business Rules

Oracle Revenue Management and Billing enables you to define business rules to determine whether gift ways should be offered to an adopted child or adult. The insurance company may offer different adoption gift days to different individuals based on certain parameters, such as health plan, division, membership, or member person characteristic, etc. The system will then accordingly derive the adoption gift days for the individual membership and waive off the premium of an adopted child or adult for the gift period. In addition, the adoption business rule enables you to determine whether adoption enrollment timeline regulations should be enforced on the individual memberships. If so, the system will calculate the adoption enrollment notice period and allow to waive off premium for the adopted child or adult only when the enrollment received date is within the cutoff date.

Copyright © 2026, Oracle and/or its affiliates.

On enrolling an adopted child or adult to an individual membership, the system derives the business rules with the **Adoption Business Rule** category that are effective on the processing date. Note that the system considers only those effective business rules which are in the **Active** status. The system then executes the criteria of each effective business rule and considers the business rule that meet the criteria. If two or more business rules meet the criteria, the system considers the business rule with the highest priority. The system stamps the adoption business rule against the individual membership in the **C1_ENT_BUS_RULE** table.

While defining criteria for an adoption business rule, you can use the parameters that are defined on the following source entities:

Source Entity	Supported Source Type
Account	Field, Characteristic
Customer Class	Field
Division	Field
Health Plan	Field, Characteristic
Health Product	Field, Characteristic
Membership	Field, Characteristic
Membership Person	Field, Characteristic

You can define, edit, and delete an adoption business rule through the **Business Rule** screen. While defining an adoption business rule, you need to set the category to **Adoption Business Rule**. The adoption business rule enables you to define the following parameters:

- **Gift Days Applicability** – Used to indicate whether you want to offer gift days for an adopted child or adult.
- **Gift Days** – Used to specify the number of days you want to offer as gift days from the adoption date.
- **Notice Rule Applicability** – Used to indicate whether you want to enforce enrollment timeline regulations for an adopted person.
- **Notice Rule Days** – Used to indicate the number of days you want to offer to determine the adoption enrollment notice period.
- **Adoption Notice Rule Calculation** – Used to indicate whether you want to calculate the adoption enrollment notice period starting from the adoption date or member person start date. The system will then derive the adoption enrollment notice period using the given date and notice rule days.

Note: The **Notice Rule Applicability** option is enabled only when the **Gift Days Applicability** option is selected in the adoption business rule.

Once the business rule is created, the business rule ID is generated. While creating a business rule, the status is, by default, non-editable and set to **Active**. While editing a business rule, you can change its status from **Active** to **Inactive** and vice-versa. Note that you cannot edit or delete a business rule if it is referred in the system. You can use the same criteria in multiple business rules with a different effective date to derive different gift days. You can view the member adoption business rules through the **Business Rule** screen.

New Born Business Rules

Oracle Revenue Management and Billing enables you to define business rules for newborn pricing. A new category named **New Born Business Rule** is introduced in this release. The premium calculation process for an individual membership is described as follows:

- If you want to calculate the premium for an individual membership using an age based pricing rule, the system derives the rate for each eligible member person. Once the rate is derived, the system identifies members that are eligible for premium calculation using the newborn business rules. On creating or editing an individual membership through a health care inbound message or membership repricing inbound web service, the system determines the

Copyright © 2026, Oracle and/or its affiliates.

newborn business rules which are applicable for the individual membership. If an individual membership meets the criteria of the newborn business rule, the system then stamps the newborn business rule corresponding to the individual membership.

- If you want to calculate the premium for an individual membership using a tier based pricing rule, the system derives the subscription tier using the newborn business rules. Once the premium is calculated for an individual membership, the system creates a billable charge for the premium. If the account is defined for the individual membership using the characteristic types specified in the **Account Identifier Type Char Type** and **Account Identifier Value Char Type** option types of the **C1-ASOBLLNG** feature configuration, the system uses the account to bill the charge for the premium. However, if these characteristics are not defined for the individual membership, the system considers the account of the financially responsible member person to the charge for the premium.

Note: While deriving a business rule of the **New Born Business Rule** category, the system considers the respective business rules which are effective on the audit event's effective date.

You can define, edit, and delete a newborn business rule through the **Business Rule** screen. While defining a newborn business rule, you need to set its category to **Fully-Insured Pricing Business Rule**. The newborn business rule enables you to define the following parameters:

- **Gift Days Applicability** - Used to indicate whether you want to offer gift days in case of a newborn child.
- **Gift Days** - Used to specify the number of days you want to offer as gift days from the newborn child's birth date.
- **Notice Rule Applicability** - Used to indicate whether the notice period rule should be applied in case of a new born child.
- **Notice Rule Days** - Used to specify the number of days after which the system triggers the notice in case of a new born child.
- **New Born Notice Rule Calculation** - Used to indicate the criteria based on which the system performs the calculation to generate the notice in case of a new born child.

You can view the newborn business rules through the **Business Rule** screen.

Rate Guarantee Business Rules

Oracle Revenue Management and Billing enables you to define a rate guarantee business rule for an individual membership. A new category named **Rate Guarantee Business Rule** is introduced in this release.

While deriving a business rule of the **Rate Guarantee Business Rule** category, the system considers the respective business rules which are effective on the membership start date. Once the effective business rules are identified, the system executes these business rules in the order of their priority. Once the criteria of the business rule is met, the business rule is stamped against the individual membership. If two or more business rules have the same priority, the system sorts the business rules for execution based the business rule criteria sequence.

While defining the rate guarantee business rule criteria, you can use the parameters which are defined on the following entities:

- Health Plan
- Health Product
- Individual Membership
- Member Person of an Individual Membership

You can define, edit, and delete a rate guarantee business rule through the **Business Rule** screen. While defining a rate guarantee business rule, you need to set its category to **Rate Guarantee Business Rule**. The rate guarantee business rule enables you to define the following parameters:

- **Rate Guarantee Applicability** - Used to indicate whether the rate guarantee is available for the individual membership.
- **Rate Guarantee Period** - Used to derive the rate guarantee start and end dates.

Note: The system sets the rate guarantee start date to the membership start date and the rate guarantee end date to the rate guarantee start date + rate guarantee period.

Copyright © 2026, Oracle and/or its affiliates.

You can view the rate guarantee business rules through the **Business Rule** screen.

Refund/Write Off Business Rules

Oracle Revenue Management and Billing enables you to define business rules to initiate automatic refund and write off. The refund/write off business rules are used while creating automatic refund/write off request for accounts when the fully insured group policy or individual membership is terminated.

While terminating a fully insured group policy or individual membership, the system derives the refund/write off business rule for the fully insured group policy or individual membership, respectively. While deriving the refund/write off business rule, the system considers the business rules with the **Refund/Write Off Business Rule** category that are effective on the termination date. Note that the system considers only those effective business rules which are in the **Active** status. The system then executes the criteria of each effective business rule and considers the business rule that meet the criteria. If two or more business rules meet the criteria, the system considers the business rule with the highest priority. The system then stamps the refund/write off business rule against the fully insured group policy or individual membership in the **C1_ENT_BUS_RULE** table.

While defining criteria for a refund/write off business rule, you can use parameters that are defined on the following source entities:

- Membership
- Membership Person
- Health Plan
- Health Product
- Policy
- Account

You can define, edit, and delete a refund/write off business rule through the **Business Rule** screen. While defining a refund/write off business rule, you need to set the category to **Refund/Write Off Business Rule**. The refund/write off business rule enables you to define the following parameters:

- **Refund Threshold Amount** - Used to specify the threshold amount for refund. If the account balance is greater than or equal to the refund threshold amount, the system creates automatic refund for an account.
- **Defer Refund (in Days)** - Used to specify the number of days till when you want to defer automatic refund for an account. It is used to calculate the automatic refund request creation date.
- **Write Off Threshold Amount** - Used to specify the threshold amount for write off. If the account balance is less than or equal to the write off threshold amount, the system creates automatic write off for an account.
- **Defer Write Off (in Days)** - Used to specify the number of days till when you want to defer automatic write off for an account. It is used to calculate the automatic write off request creation date.

You can use the same criteria in multiple business rules with a different effective date to derive a different set of refund/write off parameters. You can view the refund/write off business rules through the **Business Rule** screen.

Delinquency Grace Period Business Rule

Oracle Revenue Management and Billing enables you to define business rules to determine the grace period while monitoring delinquency at the person or account level. The insurance company may offer different grace period for different policies, direct billed group memberships, or individual memberships based on their attributes, such as health or policy plan, division, policy or membership characteristic, etc. The system will then accordingly use the grace period to calculate the following:

- Trigger dates for the delinquency events.
- Termination request date when you want to send the outbound message to the external system requesting to terminate the fully insured group policy, direct billed group membership, or individual membership, respectively.

While executing the **C1-DPEVL** batch, the system derives the business rules with the **Delinquency Grace Period Business Rule** category that are effective on the batch business date. Note that the system considers only those effective

Copyright © 2026, Oracle and/or its affiliates.

business rules which are in the **Active** status. The system then executes the criteria of each effective business rule and considers the business rule that meet the criteria. If two or more business rules meet the criteria, the system considers the business rule with the highest priority.

The system stamps the delinquency grace period business rule against the fully insured group policy, direct billed group membership, or individual membership, respectively, in the **C1_ENT_BUS_RULE** table. The system derives the grace details for the delinquency process from the business rule. The system derives the grace period for each active policy billed to the delinquent person or account. Similarly, the system derives the grace period for each active direct billed group membership or individual membership billed to the delinquent account. Among the grace period derived for different policies or memberships, the system considers the grace period of the policy or membership with maximum grace limit and calculates the grace end date for the delinquency process using the maximum grace limit.

Note: The system considers the delinquency grace period business rules to determine the grace period only when the grace period source is set to **Algorithm** in the respective delinquency process type. If the grace period source is set to **Algorithm**, the system executes the **C1-DERGRBR** algorithm attached to the **Grace Period Derivation** system event of the delinquency process type. For more information about the algorithm, see C1-DERGRBR on page 4324.

While defining criteria for a delinquency grace period business rule, you can use parameters that are defined on the following source entities:

- Account
- Customer Class
- Delinquency Event Type
- Division
- Health Plan
- Health Product
- Membership
- Membership Person
- Policy
- Policy Plan
- Algorithm

You can define, edit, and delete a delinquency grace period business rule through the **Business Rule** screen. While defining a delinquency grace period business rule, you need to set the category to **Delinquency Grace Period Business Rule**. The delinquency grace period business rule enables you to define the following parameter:

- **Grace Period Type** - Used to indicate whether the grace period is in days or months.
- **Grace Period** - Used to specify the number of days or months.

You can use the same criteria in multiple business rules with a different effective date to derive different grace details. You can view the delinquency grace period business rules through the **Business Rule** screen.

Delinquency Event Attributes Business Rule

Oracle Revenue Management and Billing enables you to define business rules to determine how much to wait before an event is triggered in a delinquency process. The insurance company may offer different wait period for different delinquency event types (such as, while sending letters, To Do notification, or initiating the termination request) based on certain parameters, such as health or policy plan, division, policy or membership characteristic, etc. The system will accordingly derive wait days or wait months and day of month based on the wait period (configured in the respective delinquency process type) and calculate trigger date for the delinquency event.

While executing the **C1-DPEVL** batch, the system derives the business rules with the **Delinquency Event Attributes Business Rule** category that are effective on the batch business date. Note that the system considers only those effective business rules which are in the **Active** status. The system then executes the criteria of each effective business rule and considers the business rule that meet the criteria. If two or more business rules meet the criteria, the system considers the business rule with the highest priority.

Copyright © 2026, Oracle and/or its affiliates.

The system stamps the delinquency event attributes business rule against the fully insured group policy, direct billed group membership, or individual membership, respectively in the **C1_ENT_BUS_RULE** table. The system derives wait days or wait months and day of month based on the wait period (configured in the respective delinquency process type) from the business rule. The system derives the wait days or wait month and day of month for each active policy billed to the delinquent person or account. Similarly, the system derives the wait days or wait month and day of month for each active direct billed group membership or individual membership billed to the delinquent account. Among the wait days or wait months derived for different policies or memberships, the system considers the wait days or wait months of the policy or membership with maximum limit and calculates trigger date for the respective delinquency event using the maximum limit.

Note: The system considers the delinquency event attributes business rules to determine the wait period only when the wait period source is set to **Algorithm** in the respective delinquency process type. If the wait period source is set to **Algorithm**, the system executes the **C1-DERWDBR** algorithm attached to the **Wait Days Derivation** system event of the delinquency process type. For more information about the algorithm, see C1-DERWDBR on page 4330.

The system also derives the **Send Membership Level Notification** parameter from the business rule. The system checks whether the **Send Membership Level Notification** parameter is set to **Send Membership Level Notification Required** for at least one policy, direct billed group membership, or individual membership, respectively, billed to the delinquent entity. If so, the system sets the **Send Membership Level Notification** parameter of the delinquency event to **Send Membership Level Notification Required**. However, if the **Send Membership Level Notification** parameter is set to **Send Membership Level Notification Not Required** for all the policies, direct billed group memberships, or individual memberships, respectively, billed to the delinquent entity, the system sets the **Send Membership Level Notification** parameter of the delinquency event to **Send Membership Level Notification Not Required**.

Note: The system considers the delinquency event attributes business rules to determine the **Send Membership Level Notification** parameter only when the send membership level notification source is set to **Algorithm** in the respective delinquency process type. If the send membership level notification source is set to **Algorithm**, the system executes the **C1-DERMLNBR** algorithm attached to the **Send Member Level Notification Option Derivation** system event of the delinquency process type. For more information about the algorithm, see C1-DERMLNBR on page 4328.

While defining criteria for a delinquency event attributes business rule, you can use the parameters that are defined on the following source entities:

- Account
- Customer Class
- Delinquency Event Type
- Division
- Health Plan
- Health Product
- Membership
- Membership Person
- Policy
- Policy Plan
- Algorithm

You can define, edit, and delete a delinquency event attributes business rule through the **Business Rule** screen. While defining a delinquency event attributes business rule, you need to set the category to **Delinquency Event Attributes Business Rule**. The delinquency event attributes business rule enables you to define the following parameters:

- **Wait Days** – Used to indicate the number of days for which you want to delay a delinquency event in a delinquency process.
- **Wait Month** – Used to indicate the number of months for which you want to delay a delinquency event in a delinquency process.
- **Wait Day of Month** – Used to indicate the day of the month when you want to trigger a delinquency event in a delinquency process.
- **Send Membership Level Notification** – Used to indicate whether you want to create a customer contact for the main subscriber of each membership billed to the delinquent customer or account. The valid values are:

Copyright © 2026, Oracle and/or its affiliates.

- Send Member Level Notification Not Required
- Send Member Level Notification Required

You can use the same criteria in multiple business rules with a different effective date to derive different event attributes. You can view the delinquency event attributes business rules through the **Business Rule** screen.

Delinquency Process Type Derivation Business Rule

Oracle Revenue Management and Billing enables you to define business rules to determine the delinquency process type for an account to which an individual membership is billed. The insurance company may want to use different delinquency process type for different accounts based on certain parameters, such as health plan, division, membership effectuation status, membership termination status, and so on.

While monitoring delinquency for an account to which an individual membership is billed, the system checks whether the delinquency process type preference is specified in the **Delinquency Process Type Field Mapping – Individual** parameter of the **C1-DLNQMNRL** algorithm. If the delinquency process type preference is not specified in the **Delinquency Process Type Field Mapping – Individual** parameter, the system derives the business rules with the **Delinquency Process Type Derivation Business Rule** category that are effective on the processing date. Note that the system considers only those effective business rules which are in the **Active** status. The system then executes the criteria of each effective business rule and considers the business rule that meet the criteria. If two or more business rules meet the criteria, the system considers the business rule with the highest priority. The system then derives the delinquency process type for the account and accordingly creates a delinquency process using the derived delinquency process type.

While defining the delinquency process type derivation business rule criteria, you can use the parameters which are defined on the following source entities:

- Account
- Customer Class
- Delinquency Event Type
- Division
- Health Plan
- Health Product
- Membership
- Membership Person
- Algorithm

Note: Two new source type codes named **Membership Effectuation Status** and **Terminated membership status** are are available while defining a parameter. You can use these source type codes while defining a parameter that can be used to evaluate the criteria in the delinquency process type derivation business rule.

You can define, edit, and delete a delinquency process type derivation business rule through the **Business Rule** screen. While defining a delinquency process type derivation business rule, you need to set its category to **Delinquency Process Type Derivation Business Rule**. The delinquency process type derivation business rule enables you to define the following parameter:

- **Delinquency Process Type** – Used to indicate the delinquency process type. The list includes only those delinquency process type which are in the **Active** status.

You can use the same criteria in the business rule to derive a different delinquency process type for a different effective date. You can view the delinquency process type derivation business rules through the **Business Rule** screen.

Delinquency Termination Date Rule Business Rule

Oracle Revenue Management and Billing enables you to define business rules for determining the termination date rule during the delinquency management. The termination date rule is used to derive the termination date for a policy

Copyright © 2026, Oracle and/or its affiliates.

or individual membership. The insurance company may derive different termination date rule for different policies or individual memberships based on certain parameters, such as division, customer class, region, and jurisdiction, in which the group or individual customer has availed for the policy plan or health plan coverage. The system will then accordingly use the termination date rule to calculate the termination date for the delinquency event type that requests to terminate the following:

- Policies billed to the delinquent person or account
- Individual memberships billed to the delinquent account

The system always derives the termination date rule through a delinquency termination date rule business rule. The system executes the **C1-DERTRBR** algorithm attached to the **Termination Date Rule Derivation** system event of the respective delinquency process type to derive the termination date rule for the delinquency event. For more information on how the termination date rule is derived, refer to the **C1-DERTRBR** algorithm description in the Delinquency Process Type Algorithms on page 4322 section.

While defining the delinquency termination date rule business rule criteria, you can use the parameters which are defined on the following entities:

The following table lists the entities on which the parameters are used while defining the delinquency termination date rule business rule criteria

Line of Business	Source Entity	Supported Source Type
Fully Insured Group Health Insurance	Account	Field and Characteristic
	Customer Class	Field
	Delinquency Event Type	Field
	Division	Field
	Policy	Field and Characteristic
	Policy Plan	Field and Characteristic
Fully Insured Individual Health Insurance	Health Plan	Field and Characteristic
	Health Product	Field and Characteristic
	Delinquency Event Type	Field
	Membership	Field and Characteristic
	Membership Person	Field and Characteristic

Note:

If the delinquency process is created at the person level and if an attribute of a division or customer class is used in the business rule criteria, the system will check whether the division or customer class is present on the person (i.e. on the parent customer or bill group, respectively) while evaluating the business rule criteria. If so, the system will use the details of the person to evaluate the business rule criteria. However, if the division or customer class is not present on the person, the system will use the details of any account where the person is added as the main customer to evaluate the business rule criteria.

If the delinquency process is created at the account level and if an attribute of a division or customer class is used in the business rule criteria, the system will use the details of the respective account to evaluate the business rule criteria.

You can define, edit, and delete a delinquency termination date rule business rule through the **Business Rule** screen. While defining a delinquency termination date rule business rule, you need to set its category to **Delinquency Termination Date Rule Business Rule** and specify the following details:

- **Criteria Description** - Used to indicate the business criteria that a policy or individual membership must satisfy in order to derive the termination date rule from the business rule.

Copyright © 2026, Oracle and/or its affiliates.

- **Effective Date** - Used to specify the date from when the business rule is effective.
- **Status** - Used to indicate the status of the business rule. The valid values are:
  - Active
  - Inactive
- **Termination Date Rule** - Used to indicate the termination date rule using which you want to calculate the termination date. The valid values are:
  - Latest Billed Coverage End Date
  - Latest Due Coverage End Date
  - Max of either XDays after Bill Due Date or Paid Through Date
  - Month End of Grace Period Start
  - Month End of Termination Letter Creation
  - Month End of Termination Request Event
  - X Months After Paid Through Date
  - X days After Grace End Date
  - X days After Paid Through Date
  - X days After Termination Request Event

Once the business rule is created, the business rule ID is generated. While creating a business rule, the status is, by default, non-editable and set to **Active**. While editing a business rule, you can change its status from **Active** to **Inactive** and vice-versa. Note that you cannot edit or delete a business rule if it is referred in the system. You can view the delinquency termination date rule business rules through the **Business Rule** screen.

For more information on how the termination date rule is used to calculate the termination date, refer to the **C1-DETTERMDT** algorithm description in the **Delinquency Event Activation** section.

Delinquency Miscellaneous Options Business Rule

Oracle Revenue Management and Billing enables you to define business rules for determining the following during the delinquency management:

- Whether the trigger dates of delinquency events should be recalculated when the hold on the delinquency process is released
- Whether the trigger dates of delinquency events should be recalculated when the delinquency process is resumed after cancellation
- Whether you want to send an outbound message to the enrollment system for terminating the individual memberships billed to the delinquent account immediately, at the end of the month when the termination event is triggered, or after X number of days (i.e. termination wait days) from the termination event trigger date
- The number of days that you want to add to the base date while calculating the termination effective date

The insurance company may offer different delinquency arrangements to different individuals based on certain parameters, such as division, customer class, region, and jurisdiction in which the individual customer has availed for the health plan coverage. The system will then accordingly use the business rule to calculate the following:

- Trigger dates for the delinquency events
- Termination request date when you want to send the outbound message to the external system requesting to terminate the individual membership
- Termination effective date for the delinquency event type that requests to terminate the individual memberships billed to the delinquent account

The system considers the delinquency miscellaneous options business rules to determine the following:

- The value for the **Trigger Date Recalculation On Hold Release** flag when the trigger date recalculation on hold release source is set to **Algorithm** in the respective delinquency process type. If the trigger date recalculation on hold release source is set to **Algorithm**, the system executes the **C1-DERRTDBR** algorithm attached to the **Trigger Date Recalculation Option Derivation** system event of the delinquency process type when you execute the **C1-DPMON**

Copyright © 2026, Oracle and/or its affiliates.

batch. For more information on how the value is derived for the **Trigger Date Recalculation On Hold Release** flag, refer to the respective algorithm description in the Delinquency Process Type Algorithms on page 4322 section.

- The value for the **Trigger Date Recalculation On Resume** flag when the trigger date recalculation on resume source is set to **Algorithm** in the respective delinquency process type. If the trigger date recalculation on resume source is set to **Algorithm**, the system executes the **C1-DERRTDBR** algorithm attached to the **Trigger Date Recalculation Option Derivation** system event of the delinquency process type when you execute the **C1-DPMON** batch. For more information on how the value is derived for the **Trigger Date Recalculation On Resume** flag, refer to the respective algorithm description in the Delinquency Process Type Algorithms on page 4322 section.
- The value for the **Trigger Termination Process** flag and the termination wait days when the termination reinstatement configuration source is set to **Algorithm** in the respective delinquency process type. If the termination reinstatement configuration source is set to **Algorithm**, the system executes the **C1-DERTROBR** algorithm attached to the **Termination and Reinstatement Configuration Derivation** system event of the delinquency process type when you execute the **C1-DPMON** batch. For more information on how the value is derived for the **Trigger Termination Process** flag, refer to the respective algorithm description in the Delinquency Process Type Algorithms on page 4322 section.
- The number of days that you want to add to the base date while deriving the termination effective date. The system executes the **C1-DETTERMDT** algorithm attached to the **Event Activation** system event of the respective delinquency event type whenever the delinquency event is triggered manually or automatically on the trigger date.
    - Add Days to Coverage End Date
    - Add Days to Paid Through Date
    - Add Months to Paid Through Date
    - Add Days to Grace End Date
    - Add Days to Date of Processing of Termination Request

While defining the delinquency miscellaneous options business rule criteria, you can use the parameters which are defined on the following entities for individual membership:

- Delinquency Event Type
- Health Plan
- Health Product
- Membership
- Membership Person

While defining the delinquency miscellaneous options business rule criteria, you can use the parameters which are defined on the following entities for group membership:

- Account
- Customer Class
- Delinquency Event Type
- Division
- Policy
- Policy Plan

You can define, edit, and delete a delinquency miscellaneous options business rule through the **Business Rule** screen. While defining a delinquency miscellaneous options business rule, you need to set its category to **Delinquency Miscellaneous Options Business Rule** and specify the following details:

- **Criteria Description** - Used to indicate the business criteria that an individual membership must satisfy in order to derive the required parameters from the business rule.
- **Effective Date** - Used to specify the date from when the business rule is effective.
- **Status** - Used to indicate the status of the business rule. The valid values are **Active** and **Inactive**.
- **Trigger Date Recalculation On Hold Release** - Used to indicate whether the trigger dates of delinquency events should be recalculated when the hold on the delinquency process is released. The valid values are - **Yes** and **No**.
- **Trigger Date Recalculation On Resume** - Used to indicate whether the trigger dates of delinquency events should be recalculated when the delinquency process is resumed after cancellation. The valid values are - **Yes** and **No**.

Copyright © 2026, Oracle and/or its affiliates.

- **Trigger Termination Process** - Used to indicate when you want the system to send an outbound message to the enrollment system for terminating the individual memberships billed to the delinquent account. The valid values are:
  - **Immediate** - Used when you want the system to send an outbound message for termination on the same day when the termination event is triggered.
  - **Month End** - Used when you want the system to send an outbound message for termination at the end of the month when the termination event is triggered.
  - **After X Days** - Used when you want the system to send an outbound message for termination after X number of days from the date when the termination event is triggered.
- **Termination Wait Days** - Used to specify the number of days after which an outbound message for termination should be sent to the enrollment system. This parameter is required only when the **Trigger Termination Process** parameter in the business rule is set to **After X Days**.
- **Add Days to Date of Processing of Termination Request** - Used to specify the number of days that you want to add to termination request date in order to derive termination effective date.
- **Add Days to Grace End Date** - Used to specify the number of days that you want to add to grace end date in order to derive termination effective date.
- **Add Days to Coverage End Date** - Used to specify the number of days that you want to add to coverage end date in order to derive termination effective date.
- **Add Days to Paid Through Date** - Used to specify the number of days that you want to add to the paid through date (of the account) in order to derive termination effective date.
- **Add Months to Paid Through Date** - Used to specify the number of months that you want to add to the paid through month (derived from the paid through date of the account) in order to derive termination effective date.
- **Add Days to Bill Due Date** - Used to specify the number of days through which the due date of the original bill is extended before treating the account as delinquent.

Note: The **Allow Automatic Reinstatement**, **Maximum Automatic Reinstatement Count**, **Trigger Reinstatement Process**, **Reinstatement Wait Days**, **Reinstatement Threshold (%)**, **Days Since Termination**, and **Member Notification Days** parameters in the delinquency miscellaneous options business rule are not applicable for the fully insured individual business.

You can view the delinquency miscellaneous options business rules through the **Business Rule** screen.

Business Rule Type

The **Business Rule Type** screen allows you to search for a business rule type using various search criteria. It also allows you to define, edit and delete a business rule type. It contains the following zone:

- Search Business Rule Type on page 3856
- Business Rule Type on page 3860
- Business Rule Criteria on page 3861

Search Business Rule Type

The **Search Business Rule Type** zone allows you to search for a business rule type using various search criteria. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Business Rule Type	Used to search for a particular business rule type.	No
Priority	Used to search for a business rule type based on the priority.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: If you set the priority to a lowest number, the system crawls from the lowest number to the highest, whenever you perform a search for a business rule type. For example, a business rule type with the priority 10 will be searched before a business rule type with the priority 20.	
Description	Used to search for a business rule type having a particular description.	No
Criteria Sequence	Used to search for a business rule type where the business rule criteria has a specific order of execution. **Note:** This field appears when you click the **Advanced Search** link available in the right side of the **Search Business Rule Type** zone.	No
Criteria Description	Used to search for a business rule type where the business rule criteria has a specific description. **Note:** This field appears when you click the **Advanced Search** link available in the right side of the **Search Business Rule Type** zone.	No
Parameter 1	Used to search for a business rule type with a parameter code. **Note:** This field appears when you click the **Advanced Search** link available in the right side of the **Search Business Rule Type** zone. The **Search** (🔍) icon appears corresponding to this field. On clicking the **Search** icon, the **Parameter Search** window appears. You can specify the parameter code where the parameter usage is set to **Business Rule Eligibility Criteria**. You must not specify the ampersand (&) symbol in this field.	No
Parameter 1 Value	Used to search for a business rule type with a parameter value. **Note:** This field appears when you click the **Advanced Search** link available in the right side of the **Search Business Rule Type** zone.	Yes (Conditional) **Note:** This field is required when the value is specified in the**Parameter 1** field.
Parameter 2	Used to search for a business rule type with a parameter code.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field appears when you click the **Advanced Search** link available in the right side of the **Search Business Rule Type** zone. You can specify the parameter code where the parameter usage is set to **Business Rule Eligibility Criteria**. The **Search** (🔍) icon appears corresponding to this field. On clicking the **Search** icon, the **Parameter Search** window appears. You must not specify the ampersand (&) symbol in this field.	
Parameter 2 Value	Used to search for a business rule type with a parameter value.	Yes (Conditional)
	Note: This field appears when you click the **Advanced Search** link available in the right side of the **Search Business Rule Type** zone.	**Note:** This field is required when the value is specified in the**Parameter 2** field.
Parameter 3	Used to search for a business rule type with a parameter code.	No
	Note: This field appears when you click the **Advanced Search** link available in the right side of the **Search Business Rule Type** zone. The **Search** (🔍) icon appears corresponding to this field. On clicking the **Search** icon, the **Parameter Search** window appears. You can specify the parameter code where the parameter usage is set to **Business Rule Eligibility Criteria**. You must not specify the ampersand (&) symbol in this field.	
Parameter 3 Value	Used to search for a business rule type with a parameter value.	Yes (Conditional)
	Note: This field appears when you click the **Advanced Search** link available in the right side of the **Search Business Rule Type** zone.	**Note:** This field is required when the value is specified in the**Parameter 3** field.
Parameter 4	Used to search for a business rule type with a parameter code.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field appears when you click the **Advanced Search** link available in the right side of the **Search Business Rule Type** zone. The **Search** (🔍) icon appears corresponding to this field. On clicking the **Search** icon, the **Parameter Search** window appears. You can specify the parameter code where the parameter usage is set to **Business Rule Eligibility Criteria**. You must not specify the ampersand (&) symbol in this field.	
Parameter 4 Value	Used to search a business rule type with a parameter value.	Yes (Conditional)
	Note: This field appears when you click the **Advanced Search** link available in the right side of the **Search Business Rule Type** zone.	**Note:** This field is required when the value is specified in the**Parameter 4** field.

Note: While searching for the business rule type, always ensure that you provide the parameter and the parameter value in a sequential order.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Business Rule Type	Displays the business rule type which is associated with the parameters of the **Business Rule Eligibility Criteria** usage type.
Description	Displays the description of the business rule type.
Priority	Displays the priority of the business rule type.
Parameters	Indicates the parameters which are associated with the business rule type.
Edit	On clicking the **Edit** (✎) icon, the **Business Rule Type** screen appears where you can edit the business rule type details.
Delete	On clicking the **Delete** (🗑) icon, you can delete the business rule type.

Note:

Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

By default, the **Filter** area is visible. You can hide the **Filter** area by clicking the **Filters** (▽) icon in the upper right corner of this zone.

Business Rule Type

The **Business Rule Type** zone displays the details of the business rule type. It contains the following sections:

- **Main** - Displays the basic information about the business rule type. It contains the following fields:

Field Name	Field Description
Business Rule Type	Displays the business rule type.
Priority	Displays the priority of the business rule type.
Description	Displays the description of the business rule type.

- **Parameters** - Lists the parameters associated with the business rule type where the parameter usage is set to **Business Rule Eligibility Criteria**. It contains the following columns:

Column Name	Column Description
Sequence	Indicates the order in which the business rule criteria should be executed in the business rule type.
Parameter	Indicates the parameter which is associated with the business rule type.

- **Characteristics** - Lists the characteristics of the business rule type. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - Enables you to perform various actions on the business rule type. It contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the business rule type.
Delete	Used to delete the business rule type.

- **Record Information** - This section contains the following fields:

Field Name	Field Description
Business Object	Indicates the business object using which the business rule type is created. In addition, a context menu (⊙) icon appears corresponding to this field which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.
Create Date/Time	Displays the date and time when the business rule type is created.

Copyright © 2026, Oracle and/or its affiliates.

Note: By default, the **Business Rule Type** zone does not appear in the **Business Rule Type** screen. It appears when you click the **Broadcast** (📡) icon corresponding to a business rule type in the **Search Business Rule Type** zone.

Business Rule Criteria

The **Business Rule Criteria** zone lists the criteria details of the business rule. It contains the following columns:

Column Name	Column Description
Criteria Sequence	Indicates the order in which the business rule criteria is executed in the business rule type.
Criteria Description	Displays the description of the business rule criteria.
Criteria	Displays the details about the business rule criteria.

In addition, this zone contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the business rule criteria.
Delete	Used to delete the business rule criteria from the business rule type.

Note:

By default, the **Business Rule Criteria** zone does not appear in the **Business Rule Type** screen. It appears when you click the **Broadcast** (📡) icon corresponding to a business rule type in the **Search Business Rule Type** zone.

A check box appears corresponding to each business rule criteria. To update the details of a business rule criteria, select the check box corresponding to the business rule criteria and then click the **Edit** button. You can also select multiple business rule criteria at the same time. In addition, you can select the check box corresponding to the column header. This allows you to update the details of all the business rule criteria listed in the respective page. For more information, see Editing the Business Rule Criteria of a Business Rule Type on page 3868.

To delete a business rule criteria, select the check box corresponding to the business rule criteria and click the **Delete** button. You can also select multiple business rule criteria at the same time. In addition, you can select the check box corresponding to the column header. This allows you to delete all the business rule criteria listed in the respective page. For more information, see Deleting the Business Rule Criteria from a Business Rule Type on page 3869.

You can filter the list using the **Criteria Sequence**, **Criteria Description**, **Parameter 1**, **Parameter 1 Value**, **Parameter 2**, **Parameter 2 Value**, **Parameter 3**, **Parameter 3 Value**, **Parameter 4**, and **Parameter 4 Value** field available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (▽) icon in the upper right corner of this zone.

You can define a business rule criteria by clicking the **Add** link in the upper right corner of this zone.

Searching for a Business Rule Type

Prerequisites

To search for a business rule type, you should have:

- Parameters defined in the application where the parameter usage is set to **Business Rule Eligibility Criteria**

Procedure

To search for a business rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, click **B** and then click **Business Rule Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Business Rule Type** sub-menu.
   The **Business Rule Type** screen appears.
4. Enter the search criteria in the **Search Business Rule Type** zone.

> **Note:** ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
   A list of business rule types that meet the search criteria appears in the **Search Results** section.

Viewing the Business Rule Type Details

Procedure

To view the details of a business rule type:

1. Search for the business rule type in the **Business Rule Type** screen.
2. In the **Search Results** section, click the **Broadcast** (📡) icon corresponding *t*o the business rule type whose details you want to view.
   The **Business Rule Type** zone appears.
3. View the details of the business rule type in the **Business Rule Type** zone.
4. View the criteria of the business rule type in the **Business Rule Criteria** zone.

Defining a Business Rule Type

Procedure

To define a business rule type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **B** and then click **Business Rule Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Business Rule Type** sub-menu.

   The **Business Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify the basic details for the business rule type.
   - **Parameters** - Used to associate the parameters with the business rule type.
   - **Characteristics** - Used to define the characteristics for the business rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Business Rule Type	Used to specify the business rule type.	Yes
Priority	Used to specify the priority for the business rule type. **Note:** If you set the priority to a lowest number, the system crawls from the lowest number to the highest, whenever you perform a search for a business rule type. For example, a business rule type with the priority 10 will be searched before a business rule type with the priority 20. You must specify a positive integer value in this field.	Yes
Description	Used to specify the description for the business rule type.	Yes

   Tip: Alternatively, you can access the **Business Rule Type** screen by clicking the **Add** button in the **Page Title** area of the **Business Rule Type** screen.
4. Enter the required details in the **Main** section.
5. Associate the parameters with the business rule type, if required.
6. Define the characteristics for the business rule type, if required.
7. Click **Save**.
   The business rule type is defined.

Associating a Parameter with a Business Rule Type

Prerequisites

To associate a parameter with a business rule type, you should have:

- Parameters defined in the application (where the **Business Rule Eligibility Criteria** option is selected in the **Parameter Usage** section)

Procedure

To associate a parameter with a business rule type:

1. Ensure that the **Parameters** section is expanded when you are defining, or editing a business rule type.

   The **Parameters** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Sequence	Used to indicate the order in which you want to display the corresponding parameters in the **Parameters** section of the **Business Rule Type** zone. **Note:** You must specify a positive integer value in this field.	Yes (Conditional) **Note:** This data is required while associating the parameters with the business rule type.
Parameter	Used to indicate the parameter which you want to associate with the business rule type. **Note:** The **Search** (🔍) icon appears corresponding to the **Parameter** field. On clicking the **Search** icon, the **Parameter Search** window appears. On specifying the value for a parameter, the description of the parameter appears corresponding to the **Parameter** field.	Yes (Conditional) **Note:** This data is required while associating the parameters with the business rule type.

2. Enter the required details in the **Parameters** section.
3. If you want to associate more than one parameter with the business rule type, click the **Add** (+) icon and *t*hen repeat step 2.

Note: However, if you want to disassociate a parameter from the business rule type, click the **Delete** (🗑) icon corresponding to the parameter.

Defining a Characteristic for a Business Rule Type

Prerequisites

To define a characteristic for a business rule type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Business Rule Definition**)

Procedure

To define a characteristic for a business rule type:

1. Ensure that the **Characteristics** section is expanded when you are defining, or editing a business rule type.

   The **Characteristics** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Business Rule Definition**.	**Note:** This field is required when you are defining a characteristic for the business rule type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for the business rule type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the business rule type, click the **Add** (+) icon and *t*hen repeat step 2.

> **Note:** However, if you want to remove a characteristic from the business rule type, click the **Delete** (🗑) icon corresponding to the characteristic.

Editing a Business Rule Type

Prerequisites

To edit a business rule type you should have:

- Parameters defined in the application (where the **Business Rule Eligibility Criteria** option is selected in the **Parameter Usage** section)
- Characteristic types defined in the application (where the characteristic entity is set to **Business Rule Type**)

Procedure

To edit a business rule type:

Copyright © 2026, Oracle and/or its affiliates.

1. Search for the business rule type in the **Business Rule Type** screen.
2. In the **Search Results** section, click the **Edit** (✎) icon in the **Edit** column corresponding to the business rule type whose *d*etails you want to edit.

   The **Business Rule Type** screen appears. It contains the following sections:

   - **Main** - Used to specify the basic details for the business rule type.
   - **Parameters** - Used to associate the parameters with the business rule type.
   - **Characteristics** - Used to define the characteristics for the business rule type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Business Rule Type	Displays the business rule type.	Not applicable
Priority	Used to specify the priority for the business rule type. **Note:** If you set the priority to a lowest number, the system crawls from the lowest number to the highest, whenever you perform a search for a business rule type. For example, a business rule type with the priority 10 will be searched before a business rule type with the priority 20. You must specify a positive integer value in this field.	Yes
Description	Used to specify the description for the business rule type.	Yes

Tip: Alternatively, you can click the **Edit** button in the **Business Rule Type** zone to edit the details of the business rule type.

3. Modify the required details in the **Main** section.
4. Associate or disassociate the parameters from the business rule type, if required.
5. Define, edit, or remove characteristics of the business rule type, if required.
6. Click **Save**.
   The changes made to the business rule type are saved.

Defining a Business Rule Criteria for a Business Rule Type

Prerequisites

To define a business rule criteria for a business rule type, you should have:

- Parameters defined in the business rule type

Procedure

To define a business rule criteria for a business rule type:

1. Search for the business rule type in the **Business Rule Type** screen.
2. In the **Search Results** section, click the **Broadcast** (📡) icon corresponding to the business rule type whose *b*usiness rule criteria details you want to edit.

   The **Business Rule Type** and **Business Rule Criteria** zones appear in the **Business Rule Type** screen.
3. Click the **Add** link in the upper-right corner of the **Business Rule Criteria** zone.
   The **Business Rule Criteria** screen appears. It contains the following columns:

Column Name	Column Description
Business Rule Type	Displays the business rule type for which you want to define the business rule criteria.
Description	Displays the description of the business rule type.

In addition, this screen contains the following fields:

Field Name	Field Description
Criteria Sequence	Used to specify the order in which the criteria is executed in the business rule.
Criteria Description	Used to specify the description of the criteria.
Criteria	Used to define the criteria for the business rule type. It contains the following columns:

In addition, the **Criteria** field contains the following columns:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Parameter	Lists the parameter added in the business rule type. **Note:** This is a read-only field.
Parameter Value	Used to indicate the value of the parameter code. **Note:** The **Search** (🔍) icon appears corresponding to **Parameter Value** field. On clicking the **Search** icon, the **Predefined Parameter Value Search** window appears. On specifying the parameter, the description of the parameter appears corresponding to the **Parameter Value** field.

4. Enter the required details in the **Business Rule Criteria** screen.
5. If you want to add more than one criteria to the business rule type, click the **Add** (+) icon and *t*hen repeat step 2.

> **Note:** However, if you want to remove a criteria from the business rule type, click the **Delete** (🗑) icon corresponding to the criteria sequence field.

6. Click **Save**.
   The business rule criteria is defined for the business rule type.

Editing the Business Rule Criteria of a Business Rule Type

Procedure

To edit the business rule criteria of a business rule type:

1. Search for the business rule type in the **Business Rule Type** screen.
2. In the **Search Results** section, click the **Broadcast** (📡) icon corresponding to the business rule type whose *b*usiness rule criteria details you want to edit.

   The following zones appear in the **Business Rule Type** screen:

   - Business Rule Type on page 3860
   - Business Rule Criteria on page 3861
3. Select the check box corresponding to the business rule criteria that you want to edit in the **Business Rule Criteria** zone.

> **Note:** You can also select multiple business criterias at the same time. In addition, you can select the check box corresponding to the column header. This allows you to update the details of all the business criterias listed in the respective page.

Copyright © 2026, Oracle and/or its affiliates.

4. Click **Edit**.
   The **Business Rule Criteria** screen appears. It contains the following columns:

Column Name	Column Description
Business Rule Type	Displays the business rule type.
Description	Displays the description of the business rule type.

In addition, this screen contains the following fields:

Field Name	Field Description
Criteria Sequence	Displays the sequence in which the business rule criteria must be executed in the business rule. **Note:** This is a read-only field.
Criteria Description	Used to specify the description of the business rule criteria.
Criteria	Used to specify the criteria details for the business rule. It contains the following fields: • **Parameter** - Displays the parameter code associated with the business rule type. **Note:** This is a read-only field. • **Parameter Value** - Displays the value of the parameter code. **Note:** This is a read-only field. The description of the parameter value appears corresponding to the **Parameter Value** field.

