This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Preface

This guide covers installation procedures and operation reference material for the cloud infrastructure API and cloud infrastructure CLI of Oracle Enterprise Manager Ops Center.

Audience

This document is intended for advanced users or developers who require access to manage the virtual servers, storage, and network infrastructure as a service from a shell or scripts.

Related Documents

For more information, see the Oracle Enterprise Manager Ops Center Documentation Library at http://docs.oracle.com/cd/E59957_01/index.htm.

Oracle Enterprise Manager Ops Center provides online help. Click Help at the top-right corner of any page in the user interface to display the online help window.

For the latest releases of this and other Oracle documentation, check the Oracle Technology Network at <http://www.oracle.com/technetwork/documentation/index.html#em>

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
<code>monospace</code>	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Get Started With Cloud API and CLI

Oracle Enterprise Manager Ops Center provides APIs and a command-line interface (CLI) to enable access to a subset of the virtual datacenter (vDC) functionality provided to cloud users.

The following topics are covered in this chapter:

- [About the APIs and CLI](#)
- [Overview of Virtual Datacenter Management](#)
- [How APIs and CLI Work](#)
- [Comparison of Functionality](#)

About the APIs and CLI

Describes the purpose of the Cloud APIs and CLI and describes each one.

These APIs and CLI offer a way for cloud users to programmatically manage allocated virtual resources in a vDC account, providing the ability to create and manage virtual servers (vServers) to deploy applications in an infrastructure as a service (IaaS) mode. This guide provides information about:

- Cloud infrastructure API: A programmatic Web service interface for managing virtual datacenter (vDC) resources allocated in vDC accounts. This API is also referred to simply as Web service in this guide.
- Cloud infrastructure Java client API: A Java client API for interacting with the Web service interface. This API is also referred to simply as Java client API in this guide.
- Cloud infrastructure CLI: A Java-based command-line interface that wraps the cloud infrastructure Java client API with simple scripts. It is also referred to simply as CLI in this guide.

Overview of Virtual Datacenter Management

Describes the purpose of a virtual datacenter and the role of its users.

Oracle Enterprise Manager Ops Center supports cloud management functions through its vDC management system in three main areas:

- vDC infrastructure administration: Area related to the management and allocation of physical resources for the vDC by a cloud administrator. The managed resources are the server pools, storage, and networks.
- Cloud users management: Area related to the management of the cloud users, their linkage with the authentication systems, and their association with the vDC accounts that they are authorized to access by a cloud administrator.

- vDC resource utilization: Area related to cloud user tasks to perform lifecycle management of vServers and resources in a vDC account. There might be more than one cloud user associated with an account with the same level of privileges and access control.

See Oracle Enterprise Manager Ops Center Virtualize Reference for more information about vDC management.

The following list describes vDC management concepts used in this guide:

- Virtual datacenter: Consolidation of virtualization servers, storage, and network resources to be used optimally and securely for mixed and dynamic workloads.
- Account: An account entitles designated cloud users the right to use computing, network, and storage resources of vDC. The account provides the required capabilities to manage these resources. The amount of virtual CPU (vCPU), memory, and storage resources that can be used from the available vDC resources.
- Cloud administrator: An Oracle Enterprise Manager Ops Center user with the cloud administrator role. A cloud administrator can create and manage the vDCs, accounts, and cloud users.
- Cloud user: An Oracle Enterprise Manager Ops Center user with the cloud user role. Cloud users can have access to different accounts to manage the allocated resources. Cloud users can create virtual servers to host or access applications.

How APIs and CLI Work

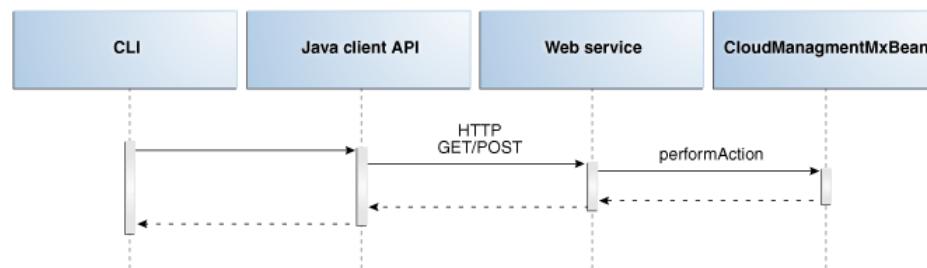

Describes how this API and CLI manage resources.

For this release, cloud infrastructure APIs and CLI support the management of the resources in vDC accounts based on the following virtualization technologies:

- Oracle Solaris Zones
- Oracle VM Server for x86

[Figure 1-1](#) illustrates the execution flow and components that support the cloud infrastructure APIs and CLI.

Figure 1-1 Cloud Infrastructure APIs and CLI Execution Flow

- The cloud infrastructure CLI is delivered as a standalone package and can be used without an Oracle Enterprise Manager Ops Center installation in the computer where CLI is deployed. This element offers the same functionality as the cloud infrastructure API and Java client API.
- The cloud infrastructure Java client API provides for the cloud infrastructure CLI a common set of functionality for executing actions through the cloud infrastructure API. The Java client API is delivered as a standalone package.

- The cloud infrastructure API is a Web service that exposes a subset of the functionality of the vDC management system. A cloud infrastructure API request triggers an action by calling the corresponding action of the vDC management system.

The functionality exposed by the Web service can then be accessed programmatically using the Java Client API, the CLI, or by making calls directly to the Web service.

The cloud infrastructure API provides a synchronous call semantic for all modify or create actions. The call returns at least the identifiers of the changed or created resources.

The creation of the resource IDs and the mapping to jobs is handled by the vDC management system. The cloud infrastructure API must wait actively for notifications from the Job Manager to get the IDs of the changed or created resources. Jobs are specially tailored to deliver fast results; the cloud infrastructure API waits only until the necessary results are available.

The cloud infrastructure API returns a valid identifier even when resource creation fails. A cloud user must be able to view resource information, such as name, description, and status using the identifier returned. For more information, see “[Status of a Cloud Resource](#)”.

Comparison of Functionality

The vDC management system in Oracle Enterprise Manager Ops Center has functions that are also reached by the cloud infrastructure APIs and CLI. [Table 1-1](#) through [Table 1-11](#) compare the functions provided by the vDC management system with those provided by the cloud infrastructure APIs and CLI.

Table 1-1 vDC Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Create, update, and delete vDC	Yes	No
View vDC details	Yes	Yes

Table 1-2 Account Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Create, update, and delete account	Yes	No
View account details	Yes	No
Associate or disassociate cloud user with account	Yes	No

Table 1-3 Server Template Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Upload, update, and delete server template	Yes	Yes

Table 1-3 (Cont.) Server Template Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Create server template	Yes	No

Table 1-4 vServer Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Create, update, and delete vServer	Yes	Yes
Stop, start, and reboot vServer	Yes	Yes
View vServer attributes and metrics	Yes	Yes
Suspend and resume vServer	Yes	No
Shut down all vServers	Yes	No
Send and receive message from vServer	No	Yes
Save vServer as server template	Yes	Yes

Table 1-5 Volume Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Create, update, and delete volume	Yes	Yes
Attach volume to and detach volume from vServer	Yes	Yes
Create volume from snapshot	Yes	Yes
Import volume	Yes	Yes

Table 1-6 Snapshot Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Create, update, and delete snapshot	Yes	Yes

Table 1-7 Virtual IP Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Allocate and deallocate IP address	Yes	Yes
Blacklist and clear IP address	Yes	Yes

Table 1-8 Virtual Network Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Create, update, connect, and delete private virtual network	Yes	Yes

Table 1-9 Account and vServer Access Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Create, import, and delete key pair	Yes	Yes
Create, delete, and access key	Yes	Yes

Table 1-10 Distribution Groups Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Create and delete distribution groups	Yes	Yes

Table 1-11 Tag Management

Functionality	Virtual Datacenter Management	Cloud Infrastructure APIs and CLI
Create and delete tags	Yes	Yes

Install Cloud API and CLI

This chapter identifies the prerequisites for the cloud infrastructure APIs and CLI, and describes their installation and configuration.

The following topics are covered in this chapter:

- [Prerequisites](#)
- [Installation of Cloud Infrastructure API](#)
- [Installing Cloud Infrastructure Java Client API](#)
- [Installing the Cloud Infrastructure CLI](#)
- [Preparing to Use the APIs and CLI](#)

Prerequisites

The following prerequisites must be met before using the APIs and CLI:

- Java Runtime Environment (JRE) or Java Development Kit (JDK) version 1.6 or later for the platform appropriate for the system where the APIs and CLI will run.
- Access to the Enterprise Controller

Installation of Cloud Infrastructure API

The Web service is installed on the Enterprise Controller as part of the Oracle Enterprise Manager Ops Center installation. No further steps are required.

Installing Cloud Infrastructure Java Client API

Procedure for installing Cloud Infrastructure Java API.

The Java Client API is delivered as a package with the Oracle Enterprise Manager Ops Center product. You can install this standalone package on a system that has a connection to the Enterprise Controller.

Package Name	Operating System
ORCL-sysman-iaas-api.pkg	Oracle Solaris
orcl-sysman-iaas-api.rpm	Linux

To install this package, enter the following commands as root user:

- For Oracle Solaris:

```
# cd <repo>/src/dvd/SunOS_i386/Product/components/packages/
# pkgadd -d ORCLsysman-iaas-api.pkg
```

- For Linux:

```
# cd <repo>/src/dvd/Linux_i686/Product/components/packages/
# rpm -i orcl-sysman-iaas-api.rpm
```

After installation, the API jar files are in /opt/oracle/iaas/iaas-java-api.

Before you use the API jar file, set the JAVA_HOME environment variable and ensure that the environment variable is part of your PATH:

- Korn and bash shells:

```
export JAVA_HOME=<jdk-install-dir>
export PATH=$JAVA_HOME/bin:$PATH
```

- Bourne shell:

```
JAVA_HOME=<jdk-install-dir>
export JAVA_HOME
PATH=$JAVA_HOME/bin:$PATH
export PATH
```

- C shell:

```
setenv JAVA_HOME <jdk-install-dir>
setenv PATH $JAVA_HOME/bin:$PATH
export PATH=$JAVA_HOME/bin:$PATH
```

Installing the Cloud Infrastructure CLI

Procedure for installing the Cloud Infrastructure CLI.

The cloud infrastructure CLI is delivered as a separate package with the Oracle Enterprise Manager Ops Center product. You can install this standalone package on a system that has a connection to the Enterprise Controller.

Package Name	Operating System
ORCLsysman-iaas-cli.pkg	Oracle Solaris
orcl-sysman-iaas-cli.rpm	Linux

To install this package, enter the following commands as root user:

- For Oracle Solaris:

```
# cd <repo>/src/dvd/SunOS_i386/Product/components/packages/
# pkgadd -d ORCLsysman-iaas-cli.pkg
```

- For Linux:

```
# cd <repo>/src/dvd/Linux_i686/Product/components/packages/
# rpm -i orcl-sysman-iaas-cli.rpm
```

The files from the package are stored at /opt/oracle/iaas/cli. To execute the CLI commands, the user must have permissions to access this directory.

Before using the cloud infrastructure CLI:

1. Set the JAVA_HOME environment variable and ensure that the environment variable is part of your PATH:

- Korn and bash shells:

```
export JAVA_HOME=<jdk-install-dir>
export PATH=$JAVA_HOME/bin:$PATH
```

- Bourne shell:

```
JAVA_HOME=<jdk-install-dir>
export JAVA_HOME
PATH=$JAVA_HOME/bin:$PATH
export PATH
```

- C shell:

```
setenv JAVA_HOME <jdk-install-dir>
setenv PATH $JAVA_HOME/bin:$PATH
export PATH=$JAVA_HOME/bin:$PATH
```

2. Set the IAAS_HOME environment variable:

- Korn and bash shells:

```
export IAAS_HOME=/opt/oracle/iaas/cli
```

- Bourne shell:

```
IAAS_HOME=/opt/oracle/iaas/cli
export IAAS_HOME
```

- C shell:

```
setenv IAAS_HOME /opt/oracle/iaas/cli
```

Preparing to Use the APIs and CLI

Procedure to prepare an account for the API and CLI.

To use the APIs or the CLI, the cloud administrator must complete the following tasks:

1. Create vDC.
2. Create an account for the vDC.
3. Create a cloud account and associate this account with the vDC account and vDC.
4. Give the credentials for the cloud account to the intended user.
5. The cloud user creates an access key for the account, as described in [Creating an Access Key](#), to manage the account's resources.