5. Modify the criteria description.

Note: You can only modify the criteria description.

6. Click **Save**.
   The changes made to the business rule criteria are saved.

You must not specify the ampersand (&) character in this field.	No
Parameter 1 Value	Used to search for business rules based on a particular parameter value.	Yes (Conditional) **Note:** This field is required when the value is specified in the**Parameter 1** field.
Parameter 2	Used to search for business rules based on a particular parameter code. **Note:** The **Search** ( ) icon appears corresponding to this field. On clicking the **Search** icon, the **Parameter Search** window appears. You can specify the parameter code where the parameter usage is set to **Business Rule Eligibility Criteria**. You must not specify the ampersand (&) character in this field.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Parameter 2 Value	Used to search for business rules based on a particular parameter value.	Yes (Conditional) **Note:** This field is required when the value is specified in the**Parameter 2** field.
Parameter 3	Used to search for business rules based on a particular parameter code. **Note:** The **Search** (🔍) icon appears corresponding to this field. On clicking the **Search** icon, the **Parameter Search** window appears. You can specify the parameter code where the parameter usage is set to **Business Rule Eligibility Criteria**. You must not specify the ampersand (&) character in this field.	No
Parameter 3 Value	Used to search for business rules based on a particular parameter value.	Yes (Conditional) **Note:** This field is required when the value is specified in the**Parameter 3** field.
Parameter 4	Used to search for business rules based on a particular parameter code. **Note:** The **Search** (🔍) icon appears corresponding to this field. On clicking the **Search** icon, the **Parameter Search** window appears. You can specify the parameter code where the parameter usage is set to **Business Rule Eligibility Criteria**. You must not specify the ampersand (&) character in this field.	No
Parameter 4 Value	Used to search for business rules based on a particular parameter value.	Yes (Conditional) **Note:** This field is required when the value is specified in the**Parameter 4** field.

Note: While searching for the business rule, always ensure that you provide the parameter and parameter value in a sequential order.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Criteria Description	Displays the description of the criteria which is associated with the business rule.
Eligibility Criteria	Displays the eligibility criteria for the business rule.
Priority	Displays the sequence in which the business rule must be executed.
Effective Date	Displays the date from when the business rule is effective.
Status	Indicates the status of the business rule. The valid values are: • Active • Inactive
Maximum Dependents	Indicates the maximum number of dependent persons which are eligible for premium calculation. **Note:** This column appears when the **Fully-Insured Pricing Business Rule** option is selected from the **Search By** list.
Dependant Max Age Limit	Indicates the maximum age limit for children which are eligible for premium calculation. **Note:** This column appears when the **Fully-Insured Pricing Business Rule** option is selected from the **Search By** list.
Dependant Order Priority	Indicates the order in which the system should first consider youngest or eldest children during the premium calculation. The system supports the following two characteristic values: • Eldest • Youngest **Note:** This column appears when the **Fully-Insured Pricing Business Rule** option is selected from the **Search By** list.
Age Calculation Date	Indicates whether you want to calculate the member person's age using the member person's enrollment date or policy's start or renewal date. The valid values are: • Member Enrollment Date • Member Enrollment Nearest Age **Note:** This column appears when the **Fully-Insured Pricing Business Rule** option is selected from the **Search By** list.
Age Recalculation Date	Indicates whether you want to recalculate the member person's age using the member person's enrollment date or policy's start or renewal date. The valid values are: • After Birthday Month • Membership Renewal Date • Nearest Birthday **Note:** This column appears when the **Fully-Insured Pricing Business Rule** option is selected from the **Search By** list.
Young Adult Applicability	Indicates whether you want to consider the young adults during the premium calculation.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
	Note: This column appears when the **Fully-Insured Pricing Business Rule** option is selected from the **Search By** list.
Young Adult Max Age Limit	Indicates the maximum age limit for young adults which are eligible for premium calculation. **Note:** This column appears when the **Fully-Insured Pricing Business Rule** option is selected from the **Search By** list.
Member Relationship Derivation Date	Indicates the member relationship for a member person. The valid values are: • Member Date of Birth • Member Enrollment Date **Note:** This column appears when the **Fully-Insured Pricing Business Rule** option is selected from the **Search By** list.
Gift Days Applicability	Indicates whether you want to offer gift days in case of a newborn child or member adoption. **Note:** This column appears when the **New Born Rules** or **Member Adoption Business Rule** option is selected from the **Search By** list.
Gift Days	Displays the number of days you want to offer as gift days from the newborn child's birth date or from the adoption effective date. **Note:** This column appears when the **New Born Rules** or **Member Adoption Business Rule** option is selected from the **Search By** list.
Notice Rule Applicability	Indicates whether the notice period rule should be applied in case of a new born or while processing the member adoption. The valid values are: • Yes • No **Note:** This column appears when the **New Born Rules** or **Member Adoption Business Rule** option is selected from the **Search By** list.
Notice Rule Days	Displays the number of days after which the system triggers the notice related to new born or member adoption activities. **Note:** This column appears when the **New Born Rules** or **Member Adoption Business Rule** option is selected from the **Search By** list.
New Born Notice Rule Calculation	Indicates the criteria based on which the system calculates when to generate the notice for a new born. **Note:** This column appears when the **New Born Rules** option is selected from the **Search By** list.
Adoption Notice Rule Calculation	Indicates the criteria based on which the system calculates when to generate an adoption-related notice for a member.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
	Note: This column appears when the **Member Adoption Business Rule** option is selected from the **Search By** list.
Binder Payment Applicability	Indicates that you want the system to monitor whether the binder payment is received or not before activating the individual membership.
	Note: This column appears when the **Binder Payment Rules** option is selected from the **Search By** list.
Threshold Percentage	Displays the threshold percentage using which the threshold amount should be calculated.
	Note: This column appears when the **Binder Payment Rules** option is selected from the **Search By** list.
Grace Days	Displays the grace days used for calculating the individual membership.
	Note: This column appears when the **Binder Payment Rules** option is selected from the **Search By** list.
Hold Billing	Indicates whether you want to hold the bill generation process for the individual membership until the binder payment is received.
	Note: This column appears when the **Binder Payment Rules** option is selected from the **Search By** list.
Rate Guarantee Applicability	Indicates whether the rate guarantee is available for the individual membership.
	Note: This column appears when the **Rate Guarantee Rules** option is selected from the **Search By** list.
Rate Guarantee Period	Displays the rate guarantee period for the individual membership.
	Note: This column appears when the **Rate Guarantee Rules** option is selected from the **Search By** list.
Refund Threshold Amount	Displays the threshold amount for refund.
	Note: This column appears when the **Refund/Write Off Business Rules** option is selected from the **Search By** list.
Defer Refund (in Days)	Displays the number of days till when you want to defer the automatic refund for an account.
	Note: This column appears when the **Refund/Write Off Business Rules** option is selected from the **Search By** list.
Write Off Threshold Amount	Displays the threshold amount for write off.
	Note: This column appears when the **Refund/Write Off Business Rules** option is selected from the **Search By** list.
Defer Write Off (in Days)	Displays the number of days till when you want to defer the automatic write off for an account.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
	Note: This column appears when the **Refund/Write Off Business Rules** option is selected from the **Search By** list.
Grace Period Type	Indicates whether the grace period is in days or months. The valid values are: • Day(s) • Month(s)
Grace Period	Displays the number of days of grace you want to offer from the grace start date. **Note:** This column appears when the **Delinquency Grace Period Business Rule** option is selected from the **Search By** list.
Wait Days	Indicates the number of days for which you want to delay a delinquency event in a delinquency process. **Note:** This column appears when the **Delinquency Event Attribute Business Rule** option is selected from the **Search By** list.
Wait Month	Indicates the number of months for which you want to delay a delinquency event in a delinquency process. **Note:** This column appears when the **Delinquency Event Attribute Business Rule** option is selected from the **Search By** list.
Wait Day Of Month	Indicates the day of the month when you want to trigger a delinquency event in a delinquency process. **Note:** This column appears when the **Delinquency Event Attribute Business Rule** option is selected from the **Search By** list.
Send Membership Level Notification	Indicates whether you want to create a customer contact for the main subscriber of each membership billed to the delinquent customer or account. The valid values are: • Send Membership Level Notification Required • Send Membership Level Notification Not Required **Note:** This column appears when the **Delinquency Event Attribute Business Rule** option is selected from the **Search By** list.
Termination Date Rule	Indicates the termination date rule using which you want to calculate the termination date. **Note:** This column appears when the **Delinquency Termination Date Rule Business Rule** option is selected from the **Search By** list.
Trigger Date Recalculation On Hold Release	Indicates whether you want to recalculate the trigger date once the hold request is released. The valid values are: • Yes • No

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list.
Trigger Date Recalculation On Resume	Indicates whether you want to recalculate the trigger date once the hold request is resumed. The valid values are: • Yes • No
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list.
Trigger Termination Process	Indicates an option based on which the termination process is triggered. The valid values are: • After X Days • Immediate • Month End
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list.
Termination Wait Days	Displays the wait period (in days) after which the termination process is triggered.
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list. The system sets the termination wait days to **zero (0)**, if you do not specify a value while defining or editing a delinquency process type.
Allow Automatic Reinstatement	Indicates whether you want to allow automatic reinstatement of the individual membership. The valid values are: • Yes • No
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list. This field is not applicable in the case of fully insured individual business.
Maximum Automatic Reinstatement Count	Displays the maximum number of time the system allows automatic reinstatement.
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list. This field is not applicable in the case of fully insured individual business.
Trigger Reinstatement Process	Indicates an option based on which the reinstatement process must be triggered. The valid values are:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
	• After X Days • Immediate • Month End
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list. This field is not applicable in the case of fully insured individual business.
Reinstatement Wait Days	Displays the wait period (in days) after which the reinstatement process is triggered.
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list. This field is not applicable in the case of fully insured individual business.
Reinstatement Threshold (%)	Displays the percentage value based on which the automatic reinstatement takes place.
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list. This field is not applicable in the case of fully insured individual business.
Days Since Termination	Displays the number of days since the termination effective date for automatic reinstatement to take place.
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list. This field is not applicable in the case of fully insured individual business.
Member Notification Days	Displays the number of days after which the member receives notification.
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list. This field is not applicable in the case of fully insured individual business.
Add Days to Date of Processing of Termination Request	Displays the number of days that you want to add to the termination request date in order to derive the termination effective date.
	Note: This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Add Days to Grace End Date	Displays the number of days that you want to add to the grace end date in order to derive the termination effective date. **Note:** This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list.
Add Days to Coverage End Date	Displays the number of days that you want to add to the coverage end date in order to derive the termination effective date. **Note:** This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list.
Add Days to Paid Through Date	Displays the number of days that you want to add to the paid through date (of the account) in order to derive the termination effective date. **Note:** This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list.
Add Months to Paid Through Date	Displays the number of months that you want to add to the paid through month (derived from the paid through date of the account) in order to derive the termination effective date. **Note:** This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list.
Minimum Days Before Customer Contact	Displays the minimum number of days required before contacting the customer. **Note:** This column appears when the **Delinquency Miscellaneous Options Business Rule** option is selected from the **Search By** list.
Add Days to Bill Due Date	Displays the number of days through which the due date of the original bill is extended before treating the account as delinquent. **Note:** The original bill's due date extension acts as a grace period for the payment before the delinquency process begins.
Delinquency Process Type	Indicates the delinquency process type for the delinquency process type derivation business rule. The valid values are: • **Delinquency Process Type Account Level** - Used when an account becomes delinquent, where the delinquency evaluation and processing takes place at the account level. • **Delinquency Process Type Person Level** - Used when a person becomes delinquent, where the delinquency evaluation and processing takes place at the person level and not at the account or bill level. **Note:** This column appears when the **Delinquency Process Type Derivation Business Rule** option is selected from the **Search By** list.
Business Rule ID	Displays the business rule ID.

In addition, this zone contains the following buttons:

Copyright © 2026, Oracle and/or its affiliates.

Button Name	Button Description
Edit	Used to edit the business rule.
Delete	Used to delete the business rule.

Note:

On clicking the **Broadcast** (📡) icon corresponding to the business rule, the **Business Rule Log** zone appears where you can view the complete trail of actions performed on the business rule.

Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Searching for a Business Rule

Prerequisites

To search for a business rule, you should have:

- Business rule criteria defined in the respective business rule type
- Parameters associated with the respective business rule type

Procedure

To search for a business rule:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.

Copyright © 2026, Oracle and/or its affiliates.

2. From the **Admin** menu, click **B** and then click **Business Rule**.
   A sub-menu appears.
3. Click the **Search** option from the **Business Rule** sub-menu.
   The **Business Rule** screen appears.
4. Enter the search criteria in the **Search Business Rule** zone.

   Note: ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
   A list of business rules that meet the search criteria appears in the **Search Results** section.

Defining a Binder Payment Business Rule

Prerequisites

To define a binder payment business rule, you should have:

- Required business rule criteria defined in the application.

Procedure

To define a binder payment business rule:

1. Click the **Menu** ( ) icon in the **Application** toolbar.
   A list appears.
2. Click the **Admin Menu** option from the list.
   A sub menu appears.
3. Select **B** and then click the **Add** button corresponding to the **Business Rule** option from the sub menu.

   The **Business Rule Category** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Business Rule Category	Used to indicate the category for which you want to create a business rule. The valid values are: • Binder Payment Business Rule • Delinquency Event Attributes Business Rule • Delinquency Grace Period Business Rule • Delinquency Miscellaneous Options Business Rule • Delinquency Process Type Derivation Business Rule • Delinquency Termination Date Rule Business Rule • Fully-Insured Pricing Business Rule • Member Adoption Business Rule • New Born Business Rule • Rate Guarantee Business Rule • Refund Write-Off Business Rule	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The list includes only those values which are defined in the **BUS_RULE_CAT_FLG** lookup field. You must select the **Binder Payment Business Rule** option from the list while creating a binder payment business rule.	

Note: Alternatively, you can access the **Binder Payment Business Rule** screen by clicking the **Add** button in the **Page Title** area of the **Business Rule** screen.

4. Select the **Binder Payment Business Rule** option from the **Business Rule Category** list.
5. Click **OK**.

The **Binder Payment Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Used to indicate the criteria for the binder payment business rule. **Note:** The **Search** (🔍) icon appears corresponding to the **Criteria Description** field. On clicking the **Search** icon, the **Business Rule Criteria Search** window appears.	Yes
Effective Date	Used to specify the date from when the business rule is effective. **Note:** You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	Yes
Status	Indicates the status of the business rule. **Note:** This field is disabled. By default, the status is set to **Active**.	Not applicable
Binder Payment Applicability	Used to indicate that you want the system to monitor whether the binder payment is received or not before activating the individual membership.	No
Threshold Percentage	Used to specify the threshold percentage using which the threshold amount should be calculated. **Note:** This field is disabled. It is enabled when the **Binder Payment Applicability** option is selected.	No
Grace Days	Used to specify the number of days which are used to calculate the grace date for an individual membership.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The grace days cannot be less than or equal to zero. This field is disabled. It is enabled when the **Binder Payment Applicability** option is selected.	**Note:** This field is required if the **Binder Payment Applicability** option is selected.
Hold Billing	Used to indicate whether you want to hold the bill generation process for an individual membership until the binder payment is received. **Note:** This field is disabled. It is enabled when the **Binder Payment Applicability** option is selected.	No

6. Enter the required details in the **Binder Payment Business Rule** screen.
7. If you want to define more than one binder payment business rule, click the **Add** (+) icon and then repeat step 6.

Note: However, if you want to remove a binder payment business rule, click the **Delete** (🗑) icon corresponding to the **Criteria Description** field.

8. Click **Save**.
   The binder payment business rule is defined.

Defining a Delinquency Grace Period Business Rule

Prerequisites

To define a delinquency grace period business rule, you should have:

- Required business rule criteria defined in the application

Procedure

To define a delinquency grace period business rule:

1. Click the **Menu** (☰) icon in the **Application** toolbar.
   A list appears.
2. Click the **Admin Menu** option from the list.
   A sub menu appears.
3. Select **B** and then click the **Add** button corresponding to the **Business Rule** option from the sub menu.

   The **Business Rule Category** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Business Rule Category	Used to indicate the category for which you want to create a business rule. The valid values are: • Binder Payment Business Rule • Delinquency Event Attributes Business Rule • Delinquency Grace Period Business Rule	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• Delinquency Miscellaneous Options Business Rule • Delinquency Process Type Derivation Business Rule • Delinquency Termination Date Rule Business Rule • Fully-Insured Pricing Business Rule • Member Adoption Business Rule • New Born Business Rule • Rate Guarantee Business Rule • Refund Write-Off Business Rule	
	Note: The list includes only those values which are defined in the **BUS_RULE_CAT_FLG** lookup field. You must select the **Delinquency Grace Period Business Rule** option from the list while creating a delinquency grace period business rule.	

Note: Alternatively, you can access the **Delinquency Grace Period Business Rule** screen by clicking the **Add** button in the **Page Title** area of the **Business Rule** screen.

4. Select the **Delinquency Grace Period Business Rule** option from the **Business Rule Category** list.
5. Click **OK**.

The **Delinquency Grace Period Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Used to indicate the criteria for the delinquency grace period business rule. **Note:** The **Search** (🔍) icon appears corresponding to the **Criteria Description** field. On clicking the **Search** icon, the **Business Rule Criteria Search** window appears.	Yes
Effective Date	Used to specify the date from when the business rule is effective. **Note:** You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	Yes
Status	Indicates the status of the business rule. **Note:** This field is disabled. By default, the status is set to **Active**.	Not applicable
Grace Period Type	Used to indicate whether the grace period is in days or months. The valid values are: • Day(s) • Month(s)	Yes
Grace Period	Used to specify the number of days of grace you want to offer from the grace start date.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: For example, if the trigger date calculation mode in the respective delinquency process type is set to **Latest Bill Due Date with Grace Period** and if a delinquency process contains bills with the latest bill due date as 01-Jan-2026, the system considers the latest bill due date as the grace start date. Now, if the grace period is set to 30 days, the system sets the grace end date to 31-Jan-2026 using the following formula: `Grace End Date = Grace Start Date + Grace Period` If you do not specify any value, by default, it is set to **zero (0)**. If the drag days (i.e., additional grace days (if any)) are offered at the account or person level, then these drag days are considered while calculating the grace end date when the trigger date calculation mode (in the respective delinquency process type) is set to either **Latest Bill Due Date with Grace Period** or **Usage Basis**. For example, if the latest bill due date is 05-Jan-2026, grace period is set to 5 days, and drag days is to 10 days (for the respective account), then the grace end date is set to 20-Jan-2026.	

6. Enter the required details in the **Delinquency Grace Period Business Rule** screen.
7. If you want to define more than one delinquency grace period business rule, click the **Add** (+) icon and then repeat step 6.

> **Note:** However, if you want to remove a delinquency grace period business rule, click the **Delete** (🗑) icon corresponding to the **Criteria Description** field.

8. Click **Save**.
   The delinquency grace period business rule is defined.

Defining a Delinquency Process Type Derivation Business Rule

Prerequisites

To define a delinquency process type derivation business rule, you should have:

- Required business rule criteria defined in the application.

Procedure

To define a delinquency process type derivation business rule:

1. Click the **Menu** ( ) icon in the **Application** toolbar.
   A list appears.
2. Click the **Admin Menu** option from the list.
   A sub menu appears.
3. Select **B** and then click the **Add** button corresponding to the **Business Rule** option from the sub menu.

   The **Business Rule Category** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Business Rule Category	Used to indicate the business rule category using which you want to create the business rule. The valid values are: • Binder Payment Business Rule • Delinquency Event Attributes Business Rule • Delinquency Grace Period Business Rule • Delinquency Miscellaneous Options Business Rule • Delinquency Process Type Derivation Business Rule • Delinquency Termination Date Rule Business Rule • Fully-Insured Pricing Business Rule • Member Adoption Business Rule • New Born Business Rule • Rate Guarantee Business Rule • Refund Write-Off Business Rule	Yes
	Note: The list includes only those values which are defined in the **BUS_RULE_CAT_FLG** lookup field. You must select the **Delinquency Process Type Derivation Business Rule** option from the list while creating a delinquency process type derivation business rule.	

Note: Alternatively, you can access the **Business Rule Category** screen by clicking the **Add** button in the **Page Title** area of the **Business Rule** screen.

4. Select the **Delinquency Process Type Derivation Business Rule** option from the **Business Rule Category** list.
5. Click **OK**.
   The **Delinquency Process Type Derivation Business Rule** screen appears. It contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Used to indicate the criteria for the delinquency process type derivation business rule. **Note:** The **Search** (🔍) icon appears corresponding to the **Criteria Description** field. On clicking the **Search** icon, the **Business Rule Criteria Search** window appears.	Yes
Effective Date	Used to specify the date from when the business rule is effective. **Note:** You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	Yes
Status	Indicates the status of the business rule. **Note:** This field is disabled. By default, the status is set to **Active**.	Not applicable
Delinquency Process Type	Used to indicate the delinquency process type for the delinquency process type derivation business rule. The valid values are: • **Delinquency Process Type Account Level** - Used when an account becomes delinquent, where the delinquency evaluation and processing takes place at the account level. • **Delinquency Process Type Person Level** - Used when a person becomes delinquent, where the delinquency evaluation and processing takes place at the person level and not at the account or bill level. **Note:** The list includes only those delinquency process types which are in the **Active** status.	No

6. Enter the required details in the **Delinquency Process Type Derivation Business Rule** screen.
7. If you want to define more than one delinquency process type derivation business rule, click the **Add** (+) icon and then repeat step 6.

Note: However, if you want to remove a delinquency process type derivation business rule, click the **Delete** (🗑) icon corresponding to the **Criteria Description** field.

8. Click **Save**.
   The delinquency process type derivation business rule is defined.

Defining a Delinquency Miscellaneous Options Business Rule

Prerequisites

To define a delinquency miscellaneous options business rule, you should have:

- Required business rule criteria defined in the application
- Values defined for the **TERM_TRIGGER_OPTION_FLG**, **ALLOW_AUTO_REIN_FLG**, and **REIN_TRIGGER_OPTION_FLG** lookup fields.

Procedure

Copyright © 2026, Oracle and/or its affiliates.

To define a delinquency miscellaneous options business rule:

1. Click the **Menu** ( ) icon in the **Application** toolbar.
   A list appears.
2. Click the **Admin Menu** option from the list.
   A sub menu appears.
3. Select **B** and then click the **Add** button corresponding to the **Business Rule** option from the sub menu.

   The **Business Rule Category** screen appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Business Rule Category	Used to indicate the category for which you want to create a business rule. The valid values are: • Binder Payment Business Rule • Delinquency Event Attributes Business Rule • Delinquency Grace Period Business Rule • Delinquency Miscellaneous Options Business Rule • Delinquency Process Type Derivation Business Rule • Delinquency Termination Date Rule Business Rule • Fully-Insured Pricing Business Rule • Member Adoption Business Rule • New Born Business Rule • Rate Guarantee Business Rule • Refund Write-Off Business Rule	Yes
	Note: The list includes only those values which are defined in the **BUS_RULE_CAT_FLG** lookup field. You must select the **Delinquency Miscellaneous Options Business Rule** option from the list while creating a delinquency miscellaneous options business rule.	

Note: Alternatively, you can access the **Delinquency Miscellaneous Options Business Rule** screen by clicking the **Add** button in the **Page Title** area of the **Business Rule** screen.

4. Select the **Delinquency Miscellaneous Options Business Rule** option from the **Business Rule Category** list.
5. Click **OK**.
   The **Delinquency Miscellaneous Options Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Used to indicate the criteria for the delinquency miscellaneous options business rule.	Yes
	Note: The **Search** ( ) icon appears corresponding to the **Criteria Description** field. On clicking the **Search** icon, the **Business Rule Criteria Search** window appears.	
Effective Date	Used to specify the date from when the business rule is effective.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: You can either manually specify the date or select it using the **Date Picker** () icon corresponding to the field.	
Status	Indicates the status of the business rule. **Note:** This field is disabled. By default, the status is set to **Active**.	Not applicable
Trigger Date Recalculation On Hold Release	Used to indicate whether the trigger dates of delinquency events should be recalculated when the hold on the delinquency process is released. The valid values are: • **Yes** • **No**	No
Trigger Date Recalculation On Resume	Used to indicate whether the trigger dates of delinquency events should be recalculated when the delinquency process is resumed after cancellation. The valid values are: • **Yes** • **No**	No
Trigger Termination Process	Used to indicate when you want the system to send an outbound message to the enrollment system for terminating the individual memberships billed to the delinquent account. The valid values are: • **After X Days** - Used when you want the system to send an outbound message for termination after X number of days from the date when the termination event is triggered. • **Immediate** - Used when you want the system to send an outbound message for termination on the same day when the termination event is triggered. • **Month End** - Used when you want the system to send an outbound message for termination at the end of the month when the termination event is triggered. **Note:** The list includes only those values which are defined in the **TERM_TRIGGER_OPTION_FLG** lookup field.	No
Termination Wait Days	Used to specify the number of days after which an outbound message for termination should be sent to the enrollment system. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is required only when the **After X Days** option is selected from the **Trigger Termination Process** list.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Allow Automatic Reinstatement	Used to indicate whether you want to allow automatic reinstatement of the individual membership. The valid values are: • No • Yes **Note:** The list includes only those values which are defined in the **ALLOW_AUTO_REIN_FLG** lookup field This field is not applicable for the fully insured individual business.	No
Maximum Automatic Reinstatement Count	Used to specify the maximum number of time the system will allow automatic reinstatement. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No
Trigger Reinstatement Process	Used to indicate an option based on which the reinstatement process must be triggered. The valid values are: • After X Days • Immediate • Month End **Note:** The list includes only those values which are defined in the **REIN_TRIGGER_OPTION_FLG** lookup field. This field is not applicable for the fully insured individual business.	No
Reinstatement Wait Days	Used to specify the wait period (in days) after which the reinstatement process is triggered. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No
Reinstatement Threshold	Used to specify the percentage value based on which the automatic reinstatement takes place.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	
Days Since Termination	Used to specify the number of days since the termination effective date after which the automatic reinstatement takes place. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No
Member Notification Days	Used to specify the number of days after which the member receives a notification. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No
Add Days to Date of Processing of Termination Request	Used to specify the number of days that you want to add to termination request date in order to derive the termination effective date. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No
Add Days to Grace End Date	Used to specify the number of days that you want to add to the grace end date in order to derive the termination effective date. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**.	No
Add Days to Coverage End Date	Used to specify the number of days that you want to add to the coverage end date in order to derive the termination effective date.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**.	
Add Days to Paid Through Date	Used to specify the number of days that you want to add to the paid through date (of the account) in order to derive termination effective date. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**.	No
Add Months to Paid Through Date	Used to specify the number of months that you want to add to the paid through month (derived from the paid through date of the account) in order to derive the termination effective date. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**.	No
Minimum Days Before Customer Contact	Used to specify the minimum number of days required before contacting the customer. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**.	No
Add Days to Bill Due Date	Used to specify the number of days through which the due date of the original bill is extended before treating the account as delinquent.	No

6. Enter the required details in the **Delinquency Miscellaneous Options Business Rule** screen.
7. If you want to define more than one delinquency miscellaneous options business rule, click the **Add** (+) icon and then repeat step 6.

Note: However, if you want to remove a delinquency miscellaneous options business rule, click the **Delete** (🗑) icon corresponding to the **Criteria Description** field.

8. Click **Save**.
   The delinquency miscellaneous options business rule is defined.

Editing a Fully-Insured Pricing Business Rule

Procedure

To edit a fully-insured pricing business rule:

1. Search for the fully-insured pricing business rule in the **Business Rule** screen.
2. In the **Search Results** section, select the check box corresponding to the fully-insured pricing business rule and then click the **Edit** button.

> **Note:**
>
> You can edit multiple fully-insured pricing business rules at once by selecting the check boxes corresponding to them and then clicking the **Edit** button.
>
> You can edit the fully-insured pricing business rule only when it is not yet used in the system.

The **Fully-Insured Pricing Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Indicates the criteria for the fully-insured pricing business rule. **Note:** By default, this field is non-editable.	Not applicable
Effective Date	Used to specify the date from when the business rule is effective. **Note:** You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	Yes
Status	Used to indicate the status of the business rule. The valid values are: • Active • Inactive	Yes
Maximum Dependents	Used to specify the maximum number of children (dependents) which are eligible for premium calculation. **Note:** The value for this field must be either zero (0) or a positive integer.	No
Dependent Max Age Limit	Used to specify the maximum age limit for children eligible for premium calculation.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The value for this field must be either zero (0) or a positive integer. If the **Maximum Dependents** field is either set to **zero(0)** or no value is specified then the **Dependent Max Age Limit** field must be set to **zero (0)** .	**Note:** This field is required when the **Maximum Dependents** field is set to a value which is greater than **zero(0)**.
Dependent Order Priority	Used to indicate the order priority of the dependent during premium calculation. The valid values are: • Eldest • Youngest	Yes (Conditional) **Note:** This field is required when the **Maximum Dependents** field is set to **zero(0)**.
Age Calculation Date	Used to indicate whether the member person's age should be calculated using the member person's enrollment date or policy's start or renewal date. The valid values are: • Member Enrollment Date • Member Enrollment Nearest Age	Yes
Age Recalculation Date	Used to indicate whether the member person's age should be recalculated using the member person's enrollment date or policy's start or renewal date. The valid values are: • After Birthday Month • Membership Renewal Date • Nearest Birthday	No
Young Adult Applicability	Used to indicate that the child or dependent enrolling in the membership becomes the young adult in the enrollment period.	No
Young Adult Max Age Limit	Used to specify the maximum age limit for young adults which are eligible for premium calculation. **Note:** This field is disabled. It is enabled when the **Young Adult Applicability** option is selected.	Yes (Conditional) **Note:** This field is required if you have selected the **Young Adult Applicability** option.
Member Relationship Derivation Date	Used to indicate the member relationship for a member person. The valid values are: • Member Date of Birth • Member Enrollment Date	Yes

3. Modify the required details in the **Fully-Insured Pricing Business Rule** screen.
4. Click **Save**.
   The changes made to the fully-insured pricing business rule are saved.

The **Refund/Write Off Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Indicates the criteria for the refund/write off business rule. **Note:** By default, this field is non-editable.	Not applicable
Effective Date	Used to specify the date from when the business rule is effective. **Note:** You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	Yes
Status	Used to indicate the status of the business rule. The valid values are: • Active • Inactive	Yes
Refund Threshold Amount	Used to specify the threshold amount for refund. The system creates automatic refund for an account when the account balance is greater than or equal to the refund threshold amount. **Note:** If you do not specify any value, by default, it is set to **zero (0.00)**.	No
Defer Refund (in Days)	Used to specify the number of days till when you want to defer automatic refund for an account. It is used to calculate the automatic refund request creation date. **Note:** If you do not specify any value, by default, it is set to **zero (0)**.	No
Write Off Threshold Amount	Used to specify the threshold amount for write off. If the account balance is less than or equal to the write off threshold amount, the system creates automatic write off for an account.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: If you do not specify any value, by default, it is set to **zero (0.00)**.	
Defer Write Off (in Days)	Used to specify the number of days till when you want to defer automatic write off for an account. It is used to calculate the automatic write off request creation date.	No
	Note: If you do not specify any value, by default, it is set to **zero (0)**.	

3. Modify the required details in the **Refund/Write Off Business Rule** screen.
4. Click **Save**.
   The changes made to the refund/write off business rule are saved.

Editing a Delinquency Grace Period Business Rule

Procedure

To edit a delinquency grace period business rule:

1. Search for the delinquency grace period business rule in the **Business Rule** screen.
2. In the **Search Results** section, select the check box corresponding to the delinquency grace period business rule and then click the **Edit** button.

Note:

You can edit multiple delinquency grace period business rules at once by selecting the check boxes corresponding to them and then clicking the **Edit** button.

You can edit the delinquency grace period business rule only when it is not yet used in the system.

The **Delinquency Grace Period Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Indicates the criteria for the delinquency grace period business rule.	Not applicable
	Note: By default, this field is non-editable.	
Effective Date	Used to specify the date from when the business rule is effective.	Yes
	Note: You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Status	Used to indicate the status of the business rule. The valid values are: • Active • Inactive	Yes
Grace Period Type	Used to indicate whether the grace period is in days or months. The valid values are: • Day(s) • Month(s)	Yes
Grace Period	Used to specify the number of days of grace you want to offer from the grace start date. **Note:** For example, if the trigger date calculation mode in the respective delinquency process type is set to **Latest Bill Due Date with Grace Period** and if a delinquency process contains bills with the latest bill due date as 01-Jan-2026, the system considers the latest bill due date as the grace start date. Now, if the grace period is set to 30 days, the system sets the grace end date to 31-Jan-2026 using the following formula: `Grace End Date = Grace Start Date + Grace Period` If you do not specify any value, by default, it is set to **zero (0)**. If the drag days (i.e., additional grace days (if any)) are offered at the account or person level, then these drag days are considered while calculating the grace end date when the trigger date calculation mode (in the respective delinquency process type) is set to either **Latest Bill Due Date with Grace Period** or **Usage Basis**. For example, if the latest bill due date is 05-Jan-2026, grace period is set to 5 days, and drag days is to 10 days (for the respective account), then the grace end date is set to 20-Jan-2026.	No

3. Modify the required details in the **Delinquency Grace Period Business Rule** screen.
4. Click **Save**.
   The changes made to the delinquency grace period business rule are saved.

Editing a Delinquency Event Attributes Business Rule

Procedure

Copyright © 2026, Oracle and/or its affiliates.

To edit a delinquency event attributes business rule:

1. Search for the delinquency event attributes business rule in the **Business Rule** screen.
2. In the **Search Results** section, select the check box corresponding to the delinquency event attributes business rule and then click the **Edit** button.

> **Note:**
>
> You can also edit more than one delinquency event attributes business rule by selecting multiple check boxes and clicking the **Edit** button.
>
> You can edit the delinquency event attributes business rule when it is not yet used in the system.

The **Delinquency Event Attributes Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Indicates the criteria for the delinquency event attributes business rule. **Note:** By default, this field is non-editable.	Not applicable
Effective Date	Used to specify the date from when the business rule is effective. **Note:** You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	Yes
Status	Used to indicate the status of the business rule. The valid values are: • Active • Inactive	Yes
Wait Days	Used to indicate the number of days for which you want to delay a delinquency event in a delinquency process. **Note:** If you do not specify any value, by default, it is set to **zero (0)**.	No
Wait Month	Used to indicate the number of months for which you want to delay a delinquency event in a delinquency process. **Note:** If you do not specify any value, by default, it is set to **zero (0)**.	No
Wait Day of Month	Used to indicate the day of the month when you want to trigger a delinquency event in a delinquency process. **Note:** If you do not specify any value, by default, it is set to **zero (0)**.	No
Send Membership Level Notification	Used to indicate whether you want to create a customer contact for the main subscriber of each membership billed to the delinquent customer or account. The valid values are: • **Send Membership Level Notification Required** - Used when you want to create a customer contact for the main	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	subscriber of each membership billed to the delinquent customer or account. • **Send Membership Level Notification Not Required** - Used when you do not want to create a customer contact for each membership billed to the delinquent customer or account. **Note:** For more information, see Creating Customer Contacts for Each Membership Billed to Delinquent Customer or Account on page 4361	

3. Modify the required details in the **Delinquency Event Attributes Business Rule** screen.
4. Click **Save**.
   The changes made to the delinquency event attributes business rule are saved.

Editing a Delinquency Process Type Derivation Business Rule

Procedure

To edit a delinquency process type derivation business rule:

1. Search for the delinquency process type derivation business rule in the **Business Rule** screen.
2. In the **Search Results** section, select the check box corresponding to the delinquency process type derivation business rule and then click the **Edit** button.

Note:

You can edit multiple delinquency process type business rules at once by selecting the check boxes corresponding to them and then clicking the **Edit** button.

You can edit the delinquency process type business rule only when it is not yet used in the system.

3. Click **Edit**.

   The **Delinquency Process Type Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Indicates the criteria for the delinquency process type business rule. **Note:** By default, this field is non-editable.	Not applicable
Effective Date	Used to specify the date from when the business rule is effective.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	
Status	Used to indicate the status of the business rule. The valid values are: • Active • Inactive	No
Delinquency Process Type	Used to indicate the delinquency process type for the delinquency process type derivation business rule. The valid values are: • **Delinquency Process Type Account Level** - Used when an account becomes delinquent, where the delinquency evaluation and processing takes place at the account level. • **Delinquency Process Type Person Level** - Used when a person becomes delinquent, where the delinquency evaluation and processing takes place at the person level and not at the account or bill level. **Note:** The list includes only those delinquency process types which are in the **Active** status.	No

4. Modify the required details of the delinquency process type derivation business rule.
5. Click **Save**.

Editing a Delinquency Miscellaneous Options Business Rule

Procedure

To edit a delinquency miscellaneous options business rule:

1. Search for the delinquency miscellaneous options business rule in the **Business Rule** screen.

Copyright © 2026, Oracle and/or its affiliates.

2. In the **Search Results** section, select the check box corresponding to the delinquency miscellaneous options business rule and then click the **Edit** button.

> **Note:**
>
> You can edit multiple delinquency miscellaneous options business rules at once by selecting the check boxes corresponding to them and then clicking the **Edit** button.
>
> You can edit the delinquency miscellaneous options business rule only when it is not yet used in the system.

The **Delinquency Miscellaneous Options Business Rule** screen appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Criteria Description	Indicates the criteria for the delinquency miscellaneous options business rule. **Note:** By default, this field is non-editable.	Not applicable
Effective Date	Used to specify the date from when the business rule is effective. **Note:** You can either manually specify the date or select it using the **Date Picker** ( ) icon corresponding to the field.	Yes
Status	Used to indicate the status of the business rule. The valid values are: • Active • Inactive	Yes
Trigger Date Recalculation On Hold Release	Used to indicate whether the trigger dates of delinquency events should be recalculated when the hold on the delinquency process is released. The valid values are: • **Yes** • **No**	No
Trigger Date Recalculation On Resume	Used to indicate whether the trigger dates of delinquency events should be recalculated when the delinquency process is resumed after cancellation. The valid values are: • **Yes** • **No**	No
Trigger Termination Process	Used to indicate when you want the system to send an outbound message to the enrollment system for terminating the individual memberships billed to the delinquent account. The valid values are: • **After X Days** - Used when you want the system to send an outbound message for termination after X number of days from the date when the termination event is triggered. • **Immediate** - Used when you want the system to send an outbound message for termination on the same day when the termination event is triggered. • **Month End** - Used when you want the system to send an outbound message for termination at the end of the month when the termination event is triggered.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The list includes only those values which are defined in the **TERM_TRIGGER_OPTION_FLG** lookup field.	
Termination Wait Days	Used to specify the number of days after which an outbound message for termination should be sent to the enrollment system. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is required only when the **After X Days** option is selected from the **Trigger Termination Process** list.	No
Allow Automatic Reinstatement	Used to indicate whether you want to allow automatic reinstatement of the individual membership. The valid values are: • No • Yes **Note:** The list includes only those values which are defined in the **ALLOW_AUTO_REIN_FLG** lookup field This field is not applicable for the fully insured individual business.	No
Maximum Automatic Reinstatement Count	Used to specify the maximum number of time the system will allow automatic reinstatement. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No
Trigger Reinstatement Process	Used to indicate an option based on which the reinstatement process must be triggered. The valid values are: • After X Days • Immediate • Month End **Note:** The list includes only those values which are defined in the **REIN_TRIGGER_OPTION_FLG** lookup field. This field is not applicable for the fully insured individual business.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Reinstatement Wait Days	Used to specify the wait period (in days) after which the reinstatement process is triggered. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No
Reinstatement Threshold	Used to specify the percentage value based on which the automatic reinstatement takes place. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No
Days Since Termination	Used to specify the number of days since the termination effective date after which the automatic reinstatement takes place. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No
Member Notification Days	Used to specify the number of days after which the member receives a notification. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No
Add Days to Date of Processing of Termination Request	Used to specify the number of days that you want to add to termination request date in order to derive the termination effective date. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**. This field is not applicable for the fully insured individual business.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Add Days to Grace End Date	Used to specify the number of days that you want to add to the grace end date in order to derive the termination effective date. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**.	No
Add Days to Coverage End Date	Used to specify the number of days that you want to add to the coverage end date in order to derive the termination effective date. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**.	No
Add Days to Paid Through Date	Used to specify the number of days that you want to add to the paid through date (of the account) in order to derive termination effective date. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**.	No
Add Months to Paid Through Date	Used to specify the number of months that you want to add to the paid through month (derived from the paid through date of the account) in order to derive the termination effective date. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**.	No
Minimum Days Before Customer Contact	Used to specify the minimum number of days required before contacting the customer. **Note:** You cannot specify a negative value in this field. If you do not specify the value, by default, it is set to **zero (0)**.	No
Add Days to Bill Due Date	Used to specify the number of days through which the due date of the original bill is extended before treating the account as delinquent.	No

3. Modify the required details in the **Delinquency Miscellaneous Options Business Rule** screen.
4. Click **Save**.
   The changes made to the delinquency miscellaneous options business rule are saved.

Deleting a Business Rule

Procedure

Copyright © 2026, Oracle and/or its affiliates.

To delete a business rule:

1. Search for the business rule in the **Business Rule** screen.
2. In the **Search Results** section, select the check box corresponding to the business rule that you want to delete.

> **Note:** You can also select multiple business rules at the same time. In addition, you can select the check box corresponding to the column header. This allows you to delete all the business rules listed in the respective page.

3. Click **Delete**.
   A message appears confirming whether you want to delete the business rule.
4. Click **OK**.
   The business rule is deleted.

> **Note:** You can delete a business rule only when it is not yet used in the system.

Young Adult Coverage in an Individual Membership

Oracle Revenue Management and Billing enables you to calculate premium for the young adults who are covered in an individual membership. While creating or editing an individual membership, or while adding, editing, or inactivating a member person in an individual membership through a health care inbound message or through membership repricing inbound web service, the system derives the fully-insured pricing business rule for the individual membership. The system enables you to define the following young adult related output parameters in the fully-insured pricing business rules:

- **Young Adult Applicability** - Used to indicate whether you want to consider the young adults during the premium calculation. The valid values are - **Yes** and **No**.
- **Young Adult Max Age Limit** - Used to indicate the maximum age limit for young adults who are eligible for premium calculation. This output parameter is mandatory when the **Young Adult Applicability** parameter is set to **Yes**.

Copyright © 2026, Oracle and/or its affiliates.

While deriving member relationship for each member person of the individual membership from a member relationship structure, the system considers the following information from the fully-insured pricing business rule of the individual membership:

- Young Adult Applicability
- Young Adult Max Age Limit

Similarly, while deriving subscription tier for the individual membership from a subscription tier structure, the system considers the following information from the fully-insured pricing business rule of the individual membership:

- Young Adult Applicability
- Young Adult Max Age Limit

Thus, while calculating the premium for an individual membership using an age based or tier based pricing rule, the system considers the young adult for the premium calculation based on the above two parameters set in the fully-insured pricing business rule.