Manage Resources

Demonstrates how a cloud user manages account resources.

This chapter describes how a cloud user can manage resources for an account and includes a basic example for each action that a cloud user can perform.

For a complete reference and other examples, see:

- [Cloud Infrastructure API Reference](#)
- [Cloud Infrastructure CLI Reference](#)

For more information about the cloud infrastructure Java client API, see the Javadoc files included in the package of the API.

Overview of Cloud Resources

Summary of resources that a cloud user manages.

This section describes the resources that a cloud user manages using the APIs and CLI.

Availability and management of some of these resources might vary depending on the configuration of the vDC. Contact your cloud administrator for more information.

- Access keys control access to an account. See [Managing Account Access](#).
- Virtual networks (vNets) manage network connectivity of vServers. See [Managing Virtual Networks](#) and [Managing vIP Addresses](#).
- Server templates specify how an operating system is deployed when creating a vServer. See [Managing Server Templates](#) for more information.
- Virtual storage is the volumes that are attached to vServers and the snapshots that capture the current state of a volume. See [Managing Storage](#).
- Distribution Groups are used to create a behavior in vServers that is similar to anti-affinity scaling properties. See [Managing Distribution Groups](#).
- Virtual servers (vServers) expose an interface of a standalone operating system. A vServer has its own identity, local storage, interfaces, and configuration that exist for the lifetime of the vServer. See [Managing vServers](#).

These resources have both attributes and tags:

- Attributes: When a resource is created, it has a set of attributes to describe it, such as name, description, and size. Some attributes can be modified. See [Managing Attributes of an Account Resource](#).
- Tags: Tags are assigned to a resource to bind cloud user-specific information to account resources. See [Managing Tags](#).

Status of a Cloud Resource

The status attribute of an account resource indicates:

- Whether a job that creates a new account resource has completed or is still in progress.
- Whether an account resource is in a usable state or in an unusable state.

The status attribute is displayed when viewing information or attributes of any of the following account resources:

- vServers
- vNets
- Server templates
- Volumes
- Snapshots
- Distribution groups

An account resource can have one of the following states:

- Pending status: Resource creation or deletion.
 - SCHEDULED: Indicates that the job is in progress. Wait for the resource to transition from this state to a healthy status before attempting to use it.
 - FAILED: Indicates that the job cannot be completed. A failed job is also reported in the user interface (UI). When a delete operation fails, the resource transitions to one of the unhealthy states.
- Healthy status: The following values indicate that a resource is usable.
 - OK: Indicates that the resource is healthy and ready to be used.
 - INFO: Indicates that the resource is healthy but an informational event needs attention in the UI.
 - UNKNOWN

For vServer resources, the healthy status values are the same as the values for vServer itself. Instead of OK or INFO, a vServer reports one of the following healthy status values: RUNNING, PAUSED, SHUTDOWN, SUSPENDED, INSTALLING, SHUTDOWNDETACHED, MIGRATING_SRC, and MIGRATING_DST.

For vNets, the status of NOT CONNECTED indicates that the vNet is healthy but not associated with a vDC server pool. The `iaas-connect-vnet` operation connects the vNet to a server pool and changes the status to OK.

- Unhealthy status: A resource exists but might not be usable. This does not apply to the WARNING state.

Note:

Some status values depend on the type of resource; for example, NEEDS_POWERON does not apply to a volume.

- CRITICAL
- DECONFIGURED
- FAULTED
- MAINTENANCE
- NON_RECOVERABLE
- UNCONFIGURED
- UNINITIALIZED
- UNKNOWN
- NEEDS_POWERON

For vServer resources, the unhealthy status values are the same as the values for vServer itself. A vServer reports unhealthy states of BLOCKED, DYING, CRASHED, NOSTATE, and FAILED.

Operations that delete resources might report a state transition until the resource is removed completely. For example, the process of terminating a vServer can exhibit a transition to the state SHUTDOWNDETACHED before the resource is removed.

Managing Account Access

Explains how cloud user get access to the cloud account and lists the available operations for managing acces keys.

Oracle Enterprise Manager Ops Center uses a central Web service to manage cloud accounts and to authenticates incoming requests. A cloud user must provide an access key to perform any operations on the resources allocated to the user account.

- [About Access Keys](#)
- [Creating an Access Key](#)
- [Viewing Access Key Information](#)
- [Deleting an Access Key](#)

Use either the cloud infrastructure API actions or the cloud infrastructure CLI command to perform these operations.

About Access Keys

Describes the role of the access key and each of the key's components.

An access key consists of an ID, a private key, a public key, and a target account. The private key is used on the client side to sign HTTP requests. The public key is stored in the server-side database. The Web service retrieves the public key to verify incoming HTTP requests and to authenticate the cloud user.

The cloud administrator creates the private key and gives it to the cloud user. A cloud administrator has the option to manage access keys on behalf of another cloud user.

A cloud user needs an access key to get access to an account and to authenticate all other HTTP requests for an account.

Creating an Access Key

Lists the API action and CLI command for creating an access key.

When using the CLI to create an access key, the private key is provided to the user after the access key is created.

When using the API to create an access key, the cloud user supplies the public key and manages the private key.

In both cases, a unique access key identifier, such as AK_5, is supplied to the cloud user for direct use of the API. The cloud user is responsible for limiting the access to the private key.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
RegisterAccessKeyRequest	akm-create-access-key
CreateAccessKeyAsObjectRequest	

Example 3-1 Creating an access key using the Cloud Infrastructure API

```
https://<username>:<password>@<EnterpriseControllerHostname>/akm/?  
Action=RegisterAccessKey&Version=1&Timestamp=1330975344&Expires=1333975344&account=AC  
C-0162da5a-5d25-4096-  
af59-3dd1de27cfad&publicKey=MIIBIjANBgkqhkiG9w0BAQEFAOCAQ8AMIIIBCgKCAQEufVdjdp0Mm0Lb

+F2YNkLrTJQIDAQAB
```

Example 3-2 Creating an access key using the Cloud Infrastructure CLI

```
akm-create-access-key --base-url https://<EnterpriseControllerHostname>/ --  
user clouuser1 --password-file ~/pwd.file --account ACC-4b83b85e-592c-45a1-  
ba71-3bd0774fdb0e --access-key-file ~/tmp_access_key
```

Viewing Access Key Information

Lists the API action and CLI command for displaying the access key.

A cloud user can view information about the access keys that the user owns. This information is a list of the access keys with the following attributes:

- Access key ID
- Account ID associated with the access key
- Cloud user name associated with the access key

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeAccessKeysRequest	akm-describe-access-keys

Example 3-3 Viewing access key information using the Cloud Infrastructure API

```
https://<username>:<password>@<EnterpriseControllerHostname>/akm/?Action=DescribeAccessKeys&Version=1&Timestamp=1330954619299&Expires=1330954919299
```

Example 3-4 Viewing access key information using the Cloud Infrastructure CLI

```
akm-describe-access-keys --base-url https://<EnterpriseControllerHostname>/ --user <username> --password-file ~/pwd.file
```

Deleting an Access Key

Lists the API action and CLI command for deleting an access key.

A cloud user can remove an access key. The operation also deletes and invalidates the public key.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DeleteAccessKeyRequest	akm-delete-access-key

Example 3-5 Deleting an access key information using the Cloud Infrastructure API

```
https://<username>:<password>@<EnterpriseControllerHostname>/akm/?Action=DeleteAccessKey&Version=1&Timestamp=1318278941862&Expires=1318279241862&accessKeyId=AK_3
```

Example 3-6 Deleting an access key information using the Cloud Infrastructure CLI

```
akm-delete-access-key --base-url https://<EnterpriseControllerHostname>/ --user <username> --password-file ~/pwd.file AK_3
```

Viewing vDC Capabilities

Lists the API action and CLI command for viewing the attributes of a virtual datacenter.

A cloud user can view details about the capabilities of the vDC for an account. The vDC capabilities listed include:

- VirtualizationType
- VirtualizationVersion
- ProcessorArchitecture
- ProcessorVersion
- DistributionGroupSupport
- HighAvailabilityDefault
- HighAvailabilityUserControl
- OpsCenterVersion

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeVdcCapabilitiesRequest	iaas-describe-vdc-capabilities

Example 3-7 Viewing vDC capabilities using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeVdcCapabilities&Version=1&Timestamp=1320085185647&Expires=132008548564  
7&AccessKeyId=AK_3&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATU  
RE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST
```

Example 3-8 Viewing vDC capabilities using the Cloud Infrastructure CLI

```
./iaas-describe-vdc-capabilities --base-url https://  
<EnterpriseControllerHostname>/ -a ak.file -H
```

Managing Virtual Networks

Defines a vNet and lists the available operations for managing it.

Virtual networks, or vNets, connect the vServers within an account and connect vServers to an external network.

The APIs and CLI provide operations for:

- [Creating a vNet](#)
- [Viewing vNet Information](#)
- [Deleting a vNet](#)

Use either the cloud infrastructure API actions or the cloud infrastructure CLI command to perform these operations.

About vNets

Describes the types of virtual networks.

A virtual network can be of the following types:

- Private vNet – A private vNet is created based on the private network from the network domain of the virtual datacenter (vDC). Private vNets are accessible only within an account. All vServers that have membership of a private vNet in common can communicate freely through that subnet.
- Public network – This type of networks can be shared among several accounts in a vDC. All vServers that share a public network also have external communication beyond vDCs and can be used to host public services.

A vServer is a member of one or more vNets. The membership of a vServer must be specified when the vServer is created.

Creating a vNet

Lists the API action and CLI command for creating a vNet.

A cloud user can create private vNets according to the user requirements and within the limits of the account quota.

A public network available in an account is visible to cloud users. However, a cloud user cannot create a public network. The number of public network IP addresses allocated to the cloud user is controlled by the cloud administrator.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
CreateVnetRequest	iaas-create-vnet

Example 3-9 Creating a vNet using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=CreateVnet&Version=1&AccessKeyId=AK_1&name=privatevnetWebApi&Timestamp=1331058639019&Expires=1331058939019&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST
```

Example 3-10 Creating a vNet using the Cloud Infrastructure CLI

```
iaas-create-vnet --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --name myVNET
```

Viewing vNet Information

Lists the API action and CLI command for displaying a vNet.

A cloud user can get information about vNets. The cloud user can restrict the vNets included in the result by specifying filters. If there is no match, no message is returned and the response is empty.

When viewing vNets, a list of available vNets for the account is returned with the following attributes:

- ID
- Name
- Description
- Status: In addition to the standard values for status, a vNet reports the NOT CONNECTED status when the vNet is not associated with a vDC server pool. The iaas-connect-vnet operation connects the vNet to a server pool and changes the status to OK.
- IP address
- vNet type: public_external or private

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeVnetsRequest	iaas-describe-vnets

Example 3-11 Viewing vNet information using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=DescribeVnets&Version=1&AccessKeyId=AK_3&Timestamp=1318283467620&Expires=1318283767620&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST
```

Example 3-12 Viewing vNet information using the Cloud Infrastructure CLI

```
iaas-describe-vnets --base-url https://<EnterpriseControllerHostname>/ -a ak.file
```

Connecting a vNet

Lists the API action and CLI command for connecting a vNet.

A cloud user can associate a vNet with all the server pools of a vDC.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
ConnectVnetRequest	iaas-connect-vnet

Example 3-13 Connecting a vNet using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=ConnectVnet&Version=1&AccessKeyId=AK_3&vnet=VNET-00cd848c-771a-4091-
b3f4-195a090bbc01&Timestamp=1318283467620&Expires=1318283767620&SignatureMethod=SHA51
2withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_
OF_THE_REQUEST
```

Example 3-14 Connecting a vNet using the Cloud Infrastructure CLI

```
iaas-connect-vnet --base-url https://<EnterpriseControllerHostname>/ -a
ak.file --vnet VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t
```

Deleting a vNet

Lists the API action and CLI command for deleting a vNet.

A cloud user can delete only private vNets.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DeleteVnetRequest	iaas-delete-vnet

Example 3-15 Deleting a vNet using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DeleteVnet&Version=1&AccessKeyId=AK_3&vnet=VNET-00cd848c-771a-4091-
b3f4-195a090bbc01&Timestamp=1318283467620&Expires=1318283767620&SignatureMethod=SHA51
2withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_
OF_THE_REQUEST
```

Example 3-16 Deleting a vNet using the Cloud Infrastructure CLI

```
iaas-delete-vnet --base-url https://<EnterpriseControllerHostname>/ -a
ak.file --vnet VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t
```

Managing vIP Addresses

Defines a vIP and lists the available operations for managing it.

A virtual IP (vIP) address is a statically configured IP address that is owned by a user.

The APIs and CLI provide operations for:

- [Allocating a vIP Address](#)
- [Deallocating a vIP Address](#)
- [Viewing vIP Addresses](#)

Use either the cloud infrastructure API actions or the cloud infrastructure CLI command to perform these operations.

About vIP Addresses

Describes a virtual IP address and its lifecycle.

When creating a vServer, a cloud user assigns an allocated vIP address to the vServer. A vIP address can be allocated from a public network or private vNet. The allocated vIP address is bound to an account.

A vServer's vIP address remains bound to the vServer even when the vServer is stopped. vIP addresses are not disassociated until the vServer is deleted.

Allocating a vIP Address

List the API action and CLI command for allocating a virtual IP address.

A cloud user allocates a vIP address from a public network or a private vNet.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
AllocateIpAddressesRequest	iaas-allocate-ip-addresses

Example 3-17 Allocating a vIP address using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=AllocateIpAddresses&AccessKeyId=AK_32&vnet=VNET-6ea466f5-6e6b-4159-adf3-8867473d4cf4&Version=1&Timestamp=1320342206808&Expires=1320342506808&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_ABILITY_OF_THE_REQUEST
```

Example 3-18 Allocating a vIP address using the Cloud Infrastructure CLI

```
iaas-allocate-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972abcdd-4714-8c7f-b67d8010f13c
```

Viewing vIP Addresses

Lists the API action and CLI command for displaying vIP addresses.

A cloud user can get information about allocated vIP addresses and their assigned vServers. To view unallocated IP addresses associated with vServers, use the actions described in “[Viewing vServer Information](#)”.

The cloud user can restrict the vIP addresses included in the result by specifying filters. The result includes the following details for each vIP address:

- IP address
- vNet ID
- vServer ID

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeIpAddressesRequest	iaas-describe-ip-addresses

Example 3-19 Viewing vIP addresses using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeIpAddresses&AccessKeyId=AK_32&Version=1&Timestamp=1320339663115&Expires=1320339963115&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST
```

Example 3-20 Viewing vIP addresses using the Cloud Infrastructure CLI

```
iaas-describe-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file
```

Deallocating a vIP Address

Lists the API action and CLI command for releasing an allocated virtual IP address.

A cloud user can release an allocated vIP address if the vIP address is not associated with a vServer.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
ReleaseIpAddressesRequest	iaas-release-ip-addresses

Example 3-21 Deallocating a vIP address using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=ReleaseIpAddresses&AccessKeyId=AK_32&ipAddresses.2=192.0.2.10&ipAddresses.1=192.0.2.13&vnet=VNET-6ea466f5-6e6b-4159-adf3-8867473d4cf4&Version=1&Timestamp=1320341801846&Expires=1320342101846&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST
```

Example 3-22 Deallocating a vIP address using the Cloud Infrastructure CLI

```
iaas-release-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c --ip-addresses 192.0.2.1
```

Blacklisting a vIP Address

Lists the API action and CLI command for restricting a virtual IP address.

A cloud user can restrict an allocated vIP address so that it cannot be used for a vServer. The --owner parameter adds a string to the status to identify the cloud user or the purpose of the restriction.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
BlacklistIpAddressesRequest	iaas-blacklist-ip-addresses

Example 3-23 Blacklisting a vIP address using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=BlacklistIpAddresses&AccessKeyId=AK_32&ipAddresses.2=192.0.2.10&ipAddresses.1=192.0.2.13&vnet=VNET-6ea466f5-6e6b-4159-adf3-8867473d4cf4&Version=1&Timestamp=1320341801846&Expires=1320342101846&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST
```

Example 3-24 Blacklisting a vIP address using the Cloud Infrastructure CLI

```
iaas-blacklist-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a
ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c --ip-addresses 192.0.2.1 --
owner test
```

Displaying Blacklisted vIP Addresses

Lists the API action and CLI command for displaying restricted virtual IP addresses.

A cloud user can list all blacklisted vIP addresses or addresses that match the owner.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeBlacklistedIpAddressesRequest	iaas-describe-blacklisted-ip-addresses

Example 3-25 Displaying a Blacklisted vIP addresses using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DescribeBlacklistedIpAddresses&AccessKeyId=AK_32&ipAddresses.
2=192.0.2.10&ipAddresses.1=192.0.2.13&vnet=VNET-6ea466f5-6e6b-4159-
adf3-8867473d4cf4&Version=1&Timestamp=1320341801846&Expires=1320342101846&SignatureMe
thod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_RE
ADABILITY_OF_THE_REQUEST
```

Example 3-26 Displaying Blacklisted vIP addresses using the Cloud Infrastructure CLI

```
iaas-describe-blacklisted-ip-addresses --base-url https://
<EnterpriseControllerHostname>/ -a ak.file --owner test
```

Removing a vIP Address From the Blacklist

Lists the API action and CLI command for releasing a virtual IP address from the blacklist.

A cloud user clears a blacklisted vIP address so that the address can be used for a vServer.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
ClearBlacklistIpAddressesRequest	iaas-clear-blacklisted-ip-addresses

Example 3-27 Clearing a Blacklisted vIP address using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=ClearBlacklistIpAddresses&AccessKeyId=AK_32&ipAddresses.
2=192.0.2.10&ipAddresses.1=192.0.2.13&vnet=VNET-6ea466f5-6e6b-4159-
adf3-8867473d4cf4&Version=1&Timestamp=1320341801846&Expires=1320342101846&SignatureMe
thod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_RE
ADABILITY_OF_THE_REQUEST
```

Example 3-28 Clearing a Blacklisted vIP address using the Cloud Infrastructure CLI

```
iaas-clear-blacklisted-ip-addresses --base-url https://
<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-
b67d8010f13c --ip-addresses 192.0.2.1
```

Managing Server Templates

Defines a Server Template and lists the available operations for managing it.

A cloud user uses a server template to create a vServer. The server template specifies the type of operating system and how the operating system is installed in the vServer.

The APIs and CLI provide operations for:

- [Uploading a Server Template from a vServer](#)
- [Uploading a Server Template from a URL](#)
- [Uploading a Server Template from an Assembly](#)
- [Deleting a Server Template](#)
- [Viewing Server Template Information](#)

Use either the cloud infrastructure API actions or the cloud infrastructure CLI command to perform these operations.

About Server Templates

Describes the purpose of a server template and lists its attributes.

A server template generates a vServer for an account. Server templates are specific to the processor architecture of the server pool and to the virtualization type. The operating system can be specified as an OS image or as an operating system distribution.

Server templates cannot be changed, other than changing the name or description. A server template has the following attributes:

- Minimum and default vServer type
- User and unique name
- Version
- Owner
- Location
- HA enabled
- Life cycle aware

Server templates are bound to a specific account. A new server template can be uploaded as follows:

- Based on an existing vServer
- From a single virtual machine template
- From an assembly. When you upload an assembly, snapshots can be also created as result

Uploading a Server Template from a vServer

Lists the API action and CLI command for uploading a server template from a vServer.

A cloud user can save a server template from a stopped vServer. When a user creates a vServer based on a server template, it is common to install additional software or to configure certain aspects that can be conserved and reused. To conserve the state, the user must save the vServer as a new server template.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
RegisterServerTemplateFromVserverRequest	iaas-create-server-template-from-vserver

Example 3-29 Uploading a server template from a vServer using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=RegisterServerTemplateFromVserver&AccessKeyId=AK_2&name=mySTfromVserver&vserverId=VSRV-fdba0b48-6e1c-4f41-bde4-2c739dfeeb2&Version=1&Timestamp=1324422880552&Expires=1324423180552f&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST
```

Example 3-30 Uploading a server template from a vServer using the Cloud Infrastructure CLI

```
iaas-create-server-template-from-vserver --base-url https://<EnterpriseControllerHostname>/
--access-key-file ak.file --name myST --vserver-id VSRV-a959be32-6237-40c7-b44b-47d392e7a0ac
```

Uploading a Server Template from a URL

Lists the API action and CLI command for uploading a server template from a URL.

A cloud user can register a server template based on a file for a single virtual machine template that is ready to be deployed into virtualized platforms. Templates can be of the format .tgz, .tar, or other file types. The file must be accessible through a URL.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
RegisterServerTemplateFromUrlRequest	iaas-create-server-template-from-url

Example 3-31 Uploading a server template from a URL using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=RegisterServerTemplateFromUrl&Version=1&Timestamp=1320096741216&Expires=1320097041216&name=myST&url=http%3A%2F%2example.com%2Fvm-templates%2FOVM_EL52_jeos_i386_PVM_WebLogic10gR3_v10.tar.gz&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-32 Uploading a server template from a URL using the Cloud Infrastructure CLI

```
iaas-create-server-template-from-url --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --name myAssembly --url http://myServer.com/myTemplate.tar.gz
```

Uploading a Server Template from an Assembly

Lists the API action and CLI command for uploading a server template from an assembly.

A cloud user can upload a server template based on an assembly.

An assembly is a collection of interrelated software appliances that can include a configuration of multiple virtual machines with their virtual disks and their interconnectivity. An assembly is contained in a single .ova (Open Virtualization Format Archive) file. The assembly file must be accessible through a URL.

When you upload an assembly, snapshots might be also created. When an assembly contains multiple virtual machines, each virtual machine is unpacked into its own server template. Names of the new server templates are taken from the assembly. Each new server template has a tag to identify the assembly it belongs to. This tag is *assemblyKey*, and its value is the original assembly ID returned from this action.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
RegisterServerTemplatesFromAssemblyRequest	iaas-create-server-template-from-assembly

Example 3-33 Uploading a server template from an assembly using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=RegisterServerTemplatesFromAssembly&AccessKeyId=AK_3&url=http%3A%2F%2Fexample.com%3A8888%2FmyAssembly.ova&Version=1&Timestamp=1320097901377&Expires=1320098201377&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST
```

Example 3-34 Uploading a server template from an assembly using the Cloud Infrastructure CLI

```
iaas-create-server-template-from-assembly --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --name myAssembly --url http://myServer.com/myAssembly.ova
```

Viewing Server Template Information

Lists the API action and CLI command for displaying a server template.

A cloud user can get information about server templates. The cloud user can restrict the server templates included in the results by specifying filters.

The information includes details about the server templates of an account and all other server templates registered for public use. The server template attributes displayed are:

- ID

- Name
- Description
- Status
- Size
- Public
- Image type
- Read-only

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeServerTemplatesRequest	<code>iaas-describe-server-templates</code>

Example 3-35 Viewing server template information using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DescribeServerTemplates&Version=1&Timestamp=1320088801876&Expires=132008910187
6&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-36 Viewing server template information using the Cloud Infrastructure CLI

```
iaas-describe-server-templates --base-url https://<EnterpriseControllerHostname>/
--access-key-file ak.file -H
```

Deleting a Server Template

Lists the API action and CLI command for deleting a server template.

A cloud user can delete a server template. All data associated with the server template is deleted. The deletion of a server template does not affect any vServers that were created from the server template.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DeregisterServerTemplateRequest	<code>iaas-delete-server-template</code>

Example 3-37 Deleting a server template using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DeregisterServerTemplate&AccessKeyId=AK_3&serverTemplateId=TMPL-
f089b985-f7fc-4b8a-a5f8-
df8f44c95f3c&Version=1&Timestamp=1320098301701&Expires=1320098601701&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST
```

Example 3-38 Deleting a server template using the Cloud Infrastructure CLI

```
iaas-delete-server-template --base-url https://<EnterpriseControllerHostname>/
--access-key-file ak.file --server-template-id TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-
eeeeeeeeee03
```

Managing Storage

Defines storage as either a volume or a snapshot and lists the available operations for managing it.

Volumes and snapshots are the two types of storage devices that are managed by a cloud user.

The APIs and CLI provide operations for:

- [Creating a Volume](#)
- [Deleting a Volume](#)
- [Viewing Volume Information](#)
- [Attaching a Volume to a vServer](#)
- [Detaching a Volume from a vServer](#)
- [Importing a Volume](#)
- [Creating a Snapshot](#)
- [Deleting a Snapshot](#)
- [Viewing Snapshot Information](#)

Use either the cloud infrastructure API actions or the cloud infrastructure CLI command to perform these operations.

About Volumes and Snapshots

Describes the purpose of a volume and its snapshots.

The virtual block storage devices are called volumes. Volumes are serially shareable and can be attached to or detached from a vServer.