Age Calculation During Continuous Individual Membership Coverage

In the fully insured individual line of business, there are scenarios wherein an individual and his/her dependent persons may continuously belong to different memberships of different health plans that belong to the same health product category, such as Medical or Dental, etc. In other words, an individual person has continuous insurance coverage over a period without any lapses or gaps. In such scenarios, the business requires that an individual person's age should be calculated based on the plan year's first continuous coverage start date. For example, in the plan year 2024, if an individual belongs to four memberships with continuous coverage period (for example, M1 with the coverage period 01-Jan-2024 to 31-Mar-2024, M2 with the coverage period 01-Apr-2024 to 30-Jun-2024, M3 with the coverage period 01-Jul-2024 to 30-Sep-2024, and M4 with the coverage period 01-Oct-2024 to 31-Dec-2024), the system should calculate the individual person's age using the M1 coverage start date.

To implement this business scenario, the following changes are made to the system:

- A new algorithm type named **C1-DTCAGEIM** is introduced in this release. An algorithm created using the **C1-DTCAGEIM** algorithm type is attached to the **Audit** system event of the **C1-IndividualMembership** business object. This algorithm determines whether the health plans belong to the same health product category (i.e., first few digits of HIOS ID are same) while deriving continuous coverage individual memberships and the plan year start month (i.e., 1 for Jan-Dec, 3 for Mar-Feb, 6 for Jun-May, etc.) based on which first continuous coverage is considered for the plan year.
- The **C1CTRLDT** characteristic type is shipped with the product.

Now, when an individual person belongs to different memberships with continuous coverage period, the system stores the plan year's first continuous coverage start date in the form of characteristic corresponding to the member person using the **C1CTRLDT** characteristic type. The system then considers this characteristic while calculating the individual person's age during premium calculation.

The system stamps this characteristic against the main subscriber and each dependent person in an individual membership. However, in the following scenarios, the **C1CTRLDT** characteristic is not stamped on the respective dependent person:

- A dependent person in any subsequent memberships (i.e., M2, M3, or M4) was not enrolled on the plan year's first continuous coverage membership (i.e. M1) start date.
- A dependent person is not continuously covered in different memberships (for example, DP1 is covered in M1 and M2 for the entire coverage period, covered in M3 from 01-Jul-2024 to 31-Jul-2024, and then covered in M4 for the entire coverage period).

If the characteristic is not stamped on any dependent person in an individual membership, the system calculates the age using the traditional method (i.e., using the age calculation date specified in the fully insured pricing rule business rule).

Copyright © 2026, Oracle and/or its affiliates.

The above feature is implemented with the basic assumption that the main subscriber would be same in the continuous individual membership coverage. The product does not cater to the scenario wherein the main subscriber is different in the continuous individual membership coverage of a dependent person. To handle such scenarios, you can manually stamp the **C1CTRLDT** characteristic on the dependent person so that the age is calculated during the premium calculation.

Chapter 43

Individual Health Insurance Billing

While calculating the premium for an individual membership using an age based pricing rule, the system derives the rate for each eligible member person. The system identifies members which are eligible for premium calculation using the fully-insured pricing and newborn business rules.

On creating or editing an individual membership through a health care inbound message or membership repricing inbound web service, the system determines the fully-insured pricing and newborn business rules which are applicable for the individual membership. The system enables you to define business rules of the following categories:

- Fully-Insured Pricing
- New Born

While determining the business rules which are applicable for an individual membership, the system executes the business rules of each category which are effective on the inbound processing date based on the priority of the business rule. If an individual membership meets the criteria of the business rule, the system stamps the respective business rule corresponding to the individual membership. In this way, the system derives two business rules - one fully-insured pricing business rule and another newborn business rule.

While calculating the premium for an individual membership using a tier based pricing rule, the system derives the subscription tier using the fully-insured pricing and newborn business rules.

Once the premium is calculated for an individual membership, the system creates a billable charge for the premium. If the account is defined for the individual membership using the characteristic types specified in the **Account Identifier Type Char Type** and **Account Identifier Value Char Type** option types of the **C1-ASOBLLNG** feature configuration, the system uses the account to bill the charge for the premium. However, if these characteristics are not defined for the individual membership, the system considers the account of the financially responsible member person to the charge for the premium.

Chapter 44

Entity Audit

Topics:

- Audit Event Status Transition
- Prerequisites
- Entity Audit Process
- Algorithms Used in the Entity Audit Process
- Audit Event Type
- Audit Event (Used for Searching)
- Audit Event (Used for Viewing)

Oracle Revenue Management and Billing provides a mechanism wherein auditors can track various actions, such as add, update, and delete for an entity. If the entity audit feature is enabled for a business object, the system creates audit events whenever you define, edit, or delete an entity (which is created using the respective business object). For example, if the entity audit feature is enabled for the **C1-Membership** business object, the system creates an audit event whenever you define, edit, or delete a membership in a policy plan or whenever you add or remove persons from a membership. For more information on how to enable the entity audit feature for a business object, see Prerequisites on page 3932.

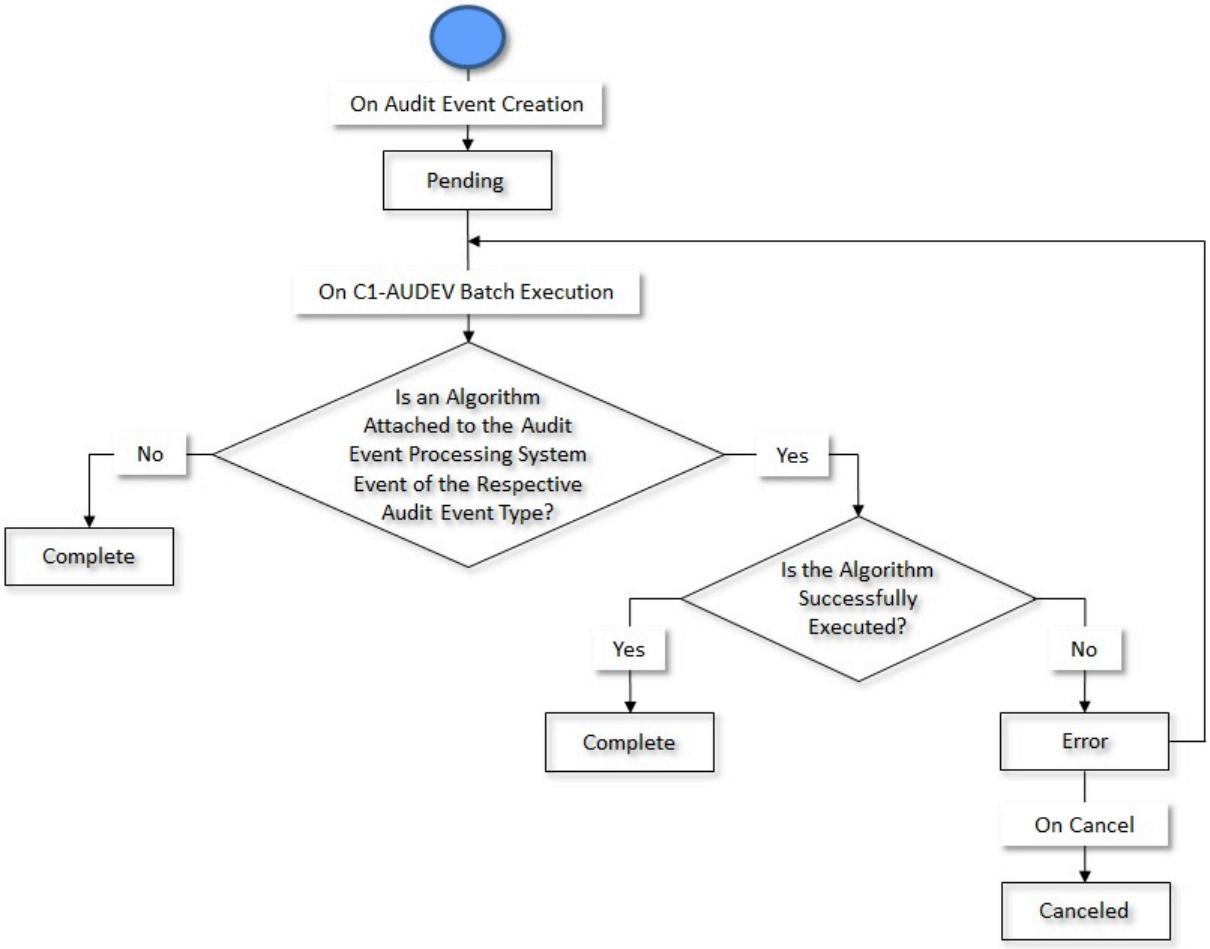
The entity audit process is a two-step process, wherein the system creates the audit events and then processes them whenever the **Audit Event Processing (C1-AUDEV)** batch is executed. For more information about these processes, see the following sections:

- Audit Event Creation on page 3933
- Audit Event Processing on page 3934

During the entity audit process, each audit event goes through various statuses in its lifecycle. For more information about the audit event statuses, see Audit Event Status Transition on page 3932.

Audit Event Status Transition

The following figure graphically indicates how an audit event moves from one status to another in its lifecycle:



Prerequisites

To setup the entity audit feature for a business object, you need to do the following:

- Set the **Eligible for Audit Event** option type of the entity business object to **Y**.

  Note: The **Eligible for Audit Event** option type is available for the entity business object when the **Valid BO Option Type** option type of the respective maintenance object is set to **C1AT**.

- Attach an algorithm created using the **C1-REAUDEVNT** algorithm type to the **Audit** system event of the entity business object.

Copyright © 2026, Oracle and/or its affiliates.

Note:

At present, this algorithm is designed to work with the following business objects:

- C1-POLICY
- C1-ASOPolicy
- C1-Membership
- C1-PolicyPlan
- C1_PERSON_BO
- C1-PricingRuleTierBased
- C1-PricingRuleAgeBased

If you want to use the audit algorithm for the business objects which are not listed above, you need to create a custom audit algorithm.

- Define an active audit event type for the entity business object in the system.
- Define the required algorithm types where the algorithm entity is set to **Audit Event Processing**.
- Create the required algorithms and attach them to the **Audit Event Processing** system event of the audit event type.

Note: The **C1-AUDEVMPR** algorithm type is shipped with the product. You must attach an algorithm created using the **C1-AUDEVMPR** algorithm type to the audit event types which are defined for the **C1-PricingRuleTierBased** and **C1-PricingRuleAgeBased** business objects.

- Define the values for the **AUDIT_USAGE_FLG** lookup field
- Define the required characteristic types where the characteristic entity is set to **Audit Event Type**.

Entity Audit Process

The entity audit process consists of the following two sub-processes:

- Audit Event Creation on page 3933
- Audit Event Processing on page 3934

Audit Event Creation

If you add, edit, or delete an entity which is created using a business object for which the entity audit feature is enabled, the system checks whether an active audit event type exists for the entity business object. If so, it considers the active audit event type and creates the audit event using the respective audit event type. The system creates the audit event while:

- Defining an entity when the **Add Action** option is selected in the audit event type
- Editing an entity when the **Update All** option is selected in the audit event type or when the updated element is listed in the **Audit Elements for Entity Update** section
- Deleting an entity when the **Delete Action** option is selected in the audit event type

For more information about the audit event type, see Audit Event Type on page 3935.

The audit event is created in the **Pending** status. Note that the system creates one audit event for the entity irrespective of the number of changes made during the entity update. The entity type and entity ID for which an audit event is created are added corresponding to the audit event in the **C1_AUDIT_EVENT** table. For example, if the audit event is created while adding or updating a pricing rule, then the entity type is set to **Pricing Rule** and entity ID is set to the pricing rule ID. In addition, an effective date is stamped corresponding to the audit event in the **C1_AUDIT_EVENT** table. Note that if the entity has a start date, then the effective date is set to the entity's start date. But, if the entity does not have a start date, then the effective date is set to the system date.

Copyright © 2026, Oracle and/or its affiliates.

At a time, you can have only two audit events for the entity in the **Pending** status - one audit event which is created during the **Add** action and another audit event which is created during the **Update** action.

Note: Before creating an audit event, the system checks whether an audit event for the entity ID with the same effective date already exists in the **Pending** or **Error** status for the respective action. If so, the system does not create a new audit event for the entity. Instead, the system adds a new log entry in the existing audit event.

Audit Event Processing

On executing the **Audit Event Processing (C1-AUDEV)** batch, the system checks whether there are any audit events in the **Pending** status. If there is an audit event in the **Pending** status, the system checks whether an algorithm is attached to the **Audit Event Processing** system event of the respective audit event type. If an algorithm is not attached to the **Audit Event Processing** system event of the respective audit event type, the status of the audit event is set to **Complete**.

However, if an algorithm is attached to the **Audit Event Processing** system event of the respective audit event type, the system executes the algorithm and accordingly changes the status of the audit event to **Complete**. For example, while processing the audit events of the **C1-PricingRuleTierBased** and **C1-PricingRuleAgeBased** business objects, the system checks whether an algorithm is attached to the **Audit Event Processing** system event of the respective audit event type. If the **C1-AUDEVMPR** algorithm is attached to the audit event type, the system identifies the policy plan where the pricing rule is defined. Once the policy plan is identified, it extracts a list of membership defined on the policy plan and the pricing rule type using which the pricing rule is created. Then, the system creates an entry for each membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of these entries is set to **P**. Finally, the status of the audit event is set to **Complete**.

If any error occurs, the status of the audit event is set to **Error**. The system enables you to either reprocess or cancel the audit events which are in the **Error** status. On canceling an audit event, the status of the audit event is changed to **Canceled**.

For more information about the **Audit Event Processing (C1-AUDEV)** batch and its parameters, see *Oracle Revenue Management and Billing Batch Guide*.

Algorithms Used in the Entity Audit Process

The following table lists the algorithms which are designed to implement the entity audit process:

Algorithm	Algorithm Type	Attached To	System Event	Algorithm Description
C1-REAUDEVNT	C1-REAUDEVNT	Entity Business Object	Audit	Refer to C1-REAUDEVNT on page 3934.
C1-AUDEVMPR	C1-AUDEVMPR	Audit Event Type of the **C1-PricingRuleAgeBased** and **C1-PricingRuleTierBased** business objects	Audit Event Processing	Refer to C1-AUDEVMPR on page 3935.

C1-REAUDEVNT

If this algorithm is attached to the **Audit** system event of a business object, it is invoked whenever you define, edit, or delete the respective entity. It checks whether an active audit event type exists for the entity business object. If so, it considers the active audit event type and creates the audit event using the respective audit event type. The system creates the audit event while:

- Defining an entity when the **Add Action** option is selected in the audit event type

Copyright © 2026, Oracle and/or its affiliates.

- Editing an entity when the **Update All** option is selected in the audit event type or when the updated element is listed in the **Audit Elements for Entity Update** section
- Deleting an entity when the **Delete Action** option is selected in the audit event type

The entity type and entity ID for which an audit event is created are added corresponding to the audit event in the **C1_AUDIT_EVENT** table. In addition, the effective date is stamped corresponding to the audit event in the **C1_AUDIT_EVENT** table. Note that if the entity has a start date, then the effective date is set to the entity's start date. But, if the entity does not have a start date, then the effective date is set to the system date.

Note: Before creating an audit event, the system checks whether an audit event for the entity ID with the same effective date already exists in the **Pending** or **Error** status for the respective action. If so, the system does not create a new audit event for the entity. Instead, the system adds a new log entry in the existing audit event.

At present, this algorithm is designed to work with the following business objects:

- C1-POLICY
- C1-ASOPolicy
- C1-Membership
- C1-PolicyPlan
- C1_PERSON_BO
- C1-PricingRuleTierBased
- C1-PricingRuleAgeBased

If you want to use the audit algorithm for the business objects which are not listed above, you need to create a custom audit algorithm.

It contains the following parameters:

- **Audit Event Business Object** - Used to specify the business object using which you want to create the audit event.
- **Audit Event Pending Status** - Used to specify the status in which you want to create the audit event. This parameter is also used for determining whether an audit event for the entity ID already exists in the system.
- **Audit Event Error Status** - Used to specify the status in which an audit event is transitioned when an error occurs while processing the audit event. This parameter is used for determining whether an audit event for the entity ID already exists in the system.

All the above parameters are mandatory.

C1-AUDEVMPR

You must attach this algorithm to the **Audit Event Processing** system event while creating an audit event type for the **C1-PricingRuleAgeBased** and **C1-PricingRuleTierBased** business objects.

This algorithm is invoked when the **Audit Event Processing (C1-AUDEV)** batch is executed. If this algorithm is attached to the **Audit Event Processing** system event of the respective audit event type, the system identifies the policy plan where the pricing rule is defined. Once the policy plan is identified, it extracts a list of membership defined on the policy plan and the pricing rule type using which the pricing rule is created. Then, the system creates an entry for each membership, pricing rule type, and effective date combination in the **CI_REPRC_ENTITY_DTL** table. The status of these entries is set to **P** in the **CI_REPRC_ENTITY_DTL** table.

Audit Event Type

Oracle Revenue Management and Billing enables you to define an audit event type for an entity business object. However, at a time, only one audit event type of the entity business object can be in the **Active** status. The system creates an audit event using the active audit event type whenever you define, edit, or delete the respective entity. The audit event type helps the system to determine:

Copyright © 2026, Oracle and/or its affiliates.

- **Entity Business Object** - The business object for which you want to define the audit event type.
- **Audit Usage** - The usage indicates the purpose of auditing an entity which is created using the entity business object. For example, membership premium charges might change due to change in pricing and therefore you may want to audit the pricing rules for premium calculation.
- **Audit Actions** - The various options, such as **Add Action**, **Delete Action**, and **Update All** are available while defining an audit event type. The system creates an audit event while defining, editing or deleting an entity depending on whether the respective option is selected in the audit event type. For example, if you create the active audit event types for the following entity business objects where the below listed options are selected:

Audit Event Type	Entity Business Object	Add Action	Update All	Delete Action
AETY1	C1-POLICY	Y	N	N
AETY2	C1-ASOPolicy	Y	Y	Y

  Then, the system will create an audit event using the **AETY1** audit event type when you define a fully-insured group policy. But, the system will not create an audit event when you edit or delete a fully-insured group policy. However, the system will create an audit event using the **AETY2** audit event type when you define, edit, or delete a self-funded policy.
- **Audit Elements During Update** - Alternatively, you can list the elements of the entity business object which should be monitored for the auditing purpose while editing an entity in the audit event type. You can list the elements of the entity business object when the **Update All** option is not selected. The system enables you to monitor a set of the business object statuses, characteristic types, and fields and accordingly creates an audit event while editing an entity. For example, if you create the audit event types for the following entity business objects:

Audit Event Type	Entity Business Object	Update All	Audit Elements During Update
AETY3	C1_PERSON_BO	Y	Not applicable
AETY4	C1-PricingRuleTierBased	N	Pricing Start Date, Rate Option, Base Fee for a Price Component
AETY5	C1-PricingRuleAgeBased	N	Rate Option, Base Fee for a Price Component

  Then, the system will create an audit event using the **AETY3** audit event type when you edit any details of a person. But, the system will create an audit event using the **AETY4** audit event type when the following fields in a tier based pricing rule are edited:

  - Pricing Start Date
  - Rate Option
  - Base Fee for a Price Component

  Similarly, the system will create an audit event using the **AETY5** audit event type when the following fields in an age based pricing rule are edited:

  - Rate Option
  - Base Fee for a Price Component

The **Audit Event Type** screen allows you to define, edit, copy, and delete an audit event type. It contains the following zones:

- Audit Event Type List on page 3937
- Audit Event Type on page 3938

Copyright © 2026, Oracle and/or its affiliates.

Audit Event Type List

The **Audit Event Type List** zone lists the audit event types that are already defined in the system. It contains the following columns:

Column Name	Column Description
Audit Event Type	Displays the audit event type.
Description	Displays the description of the audit event type.
Entity Business Object	Indicates the business object for which the audit event type is created. In addition, this column has a context menu which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.
Status	Indicates the status of the audit event type. The valid values are: • Active • Inactive
Audit Usage	Indicates the purpose of auditing an entity which is created using the entity business object. The valid values are: • **Disaggregation/Reseeding** - Used when you want to audit an entity for which the system should automatically create disaggregation or reseeding request. • **Premium Calculation** - Used when you want to audit an entity which has an impact on membership premium calculation.
Edit	On clicking the **Edit** (✎) icon, the **Audit Event Type** screen appears where you can edit the details of the audit event type. **Note:** You can edit an audit event type when an audit event is not yet created using the audit event type. However, if an audit event is created using the audit event type, you can only do the following: • Change the status from **Active** to **Inactive** and vice-versa • Attach algorithms (if required) to the audit event type • Define, edit, or remove characteristics of the audit event type
Duplicate	On clicking the **Duplicate** (⧉) icon, the **Audit Event Type** screen appears where you can define a new audit event type using an existing audit event type.
Delete	On clicking the **Delete** (🗑) icon, you can delete the audit event type. **Note:** You can delete an audit event type when an audit event is not yet created using the audit event type.

Note: Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

You can filter the list using various search criteria (such as, **Status** and **Entity Business Object**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (▽) icon in the upper right corner of this zone.

Copyright © 2026, Oracle and/or its affiliates.

On clicking the **Broadcast** (((•))) icon corresponding to an audit event type, the **Audit Event Type** zone appears with the details of the respective audit event type.

Audit Event Type

The **Audit Event Type** zone displays the details of the audit event type. It contains the following sections:

- **Main** - Displays basic information about the audit event type. It contains the following fields:

Field Name	Field Description
Audit Event Type	Displays the audit event type.
Description	Displays the description of the audit event type.
Detailed Description	Displays additional information about the audit event type.
Status	Indicates the status of the audit event type. The valid values are: • Active • Inactive
Entity Business Object	Indicates the business object for which the audit event type is defined. In addition, this field has a context menu which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.
Audit Usage	Indicates the purpose of auditing an entity which is created using the entity business object. The valid values are: • **Premium Calculation** - Used when you want to audit an entity which has an impact on membership premium calculation. • **Disaggregation/Reseeding** - Used when you want to audit an entity for which the system should automatically create disaggregation or reseeding request.
Update All	Indicates whether an audit event must be created whenever any field, characteristic, or status of the entity is updated.
Add Action	Indicates whether an audit event must be created whenever an entity is added.
Delete Action	Indicate whether an audit event must be created whenever an entity is deleted.

- **Algorithms** - Lists the algorithms associated with the audit event type. It contains the following columns:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
System Event	Indicates the system event when the algorithm must be triggered. The valid value is: • Audit Event Processing
Sequence	Indicates the order in which the algorithms with the same system event must be triggered.
Algorithm	Indicates the algorithm attached to the system event. **Note:** It has a link. On clicking the link, the **Algorithm** screen appears where you can view the details of the respective algorithm.

- **Audit Elements for Entity Update** - Lists the elements which must be monitored for auditing while updating the entity. It contains the following columns:

Column Name	Column Description
Element Type	Indicates the type of element. The valid values are: • Business Object Status • Characteristic • Field
Element Name	Displays the element which must be monitored for auditing. **Note:** If the element is a part of a group or list, the system displays the element name along with the element group and/or list. For example, if you select the **policyPerRole** element of the **C1-ASOPolicy** business object, the system displays the `policyPersons/policyPerRole` in the **Element Name** field. Here, the **policyPersons** is the element list.
Element Value	The following table lists the element value depending on the element type: **Element Type** / **Element Value** Business Object Status: Indicates the status of the entity business object which must be monitored for auditing. Characteristic: Indicates the characteristic type which must be monitored for auditing. **Note:** The data does not appear in this column when the element type is set to **Field**.

- **Characteristics** - Lists the characteristics which are defined for the audit event type. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - This section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the audit event type.

Copyright © 2026, Oracle and/or its affiliates.

Button Name	Button Description
	Note: You can edit an audit event type when an audit event is not yet created using the audit event type. However, if an audit event is created using the audit event type, you can only do the following: • Change the status from **Active** to **Inactive** and vice-versa • Attach algorithms (if required) to the audit event type • Define, edit, or remove characteristics of the audit event type
Delete	Used to delete the audit event type.
	Note: You can delete an audit event type when an audit event is not yet created using the audit event type.
Duplicate	Used to create a new audit event type using an existing audit event type.

- **Record Information** - This section contains the following field:

Field Name	Field Description
Business Object	Indicates the business object using which the audit event type is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.

By default, the **Audit Event Type** zone does not appear in the **Audit Event Type** screen. It appears when you click the **Broadcast** (📡) icon corresponding to an audit event type in the **Audit Event Type List** zone.

Defining an Audit Event Type

Prerequisites

To define an audit event type, you should have:

- Entity business objects defined in the application
- The **Eligible for Audit Event** option type of the entity business object (for which you want to define an audit event type) set to **Y**

> **Note:** The **Eligible for Audit Event** option type is available for the entity business object when the **Valid BO Option Type** option type of the respective maintenance object is set to **C1AT**.

- Values defined for the **AUDIT_USAGE_FLG** lookup field

Copyright © 2026, Oracle and/or its affiliates.

Procedure

To define an audit event type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **A** and then click **Audit Event Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Audit Event Type** sub-menu.

   The **Audit Event Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic information about the audit event type.
   - **Algorithms** - Used to associate algorithms with the audit event type.
   - **Audit Elements for Entity Update** - Used to list the elements from the entity business object which you want to monitor for auditing while updating the entity.

     Note: The **Audit Elements for Entity Update** section is enabled only when the **Update All** option is not selected in the **Main** section.
   - **Characteristics** - Used to define the characteristics for the audit event type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Audit Event Type	Used to specify the audit event type. **Note:** You cannot specify any special characters except hyphen and underscore in the audit event type.	Yes
Business Object	Indicates the business object using which you are defining the audit event type.	Not applicable
Description	Used to specify the description for the audit event type.	Yes
Detailed Description	Used to specify additional information about the audit event type.	No
Status	Used to indicate the status of the audit event type. The valid values are: • Active • Inactive **Note:** You can create only one audit event type in the **Active** status for an entity business object.	Yes
Entity Business Object	Used to indicate the business object for which you want to define the audit event type. **Note:** The list includes only those business objects where the **Eligible for Audit Event** option type is set to **Y**.	Yes
Audit Usage	Used to indicate the purpose of auditing an entity which is created using the entity business object. The valid values are: • **Disaggregation/Reseeding** - Used when you want to audit an entity for which the system should	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	automatically create disaggregation or reseeding request. • **Premium Calculation** - Used when you want to audit an entity which has an impact on membership premium calculation.	
Update All	Used to indicate whether you want to create an audit event whenever any field, characteristic, or status of the entity is updated.	No
Add Action	Used to indicate whether you want to create an audit event whenever the entity is added.	Yes (Conditional) **Note:** This field is required when you want to create an audit event while adding the entity.
Delete Action	Used to indicate whether you want to create an audit event whenever the entity is deleted.	Yes (Conditional) **Note:** This field is required when you want to create an audit event while deleting the entity.

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Audit Event Type** screen.

4. Enter the required details in the **Main** section.
5. Associate the required algorithms with the audit event type.
6. Add elements (such as, field, characteristic, or status) which you want to monitor for auditing while updating the entity.

Note: You can list the elements for auditing when the **Update All** option is not selected in the **Main** section.

7. Define characteristics for the audit event type, if required.
8. Click **Save**.
   The audit event type is defined.

Associating an Algorithm with an Audit Event Type

Prerequisites

To associate an algorithm with an audit event type, you should have:

- Algorithms defined in the application (which are created using an algorithm type where the algorithm entity is set to **Audit Event Processing**)

> **Note:** The **C1-AUDEVMPR** algorithm type is shipped with the product. You must attach an algorithm created using the **C1-AUDEVMPR** algorithm type to the audit event types which are defined for the **C1-PricingRuleTierBased** and **C1-PricingRuleAgeBased** business objects.

Procedure

To associate an algorithm with an audit event type:

1. Ensure that the **Algorithms** section is expanded when you are defining, editing, or copying an audit event type.

   The **Algorithms** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
System Event	Used to indicate the system event when you want to trigger the algorithm. The valid value is: • **Audit Event Processing** - Used when you want to trigger the attached algorithm while executing the **Audit Event Process Monitor (C1-AUDEV)** batch.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the audit event type.
Sequence	Used to indicate the order in which the algorithms with the same system event should be triggered.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the audit event type.
Algorithm	Used to indicate the algorithm that you want to attach to the system event. **Note:** Once you select the system event, the **Search** (🔍) icon appears corresponding to the **Algorithm** field. On clicking the **Search** icon, the **Algorithm Search** window appears. On specifying the algorithm, the description of the algorithm appears corresponding to the **Algorithm** field.	Yes (Conditional) **Note:** This field is required when you are associating an algorithm with the audit event type.

2. Enter the required details in the **Algorithms** section.
3. If you want to associate more than one algorithm with the audit event type, click the **Add** (+) icon, and then *r*epeat step 2.

> **Note:** However, if you want to remove an algorithm from the audit event type, click the **Delete** (🗑) icon corresponding to the algorithm.

Adding an Element for Auditing in an Audit Event Type

Prerequisites

To add an element for auditing in an audit event type, you should have:

- Required elements defined in the entity business object schema
- Required statuses defined in the lifecycle of the entity business object
- Required characteristic types defined in the application (where the characteristic entity is set to the respective entity)

Procedure

To add an element for auditing in an audit event type:

1. Ensure that the **Audit Elements for Entity Update** section is expanded when you are defining, editing, *or* copying an audit event type.

   The **Audit Elements for Entity Update** section contains the following fields in a grid:

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td>Element Type</td><td>Used to indicate the type of element. The valid values are:
Business Object Status
Characteristic
Field</td><td>Yes (Conditional)
Note: This field is required when you want to create an audit event whenever the specified element is updated.</td></tr>
<tr><td>Element Name</td><td>Used to specify the element which you want to monitor while updating the entity. The following table lists the elements which you must select for the respective element type:<table><tr><th>Element Type</th><th>Element Name</th></tr><tr><td>Business Object Status</td><td>boStatus</td></tr><tr><td>Characteristic</td><td>characteristics/characteristicsList/characteristicType</td></tr><tr><td>Field</td><td>Any field from the entity business object schema</td></tr></table></td><td>Yes (Conditional)
Note: This field is required when you want to create an audit event whenever the specified element is updated.</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

<table>
<tr><th>Field Name</th><th>Field Description</th><th>Mandatory (Yes or No)</th></tr>
<tr><td></td><td>
<table>
<tr><th>Element Type</th><th>Element Name</th></tr>
<tr><td></td><td>Note:
Here, you must not specify a element whose type is set to group or list.
If the element is a part of a group or list, the system displays the element name along with the element group and/or list. For example, if you select the policyPerRole element of the C1-ASOPolicy business object, the system displays the <code>policyPersons/policyPerRole</code> in the Element Name field. Here, the policyPersons is the element list.</td></tr>
</table>
</td><td></td></tr>
<tr><td></td><td>Note:
The Search (🔍) icon appears corresponding to the Element Name field. On clicking the Search icon, the Schema window appears.
The Schema window does not appear when the entity business object is not specified in the Main section.</td><td></td></tr>
<tr><td>Element Value</td><td>Used to specify the element value depending on the element type. The following table lists the element value that you must specify depending on the element type:
<table>
<tr><th>Element Type</th><th>Element Value</th></tr>
<tr><td>Business Object Status</td><td>Used to indicate the status of the entity business object which you want to monitor for auditing. The system then creates an audit event whenever the entity is transitioned to the specified status.</td></tr>
<tr><td>Characteristic</td><td>Used to indicate the characteristic type which you want to monitor for auditing. Here, you must specify a characteristic type where the characteristic entity is set to the respective entity. The system then creates an audit event whenever the specified characteristic is defined, edited, or removed from the entity.</td></tr>
</table>
</td><td>Yes (Conditional)
Note: This field is required when you want to create an audit event whenever the specified element is updated.</td></tr>
</table>

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description		Mandatory (Yes or No)
	Element Type	**Element Value**	
		Note: The **Search** (🔍) icon appears corresponding to the **Element Value** field. On clicking the **Search** icon, the **Characteristic Type Search** window appears.	
	Note: This field does not appear when the **Field** option is selected from the **Element Type** list.		

Note: The **Audit Elements for Entity Update** section is enabled when the **Update All** option is not selected in the **Main** section.

2. Enter the required details in the **Audit Elements for Entity Update** section.
3. If you want to add more than one element for auditing in the audit event type, click the **Add** (+) icon and then *r*epeat step 2.

Note: However, if you want to remove an element from the audit event type, click the **Delete** (🗑) icon corresponding to the element.

Defining a Characteristic for an Audit Event Type

Prerequisites

To define a characteristic for an audit event type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Audit Event Type**)

Procedure

To define a characteristic for an audit event type:

1. Ensure that the **Characteristics** section is expanded when you are defining, editing, or copying an audit *e*vent type.

   The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Audit Event Type**.	**Note:** This field is required when you are defining a characteristic for the audit event type.

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears where you can search for a predefined characteristic value. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required when you are defining a characteristic for the audit event type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the audit event type, click the **Add** (+) icon, and then *r*epeat step 2.

Note: However, if you want to remove a characteristic from the audit event type, click the **Delete** (🗑) icon corresponding to the characteristic.

Related Topics

For more information on...	See...
How to define an audit event type	Defining an Audit Event Type on page 3940
How to edit an audit event type	Editing an Audit Event Type on page 3947
How to copy an audit event type	Copying an Audit Event Type on page 3950

Editing an Audit Event Type

You can edit an audit event type when an audit event is not yet created using the audit event type. However, if an audit event is created using the audit event type, you can only do the following:

- Change the status from **Active** to **Inactive** and vice-versa
- Attach algorithms (if required) to the audit event type
- Define, edit, or remove characteristics of the audit event type

Prerequisites

To edit an audit event type, you should have:

- Values defined for the **AUDIT_USAGE_FLG** lookup field

Procedure

To edit an audit event type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **A** and then click **Audit Event Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Audit Event Type** sub-menu.
   The **Audit Event Type** screen appears.

Copyright © 2026, Oracle and/or its affiliates.

4. In the **Audit Event Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the audit *e*vent type whose details you want to edit.

   The **Audit Event Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic information about the audit event type.
   - **Algorithms** - Used to associate algorithms with the audit event type.
   - **Audit Elements for Entity Update** - Used to list the elements from the entity business object which you want to monitor for auditing while updating the entity.

     Note: The **Audit Elements for Entity Update** section is enabled only when the **Update All** option is not selected in the **Main** section.

   - **Characteristics** - Used to define the characteristics for the audit event type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Audit Event Type	Displays the audit event type.	Not applicable
Business Object	Indicates the business object which is used while defining the audit event type.	Not applicable
Description	Used to specify the description for the audit event type.	Yes
Detailed Description	Used to specify additional information about the audit event type.	No
Status	Used to indicate the status of the audit event type. The valid values are: • Active • Inactive **Note:** You can create only one audit event type in the **Active** status for an entity business object.	Yes
Entity Business Object	Indicates the business object for which the audit event type is defined.	Not applicable
Audit Usage	Used to indicate the purpose of auditing an entity which is created using the entity business object. The valid values are: • **Premium Calculation** - Used when you want to audit an entity which has an impact on membership premium calculation. • **Disaggregation/Reseeding** - Used when you want to audit an entity for which the system should automatically create disaggregation or reseeding request.	Yes
Update All	Used to indicate whether you want to create an audit event whenever any field, characteristic, or status of the entity is updated.	No
Add Action	Used to indicate whether you want to create an audit event whenever the entity is added.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
		Note: This field is required when you want to create an audit event while adding the entity.
Delete Action	Used to indicate whether you want to create an audit event whenever the entity is deleted.	Yes (Conditional) **Note:** This field is required when you want to create an audit event while deleting the entity.

Tip: Alternatively, you can access this screen by clicking the **Edit** button in the **Audit Event Type** zone.

5. Modify the required details in the **Main** section.
6. Associate or disassociate the required algorithms from the audit event type.

Note: If an audit event is created using the audit event type, you cannot edit or remove algorithms from the audit event type. In such case, you can only associate additional algorithms with the audit event type.

7. Add, edit, or remove elements from the audit event type, if required.

Note:

The **Audit Elements for Entity Update** section is enabled when the **Update All** option is not selected in the **Main** section.

You cannot add, edit, or remove elements from the **Audit Elements for Entity Update** section when an audit event is already created using the audit event type.

8. Define, edit, or remove characteristics of the audit event type, if required.

Note: You cannot define, edit, or remove characteristics of the **Characteristics** section when an audit event is already created using the audit event type.

9. Click **Save**.
   The changes made to the audit event type are saved.

Copying an Audit Event Type

Instead of creating an audit event type from scratch, you can create a new audit event type using an existing audit event type. This is possible through copying an audit event type. On copying an audit event type, the details including the algorithms, audit elements, and characteristics are copied to the new audit event type. You can then edit the details, if required.

Prerequisites

To copy an audit event type, you should have:

- Audit event type (whose copy you want to create) defined in the application
- Entity business objects defined in the application
- The **Eligible for Audit Event** option type of the entity business object (for which you want to define an audit event type) set to **Y**

> **Note:** The **Eligible for Audit Event** option type is available for the entity business object when the **Valid BO Option Type** option type of the respective maintenance object is set to **C1AT**.

- Values defined for the **AUDIT_USAGE_FLG** lookup field

Procedure

To copy an audit event type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **A** and then click **Audit Event Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Audit Event Type** sub-menu.
   The **Audit Event Type** screen appears.
4. In the **Audit Event Type List** zone, click the **Duplicate** (⧉) icon in the **Duplicate** column corresponding to the *a*udit event type whose copy you want to create.

   The **Audit Event Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic information about the audit event type.
   - **Algorithms** - Used to associate algorithms with the audit event type.
   - **Audit Elements for Entity Update** - Used to list the elements from the entity business object which you want to monitor for auditing while updating the entity.

     > **Note:** The **Audit Elements for Entity Update** section is enabled only when the **Update All** option is not selected in the **Main** section.

   - **Characteristics** - Used to define the characteristics for the audit event type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Audit Event Type	Used to specify the audit event type. **Note:** You cannot specify any special characters except hyphen and underscore in the audit event type.	Yes
Business Object	Indicates the business object which is used while defining the audit event type.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Description	Used to specify the description for the audit event type.	Yes
Detailed Description	Used to specify additional information about the audit event type.	No
Status	Used to indicate the status of the audit event type. The valid values are: • Active • Inactive **Note:** You can create only one audit event type in the **Active** status for an entity business object.	Yes
Entity Business Object	Used to indicate the business object for which you want to define the audit event type. **Note:** The list includes only those business objects where the **Eligible for Audit Event** option type is set to **Y**.	Yes
Audit Usage	Used to indicate the purpose of auditing an entity which is created using the entity business object. The valid values are: • **Premium Calculation** - Used when you want to audit an entity which has an impact on membership premium calculation. • **Disaggregation/Reseeding** - Used when you want to audit an entity for which the system should automatically create disaggregation or reseeding request.	Yes
Update All	Used to indicate whether you want to create an audit event whenever any field, characteristic, or status of the entity is updated.	No
Add Action	Used to indicate whether you want to create an audit event whenever the entity is added.	Yes (Conditional) **Note:** This field is required when you want to create an audit event while adding the entity.
Delete Action	Used to indicate whether you want to create an audit event whenever the entity is deleted.	Yes (Conditional) **Note:** This field is required when you want to create an audit event while deleting the entity.

Tip: Alternatively, you can copy an audit event type by clicking the **Duplicate** button in the **Audit Event Type** zone.

5. Enter the required details in the **Main** section.
6. Associate or disassociate the required algorithms from the audit event type.
7. Add, edit, or remove elements from the audit event type, if required.

Copyright © 2026, Oracle and/or its affiliates.

> **Note:** The **Audit Elements for Entity Update** section is enabled when the **Update All** option is not selected in the **Main** section.

8. Define, edit, or remove characteristics of the audit event type, if required.
9. Click **Save**.
   The new audit event type is defined.

Deleting an Audit Event Type

Procedure

To delete an audit event type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **A** and then click **Audit Event Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Audit Event Type** sub-menu.
   The **Audit Event Type** screen appears.
4. In the **Audit Event Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to the audit *e*vent type that you want to delete.

   A message appears confirming whether you want to delete the audit event type.

   > **Note:** You can delete an audit event type when an audit event is not yet created using the audit event type.

   > **Tip:** Alternatively, you can delete an audit event type by clicking the **Delete** button in the **Audit Event Type** zone.
5. Click **OK**.
   The audit event type is deleted.

Search Audit Event

The **Search Audit Event** zone allows you to search for an audit event using various search criteria. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Search By	Used to indicate whether you want to search for an audit event using the entity or audit event details. The valid values are: • Entity Details • Audit Event Details **Note:** By default, the **Entity Details** option is selected.	Yes
Entity	Used to search audit events which are created for a particular entity business object. **Note:** This field appears when the **Entity Details** option is selected from the **Search By** list. The list includes only those entity business objects where the **Eligible for Audit Event** option type is set to **Y**.	No
Created From	Used to search audit events which are created from a particular date onwards.	No
Created To	Used to search audit events which are created till a particular date.	No
Entity ID	Used to search audit events which are created for a particular entity. **Note:** This field appears when the following conditions are met: • The **Entity Details** option is selected from the **Search By** list. • The entity business object is selected from the **Entity** list. You can search for an audit event by clicking the **Search** (🔍) icon corresponding to the field.	No
Status	Used to search audit events with a particular status. The valid values are: • Canceled • Complete • Error • Pending	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: This field appears in the search criteria by default, when the **Audit Event Details** option is selected from the **Search By** list. In case you choose the **Entity Details** option, this field appears only when the entity business object is selected from the **Entity** list.	
From Effective Date	Used to search audit events whose effective date is equal to or later than the specified date. **Note:** This field appears only when you choose the **Entity Details** option from the **Search By** list and entity business object from the **Entity** list.	No
To Effective Date	Used to search audit events whose effective date is equal to or earlier than the specified date. **Note:** This field appears only when you choose the **Entity Details** option from the **Search By** list and entity business object from the **Entity** list.	No
Audit Event ID	Used to search a particular audit event. **Note:** This field appears when the **Audit Event Details** option is selected from the **Search By** list.	No
Audit Event Type	Used to search audit events which are created using a particular audit event type. **Note:** This field appears when the **Audit Event Details** option is selected from the **Search By** list.	No
Audit Action	Used to search audit events which are created while adding, updating, or deleting an entity. The valid values are: • Add Row • Change Row • Delete Row **Note:** This field appears when the **Audit Event Details** option is selected from the **Search By** list.	No

Note: You must specify at least one search criterion while searching for an audit event.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Creation Date Time	Displays the date and time when the audit event is created.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Audit Event Information	Displays information about the audit event. **Note:** It has a link. On clicking the link, the **Audit Event** screen appears where you can view the details of the respective audit event.
Entity ID	Indicates the entity for which the audit event is created.
Entity	Indicates the entity business object for which the audit event is created.
Effective Date	Displays the effective date which is stamped corresponding to the audit event. **Note:** The effective date is used later to derive the timeline for premium calculation.
Status	Indicates the status of the audit event. The valid values are: • Canceled • Complete • Error • Pending
Audit Action	Indicates the action due to which the audit event is created for the entity. The valid values are: • Add Row • Change Row • Delete Row
Pricing Requested	Indicates whether the repricing entity detail records are created for the audit event. The valid values are: • Yes • No **Note:** It has a link. On clicking the link, if the repricing entity record exist, the **Repricing Request** screen appears where you can view the details of the repricing entity. In case the record does not exist, the system displays a warning message.