A snapshot captures the current state of a volume. Snapshots are immutable. The snapshot exists independently of the volume.

Snapshot creation and management is available if it is supported by the storage of the vDC.

Creating a snapshot serves two purposes:

- Backup of data stored on a volume
- Creation of new volumes from a snapshot

Creating a Volume

Lists the API action and CLI command for creating a volume.

A cloud user can create a shared or non-shared empty volume with a given size. A cloud user can also create a shared or non-shared volume from a snapshot. The new volume can be attached to vServers. Shared volumes can be attached to more than one vServer.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
CreateVolumeRequest	iaas-create-volume

Example 3-39 Creating a volume using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=CreateVolume&Version=1&Timestamp=1318462897126&Expires=1318463197126&name=myVol2&size=1&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-40 Creating a volume using the Cloud Infrastructure CLI

```
iaas-create-volume --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --name firstVol --size 2
```

Deleting a Volume

Lists the API action and CLI command for deleting a volume.

A cloud user can delete a volume. Only volumes that are not currently attached to a vServer can be deleted. The process of deleting a volume does not affect any snapshot that has been created previously based on that volume.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DeleteVolumeRequest	iaas-delete-volume

Example 3-41 Deleting a volume using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=DeleteVolume&Version=1&Timestamp=1318463692509&Expires=1318463992509&volumeId=VOL-3bbc8f1c-bb4c-4a70-a370-4b6c06d990dc&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-42 Deleting a volume using the Cloud Infrastructure CLI

```
iaas-delete-volume --base-url https://<EnterpriseControllerHostname>/ -a ak.file --volume-id VOL-82b4661e-de12-4931-b9a4-cce8edd23532
```

Viewing Volume Information

Lists the API action and CLI command for displaying a volume.

A cloud user can get information about the existing volumes in an account. The cloud user can restrict the volumes included in the result by specifying filters. The result includes volumes in all states and has additional information for each volume.

The attributes displayed for each volume are:

- ID
- Name
- Description
- Status

- Shared
- vServers

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeVolumesRequest	iaas-describe-volumes

Example 3-43 Viewing volume information using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DescribeVolumes&Version=1&Timestamp=1318463287921&Expires=1318463587921&Access
KeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&Si
gnatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-44 Viewing volume information using the Cloud Infrastructure CLI

```
iaas-describe-volumes --base-url https://<EnterpriseControllerHostname>/ -a ak.file -
H
```

Attaching a Volume to a vServer

Lists the API action and CLI command for attaching a volume to a vServer.

A cloud user can attach volumes to an existing vServer. A cloud user might also attach volumes to a vServer during the vServer creation process. The volume attached is available as a device in the vServer. Depending on the virtualization type of the virtual datacenter, the cloud user might need to stop the vServer before attaching a volume.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
AttachVolumesToVserverRequest	iaas-attach-volumes-to-vserver

Example 3-45 Attaching a volume to a vServer using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=AttachVolumesToVserver&Version=1&Timestamp=1321384886152&Expires=1321385186152
&volumeIds.1=VOL-052cb4b4-5e56-4303-8b3a-82d6ba743a15&vserverId=VSRV-8ae29df9-
ccfe-4184-
ac8b-10080665d7f6&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READA
BILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-46 Attaching a volume to a vServer using the Cloud Infrastructure CLI

```
iaas-attach-volumes-to-vserver --base-url https://<EnterpriseControllerHostname>/ -a
~/ak.file -vserver-id VSRV-0fb57293-347c-4717-96ef-6dd23154596f --volume-ids
VOL-052cb4b4-5e56-4303-8b3a-82d6ba743a15
```

Detaching a Volume from a vServer

Lists the API action and CLI command for detaching a volume from a vServer.

A cloud user can detach a volume from a vServer. After it is detached, the volume is no longer available as a device in the vServer. Depending on the virtualization type of the vDC, cloud user might need to stop the vServer before detaching a volume.

Caution:

Before detaching a volume from a vServer, ensure that the disk being detached is not longer in use to avoid services instability or disk data corruption. Ensure that the vServer properly unmounts the device for the volume; otherwise, data loss or file system corruption might occur

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DetachVolumesFromVserverRequest	iaas-detach-volumes-from-vserver

Example 3-47 Detaching a volume to a vServer using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DetachVolumesFromVserver&Version=1&Timestamp=1321385229679&Expires=13
21385529679&volumeIds.
1=VOL-052cb4b4-5e56-4303-8b3a-82d6ba743a15&force=true&vserverId=VSRV-8ae29df
9-ccfe-4184-
acb8-10080665d7f6&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_
THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersio
n=1
```

Example 3-48 Detaching a volume to a vServer using the Cloud Infrastructure CLI

```
iaas-detach-volumes-from-vserver --base-url https://<EnterpriseControllerHostname>/
-a ~/ak.file -vserver-id VSRV-0fb57293-347c-4717-96ef-6dd23154596f --volume-ids
VOL-052cb4b4-5e56-4303-8b3a-82d6ba743a15 --force
```

Importing a Volume

Lists the API action and CLI command for importing a volume.

A cloud user can import a volume from another location. Volumes must be contained in a file of the format .img. The volume must be accessible through a URL. The file is uploaded to the vDC, and the volume is created and stored physically. The imported volume is only accessible within the target account.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
ImportVolumeRequest	iaas-import-volume

Example 3-49 Importing a volume using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=ImportVolume&Version=1&Timestamp=1324421943593&Expires=1324422243593&shared=tr
ue&name=myVolumeImported&url=http%3A%2F%2Fexample.com%2FES%2FOVM%2Fvolume
%2Fvolume1.img&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABIL
ITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-50 Importing a volume using the Cloud Infrastructure CLI

```
iaas-import-volume --base-url https://<EnterpriseControllerHostname>/
-a ak.file --name myVolume --url http://example.com/volume-image/volume.img
```

Creating a Snapshot

Lists the API action and CLI command for creating a snapshot.

A cloud user can create a snapshot of a volume or a snapshot can be created as a result of uploading an assembly.

There are four types of exposed disks in an assembly's template. When snapshots are created from an assembly, three of the disk types are presented to cloud users as snapshots. This allows cloud users to create a shared volume from the snapshot. The three exposed disks are:

- Public Populated: An extra disk with data already present.
- Private Raw: Dynamically created as an empty disk with a size but no disk data.
- Shared Raw: Dynamically created as an empty disk, with a size but no disk data.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
CreateSnapshotRequest	iaas-create-snapshot

Example 3-51 Creating a snapshot using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=CreateSnapshot&Version=1&Timestamp=1318466247111&Expires=1318466547111&volumeId=VOL-246b5c62-4072-41cf-885b-99d6c63583bd&name=mySnapshot&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-52 Creating a snapshot using the Cloud Infrastructure CLI

```
iaas-create-snapshot --base-url https://<EnterpriseControllerHostname>/ -a ak.file --volume-id VOL-246b5c62-4072-41cf-885b-99d6c63583bd --name mySnapshot
```

Deleting a Snapshot

Lists the API action and CLI command for deleting a snapshot.

A cloud user can delete a snapshot of a volume. The deletion of a snapshot does not affect any volumes or any other snapshots.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DeleteSnapshotRequest	iaas-delete-snapshot

Example 3-53 Deleting a snapshot using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DeleteSnapshot&Version=1&Timestamp=1318624338550&Expires=1318624638550&snapshotId=SNAP-2f2039cd-943b-4072-9ded-e96b54b7ca79&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-54 Deleting a snapshot using the Cloud Infrastructure CLI

```
iaas-delete-snapshot --base-url https://<EnterpriseControllerHostname>/ -a ak.file --snapshot-id SNAP-d743e90c-53c5-4b01-a297-e2c944755c48
```

Viewing Snapshot Information

Lists the API action and CLI command for displaying a snapshot.

A cloud user can get information about the existing snapshots in an account. The cloud user can restrict the snapshots included in the result by specifying filters. The result includes a list of the snapshots found and additional information for each snapshot.

The attributes displayed for each snapshot are:

- ID
- Name
- Description
- Status

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeSnapshotsRequest	iaas-describe-snapshots

Example 3-55 Viewing snapshot information using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=DescribeSnapshots&Version=1&Timestamp=1318467903784&Expires=1318468203784&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-56 Viewing snapshot information using the Cloud Infrastructure CLI

```
iaas-describe-snapshots --base-url https://<EnterpriseControllerHostname>/-a ak.file -H
```

Managing Distribution Groups

Defines the purpose of a distribution group and lists the available operations for managing it.

Distribution groups provide properties similar to anti-affinity scaling. Distribution groups are available for vDCs that are based on Oracle VM Server for SPARC virtualization technology.

The APIs and CLI provide operations for:

- [Creating a Distribution Group](#)
- [Deleting a Distribution Group](#)
- [Viewing Distribution Group Information](#)

Use either the cloud infrastructure API actions or the cloud infrastructure CLI command to perform these operations.

About Distribution Groups

Describes a distribution group and the rules for the vServers in it.

You can create a distribution group for your account and define its size. To assign a vServer to a distribution group, you must create the vServer. The size of the distribution group represents the minimum amount of anti-affinity desired for running vServers in the distribution group.

The rules for a distribution group rules are applied every time a vServer in the distribution group is started or a vServer is created. The rules enforce the following behavior:

- When the number of running vServers in the distribution group does not exceed the size of the distribution group, all running vServers are distributed in a separate server of the vDC. If a spare server is not available in the vDC, the job fails.
- When the number of running vServers in the distribution group exceeds the size of the distribution group, the running vServers are distributed in the servers of the vDC according to the normal account resources capacities.

Other events that can break the rules are stopping, deleting, or migrating a vServer. An alert is displayed for the account and for the incidents report for the vDC.

Creating a Distribution Group

Lists the API action and CLI command for creating a distribution group.

A cloud user can create distribution groups to associate them with vServers. The membership of a vServer to a distribution group can only be specified at vServer creation time.

When creating a distribution group, a cloud user can specify the size of the distribution group, the default size is 21.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
CreateDistributionGroupRequest	iaas-create-distribution-group

Example 3-57 Creating a distribution group using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=CreateDistributionGroup&Version=1&Timestamp=1324407098313&Expires=1324407398313&name=myDistributionGroup&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-58 Creating a distribution group using the Cloud Infrastructure CLI

```
iaas-create-distribution-group --base-url https://<EnterpriseControllerHostname>/ -a ak.file --name myDistributionGroup
```

Deleting a Distribution Group

Lists the API action and CLI command for removing a distribution group.

A cloud user can delete distribution groups that are not associated with vServer.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DeleteDistributionGroupRequest	iaas-delete-distribution-group

Example 3-59 Deleting a distribution group using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=DeleteDistributionGroup&Version=1&Timestamp=1324407269441&Expires=1324407569441&distributionGroupId=DG-8f81381c-a559-4f5b-b45f-086e605a382b&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-60 Deleting a distribution group using the Cloud Infrastructure CLI

```
iaas-delete-distribution-group --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --distribution-group-id DG-3206ed4d-44c9-42c4-8df7-511709a49ead
```

Viewing Distribution Group Information

Lists the API action and CLI command for displaying a distribution group.

A cloud user can get information about the existing distribution groups in an account. The cloud user can restrict the distribution groups included in the result by specifying filters. The result includes a list of the distribution groups found and additional information for each distribution group.

The attributes displayed for each distribution group are:

- ID
- Name
- Description
- Status
- vServers
- Size

The value for a distribution group size greater or equal to the default value is shown as unlimited when using the CLI and APIs.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeDistributionGroupsRequest	iaas-describe-distribution-groups

Example 3-61 Viewing distribution groups information using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=DescribeDistributionGroups&Version=1&Timestamp=1324407152926&Expires=1324407452926&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-62 Viewing distribution groups information using the Cloud Infrastructure CLI

```
iaas-describe-distribution-groups --base-url https://<EnterpriseControllerHostname>/  
-a ~/ak.file -H
```

Managing vServers

Defines a vServer and lists the available operations for managing it.

A vServer is a virtual server; it has its own identity, storage, network interfaces, and configuration, which exist for the lifetime of the vServer.

The APIs and CLI provide operations for:

- [Viewing vServer Types](#)
- [Creating a vServer](#)
- [Deleting a vServer](#)
- [Viewing vServer Information](#)
- [Viewing vServer Metrics](#)
- [Stopping a vServer](#)
- [Starting a vServer](#)
- [Rebooting a vServer](#)
- [Sending a Message to a vServer](#)
- [Receiving a Message from a vServer](#)

Use either the cloud infrastructure API actions or the cloud infrastructure CLI command to perform these operations.

About vServers

Describes the purpose of a vServer and how users create them.

A vServer is a virtual server or a virtual machine (VM). It has a standalone operating system and consumes CPU and memory resources from its virtual datacenter (vDC). A vServer has its own identity, storage, interfaces, and configuration, which exist for the full lifetime of the vServer. For network connectivity, the vServer can be a member of one or more virtual networks (vNets).

Users with a cloud account create vServers for their applications and manage the vServers, using computing, network, and storage resources of the vDC. To create a vServer, Cloud Users use a template of a vServer type that specifies the platform and characteristics such as CPU, memory size, and network bandwidth so that each vServer is created consistently and within the limits of the account quota. In addition to local storage, a vServer can be defined to use hard disk storage by associating the vserver with one or more volumes.

Viewing vServer Types

Lists the API action and CLI command for displaying a vServer type.

A cloud user can get information about all available vServer types for an account. The cloud user can restrict the vServer types included in the result by specifying filters.

The result includes a list of the vServer types found and additional information for each vServer type.

If the response is an empty list, contact your cloud administrator to verify your cloud user's privileges.

The attributes displayed for each vServer type are:

- ID
- Name
- Description
- Memory Size
- Storage Size
- vCPU

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeVserverTypesRequest	iaas-describe-vserver-types

Example 3-63 Listing vServer types using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DescribeVserverTypes&Version=1&Timestamp=1318625453358&Expires=131862
5753358&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-64 Listing vServer types using the Cloud Infrastructure CLI

```
iaas-describe-vserver-types --base-url https://<EnterpriseControllerHostname>/ -a
ak.file -H
```

Creating a vServer

Lists the API action and CLI command for creating a vServer.

A cloud user can create a one or more vServers based on a server template. When a vServer is created, it is automatically started.

You can create a vServer using a static or an automatic method for IP address assignment. When using the static method, you can create only a single vServer and you must use an allocated vIP address from the specified vNets. When using the automatic IP assignment method, you can create one or more vServers and IP addresses are automatically assigned from each specified vNets.

When a cloud user creates a vServer, the following resources are required:

- A vServer type
- A server template
- One or more vNets
- One or more IP addresses, when using the option for static IP assignment.

Depending on the needs of the user and the virtualization type of the vDC, a cloud user can also specify the following resources:

- A key pair
- One or more volumes
- A distribution group

In addition, a cloud user can specify the following values when creating a vServer:

- A host name to override vServer default internal host name, which is same as vServer name.
- A root password for the vServer
- A local user and password
- One or more messages for the vServer
- Enable or disable high availability

When creating a vServer, a cloud user has the option to change the high availability feature for the vServer, which is set by the value of the HighAvailabilityDefault capability of the vDC. If a cloud user chooses not to use the default value, an option is available to specify a value and to enable the HighAvailabilityUserControl capability of the vDC. Cloud users can also enable or disable high availability for an existing vServer, according to the procedure in “[Modifying Attributes of an Account Resource](#)”.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
<code>RunVserverRequest</code> for static IP assignment	<code>iaas-run-vserver</code> for static IP assignment
<code>RunVserverRequest</code> for automatic IP assignment	<code>iaas-run-vserver</code> for automatic IP assignment

Example 3-65 Creating a vServer using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=RunVserver&Version=1&Timestamp=1321379615665&Expires=1321379915665&vserverType=457&keyName=myKeyPair&vnets.1=VNET-84ada392-1c13-4f86-8365-1cf7f9c8aadf&name=myVserver&ipAddresses.1=192.0.2.2&serverTemplateId=TMPL-9e4a9ed3-e675-45f1-9d7cb21c25a55632&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-66 Creating a vServer using the Cloud Infrastructure CLI

```
iaas-run-vserver --base-url https://<EnterpriseControllerHostname>/-a ~/ak.file --vnets VNET-84ada392-1c13-4f86-8365-1cf7f9c8aadf --key-name myKeyPair --name myVserver --server-template-id TMPL-9e4a9ed3-e675-45f1-9d7cb21c25a55632 --ip-addresses 192.0.2.2 --vserver-type 457
```

Deleting a vServer

Lists the API action and CLI command for deleting a vServer.

A cloud user can delete a vServer. Deleting a vServer results in shutting down the vServer followed by the deletion of the vServer.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
TerminateVserversRequest	iaas-terminate-vservers

Example 3-67 Deleting a vServer using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=TerminateVservers&Version=1&Timestamp=1321385662260&Expires=1321385962260&vserverIds.
1=VSRV-0fb57293-347c-4717-96ef-6dd23154596f&force=true&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-68 Deleting a vServer using the Cloud Infrastructure CLI

```
iaas-terminate-vservers --base-url https://<EnterpriseControllerHostname>/ -a ~/ak.file --vserver-ids VSRV-0fb57293-347c-4717-96ef-6dd23154596f --force
```

Viewing vServer Information

Lists the API action and CLI command for displaying a vServer.

A cloud user can get information about all available vServers for an account. The cloud user can restrict the vServers included in the result by specifying filters. The result includes a list of the vServers found and additional information for each vServer.

The attributes displayed for each vServer are:

- ID: ID of the vServer
- Name: Name of the vServer
- Description: Description of the vServer
- Status: Status of the vServer
- vNets: IDs of the vNets to which the vServer belongs to
- IP addresses: IP addresses associated with the vServer
- Server template ID: ID of the server template that the vServer is based on
- Key pair name: Name of the key pair installed in the vServer for secure shell access
- vServer type: vServer type that the vServer is based on
- HA: Flag to indicate whether the vServer is set to automatic recovery
- Distribution group: ID of the distribution group the vServer belongs to
- Volumes: ID of the volumes associated with the vServer
- vCPU: Number of virtual CPUs allocated to a vServer
- Memory: Total memory allocated to a vServer
- Dedicated storage: Total storage dedicated to the vServer
- Attached storage: Total storage of the volumes attached to the vServer

- Tags: List of tags associated with the vServer

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeVserversRequest	iaas-describe-vservers

Example 3-69 Viewing vServer information using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DescribeVservers&Version=1&Timestamp=1320105338731&Expires=1320105638731&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-70 Viewing vServer information using the Cloud Infrastructure CLI

```
iaas-describe-vservers --base-url https://<EnterpriseControllerHostname>/ -a ak.file -H
```

Viewing vServer Metrics

Lists the API action and CLI command for displaying metrics about vServers.

A cloud user can get information about the CPU usage of the vServers. The cloud user can restrict the vServers included in the result by specifying filters. The result includes a list of the vServers found and additional information for each vServer.

The attributes displayed for each vServer are:

- ID: ID of the vServer
- Name: Name of the vServer
- Description: Description of the vServer
- Status: Status of the vServer
- CPU usage: CPU usage of the vServer
- Tags: List of tags associated with the vServer

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeVserverMetricsRequest	iaas-describe-vserver-metrics

Example 3-71 Viewing vServer metrics using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DescribeVserverMetrics&Version=1&Timestamp=1320105338731&Expires=1320105638731
&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-72 Viewing vServer metrics using the Cloud Infrastructure CLI

```
iaas-describe-vserver-metrics --base-url https://<EnterpriseControllerHostname>/ -a ak.file -H
```

Stopping a vServer

Lists the API action and CLI command for stopping a vServer.

A cloud user can stop a vServer. When a vServer is stopped, the guest operating system is shut down. A stopped vServer can be restarted.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
StopVserversRequest	iaas-stop-vservers

Example 3-73 Stopping a vServer using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=StopVservers&Version=1&Timestamp=1320105610783&Expires=1320105910783&vserverIds.1=VSRV-cle236e6-ef4d-4936-911a-97923dfbc291&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-74 Stopping a vServer using the Cloud Infrastructure CLI

```
iaas-stop-vservers --base-url https://<EnterpriseControllerHostname>/-a ak.file --vserver-ids VSRV-cle236e6-ef4d-4936-911a-97923dfbc291
```

Starting a vServer

Lists the API action and CLI command for starting a vServer.

A cloud user can start a vServer that has been stopped. The restarted vServer might not get the same IP address as the original vServer.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
StartVserversRequest	iaas-start-vservers

Example 3-75 Starting a vServer using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=StartVservers&Version=1&Timestamp=1320104759496&Expires=1320105059496&vserverIds.1=VSRV-cle236e6-ef4d-4936-911a-97923dfbc291&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-76 Starting a vServer using the Cloud Infrastructure CLI

```
iaas-start-vservers --base-url https://<EnterpriseControllerHostname>/-a ak.file --vserver-ids VSRV-cle236e6-ef4d-4936-911a-97923dfbc291
```

Rebooting a vServer

Lists the API action and CLI command for rebooting a vServer.

A cloud user can reboot a vServer. Rebooting a vServer does not change the IP address and other resources of the vServer.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
RebootVserversRequest	iaas-reboot-vservers

Example 3-77 Rebooting a vServer using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=RebootVservers&Version=1&Timestamp=1321380470326&Expires=132138077032
6&vserverIds.
1=VSRV-0fb57293-347c-4717-96ef-6dd23154596f&AccessKeyId=AK_1&Signature=SIGNA
TURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA
512withRSA&SignatureVersion=1
```

Example 3-78 Rebooting a vServer using the Cloud Infrastructure CLI

```
iaas-reboot-vservers --base-url https://<EnterpriseControllerHostname>/ -a ~/ak.file
--vserver-ids VSRV-0fb57293-347c-4717-96ef-6dd23154596f
```

Sending a Message to a vServer

Lists the API action and CLI command for sending a message to a vServer.

A cloud user can send messages to a vServer and these messages can be read from the guest operating system. The messages are sent to a common buffer in the virtualization layer that has a limited size. This action might return an error if the size limit is reached or if the vServer is not in an appropriate state to send messages.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
SendMessagesToVserverRequest	iaas-send-messages-to-vserver

Example 3-79 Sending messages to a vServer using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=SendMessagesToVserver&Version=1&Timestamp=1321381585564&Expires=1321381885564&
messages.1.value=Running&messages.1.key=myStatus&vserverId=VSRV-8ae29df9-ccfe-4184-
acb8-10080665d7f6&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READA
BILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-80 Sending messages to a vServer using the Cloud Infrastructure CLI

```
iaas-send-messages-to-vserver --base-url https://<EnterpriseControllerHostname>/ -a
~/ak.file --vserver-id VSRV-8ae29df9-ccfe-4184-acb8-10080665d7f6 --messages
com.oracle.ovab.test=Running
```

Receiving a Message from a vServer

Lists the API action and CLI command for receiving a vServer message.

A cloud user can read a message sent by a vServer. The message is read from the common buffer in the virtualization layer by name. This action might return an error if the vServer is not in appropriate state to receive messages.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
ReceiveMessageFromVserverRequest	iaas-receive-message-from-vserver

Example 3-81 Receiving message from a vServer using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=ReceiveMessageFromVserver&Version=1&Timestamp=1321381585564&Expires=1321381885
564&vserverId=VSRV-8ae29df9-ccfe-4184-
```

```
acb8-10080665d7f6&key=myMessageKey&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-82 Receiving message from a vServer using the Cloud Infrastructure CLI

```
iaas-receive-message-from-server --base-url https://<EnterpriseControllerHostname>/ -a ~/ak.file --vserver-id VSRV-8ae29df9-ccfe-4184-acb8-10080665d7f6 --key com.oracle.ovab.test-response
```

Managing Key Pairs

Defines the purpose of a key pair and lists the available operations for managing it.

A key pair provides credentials for user authentication for access to the guest operating system of a vServer

The APIs and CLI provide operations for:

- [Creating a Key Pair](#)
- [Importing a Key Pair](#)
- [Deleting a Key Pair](#)
- [Viewing Key Pair Information](#)

Use either the cloud infrastructure API actions or the cloud infrastructure CLI command to perform these operations.

About Key Pairs

Describes the role of the key pair and its components.

The Web service authenticates access to vServers using key pairs for the accounts. A key pair is a public key stored in the application and a private key is provided to the account user. Key pairs are managed for each account and they are only visible as tags. The cloud user chooses the credentials before the vServer is created or run for the first time.

The key pair is typically an RSA 2048-bit key. If a different key pair strength is required, use the Import Key Pair action.

Creating a Key Pair

Lists the API action and CLI command for creating a key pair.