Note: Pagination is used to display limited number of records in the **Search Results** section. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

Searching for an Audit Event

Prerequisites

To search for an audit event, you should have:

- Entity business objects defined in the application

Copyright © 2026, Oracle and/or its affiliates.

- The **Eligible for Audit Event** option type of the entity business object set to **Y**

> **Note:** The **Eligible for Audit Event** option type is available for the entity business object when the **Valid BO Option Type** option type of the respective maintenance object is set to **C1AT**.

Procedure

To search for an audit event:

1. Click the **Menu** link in the **Application** toolbar.
   A list appears.
2. From the **Main** menu, select **Transaction and Audit Event Management** and then click **Audit Event**.
   The **Audit Event** screen appears.
3. Enter the search criteria in the **Search Audit Event** zone.

> **Note:** ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

4. Click **Search**.
   A list of audit events that meet the search criteria appears in the **Search Results** section.

- Audit Event on page 3958

Audit Event

The **Audit Event** zone displays the details of the audit event. It contains the following sections:

- **Main** - Displays basic information about the audit event. It contains the following fields:

Field Name	Field Description
Audit Event Information	Displays information about the audit event.
Audit Event Type	Indicates the audit event type using which the audit event is created. **Note:** It has a link. On clicking the link, the **Audit Event Type** screen appears where you can view the details of the respective audit event type.
Status	Indicates the status of the audit event. The valid values are: • Canceled • Complete • Error • Pending
Entity ID	Indicates the entity for which the audit event is created.
Effective Date	Displays the effective date which is stamped corresponding to the audit event in the **C1_AUDIT_EVENT** table. **Note:** If the entity has a start date, then the effective date is set to the entity's start date. But, if the entity does not have a start date, then the effective date is set to the system date.
Audit Action Flag	Indicates the action due to which the audit event is created for the entity. The valid values are:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description
	• Add Row • Change Row • Delete Row
Maintenance Object	Indicates the maintenance object of the entity business object for which the audit event is created. **Note:** It has a link. On clicking the link, the **Maintenance Object** screen appears where you can view the details of the respective maintenance object.

- **Characteristics** - Lists the characteristics defined for the audit event. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - This section contains the following button:

Button Name	Button Description
Cancel	Used to cancel the audit event. **Note:** The **Cancel** button appears when the audit event is in the **Error** status.

- **Record Information** - This section contains the following fields:

Field Name	Field Description
Business Object	Indicates the business object using which the audit event is created. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.
Status Date/Time	Displays the date and time when the audit event status is updated.
Create Date/Time	Displays the date and time when the audit event is created.

Canceling an Audit Event

There might be situations when an erroneous audit event is created in the system. In such case, the system provides you with an ability to cancel such audit events. However, note that you can cancel an audit event when the audit event is in the **Error** status.

Prerequisites

To cancel an audit event, you should have:

- Cancel reasons defined in the application

Note: While cancelling an audit event, you need to specify the reason why you want to cancel the audit event. You can select the appropriate cancel reason when you have defined the reasons for the **Canceled** status of the **C1-AuditEvent** business object in the **Status Reason** screen.

Procedure

To cancel an audit event:

1. Search for the audit event in the **Audit Event** screen.
2. In the **Search Results** section, click the link in the **Audit Event Information** column corresponding to the *a*udit event which you want to cancel.
   The **Audit Event** screen appears.
3. Ensure that the **Main** tab is selected.
4. Click the **Cancel** button in the **Audit Event** zone.

   The **Status Reason** window appears. It contains the following field:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Status Reason	Used to indicate the reason why you want to cancel the audit event.	Yes

Note: The **Cancel** button appears when the audit event is in the **Error** status.

5. Select the cancel reason from the **Status Reason** list.
6. Click **Save**.
   The status of the audit event is changed to **Canceled**.

Chapter 45

Invoice Request

Topics:

- Invoice Request for Group Health Insurance Billing
- Invoice Request for Individual Health Insurance Billing
- Invoice Request for Direct Billed Group Membership Accounts
- Prerequisites
- Invoice Request Manual Trial Bill Generation (Without Approval) Status Transition
- Invoice Request Manual Regular Bill Generation (Without Approval) Status Transition
- Invoice Request Manual Regular Bill Generation (With Approval) Status Transition
- Invoice Request Automatic Regular Bill Generation (Without Approval) Status Transition
- Invoice Request Type
- Invoice Request (Used for Searching)
- Invoice Request (Used for Viewing)

Oracle Revenue Management and Billing enables you to create invoice request for the following lines of health insurance business:

- **Fully-Insured Group Business** - For more information about the invoice request for the fully-insured group business, see Invoice Request for Group Health Insurance Billing on page 3964 and Types of Invoice Request for Fully-Insured Group Business on page 3966
- **Fully-Insured Individual Business** - For more information about the invoice request for the fully-insured individual business, see and Invoice Request for Individual Health Insurance Billing on page 3968 and Types of Invoice Request for Fully-Insured Individual Business on page 3970

Invoice Request for Group Health Insurance Billing

Oracle Revenue Management and Billing enables you to generate an adhoc regular or trial bill for an account through an invoice request. The system enables you to create an invoice request manually or automatically. It enables you to create an invoice request for a person or an account. You can create an invoice request for an account where the **Eligible For Invoice Request Creation (INVRACTE)** characteristic is set to **Y**.

If you create an invoice request for a person, the system will consider all those accounts of the person where the **Eligible For Invoice Request Creation (INVRACTE)** characteristic is set to **Y**. You can then exclude an account from the invoice request, if required. The system also enables you to consider all accounts of the person and its child persons where the **Eligible For Invoice Request Creation (INVRACTE)** characteristic is set to **Y**.

Note: The system searches for the characteristic type which is specified in the **Invoice Request Account Eligibility Char Type** option type of the **C1-INVREQ** feature configuration. By default, this option type is set to **INVRACTE**. You can change the characteristic type, if required.

In other words, the system enables you to create the following types of invoice request:

- **Manual Regular Bill Generation Invoice Request** - It is used to generate an adhoc regular bill for an account. You can create a manual regular bill generation invoice request for a person or an account from the user interface.
- **Manual Trial Bill Generation Invoice Request** - It is used to generate an adhoc trial bill for an account. You can create a manual trial bill generation invoice request for a person or an account from the user interface.
- **Automatic Regular Bill Generation Invoice Request** - It is used to generate an adhoc regular bill for an account. You can configure the system such that an automatic regular bill generation invoice request is created for an account automatically when a fully-insured group policy is activated, terminated, reinstated, or renewed from the user interface or through a health care inbound message.

Note:

The automatic invoice request creation feature is only designed to work for the fully-insured group health insurance business and not for the financial services or self-funded health insurance business.

You cannot create an automatic regular bill generation invoice request for a person.

At present, the system is not designed to create an automatic trial bill generation invoice request.

While creating an invoice request, you need to specify an invoice request type using which you want to create the invoice request. The system enables you to create the invoice request types with the following combinations:

Invoice Mode	Bill Generation Type	Approval Process
Manual	Regular	On
Manual	Regular	Off
Manual	Trial	Off
Automatic	Regular	Off

It is the invoice request type which helps the system to determine:

- The business object using which the invoice request should be created in the system

Copyright © 2026, Oracle and/or its affiliates.

> **Note:** Two invoice request business objects named **Invoice Request - Regular Bill Generation** (**C1-InvoiceRequest**) and **Invoice Request - Trial Bill Generation** (**C1-InvoiceRequestTrial**) are introduced in this release. If the **Bill Generation Type** field is set to **Regular**, you must select the **Invoice Request - Regular Bill Generation** business object from the **Invoice Request Business Object** list. However, if the **Bill Generation Type** field is set to **Trial**, you must select the **Invoice Request - Trial Bill Generation** business object from the **Invoice Request Business Object** list.

- Whether a manual or automatic invoice request should be created in the system
- Whether a regular or trial bill generation invoice request should be created in the system
- Whether a manual regular bill generation invoice request for an account should be processed in the online or deferred mode

> **Note:**
>
> The system will process a manual regular bill generation invoice request for an account in the deferred mode when the number of billable charges of the account exceeds the defer processing billable charge count.
>
> The defer processing billable charge count is not considered when a manual regular bill generation invoice request is created for a person.
>
> You can specify the defer processing billable charge count when the invoice mode is set to **Manual** and bill generation type is set to **Regular**.

- Whether the approval is required for the invoice request

> **Note:** You can only set the **Approval Required** flag when the invoice mode is set to **Manual** and bill generation type is set to **Regular**.

- The wait days which is used to calculate the processing date for an invoice request

> **Note:**
>
> If the invoice request is processed in the online mode, the system will process the invoice request when the processing date is earlier than or equal to the system date. However, if the invoice request is processed in the deferred mode, the system will process the invoice request when the processing date is earlier than or equal to the batch business date.
>
> If required, you can configure the system such that the processing date does not fall on a holiday. To implement this requirement you need to specify the work calendar which helps to determine the working day.

- The date calculation algorithm which is used to calculate the processing date for an automatic regular bill generation invoice request

> **Note:** In addition, you can configure threshold days for automatic invoice request creation. It is used to determine whether the number of days between the bill cycle date and processing date is greater than the threshold days. This parameter is used in Invoice Request Date Calculation algorithm to check whether the processing date of the invoice request is within threshold period. If so, the automatic invoice request is not created for the account. This parameter is only applicable while activating or renewing a fully-insured group policy.

While creating a manual invoice request, you need to specify the following - invoice request type, entity (i.e. person or account for which the invoice request should be created), cutoff date, accounting date, and bill date.

> **Note:** The cutoff date, accounting date, and bill date are derived while creating an automatic invoice request for an account.

For more information about the types of invoice request, see Types of Invoice Request for Fully-Insured Group Business on page 3966.

For more information on how to setup the invoice request feature, see Prerequisites on page 3981.

Copyright © 2026, Oracle and/or its affiliates.

Types of Invoice Request for Fully-Insured Group Business

The system allows you to create the following types of invoice requests for the fully-insured group business:

- Manual Regular Bill Generation Invoice Request on page 3966
- Manual Trial Bill Generation Invoice Request on page 3967
- Automatic Regular Bill Generation Invoice Request on page 3967

Manual Regular Bill Generation Invoice Request

Once a manual regular bill generation invoice request is created in the **Draft** status, the system checks whether it is created for a person or an account. If a manual regular bill generation invoice request is created for an account, you can submit the invoice request. On submitting the invoice request, the system checks whether the number of the billable charges of the account exceed the defer processing billable charge count. If the number of the billable charges of the account exceed the defer processing billable charge count, the status of the invoice request is changed to **Defer Processing Batch**. However, if the number of the billable charges of the account does not exceed the defer processing billable charge count, the system checks whether the processing date of the invoice request is earlier than or equal to the system date. If the processing date is later than the system date, the status of the invoice request is changed to **Defer Processing**. On the **C1-INVRQ** batch execution, the system checks whether there are any invoice requests in the **Defer Processing** status. If there is an invoice request in the **Defer Processing** status, the system checks whether the processing date of the invoice request is earlier than or equal to the system date. If the processing date is later than the system date, the status of the invoice request remains as **Defer Processing**.

Note: The system enables you to cancel an invoice request which is in the **Defer Processing Batch** or **Defer Processing** status.

However, if the processing date is earlier than or equal to the system date, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar is open for the accounting date. If the accounting calendar is open for the accounting date, the system creates the adhoc regular bill for the account in the online mode. Finally, the status of the invoice request is changed to **Processed**.

However, if the pending bill exists for the account, or if the cutoff date is earlier than or equal to the bill after date, or if the accounting calendar is not open for the accounting date, or if an error occurs while creating adhoc regular bill or its bill segments, the status of the invoice request is changed to **Error**. The system enables you to move such erroneous invoice request back to the **Draft** status.

However, if a manual regular bill generation invoice request is created for a person, the system checks whether the number of accounts of the person (if the **Include Person Hierarchy** option is not selected) or the number of accounts of the person and its child persons (if the **Include Person Hierarchy** option is selected) exceeds the limit defined in the **Account Limit** option type of the **C1-INVREQ** feature configuration. If the number of accounts does not exceed the account limit, the system derives the account of the person or the person and its child persons. Once the accounts are successfully derived, the status of the invoice request is changed to **Defer Processing Batch**.

However, if the number of accounts exceeds the account limit, the status of the invoice request is changed to **Account Derivation Pending**. On the **C1-INVRQ** batch execution, the system checks whether there are any invoice requests in the **Account Derivation Pending** status. If there is an invoice request in the **Account Derivation Pending** status, the system derives the accounts of the person or the person and its child persons. Once the accounts are successfully derived, the status of the invoice request is changed to **Defer Processing Batch**.

When you execute the **BILLOPEN** batch with the **Off Cycle Switch** parameter set to **Y**, the system checks whether the account that meets the search criteria is included in any invoice request which is in the **Defer Processing Batch** status. If the account is included in the invoice request, the system checks whether the processing date of the invoice request is earlier than or equal to the batch business date. If processing date is earlier than or equal to the batch business date, the system checks whether there is any record in the **Processing** status for the account in the invoice request. If so, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar is open for the accounting date. If the accounting calendar is

Copyright © 2026, Oracle and/or its affiliates.

open for the accounting date, the system creates the adhoc regular bill for the account in the **Pending** status. When you execute the **BSGENREQ** batch with the **Off Cycle Switch** parameter set to **Y**, the system creates the bill segments for the adhoc regular bill. When you execute the **POSTPROC** batch with the **Off Cycle Switch** parameter set to **Y**, the system creates the post-processing bill segments (if any) and completes the adhoc regular bill of the account. Finally, the status of the invoice request is changed to **Processed**.

However, if the pending bill exists for the account, or if the cutoff date is earlier than or equal to the bill after date, or if the accounting calendar is not open for the accounting date, or if an error occurs while creating adhoc regular bill or its bill segments, or if a To Do is generated for the bill review, the status of the record in the invoice request is changed to **Error**. If all records in the invoice request are in the **Error** status, the status of the invoice request is changed to **Error**. The system enables you to move such erroneous invoice request back to the **Draft** status.

You can optionally configure the approval process for the manual regular bill generation invoice request. If the **Approval Required** flag is set to **Yes** in the invoice request type, the status of the manual regular bill generation invoice request is changed to **Approval In Progress** when you submit the invoice request. The approver can then approve or reject the manual regular bill generation invoice request based on the observations.

Manual Trial Bill Generation Invoice Request

The manual regular bill generation invoice request and manual trial bill generation invoice request are created and processed identically with the following exceptions:

- On submitting the manual trial bill generation invoice request for an account, the system does not check whether the number of the billable charges of the account exceed the defer processing billable charge count. Therefore, the manual trial bill generation invoice request is always processed in the deferred mode.
- You need to specify the following parameters while executing the **BILLOPEN**, **BSGENREQ**, and **POSTPROC** batches:
  - Bill Generation Type (set to **Trial**)
  - Description for Trial Billing Batch Run
  - Off Cycle Switch (set to **Y**)
- The **BSGENREQ** batch will not freeze and complete a trail bill for the account.
- At present, a To Do is not generated for a trial bill review, and therefore the system does not check whether a To Do is generated for a trial bill review.

Automatic Regular Bill Generation Invoice Request

The following table lists the algorithms that you need to attach to the corresponding business objects in the respective scenarios:

If you want to create an automatic invoice request for an account while…	**Then attach the algorithm….**			
	Business Object	**Status**	**System Event**	**Algo**
Activating a Fully-Insured Group Policy	C1-POLICY	In Force/Active	Enter	C1-IN
Note: This happens only on the customer onboarding. If an invoice request is already processed for any account in the person's hierarchy, the system will not create an invoice request for the account.				
Terminating a Fully-Insured Group Policy		Terminated	Enter	C1-IN
Reinstating a Fully-Insured Group Policy		Reinstated	Enter	C1-IN
Renewing a Fully-Insured Group Policy		-	Audit	C1-IR
Creating an Account for a Parent Customer or Bill Group who is the Main Customer of the Fully-Insured Group Policy	C1-AccountBO	-	Post-Processing	C1-IN

Copyright © 2026, Oracle and/or its affiliates.

If you want to create an automatic invoice request for an account while…	Then attach the algorithm….			
	Business Object	**Status**	**System Event**	**Algor**
Note: This happens only on the customer onboarding. If an invoice request is already processed for any account in the person's hierarchy, the system will not create an invoice request for the account.				

The above algorithms contain a parameter wherein you can specify the invoice request type using which the automatic invoice request should be created in the system.

If the automatic invoice request creation feature is configured for the fully-insured group health insurance business, the system creates an automatic regular bill generation invoice request in the **Defer Processing Batch** status for an account when:

- A fully-insured group policy is activated, terminated, reinstated, or renewed
- An account is created for a parent customer or bill group who is the main customer of the fully-insured group policy

The deferred mode processing for manual regular bill generation invoice request and automatic regular bill generation invoice request is identical.

Invoice Request for Individual Health Insurance Billing

Until now, the system enabled you to generate an adhoc regular or trial bill for an account through an invoice request for the fully insured group business. Now, this feature is extended to support the adhoc billing requirements of the fully insured individual business.

The system enables you to manually or automatically create an invoice request for the fully insured individual business. It enables you to create an invoice request for an account to which an individual membership is billed. Before creating an invoice request for an account of an individual membership, the system validates whether the individual membership is eligible for the invoice request creation. You can create an invoice request only for an account of those individual memberships where the **Eligible For Invoice Request Creation (INVRACTE)** characteristic is set to **Y**. Whenever an invoice request is created for the account of an individual membership, the system adds the appropriate log entries for the individual membership in the **Log** tab of the **Membership** screen.

Note: The system validates whether the individual membership is eligible for invoice request creation using the characteristic type which is specified in the **Invoice Request Eligibility Char Type** option type of the **C1-INVREQ** feature configuration. By default, this option type is set to **INVRACTE**. You can change the characteristic type, if required.

The system enables you to create the following types of invoice request for the fully insured individual business:

- **Manual Regular Bill Generation Invoice Request** - It is used to generate an adhoc regular bill for an account. You can create a manual regular bill generation invoice request for an account from the user interface.
- **Manual Trial Bill Generation Invoice Request** - It is used to generate an adhoc trial bill for an account. You can create a manual trial bill generation invoice request for an account from the user interface.
- **Automatic Regular Bill Generation Invoice Request** - It is used to generate an adhoc regular bill for an account. You can configure the system such that an automatic regular bill generation invoice request is automatically created for an account when an individual membership is enrolled, terminated, reinstated, or canceled through a health care inbound message.

Copyright © 2026, Oracle and/or its affiliates.

Note:

The automatic invoice request creation feature is only designed to work for the fully insured group and individual businesses and not for the financial services or self-funded health insurance business.

At present, the system is not designed to create an automatic trial bill generation invoice request.

While creating an invoice request, you need to specify an invoice request type using which you want to create the invoice request. The system enables you to create the invoice request types with the following combinations:

Invoice Mode	Bill Generation Type	Approval Process
Manual	Regular	On
Manual	Regular	Off
Manual	Trial	Off
Automatic	Regular	Off

It is the invoice request type which helps the system to determine:

- The business object using which the invoice request should be created in the system

  Note: If the **Bill Generation Type** field is set to **Regular**, you must select the **Invoice Request - Regular Bill Generation** business object from the **Invoice Request Business Object** list. However, if the **Bill Generation Type** field is set to **Trial**, you must select the **Invoice Request - Trial Bill Generation** business object from the **Invoice Request Business Object** list.
- Whether a manual or automatic invoice request should be created in the system
- Whether a regular or trial bill generation invoice request should be created in the system
- Whether a manual regular bill generation invoice request for an account should be processed in the online or deferred mode

  Note:

  The system will process a manual regular bill generation invoice request for an account in the deferred mode when the number of billable charges of the account exceeds the defer processing billable charge count.

  You can specify the defer processing billable charge count only when the invoice mode is set to **Manual** and bill generation type is set to **Regular**.
- Whether the approval is required for the invoice request

  Note: You can set the **Approval Required** flag only when the invoice mode is set to **Manual** and bill generation type is set to **Regular**.
- The wait days using which the processing date is calculated for an invoice request

  Note: If the invoice request is processed in the online mode, the system will process the invoice request when the processing date is earlier than or equal to the system date. However, if the invoice request is processed in the deferred mode, the system will process the invoice request when the processing date is earlier than or equal to the batch business date.
- The date calculation algorithm which is used to calculate the cutoff date, bill date, processing date, and accounting date for an automatic regular bill generation invoice request

Copyright © 2026, Oracle and/or its affiliates.

Note:

The **C1-INVRDTCIM** algorithm is shipped in this release for the fully insured individual business. It is used to calculate the cutoff date, bill date, processing date, and accounting date for an automatic regular bill generation invoice request. If required, you can configure the algorithm such that the processing date does not fall on a holiday. In that case, you need to specify the work calendar which helps to determine the working day. You can specify the work calendar in the **C1-INVRDTCIM** algorithm. Alternatively, if the work calendar is not specified in the **C1-INVRDTCIM** algorithm, the system will use the work calendar of the account's division to ensure that the processing date falls on a working day.

In addition, you can configure threshold days for the automatic invoice request creation. The system then determines whether the number of days between the bill cycle date and processing date is greater than the threshold days. If so, the automatic invoice request is created for the account. However, if the number of days between the bill cycle date and processing date is less than or equal to the threshold days, the automatic invoice request is created for the account such that cutoff date is calculated using the next window of the bill cycle.

While creating a manual invoice request, you need to specify the following - invoice request type, account, cutoff date, accounting date, and bill date. Note that before manually or automatically creating an invoice request for an account, you need to ensure that the following algorithms are attached to the respective system event of the corresponding customer class:

System Event	Algorithm
Invoice Request Account Selection	C1-INVACTEL
Invoice Request Status Update	C1-INVRSTUP

For more information about the types of invoice request, see Types of Invoice Request for Fully-Insured Individual Business on page 3970.

For more information on how to setup the invoice request feature, see Prerequisites on page 3981.

Types of Invoice Request for Fully-Insured Individual Business

The system allows you to create the following types of invoice requests for the fully-insured individual business:

- Manual Regular Bill Generation Invoice Request on page 3970
- Manual Trial Bill Generation Invoice Request on page 3971
- Automatic Regular Bill Generation Invoice Request on page 3971

Manual Regular Bill Generation Invoice Request

Once you manually create a regular bill generation invoice request for an account, the status of the invoice request is set to **Draft**. You can then submit the invoice request. You can optionally configure the approval process for the manual regular bill generation invoice request. If the **Approval Required** flag is set to **Yes** in the invoice request type, the status of the manual regular bill generation invoice request is changed to **Approval In Progress** when you submit the invoice request. The approver can then approve or reject the manual regular bill generation invoice request based on the observations.

On submitting or approving the invoice request, the system checks whether the number of the billable charges of the account exceeds the defer processing billable charge count. If the number of the billable charges of the account exceeds the defer processing billable charge count, the status of the invoice request is changed to **Defer Processing**. However, if the number of the billable charges of the account does not exceed the defer processing billable charge count, the system checks whether the processing date of the invoice request is earlier than or equal to the system date.

If the processing date is earlier than or equal to the system date, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar

Copyright © 2026, Oracle and/or its affiliates.

is open for the accounting date. If the accounting calendar is open for the accounting date, the system creates the adhoc regular bill for the account in the online mode. Finally, the status of the invoice request is changed to **Processed**. But, if the pending bill exists for the account, or if the cutoff date is earlier than or equal to the bill after date, or if the accounting calendar is not open for the accounting date, or if an error occurs while creating adhoc regular bill or its bill segments, the status of the invoice request is changed to **Error**. The system enables you to move such erroneous invoice request back to the **Draft** status.

However, if the processing date is later than the system date, the status of the invoice request is changed to **Defer Processing**. On the **C1-INVRQ** batch execution, the system checks whether there are any invoice requests in the **Defer Processing** status. If there is an invoice request in the **Defer Processing** status, the system checks whether the processing date of the invoice request is earlier than or equal to the system date. If the processing date is earlier than or equal to the system date, the status of the invoice request is changed to **Processing** and the algorithm attached to the **Processing** status is invoked. However, if the processing date is later than the system date, the status of the invoice request remains as **Defer Processing**.

Note: The system enables you to cancel an invoice request which is in the **Defer Processing** status.

Manual Trial Bill Generation Invoice Request

The manual regular bill generation invoice request and manual trial bill generation invoice request are created and processed identically with the following exceptions:

- On submitting the manual trial bill generation invoice request for an account, the system does not check whether the number of the billable charges of the account exceed the defer processing billable charge count. The manual trial bill generation invoice request is always processed in the deferred mode.
- You need to specify the following parameters while executing the **BILLOPEN**, **BSGENREG**, and **POSTPROC** batches:
  - **Bill Generation Type** (set to **Trial**)
  - **Description for Trial Billing Batch Run**
  - **Off Cycle Switch** (set to **Y**)
- The **BSGENREG** batch will not freeze and complete a trail bill for the account.
- At present, a To Do is not generated for a trial bill review, and therefore the system does not check whether a To Do is generated for a trial bill review.

Automatic Regular Bill Generation Invoice Request

To enable the automatic invoice request creation feature for the fully insured individual business, you need to attach the following algorithms:

If you want to create an automatic invoice request for the account while…	**Then attach the algorithm….**			
	Business Object	**Status**	**System Event**	**Algorithm**
Activating an individual membership	C1-IndMembership	Active	Enter	C1-INVRQIMEN
Terminating an individual membership		Terminated	Enter	C1-INVRQIMTM
Reinstating a terminated individual membership		Active	Enter	C1-INVRQIMEN
Canceling an active individual membership		Canceled	Enter	C1-INVRQIMCN

You can create a single or different invoice request type for each individual membership event (such as, activation, termination, reinstatement, or cancelation) depending on the wait days you want to configure for the respective event. While attaching the above algorithms, you need to specify the following parameters:

Copyright © 2026, Oracle and/or its affiliates.

Algorithm	Parameter	Parameter Description
C1-INVRQIMEN	Invoice Request Type for Individual Membership New Enrollment	Used to indicate the invoice request type using which you want the system to automatically create an invoice request when an individual membership is activated. **Note:** This parameter is mandatory.
	Invoice Request Type for Individual Membership Reinstatement	Used to indicate the invoice request type using which you want the system to automatically create an invoice request when an individual membership is reinstated. **Note:** This parameter is optional.
	Termination Reason	Used to specify the termination reason. The system will automatically create an invoice request while reinstating an individual membership which was terminated due to the specified reason. **Note:** This parameter is valid only when you specify the value for the **Invoice Request Type for Individual Membership Reinstatement** parameter. This parameter is optional. If you do not specify the termination reason, the system will create the invoice request on the individual membership reinstatement irrespective of the termination reason. However, if you specify the termination reason, the system will create the invoice request on the individual membership reinstatement only when the individual membership was terminated due to the specified reason. You can specify maximum five comma-separated values for this parameter. You must specify a reason which is already defined for the **Terminated** status of the **C1-IndMembership** business object in the **Status Reason** screen.
C1-INVRQIMTM	Invoice Request Type	Used to indicate the invoice request type using which you want the system to automatically create an invoice request when an individual membership is terminated. **Note:** This parameter is mandatory.
	Termination Reason	Used to specify the termination reason. The system will automatically create an invoice

Copyright © 2026, Oracle and/or its affiliates.

Algorithm	Parameter	Parameter Description
		request when the individual membership is terminated due to the specified reason. **Note:** This parameter is optional. If you do not specify the termination reason, the system will create the invoice request on the individual membership termination irrespective of the termination reason. However, if you specify the termination reason, the system will create the invoice request on the individual membership termination only when the individual membership is terminated due to the specified reason. You can specify maximum five comma-separated values for this parameter. You must specify a reason which is already defined for the **Terminated** status of the **C1-IndMembership** business object in the **Status Reason** screen.
C1-INVRQIMCN	Invoice Request Type	Used to indicate the invoice request type using which you want the system to automatically create an invoice request when an individual membership is canceled. **Note:** This parameter is mandatory.
	Cancelation Reason	Used to specify the cancellation reason. The system will automatically create an invoice request when the individual membership is canceled due to the specified reason.

Copyright © 2026, Oracle and/or its affiliates.

Algorithm	Parameter	Parameter Description
		Note: This parameter is optional. If you do not specify the cancellation reason, the system will create the invoice request on the individual membership cancellation irrespective of the cancellation reason. However, if you specify the cancellation reason, the system will create the invoice request on the individual membership cancellation only when the individual membership is canceled due to the specified reason. You can specify maximum five comma-separated values for this parameter. You must specify a reason which is already defined for the **Canceled** status of the **C1-IndMembership** business object in the **Status Reason** screen.

The system determines the account to which the individual membership should be billed using the Account Identifier Type and Account Identifier Value characteristics which are defined on the individual membership. While fetching the characteristics, the system considers the characteristic types which are specified in the **Account Identifier Type Char Type** and **Account Identifier Value Char Type** option types of the **C1-ASOBLLNG** feature configuration. Before automatically creating an invoice request for the account of an individual membership, the system validates whether the individual membership is eligible for the invoice request creation. If the individual membership is eligible for the invoice request creation, the system checks whether any invoice request already exists for the account in the non-final status. If an invoice request exists for the account in the non-final status, a new invoice request is not created for the account. However, if an invoice request does not exist for the account in the non-final status, a new invoice request is created for the account in the **Draft** status. The system then transitions the status of the invoice request from **Draft** to **Defer Processing Batch**.

Note:

The system validates whether the individual membership is eligible for the invoice request creation only while activating an individual membership and not while terminating, reinstating, or canceling an individual membership.

The system enables you to cancel an invoice request which is in the **Defer Processing Batch** status.

When you execute the **BILLOPEN** batch with the **Off Cycle Switch** parameter set to **Y**, the system checks whether the account that meets the search criteria is included in any invoice request which is in the **Defer Processing Batch** status. If the account is included in the invoice request, the system checks whether the processing date of the invoice request is earlier than or equal to the batch business date. If the processing date is earlier than or equal to the batch business date, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar is open for the accounting date. If the accounting calendar is open for the accounting date, the system creates the adhoc regular bill for the account in the **Pending** status. When you execute the **BSGENREG** batch with the **Off Cycle Switch** parameter set to **Y**, the system creates the bill segments for the adhoc regular bill. When you execute the **POSTPROC** batch with the **Off Cycle Switch** parameter set to **Y**, the system creates the post-processing bill segments (if any) and completes the adhoc regular bill of the account. Finally, the status of the invoice request is changed to **Processed**.

However, if the pending bill exists for the account, or if the cutoff date is earlier than or equal to the bill after date, or if the accounting calendar is not open for the accounting date, or if an error occurs while creating adhoc regular bill or its

Copyright © 2026, Oracle and/or its affiliates.

bill segments, or if a To Do is generated for the bill review, the status of the invoice request is changed to **Error**. The system enables you to move such erroneous invoice request back to the **Draft** status.

Generate Bill for Each Coverage Period on Account's Hold Release

Oracle Revenue Management and Billing enables you to create automatic regular bill generation invoice request for an account which is eligible for invoice request creation whenever hold on its bill generation process is released. On manually or automatically releasing a hold on the bill generation process of an account, the system checks whether the **Eligible For Invoice Request Creation (INVRACTE)** characteristic is set to **Y** for the account. If so, the system creates an entry for the account in the **F1_GEN_PROC** table and stamps the **C1-IRBHR** batch control against it.

On executing the **C1-IRBHR** batch control, the system considers the records in the **F1_GEN_PROC** table. For each record where the batch control is set to **C1-IRBHR**, the batch checks the following:

- The respective account is eligible for invoice request creation (i.e., the **INVRACTE** characteristic type is set to **Y**).
- The bill generation process of the respective account is not kept on hold through a hold request.

If both the above conditions are met, the system creates an invoice request for the account using the invoice request type given in the **Systematic Invoice Request Type for Hold Release** parameter.

The batch then checks whether the **C1-SPCVB** characteristic type is defined for the account and its characteristic value is set to **Y**. If so, the batch stamps the **C1-IRSCP** characteristic type on the invoice request and sets it to the accounting date after the last billed coverage. The status of such invoice request is set to **Defer Processing**. However, if the **C1-SPCVB** characteristic type is not defined for the respective account, the system will not stamp the **C1-IRSCP** characteristic type on the invoice request. The status of such invoice request is set to **Defer Processing Batch**. Once the invoice request is created for an account, the entry for the respective account is removed from the **F1_GEN_PROC** table.

Note: The processing date of the invoice request is set to system date + wait days (defined in the respective invoice request type).

On executing the **C1-INVRQ** batch, the system checks whether there are any invoice requests in the **Defer Processing** status. If there is an invoice request in the **Defer Processing** status, the system checks whether the processing date of the invoice request is earlier than or equal to the batch business date. If the processing date is earlier than or equal to the batch business date, the status of the invoice request is changed to **Processing** and the algorithm attached to the **Processing** status is invoked. However, if the processing date is later than the batch business date, the status of the invoice request remains as **Defer Processing**. Once the invoice request is processed, the batch creates multiple bills for the account – one for each coverage period – against the invoice request. On executing the billing batches with the **Off Cycle Switch** parameter set to **Y** and **Off Cycle Mode** parameter set to **I**, the system checks whether the account that meets the search criteria is included in any invoice request with the **Defer Processing Batch** status. If the account is included in an invoice request with the **Defer Processing Batch** status, the system checks whether the processing date of the invoice request is earlier than or equal to the batch business date.

If the processing date is earlier than or equal to the batch business date, the system checks whether there is any record in the **PROC** (i.e., **Processing**) status for the account in the invoice request. If so, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar is open for the accounting date. If the accounting calendar is open for the accounting date, the system creates a single consolidated bill for multiple coverage periods against the invoice request of the account.

Note: At present, this feature is tested and certified only for the fully insured individual business and not for any other lines of health insurance business.

Copyright © 2026, Oracle and/or its affiliates.

Generate Bill for Each Coverage Period on Late Enrollment or Reinstatement

Until now, the system enabled you to create an automatic invoice request for the respective account whenever an individual membership is enrolled or reinstated. Once this automatic invoice request was processed, the system used to create a bill for the account against the invoice request. However, in case of late enrollment or reinstatement, the system created a single consolidated bill for multiple coverage periods which were yet to be billed (i.e., a bill containing one bill segment for each such coverage period). However, the business requires separate bill for each coverage period instead of one consolidated bill. To implement this business requirement, we have enhanced the existing automatic regular bill generation invoice request feature for the fully insured individual business. The following changes are made to the system:

- The following new characteristic types are introduced in this release:
  - **Eligible for Separate Coverage Billing (C1-SPCVB)** – You need to define this characteristic type for an account for which you want to create a separate bill for each individual membership coverage period. You can define this characteristic for an account from the user interface, through a membership repricing request, or through a health care inbound message.
  - **Accounting date of earliest missed coverage (C1-IRSCP)** – On creating an automatic regular bill generation invoice request, the system automatically defines the **C1-IRSCP** characteristic type for the invoice request when the **C1-SPCVB** characteristic of the respective account is set to **Y**.
- The following new parameters are added in the **C1-INVRQIMEN** algorithm type:
  - **Invoice Request Type for Individual Membership New Enrollment - Separate Bill** – Used to specify the invoice request type using which you want to create an invoice request for an account for which a separate bill must be created for each individual membership coverage period on late enrollment.
  - **Invoice Request Type for Individual Membership Reinstatement - Separate Bill** – Used to specify the invoice request type using which you want to create an invoice request for an account for which a separate bill must be created for each individual membership coverage period on reinstatement.

On an individual membership enrollment or reinstatement, the system will check the following:

- The membership or account to which the membership is billed is eligible for invoice request creation (i.e., the **INVRACTE** characteristic type is set to **Y**).
- The bill generation process of the respective account is not kept on hold through a hold request.

If both the above conditions are met, the system will invoke the **C1-INVRQIMEN** algorithm attached to the **Active** status of the **C1-IndMembership** business object. This algorithm will then check whether the **C1-SPCVB** characteristic type is defined for the account and its characteristic value is set to **Y**.

If the **C1-SPCVB** characteristic type is defined for the account and its characteristic value is set to **Y**, the system will create an automatic regular bill generation invoice request where the **C1-IRSCP** characteristic type is set to the accounting date of earliest missed coverage. In case of late enrollment, the accounting date is set based on the membership start date. However, in case of reinstatement, the accounting date is set based on the membership termination date. The status of the invoice request is set to **Defer Processing**. The processing date of the invoice request is set to system date + wait days (defined in the respective invoice request type).

You need to then execute the **C1-INVRQ** batch. On executing the **C1-INVRQ** batch, the system checks whether there are any invoice requests in the **Defer Processing** status. If there is an invoice request in the **Defer Processing** status, the system checks whether the processing date of the invoice request is earlier than or equal to the batch business date. If the processing date is earlier than or equal to the batch business date, the status of the invoice request is changed to **Processing** and the algorithm attached to the **Processing** status is invoked. However, if the processing date is later than the batch business date, the status of the invoice request remains as **Defer Processing**. Once the invoice request is processed, the batch creates multiple bills for the account – one for each coverage period – against the invoice request.

However, if the **C1-SPCVB** characteristic type is not defined for the respective account, the system will create automatic regular bill generation invoice request where the **C1-IRSCP** characteristic type is not defined (i.e., in the traditional manner). The status of the invoice request is set to **Defer Processing Batch**. The processing date of the invoice request

Copyright © 2026, Oracle and/or its affiliates.

is set to system date + wait days (defined in the respective invoice request type). When such invoice request is processed through the billing batches, the system will create a single consolidated bill for multiple coverage periods against the invoice request of the account.

Invoice Request for Direct Billed Group Membership Accounts

Until now, the system enabled you to generate an adhoc regular or trial bill for an account through an invoice request for the fully insured group and individual lines of business. Now, this feature is extended to support the adhoc billing requirements of the direct billed group membership business.

The system enables you to manually or automatically create an invoice request for the direct billed group membership business. It enables you to create an invoice request for an account to which a group membership is billed directly. Before creating an invoice request for an account of a direct billed group membership, the system validates whether the direct billed group membership is eligible for the invoice request creation. You can create an invoice request only for an account of those direct billed group memberships where the **Eligible For Invoice Request Creation (INVRACTE)** characteristic is set to **Y**. Whenever an invoice request is created for the account of a direct billed group membership, the system adds the appropriate log entries for the direct billed group membership in the **Log** tab of the **Membership** screen.

Note: The system validates whether the direct billed group membership is eligible for invoice request creation using the characteristic type which is specified in the **Invoice Request Eligibility Char Type** option type of the **C1-INVREQ** feature configuration. By default, this option type is set to **INVRACTE**. You can change the characteristic type, if required.

The system enables you to create the following types of invoice request for the direct billed group membership business:

- **Manual Regular Bill Generation Invoice Request** – It is used to generate an adhoc regular bill for an account. You can create a manual regular bill generation invoice request for an account from the user interface.
- **Manual Trial Bill Generation Invoice Request** - It is used to generate an adhoc trial bill for an account. You can create a manual trial bill generation invoice request for an account from the user interface.
- **Automatic Regular Bill Generation Invoice Request** – It is used to generate an adhoc regular bill for an account. You can configure the system such that an automatic regular bill generation invoice request is (automatically) created for an account when a direct billed group membership is enrolled, terminated, reinstated, or canceled through a health care inbound message.

Note:

The automatic invoice request creation feature is only designed to work for the fully insured group, fully insured individual, and direct billed group membership lines of business and not for the financial services or self-funded health insurance business.

At present, the system is not designed to create an automatic trial bill generation invoice request.

While creating an invoice request, you need to specify an invoice request type using which you want to create the invoice request. The system enables you to create the invoice request types with the following combinations:

Invoice Mode	Bill Generation Type	Approval Process
Manual	Regular	On
Manual	Regular	Off
Manual	Trial	Off
Automatic	Regular	Off

It is the invoice request type which helps the system to determine:

Copyright © 2026, Oracle and/or its affiliates.

- The business object using which the invoice request should be created in the system

  Note: If the **Bill Generation Type** field is set to **Regular**, you must select the **Invoice Request - Regular Bill Generation** business object from the **Invoice Request Business Object** list. However, if the **Bill Generation Type** field is set to **Trial**, you must select the **Invoice Request - Trial Bill Generation** business object from the **Invoice Request Business Object** list.
- Whether a manual or automatic invoice request should be created in the system
- Whether a regular or trial bill generation invoice request should be created in the system
- Whether a manual regular bill generation invoice request for an account should be processed in the online or deferred mode

  Note:

  The system will process a manual regular bill generation invoice request for an account in the deferred mode when the number of billable charges of the account exceeds the defer processing billable charge count.

  You can specify the defer processing billable charge count only when the invoice mode is set to **Manual** and bill generation type is set to **Regular**.
- Whether the approval is required for the invoice request

  Note: You can set the **Approval Required** flag only when the invoice mode is set to **Manual** and bill generation type is set to **Regular**.
- The wait days using which the processing date is calculated for an invoice request

  Note: If the invoice request is processed in the online mode, the system will process the invoice request when the processing date is earlier than or equal to the system date. However, if the invoice request is processed in the deferred mode, the system will process the invoice request when the processing date is earlier than or equal to the batch business date.
- The date calculation algorithm which is used to calculate the cutoff date, bill date, processing date, and accounting date for an automatic regular bill generation invoice request

Note:

The existing algorithm named **C1-INVRDTCIM** can also be used for the direct billed group membership business. It is used to calculate the cutoff date, bill date, processing date, and accounting date for an automatic regular bill generation invoice request. If required, you can configure the algorithm such that the processing date does not fall on a holiday. In that case, you need to specify the work calendar which helps to determine the working day. You can specify the work calendar in the **C1-INVRDTCIM** algorithm. Alternatively, if the work calendar is not specified in the **C1-INVRDTCIM** algorithm, the system will use the work calendar of the account's division to ensure that the processing date falls on a working day.

In addition, you can configure threshold days for the automatic invoice request creation. The system then determines whether the number of days between the bill cycle date and processing date is greater than the threshold days. If so, the automatic invoice request is created for the account. However, if the number of days between the bill cycle date and processing date is less than or equal to the threshold days, the automatic invoice request is created for the account such that cutoff date is calculated using the next window of the bill cycle.

While creating a manual invoice request, you need to specify the following – invoice request type, account, cutoff date, accounting date, and bill date. Note that before manually or automatically creating an invoice request for an account, you need to ensure that the following algorithms are attached to the respective system event of the corresponding customer class:

System Event	**Algorithm**
Invoice Request Account Selection	C1-INVACTEL
Invoice Request Status Update	C1-INVRSTUP

Copyright © 2026, Oracle and/or its affiliates.

Types of Invoice Request for Direct Billed Group Membership Accounts

The system allows you to create the following types of invoice requests for the direct billed group membership accounts:

- Manual Regular Bill Generation Invoice Request on page 3979
- Manual Trial Bill Generation Invoice Request on page 3979
- Automatic Regular Bill Generation Invoice Request on page 3980

Manual Regular Bill Generation Invoice Request

Once you manually create a regular bill generation invoice request for an account, the status of the invoice request is set to **Draft**. You can then submit the invoice request. You can optionally configure the approval process for the manual regular bill generation invoice request. If the **Approval Required flag** is set to **Yes** in the invoice request type, the status of the manual regular bill generation invoice request is changed to **Approval In Progress** when you submit the invoice request. The approver can then approve or reject the manual regular bill generation invoice request based on the observations.

On submitting or approving the invoice request, the system checks whether the number of the billable charges of the account exceeds the defer processing billable charge count. If the number of the billable charges of the account exceeds the defer processing billable charge count, the status of the invoice request is changed to **Defer Processing**. However, if the number of the billable charges of the account does not exceed the defer processing billable charge count, the system checks whether the processing date of the invoice request is earlier than or equal to the system date.

If the processing date is earlier than or equal to the system date, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar is open for the accounting date. If the accounting calendar is open for the accounting date, the system creates the adhoc regular bill for the account in the online mode. Finally, the status of the invoice request is changed to **Processed**. But, if the pending bill exists for the account, or if the cutoff date is earlier than or equal to the bill after date, or if the accounting calendar is not open for the accounting date, or if an error occurs while creating an adhoc regular bill or its bill segments, the status of the invoice request is changed to **Error**. The system enables you to move such erroneous invoice request back to the **Draft** status.

However, if the processing date is later than the system date, the status of the invoice request is changed to **Defer Processing**. On the **C1-INVRQ** batch execution, the system checks whether there are any invoice requests in the **Defer Processing** status. If there is an invoice request in the **Defer Processing** status, the system checks whether the processing date of the invoice request is earlier than or equal to the system date. If the processing date is earlier than or equal to the system date, the status of the invoice request is changed to **Processing** and the algorithm attached to the **Processing** status is invoked. However, if the processing date is later than the system date, the status of the invoice request remains as **Defer Processing**.

Note: The system enables you to cancel an invoice request which is in the **Defer Processing** status.

Manual Trial Bill Generation Invoice Request

The manual regular bill generation invoice request and manual trial bill generation invoice request are created and processed identically with the following exceptions:

- On submitting the manual trial bill generation invoice request for an account, the system does not check whether the number of the billable charges of the account exceed the defer processing billable charge count. The manual trial bill generation invoice request is always processed in the deferred mode.
- You need to specify the following parameters while executing the **BILLOPEN**, **BSGENREG**, and **POSTPROC** batches:
  - **Bill Generation Type** (set to **Trial**)
  - **Description for Trial Billing Batch Run**
  - **Off Cycle Switch** (set to **Y**)
- The **BSGENREG** batch will not freeze and complete a trail bill for the account.

Copyright © 2026, Oracle and/or its affiliates.

- At present, a To Do is not generated for a trial bill review, and therefore the system does not check whether a To Do is generated for a trial bill review.

Automatic Regular Bill Generation Invoice Request

To enable the automatic invoice request creation feature for the direct billed group membership business, you need to attach the following algorithms:

If you want to create an automatic invoice request for the account while…	**Then attach the algorithm….**			
	Business Object	**Status**	**System Event**	**Algorithm**
Activating a direct billed group membership	C1-Membership	Active	Enter	C1-INVRQIMEN
Terminating a direct billed group membership		Terminated	Enter	C1-INVRQIMTM
Reinstating a direct billed group membership		Active	Enter	C1-INVRQIMEN
Canceling a direct billed group membership		Canceled	Enter	C1-INVRQIMCN

Note:

The above three algorithms are existing algorithms and are enhanced to support the direct billed group membership business along with the fully insured individual business.

By default, the automatic invoice request creation algorithms for the fully insured group business are attached to the above-mentioned statuses in the **C1-Membership** business object. If you want to enable the automatic invoice request creation feature for the direct billed group membership business, you need to inactivate the existing automatic invoice request creation algorithms of the fully insured group business and then attach the above-mentioned algorithms to the respective status in the **C1-Membership** business object.

You can create a single or different invoice request type for each direct billed group membership event (such as, activation, termination, reinstatement, or cancelation) depending on the wait days you want to configure for the respective event.

Before automatically creating an invoice request for the account of a direct billed group membership, the system validates whether the direct billed group membership is eligible for the invoice request creation. If the direct billed group membership is eligible for the invoice request creation, the system determines the account to which the direct billed group membership should be billed using the **Account Identifier Type** and **Account Identifier Value** characteristics which are defined on the direct billed group membership. While fetching the characteristics, the system considers the characteristic types which are specified in the **Account Identifier Type Char Type** and **Account Identifier Value Char Type** option types of the **C1-ASOBLLNG** feature configuration. If the above two characteristics are not defined for a direct billed group membership, the system checks whether the billing arrangement characteristic is defined on the direct billed group membership. The system considers the characteristic type which is specified in the **Billing Arrangement** option type of the **C1-ASOBLLNG** feature configuration. If the billing arrangement characteristic is defined on the direct billed group membership, the system checks whether the characteristic value is set to **DRCT** (i.e., Direct Billing). If so, the system derives the financially responsible person's account from the system. However, if the billing arrangement characteristic is not defined on the direct billed group membership or if its characteristic value is not set to **DRCT** (i.e., Direct Billing), the system will not create the invoice request for the account.

Copyright © 2026, Oracle and/or its affiliates.

If an account is derived for the direct billed group membership, the system checks whether any invoice request already exists for the account in the non-final status. If an invoice request exists for the account in the non-final status, a new invoice request is not created for the account. However, if an invoice request does not exist for the account in the non-final status, a new invoice request is created for the account in the **Draft** status. The system then transitions the status of the invoice request from **Draft** to **Defer Processing Batch**.

Note:

The system validates whether the direct billed group membership is eligible for the invoice request creation only while activating a direct billed group membership and not while terminating, reinstating, or canceling the direct billed group membership.

The system enables you to cancel an invoice request which is in the **Defer Processing Batch** status.

When you execute the **BILLOPEN** batch with the **Off Cycle Switch** parameter set to **Y**, the system checks whether the account that meets the search criteria is included in any invoice request which is in the **Defer Processing Batch** status. If the account is included in the invoice request, the system checks whether the processing date of the invoice request is earlier than or equal to the batch business date. If the processing date is earlier than or equal to the batch business date, the system checks whether the pending bill already exists for the account. If the pending bill does not exist for the account, the system checks whether the cutoff date is later than the bill after date. If cutoff date is later than the bill after date, the system checks whether the accounting calendar is open for the accounting date. If the accounting calendar is open for the accounting date, the system creates the adhoc regular bill for the account in the **Pending** status. When you execute the **BSGENREG** batch with the **Off Cycle Switch** parameter set to **Y**, the system creates the bill segments for the adhoc regular bill. When you execute the **POSTPROC** batch with the **Off Cycle Switch** parameter set to **Y**, the system creates the post-processing bill segments (if any) and completes the adhoc regular bill of the account. Finally, the status of the invoice request is changed to **Processed**.

However, if the pending bill exists for the account, or if the cutoff date is earlier than or equal to the bill after date, or if the accounting calendar is not open for the accounting date, or if an error occurs while creating adhoc regular bill or its bill segments, or if a To Do is generated for the bill review, the status of the invoice request is changed to **Error**. The system enables you to move such erroneous invoice request back to the **Draft** status.

Prerequisites

To setup the invoice request process, you need to do the following:

- Define the required invoice request types in the system.
- Define the required characteristic types where the characteristic entity is set to **Invoice Request Type**
- Define the required characteristic types where the characteristic entity is set to **Invoice Request**
- Assign the **C1-INVRA** To Do type to a To Do role whose users must receive To Do generated while submitting an invoice request for approval
- Assign the **C1-INVRS** To Do type to a To Do role whose users must receive To Do generated while resubmitting an invoice request
- Set the batch control type of the **Invoice Request Periodic Monitor (C1-INVRQ)** batch to **Timed** and define the following attributes:
  - Time Interval
  - Timer Active
  - User ID
  - Batch Language
  - Email Address

  For more information about the **Invoice Request Periodic Monitor (C1-INVRQ)** batch, see *Oracle Revenue Management and Billing Batch Guide*.
- Set the batch control type of the **Pending Bill Generation (BILLOPEN)**, **Bill Segment Generation (BSGENREG)**, and **Bill Completion (POSTPROC)** batches to **Timed** and define the following attributes:

Copyright © 2026, Oracle and/or its affiliates.

- Time Interval
- Timer Active
- User ID
- Batch Language
- Email Address

For more information about these batches, see *Oracle Revenue Management and Billing Batch Guide*.

Set the following feature configuration in the system:

- **Invoice Request Configuration (C1-INVREQ)**

Invoice Request Manual Trial Bill Generation (Without Approval) Status Transition

Invoice Request Type

Oracle Revenue Management and Billing enables you to configure an invoice request type using which you can create an invoice request. The invoice request type helps the system to determine:

- The invoice request business object for which the invoice request should be created in the system
- The mode in which the invoice should be created in the system
- The bill generation type using which the invoice should be created in the system
- Whether a manual regular bill generation invoice request for an account should be processed in the online or deferred mode
- The date calculation algorithm which is used to calculate the processing date for an automatic regular bill generation invoice request
- Whether the approval is required for the invoice request
- The submitter To Do role for resubmitting the invoice request for approval
- The wait days which is used to calculate the invoice request processing date

Note: The automatic invoice request is designed to work only for the fully-insured group and individual health insurance businesses and not for the financial services or self-funded health insurance businesses.

The **Invoice Request Type** screen allows you to define, edit, copy, delete, and view the details of an invoice request type. It contains the following zones:

- Invoice Request Type List on page 4000
- Invoice Request Type on page 4001

Invoice Request Type List

The **Invoice Request Type List** zone lists the invoice request types that are already defined in the system. It contains the following columns:

Column Name	Column Description
Invoice Request Type	Displays the invoice request type.
Description	Displays the description of the invoice request type.
Edit	On clicking the **Edit** (✎) icon, the **Invoice Request Type** screen appears where you can edit the details of the invoice request type.
Duplicate	On clicking the **Duplicate** (⧉) icon, the **Invoice Request Type** screen appears where you can define a new invoice request type using an existing invoice request type.

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Delete	On clicking the **Delete** (🗑) icon, you can delete the invoice request type.
	Note: You can delete an invoice request type only when an invoice request is not yet created using the invoice request type.

On clicking the **Broadcast** (📡) icon corresponding to an invoice request type, the **Invoice Request Type** zone appears with the details of the respective invoice request type.

Invoice Request Type

The **Invoice Request Type** zone displays the details of the invoice request type. It contains the following sections:

- **Main** - The **Main** section displays basic information about the invoice request type. It contains the following fields:

Field Name	Field Description
Invoice Request Type	Displays the invoice request type.
Description	Displays the description of the invoice request type.
Invoice Request Business Object	Indicates the business object using which the invoice request should be created in the system. In addition, the context menu (⌄) icon appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.
Detailed Description	Displays additional information about the invoice request type.
Status	Indicates the current status of the invoice request type. The valid values are: • Active • Inactive
Invoice Mode	Indicates the mode in which the invoice request is created in the system using the invoice request type. The valid values are: • Automatic • Manual

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description
Bill Generation Type	Indicates the type of bill that is generated for the invoice request in the system. The valid values are: • Regular • Trial
Defer Processing Billable Charge Count	Displays the count which helps to determine whether the invoice request must be processed in the deferred mode (i.e. in the background) or in real time (i.e. immediately). If the number of billable charges created for the bills which are selected in the invoice request exceeds the defer processing billable charge count, the system processes the invoice request in the deferred mode. However, if the number of billable charges created for the bills which are selected in the invoice request does not exceed the defer processing billable charge count, the system processes the invoice request in real time (i.e. immediately).
	Note: This field appears only when the **Invoice Mode** is set to**Manual** and the **Bill Generation Type** is set to **Regular**. If you set the defer processing billable charge count to zero (0), the system resets the default value to 500.
Date Calculation Algorithm	Indicates the algorithm using which the date is calculated for processing the billable charges created for the bills in the invoice request.
	Note: It has a link. On clicking the link, the **Algorithm** screen appears where you can view the details of the respective algorithm. This field appears only when the **Invoice Mode** is set to **Automatic**.
Approval Required	Indicates whether approval is required for approving the bills generated through the invoice request.
	Note: This field appears only when the **Invoice Mode** is set to**Manual** and the **Bill Generation Type** is set to **Regular**.
Approval To Do Type	Indicates that the To Do task of the specified To Do type must be created when the invoice request is submitted for approval.
	Note: It has a link. On clicking the link, the **To Do Type** screen appears where you can view the details of the respective To Do type. This field appears only when the **Approval Required** option is selected.
Approval To Do Role	Indicates the user and/or group of users who can approve the invoice request.

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description
	Note: It has a link. On clicking the link, the **To Do Role** screen appears where you can view the details of the respective To Do role. This field appears only when the **Approval Required** option is selected.
Submitter To Do Type	Indicates that the To Do task of the specified To Do type is created for re-submitting the invoice request for approval.
	Note: It has a link. On clicking the link, the **To Do Type** screen appears where you can view the details of the respective To Do type.
Submitter To Do Role	Indicates the user and/or group of users who can re-submit the invoice request for approval.
	Note: It has a link. On clicking the link, the **To Do Role** screen appears where you can view the details of the respective To Do role.
Wait Days	Displays the maximum wait period (in days) after which the bills of the invoice request are processed.
	Note: You cannot specify a negative value in the **Wait Days** field.

- **Characteristics** - The **Characteristics** section lists the characteristics defined for the invoice request type. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - The **Record Actions** section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the invoice request type.
Delete	Used to delete the invoice request type.
	Note: You can delete an invoice request type only when an invoice request is not yet created using the invoice request type.
Duplicate	Used to create a new invoice request type using an existing invoice request type.

- **Record Information** - The **Record Information** section contains the following field:

Field Name	Field Description
Business Object	Indicates the business object using which the invoice request type is created in the system. In addition, the context menu (⊙) icon appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.

Copyright © 2026, Oracle and/or its affiliates.

By default, the **Invoice Request Type** zone does not appear in the **Invoice Request Type** screen. It appears when you click the **Broadcast** (📡) icon corresponding to an invoice request type in the **Invoice Request Type List** zone.

Related Topics

Defining an Invoice Request Type

Prerequisites

To define an invoice request type, you should have:

- Invoice request type business object defined in the application.
- Invoice request business objects defined in the application.
- Date calculation algorithm defined using the **C1-INVREDTCA** algorithm type.
- Required To Do role assigned to the **C1-INVRA** and **C1-INVRS** To Do types in the application

Procedure

To define an invoice request type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **I** and then click **Invoice Request Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Invoice Request Type** sub-menu.

   The **Invoice Request Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the invoice request type.
   - **Characteristics** - Used to define a list of characteristics for the invoice request type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Invoice Request Type	Used to specify the invoice request type.	Yes
Business Object	Indicates the business object using which you want to define the invoice request type.	Not applicable
Description	Used to specify the description for the invoice request type.	Yes
Invoice Request Business Object	Used to indicate the invoice request business object for which you want to define the invoice request type. The valid values are: • Invoice Request - Regular Bill Generation • Invoice Request - Trial Bill Generation	Yes
Detailed Description	Used to specify additional information about the invoice request type.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Status	Used to indicate the current status of the invoice request type. The valid values are: • Active • Inactive	Yes
Invoice Mode	Used to indicate the mode in which the invoice request should be created in the system using the invoice request type. The valid values are: • Automatic **Note:** The automatic mode is not supported while creating an invoice request type for the financial services domain. • Manual	Yes
Bill Generation Type	Used to indicate the type of bill that should be generated for the invoice request in the system using the invoice request type. The valid values are: • Regular • Trial **Note:** By default, this field is set to **Regular** when the **Invoice Mode** is set to **Automatic**.	Yes
Defer Processing Billable Charge Count	Used to specify the count which helps to determine whether the invoice request must be processed in the deferred mode (i.e. in the background) or in real time (i.e. immediately). If the number of billable charges created for the bills which are selected in the invoice request exceeds the defer processing billable charge count, the system processes the invoice request in the deferred mode. However, if the number of billable charges created for the bills which are selected in the invoice request does not exceed the defer processing billable charge count, the system processes the invoice request in real time (i.e. immediately). **Note:** You cannot specify a negative value in this field. Deferred mode means, in the background, when the **Generic Request Periodic Monitor (C1-GENRQ)** batch is invoked. You can configure the **Generic Request Periodic Monitor (C1-GENRQ)** batch such that it is executed at regular intervals. For more information about the **Generic Request Periodic Monitor (C1-GENRQ)** batch, refer to *Oracle Revenue Management and Billing Batch Guide*.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Date Calculation Algorithm	Used to indicate the algorithm using which the date is calculated for processing the billable charges created for the bills in the invoice request. **Note:** The **Search** (🔍) icon appears corresponding to the **Date Calculation Algorithm** field. On clicking the **Search** icon, the **Algorithm Search** window appears. On specifying the date calculation algorithm, the description of the date calculation algorithm appears corresponding to the **Date Calculation Algorithm** field. You can specify the date calculation algorithm only when the **Invoice Mode** is set to **Automatic**.	Yes (Conditional) **Note:** This field is required for creating an invoice request in the automatic mode.
Approval Required	Used to indicate whether approval is required for approving the bills generated through the invoice request. **Note:** This field appears only when the **Invoice Mode** is set to**Manual** and the **Bill Generation Type** is set to **Regular**.	No
Approval To Do Type	Used to indicate that the To Do task of the specified To Do type must be created when the invoice request is submitted for approval. **Note:** The **Search** (🔍) icon appears corresponding to the **Approval To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the **Approval To Do Type** field. This field appears only when the **Approval Required** option is selected. The **C1-INVRA** To Do type is shipped with the product. You can use the **C1-INVRA** To Do type or a custom To Do type, if required.	Yes (Conditional) **Note:** This field is required for approving the invoice request which is created using the invoice request type.
Approval To Do Role	Used to indicate the user and/or group of users who can approve the invoice request. **Note:** The list includes only those To Do roles which are associated with the approval To Do type. This field appears only when the **Approval Required** option is selected.	Yes (Conditional) **Note:** This field is required for approving the invoice request which is created using the invoice request type.

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Submitter To Do Type	Used to indicate that the To Do task of the specified To Do type is created for re-submitting the invoice request for approval. **Note:** The **Search** (🔍) icon appears corresponding to the **Submitter To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the **Submitter To Do Type** field. The **C1-INVRS** To Do type is shipped with the product. You can use the **C1-INVRS** To Do type or a custom To Do type, if required.	Yes (Conditional) **Note:** This field is required for resubmitting the invoice request for approval.
Submitter To Do Role	Used to indicate the user and/or group of users who can re-submit the invoice request for approval. **Note:** The list includes only those To Do roles which are associated with the submitter To Do type.	Yes (Conditional) **Note:** This field is required for resubmitting the invoice request for approval. Once the it is defined and saved, it cannot be changed as it is linked to request(s) which are under processing.
Wait Days	Used to specify the maximum wait period (in days) after which the bills in the invoice request are processed. **Note:** You cannot specify a negative value in the **Wait Days** field.	No

4. Enter the required details in the **Main** section.
5. Define a list of characteristics for the invoice request type, if required.
6. Click **Save**.
   The invoice request type is defined.

Defining a Characteristic for an Invoice Request Type

Prerequisites

To define a characteristic for an invoice request type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Invoice Request Type**)

Procedure

To define a characteristic for an invoice request type:

1. Ensure that the **Characteristics** section is expanded when you *a*re defining, editing, or copying an invoice request type.

   The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type.	Yes (Conditional)
	Note: The list includes only those characteristic types where the characteristic entity is set to **Invoice Request Type**.	**Note:** This field is required while defining a characteristic for an invoice request type.
Characteristic Value	Used to specify the value for the characteristic type.	Yes (Conditional)
	Note: If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, the **Predefined Characteristic Search** window appears. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	**Note:** This field is required while defining a characteristic for an invoice request type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the invoice request type, click the **Add** (+) icon and *t*hen repeat step *2*.

Note: However, if you want to remove a characteristic from the invoice request type, click the **Delete** (🗑) icon corresponding to the characteristic.

Editing an Invoice Request Type

Prerequisites

To edit an invoice request type, you should have:

- Invoice request type business object defined in the application.
- Invoice request business objects defined in the application.
- Date calculation algorithm defined using the **C1-INVREDTCA** algorithm type.
- Required To Do role assigned to the **C1-INVRA** and **C1-INVRS** To Do types in the application

Procedure

To edit an invoice request type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **I** and then click **Invoice Request Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Invoice Request Type** sub-menu.
   The **Invoice Request Type** screen appears.
4. In the **Invoice Request Type List** zone, click the **Edit**( ) icon in the **Edit** column corresponding *t*o the invoice request type whose details you want to edit.

   The **Invoice Request Type** screen appears. It contains the following section:

   - **Main** - Used to specify basic details about the invoice request type.
   - **Characteristics** - Used to define a list of characteristics for the invoice request type.

   The **Main** section contains the following fields:

Field Name	**Field Description**	**Mandatory (Yes or No)**
Invoice Request Type	Displays the invoice request type.	Not applicable
Business Object	Indicates the business object using which you want to define the invoice request type.	Not applicable
Description	Used to specify the description for the invoice request type.	Yes
Invoice Request Business Object	Used to indicate the invoice request business object for which you want to define the invoice request type. The valid values are: • Invoice Request - Regular Bill Generation • Invoice Request - Trial Bill Generation	Yes
Detailed Description	Used to specify additional information about the invoice request type.	No
Status	Used to indicate the current status of the invoice request type. The valid values are: • Active • Inactive	Yes
Invoice Mode	Used to indicate the mode in which the invoice request should be created in the system using the invoice request type. The valid values are:	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• Automatic **Note:** The automatic mode is not supported while creating an invoice request type for the financial services domain. • Manual	
Bill Generation Type	Used to indicate the type of bill that should be generated for the invoice request in the system using the invoice request type. The valid values are: • Regular • Trial **Note:** By default, this field is set to **Regular** when the **Invoice Mode** is set to **Automatic**.	Yes
Defer Processing Billable Charge Count	Used to specify the count which helps to determine whether the invoice request must be processed in the deferred mode (i.e. in the background) or in real time (i.e. immediately). If the number of billable charges created for the bills which are selected in the invoice request exceeds the defer processing billable charge count, the system processes the invoice request in the deferred mode. However, if the number of billable charges created for the bills which are selected in the invoice request does not exceed the defer processing billable charge count, the system processes the invoice request in real time (i.e. immediately). **Note:** You cannot specify a negative value in this field. Deferred mode means, in the background, when the **Generic Request Periodic Monitor (C1-GENRQ)** batch is invoked. You can configure the **Generic Request Periodic Monitor (C1-GENRQ)** batch such that it is executed at regular intervals. For more information about the **Generic Request Periodic Monitor (C1-GENRQ)** batch, refer to *Oracle Revenue Management and Billing Batch Guide*.	No
Date Calculation Algorithm	Used to indicate the algorithm using which the date is calculated for processing the billable charges created for the bills in the invoice request.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Date Calculation Algorithm** field. On clicking the **Search** icon, the **Algorithm Search** window appears. On specifying the date calculation algorithm, the description of the date calculation algorithm appears corresponding to the **Date Calculation Algorithm** field. You can specify the date calculation algorithm only when the **Invoice Mode** is set to **Automatic**.	**Note:** This field is required for creating an invoice request in the automatic mode.
Approval Required	Used to indicate whether approval is required for approving the bills generated through the invoice request. **Note:** This field appears only when the **Invoice Mode** is set to**Manual** and the **Bill Generation Type** is set to **Regular**.	No
Approval To Do Type	Used to indicate that the To Do task of the specified To Do type must be created when the invoice request is submitted for approval. **Note:** The **Search** (🔍) icon appears corresponding to the **Approval To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the **Approval To Do Type** field. This field appears only when the **Approval Required** option is selected. The **C1-INVRA** To Do type is shipped with the product. You can use the **C1-INVRA** To Do type or a custom To Do type, if required.	Yes (Conditional) **Note:** This field is required for approving the invoice request which is created using the invoice request type.
Approval To Do Role	Used to indicate the user and/or group of users who can approve the invoice request. **Note:** The list includes only those To Do roles which are associated with the approval To Do type. This field appears only when the **Approval Required** option is selected.	Yes (Conditional) **Note:** This field is required for approving the invoice request which is created using the invoice request type.
Submitter To Do Type	Used to indicate that the To Do task of the specified To Do type is created for re-submitting the invoice request for approval.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Submitter To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the **Submitter To Do Type** field. The **C1-INVRS** To Do type is shipped with the product. You can use the **C1-INVRS** To Do type or a custom To Do type, if required.	**Note:** This field is required for resubmitting the invoice request for approval.
Submitter To Do Role	Used to indicate the user and/or group of users who can re-submit the invoice request for approval. **Note:** The list includes only those To Do roles which are associated with the submitter To Do type.	Yes (Conditional) **Note:** This field is required for resubmitting the invoice request for approval. Once the it is defined and saved, it cannot be changed as it is linked to request(s) which are under processing.
Wait Days	Used to specify the maximum wait period (in days) after which the bills in the invoice request are processed. **Note:** You cannot specify a negative value in the **Wait Days** field.	No

Tip: Alternatively, you can access this screen by clicking the **Edit** button in the **Invoice Request Type** zone.

5. Modify the required details in the **Main** section.
6. Define, edit, or remove characteristics from the invoice request type, if required.
7. Click **Save**.
   The changes made to the invoice request type are saved.

Deleting an Invoice Request Type

Procedure

To delete an invoice request type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **I** and then click **Invoice Request Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Invoice Request Type** sub-menu.
   The **Invoice Request Type** screen appears.
4. In the **Invoice Request Type List** zone, click the **Delete** (🗑) icon in the **Delete** column corresponding to *t*he invoice request type that you want to delete.

   A message appears confirming whether you want to delete the invoice request type.

   Note: You can delete an invoice request type only when an invoice request is not yet created using the invoice request type.
5. Click **OK**.
   The invoice request type is deleted.

   Tip: Alternatively, you can delete an invoice request type by clicking the **Delete** button in the **Invoice Request Type** zone.

Copying an Invoice Request Type

Instead of creating an invoice request type from scratch, you can create a new invoice request type using an existing invoice request type. This is possible through copying an invoice request type. On copying an invoice request type, the details including the characteristics are copied to the new invoice request type. You can then edit the details, if required.

Prerequisites

To copy an invoice request type, you should have:

- Invoice request type (whose copy you want to create) defined in the application.
- Invoice request type business object defined in the application.
- Invoice request business objects defined in the application.
- Date calculation algorithm defined using the **C1-INVREDTCA** algorithm type.
- Required To Do role assigned to the **C1-INVRA** and **C1-INVRS** To Do types in the application

Copyright © 2026, Oracle and/or its affiliates.

Procedure

To copy an invoice request type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **I** and then click **Invoice Request Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Invoice Request Type** sub-menu.
   The **Invoice Request Type** screen appears.
4. In the **Invoice Request Type List** zone, click the **Duplicate** (⧉) icon in the **Duplicate** column corresponding to *t*he invoice request type whose copy you want to create.

   The **Invoice Request Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the invoice request type.
   - **Characteristics** - Used to define a list of characteristics for the invoice request type.

   The **Main** section contains the following fields:

Field Name	**Field Description**	**Mandatory (Yes or No)**
Invoice Request Type	Used to specify the invoice request type.	Yes
Business Object	Indicates the business object using which you want to define the invoice request type.	Not applicable
Description	Used to specify the description for the invoice request type.	Yes
Invoice Request Business Object	Used to indicate the invoice request business object for which you want to define the invoice request type. The valid values are: • Invoice Request - Regular Bill Generation • Invoice Request - Trial Bill Generation	Yes
Detailed Description	Used to specify additional information about the invoice request type.	No
Status	Used to indicate the current status of the invoice request type. The valid values are: • Active • Inactive	Yes
Invoice Mode	Used to indicate the mode in which the invoice request should be created in the system using the invoice request type. The valid values are: • Automatic **Note:** The automatic mode is not supported while creating an invoice request type for the financial services domain. • Manual	Yes
Bill Generation Type	Used to indicate the type of bill that should be generated for the invoice request in the system using the invoice request type. The valid values are: • Regular	Yes

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• Trial **Note:** By default, this field is set to **Regular** when the **Invoice Mode** is set to **Automatic**.	
Defer Processing Billable Charge Count	Used to specify the count which helps to determine whether the invoice request must be processed in the deferred mode (i.e. in the background) or in real time (i.e. immediately). If the number of billable charges created for the bills which are selected in the invoice request exceeds the defer processing billable charge count, the system processes the invoice request in the deferred mode. However, if the number of billable charges created for the bills which are selected in the invoice request does not exceed the defer processing billable charge count, the system processes the invoice request in real time (i.e. immediately). **Note:** You cannot specify a negative value in this field. Deferred mode means, in the background, when the **Generic Request Periodic Monitor (C1-GENRQ)** batch is invoked. You can configure the **Generic Request Periodic Monitor (C1-GENRQ)** batch such that it is executed at regular intervals. For more information about the **Generic Request Periodic Monitor (C1-GENRQ)** batch, refer to *Oracle Revenue Management and Billing Batch Guide*.	No
Date Calculation Algorithm	Used to indicate the algorithm using which the date is calculated for processing the billable charges created for the bills in the invoice request. **Note:** The **Search** (🔍) icon appears corresponding to the **Date Calculation Algorithm** field. On clicking the **Search** icon, the **Algorithm Search** window appears. On specifying the date calculation algorithm, the description of the date calculation algorithm appears corresponding to the **Date Calculation Algorithm** field. You can specify the date calculation algorithm only when the **Invoice Mode** is set to **Automatic**.	Yes (Conditional) **Note:** This field is required for creating an invoice request in the automatic mode.
Approval Required	Used to indicate whether approval is required for approving the bills generated through the invoice request. **Note:** This field appears only when the **Invoice Mode** is set to**Manual** and the **Bill Generation Type** is set to **Regular**.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Approval To Do Type	Used to indicate that the To Do task of the specified To Do type must be created when the invoice request is submitted for approval. **Note:** The **Search** (🔍) icon appears corresponding to the **Approval To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the **Approval To Do Type** field. This field appears only when the **Approval Required** option is selected. The **C1-INVRA** To Do type is shipped with the product. You can use the **C1-INVRA** To Do type or a custom To Do type, if required.	Yes (Conditional) **Note:** This field is required for approving the invoice request which is created using the invoice request type.
Approval To Do Role	Used to indicate the user and/or group of users who can approve the invoice request. **Note:** The list includes only those To Do roles which are associated with the approval To Do type. This field appears only when the **Approval Required** option is selected.	Yes (Conditional) **Note:** This field is required for approving the invoice request which is created using the invoice request type.
Submitter To Do Type	Used to indicate that the To Do task of the specified To Do type is created for re-submitting the invoice request for approval. **Note:** The **Search** (🔍) icon appears corresponding to the **Submitter To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the **Submitter To Do Type** field. The **C1-INVRS** To Do type is shipped with the product. You can use the **C1-INVRS** To Do type or a custom To Do type, if required.	Yes (Conditional) **Note:** This field is required for resubmitting the invoice request for approval.
Submitter To Do Role	Used to indicate the user and/or group of users who can re-submit the invoice request for approval.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The list includes only those To Do roles which are associated with the submitter To Do type.	**Note:** This field is required for resubmitting the invoice request for approval. Once the it is defined and saved, it cannot be changed as it is linked to request(s) which are under processing.
Wait Days	Used to specify the maximum wait period (in days) after which the bills in the invoice request are processed. **Note:** You cannot specify a negative value in the **Wait Days** field.	No

Tip: Alternatively, you can copy an invoice request type by clicking the **Duplicate** button in the **Invoice Request Type** zone.

5. Enter the required details in the **Main** section.
6. Define, edit, or remove characteristics from the invoice request type, if required.
7. Click **Save**.
   The new invoice request type is defined.

Invoice Request (Used for Searching)

The **Invoice Request** screen allows you to search for an invoice request using various search criteria. It also allows you to manually create an invoice request. It contains the following zone:

- Search Invoice Request on page 4018

Through this screen, you can navigate to the following screen:

- Invoice Request (Used for Viewing) on page 4026

Search Invoice Request

The **Search Invoice Request** zone allows you to search for an invoice request using various search criteria. It contains the following two sections:

- **Search Criteria** - The **Search Criteria** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Search By	Used to indicate whether you want to search for an invoice request created for an account or a person. The valid values are: • Invoice Requests for Accounts • Invoice Requests for Persons **Note:** By default, the **Invoice Requests for Accounts** option is selected.	Yes
Invoice Request ID	Used to search a particular invoice request.	No
Creation From Date	Used to search invoice requests which are created from a particular date onwards.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field. The **Creation From Date** cannot be later than the **Created To** date.	
Created To	Used to search invoice requests which are created till a particular date. **Note:** You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field. The **Created To** date cannot be earlier than the **Creation From Date**.	No
Cutoff From	Used to indicate the date from when the billable charges are considered for processing the invoice request. **Note:** You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field. The cutoff from date cannot be later than the cutoff to date.	No
Cutoff To	Used to indicate the date till when the billable charges are considered for processing the invoice request. **Note:** You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field. The cutoff to date cannot be earlier than the cutoff from date.	No
Invoice Request Type	Used to search invoice requests which are created using a particular invoice request type.	No
Status	Used to search invoice requests which are in a particular status. The valid values are: • Account Derivation Pending • Approved • Approval In Progress • Canceled	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	• Deferred Processing • Deferred Processing Batch • Draft • Error • Processed • Rejected	
Person ID	Used to search invoice requests which include bills of a particular person. **Note:** The **Search** (🔍) icon appears corresponding to the **Person ID** field. On clicking the **Search** icon, the **Person Search** window appears where you can search for a particular person.	No
Account ID	Used to search invoice requests which include bills of a particular account. **Note:** The **Search** (🔍) icon appears corresponding to the **Account ID** field. On clicking the **Search** icon, the **Account Search** window appears where you can search for a particular account. This field appears only when the **Invoice Requests for Accounts** option is selected from the **Search By** list.	No
Bill Generation Type	Used to indicate the bill generation type using which the bills of the invoice request are created in the system. The valid values are: • Regular • Trial	No
External Reference Type	Used to indicate the external reference type using which the invoice request is created in the system. The valid values are: • Membership • Policy **Note:** This field appears only when the **Invoice Requests for Accounts** option is selected from the **Search By** list. This field is not applicable for the banking business.	No
External Reference ID	Used to specify the external reference ID of the account for which the invoice request is created in the system.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **External Reference ID** field. On clicking the **Search** icon, the **Search Membership** or the **Search Policy** window appears depending upon the option selected from the **External Reference Type** list. This field appears only when the **Invoice Requests for Accounts** option is selected from the **Search By** list. This field is not applicable for the banking business.	This field is required when you specify the external reference type.

Note: You must specify at least one search criterion while searching for an invoice request.

- **Search Results** - On clicking the **Search** button, the search results appear based on the specified search criteria. The **Search Results** section contains the following columns:

Column Name	Column Description
Creation Date Time	Displays the date and time when the invoice request is created in the system.
Invoice Request Information	Displays information about the invoice request. **Note:** It has a link. On clicking the link, the **Invoice Request** screen appears where you can view the details of the respective invoice request.
Created By	Indicates the user who has created the invoice request.
Cutoff Date	Displays the date till when all the billable charges are considered for processing the invoice request.
Account Information	Displays information about the account for which the invoice request is processed in the system. In addition, this column has a context menu (⊙) which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Account** screen appears where you can view the details of the respective account. This column appears only when the **Invoice Requests for Accounts** option is selected from the **Search By** list.
Person Information	Displays information about the person for whose accounts the invoice request is processed in the system. In addition, this column has a context menu (⊙) which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Person** screen appears with the details of the respective person. This column appears when the **Invoice Requests for Persons** option is selected from the **Search By** list.

Searching for an Invoice Request

Prerequisites

To search for an invoice request, you should have:

- Invoice requests defined in the application

Procedure

To search for an invoice request:

1. Click the **Menu** link in the **Application** toolbar.
   A list appears.
2. From the **Main** menu, select **Billing Management** and then click **Invoice Request**.
   A sub-menu appears.
3. Click the **Search** option from the **Invoice Request** sub-menu.
   The **Invoice Request** screen appears.
4. Enter the search criteria in the **Search Invoice Request** zone.

> **Note:** ORMB search engine supports wildcard search, where you can substitute the percentage (%) symbol as a stand in for any word or letter in a search criteria. You can use the '%' wildcard character in all input fields except the date and ID fields. The '%' wildcard character is suffixed automatically at the end of the partial search criteria. Therefore, you may or may not specify the wildcard character at the end of the partial search criteria. However, you have to prefix the wildcard character manually wherever required.

5. Click **Search**.
   A list of invoice requests that meet the search criteria appears in the **Search Results** section.

Manually Creating an Invoice Request

Prerequisites

To manually create an invoice request, you should have:

- Invoice request types defined in the application
- Entity (i.e., person or account for which you want to create the invoice request) defined in the application
- Bills generated for the entity (i.e., person or account) in the application

Procedure

Copyright © 2026, Oracle and/or its affiliates.

To manually create an invoice request:

1. Click the **Menu** link in the **Application** toolbar.
   A list appears.
2. From the **Main** menu, select **Billing Management** and then click **Invoice Request**.
   A sub-menu appears.
3. Click the **Add** option from the **Invoice Request** sub-menu.

   The **Add Invoice Request** window appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Invoice Request Type	Used to indicate the invoice request type using which you want to create the invoice request in the system.	Yes

4. Select the required invoice request type from the **Invoice Request Type** list.
5. Click **OK**.

   The **Invoice Request** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the invoice request.
   - **Characteristics** - Used to define a list of characteristics for the invoice request.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Invoice Request Type	Indicates the invoice request type using which you want to create the invoice request.	Not applicable
Entity	Used to indicate the entity for which you want to create the invoice request. The valid values are: • Account • Person **Note:** By default, the **Account** option is selected.	Yes
Account ID	Used to indicate the invoice request which includes the bills of a particular account. **Note:** The **Search** (🔍) icon appears corresponding to the **Account ID** field. On clicking the **Search** icon, the **Account Search** window appears where you can search for the respective account. This field appears only when you select the **Account** option from the **Entity** list.	Yes (Conditional) This field is required while specifying the account for which you want to create the invoice request.
Person ID	Used to indicate the invoice request which includes the bills of a particular person.	Yes (Conditional) This field is required while specifying the

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to **Person ID** field. On clicking the **Search** icon, the **Person Search** window appears where you can search for the respective person. This field appears only when you select the **Person** option from the **Entity** list.	person for whose accounts you want to create the invoice request.
Include Person Hierarchy	Used to specify whether you want to include the accounts of all the child persons of the main person for creating the invoice request. **Note:** This field appears when you select the **Person** option from the **Entity** list.	No
Cutoff Date	Used to specify the date till when all the billable charges are considered for processing the invoice request. **Note:** By default, the current date appears in this field. You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	No
Accounting Date	Used to specify the accounting date for which the financial transaction of the bill is created. **Note:** By default, the current date appears in this field. You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	No
Bill Date	Used to specify the date on which the bill is generated for the entity. **Note:** The bill date cannot be on or earlier than the last bill date of the account. By default, the current date appears in this field. You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	No
Comments	Used to specify additional information about the invoice request.	No

6. Enter the required details in the **Main** section.
7. Define a list of characteristics for the invoice request in the **Characteristics** section, if required.
8. Click **Save**

Copyright © 2026, Oracle and/or its affiliates.

The invoice request is created in the **Draft** status and the status of all the records (in the invoice request) is set to **Pending**.

Tip: Alternatively, you can access this screen by clicking the **Add** button in the **Page Title** area of the **Invoice Request** screen.

Invoice Request (Used for Viewing)

The **Invoice Request** screen allows you to:

- View the details of the invoice request
- Edit the details of the invoice request
- Delete the invoice request
- Submit the invoice request for processing
- Approve or reject the invoice request
- Cancel the invoice request
- View the log of the invoice request
- Add a log entry for the invoice request

The **Invoice Request** screen contains the following tabs:

- Invoice Request - Main on page 4027
- Invoice Request - Log on page 4033

Copyright © 2026, Oracle and/or its affiliates.

Invoice Request - Main

The **Main** tab displays information about the invoice request. It contains the following zones:

- Invoice Request on page 4027
- Invoice Request Details on page 4031
- Account List on page 4032
- Excluded Accounts on page 4033

Invoice Request

The **Invoice Request** zone displays the details of the invoice request. It contains the following sections:

- **Main** - The **Main** section displays basic information about the invoice request. It contains the following fields:

Field Name	Field Description
Invoice Request Information	Displays information about the invoice request.
Invoice Request Type	Indicates the invoice request type using which the invoice request is created in the system. **Note:** It has a link. On clicking the link, the **Invoice Request Type** screen appears where you can view the details of the respective invoice request type.
Entity	Indicates the entity for which the invoice request is created in the system. The valid values are: • Account • Person
Account Information	Displays information about the account for which the invoice request is created in the system. **Note:** It has a link. On clicking the link, the **Account** screen appears where you can view the details of the respective account. This field appears only when you are viewing the invoice request details of an account.
Person Information	Displays information about the person for whose accounts the invoice request is created in the system. **Note:** It has a link. On clicking the link, the **Person** screen appears where you can view the details of the respective person. This field appears only when you are viewing the invoice request details of a person.
Include Person Hierarchy	Indicates whether the accounts of the child persons of the main person are included for processing the invoice request.