A cloud user can create a key pair in the RSA 2048 format to be associated with a vServer as part of the create vServer operation. If a different key pair strength is required, use the Import Key Pair action.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
RegisterKeyPairRequest	iaas-create-key-pair

Example 3-83 Creating a key pair using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=RegisterKeyPair&Version=1&Timestamp=1318279380444&Expires=1318279680444&publicKey=ssh-rsa+AAAAB3NzaC1yc2EAAAQABAAQDg2eienGE4vEMSMcVMbYbC8z2q
```

```
%2Fvhz3H6AanlJ6B4udseK%0A8CpaHJ23eGWCjcgAmuZCJ%2FOoHUA2dN2PNPPuK6g  
%2BZndR8wVaaQT89eWDZx9oaf0%2F2Eg%2FLeKJ3moVH%0AvIYvFB9aFCpa4H%2B0mLfM

%2Bs789v9ipaDB5B26y3aqjIdvW4ZLDvuGXPs60aiUfj2WGIqx0KSVL%2FyB%2FtK1WbuZYw1+IaaS-  
Generated&keyName=myKeyPairK&AccessKeyId=AK_3&signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-84 Creating a key pair using the Cloud Infrastructure CLI

```
iaas-create-key-pair --base-url https://<EnterpriseControllerHostname>/ -a  
ak.file --key-name myKeyPair --key-file myKeyFile
```

Importing a Key Pair

Lists the API action and CLI command for importing a key pair.

A cloud user can import a public key pair that was created with a third-party tool using the RSA encryption algorithm. The length of the formatted key string is limited to 2048 characters.

When importing a key pair, the cloud user supplies the file that stores the public key and then the public key is registered. The cloud user must manage the private key.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
ImportKeyPairRequest,	iaas-import-key-pair
RegisterKeyPairRequest	

Example 3-85 Importing a key pair using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=RegisterKeyPair&Version=1&Timestamp=1324421510757&Expires=1324421810757&public  
Key=ssh-rsa+AAAAB3NzaC1yc2EAAQEAJnFD8INGLtM%2FQI1xkDjh4t2R4%2FtTMpUDzMIRP  
%0A&keyName=myKeyPair&AccessKeyId=AK_1&signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_R  
EADABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-86 Importing a key pair using the Cloud Infrastructure CLI

```
iaas-import-key-pair --base-url https://<EnterpriseControllerHostname>/ -a  
ak.file --key-name myOtherPair --key-file myOtherPair.key
```

Deleting a Key Pair

Lists the API action and CLI command for deleting a key pair.

A cloud user can delete a key pair from an account. When a key pair is deleted, the public key registered in the application is deleted and no longer valid.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DeleteKeyPairRequest	iaas-delete-key-pair

Example 3-87 Deleting a key pair using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DeleteKeyPair&Version=1&Timestamp=1318281994430&Expires=1318282294430&keyName=  
myKeyPair&AccessKeyId=AK_3&signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_O  
F_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-88 Deleting a key pair using the Cloud Infrastructure CLI

```
iaas-delete-key-pair --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --key-name myKeyPairName
```

Viewing Key Pair Information

Lists the API action and CLI command for displaying a key pair.

A cloud user can get information about the existing key pairs in an account. The cloud user can restrict the key pairs included in the result by specifying filters. The result includes the name and fingerprint for each key pair found.

The cloud infrastructure API action and the cloud infrastructure CLI command required to view information about a key pair are:

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeKeyPairsRequest	iaas-describe-key-pairs

Example 3-89 Viewing key pair information using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=DescribeKeyPairs&Version=1&Timestamp=1320361610130&Expires=1320361910130&AccessKeyId=AK_32&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-90 Viewing key pair information using the Cloud Infrastructure CLI

```
iaas-describe-key-pairs --base-url https://<EnterpriseControllerHostname>/ -a ak.file
```

Managing Attributes of an Account Resource

Defines attribute management and lists the available operations.

The management of attributes of an account resource includes viewing and modifying the value of specific attributes for an account resource.

The APIs and CLI provide operations for:

- [Viewing Attributes of an Account Resource](#)
- [Modifying Attributes of an Account Resource](#)

Use either the cloud infrastructure API actions or the cloud infrastructure CLI command to perform these operations.

About Account Resource Attributes

Describes an account and each of the account's resources.

A cloud account consists of a set of resources. Each resource has a set of attributes. To manage the account, a cloud user manages the attributes of the following account resources: volumes, snapshots, vServers, server templates, and vNets.

Viewing Attributes of an Account Resource

Lists the API action and CLI command for displaying attributes of an account.

A cloud user can view the value of specific attributes of an account resource. To view the attribute value, the cloud user needs to specify:

- ID of a valid account resource.
- One or more attribute names for the account resource. Attribute names for a resource are listed when viewing an account resource information.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeAttributesRequest	iaas-describe-attributes

Example 3-91 Viewing attributes of an account resource using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=DescribeAttributes&Version=1&Timestamp=1318464041596&Expires=1318464341596&attrNames.4=shared&resourceId=VOL-246b5c62-4072-41cf-885b-99d6c63583bd&attrNames.3=size&attrNames.2=status&attrNames.1=id&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-92 Viewing attributes of an account resource using the Cloud Infrastructure CLI

```
iaas-describe-attributes --base-url https://<EnterpriseControllerHostname>/-a ak.file --id VNET-7403e87f-1bab-4097-98ae-ea72d8fe4b3f --attr-names name
```

Modifying Attributes of an Account Resource

Lists the API action and CLI command for modifying an account.

A cloud user can modify the values of the attributes of the following account resources: volumes, snapshots, vServers, server templates, and vNets. The attributes that are editable for these account resources are name and description.

When the HighAvailabilityUserControl capability is enabled in the vDC, cloud users can also enable or disable high availability for an existing vServer by modifying the HA attribute of the vServer.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
ModifyAttributesRequest	iaas-modify-attributes

Example 3-93 Modifying vNet attributes using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?Action=ModifyAttributes&Version=1&Timestamp=1318464546890&Expires=1318464846890&resourceId=VOL-246b5c62-4072-41cf-885b-99d6c63583bd&attributes.2.value=myNewDescription&attributes.2.name=description&attributes.1.name=name&attributes.1.value=myNewName&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-94 Modifying vNet attributes using the Cloud Infrastructure CLI

```
iaas-modify-attributes --base-url https://<EnterpriseControllerHostname>/-a ak.file --id VNET-7403e87f-1bab-4097-98ae-ea72d8fe4b3f --attributes name=myNewName
```

Managing Tags

Defines a tag and lists the available operations for managing it.

Tags are used to bind user-specific information to managed resources.

The APIs and CLI provide operations for:

- [Creating a Tag](#)
- [Removing a Tag](#)
- [Viewing Tag Information](#)

Use either the cloud infrastructure API actions or the cloud infrastructure CLI command to perform these operations.

About Tags

Describes the purpose of a tag and its attributes.

A tag is a key and value pair that can be attached to a resource to identify it. The key and the value are strings. All entities in Oracle Enterprise Manager Ops Center are managed resources that can be tagged.

Creating a Tag

Lists the API action and CLI command for creating a tag.

A cloud user can create a tag. Creating a tag adds a new tag or overwrites an existing tag.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
CreateTagsRequest	iaas-create-tags

Example 3-95 Creating a tag using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?
Action=CreateTags&Version=1&Timestamp=1320101484395&Expires=1320101784395&resourceId=
VNET-9ba968d5-e64f-a639-ee3d398e0d50&tags.1.name=myTag&tags.
1.value=myTagValue&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READ
ABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-96 Creating a tag using the Cloud Infrastructure CLI

```
iaas-create-tags --base-url https://<EnterpriseControllerHostname> / -a ak.file --id
VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t --tags myTag=myTagValue
```

Removing a Tag

Lists the API action and CLI command for removing a tag.

A cloud user can remove tags from an account resource of an account.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeTagsRequest	iaas-delete-tags

Example 3-97 Deleting a tag using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DeleteTags&Version=1&Timestamp=1320102752960&Expires=1320103052960&resourceId=  
VNET-9ba968d5-e64f-4b54-a639-ee3d398e0d50&tags.  
1.name=myTag&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-98 Deleting a tag using the Cloud Infrastructure CLI

```
iaas-delete-tags --base-url https://<EnterpriseControllerHostname>/ -a ak.file --id  
VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t --tags myTag
```

Viewing Tag Information

Lists the API action and CLI command for displaying tags.

A cloud user can get information about tags attached to an account resource. The cloud user can restrict the tags included in the result by specifying filters. The result includes the ID of the account resource, along with the name and value of the tags found.

Cloud Infrastructure API Action	Cloud Infrastructure CLI Command
DescribeTagsRequest	iaas-describe-tags

Example 3-99 Viewing tag information using the Cloud Infrastructure API

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeTags&Version=1&Timestamp=1320101837081&Expires=1320102137081&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

Example 3-100 Viewing tag information using the Cloud Infrastructure CLI

```
iaas-describe-tags --base-url https://<EnterpriseControllerHostname>/ -a ak.file
```

Cloud Infrastructure CLI Reference

This chapter provides a reference to using the cloud infrastructure CLI once it is installed. The chapter includes a description, syntax, options, and examples for each command.

The following topics are covered in this chapter:

- [Common Command Options](#)
- [List of Commands](#)

Common Command Options

All the cloud infrastructure CLI commands have one of two common prefixes:

- akm – Use only for commands related to access keys, for example akm-create-access-key.
- iaas – Use for all other cloud computing management commands, for example iaas-create-volume.

All the cloud infrastructure CLI commands share some common options. Other options are common for commands with the same prefix. [Table 4-1](#) lists the command options and their descriptions, and indicates whether the option is required for the command.

Table 4-1 Common Command Options

Command Type	Option	Description	Required
akm and iaas	--base-url <base_url>	Base URL of the Enterprise Controller where the Web service is running. <code>https://<EnterpriseControllerhost>.</code>	Yes
akm	--user	The user name for authentication.	Yes
akm	--password-file -p <pw_file>	Path to the password file for authentication. If this option is not supplied, then the cloud user is prompted for a password.	No
iaas	--access-key-file -a <access_key_file>	Path of the file storing the access key	Yes
akm and iaas	--help -h	Explains the command usage and its argument.	No

Table 4-1 (Cont.) Common Command Options

Command Type	Option	Description	Required
akm and iaas	--header -H	Adds a header row to the command output	No
akm and iaas	--sep <separator>	Specifies a column separator character. The default separator is TAB.	No
akm and iaas	--xml	Displays the output in XML format. The default output is in table format.	No
akm and iaas	--verbose -v	Starts the command in verbose mode	No
akm and iaas	--debug -D	Starts the command in debug mode	No

Alternatively, the value for some common required options can be specified using the environment variables: IAAS_PASSWORD_FILE, IAAS_BASE_URL, IAAS_USER, and IAAS_ACCESS_KEY_FILE.

List of Commands

Each command is delivered as separate file. Every command has a short and long form. The following CLI commands are described in this section:

Functionality	Commands
Account access	akm-create-access-key , akm-delete-access-key , akm-describe-access-keys , akm-describe-accounts
Server template management	iaas-create-server-template-from-assembly , iaas-create-server-template-from-url , iaas-create-server-template-from-vserver , iaas-delete-server-template , iaas-describe-server-templates
Virtual network management	iaas-create-vnet , iaas-connect-vnet , iaas-delete-vnet , iaas-describe-vnets
IP address management	iaas-allocate-ip-addresses , iaas-describe-ip-addresses , iaas-release-ip-addresses , iaas-blacklist-ip-addresses , iaas-clear-blacklisted-ip-addresses , iaas-describe-blacklisted-ip-addresses
Volume management	iaas-attach-volumes-to-vserver , iaas-create-volume , iaas-delete-volume , iaas-describe-volumes , iaas-detach-volumes-from-vserver , iaas-import-volume
Snapshot management	iaas-create-snapshot , iaas-delete-snapshot , iaas-describe-snapshots
Key pair management	iaas-create-key-pair , iaas-delete-key-pair , iaas-describe-key-pairs , iaas-import-key-pair

Functionality	Commands
vServer management	iaas-describe-vserver-metrics , iaas-describe-vservers , iaas-describe-vserver-types , iaas-reboot-vservers , iaas-receive-message-from-vserver , iaas-run-vserver , iaas-run-vservers , iaas-send-messages-to-vserver , iaas-start-vservers , iaas-stop-vservers , iaas-terminate-vservers
Distribution group management	iaas-create-distribution-group , iaas-delete-distribution-group , iaas-describe-distribution-groups
Resource attribute management	iaas-describe-attributes , iaas-modify-attributes
Tag management	iaas-create-tags , iaas-delete-tags , iaas-describe-tags
vDC capabilities	iaas-describe-vdc-capabilities

akm-create-access-key

Creates an access key for a cloud user.