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description
	Note: This field appears only when you are viewing the invoice request details of a person.
Cutoff Date	Displays the date till when all the billable charges are considered for processing the invoice request.
Accounting Date	Displays the accounting date for which the financial transaction of the bill is created.
Bill Date	Displays the date on which the bill is generated. **Note:** The bill date must not be equal to or earlier than the last bill date of the account for which the invoice request is generated.
Processing Date	Indicates the date when the invoice request is processed. **Note:** `Processing Date = Invoice Request Creation Date + ' Wait Day + Work Days`
Status	Indicates the current status of the invoice request. The valid values are: • Account Derivation Pending • Approved • Approval In Progress • Cancelled • Deferred Processing • Deferred Processing - Batch • Draft • Error • Processed • Rejected • Submitted • Processing • Return to Submitter
Status Reason	Indicates the reason why the status of the invoice request is changed. **Note:** It has a link. On clicking the link, the **Status Reason** screen appears where you can view the details of the respective status. This field appears only when you select **canceled** option from the status list.
Comments	Displays additional information about the invoice request. **Note:** This field appears only when the invoice request is in the **Processed** status.

- **Characteristics** - The **Characteristics** section lists the characteristics defined for the invoice request. It contains the following columns:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Effective Date	Displays the date from when the characteristic is effective for the invoice request.
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - The **Record Actions** section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the invoice request. **Note:** The **Edit** button appears only when the invoice request is in the **Draft** status.
Delete	Used to delete the invoice request. **Note:** The **Delete** button appears only when the invoice request is in the **Draft** status.
Submit	Used to submit the invoice request for approval. **Note:** The **Submit** button appears only when the invoice request is in the **Draft** status.
Cancel	Used to cancel the invoice request. **Note:** The **Cancel** button appears when the invoice request is in the **Deferred Processing Batch** status.
Approve	Used to approve the invoice request. **Note:** The **Approve** button appears when: • The invoice request is in the **Approval In Progress** status. • A user with the approval To Do role is reviewing the invoice request.
Reject	Used to reject the invoice request. **Note:** The **Reject** button appears when: • The invoice request is in the **Approval In Progress** status. • A user with the approval To Do role is reviewing the invoice request.
Re Submit	Used to request the user for resubmitting the invoice request for approval. **Note:** The **Re Submit** button appears when: • The invoice request is in the **Approval In Progress** status. • A user with the approval To Do role is reviewing the invoice request.

- **Record Information** - The **Record Information** section contains the following fields:

Field Name	Field Description
Business Object	Indicates the business object using which the invoice request is created in the system. In addition, this column has a context menu (⊙) icon appears

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description
	corresponding to this column which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.
Status Date/Time	Displays the date and time when the invoice request status is updated.
Create Date/Time	Displays the date and time when the invoice request is created.

- **External Reference** - The **External Reference** section lists the external references using which the invoice request is created in the system. It contains the following columns:

Column Name	Column Description
External Reference Type	Indicates the external reference type using which the invoice request is created for the external references. The valid values are: • Membership • Policy **Note:** The value in this field appears only when you are viewing the invoice request details of an account which belongs to the health insurance business and is created using an external reference.
External Reference Information	Displays information about the external reference for the invoice request. **Note:** It has a link. On clicking the link, the **Policy** screen appears with the details of the respective policy. The value in this field appears only when you are viewing the invoice request details of an account which belongs to the health insurance business and is created using an external reference.

- **Statistics** - The **Statistics** section displays information about the records generated while processing the invoice request. It contains the following fields:

Field Name	Field Description
Total Records	Displays the total number of records that were considered for processing the invoice request.
Processed Records	Displays the number of records that were processed while processing the invoice request.
Total Bills Created	Displays the total number of bills generated for the accounts considered for processing the invoice request.
Excluded Records	Displays the number of records that were excluded from the invoice request generation process.
Error Records	Displays the number of records which are in the error status.
Processing Records	Displays the number of records in the invoice request which are still under the generation process.
Pending Records	Displays the number of records that are pending to be processed for the invoice request generation process.

Invoice Request Details

The **Invoice Request Details** zone lists the persons whose accounts are added to the invoice request. It contains the following columns:

Column Name	Column Description
Person Information	Indicates the person for which the invoice request is created. In addition, this column has a context menu (⊙) icon appears corresponding to this column which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Person** screen appears where you can view the details of the respective person.
Record Status	Indicates the status of the bills in the invoice request. The valid values are: • Pending • Error • Processing
Bill Information	Indicates the bill which is added to the invoice request. In addition, this column has a context menu (⊙) icon appears corresponding to this column which helps in navigating to other screens in the application. **Note:** It has a link. On clicking the link, the **Bill** screen appears where you can view the details of the respective bill.
Error Message	Displays the error message indicating the error that occurred while processing the bills in the invoice request.
Recent Billed Date	Displays the date of the bill that has been recently processed from the invoice request.

Copyright © 2026, Oracle and/or its affiliates.

Note:

Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

The **Filter** icon appears when the zone is **Account List**.

You can filter the list using various search criteria (such as, **Record Status**, **Account ID**, and **Person ID**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (▽) icon in the upper right corner of this zone.

Account List

The **Account List** zone lists the accounts of the entity whose bills are considered for creating the invoice request. It contains the following columns:

Column Name	Column Description
Account Information	Indicates the account for which the invoice request is created in the system. In addition, this column has a context menu (⊙) which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Account** screen appears where you can view the details of the respective account.
Person Information	Indicates the person for which the invoice request is created in the system. In addition, this column has a context menu (⊙) which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Person** screen appears where you can view the details of the respective person.
Record Status	Indicates the status of the bills in the invoice request. The valid values are: • Pending • Error • Processing
Bill Information	Indicates the bill which is added to the invoice request. In addition, this column has a context menu (⊙) which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Bill** screen appears where you can view the details of the respective bill.
Error Message	Displays the error message indicating the error that occurred while processing the bills in the invoice request for the account.
Recent Billed Date	Displays the date of the bill that has been recently processed from the invoice request for the account.

A check-box appears corresponding to each account when the invoice request is in the **Draft** status. On selecting the check-box, and clicking the **Exclude** button, you can exclude the account from the invoice request process. You can also select multiple accounts at the same time. In addition, you can select the check box corresponding to the column header to exclude all the accounts from the invoice request process.

Note:

Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

You can filter the list using various search criteria (such as, **Record Status**, **Account ID**, and **Person ID**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (▽) icon in the upper right corner of this zone.

Excluded Accounts

The **Excluded Accounts** zone lists the accounts of the main person whose bills are not considered for processing the invoice request. It contains the following columns:

Column Name	Column Description
Account Information	Indicates the account whose bills are excluded from the invoice request process. In addition, this column has a context menu (⊙) which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Account** screen appears where you can view the details of the respective account.
Person Information	Indicates the person to which the account belongs. In addition, this column has a context menu (⊙) which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Person** screen appears where you can view the details of the respective person.

A check-box appears corresponding to each account when the invoice request is in the **Draft** status. On selecting the check-box, and clicking the **Include** button, you can include the account to the invoice request process. You can also select multiple accounts at the same time. In addition, you can select the check box corresponding to the column header to include all the accounts of the person to the invoice request process.

Note:

Pagination is used to display limited number of records in this zone. You can use the navigation links, such as **Previous** and **Next** to navigate between pages.

You can filter the list using various search criteria (such as, **Record Status**, **Account ID**, and **Person ID**) available in the **Filter** area. By default, the **Filter** area is hidden. You can view the **Filter** area by clicking the **Filters** (▽) icon in the upper right corner of this zone.

The **Excluded Accounts** zone appears when **Invoice Requests for Persons** option is selected from the **Search By list** in the **Search Invoice Request** zone.

Invoice Request - Log

The **Log** tab contains the following zone:

- Invoice Request Log on page 4033

Invoice Request Log

The **Invoice Request Log** zone lists the complete trail of actions performed on the invoice request. It contains the following columns:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Creation Date/Time	Displays the date and time when the action was performed on the invoice request.
Details	Displays the details of the action performed on the invoice request.
User	Indicates the user who has performed the action on the invoice request.
Log Type	Indicates the type of log.
Related Object	Indicates the object or entity which is created when the action is performed on the invoice request.
	Note: At present, no data appears in this column. The implementation team can build the custom logic to meet the business requirements.
Status Reason	Indicates the reason why the status of the invoice request was changed.

Note: You can manually add a log entry for the invoice request by clicking the **Add Log Entry** link in the upper right corner of the **Invoice Request Log** zone.

Editing an Invoice Request

Prerequisites

To edit an invoice request, you should have:

- Invoice request types defined in the application
- Bills created in the application
- Account and Person entities defined in the application

Procedure

To edit an invoice request:

1. Search for the invoice request in the **Invoice Request** screen.
2. In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to *t*he invoice request whose details you want to edit.
   The **Invoice Request** screen appears.
3. Click the **Edit** button in the **Invoice Request** zone.

   The **Invoice Request** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the invoice request.
   - **Characteristics** - Used to define a list of characteristics for the invoice request.

   The **Main** section contains the following fields:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Invoice Request Information	Displays information about the invoice request.	Not applicable
Invoice Request Type	Indicates the invoice request type using which the invoice request is created in the system.	Not applicable
Entity	Indicates the entity for which the invoice request is created in the system. The valid values are: • Account • Person	Not applicable
Account ID	Used to edit the invoice request which includes the bills of a particular account. **Note:** The **Search** (🔍) icon appears corresponding to the **Account ID** field. On clicking the **Search** icon, the **Account Search** window appears where you can search for the respective account. This field appears only when the **Account** option is selected from the **Entity** list.	Yes
Person ID	Used to edit the invoice request which includes the bills of a particular person. **Note:** The **Search** (🔍) icon appears corresponding to **Person ID** field. On clicking the **Search** icon, the **Person Search** window appears where you can search for the respective person. This field appears only when the **Person** option is selected from the **Entity** list.	Yes
Include Person Hierarchy	Used to specify whether you want to include the accounts of all the child persons of the main person for creating the invoice request. **Note:** This field appears only when the **Person** option is selected from the **Entity** list.	No
Cutoff Date	Used to specify the date till when all the billable charges are considered for processing the invoice request. **Note:** You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	No
Accounting Date	Used to specify the accounting date for which the financial transaction of the bill is created.	No

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	
Bill Date	Used to specify the date on which the bill is generated for the entity. **Note:** The bill date cannot be on or earlier than the last bill date of the account. You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	No
Processing Date	Displays the date when the invoice request is processed in the system.	No
Comments	Used to specify additional information about the invoice request.	No

Note: The **Edit** button appears when the invoice request is in the **Draft** status.

4. Modify the details of the invoice request, if required.
5. Define, edit, or remove characteristics from the invoice request, if required.
6. Click **Save**.
   The changes made to the invoice request are saved.

How to define a characteristic for an invoice request	Defining a Characteristic for an Invoice Request on page 4036

Defining a Characteristic for an Invoice Request

Prerequisites

To define a characteristic for an invoice request, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Invoice Request**)

Procedure

To define a characteristic for an invoice request:

1. Ensure that the **Characteristics** section is expanded when you *a*re manually creating or editing an invoice request.

   The **Characteristics** section contains the following fields in a grid:

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Effective Date	Used to specify the date from when the characteristic is effective for the invoice request. **Note:** You can either manually specify the date or select it using the **Date Picker** (📅) icon corresponding to the field.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for the invoice request.
Characteristic Type	Used to indicate the characteristic type. **Note:** The list includes only those characteristic types where the characteristic entity is set to **Invoice Request**.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for the invoice request.
Characteristic Value	Used to specify the value for the characteristic type. **Note:** If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, you can search for a predefined characteristic value. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	Yes (Conditional) **Note:** This field is required when you are defining a characteristic for the invoice request.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the invoice request, click the **Add** (+) icon and then *r*epeat step *2*.

> **Note:** However, if you want to remove a characteristic from the invoice request, click the **Delete** (🗑) icon corresponding to the characteristic.

4. Click **Save**.
   The characteristic is defined for the invoice request.

Canceling an Invoice Request

Prerequisites

To cancel an invoice request, you should have:

- Reasons defined for the **Canceled** status of the **C1-InvoiceRequest** business object in the **Status Reason** screen

Procedure

To cancel an invoice request:

1. Search for the invoice request in the **Invoice Request** screen.
2. In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to *t*he invoice request that you want to cancel.
   The **Invoice Request** screen appears.
3. Click the **Cancel** button in the **Invoice Request** zone.

   The **Invoice Request** window appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Status Reason	Used to indicate the reason why you want to cancel the invoice request. **Note:** The list includes only those reasons which are defined for the **Canceled** status of the **C1-InvoiceRequest** business object in the **Status Reason** screen.	Yes

> **Note:** The **Cancel** button appears when the invoice request is in the **Deferred Processing** or **Deferred Processing - Batch** status.

4. Select the reason for canceling the invoice request from the **Status Reason** list.
5. Click **Save**.
   The status of the invoice request (along with the bills within the invoice request) is changed to **Canceled**.

Submitting an Invoice Request

Prerequisites

To submit an invoice request, you should have:

- The status of the invoice request in the **Draft** status.
- The invoice request type as **Manual**.

Procedure

To submit an invoice request:

1. Search for the invoice request in the **Invoice Request** screen.
2. In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to *t*he invoice request that you want to submit.
   The **Invoice Request** screen appears.
3. Click the **Submit** button in the **Invoice Request** zone.

   The system behaves in the following manner:

If...	Then...
The **Approval Required** option is selected in the respective invoice request type	The status of the invoice request is changed to **Approval In Progress**. In this status, you can perform various actions on the invoice request, such as, **Approve** or **Reject** or **Return To Submitter**. If the approver clicks the **Approve** button, the status of the invoice request is changed to **Approved**. If the approver clicks the **Reject** button, the status of the invoice request is changed to **Rejected**. If the approver clicks the **Return To Submitter** button, a To Do is generated and the invoice request status is changed to **Draft**. The submitter updates the invoice request and redirects it back to the approver for approval purposes.
The **Approval Required** option is not selected in the respective invoice request type and the entity type is **Person**	The status of the invoice request is changed to **Processed**, or **Deferred Processing** or **Deferred Processing Batch**.
The **Approval Required** option is not selected in the respective invoice request type, and the entity type is **Account**, and the billable charge count exceeds the defer processing billable charge count	The status of the invoice request is changed to **Deferred Processing Batch**.
The **Approval Required** option is not selected in the respective invoice request type, and the entity type is **Account**, and the billable charge count does not exceed the defer processing billable charge count, and	The status of the invoice request is changed to **Processed** else it is changed to **Deferred Processing**.

Approving an Invoice Request

You can view the number of invoice requests which are pending for approval in the **Invoice Request** screen. The approver can review, and accordingly approve, reject, or ask the submitter to resubmit the invoice request based on the observations.

Note: The system will not allow you to approve, reject, or resubmit an invoice request submitted by you.

Prerequisites

To approve an invoice request, you should have:

- Approval To Do role assigned in the system

Procedure

To approve an invoice request:

1. Do either of the following:

If you want to...	Then...
Approve an invoice request through the Invoice Request screen	**a.** Search for the invoice request in the **Invoice Request** screen. **b.** In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to the invoice request which you want to review.
Approve an Invoice request from the To Do List screen	**a.** Click the **Menu** link in the **Application** toolbar. A list appears. **b.** From the **Main** menu, select **To Do** and then click **To Do List**. The **To Do Type for User Search** window appears. **c.** Enter **C1-INVRATODO** in the **To Do Type** field. **d.** Click the **Search** button corresponding to the **To Do Type** field. The **To Do List** screen appears. **e.** Select the **Open** option from the **Filter by** list to view all unassigned To Dos. **f.** Click the link in the **Message** column corresponding to the To Do of the invoice request that you want to review.

Copyright © 2026, Oracle and/or its affiliates.

The **Invoice Request** screen appears.

2. Review the details in the **Invoice Request** screen.
3. If the information in the invoice request is accurate, then click the **Approve** button in the **Invoice Request** zone.

   The system behaves in the following manner:

If...	Then...
The status of the invoice request is changed to **Approved**	A To Do entry is created using the To Do type **F1-TODOCOMPL** specified in the approval profile and is assigned back to the submitter to complete the invoice request.

Note: The **Approve** button appears when:

- The invoice request is in the **Approval In Progress** status.
- A user with the approval To Do role is reviewing the invoice request.

Rejecting an Invoice Request

Prerequisites

To reject an invoice request, you should have:

- Reasons defined for the **Rejected** status of the **C1-InvoiceRequest** business object in the **Status Reason** screen.

Note: The system will not allow you to approve, reject, or resubmit an invoice request submitted by you.

Procedure

To reject an invoice request:

1. Do either of the following:

If you want to...	Then...
Reject an invoice request through the Invoice Request screen	**a.** Search for the invoice request in the **Invoice Request** screen. **b.** In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to the invoice request which you want to review.
Reject an invoice request from the To Do List screen	**a.** Click the **Menu** link in the **Application** toolbar. A list appears. **b.** From the **Main** menu, select **To Do** and then click **To Do List**. The **To Do Type for User Search** window appears. **c.** Enter **C1-INVRATODO** in the **To Do Type** field.

Copyright © 2026, Oracle and/or its affiliates.

If you want to...	Then...
	d. Click the **Search** button corresponding to the **To Do Type** field. The **To Do List** screen appears. **e.** Select the **Open** option from the **Filter by** list to view all unassigned To Dos. **f.** Click the link in the **Message** column corresponding to the To Do of the invoice request that you want to review.

The **Invoice Request** screen appears.

2. Review the details in the **Invoice Request** screen.
3. If the information in the invoice request is incorrect, then click the **Reject** button in the **Invoice Request** zone.
The **Reject Invoice Request** window appears. It contains following fields:

Field Name	Field Description	Mandatory (Yes or No)
Status Reason	Used to indicate the reason why you want to reject the invoice request. **Note:** The list includes only those reasons which are defined for the **Rejected** status of the **C1-InvoiceRequest** business object in the **Status Reason** screen.	Yes
Comments	Used to specify additional information for rejecting the invoice request.	No

Note: The **Reject** button appears when:

- The invoice request is in the **Approval In Progress** status.
- A user with the approval To Do role is reviewing the invoice request.

4. Select the reason for rejecting the invoice request from the **Status Reason** list.
5. Click **Save**.
The status of the invoice request is changed to **Rejected**.

Requesting the Submitter to Resubmit the Invoice Request for Approval

Procedure

To request the submitter to resubmit the invoice request for approval:

1. Do either of the following:

Copyright © 2026, Oracle and/or its affiliates.

If you want to...	Then...
Request for resubmitting an invoice request through the Invoice Request screen	**a.** Search for the invoice request in the **Invoice Request** screen. **b.** In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to the invoice request which you want to review.
Request for resubmitting an invoice request from the To Do List screen	**a.** Click the **Menu** link in the **Application** toolbar. A list appears. **b.** From the **Main** menu, select **To Do** and then click **To Do List**. The **To Do Type for User Search** window appears. **c.** Enter **C1-INVRATODO** in the **To Do Type** field. **d.** Click the **Search** button corresponding to the **To Do Type** field. The **To Do List** screen appears. **e.** Select the **Open** option from the **Filter by** list to view all unassigned To Dos. **f.** Click the link in the **Message** column corresponding to the To Do of the invoice request that you want to review.

The **Invoice Request** screen appears.

2. Review the details in the **Invoice Request** screen.
3. If the information in the invoice request is incomplete and you want the submitter to make the required changes *a*nd resubmit the invoice request for approval, then click the **Resubmit** button in the **Invoice Request** zone.
The **Resubmit Invoice Request** window appears. It contains the following field:

Field Name	Field Description	Mandatory (Yes or No)
Comments	Used to specify the changes which the submitter should make in the invoice request before resubmitting it for approval.	Yes

Note: The **Resubmit** button appears when:

- The invoice request is in the **Approval In Progress** status.
- A user with the approval To Do role is reviewing the invoice request.

4. Specify the changes in the **Comments** field and then click **Save**.
A To Do is created using the submitter To Do type and assigned to all users with a submitter To Do role specified in the invoice request type. In addition, the status of the invoice request is changed to **Draft**.

Viewing the Log of an Invoice Request

Procedure

To view the log of an invoice request:

1. Search for the invoice request in the **Invoice Request** screen.
2. In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to *t*he invoice request whose log you want to view.
   The **Invoice Request** screen appears.
3. Click the **Log** tab.
   The **Log** tab appears.
4. View the complete trail of actions performed on the invoice request in the **Invoice Request Log** zone.

Adding a Log Entry for an Invoice Request

Procedure

To add a log entry for an invoice request:

1. Search for the invoice request in the **Invoice Request** screen.
2. In the **Search Results** section, click the link in the **Invoice Request Information** column corresponding to *t*he invoice request for which you want to add a log entry.
   The **Invoice Request** screen appears.
3. Click the **Log** tab.
   The **Log** tab appears.
4. Click the **Add Log Entry** link in the upper right corner of the **Invoice Request Log** zone.

   The **Add Request Log** window appears. It contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Request Information	Displays information about the invoice request.	Not applicable
Log Details	Used to specify the reason for adding a log entry for the invoice request.	Yes

5. Enter the required details in the **Log Details** field.
6. Click **Save**.
   The log entry is added for the **Invoice Request Log** zone.

Chapter 46

Hold Request Creation, Modification, Release, and View Through Inbound Web Service

Topics:

- C1-CreateHoldRequest Business Service
- C1-UpdateHoldRequest Business Service
- C1-GetHoldRequestHistory Business Service
- C1-ReleaseHoldRequest Business Service

Oracle Revenue Management and Billing enables you to create, edit, and release a hold request through an inbound web service. It also enables you to view the details of a hold request through an inbound web service. You can send the hold creation, update, view, or release request from an external system through an inbound web service.

The following business services are shipped with the product to support different hold request operations:

- **C1-CreateHoldRequest** – Used to create a hold request for a single entity (i.e., for a particular person, account, or bill). For more information, see C1-CreateHoldRequest Business Service on page 4048.
- **C1-UpdateHoldRequest** – Used to edit an active hold request. For more information, see C1-UpdateHoldRequest Business Service on page 4070.
- **C1-GetHoldRequestHistory** – Used to fetch the details of the active hold requests for a single entity (i.e. person, account, or bill). For more information, see C1-GetHoldRequestHistory Business Service on page 4086.
- **C1-ReleaseHoldRequest** – Used to release an active hold request with a single entity (i.e. person, account, or bill). For more information, see C1-ReleaseHoldRequest Business Service on page 4101.

You can create one inbound web service which supports all four operations - hold creation request, hold update request, hold release request, and hold view request. Alternatively, you can create four different inbound web services - one for hold creation request, another for hold update request, third for hold release request, and fourth for hold view request.

You can create a SOAP or REST based inbound web service. If you want to send the request in the XML and/or JSON format, you need to ensure that you create a REST based inbound web service. However, if you want to send the request in the XML format, you can create a SOAP or REST based inbound web service.

C1-CreateHoldRequest Business Service

The **Create Hold Request** (**C1-CreateHoldRequest**) business service enables you to create a hold request for a single entity (i.e., for a particular person, account, or bill). In other words, you cannot include multiple entities in the same hold request. You can call this business service from an external system through an inbound web service. If you want to send the hold creation request in the XML and/or JSON format, you need to ensure that you create a REST based inbound web service in Oracle Revenue Management and Billing. However, if you want to send the hold creation request in the XML format, you can create a SOAP or REST based inbound web service in Oracle Revenue Management and Billing.

While sending the hold creation request, you need to specify the following details:

- Hold request type, hold request start date, and hold request end date or hold days (which is used to calculate hold request end date if not specified).
- Entity (i.e., Person, Account, or Bill) for which you want to create the hold request.
- Hold reason and comments, if any.
- Entity identifiers or entity ID when the entity is an account or a person, and the entity ID when the entity is a bill.
- Hold entity and hold process end dates.
- Business processes (i.e., Auto Pay, Bill Generation, Delinquency, Funding, Overdue, Refund) which you want to hold for the entity for the given duration.
- Characteristics for the hold request, if required.

Note:

You must specify an active hold request type where the approval process is not configured for activation and release.

If you do not specify the hold request type, the system, by default, considers the hold request type specified in the **Default Hold Request Type for IWS** option type of the **C1-HOLDSRCH** feature configuration.

This business service allows you to create a future dated hold request but not a past dated hold request.

Even if you explicitly specify a value for the defer processing count in the hold request type, it is not considered by this business service while creating a hold request. The system will always create the hold request in the **Active** status.

On creating a hold request, the status of the hold request is set to **Active**. The start date of the hold entity and hold process is set to the hold request start date. If you do not specify the hold entity and/or hold process end dates, the system, by default, sets it to the hold request end date. While creating a hold request through an inbound web service, the system sets the creation mode of the hold request to **Automatic**.

Once the hold request is created through an inbound web service, the hold request ID is sent in the response along with its status. If an error occurs while creating the hold request, the system sends the error message in the response. The system enables you to track the hold creation response sent to the external system using the **Inbound Web Service History** feature.

For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.

Sample Hold Creation Request and Response in the JSON Format	Sample Hold Creation Request and Response in the JSON Format on page 4068

Prerequisites

To create a hold request through an inbound web service, you need to do the following:

- Define a REST or SOAP based inbound web service to call the **C1-CreateHoldRequest** business service where **HTTP Method** is set to **Post** and **URI Component** is set to/**createHold**.
- Authorize the ORMB user to access the required application service.
- Define the required active hold request type where the **Activation Approval** option is not selected.
- Define the required source systems in the **C1-SourceSystemLookup** extendable lookup.
- Define the required person or account identifier types in the system.
- Ensure that the entities (i.e., person, account, or bill) that you want to keep on hold through a hold request should exist in the system.
- Define the required values for the **HOLD_REASON_FLG**, **HOLD_ENTITY_LVL_FLG**, and **HOLD_PROCESS_FLG** lookup fields.
- Define the required characteristic types where the characteristic entity is set to **Hold Request**.
- Set the **Default Hold Request Type for IWS** option type of the **C1-HOLDSRCH** feature configuration.

For more information on...	See...
How to setup the **C1-HOLDSRCH** feature configuration	Setting the C1-HOLDSRCH Feature Configuration on page 1974

Hold Creation Request in the XML Format

The following code snippet illustrates how the tags should be nested while receiving the hold creation request in the XML format:

```
<C1-CreateHoldRequest>
    <holdRequest>
        <sourceSystem></sourceSystem>
        <externalTransactionId></externalTransactionId>
        <externalSourceId></externalSourceId>
        <holdStartDate></holdStartDate>
        <holdEndDate></holdEndDate>
        <holdDays></holdDays>
        <holdRequestType></holdRequestType>
```

Copyright © 2026, Oracle and/or its affiliates.

```
        <holdEntity></holdEntity>
        <holdReason></holdReason>
        <holdComments></holdComments>
        <entityIdentifierType></entityIdentifierType>
        <entityIdentifierValue></entityIdentifierValue>
        <entityId></entityId>
        <holdEntityEndDate></holdEntityEndDate>
        <hierarchySwitch></hierarchySwitch>
        <holdProcessData>
            <holdProcess></holdProcess>
            <holdProcessEndDate></holdProcessEndDate>
        </holdProcessData>
        <characteristics>
            <characteristicType></characteristicType>
            <characteristicValue></characteristicValue>
            <effectiveDate></effectiveDate>
        </characteristics>
    </holdRequest>
</C1-CreateHoldRequest>
```

Note: Here, the **C1-CreateHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-CreateHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **CreateHoldRequest**, then you need to specify the **CreateHoldRequest** tag instead of the **C1-CreateHoldRequest** tag in the above request.

Sample Hold Creation Request and Response in the XML Format	Sample Hold Creation Request and Response in the XML Format on page 4058

Hold Creation Response in the XML Format

The following code snippet illustrates how the tags are nested while sending the hold creation response in the XML format:

```
<C1-CreateHoldRequest>
    <holdRequest>
        <statusCd></statusCd>
        <holdRequestId></holdRequestId>
        <holdStatus></holdStatus>
        <messageText></messageText>
        <sourceSystem></sourceSystem>
        <externalTransactionId></externalTransactionId>
        <externalSourceId></externalSourceId>
        <holdStartDate></holdStartDate>
        <holdEndDate></holdEndDate>
        <holdDays></holdDays>
        <holdRequestType></holdRequestType>
        <holdEntity></holdEntity>
        <holdReason></holdReason>
        <holdComments></holdComments>
        <entityIdentifierType></entityIdentifierType>
```

Copyright © 2026, Oracle and/or its affiliates.

```
        <entityIdentifierValue></entityIdentifierValue>
        <entityId></entityId>
        <holdEntityEndDate></holdEntityEndDate>
        <hierarchySwitch></hierarchySwitch>
        <holdProcessData>
            <holdProcess></holdProcess>
            <holdProcessEndDate></holdProcessEndDate>
        </holdProcessData>
        <characteristics>
            <characteristicType></characteristicType>
            <characteristicValue></characteristicValue>
            <effectiveDate></effectiveDate>
        </characteristics>
    </holdRequest>
</C1-CreateHoldRequest>
```

Note: Here, the **C1-CreateHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-CreateHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **CreateHoldRequest**, then the **CreateHoldRequest** tag appears instead of the **C1-CreateHoldRequest** tag in the above response.

Hold Creation Request and Response - Tags in XML Format

Note: We recommend you to refer the Hold Creation Request in the XML Format on page 4049 and Hold Creation Response in the XML Format on page 4050 topics in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the XML format.

Before calling the **C1-CreateHoldRequest** business service through an inbound web service, you need to ensure that the hold creation request contains the following tags:

Tag Name	Tag Description	Mandatory (Yes or No)
C1-CreateHoldRequest	Used to indicate that you want to invoke the **C1-CreateHoldRequest** business service.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: Here, the **C1-CreateHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-CreateHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **CreateHoldRequest**, then you need to specify the **CreateHoldRequest** tag instead of the **C1-CreateHoldRequest** tag in the hold creation request.	
holdRequest	Used to specify the details of the hold request.	Yes
sourceSystem	Used to indicate the external system from where the hold creation request is received. **Note:** You must specify an external system which is already defined in the system. If the **Inbound Web Service History** feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the **C1-IWSHIST** algorithm. If so, the system stamps the specified external system corresponding to the record in the **C1_IWS_HIST** table. If the external system is not specified in the hold creation request, the system, by default, stamps the external system associated with the outbound message type (specified in the **C1-IWSHIST** algorithm) corresponding to the record in the **C1_IWS_HIST** table. For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.	No
externalTransactionId	Used to indicate the transaction in the external system through which the hold creation request is received. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external transaction ID corresponding to the record in the **C1_IWS_HIST** table.	No
externalSourceId	Used to specify the external source system ID.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: If the **Inbound Web Service History** feature is enabled, the system stores the external source system ID corresponding to the record in the **C1_IWS_HIST** table.	
holdStartDate	Used to specify the date from when the hold request is effective. **Note:** The hold request start date cannot be later than the hold request end date. You must specify the date in the **YYYY-MM-DD** format. Here, you can specify the current or any future date but not a past date.	Yes
holdEndDate	Used to specify the date till when the hold request is effective. **Note:** The hold request end date cannot be earlier than the hold request start date. You must specify the date in the **YYYY-MM-DD** format.	Yes (Conditional) **Note:** This data is required when the value is not specified in the **holdDays** tag.
holdDays	Used to indicate the number of days for which an entity should be kept on hold through the hold request. The system then calculates the hold request end date using the hold days (i.e., hold request end date = hold request start date + hold days). For example, if the hold request start date is 01-Jan-2025 and hold days is 20, then the system sets the hold request end date to 20-Jan-2025. **Note:** You must specify a positive integer value in this tag.	Yes (Conditional) **Note:** This data is required when the value is not specified in the **holdEndDate** tag.
holdRequestType	Used to indicate a hold request type using which you want to create the hold request.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: You must specify a hold request type which is already defined in the system. It should be in the **Active** status. Also, ensure that the **Activation Approval** option is not selected in the specified hold request type. If you do not specify a hold request type, the system, by default, considers the hold request type specified in the **Default Hold Request Type for IWS** option type of the **C1-HOLDSRCH** feature configuration.	
holdEntity	Used to indicate the type of entity for which you want to create the hold request. The valid values are: • **ACCT** - Used when you want to create a hold request for an account. • **BILL** - Used when you want to create a hold request for a bill. • **PERS** - Used when you want to create a hold request for a person. **Note:** You must specify a value which is already defined in the **HOLD_ENTITY_LVL_FLG** lookup field. It must be in the **Active** status.	Yes
holdReason	Used to indicate the reason why you want to hold the entity. **Note:** You must specify a value which is already defined in the **HOLD_REASON_FLG** lookup field. It must be in the **Active** status.	Yes
holdComments	Used to specify additional information about the hold request.	No
entityIdentifierType	Used to specify the person or account identifier type. **Note:** You must specify a person or account identifier type which is already defined in the system. It should be a primary identifier type for the respective entity.	Yes (Conditional) **Note:** This data is required when: • **ACCT** or **PERS** is specified in the **holdEntity** tag. • The value is not specified in the **entityId** tag.

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
entityIdentifierValue	Used to specify the entity identifier (i.e., person or account identifier). It should be the primary identifier of the respective entity. **Note:** The system then derives the person or account ID using the given primary entity identifier details, and accordingly creates a hold request for the respective entity.	Yes (Conditional) **Note:** This data is required when: • **ACCT** or **PERS** is specified in the **holdEntity** tag. • The value is not specified in the **entityId** tag.
entityId	Used to specify the entity ID (i.e., person, account, or bill ID). **Note:** If you have specified the bill ID, the system checks whether a bill exists in the system with the given ID. If so, the system creates a hold request for the respective bill. However, if the system could not derive the bill using the bill ID, the system considers the given value as the alternate bill ID and then checks whether any bill exists in the system with the alternate bill ID. If so, the system creates a hold request for the respective bill. However, if the system could not derive the bill using the alternate bill ID, the system does not allow you to create a hold request.	Yes (Conditional) **Note:** This data is required when: • **ACCT** or **PERS** is specified in the **holdEntity** tag and the values are not specified in the **entityIdentifierType** and **entityIdentifierValue** tags. • **BILL** is specified in the **holdEntity** tag.
holdEntityEndDate	Used to specify the date till when you want to hold the entity. **Note:** You must specify the date in the **YYYY-MM-DD** format. The hold entity end date must be between hold request start and end dates and between at least one process's start and end dates. The hold entity end date cannot be earlier than the hold entity start date. Note that, by default, the system sets the hold entity start date to the hold request start date. If you do not specify the hold entity end date, the system, by default, sets it to the hold request end date.	No
hierarchySwitch	Used to indicate whether all the accounts in the person's hierarchy or only the persons' immediate accounts should be kept on hold. Note that the system considers only the child persons and not the grand child persons from the person's hierarchy and then derives the accounts where the child person is the main customer. The valid values are: • Y • N	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: This tag is applicable only when **PERS** is specified in the **holdEntity** tag.	
holdProcessData	Used to specify information about the process that you want to hold for the entity.	Yes
holdProcess	Used to specify the process that you want to keep on hold for the entity. The valid values are: • **ATPY** - Used when you want to hold the auto pay process of the entity. It is valid only when **ACCT** is specified in the **holdEntity** tag. • **BILL** - Used when you want to hold the bill generation process of the entity. It is valid only when **ACCT** or **PERS** is specified in the **holdEntity** tag. • **DELQ** - Used when you want to hold the delinquency process of the entity. It is valid only when **ACCT** or **PERS** is specified in the **holdEntity** tag. • **FNDG** - Used when you want to hold the funding process of the entity. It is valid when **ACCT**, **PERS**, or **BILL** is specified in the **holdEntity** tag. • **OVDU** - Used when you want to hold the overdue process of the entity. It is valid only when **ACCT** is specified in the **holdEntity** tag. • **REFD** - Used when you want to hold the refund process of the entity. It is valid only when **ACCT** is specified in the **holdEntity** tag. **Note:** You must specify a value which is already defined in the **HOLD_PROCESS_FLG** lookup field. It must be in the **Active** status. You cannot specify both the **OVDU** and **DELQ** processes at a time in the hold creation request. The **Overdue** process is valid for the financial services and health insurance domains but the **Delinquency** process is valid only for the health insurance domain.	Yes
holdProcessEndDate	Used to specify the date till when you want to hold the process of the entity.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: You must specify the date in the **YYYY-MM-DD** format. The hold process end date must be between the hold request start and end dates. The hold process end date cannot be earlier than the hold process start date. Note that, by default, the system sets the hold process start date to the hold request start date. If you do not specify the hold process end date, the system, by default, sets it to the hold request end date.	
characteristics	Used to specify a characteristic for the hold request.	No
characteristicType	Used to indicate the characteristic type.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to **Hold Request**.	**Note:** This data is required while defining a characteristic for the hold request.
characteristicValue	Used to specify the value for the characteristic type.	Yes (Conditional) **Note:** This data is required while defining a characteristic for the hold request.
effectiveDate	Used to specify the date from when the characteristic is effective for the hold request.	Yes (Conditional) **Note:** This data is required while defining a characteristic for the hold request.

The following table lists and describes additional tags that are included in the hold creation response:

Tag Name	Tag Description
statusCd	Indicates whether the hold creation request is successfully processed or not. The valid values are: • Success • Failure
holdRequestId	Displays the hold request ID. **Note:** This tag appears when the value in the **statusCd** tag is set to **Success**.
holdStatus	Indicates the status of the hold request. The valid value is: • Active

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description
	Note: This tag appears when the value in the **statusCd** tag is set to **Success**.
messageText	Indicates the error that occurred while creating the hold request.
	Note: This tag appears when the value in the **statusCd** tag is set to **Failure**.

        <holdStatus>Active</holdStatus>
        <sourceSystem>SMALL_PRIME</sourceSystem>
        <externalTransactionId>567888876666</externalTransactionId>
        <externalSourceId>656565</externalSourceId>
        <holdStartDate>2024-12-01</holdStartDate>
        <holdEndDate>2024-12-31</holdEndDate>
        <holdDays></holdDays>
        <holdRequestType>HOLD_WITHOUT_APPROVAL</holdRequestType>
        <holdEntity>ACCT</holdEntity>
        <holdReason>DSRE</holdReason>
        <holdComments>Disaster Recovery</holdComments>
        <entityIdentifierType>IBAN</entityIdentifierType>
        <entityIdentifierValue>XX00XXXX111111</entityIdentifierValue>
        <entityId></entityId>
        <holdEntityEndDate>2024-12-30</holdEntityEndDate>
        <hierarchySwitch></hierarchySwitch>
        <holdProcessData>
            <holdProcess>BILL</holdProcess>
            <holdProcessEndDate>2024-12-20</holdProcessEndDate>
        </holdProcessData>
        <holdProcessData>
            <holdProcess>ATPY</holdProcess>
            <holdProcessEndDate>2024-12-31</holdProcessEndDate>
        </holdProcessData>
        <characteristics>
            <characteristicType>HOLD_TYPE</characteristicType>
            <characteristicValue>P</characteristicValue>
            <effectiveDate>2024-12-01</effectiveDate>
        </characteristics>
        <characteristics>
            <characteristicType>ESC_PATH</characteristicType>
            <characteristicValue>01</characteristicValue>
            <effectiveDate>2024-12-01</effectiveDate>
        </characteristics>
    </holdRequest>
</C1-CreateAdjustment>
```

Note: We have given the above request sample to illustrate how the tags should be nested while receiving a hold creation request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Hold Creation Request in the JSON Format

The following code snippet illustrates how the attribute/value pairs should be structured while receiving the hold creation request in the JSON format:

```
{
   -"C1-CreateHoldRequest": {
       -"holdRequest": {
           -"sourceSystem": -"",
           -"externalTransactionId": -"",
           -"externalSourceId": -"",
           -"holdStartDate": -"",
           -"holdEndDate": -"",
           -"holdDays": -"",
           -"holdRequestType": -"",
           -"holdEntity": -"",
           -"holdReason": -"",
           -"holdComments": -"",
           -"entityIdentifierType": -"",
           -"entityIdentifierValue": -"",
           -"entityId": -"",
           -"holdEntityEndDate": -"",
           -"hierarchySwitch": -"",
           -"holdProcessData": {
               -"holdProcess": -"",
               -"holdProcessEndDate": -""
           -},
           -"characteristics": {
               -"characteristicType": -"",
               -"characteristicValue": -"",
               -"effectiveDate": -""
           -}
       -}
   -}
-}
```

Note: Here, the **C1-CreateHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-CreateHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **CreateHoldRequest**, then you need to specify the **CreateHoldRequest** attribute instead of the **C1-CreateHoldRequest** attribute in the above request.

Hold Creation Response in the JSON Format

The following code snippet illustrates how the attribute/value pairs are structured while sending the hold creation response in the JSON format:

```
{
   -"C1-CreateHoldRequest": {
       -"holdRequest": {
           -"statusCd": -"",
               -"holdRequestId": -"",
           -"holdStatus": -"",
           -"messageText": -"",
               -"sourceSystem": -"",
           -"externalTransactionId": -"",
           -"externalSourceId": -"",
           -"holdStartDate": -"",
           -"holdEndDate": -"",
           -"holdDays": -"",
           -"holdRequestType": -"",
           -"holdEntity": -"",
           -"holdReason": -"",
           -"holdComments": -"",
           -"entityIdentifierType": -"",
           -"entityIdentifierValue": -"",
           -"entityId": -"",
           -"holdEntityEndDate": -"",
           -"hierarchySwitch": -"",
           -"holdProcessData": {
               -"holdProcess": -"",
               -"holdProcessEndDate": -""
           -},
           -"characteristics": {
               -"characteristicType": -"",
               -"characteristicValue": -"",
               -"effectiveDate": -""
           -}
       -}
   -}
-}
```

Note: Here, the **C1-CreateHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-CreateHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **CreateHoldRequest**, then the **CreateHoldRequest** attribute appears instead of the **C1-CreateHoldRequest** attribute in the above response.

Hold Creation Request and Response - Attribute/Value Pairs in JSON Format

Note: We recommend you to refer the Hold Creation Request in the JSON Format on page 4060 and Hold Creation Response in the JSON Format on page 4061 topics in parallel while understanding the below mentioned attributes. This will help you to understand how the attribute/value pairs are structured in the JSON format.

Before calling the **C1-CreateHoldRequest** business service through an inbound web service, you need to ensure that the hold creation request contains the following attributes:

Attribute Name	Attribute Description	Mandatory (Yes or No)
C1-CreateHoldRequest	Used to indicate that you want to invoke the **C1-CreateHoldRequest** business service. **Note:** Here, the **C1-CreateHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-CreateHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **CreateHoldRequest**, then you need to specify the **CreateHoldRequest** attribute instead of the **C1-CreateHoldRequest** attribute in the hold creation request.	Yes
holdRequest	Used to specify the details of the hold request.	Yes
sourceSystem	Used to indicate the external system from where the hold creation request is received. **Note:** You must specify an external system which is already defined in the system. If the **Inbound Web Service History** feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the **C1-IWSHIST** algorithm. If so, the system stamps the specified external system corresponding to the record in the **C1_IWS_HIST** table. If the external system is not specified in the hold creation request, the system, by default, stamps the external system associated with the outbound message type (specified in the **C1-IWSHIST** algorithm) corresponding to the record in the **C1_IWS_HIST** table. For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.	No

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
externalTransactionId	Used to indicate the transaction in the external system through which the hold creation request is received. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external transaction ID corresponding to the record in the **C1_IWS_HIST** table.	No
externalSourceId	Used to specify the external source system ID. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external source system ID corresponding to the record in the **C1_IWS_HIST** table.	No
holdStartDate	Used to specify the date from when the hold request is effective. **Note:** The hold request start date cannot be later than the hold request end date. You must specify the date in the **YYYY-MM-DD** format. Here, you can specify the current or any future date but not a past date.	Yes
holdEndDate	Used to specify the date till when the hold request is effective. **Note:** The hold request end date cannot be earlier than the hold request start date. You must specify the date in the **YYYY-MM-DD** format.	Yes (Conditional) **Note:** This data is required when the value is not specified for the **holdDays** attribute.
holdDays	Used to indicate the number of days for which an entity should be kept on hold through the hold request. The system then calculates the hold request end date using the hold days (i.e., hold request end date = hold request start date + hold days). For example, if the hold request start date is 01-Jan-2025 and hold days is 20, then the system sets the hold request end date to 20-Jan-2025. **Note:** You must specify a positive integer value in this attribute.	Yes (Conditional) **Note:** This data is required when the value is not specified for the **holdEndDate** attribute.
holdRequestType	Used to indicate a hold request type using which you want to create the hold request.	No

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
	Note: You must specify a hold request type which is already defined in the system. It should be in the **Active** status. Also, ensure that the **Activation Approval** option is not selected in the specified hold request type. If you do not specify a hold request type, the system, by default, considers the hold request type specified in the **Default Hold Request Type for IWS** option type of the **C1-HOLDSRCH** feature configuration.	
holdEntity	Used to indicate the type of entity for which you want to create the hold request. The valid values are: • **ACCT** - Used when you want to create a hold request for an account. • **BILL** - Used when you want to create a hold request for a bill. • **PERS** - Used when you want to create a hold request for a person. **Note:** You must specify a value which is already defined in the **HOLD_ENTITY_LVL_FLG** lookup field. It must be in the **Active** status.	Yes
holdReason	Used to indicate the reason why you want to hold the entity. **Note:** You must specify a value which is already defined in the **HOLD_REASON_FLG** lookup field. It must be in the **Active** status.	Yes
holdComments	Used to specify additional information about the hold request.	No
entityIdentifierType	Used to specify the person or account identifier type. **Note:** You must specify a person or account identifier type which is already defined in the system. It should be a primary identifier type for the respective entity.	Yes (Conditional) **Note:** This data is required when: • **ACCT** or **PERS** is specified for the **holdEntity** attribute. • The value is not specified for the **entityId** attribute.

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
entityIdentifierValue	Used to specify the entity identifier (i.e., person or account identifier). It should be the primary identifier of the respective entity. **Note:** The system then derives the person or account ID using the given primary entity identifier details, and accordingly creates a hold request for the respective entity.	Yes (Conditional) **Note:** This data is required when: • **ACCT** or **PERS** is specified for the **holdEntity** attribute. • The value is not specified for the **entityId** attribute.
entityId	Used to specify the entity ID (i.e., person, account, or bill ID). **Note:** If you have specified the bill ID, the system checks whether a bill exists in the system with the given ID. If so, the system creates a hold request for the respective bill. However, if the system could not derive the bill using the bill ID, the system considers the given value as the alternate bill ID and then checks whether any bill exists in the system with the alternate bill ID. If so, the system creates a hold request for the respective bill. However, if the system could not derive the bill using the alternate bill ID, the system does not allow you to create a hold request.	Yes (Conditional) **Note:** This data is required when: • **ACCT** or **PERS** is specified for the **holdEntity** attribute and the values are not specified for the **entityIdentifierType** and **entityIdentifierValue** attributes. • **BILL** is specified for the **holdEntity** attribute.
holdEntityEndDate	Used to specify the date till when you want to hold the entity. **Note:** You must specify the date in the **YYYY-MM-DD** format. The hold entity end date must be between hold request start and end dates and between at least one process's start and end dates. The hold entity end date cannot be earlier than the hold entity start date. Note that, by default, the system sets the hold entity start date to the hold request start date. If you do not specify the hold entity end date, the system, by default, sets it to the hold request end date.	No
hierarchySwitch	Used to indicate whether all the accounts in the person's hierarchy or only the persons' immediate accounts should be kept on hold. Note that the system considers only the child persons and not the grand child persons from the person's hierarchy and then derives the accounts where the child person is the main customer. The valid values are: • Y • N	No

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
	Note: This attribute is applicable only when **PERS** is specified for the **holdEntity** attribute.	
holdProcessData	Used to specify information about the process that you want to hold for the entity.	Yes
holdProcess	Used to specify the process that you want to keep on hold for the entity. The valid values are: • **ATPY** - Used when you want to hold the auto pay process of the entity. It is valid only when **ACCT** is specified for the **holdEntity** attribute. • **BILL** - Used when you want to hold the bill generation process of the entity. It is valid only when **ACCT** or **PERS** is specified for the **holdEntity** attribute. • **DELQ** - Used when you want to hold the delinquency process of the entity. It is valid only when **ACCT** or **PERS** is specified for the **holdEntity** attribute. • **FNDG** - Used when you want to hold the funding process of the entity. It is valid when **ACCT**, **PERS**, or **BILL** is specified for the **holdEntity** attribute. • **OVDU** - Used when you want to hold the overdue process of the entity. It is valid only when **ACCT** is specified for the **holdEntity** attribute. • **REFD** - Used when you want to hold the refund process of the entity. It is valid only when **ACCT** is specified for the **holdEntity** attribute. **Note:** You must specify a value which is already defined in the **HOLD_PROCESS_FLG** lookup field. It must be in the **Active** status. You cannot specify both the **OVDU** and **DELQ** processes at a time in the hold creation request. The **Overdue** process is valid for the financial services and health insurance domains but the **Delinquency** process is valid only for the health insurance domain.	Yes
holdProcessEndDate	Used to specify the date till when you want to hold the process of the entity.	No

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
	Note: You must specify the date in the **YYYY-MM-DD** format. The hold process end date must be between the hold request start and end dates. The hold process end date cannot be earlier than the hold process start date. Note that, by default, the system sets the hold process start date to the hold request start date. If you do not specify the hold process end date, the system, by default, sets it to the hold request end date.	
characteristics	Used to specify a characteristic for the hold request.	No
characteristicType	Used to indicate the characteristic type.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to **Hold Request**.	**Note:** This data is required while defining a characteristic for the hold request.
characteristicValue	Used to specify the value for the characteristic type.	Yes (Conditional)
		Note: This data is required while defining a characteristic for the hold request.
effectiveDate	Used to specify the date from when the characteristic is effective for the hold request.	Yes (Conditional)
		Note: This data is required while defining a characteristic for the hold request.

The following table lists and describes additional attributes that are included in the hold creation response:

Attribute Name	Attribute Description
statusCd	Indicates whether the hold creation request is successfully processed or not. The valid values are: • Success • Failure
holdRequestId	Displays the hold request ID.
	Note: This attribute appears when the value of the **statusCd** attribute is set to **Success**.
holdStatus	Indicates the status of the hold request. The valid value is: • Active

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description
	Note: This attribute appears when the value of the **statusCd** attribute is set to **Success**.
messageText	Indicates the error that occurred while creating the hold request.
	Note: This attribute appears when the value of the **statusCd** attribute is set to **Failure**.

             -},
      {
                -"characteristicType": -"ESC_PATH",
                -"characteristicValue": -"01",
                -"effectiveDate": -"2024-12-01"
             -}
   -]
      -}
   -}
-}
```

Note: We have given the above request sample to illustrate how the attribute/value pairs should be structured while receiving a hold creation request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

C1-UpdateHoldRequest Business Service

The **Update Hold Request** (**C1-UpdateHoldRequest**) business service enables you to edit an existing hold request which is in the **Active** status. You can call this business service from an external system through an inbound web service. If you want to send the hold update request in the XML and/or JSON format, you need to ensure that you create a REST based inbound web service in Oracle Revenue Management and Billing. However, if you want to send the hold update request in the XML format, you can create a SOAP or REST based inbound web service in Oracle Revenue Management and Billing.

While sending the hold update request, you need to specify the following details:

- Hold Request ID
- Hold Entity ID (i.e. person ID, account ID, or bill ID)

Through this service, you can edit the following details of an active hold request:

- End date, comments, and characteristics of the hold request
- End date of a single hold entity in the hold request
- End date of multiple hold processes in the hold request

Note: At present, you can only update the end date of a single entity through a hold update request. If two or more entities are kept on hold through a hold request, you need to initiate a separate hold update request for each entity in order to update their respective end dates.

In addition, this service enables you to:

- **Add a New Hold Process to an Existing Hold Request** - While adding a new process to an existing hold request, the system does the following:
  - Sets the hold process start date to the hold request start date.
  - If you do not specify the hold process end date, the system, by default, sets it to the hold request end date.
- **Define, Edit, or Remove a Characteristic from an Existing Hold Request** - The system enables you to perform the following actions for a hold request characteristic:
  - **UPDATE** - Used when you want to add a new characteristic to the hold request or update the details of an existing characteristic of the hold request. The system first checks whether a characteristic with the given characteristic type and effective date combination exists for the hold request. If so, the system updates the existing characteristic of the hold request. However, if a characteristic does not exist with the given characteristic type and effective date combination for the hold request, the system creates a new characteristic for the hold request.
  - **DELETE** - Used when you want to delete an existing characteristic from the hold request.

Once the hold request is edited through an inbound web service, the hold request ID is sent in the response. If an error occurs while updating the hold request, the system sends the error message in the response. The system enables you to track the hold update response sent to the external system using the **Inbound Web Service History** feature.

For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.

Note: After updating the end date of a hold entity, you need to execute the **Hold Request Monitor** (**C1-HLMON**) batch. On executing the batch, the system will accordingly update the bill after date, postpone credit review until date, defer auto pay date, and hold refund until date, if required, for the respective entity.

Sample Hold Update Release Request and Response in the JSON Format	Sample Hold Update Request and Response in the JSON Format on page 4085

Prerequisites

To update a hold request through an inbound web service, you need to do the following:

- Define a REST or SOAP based inbound web service to call the **C1-UpdateHoldRequest** business service where **HTTP Method** is set to **Post** and **URI Component** is set to **/updateHold**.
- Authorize the ORMB user to access the required application service.
- Define the required source systems in the **C1-SourceSystemLookup** extendable lookup.
- Ensure that the entities (i.e., person, account, or bill) are already included in the hold request.
- Define the required values for the **HOLD_PROCESS_FLG** lookup field.
- Define the required characteristic types where the characteristic entity is set to **Hold Request**.

Hold Update Request in the XML Format

The following code snippet illustrates how the tags should be nested while receiving the hold update request in the XML format:

```
<C1-UpdateHoldRequest>
    <sourceSystem></sourceSystem>
    <externalTransactionId></externalTransactionId>
    <externalSourceId></externalSourceId>
    <holdRequestId></holdRequestId>
    <holdComments></holdComments>
    <holdEndDate></holdEndDate>
    <entityId></entityId>
    <entityEndDate></entityEndDate>
    <holdProcessData>
        <holdProcess></holdProcess>
        <holdProcessEndDate></holdProcessEndDate>
    </holdProcessData>
    <characteristics>
        <action></action>
        <characteristicType></characteristicType>
        <characteristicValue></characteristicValue>
        <effectiveDate></effectiveDate>
```

Copyright © 2026, Oracle and/or its affiliates.

```
    </characteristics>
</C1-UpdateHoldRequest>
```

Note: Here, the **C1-UpdateHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-UpdateHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **UpdateHoldRequest**, then you need to specify the **UpdateHoldRequest** tag instead of the **C1-UpdateHoldRequest** tag in the above request.

Hold Update Response in the XML Format

The following code snippet illustrates how the tags are nested while sending the hold update response in the XML format:

```
<C1-UpdateHoldRequest>
    <requestProcessStatus></requestProcessStatus>
    <sourceSystem></sourceSystem>
    <externalTransactionId></externalTransactionId>
    <externalSourceId></externalSourceId>
    <holdRequestId></holdRequestId>
    <holdComments></holdComments>
    <holdEndDate></holdEndDate>
    <entityId></entityId>
    <entityEndDate></entityEndDate>
    <holdProcessData>
        <holdProcess></holdProcess>
        <holdProcessEndDate></holdProcessEndDate>
    </holdProcessData>
    <characteristics>
        <action></action>
        <characteristicType></characteristicType>
        <characteristicValue></characteristicValue>
        <effectiveDate></effectiveDate>
    </characteristics>
    </errormsg><errormsg>
</C1-UpdateHoldRequest>
```

Note: Here, the **C1-UpdateHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-UpdateHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **UpdateHoldRequest**, then the **UpdateHoldRequest** tag appears instead of the **C1-UpdateHoldRequest** tag in the above response.

Hold Update Request and Response - Tags in XML Format

Note: We recommend you to refer the Hold Update Request in the XML Format on page 4071 and Hold Update Response in the XML Format on page 4072 topics in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the XML format.

Before calling the **C1-UpdateHoldRequest** business service through an inbound web service, you need to ensure that the hold update request contains the following tags:

Tag Name	Tag Description	Mandatory (Yes or No)
C1-UpdateHoldRequest	Used to indicate that you want to invoke the **C1-UpdateHoldRequest** business service. **Note:** Here, the **C1-UpdateHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-UpdateHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **UpdateHoldRequest**, then you need to specify the **UpdateHoldRequest** tag instead of the **C1-UpdateHoldRequest** tag in the hold update request.	Yes
sourceSystem	Used to indicate the external system from where the hold update request is received.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: You must specify an external system which is already defined in the system. If the **Inbound Web Service History** feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the **C1-IWSHIST** algorithm. If so, the system stamps the specified external system corresponding to the record in the **C1_IWS_HIST** table. If the external system is not specified in the hold update request, the system, by default, stamps the external system associated with the outbound message type (specified in the **C1-IWSHIST** algorithm) corresponding to the record in the **C1_IWS_HIST** table. For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.	
externalTransactionId	Used to indicate the transaction in the external system through which the hold update request is received. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external transaction ID corresponding to the record in the **C1_IWS_HIST** table.	No
externalSourceId	Used to specify the external source system ID. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external source system ID corresponding to the record in the **C1_IWS_HIST** table.	No
holdRequestId	Used to indicate the hold request whose details you want to update. **Note:** You can only update a hold request which is in the **Active** status through an inbound web service.	Yes
holdComments	Used to specify additional information about the hold request.	No
holdEndDate	Used to specify the date till when the hold request is effective.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: The hold request end date cannot be earlier than the hold request start date. You must specify the date in the **YYYY-MM-DD** format.	
entityId	Used to specify the entity ID (i.e., person, account, or bill ID).	Yes
entityEndDate	Used to specify the date till when you want to hold the entity. **Note:** You must specify the date in the **YYYY-MM-DD** format. The hold entity end date must be between hold request start and end dates and between at least one process's start and end dates. The hold entity end date cannot be earlier than the hold entity start date. At present, you can only update the end date of a single entity through a hold update request. If two or more entities are kept on hold through a hold request, you need to initiate a separate hold update request for each entity in order to update their respective end date.	Yes
holdProcessData	Used to add a new hold process or update the details of an existing hold process in the hold request.	No
holdProcess	Used to specify the process that you want to add or update in the hold request. The valid values are: • **ATPY** - Used when you want to hold the auto pay process of the entity. It is valid only when the entity level of the hold request is set to **ACCT**. • **BILL** - Used when you want to hold the bill generation process of the entity. It is valid only when the entity level of the hold request is set to **ACCT** or **PERS**. • **DELQ** - Used when you want to hold the delinquency process of the entity. It is valid only when the entity level of the hold request is set to **ACCT** or **PERS**. • **FNDG** - Used when you want to hold the funding process of the entity. It is valid only when the entity level of the hold request is set to **ACCT**, **PERS**, or **BILL**. • **OVDU** - Used when you want to hold the overdue process of the entity. It is valid only when the entity level of the hold request is set to **ACCT**.	Yes (Conditional) **Note:** This data is required when: • You want to update the end date of a hold process. • You want to add a new hold process to the hold request.

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	• **REFD** - Used when you want to hold the refund process of the entity. It is valid only when the entity level of the hold request is set to **ACCT**. **Note:** You must specify a value which is already defined in the **HOLD_PROCESS_FLG** lookup field. It must be in the **Active** status. You cannot specify both the **OVDU** and **DELQ** processes at a time in the hold update request. The **Overdue** process is valid for the financial services and health insurance domains but the **Delinquency** process is valid only for the health insurance domain.	
holdProcessEndDate	Used to specify the date till when you want to hold the process of the entity. **Note:** You must specify the date in the **YYYY-MM-DD** format. The hold process end date must be between the hold request start and end dates. The hold process end date cannot be earlier than the hold process start date. While adding a new process to the hold request, the system does the following: • Sets the hold process start date to the hold request start date. • If you do not specify the hold process end date, the system, by default, sets it to the hold request end date.	Yes (Conditional) **Note:** This data is required when: • You want to update the end date of a hold process.
characteristics	Used to add, update, or delete a characteristic from the hold request.	No
action	Used to indicate whether you want to add, update, or delete a characteristic from the hold request. The valid values are: • **UPDATE** - Used when you want to add a new characteristic to the hold request or update the details of an existing characteristic of the hold request. The system first checks whether a characteristic with the given characteristic type and effective date combination exists for the hold request. If so, the system updates the existing characteristic of the hold request. However, if a characteristic does not exist with the given characteristic type and effective date combination for the hold request, the system creates a new characteristic for the hold request.	Yes (Conditional) **Note:** This data is required when you want to add, update, or delete a characteristic from the hold request.

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	• **DELETE** - Used when you want to delete an existing characteristic from the hold request.	
characteristicType	Used to indicate the characteristic type.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to **Hold Request**.	**Note:** This data is required when you want to add, update, or delete a characteristic from the hold request.
characteristicValue	Used to specify the value for the characteristic type.	Yes (Conditional)
		Note: This data is required when you want to add, update, or delete a characteristic from the hold request.
effectiveDate	Used to specify the date from when the characteristic is effective for the hold request.	Yes (Conditional)
		Note: This data is required when you want to add, update, or delete a characteristic from the hold request.

The following table lists and describes additional tags that are included in the hold update response:

Tag Name	Tag Description
requestProcessStatus	Indicates whether the hold update request is successfully processed or not. The valid values are: • Success • Failure
errormsg	Indicates the error that occurred while updating the hold request.
	Note: This tag appears when the value in the **requestProcessStatus** tag is set to **Failure**.

Hold Update Request and Response - Attribute/Value Pairs in JSON Format

Note: We recommend you to refer the Hold Update Request in the JSON Format on page 4079 and Hold Update Response in the JSON Format on page 4080 topics in parallel while understanding the below mentioned attributes. This will help you to understand how the attribute/value pairs are structured in the JSON format.

Copyright © 2026, Oracle and/or its affiliates.

Before calling the **C1-UpdateHoldRequest** business service through an inbound web service, you need to ensure that the hold update request contains the following attributes:

Attribute Name	Attribute Description	Mandatory (Yes or No)
C1-UpdateHoldRequest	Used to indicate that you want to invoke the **C1-UpdateHoldRequest** business service. **Note:** Here, the **C1-UpdateHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-UpdateHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **UpdateHoldRequest**, then you need to specify the **UpdateHoldRequest** attribute instead of the **C1-UpdateHoldRequest** attribute in the hold update request.	Yes
sourceSystem	Used to indicate the external system from where the hold update request is received. **Note:** You must specify an external system which is already defined in the system. If the **Inbound Web Service History** feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the **C1-IWSHIST** algorithm. If so, the system stamps the specified external system corresponding to the record in the **C1_IWS_HIST** table. If the external system is not specified in the hold update request, the system, by default, stamps the external system associated with the outbound message type (specified in the **C1-IWSHIST** algorithm) corresponding to the record in the **C1_IWS_HIST** table. For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.	No
externalTransactionId	Used to indicate the transaction in the external system through which the hold update request is received. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external transaction ID corresponding to the record in the **C1_IWS_HIST** table.	No
externalSourceId	Used to specify the external source system ID. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external source system ID corresponding to the record in the **C1_IWS_HIST** table.	No

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
holdRequestId	Used to indicate hold request whose details you want to update. **Note:** You can only update a hold request which is in the **Active** status through an inbound web service.	Yes
holdComments	Used to specify additional information about the hold request.	No
holdEndDate	Used to specify the date till when the hold request is effective. **Note:** The hold request end date cannot be earlier than the hold request start date. You must specify the date in the **YYYY-MM-DD** format.	No
entityId	Used to specify the entity ID (i.e., person, account, or bill ID).	Yes
entityEndDate	Used to specify the date till when you want to hold the entity. **Note:** You must specify the date in the **YYYY-MM-DD** format. The hold entity end date must be between hold request start and end dates and between at least one process's start and end dates. The hold entity end date cannot be earlier than the hold entity start date. At present, you can only update the end date of a single entity through a hold update request. If two or more entities are kept on hold through a hold request, you need to initiate a separate hold update request for each entity in order to update their respective end date.	Yes
holdProcessData	Used to add a new hold process or update the details of an existing hold process in the hold request.	No
holdProcess	Used to specify the process that you want to add or update in the hold request. The valid values are: • **ATPY** - Used when you want to hold the auto pay process of the entity. It is valid only when the entity level of the hold request is set to **ACCT**. • **BILL** - Used when you want to hold the bill generation process of the entity. It is valid only when the entity level of the hold request is set to **ACCT** or **PERS**. • **DELQ** - Used when you want to hold the delinquency process of the entity. It is valid only when the entity level of the hold request is set to **ACCT** or **PERS**.	Yes (Conditional) **Note:** This data is required when: • You want to update the end date of a hold process. • You want to add a new hold process to the hold request.

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
	• **FNDG** - Used when you want to hold the funding process of the entity. It is valid only when the entity level of the hold request is set to **ACCT**, **PERS**, or **BILL**. • **OVDU** - Used when you want to hold the overdue process of the entity. It is valid only when the entity level of the hold request is set to **ACCT**. • **REFD** - Used when you want to hold the refund process of the entity. It is valid only when the entity level of the hold request is set to **ACCT**. **Note:** You must specify a value which is already defined in the **HOLD_PROCESS_FLG** lookup field. It must be in the **Active** status. You cannot specify both the **OVDU** and **DELQ** processes at a time in the hold update request. The **Overdue** process is valid for the financial services and health insurance domains but the **Delinquency** process is valid only for the health insurance domain.	
holdProcessEndDate	Used to specify the date till when you want to hold the process of the entity. **Note:** You must specify the date in the **YYYY-MM-DD** format. The hold process end date must be between the hold request start and end dates. The hold process end date cannot be earlier than the hold process start date. While adding a new process to the hold request, the system does the following: • Sets the hold process start date to the hold request start date. • If you do not specify the hold process end date, the system, by default, sets it to the hold request end date.	Yes (Conditional) **Note:** This data is required when: • You want to update the end date of a hold process.
characteristics	Used to add, update, or delete a characteristic from the hold request.	No
action	Used to indicate whether you want to add, update, or delete a characteristic from the hold request. The valid values are: • **UPDATE** - Used when you want to add a new characteristic to the hold request or update the details of an existing characteristic of the hold request. The system first checks whether a characteristic with the given characteristic type and effective date combination exists for the hold request. If so, the system updates the existing characteristic of the hold	Yes (Conditional) **Note:** This data is required when you want to add, update, or delete a characteristic from the hold request.

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
	request. However, if a characteristic does not exist with the given characteristic type and effective date combination for the hold request, the system creates a new characteristic for the hold request. • **DELETE** - Used when you want to delete an existing characteristic from the hold request.	
characteristicType	Used to indicate the characteristic type.	Yes (Conditional)
	Note: You must specify a characteristic type where the characteristic entity is set to **Hold Request**.	**Note:** This data is required when you want to add, update, or delete a characteristic from the hold request.
characteristicValue	Used to specify the value for the characteristic type.	Yes (Conditional)
		Note: This data is required when you want to add, update, or delete a characteristic from the hold request.
effectiveDate	Used to specify the date from when the characteristic is effective for the hold request.	Yes (Conditional)
		Note: This data is required when you want to add, update, or delete a characteristic from the hold request.

The following table lists and describes additional attributes that are included in the hold update response:

Attribute Name	Attribute Description
requestProcessStatus	Indicates whether the hold update request is successfully processed or not. The valid values are: • Success • Failure
errormsg	Indicates the error that occurred while updating the hold request.
	Note: This attribute appears when the value in the **requestProcessStatus** attribute is set to **Failure**.

Sample Hold Update Request and Response in the JSON Format

Using the below example, you can update the end date of the hold request, hold entity, and hold processes and delete two characteristics for the given hold request.

Sample Hold Update Request in the JSON Format

```
{
   -"C1-UpdateHoldRequest": {
       -"sourceSystem": -"SMALL_PRIME",
       -"externalTransactionId": -"567888876699",
       -"externalSourceId": -"656565",
       -"holdRequestId": -"100002522628",
       -"holdComments": -"Disaster Recovery",
       -"holdEndDate": -"2025-01-31",
       -"entityId": -"2339689532",
       -"entityEndDate": -"2025-01-25",
       -"holdProcessData": [
       {
           -"holdProcess": -"BILL",
           -"holdProcessEndDate": -"2025-01-23"
       -},
       {
           -"holdProcess": -"FNDG",
           -"holdProcessEndDate": -"2025-01-31"
       -}
       -],
       -"characteristics": [
       {
           -"action": -"Update",
           -"characteristicType": -"HOLD_TYPE",
           -"characteristicValue": -"P",
           -"effectiveDate": -"2025-12-24"
       -},
       {
           -"action": -"Delete",
           -"characteristicType": -"ESC_PATH",
           -"characteristicValue": -"01",
           -"effectiveDate": -"2025-12-24"
       -}
       -]
    -}
 -}
```

Sample Hold Update Response in the JSON Format

```
{
   -"C1-UpdateHoldRequest": {
       -"requestProcessStatus": -"Success"
       -"sourceSystem": -"SMALL_PRIME",
       -"externalTransactionId": -"567888876699",
       -"externalSourceId": -"656565",
       -"holdRequestId": -"100002522628",
       -"holdComments": -"Disaster Recovery",
       -"holdEndDate": -"2025-01-31",

```
        -},
        {
            -"holdProcess": -"FNDG",
            -"holdProcessEndDate": -"2025-01-31"
        -}
        -],
        -"characteristics": [
        {
            -"action": -"Update",
            -"characteristicType": -"HOLD_TYPE",
            -"characteristicValue": -"P",
            -"effectiveDate": -"2025-12-24"
        -},
        {
            -"action": -"Delete",
            -"characteristicType": -"ESC_PATH",
            -"characteristicValue": -"01",
            -"effectiveDate": -"2025-12-24"
        -}
        -]
    -}
-}
```

Note: We have given the above request sample to illustrate how the attribute/value pairs should be structured while receiving a hold update request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

C1-GetHoldRequestHistory Business Service

The **Inquire Hold Request Details** (**C1-GetHoldRequestHistory**) business service enables you to view the details of an existing hold request which is in the **Active** status. At a time, you can view the hold request details of a single entity (i.e., for a particular person, account, or bill). You can call this business service from an external system through an inbound web service. If you want to send the hold view request in the XML and/or JSON format, you need to ensure that you create a REST based inbound web service in Oracle Revenue Management and Billing. However, if you want to send the hold view request in the XML format, you can create a SOAP or REST based inbound web service in Oracle Revenue Management and Billing.

While sending the hold view request, you need to specify the following details:

- Entity (i.e., Person, Account, or Bill) whose hold requests you want to view.
- Entity identifiers or entity ID when the entity is an account or a person, and the entity ID when the entity is a bill.

In addition, you can specify the following filter criteria – Hold Request Start Date, Hold Request End Date, Hold Reason, and Hold Process. On specifying the hold process, the system fetches one or more active hold requests of the entity with the given hold process. This hold request may have one or more hold processes including the given hold process.

Once the hold view request is processed through an inbound web service, the system displays the details of one or more active hold requests that meet the search criteria. If an error occurs while retrieving the hold requests for the entity, the

Copyright © 2026, Oracle and/or its affiliates.

system sends the error message in the response. The system enables you to track the hold view response sent to the external system using the **Inbound Web Service History** feature.

For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.

Sample Hold View Request and Response in the XML Format	Sample Hold View Request and Response in the XML Format on page 4093
Sample Hold View Request and Response in the JSON Format	Sample Hold View Request and Response in the JSON Format on page 4100

Prerequisites

To view the hold requests of an entity through an inbound web service, you need to do the following:

- Define a REST or SOAP based inbound web service to call the **C1-GetHoldRequestHistory** business service where **HTTP Method** is set to **Post** and **URI Component** is set to **/inquire**.
- Authorize the ORMB user to access the required application service.
- Define the required source systems in the **C1-SourceSystemLookup** extendable lookup.
- Define the required person or account identifier types in the system.
- Define the required values for the **HOLD_REASON_FLG**, **HOLD_ENTITY_LVL_FLG**, and **HOLD_PROCESS_FLG** lookup fields.

Hold View Request in the XML Format

The following code snippet illustrates how the tags should be nested while receiving the hold view request in the XML format:

```
<C1-GetHoldRequestHistory>
    <getHoldReqHistRequest>
        <sourceSystem></sourceSystem>
        <externalSourceId></externalSourceId>
        <c1ExternalTransactionId></c1ExternalTransactionId>
        <getHoldReqStartDt></getHoldReqStartDt>
```

Copyright © 2026, Oracle and/or its affiliates.

```
        <getHoldReqEndDt></getHoldReqEndDt>
        <getHoldReqEntity></getHoldReqEntity>
        <getHoldReqReason></getHoldReqReason>
        <getHoldReqEntIdentType></getHoldReqEntIdentType>
        <getHoldReqEntIdentValue></getHoldReqEntIdentValue>
        <getHoldReqEntityId></getHoldReqEntityId>
        <getHoldReqProcess></getHoldReqProcess>
    </getHoldReqHistRequest>
</C1-GetHoldRequestHistory>
```

Note: Here, the **C1-GetHoldRequestHistory** tag represents the operation in the inbound web service which is used to call the **C1-GetHoldRequestHistory** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **GetHoldRequestHistory**, then you need to specify the **GetHoldRequestHistory** tag instead of the **C1-GetHoldRequestHistory** tag in the above request.

Hold View Response in the XML Format

The following code snippet illustrates how the tags are nested while sending the hold view response in the XML format:

```
<C1-GetHoldRequestHistory>
    <getHoldReqHistRequest>
        <sourceSystem></sourceSystem>
        <externalSourceId></externalSourceId>
        <c1ExternalTransactionId></c1ExternalTransactionId>
        <getHoldReqStartDt></getHoldReqStartDt>
        <getHoldReqEndDt></getHoldReqEndDt>
        <getHoldReqEntity></getHoldReqEntity>
        <getHoldReqReason></getHoldReqReason>
        <getHoldReqEntIdentType></getHoldReqEntIdentType>
        <getHoldReqEntIdentValue></getHoldReqEntIdentValue>
        <getHoldReqEntityId></getHoldReqEntityId>
        <getHoldReqProcess></getHoldReqProcess>
    </getHoldReqHistRequest>
    <holdReqHistResponse>
        <statusCd></statusCd>
        <messageText></messageText>
        <holdReqHistList>
            <holdReqId></holdReqId>
            <holdReqStartDt></holdReqStartDt>
            <holdReqEndDt></holdReqEndDt>
            <holdReqStatus></holdReqStatus>
            <holdReqType></holdReqType>
            <holdReqReason></holdReqReason>
            <holdReqEntity></holdReqEntity>
            <holdReqProcesses></holdReqProcesses>
        </holdReqHistList>
```

Copyright © 2026, Oracle and/or its affiliates.

```
    </holdReqHistResponse>
</C1-GetHoldRequestHistory>
```

Note: Here, the **C1-GetHoldRequestHistory** tag represents the operation in the inbound web service which is used to call the **C1-GetHoldRequestHistory** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **GetHoldRequestHistory**, then the **GetHoldRequestHistory** tag appears instead of the **C1-GetHoldRequestHistory** tag in the above response.

Hold View Request and Response - Tags in XML Format

Note: We recommend you to refer the Hold View Request in the XML Format on page 4087 and Hold View Response in the XML Format on page 4088 topics in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the XML format.

Before calling the **C1-GetHoldRequestHistory** business service through an inbound web service, you need to ensure that the hold view request contains the following tags:

Tag Name	Tag Description	Mandatory (Yes or No)
C1-GetHoldRequestHistory	Used to indicate that you want to invoke the **C1-GetHoldRequestHistory** business service. **Note:** Here, the **C1-GetHoldRequestHistory** tag represents the operation in the inbound web service which is used to call the **C1-GetHoldRequestHistory** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **GetHoldRequestHistory**, then you need to specify the **GetHoldRequestHistory** tag instead of the **C1-GetHoldRequestHistory** tag in the hold view request.	Yes
getHoldReqHistRequest	Used to specify additional criteria along with the details of the entity whose hold requests you want to view.	Yes
sourceSystem	Used to indicate the external system from where the hold view request is received.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: You must specify an external system which is already defined in the system. If the **Inbound Web Service History** feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the **C1-IWSHIST** algorithm. If so, the system stamps the specified external system corresponding to the record in the **C1_IWS_HIST** table. If the external system is not specified in the hold view request, the system, by default, stamps the external system associated with the outbound message type (specified in the **C1-IWSHIST** algorithm) corresponding to the record in the **C1_IWS_HIST** table. For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.	
c1ExternalTransactionId	Used to indicate the transaction in the external system through which the hold view request is received. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external transaction ID corresponding to the record in the **C1_IWS_HIST** table.	No
externalSourceId	Used to specify the external source system ID. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external source system ID corresponding to the record in the **C1_IWS_HIST** table.	No
getHoldReqStartDt	Used when you want to view hold requests which are effective from a particular date onwards. **Note:** You must specify the date in the **YYYY-MM-DD** format. The date should be earlier than the date specified in the **getHoldReqEndDt** tag.	No
getHoldReqEndDt	Used when you want to view hold requests which are effective till a particular date.	No

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: You must specify the date in the **YYYY-MM-DD** format. The date should be later than the date specified in the **getHoldReqStartDt** tag.	
getHoldReqEntity	Used to indicate the type of entity whose hold requests you want to view. The valid values are: • **ACCT** - Used when you want to view hold requests through which an account is kept on hold. • **BILL** - Used when you want to view hold requests through which a bill is kept on hold. • **PERS** - Used when you want to view hold requests through which a person is kept on hold. **Note:** You must specify a value which is already defined in the **HOLD_ENTITY_LVL_FLG** lookup field. It must be in the **Active** status.	Yes
getHoldReqReason	Used when you want to view hold requests which are created for a particular reason. **Note:** You must specify a value which is already defined in the **HOLD_REASON_FLG** lookup field. It must be in the **Active** status.	No
getHoldReqEntIdentType	Used to specify the person or account identifier type. **Note:** You must specify a person or account identifier type which is already defined in the system. It should be a primary identifier type for the respective entity.	Yes (Conditional) **Note:** This data is required when: • **ACCT** or **PERS** is specified in the **getHoldReqEntity** tag. • The value is not specified in the **getHoldReqEntityId** tag.
getHoldReqEntIdentValue	Used to specify the entity identifier (i.e., person or account identifier). It should be the primary identifier of the respective entity. **Note:** The system then derives the person or account ID using the given primary entity identifier details, and accordingly fetches the hold requests of the respective entity.	Yes (Conditional) **Note:** This data is required when: • **ACCT** or **PERS** is specified in the **getHoldReqEntity** tag. • The value is not specified in the **getHoldReqEntityId** tag.
getHoldReqEntityId	Used to specify the entity ID (i.e., person, account, or bill ID).	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
		Note: This data is required when: • **ACCT** or **PERS** is specified in the **getHoldReqEntity** tag and the values are not specified in the **getHoldReqEntIdentType** and **getHoldReqEntIdentValue** tags. • **BILL** is specified in the **getHoldReqEntity** tag.
getHoldReqProcess	Used when you want to view hold requests where the given processes are kept on hold. The valid values are: • ATPY • BILL • DELQ • FNDG • OVDU • REFD **Note:** You must specify a value which is already defined in the **HOLD_PROCESS_FLG** lookup field. It must be in the **Active** status.	No

The following table lists and describes additional tags that are included in the hold view response:

Tag Name	Tag Description
holdReqHistResponse	Displays the response received for the hold view request.
statusCd	Indicates whether the hold view request is successfully processed or not. The valid values are: • Success • Failure
messageText	Indicates the error that occurred while retrieving the hold requests for the entity. **Note:** This tag appears when the value in the **statusCd** tag is set to **Failure**.
holdReqHistList	Displays the details of a hold request. **Note:** This tag appears when the value in the **statusCd** tag is set to **Success**.
holdRequestId	Displays the hold request ID.
holdReqStartDt	Displays the date from when the hold request is effective.
holdReqEndDt	Displays the date till when the hold request is effective.
holdStatus	Indicates the status of the hold request. The valid value is: • Active

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description
holdReqType	Indicates the hold request type using which the hold request is created.
holdReqReason	Indicates the reason why the entity is kept on hold.
holdReqEntity	Indicates the entity for which the hold request is created.
holdReqProcesses	Indicates the process which is kept on hold. The valid values are: • Auto Pay • Bill Generation • Delinquency • Funding • Overdue • Refund **Note:** If multiple processes are kept on hold for an entity through the hold request, a comma-separated list of hold processes appears in the tag.

            <holdReqEntity>9571248085</holdReqEntity>
            <holdReqProcesses>Auto Pay</holdReqProcesses>
        </holdReqHistList>
    </holdReqHistResponse>
</C1-GetHoldRequestHistory>
```

Note: We have given the above request sample to illustrate how the tags should be nested while receiving a hold view request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Hold View Request in the JSON Format

The following code snippet illustrates how the attribute/value pairs should be structured while receiving the hold view request in the JSON format:

```
{
   -"C1-GetHoldRequestHistory": {
       -"getHoldReqHistRequest": {
           -"sourceSystem": -"",
           -"externalSourceId": -"",
           -"c1ExternalTransactionId": -"",
           -"getHoldReqStartDt": -"",
           -"getHoldReqEndDt": -"",
           -"getHoldReqEntity": -"",
           -"getHoldReqReason": -"",
           -"getHoldReqEntIdentType": -"",
           -"getHoldReqEntIdentValue": -"",
           -"getHoldReqEntityId": -"",
           -"getHoldReqProcess": -""
       -}
   -}
-}
```

Copyright © 2026, Oracle and/or its affiliates.

Note: Here, the **C1-GetHoldRequestHistory** attribute represents the operation in the inbound web service which is used to call the **C1-GetHoldRequestHistory** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **GetHoldRequestHistory**, then you need to specify the **GetHoldRequestHistory** attribute instead of the **C1-GetHoldRequestHistory** attribute in the above request.

Hold View Request and Response - Attribute/Value Pairs in JSON Format

Note: We recommend you to refer the Hold View Request in the JSON Format on page 4094 and Hold View Response in the JSON Format on page 4095 topics in parallel while understanding the below mentioned attributes. This will help you to understand how the attribute/value pairs are structured in the JSON format.

Before calling the **C1-GetHoldRequestHistory** business service through an inbound web service, you need to ensure that the hold view request contains the following attributes:

Attribute Name	Attribute Description	Mandatory (Yes or No)
C1-GetHoldRequestHistory	Used to indicate that you want to invoke the **C1-GetHoldRequestHistory** business service. **Note:** Here, the **C1-GetHoldRequestHistory** attribute represents the operation in the inbound web service which is used to call the **C1-GetHoldRequestHistory** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **GetHoldRequestHistory**, then you need to specify the **GetHoldRequestHistory** attribute instead of the **C1-GetHoldRequestHistory** attribute in the hold view request.	Yes
getHoldReqHistRequest	Used to specify additional criteria along with the details of the entity whose hold requests you want to view.	Yes
sourceSystem	Used to indicate the external system from where the hold view request is received.	No

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
	Note: You must specify an external system which is already defined in the system. If the **Inbound Web Service History** feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the **C1-IWSHIST** algorithm. If so, the system stamps the specified external system corresponding to the record in the **C1_IWS_HIST** table. If the external system is not specified in the hold view request, the system, by default, stamps the external system associated with the outbound message type (specified in the **C1-IWSHIST** algorithm) corresponding to the record in the **C1_IWS_HIST** table. For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.	
c1ExternalTransactionId	Used to indicate the transaction in the external system through which the hold view request is received. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external transaction ID corresponding to the record in the **C1_IWS_HIST** table.	No
externalSourceId	Used to specify the external source system ID. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external source system ID corresponding to the record in the **C1_IWS_HIST** table.	No
getHoldReqStartDt	Used when you want to view hold requests which are effective from a particular date onwards. **Note:** You must specify the date in the **YYYY-MM-DD** format. The date should be earlier than the date specified in the **getHoldReqEndDt** attribute.	No
getHoldReqEndDt	Used when you want to view hold requests which are effective till a particular date.	No

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
	Note: You must specify the date in the **YYYY-MM-DD** format. The date should be later than the date specified in the **getHoldReqStartDt** attribute.	
getHoldReqEntity	Used to indicate the type of entity whose hold requests you want to view. The valid values are: • **ACCT** - Used when you want to view hold requests through which an account is kept on hold. • **BILL** - Used when you want to view hold requests through which a bill is kept on hold. • **PERS** - Used when you want to view hold requests through which a person is kept on hold. **Note:** You must specify a value which is already defined in the **HOLD_ENTITY_LVL_FLG** lookup field. It must be in the **Active** status.	Yes
getHoldReqReason	Used when you want to view hold requests which are created for a particular reason. **Note:** You must specify a value which is already defined in the **HOLD_REASON_FLG** lookup field. It must be in the **Active** status.	No
getHoldReqEntIdentType	Used to specify the person or account identifier type. **Note:** You must specify a person or account identifier type which is already defined in the system. It should be a primary identifier type for the respective entity.	Yes (Conditional) **Note:** This data is required when: • **ACCT** or **PERS** is specified in the **getHoldReqEntity** attribute. • The value is not specified in the **getHoldReqEntityId** attribute.
getHoldReqEntIdentValue	Used to specify the entity identifier (i.e., person or account identifier). It should be the primary identifier of the respective entity. **Note:** The system then derives the person or account ID using the given primary entity identifier details, and accordingly fetches the hold requests of the respective entity.	Yes (Conditional) **Note:** This data is required when: • **ACCT** or **PERS** is specified in the **getHoldReqEntity** attribute. • The value is not specified in the **getHoldReqEntityId** attribute.
getHoldReqEntityId	Used to specify the entity ID (i.e., person, account, or bill ID).	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
		Note: This data is required when: • **ACCT** or **PERS** is specified in the **getHoldReqEntity** attribute and the values are not specified in the **getHoldReqEntIdentType** and **getHoldReqEntIdentValue** attributes. • **BILL** is specified in the **getHoldReqEntity** attribute.
getHoldReqProcess	Used when you want to view hold requests where the given processes are kept on hold. The valid values are: • ATPY • BILL • DELQ • FNDG • OVDU • REFD **Note:** You must specify a value which is already defined in the **HOLD_PROCESS_FLG** lookup field. It must be in the **Active** status.	No

The following table lists and describes additional attributes that are included in the hold view response:

Attribute Name	Attribute Description
holdReqHistResponse	Displays the response received for the hold view request.
statusCd	Indicates whether the hold view request is successfully processed or not. The valid values are: • Success • Failure
messageText	Indicates the error that occurred while retrieving the hold requests for the entity. **Note:** This attribute appears when the value in the **statusCd** attribute is set to **Failure**.
holdReqHistList	Displays the details of a hold request. **Note:** This attribute appears when the value in the **statusCd** attribute is set to **Success**.
holdRequestId	Displays the hold request ID.
holdReqStartDt	Displays the date from when the hold request is effective.
holdReqEndDt	Displays the date till when the hold request is effective.
holdStatus	Indicates the status of the hold request. The valid value is: • Active

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description
holdReqType	Indicates the hold request type using which the hold request is created.
holdReqReason	Indicates the reason why the entity is kept on hold.
holdReqEntity	Indicates the entity for which the hold request is created.
holdReqProcesses	Indicates the process which is kept on hold. The valid values are: • Auto Pay • Bill Generation • Delinquency • Funding • Overdue • Refund **Note:** If multiple processes are kept on hold for an entity through the hold request, a comma-separated list of hold processes appears in the attribute.