Syntax

```
akm-create-access-key|akm-cak [--base-url <base_url>] [--debug] [--header]
[--user <username>] [--help]
[--password-file <password_file>]
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>][--xml]
[--trust-store <truststore_file>]
[--for-user <username>]
--account <account_id> [--verbose]
--access-key-file <access_key_file>
```

Description

This command delivers the access key ID and the access key file containing the private key of the newly created access key for the specified cloud user. The command also registers the access key to the specified account.

The access key file created by this command is used for authentication of every iaas command.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--user <username>

User name of the cloud user. The command validates the cloud user in the Oracle Enterprise Manager Ops Center instance and verifies that the cloud user has the correct privileges for the specified account. If this option is not specified, then the user name is taken from the value set in the IAAS_USER environment variable.

--help | -h

Displays the usage information for this command.

--access-key-file | -a <access_key_file>

Complete path and name of the file that will store the access key created after using this command (for example, /tmp/ak.file). If a path is not specified, the file is created in the current directory.

--password-file | -p <password_file>

Complete path and name of the file containing the password of the cloud user (for example, /tmp/akpwd.file). If a path is not specified for this file, then the command-line interface looks for the file in the current directory. If this option is not specified, and the value is not set in the IAAS_PASSWORD_FILE environment variable, then the cloud user is prompted for a password.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is TAB.

--trust-store <truststore_file>

Name of the file that stores the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--for-user | -f <username>

User name of another cloud user to create an access key on behalf of that cloud user. The user executing the command using this option requires cloud administrator privileges.

--account | -d <account_id>

Account ID of the account for which the access key is created. The command checks that the specified user is already registered for that account. To get the account ID, use the [akm-describe-accounts](#) command.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example creates an access key with the ID *AK_3*. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
user	<username>
password-file	~/pwd.file
account	ACC-e7ed508a-dad3-4866-a41a-bf8850163b2e
access-key-file	ak.file

```
bash-3.2$ ./akm-create-access-key --base-url https://<EnterpriseControllerHostname>/ --user <username> --password-file ~/pwd.file --account ACC-e7ed508a-dad3-4866-a41a-bf8850163b2e -a ak.file
```

```
AK_3
bash-3.2$
```

Example 2

This example creates an access key with ID *AK_4* using the value set in the environment variables. It uses the following options and values:

Option	Environment Variable	Value
base-url	IAAS_BASE_URL	https://<EnterpriseControllerHostname>/
user	IAAS_USER	<username>
password-file	IAAS_PASSWORD_FILE	~/pwd.file
account	NA	ACC-g7fg508a-dad3-4866-a41a-bf8850163c3f
access-key-file	NA	ak.file

```
bash-3.2$ ./akm-create-access-key --account ACC-g7fg508a-dad3-4866-a41a-bf8850163c3f --access-key-file ak.file
```

```
AK_4
bash-3.2$
```

Example 3

In this example a cloud administrator creates, on behalf of a cloud user, an access key with ID *AK_10*. It uses the following options and values:

Option	Environment Variable	Value
base-url	IAAS_BASE_URL	https://<EnterpriseControllerHostname>/
user	IAAS_USER	cloudadmin
for-user	NA	<username>
password-file	IAAS_PASSWORD_FILE	~/pwd.file
account	NA	ACC-g7fg508a-dad3-4866-a41a-bf8850163c3f
access-key-file	NA	ak.file

```
bash-3.2$ ./akm-create-access-key --account ACC-g7fg508a-dad3-4866-a41a-bf8850163c3f --access-key-file ak.file --for-user <username>
```

```
AK_10
bash-3.2$
```

Exit Status

(Success) – The command returns the access key ID of the newly created access key. When the [akm-describe-access-keys](#) command is used, the new access key ID is listed.

(Failure) – The command displays a descriptive error message and error code.

See Also

- [akm-delete-access-key](#)
- [akm-describe-access-keys](#)
- [akm-describe-accounts](#)

akm-delete-access-key

Unregisters an access key from the specified account.

Syntax

```
akm-delete-access-key|akm-delak [--base-url <base_url>] [--debug] [--header]
[--user <user name>] [--help]
[--password-file <pw_file>]
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
<access_key_id>
```

Description

This command deletes the access key association to the account. The access key file is not deleted with this command, but the access key is no longer usable.

Options**--base-url <base_url>**

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--user <username>

User name of the cloud user. The command validates the cloud user in the Oracle Enterprise Manager Ops Center instance and verifies that the cloud user has the correct privileges for the specified account. If this option is not specified, then the user name is taken from the value set in the IAAS_USER environment variable.

--help | -h

Displays the usage information for this command.

--password-file | -p <password_file>

Name of the file containing the password of the cloud user. If a path is not specified for this file, then the command-line interface looks for the file in the current directory. If this option is not specified, and the value is not set in the IAAS_PASSWORD_FILE environment variable, then the cloud user is prompted for a password.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file that stores the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

<access_key_id>

Access key ID of the access key that will be unregistered. Access key IDs are displayed in the user interface or by using the [akm-describe-access-keys](#) command.

Examples**Example 1**

This example unregisters an access key. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
user	<username>
password-file	~/pwd.file
access-key-id	AK_3

```
bash-3.2$ ./akm-delete-access-key --base-url https://<EnterpriseControllerHostname>/ --user <username> --password-file ~/pwd.file
AK_3bash-3.2$
```

Example 2

This example unregisters an access key. It uses the following options and values:

Option	Environment Variable	Value
base-url	IAAS_BASE_URL	https://<EnterpriseControllerHostname>/
user	IAAS_USER	<username>
password-file	IAAS_PASSWORD_FILE	~/pwd.file
access-key-id	NA	AK_4

```
bash-3.2$ ./akm-delete-access-key AK_4
bash-3.2$
```

Exit Status

(Success) – The command does not return any value, only the command prompt is returned. When the [akm-describe-access-keys](#) command is used, the access key is not listed.

(Failure) – The command displays a descriptive error message and error code.

See Also

- [akm-create-access-key](#)

- [akm-describe-access-keys](#)
- [akm-describe-accounts](#)

akm-describe-access-keys

Displays a list of the access keys of a cloud user.

Syntax

```
akm-describe-access-keys|akm-dak [ --base-url <base_url> ] [ --debug ] [ --header ]
[ --user <user name> ] [ --help ]
[ --password-file <password_file> ]
[ --coln <columnNames> ]
[ --cols <columnSortNames> ]
[ --colw <columnWidth> ]
[ --sep <separator> ]
[ --trust-store <truststore_file> ]
[ --for-user <username> ]
[ --verbose ] [ --xml ]
```

Description

This command lists information about the access keys created for a cloud user. The command displays the access key ID, the account ID, and user name of the cloud user for each access key available for the specified cloud user.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--user <username>

Username of the cloud user. The command validates the cloud user in the Oracle Enterprise Manager Ops Center instance and verifies that the cloud user has the correct privileges for the specified account. If this option is not specified, then the user name is taken from the value set in the IAAS_USER environment variable.

--help | -h

Displays the usage information for this command.

--password-file | -p <password_file>

Name of the file containing the password of the cloud user. If a path is not specified for this file, then the command-line interface looks for the file in the current directory. If this option is not specified, and the value is not set in the IAAS_PASSWORD_FILE environment variable, then the cloud user is prompted for a password.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file that stores the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--for-user | -f <username>

User name of a different cloud user to display the access keys created for that cloud user. The cloud user using this option requires cloud administrator privileges.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example displays the access keys of a cloud user. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
user	<username>
password-file	~/pwd.file

```
bash-3.2$ ./akm-describe-access-keys --base-url https://<EnterpriseControllerHostname>/ --user <username> --password-file ~/pwd.file
AK_3    ACC-d7td508a-dad3-4866-a41a-bf8850163c3g      <username>
bash-3.2$
```

Example 2

This example displays the access keys of a cloud user, adding a header row to the output. It uses the following options and values:

Option	Environment Variable	Value
base-url	IAAS_BASE_URL	https://<EnterpriseControllerHostname>/

Option	Environment Variable	Value
user	IAAS_USER	<username>
password-file	IAAS_PASSWORD_FILE	~/pwd.file

```
bash-3.2$ ./akm-describe-access-keys -HaccessKeyId account user
AK_3 ACC-d7td508a-dad3-4866-a41a-bf8850163c3g <username>
bash-3.2$
```

Exit Status

(Success) – The command displays a list containing the access key ID, the account ID, and username of the specified cloud user.

(Failure) – The command displays a descriptive error message and error code.

See Also

- [akm-create-access-key](#)
- [akm-delete-access-key](#)
- [akm-describe-accounts](#)

akm-describe-accounts

Displays account information for a cloud user.

Syntax

```
akm-describe-accounts|akm-dac [ --base-url <base_url> ] [ --debug ] [ --header ]
[ --user <user name> ] [ --help ]
[ --password-file <password_file> ]
[ --coln <columnNames> ]
[ --cols <columnSortNames> ]
[ --colw <columnWidth> ]
[ --sep <separator> ]
[ --trust-store <truststore_file> ]
[ --for-user <username> ]
[ --account <account_id> ] [ --verbose ]
[ --xml ]
```

Description

This command lists information about the accounts available for a cloud user. The command displays the user name of the specified cloud user along with the account ID, name, and description of each account available for that cloud user.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL

information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--user <username>

Username of the cloud user. The command validates the cloud user in the Oracle Enterprise Manager Ops Center instance and verifies that the cloud user has the correct privileges for the specified account. If this option is not specified, then the user name is taken from the value set in the IAAS_USER environment variable.

--help | -h

Displays the usage information for this command.

--password-file | -p <password_file>

Name of the file containing the password of the cloud user. If a path is not specified for this file, then the command-line interface looks for the file in the current directory. If this option is not specified, and the value is not set in the IAAS_PASSWORD_FILE environment variable, then the cloud user is prompted for a password.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--for-user | -f <username>

User name of another cloud user. This option validates that the cloud user using this option has cloud administrator privileges.

--account | -d <account_id>

Account ID of the account. This option can be used as a filter to limit the number of accounts displayed.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example displays the account information for a cloud user. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
user	<username>
password-file	~/pwd.file

```
bash-3.2$ ./akm-describe-accounts --base-url https://<EnterpriseControllerHostname>/ --user <username> --password-file ~/pwd.file

ACC-f7gd508a-dad3-4866-a41a-bf8850163c3g      account0      account0 for user
<username>          <username>ACC-95gdb073-d569-4a45-ac24-f14eba689a8g
account1          account1 for user <username>          <username>ACC-eag64db9-
c0ee-43de-bb17-55cfb9d105fg      account2      account2 for user
<username>          <username>
bash-3.2$
```

Example 2

This example displays the account information for a different cloud user, and includes a header row. It uses the following options and values:

Option	Environment Variable	Value
base-url	IAAS_BASE_URL	https://<EnterpriseControllerHostname>/
user	IAAS_USER	<username>
password-file	IAAS_PASSWORD_FILE	~/pwd.file
for-user	NA	<username2>

```
bash-3.2$ ./akm-describe-accounts --for-user <username2> -H

account name      description      user
ACC-f7gd508a-dad3-4866-a41a-bf8850163c3g      account0      account0 for user
<username2>          <username>ACC-95gdb073-d569-4a45-ac24-f14eba689a8g
account1          account1 for user <username2>          <username>
bash-3.2$
```

Exit Status

(Success) – The command returns a list containing the account ID, the account name, the account description, and user name of the specified cloud user.

(Failure) – The command displays a descriptive error message and error code.

iaas-allocate-ip-addresses

Allocates a number of IP addresses from a virtual network.

Syntax

```
iaas-allocate-ip-addresses|iaas-aip [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
[--vnet] <vnet-id>
[--num <num>]
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command allocates a number of IP addresses from a public or private virtual network that can be associated later with a vServer.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--vnet <vnet-id>

vNet ID from which IP addresses are allocated.

--num <num>

Number of IP addresses to be allocated. The default value is 1.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example allocates an IP address from the specified virtual network. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vNet ID	VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c

```
bash-3.2$ ./iaas-allocate-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c
192.0.2.1
bash-3.2$
```

Example 2

This example allocates three IP addresses from the specified virtual network. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

Option	Option Value
vNet ID	VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c

```
bash-3.2$ ./iaas-allocate-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c --num 3
```

```
192.0.2.2
192.0.2.3
192.0.2.4
bash-3.2$
```

Exit Status

(Success) – The command returns a list of the allocated IP addresses. When using the [iaas-describe-ip-addresses](#) command, the new allocated IP addresses are listed.

(Failure) – The command displays a descriptive error message and error code.

iaas-attach-volumes-to-vserver

Attaches one or more volumes to a vServer.

Syntax

```
iaas-attach-volumes-to-vserver|iaas-attvol [--base-url <base_url>] [--debug]
                                            [--access-key-file <access_key_file>]
                                            [--debug] [--header][--help]
                                            --vserver-id <vserver_id>
                                            [--volume-ids] <vol-id>[,<vol-id>]*
                                            [--coln <columnNames>]
                                            [--cols <columnSortNames>]
                                            [--colw <columnWidth>]
                                            [--sep <separator>]
                                            [--trust-store <truststore_file>]
                                            [--verbose] [--xml]
```

Description

This command attaches one or more volumes to a vServer.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://`

<EnterpriseControllerHostname>. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, /tmp/ak.file). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--vserver-id | -i <vserver-id>

ID of the vServer to which the volume will be attached.

--volume-ids <vol-id>[,<vol-id>]*

IDs of the volumes to be attached.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is TAB.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example attaches a volume to a vServer. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/

Option	Option Value
access-key-file	ak.file
vserver-id	VSRV-8ae29df9-ccfe-4184-acb8-10080665d7f6

```
bash-3.2$./iaas-attach-volumes-to-vserver --base-url https://<EnterpriseControllerHostname>/ -a ~/ak.file -vserver-id VSRV-8ae29df9-ccfe-4184-acb8-10080665d7f6 --volume-ids VOL-052cb4b4-5e56-4303-8b3a-82d6ba743a15
```

bash-3.2\$

Exit Status

(Success) – The command attaches the specified volume to the vServer. This command does not return any value, only the command prompt is returned. When the [iaas-describe-volumes](#) command is used, the vServer is listed as part of the volume information.

(Failure) – The command displays a descriptive error message and error code.

See Also

- [iaas-create-volume](#)
- [iaas-describe-volumes](#)
- [iaas-describe-vservers](#)

iaas-blacklist-ip-addresses

Reserves one or more allocated IP addresses for some specific purpose.

Syntax

```
iaas-blacklist-ip-addresses|iaas-bip [--base-url <base_url>] <ip-address>
[--debug]
[--access-key-file <access_key_file>]
[--vnet] <vnet-id>
[--num <num>]
[--owner <owner-id>]
```

Description

This command specifies the IP addresses that cannot be used by Oracle Enterprise Manager Ops Center. As a result of blacklisting, the IP address cannot be assigned to a vServer and remains available for its purpose. It is identified by the string "BLACKLISTED" and the appended owner string, if one is provided.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, the command is directed to the current directory.

--help | -h

Displays the usage information for this command.

--vnet <vnet-id>

vNet ID for the IP addresses.

--num <num>

Number of IP addresses to be blacklisted. The default value is 1.

--owner <string>

Alphanumeric string to identify the cloud user or the purpose of the blacklisted IP address.

Examples

Example 1

This example blacklists an IP address from the available allocated IP addresses so that it can be used for testing. It uses the following options and values:

Option	Option Value
base-url	<code>https://<EnterpriseControllerHostname>/</code>
access-key-file	<code>ak.file</code>
vNet ID	<code>VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c</code>
owner	<code>test</code>

```
bash-3.2$ ./iaas-blacklist-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c --owner test
bash-3.2$
```

Example 2

This example blacklists three IP addresses. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vNet ID	VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c
num	3
owner	finance

```
bash-3.2$ ./iaas-blacklist-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c --num 3 -owner finance

192.0.2.2
192.0.2.3
192.0.2.4
bash-3.2$
```

Exit Status

(Success) – The command returns a list of the blacklisted IP addresses.

(Failure) – The command displays a descriptive error message and error code.

See Also

- [iaas-clear-blacklisted-ip-addresses](#)
- [iaas-describe-blacklisted-ip-addresses](#)

iaas-clear-blacklisted-ip-addresses

Removes the specified IP addresses from the blacklist, making them available.

Syntax

```
iaas-clear-blacklisted-ip-addresses|iaas-cbip [--base-url <base_url>] [--debug]
[--access-key-file <access_key_file>]
[--vnet] <vnet-id>
--ipaddress <ipaddress>
```

Description

This command removes IP addresses from the blacklist , restoring them to their orginal state.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: https://<EnterpriseControllerHostname>. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, /tmp/ak.file). If a path is not specified, the command is directed to the current directory.

--help | -h

Displays the usage information for this command.

--vnet <vnet-id>

vNet ID from which IP addresses are allocated.

--ipaddress <ipaddress>

The blacklisted IP address

Examples

Example 1

This example clears an IP address from the blacklisted IP addresses. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vNet ID	VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c
ipaddress	192.0.2.2

```
bash-3.2$ ./iaas-clear-blacklisted-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c --ipaddress 192.0.2.2
bash-3.2$
```

Exit Status

(Success) – The command does not return any value, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-connect-vnet

Associates the vNet with the server pools in the vDC.

Syntax

```
iaas-connect-vnet|iaas-convn [--base-url <base_url>] [--debug]
                           [--access-key-file <access_key_file>]
                           [--vnet] <vnet-id>
```

Description

This command connects an available vNet to all the server pools in the vDC. The vNet is available when it has no other connections. To display a list of available vNets, use the `iass-describe-vnets` command to see the vNets with the status NOT CONNECTED.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the `IAAS_BASE_URL` environment variable.

--debug | -D

Starts the command in debug mode.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, the command is directed to the current directory.

--help | -h

Displays the usage information for this command.

--vnet <vnet-id>

vNet ID to be connected

Examples

Example 1

This example connects the specified vNet. It uses the following options and values:

Option	Option Value
base-url	<code>https://<EnterpriseControllerHostname>/</code>
access-key-file	<code>ak.file</code>
vNet ID	<code>VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c</code>

```
bash-3.2$ ./iaas-connect-vnet --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c
```

Exit Status

(Success) – The command returns the IP address that match the owner-id or the complete list.

(Failure) – The command displays a descriptive error message and error code.

iaas-create-distribution-group

Creates a new distribution group for an account.

Syntax

```
iaas-create-distribution-group|iaas-cdg [--base-url <base_url>] [--debug]
                                         [--desc <descr>][--header] [--help]
                                         [--access-key-file <access_key_file>]
                                         --name <name>
                                         [--coln <columnNames>]
                                         [--cols <columnSortNames>]
                                         [--colw <columnWidth>]
                                         [--sep <separator>]
                                         [--size <size>]
                                         [--trust-store <truststore_file>]
                                         [--verbose] [--xml]
```

Description

This command creates a distribution group for an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--desc | -d <descr>

An optional description for the distribution group.

--name | -n <name>

Name of the distribution group.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--size <size>

Size of the distribution group. The size is the maximum limit of vServers that can be added to a distribution group. The default size is 21.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example creates a distribution group for an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
name	myDistributionGroup

```
bash-3.2$ ./iaas-create-distribution-group --base-url https://<EnterpriseControllerHostname>/ -a ak.file --name myDistributionGroup
```

```
DG-068ae84c-d0fc-406d-aa37-0be4f88d411c  
bash-3.2$
```

Example 2

This example creates a distribution group with size for 10 vServers. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
name	myDistributionGroup2

```
bash-3.2$ ./iaas-create-distribution-group --base-url https://<EnterpriseControllerHostname>/ -a ak.file --name myDistributionGroup2 --size 10
DG-9eb288c2-85e7-4392-80a6-d1c1709de4cd
bash-3.2$
```

Exit Status

(Success) – The command returns the distribution group ID. When using the [iaas-describe-distribution-groups](#) command, the new distribution group is listed.

(Failure) – The command displays a descriptive error message and error code.

iaas-create-key-pair

Creates a key pair for an account.

Syntax

```
iaas-create-key-pair|iaas-ckp [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
[--key-file <key-file-name>]
[--key-name <key-pair-name>]
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command creates a key pair for an account. The command stores the private key of the key pair in the specified key file.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--key-name | -n <key-pair-name>

Name of the key pair.

--key-file | -k <key-file-name>

Name of the key file that will store the private key of the key pair. If a path is not specified, then the command creates the file in the current directory.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example creates a key pair in an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
key-name	myKeyPair
key-file	myKeyFile

```
bash-3.2$ ./iaas-create-key-pair --base-url https://<EnterpriseControllerHostname>/
-a ak.file --key-name myKeyPair --key-file myKeyFile

dx a9:60:cb:88:4a:42:2d:c5:d4:f1:23:63:64:54:d9:0a:e0:c5:a5:9e
bash-3.2$
```

Exit Status

(Success) – The command returns the key pair name and fingerprint. When using the [iaas-describe-key-pairs](#) command, the new key pair is listed.

(Failure) – The command displays a descriptive error message and error code.

iaas-create-server-template-from-assembly

Creates a set of new server templates based on an assembly. Names of the new server templates are taken from the assembly.

Syntax

```
iaas-create-server-template-from-assembly|iaas-cstfa  [--base-url <base_url>]
[--debug] [--header] [--help]
[--access-key-file <access_key_file>]
[--desc <descr>]
[--url] <url>
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command imports an assembly and creates one or more server templates in an account based on the assembly. Snapshots can be also created as a result of this action.

Options**--base-url <base_url>**

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Add a header row to the output. If this option is not specified, then no header row is displayed.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--desc | -d <descr>

Description of the server template.

--url | -u <url>

An assembly URL.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example creates a server template from the specified assembly. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
url	http://myServer.com/myAssembly.ova

```
bash-3.2$ ./iaas-create-server-template-from-assembly --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --url http://myServer.com/myAssembly.ova
```

```
ASSM-1110da89-64c7-4c11-a239-927b77e14c2
bash-3.2$
```

Exit Status

(Success) – The command returns the assembly ID and loads the server templates for an account. When the [iaas-describe-server-templates](#) command is used, the new server templates are listed.

(Failure) – The command displays a descriptive error message and error code.

iaas-create-server-template-from-url

Creates a server template based on a file accessible through a URL.

Syntax

```
iaas-create-server-template-from-url|iaas-cstfu [--base-url <base_url>] [--debug]
                                              [--header] [--help]
                                              [--access-key-file <access_key_file>]
                                              --name <name> [--desc <descr>]
```

```
[--url] <url>
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command downloads the server template from the specified URL and then loads the server template to the associated account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--name | -n <name>

Name of the server template.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--desc | -d <descr>

Description of the server template.

--url | -u <url>

Server template URL from which the server template is downloaded.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example creates a server template from the specified URL. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
name	myST
url	http://myServer.com/vm-templates/ OVM.tar.gz

```
bash-3.2$ ./iaas-create-server-template-from-url --base-url https://<EnterpriseControllerHostname> --access-key-file ak.file --name myST --url http://myServer.com/vm-templates/OVM.tar.gz
```

```
TMPL-9330da89-64c7-4c11-a239-927b77e344d1  
bash-3.2$
```

Exit Status

(Success) – The command returns the server template ID and loads the server template in an account. When using the [iaas-describe-server-templates](#) command, the server template is listed.

(Failure) – The command displays a descriptive error message and error code.

iaas-create-server-template-from-vserver

Creates a new server template based on a stopped vServer.

Syntax

```
iaas-create-server-template-from-vserver|iaas-cstfi [--base-url <base_url>]
[--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
[--desc <descr>]
--name <name>
--vserver-id <vserver-id>
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command creates a new server template based on a stopped vServer in the account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--desc | -d <descr>

Description of the template.

--name | -n <name>

Name of the template.

--vserver-id | -i <vserver-id>

vServer ID.

--cols <column_names>

Specifies which columns to display for the command output.

--colw <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--sep <separator>Column separator character. The default separator is *TAB*.**--trust-store <truststore_file>**

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example creates a server template from the specified URL. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
name	myST
vServer ID	VSRV-a959be32-6237-40c7-b44b-47d392e7a0ac

```
bash-3.2$ ./iaas-create-server-template-from-vserver --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --name myST --vserver-id VSRV-a959be32-6237-40c7-b44b-47d392e7a0ac
```

```
TMPL-00005a39-93fd-44d9-86e5-2755d506f16f
bash-3.2$
```

Exit Status

(*Success*) – The command returns the server template ID and loads the server template in the account. When using the [iaas-describe-server-templates](#) command, the server template is listed