Sample Hold View Request and Response in the JSON Format

Using the below example, you can view hold requests which are created for a bill and are effective from a particular date.

Sample Hold View Request in the JSON Format

```
{
   -"C1-GetHoldRequestHistory": {
       -"getHoldReqHistRequest": {        '
           -"sourceSystem": -"SMALL_PRIME",
           -"externalSourceId": -"656565",
           -"c1ExternalTransactionId": -"567888876600",
           -"getHoldReqStartDt": -"2025-01-01",
           -"getHoldReqEndDt": -"",
           -"getHoldReqEntity": -"BILL",
           -"getHoldReqReason": -"",
           -"getHoldReqEntIdentType": -"",
           -"getHoldReqEntIdentValue": -"",
           -"getHoldReqEntityId": -"2339633684",
           -"getHoldReqProcess": -""
       -}
   -}
-}
```

Sample Hold View Response in the JSON Format

```
{
   -"C1-GetHoldRequestHistory": {
       -"getHoldReqHistRequest": {
           -"sourceSystem": -"SMALL_PRIME",
           -"externalSourceId": -"656565",
           -"c1ExternalTransactionId": -"567888876600",
```

Copyright © 2026, Oracle and/or its affiliates.

```
            -"getHoldReqStartDt": -"2025-01-01",
            -"getHoldReqEndDt": -"",
            -"getHoldReqEntity": -"BILL",
            -"getHoldReqReason": -"",
            -"getHoldReqEntIdentType": -"",
            -"getHoldReqEntIdentValue": -"",
            -"getHoldReqEntityId": -"2339633684",
            -"getHoldReqProcess": -""
        -}
        -"holdReqHistResponse": {
            -"statusCd": -"Success",
            -"holdReqHistList": [
               {            '
                -"holdReqId": -"588586064410",
                -"holdReqStartDt": -"2025-01-01",
                -"holdReqEndDt": -"2025-01-31",
                -"holdReqStatus": -"Active",
                -"holdReqType": -"HOLD_WITHOUT_APPROVAL",
                -"holdReqReason": -"Disaster Recovery",
                -"holdReqEntity": -"2339633684",
                -"holdReqProcesses": -"Funding"
               -},
               {
                -"holdReqId": -"588586064411",
                -"holdReqStartDt": -"2025-03-01",
                -"holdReqEndDt": -"2025-03-31",
                -"holdReqStatus": -"Active",
                -"holdReqType": -"HOLD_WITHOUT_APPROVAL",
                -"holdReqReason": -"Disaster Recovery",
                -"holdReqEntity": -"2339633684",
                -"holdReqProcesses": -"Funding"
               -}
            -]
        -}
    -}
-}
```

Note: We have given the above request sample to illustrate how the attribute/value pairs should be structured while receiving a hold view request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

C1-ReleaseHoldRequest Business Service

The **Release Hold Request** (**C1-ReleaseHoldRequest**) business service enables you to release an existing hold request which is in the **Active** status. You can call this business service from an external system through an inbound web service. At present, you can release a hold request through an inbound web service only when it has a single entity (i.e., a particular person, account, or bill) in the hold request. If you want to send the hold release request in the XML and/or JSON format, you need to ensure that you create a REST based inbound web service in Oracle Revenue Management and Billing. However, if you want to send the hold release request in the XML format, you can create a SOAP or REST based inbound web service in Oracle Revenue Management and Billing.

Copyright © 2026, Oracle and/or its affiliates.

While sending the hold release request, you need to specify the following details:

- Hold Request ID
- Hold release reason and comments, if any

Note:

You must specify a reason which is already defined for the **Released** status of the **C1-HoldRequest** business object through the **Status Reason** screen.

You can release a hold request through an inbound web service only when the release approval process is not configured on the respective hold request type.

You cannot release a hold request through an inbound web service when the hold request start date is later than the system date or when the system date is later than the hold request end date.

If you want to release a hold request with multiple entities, you can opt to update the end date of each entity in the hold request through **C1-UpdateHoldRequest** business service by calling it separately for each entity of the hold request. Once the end date of all the entities in the hold request is updated through an inbound web service, you can then execute the **C1-HLMON** batch for necessary updates. For more information about the batch, see *Oracle Revenue Management and Billing Batch Guide*. Alternatively, you can release a hold request with multiple entities from the user interface.

Once the hold request is released through an inbound web service, the status of the hold request is set to **Released**. In addition, the hold request end date is set to the system date. If an error occurs while releasing the hold request, the system sends the error message in the response. The system enables you to track the hold release response sent to the external system using the **Inbound Web Service History** feature.

For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.

Prerequisites

To release a hold request through an inbound web service, you need to do the following:

- Define a REST or SOAP based inbound web service to call the **C1-ReleaseHoldRequest** business service where the **HTTP Method** is set to **Post** and the **URI Component** is set to **/releaseHold**.
- Authorize the ORMB user to access the required application service
- Define the required hold request type where the **Release Approval** option is not selected and the status is set to **Active**.
- Define the required values for the **HOLD_REASON_FLG** lookup field.
- Define the required values for the **HOLD_ENTITY_LVL_FLG** lookup field.
- Define the required values for the **HOLD_PROCESS_FLG** lookup field.
- Define the required characteristic types where the characteristic entity is set to **Hold Request**
- Reasons defined for the **Released** status of the **C1-HoldRequest** business object in the **Status Reason** screen

Hold Release Request in the XML Format

The following code snippet illustrates how the tags should be nested while receiving the hold release request in the XML format:

```
<C1-ReleaseHoldRequest>
    <sourceSystem></sourceSystem>
    <externalTransactionId></externalTransactionId>
    <externalSourceId></externalSourceId>
    <holdRequestId></holdRequestId>
    <holdReleaseReason></holdReleaseReason>
    <holdComments></holdComments>
 </C1-ReleaseHoldRequest>
```

Note: Here, the **C1-ReleaseHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-ReleaseHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **ReleaseHoldRequest**, then you need to specify the **ReleaseHoldRequest** tag instead of the **C1-ReleaseHoldRequest** tag in the above request.

Hold Release Request and Response - Tags in XML Format

Note: We recommend you to refer the Hold Release Request in the XML Format on page 4103 andHold Release Response in the XML Format on page 4104 topics in parallel while understanding the below mentioned tags. This will help you to understand how the tags are nested in the XML format.

Before calling the **C1-ReleaseHoldRequest** business service through an inbound web service, you need to ensure that the hold release request contains the following tags:

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
C1-ReleaseHoldRequest	Used to indicate that you want to invoke the **C1-ReleaseHoldRequest** business service. **Note:** Here, the **C1-ReleaseHoldRequest** tag represents the operation in the inbound web service which is used to call the **C1-ReleaseHoldRequest** business service. This tag would change depending on the operation name specified in your SOAP or REST based inbound web service. For example, if you have set the operation name to **ReleaseHoldRequest**, then you need to specify the **ReleaseHoldRequest** tag instead of the **C1-ReleaseHoldRequest** tag in the hold release request.	Yes
sourceSystem	Used to indicate the external system from where the hold release request is received. **Note:** You must specify an external system which is already defined in the system. If the **Inbound Web Service History** feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the **C1-IWSHIST** algorithm. If so, the system stamps the specified external system corresponding to the record in the **C1_IWS_HIST** table. If the external system is not specified in the hold creation request, the system, by default, stamps the external system associated with the outbound message type (specified in the **C1-IWSHIST** algorithm) corresponding to the record in the **C1_IWS_HIST** table. For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.	No
externalTransactionId	Used to indicate the transaction in the external system through which the hold release request is received. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external transaction ID corresponding to the record in the **C1_IWS_HIST** table.	No
externalSourceId	Used to specify the external source system ID. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external source system ID corresponding to the record in the **C1_IWS_HIST** table.	No
holdRequestId	Used to indicate the hold request that you want to release.	Yes
holdReleaseReason	Used to specify the reason why you want to release the hold request.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Tag Name	Tag Description	Mandatory (Yes or No)
	Note: You must specify a reason which is defined for the **Released** status of the **C1-HoldRequest** business object through the **Status Reason** screen.	
holdComments	Used to specify additional information while releasing the hold request.	No

The following table lists and describes additional tags that are included in the hold release response:

Tag Name	Tag Description
requestProcessStatus	Indicates whether the hold release request is successfully processed or not. The valid values are: • Success • Failure
errormsg	Indicates the error that occurred while releasing the hold request. **Note:** This tag appears when the value in the **requestProcessStatus** tag is set to **Failure**.
holdEndDate	Displays the date till when the hold request is effective. **Note:** The system sets the hold end date to the system date (i.e., when the hold request is released through the inbound web service). This tag appears when the value in the **requestProcessStatus** tag is set to **Success**.
holdRequestStatus	Indicates the status of the hold request. The valid value is: • Release **Note:** This tag appears when the value in the **requestProcessStatus** tag is set to **Success**.

    <externalSourceId>656565</externalSourceId>
    <holdRequestId>220419105258</holdRequestId>
    <holdReleaseReason>SUFF</holdReleaseReason>
    <holdComments>Sufficient Funds Available</holdComments>
    <holdEndDate>2025-01-31</holdEndDate>
    <holdRequestStatus>Release</holdRequestStatus>
</C1-ReleaseHoldRequest>
```

Note: We have given the above request sample to illustrate how the tags should be nested while receiving a hold release request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Hold Release Request in the JSON Format

The following code snippet illustrates how the attribute/value pairs should be structured while receiving the hold release request in the JSON format:

```
 {
    -"C1-ReleaseHoldRequest": {
        -"sourceSystem": -"",
        -"externalTransactionId": -"",
        -"externalSourceId": -"",
        -"holdRequestId": -"",
        -"holdReleaseReason": -"",
        -"holdComments": -""
    -}
 -}
```

Note: Here, the **C1-ReleaseHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-ReleaseHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **ReleaseHoldRequest**, then you need to specify the **ReleaseHoldRequest** attribute instead of the **C1-ReleaseHoldRequest** attribute in the above request.

Hold Release Response in the JSON Format

The following code snippet illustrates how the attribute/value pairs are structured while sending the hold release response in the JSON format:

```
{
   -"C1-ReleaseHoldRequest": {
       -"requestProcessStatus": -"",
       -"sourceSystem": -"",
       -"externalTransactionId": -"",
       -"externalSourceId": -"",
       -"holdRequestId": -"",
       -"holdReleaseReason": -"",
       -"holdComments": -"",
       -"holdEndDate": -"",
       -"holdRequestStatus": -"",
       -"errormsg": -""
   -}
-}
```

Note: Here, the **C1-ReleaseHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-ReleaseHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **ReleaseHoldRequest**, then the **ReleaseHoldRequest** attribute appears instead of the **C1-ReleaseHoldRequest** attribute in the above response.

Hold Release Request and Response - Attribute/Value Pairs in JSON Format

Note: We recommend you to refer the Hold Release Request in the JSON Format on page 4107 and Hold Release Response in the JSON Format on page 4108 topics in parallel while understanding the below mentioned attributes. This will help you to understand how the attribute/value pairs are structured in the JSON format.

Before calling the **C1-ReleaseHoldRequest** business service through an inbound web service, you need to ensure that the hold release request contains the following attributes:

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
C1-ReleaseHoldRequest	Used to indicate that you want to invoke the **C1-ReleaseHoldRequest** business service. **Note:** Here, the **C1-ReleaseHoldRequest** attribute represents the operation in the inbound web service which is used to call the **C1-ReleaseHoldRequest** business service. This attribute would change depending on the operation name specified in your REST based inbound web service. For example, if you have set the operation name to **ReleaseHoldRequest**, then you need to specify the **ReleaseHoldRequest** attribute instead of the **C1-ReleaseHoldRequest** attribute in the hold release request.	Yes
sourceSystem	Used to indicate the external system from where the hold release request is received. **Note:** You must specify an external system which is already defined in the system. If the **Inbound Web Service History** feature is enabled, the system validates whether the specified external system matches the external system that is associated with the outbound message type specified in the **C1-IWSHIST** algorithm. If so, the system stamps the specified external system corresponding to the record in the **C1_IWS_HIST** table. If the external system is not specified in the hold creation request, the system, by default, stamps the external system associated with the outbound message type (specified in the **C1-IWSHIST** algorithm) corresponding to the record in the **C1_IWS_HIST** table. For more information, see the **Inbound Web Service History** section in the *Oracle Revenue Management and Billing Administrative Guide*.	No
externalTransactionId	Used to indicate the transaction in the external system through which the hold release request is received. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external transaction ID corresponding to the record in the **C1_IWS_HIST** table.	No
externalSourceId	Used to specify the external source system ID. **Note:** If the **Inbound Web Service History** feature is enabled, the system stores the external source system ID corresponding to the record in the **C1_IWS_HIST** table.	No
holdRequestId	Used to indicate the hold request that you want to release.	Yes
holdReleaseReason	Used to specify the reason why you want to release the hold request.	Yes

Copyright © 2026, Oracle and/or its affiliates.

Attribute Name	Attribute Description	Mandatory (Yes or No)
	Note: You must specify a reason which is defined for the **Released** status of the **C1-HoldRequest** business object through the **Status Reason** screen.	
holdComments	Used to specify additional information while releasing the hold request.	No

The following table lists and describes additional attributes that are included in the hold release response:

Attribute Name	Attribute Description
requestProcessStatus	Indicates whether the hold release request is successfully processed or not. The valid values are: • Success • Failure
errormsg	Indicates the error that occurred while releasing the hold request. **Note:** This attribute appears when the value in the **requestProcessStatus** attribute is set to **Failure**.
holdEndDate	Displays the date till when the hold request is effective. **Note:** The system sets the hold end date to the system date (i.e., when the hold request is released through the inbound web service). This attribute appears when the value in the **requestProcessStatus** attribute is set to **Success**.
holdRequestStatus	Indicates the status of the hold request. The valid value is: • Release **Note:** This attribute appears when the value in the **requestProcessStatus** attribute is set to **Success**.

Sample Hold Release Request and Response in the JSON Format

Using the below example, you can release a hold request.

Sample Hold Release Request in the JSON Format

```
{
   -"C1-ReleaseHoldRequest": {
       -"sourceSystem": -"SMALL_PRIME",
```

Copyright © 2026, Oracle and/or its affiliates.

```
        -"externalTransactionId": -"567800876666",
        -"externalSourceId": -"656565",
        -"holdRequestId": -"220419105258",
        -"holdReleaseReason": -"SUFF",
        -"holdComments": -"Sufficient Funds Available"
    -}
-}
```

Sample Hold Release Response in the JSON Format

```
{
    -"C1-ReleaseHoldRequest": {
        -"requestProcessStatus": -"Success",
        -"sourceSystem": -"SMALL_PRIME",
        -"externalTransactionId": -"567800876666",
        -"externalSourceId": -"656565",
        -"holdRequestId": -"220419105258",
        -"holdReleaseReason": -"SUFF",
        -"holdComments": -"Sufficient Funds Available",
        -"holdEndDate": -"2025-01-31",
        -"holdRequestStatus": -"Release"
    -}
-}
```

Note: We have given the above request sample to illustrate how the attribute/value pairs should be structured while receiving a hold release request from the external system. However, you should not seamlessly use this sample in your environment because the required pre-requisite data may not be available in your environment. In such case, the system will give erroneous results.

Chapter 47

Hold Direct Debit Instruction

Topics:

- Prerequisites
- Algorithms Used in C1-AutoPayRequest
- Auto Pay Request Status Transition without Approval
- Auto Pay Request Status Transition with Approval
- Auto Pay Request Type
- Auto Pay Request (Used for Searching)
- Auto Pay Request (Used for Viewing)

In the financial services and health insurance domains, there might be scenarios wherein the customers would like to review their invoices before the charges are directly debited from their accounts. In such scenarios, there is a need to hold a direct debit (i.e. automatic payment) for a bill until the confirmation is received from the customer.

Oracle Revenue Management and Billing provides the ability to hold a direct debit (i.e. automatic payment) for a bill until the confirmation is received from the customer. A new field named **Auto Pay Review Required** is added in the **Auto Pay** tab of the **Account** screen. On completing a bill for an account, the system creates the automatic payment records in the **CI_BILL_ACH** table as per the auto pay instructions defined for the account. If the **Auto Pay Review Required** option is selected, the system sets the **EXTRACT_ELIG_SW** column corresponding to the automatic payment records in the **CI_BILL_ACH** table to **N**. However, if the **Auto Pay Review Required** option is not selected, the system sets the **EXTRACT_ELIG_SW** column corresponding to the automatic payment records in the **CI_BILL_ACH** table to **Y**. The **EXTRACT_ELIG_SW** column indicates whether the automatic payment record is eligible for the extraction. If the **EXTRACT_ELIG_SW** column is set to **N**, the **APAYCRET** batch does not consider the automatic payment record in the **CI_BILL_ACH** table for automatic payment creation.

Once the confirmation is received for one or more bills, the system enables you to create an automatic payment request for the bills. While creating an automatic payment request, you need to specify an automatic payment request type using which you want to create the automatic payment request. It is the automatic payment request type which helps the system to determine:

- The business object using which the automatic payment request should be created in the system
- Whether the approval is required for the automatic payment request

Once you specify the automatic payment request type, the system creates the automatic payment request in the **Draft** status. You can then include the bills for which invoice confirmation is received from the customers in the automatic payment request. At least one bill should be included in the automatic payment request. Before submitting an automatic payment request, you need to do the following:

- Edit the Schedule Extract Date (if required) of each bill
- Set the **Eligible for Extraction** field of each bill to **Y**

You can also delete a bill from an automatic payment request when it is in the **Draft** status. Once you edit the required details of the bills in an automatic payment request, you can submit the automatic payment request. If the approval process is not configured in the respective automatic payment request type, the system does the following:

- Updates the **ELIG_EXTRACT_SW** and **APAY_CRE_DT** columns corresponding to the automatic payment records in the **CI_BILL_ACH** table
- Changes the status of the automatic payment request to **Processed**

If the approval process is configured in the respective automatic payment request type, the system changes the status of the automatic payment request to **Approval In Progress**. A To Do notification is created for the approver using the approval To Do type (specified in the respective automatic payment request type) and assigned to the users with the approval To Do role (specified in the respective automatic payment request type). Once the approver reviews an automatic payment request, the approver can approve, reject, or resubmit the automatic payment request based on the observations. If the approver approves the automatic payment request, the system does the following:

- Updates the **ELIG_EXTRACT_SW** and **APAY_CRE_DT** columns corresponding to the automatic payment records in the **CI_BILL_ACH** table
- Changes the status of the automatic payment request to **Processed**

If the approver rejects an automatic payment request, the status of the automatic payment request is changed to **Rejected**. However, if the approver requests the submitter to resubmit an automatic payment request, the status of the automatic payment request is changed to **Draft**. A To Do notification is created for the submitter using the submitter To Do type (specified in the respective automatic payment request type) and assigned to the users with the submitter To Do role (specified in the respective automatic payment request type). While rejecting or resubmitting an automatic payment request, the approver needs to specify the reason for rejection or resubmission.

To implement the hold direct debit feature, the following new screens are introduced in this release:

- **Auto Pay Request Type** - Enables you to create, edit, delete, and copy an automatic payment request type.
- **Auto Pay Request (Used for Searching)** - Enables you to search for an automatic payment request. It also enables you to create an automatic payment request.
- **Auto Pay Request (Used for Viewing)** - Enables you to edit, delete, submit, approve, reject, and resubmit the automatic payment request. It also enables you to add, edit, and delete bills from the automatic payment request.

In addition, the following changes are made to the system:

- **Auto Pay Review Required** - This field is added in the **Auto Pay** tab of the **Account** screen. It indicates whether you want to hold direct debit (i.e. automatic payment) for the bills of the account until the confirmation is received from the customer.
- **Eligible for Extraction** - This column is added in the **Auto Pay** tab of the **Bill** screen. It indicates whether the automatic payment record for the bill is eligible for extraction.

Prerequisites

To setup the auto pay request feature, you need to do the following:

- Auto pay request type business object defined in the application
- Auto pay request types defined in the system.
- Approval To Do types and To Do roles defined in the application
- Submitter To Do types and To Do roles defined in the application
- Characteristic types defined in the application

Algorithms Used in C1-AutoPayRequest

The following table lists the algorithm which is attached to the **C1-AutoPayRequest** business object:

System Event	Algorithm	Algorithm Type	Description
Information	C1-APAYRQINF	C1-APAYRQINF	Refer to C1-APAYRQINF on page 4115

The following table lists the algorithms which are used in the lifecycle of the **C1-AutoPayRequest** business object:

Status	System Event	Algorithm	Algorithm Type	Description
Draft	Exit	F1-TODOCOMPL	F1-TODOCOMPL	Refer to F1-TODOCOMPL on page 1549
Submitted	Enter	C1-APAYSUB	C1-APAYSUB	Refer to C1-APAYSUB on page 4116
Approval In Progress	Enter	C1-APAYAPP	C1-APAYAPP	Refer to C1-APAYAPP on page 4116
	Exit	F1-TODOCOMPL	F1-TODOCOMPL	Refer to F1-TODOCOMPL on page 1549
Update Auto Pay Record	Enter	C1-UPDAPAY	C1-UPDAPAY	Refer to C1-UPDAPAY on page 4116
Approved	Enter	C1-APAYAPRVD	C1-APAYAPRVD	Refer to C1-APAYAPRVD on page 4117
Return to Submitter	Enter	C1-APAYRESUB	C1-APAYRESUB	Refer to C1-APAYRESUB on page 4117
Processed	-	-	-	-
Rejected	-	-	-	-

C1-APAYRQINF

The **C1-APAYRQINF** algorithm generates the auto pay request information string and is plugged in at **System Event**: **Information** of business object: **C1-AutoPayRequest**.

It concatenates the following fields:

- Auto Pay Request Type Description

Copyright © 2026, Oracle and/or its affiliates.

- Auto Pay Request Status Description
- Auto Pay Request ID

F1-TODOCOMPL

This algorithm completes the To Do entries that are linked to an object when the object exits the given status. It finds and completes all open To Do entries where the business object's primary key is defined as a drill key. However, if the **Exclude To Do Entries From Auto Completion** (**F1-EXLTD**) characteristic is set to **Y** for a To Do type, the system does not automatically complete the respective To Do entry.

This algorithm contains the following parameter:

- **'Do Not Complete To Do Type' Char Type** – Used to specify the characteristic type that indicates whether the To Do entries should be automatically completed or not.

> **Note:** The **F1-EXLTD** characteristic type is shipped with the product. You can either use the **F1-EXLTD** characteristic type or a custom characteristic type, if required. Note that you must specify a predefined characteristic type where the characteristic entity is set to **To Do Type** and the predefined values are set to **Y** or **N**.

C1-APAYSUB

The **C1-APAYSUB** algorithm will be plugged at the **"Enter" System event** of the business object (**C1-AutoPayRequest**) life cycle status: **SUBMITTED**.

This algorithm checks the following:

1. Whether the approval is required for the auto pay request based on the configuration in auto pay request type (**IS_APPR_REQ** = **Y**).
   a. If the approval is required for the auto pay request, the status of the auto pay request is changed to **Approval In Progress**.
   b. If the approval is not required for the auto pay request, the status of the auto pay request is changed to **UPDATEAPAY**.
2. At least one auto pay record is selected in the auto pay request.
3. Updated scheduled extraction date cannot be less than system date.
4. **Auto Pay Request** cannot be created for any auto pay record if the same auto pay record is selected in another request which is in the **Approval In Progress** status.

C1-APAYAPP

The **C1-APAYAPP** algorithm creates the following:

1. A To Do using the To Do type specified in the approval profile which is attached to the **Auto Pay Request Type**. The To Do is sent to the appropriate users in the approval hierarchy depending on whether hierarchical approval is required or not.
2. A log entry is added when a To Do is created using the To Do type. It will create To Do Entry when **Auto Pay Request** enters in the **Approval in Progress** status from **Submit** status.

C1-UPDAPAY

The **C1-UPDAPAY** algorithm will be plugged in at **"Enter" System event** of the business object (**C1-AutoPayRequest**) life cycle status: **UPDATEAPAY**.

1. The **Extract Eligible Switch** and **Auto Pay Creation Date** are updated in the **CI_BILL_ACH** table with the latest values present in **Auto Pay Request Details** table. The auto pay request status is then changed to **PROCESSED**.

Copyright © 2026, Oracle and/or its affiliates.

2. If the bill which is present in the **Auto Pay Request** is cancelled then the latest details of **Extract Eligible Switch** and **Auto Pay Creation Date** are not updated in the **CI_BILL_ACH** table and the auto pay request status is changed to **PROCESSED**.

C1-APAYAPRVD

The **C1-APAYAPRVD** algorithm is the **Enter** status algorithm. This algorithm is invoked when you approve an **Auto Pay Request**. It confirms whether the approval flag is true and the status of the **Auto Pay request** is **APPROVED** to transit it to the next level.

C1-APAYRESUB

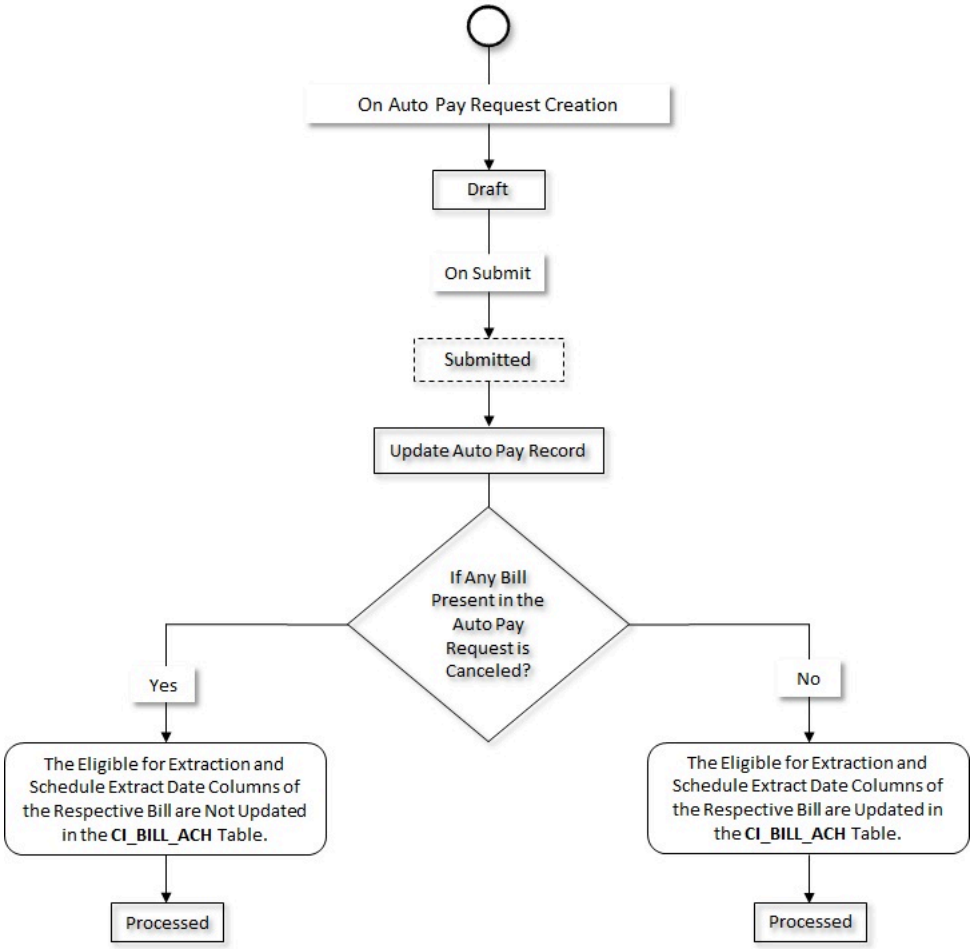
The **C1-APAYRESUB** algorithm is invoked on the **Re-Submit** button. It moves the status of the **Auto Pay Request** to **Draft**.

A To Do is generated for the user as submitter whose To Do type and To Do role are fetched from the **Auto Pay Request Type**. This algorithm creates the To Do entry when the **Auto Pay Request** enters into the **Return to Submitter** status from the **Approval In Progress** status.

Auto Pay Request Status Transition without Approval

The following figure graphically indicates how an auto pay request moves from one status to another when the approval process is not configured in the auto pay request type:

Copyright © 2026, Oracle and/or its affiliates.



Auto Pay Request Status Transition with Approval

The following figure graphically indicates how an auto pay request moves from one status to another when the approval process is configured in the auto pay request type:

Auto Pay Request Type

The **Auto Pay Request Type** screen allows you to define, edit, copy, and delete an auto pay request type. It also allows you to view the details of an auto pay request type. It contains the following zones:

- Auto Pay Request Type List on page 4119
- Auto Pay Request Type on page 4120

Auto Pay Request Type List

The **Auto Pay Request Type List** zone lists the auto pay request types that are already defined in the system. It contains the following columns:

Copyright © 2026, Oracle and/or its affiliates.

Column Name	Column Description
Auto Pay Request Type	Displays the auto pay request type.
Description	Displays the description of the auto pay request type.
Edit	On clicking the **Edit** (✎) icon, the **Auto Pay Request Type** screen appears where you can edit the details of the auto pay request type.
Duplicate	On clicking the **Duplicate** (⧉) icon, the **Auto Pay Request Type** screen appears where you can define an auto pay request type using an existing auto pay request type.
Delete	On clicking the **Delete** (🗑) icon, you can delete the auto pay request type.
	Note: You can delete an auto pay request type only when an auto pay request is not yet created using the auto pay request type.

On clicking the **Broadcast** (📡) icon corresponding to an auto pay request type, the **Auto Pay Request Type** zone appears with the details of the respective auto pay request type.

Auto Pay Request Type

The **Auto Pay Request Type** zone displays the details of the auto pay request type. It contains the following sections:

- **Main** - Displays basic information about the auto pay request type. It contains the following fields:

Field Name	Field Description
Auto Pay Request Type	Displays the auto pay request type.
Description	Displays the description of the auto pay request type.
Related Transaction BO	Indicates the business object using which the auto pay transaction is performed. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.
Detailed Description	Displays additional information about the auto pay request type.
Auto Pay Request Action	Indicates the action which is performed on the auto pay request using the auto pay request type.

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description
Status	Indicates the current status of the auto pay request type. The valid values are: • Active • Inactive
Approval Required	Indicates whether approval is required for the auto pay request which is created using the auto pay request type.
Approval To Do Type	Indicates that the To Do entry of the specified To Do Type is created when you submit the auto pay request for an approval. **Note:** It has a link. On clicking the link, the **To Do Type** screen appears where you can view the details of the respective To Do type. This field appears only when the **Approval Required** option is selected.
Approval To Do Role	Indicates that the users which belong to the specified To Do role can only approve the auto pay request when it is submitted for an approval. **Note:** It has a link. On clicking the link, the **To Do Role** screen appears where you can view the details of the respective To Do role. This field appears only when the **Approval Required** option is selected.
Submitter To Do Type	Indicates that the To Do entry of the specified To Do task is created when an auto pay request is resubmitted by an approver. **Note:** It has a link. On clicking the link, the **To Do Type** screen appears where you can view the details of the respective To Do type.
Submitter To Do Role	Indicates that the approvers which belong to the specified To Do role can only resubmit the auto pay request. **Note:** It has a link. On clicking the link, the **To Do Role** screen appears where you can view the details of the respective To Do role.

- **Characteristic** - Lists the characteristics defined for the auto pay request type. It contains the following columns:

Column Name	Column Description
Characteristic Type	Indicates the characteristic type.
Characteristic Value	Displays the value of the characteristic type.

- **Record Actions** - The **Record Actions** section contains the following buttons:

Button Name	Button Description
Edit	Used to edit the details of the auto pay request type.
Delete	Used to delete the auto pay request type. **Note:** You can delete an auto pay request type only when an auto pay request is not yet created using the auto pay request type.

Copyright © 2026, Oracle and/or its affiliates.

Button Name	Button Description
Duplicate	Used to create a new auto pay request type using an existing auto pay request type.

- **Record Information** - The **Record Information** section contains the following fields:

Field Name	Field Description
Business Object	Indicates the business object using which the auto pay request type is created in the system. In addition, a context menu appears corresponding to this field which helps in navigating to other screens in the application.
	Note: It has a link. On clicking the link, the **Business Object** screen appears where you can view the details of the respective business object.

By default, the **Auto Pay Request Type** zone does not appear in the **Auto Pay Request Type** screen. It appears only when you click the **Broadcast** (📡) icon corresponding to an auto pay request type in the **Auto Pay Request Type List** zone.

Defining an Auto Pay Request Type

Prerequisites

To define an auto pay request type, you should have:

- Auto pay request type business objects defined in the application
- Approval To Do Types and To Do roles defined in the application
- Submitter To Do Types and To Do roles defined in the application

Procedure

To define an auto pay request type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **A** and then click **Auto Pay Request Type**.
   A sub-menu appears.
3. Click the **Add** option from the **Auto Pay Request Type** sub-menu.

Tip: Alternatively, you can access the **Auto Pay Request Type** screen by clicking the **Add** button in the **Page Title** area of the **Auto Pay Request Type** screen.

Copyright © 2026, Oracle and/or its affiliates.

Note: The **Select Business Object** screen appears when there are multiple auto pay request type business objects defined in the application. If there is only one auto pay request type business object defined in the application, the **Auto Pay Request Type** screen appears.

4. Select the required auto pay request type business object from the respective field.
5. Click **OK**.

The **Auto Pay Request Type** screen appears. It contains the following sections:

- **Main** - Used to specify basic details about the auto pay request type.
- **Characteristics** - Used to define the characteristics for the auto pay request type.

The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Auto Pay Request Type	Used to specify the auto pay request type.	Yes
Business Object	Indicates the business object using which the auto pay request type is defined in the system.	Not applicable
Description	Used to specify the description for the auto pay request type.	Yes
Related Transaction BO	Used to indicate the business object using which the auto pay transaction is performed. The valid value is: • Auto Pay Request	Yes
Detailed Description	Used to specify additional information about the auto pay request type.	No
Auto Pay Request Action	Indicates the action which is performed on the auto pay request using the auto pay request type. The valid value is: • Update **Note:** By default, the **Update** option is selected and cannot be edited.	Not applicable
Status	Used to indicate the current status of the auto pay request type. The valid values are: • Active • Inactive **Note:** You cannot change the status of an auto pay request type to**Inactive** when an auto pay request created using the auto pay request type is in the **Draft** or **Rejected** status.	Yes
Approval Required	Used to indicate whether approval is required for the auto pay request which is created using the auto pay request type.	No
Approval To Do Type	Used to specify the To Do entry of the specified To Do Type that is created when you submit the auto pay request for an approval.	Yes (Conditional)

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
	Note: The **Search** (🔍) icon appears corresponding to the **Approval To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the **Approval To Do Type** field. This field appears only when the **Approval Required** check box is selected.	**Note:** This field is required while approving an auto pay request which is created using the auto pay request type.
Approval To Do Role	Used to indicate the users which belong to the specified To Do role who can approve the auto pay request when it is submitted for an approval. **Note:** The list includes only those To Do roles which are associated with the specified **Approval To Do Type**. This field appears only when the **Approval Required** check box is selected.	Yes (Conditional) **Note:** This field is required while approving an auto pay request which is created using the auto pay request type.
Submitter To Do Type	Used to indicate the To Do entry of the specified To Do Type that is created when an auto pay request is resubmitted by an approver. **Note:** The **Search** (🔍) icon appears corresponding to the **Submitter To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the **Submitter To Do Type** field. This field appears only when the **Approval Required** check box is selected.	Yes (Conditional) **Note:** This field is required while resubmitting an auto pay request which is created using the auto pay request type.
Submitter To Do Role	Used to indicate the users which belong to the specified To Do role who can resubmit the auto pay request when it is submitted for an approval. **Note:** The list includes only those To Do roles which are associated with the specified **Submitter To Do Type**. This field appears only when the **Approval Required** check box is selected.	Yes (Conditional) **Note:** This field is required while resubmitting an auto pay request which is created using the auto pay request type.

6. Enter the required details in the **Main** section.

How to define a characteristic for an auto pay request type	Defining a Characteristic for an Auto Pay Request Type on page 4125

Defining a Characteristic for an Auto Pay Request Type

Prerequisites

To define a characteristic for an auto pay request type, you should have:

- Characteristic types defined in the application (where the characteristic entity is set to **Auto Pay Request Type**)

Procedure

To define a characteristic for an auto pay request type:

1. Ensure that the **Characteristics** section is expanded when you are defining, editing, or copying an auto pay request type.

   The **Characteristics** section contains the following fields in a grid:

Field Name	Field Description	Mandatory (Yes or No)
Characteristic Type	Used to indicate the characteristic type. **Note:** The list includes only those characteristic types where the characteristic entity is set to **Auto Pay Request Type**.	Yes (Conditional) **Note:** This field is required while defining a characteristic for the auto pay request type.
Characteristic Value	Used to specify the value for the characteristic type. **Note:** If you select a predefined characteristic type, the **Search** (🔍) icon appears corresponding to the **Characteristic Value** field. On clicking the **Search** icon, you can search for the respective characteristic value. On specifying the value for a predefined characteristic type, the description of the characteristic value appears corresponding to the **Characteristic Value** field.	Yes (Conditional) **Note:** This field is required while defining a characteristic for the auto pay request type.

2. Enter the required details in the **Characteristics** section.
3. If you want to define more than one characteristic for the auto pay request type, click the **Add** (+) icon and then *r*epeat step *2*.

Editing an Auto Pay Request Type

Prerequisites

To edit an auto pay request type, you should have:

- Auto pay request type that you want to edit defined in the application

Procedure

To edit an auto pay request type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **A** and then click **Auto Pay Request Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Auto Pay Request Type** sub-menu.
   The **Auto Pay Request Type** screen appears.
4. In the **Auto Pay Request Type List** zone, click the **Edit** (✎) icon in the **Edit** column corresponding to the auto pay request type whose details you want to edit.

   The **Auto Pay Request Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the auto pay request type.
   - **Characteristics** - Used to define the characteristics for the auto pay request type.

   The **Main** section contains the following fields:

Field Name	Field Description	Mandatory (Yes or No)
Auto Pay Request Type	Displays the auto pay request type.	Not applicable
Business Object	Indicates the business object using which the auto pay request type is defined in the system.	Not applicable
Description	Used to specify the description for the auto pay request type.	Yes
Related Transaction BO	Used to indicate the business object using which the auto pay transaction is performed.	Yes
Detailed Description	Used to specify additional information about the auto pay request type.	No
Auto Pay Request Action	Displays the action which is performed on the auto pay request using the auto pay request type.	Not applicable

Copyright © 2026, Oracle and/or its affiliates.

Field Name	Field Description	Mandatory (Yes or No)
Status	Used to indicate the status of the auto pay request type. The valid values are: • Active • Inactive	Yes
Approval Required	Used to indicate whether approval is required for the auto pay request which is created using the auto pay request type.	No
Approval To Do Type	Used to indicate the To Do task which is performed by the approver while approving the auto pay request. **Note:** The **Search** (🔍) icon appears corresponding to the **Approval To Do Type** field. On clicking the **Search** (🔍) icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the **Approval To Do Type** field. This field appears when the **Approval Required** option is selected.	Yes
Approval To Do Role	Used to indicate the users with the specified To Do role who can approve the auto pay request. **Note:** The list includes only those To Do roles which are associated with the approval To Do type. This field appears when the **Approval Required** option is selected.	Yes
Submitter To Do Type	Used to indicate the To Do task created when an auto pay request is submitted by an approver. **Note:** The **Search** (🔍) icon appears corresponding to the **Submitter To Do Type** field. On clicking the **Search** icon, the **To Do Type Search** window appears. On specifying the To Do type, the description of the To Do type appears corresponding to the **Submitter To Do Type** field.	Yes
Submitter To Do Role	Used to indicate the users with the specified To Do role who can submit the auto pay request for approval.	Yes

Copying an Auto Pay Request Type

Instead of creating an auto pay request type from scratch, you can create a new auto pay request type using an existing auto pay request type. This is possible through copying an auto pay request type. On copying an auto pay request type, the details including the characteristics are copied to the new auto pay request type. You can then edit the details, if required.

Prerequisites

To copy an auto pay request type, you should have:

- Auto pay request type (whose copy you want to create) defined in the application
- Auto pay request business objects defined in the application

Procedure

To copy an auto pay request type:

1. Click the **Admin** link in the **Application** toolbar.
   A list appears.
2. From the **Admin** menu, select **A** and then click **Auto Pay Request Type**.
   A sub-menu appears.
3. Click the **Search** option from the **Auto Pay Request Type** sub-menu.
   The **Auto Pay Request Type** screen appears.
4. In the **Auto Pay Request Type List** zone, click the **Duplicate** (⎘) icon in the **Duplicate** column *c*orresponding to the auto pay request type whose copy you want to create.

   The **Auto Pay Request Type** screen appears. It contains the following sections:

   - **Main** - Used to specify basic details about the auto pay request type.
   - **Characteristics** - Used to define the characteristics for the auto pay request type.

   The **Main** section contains the following fields:
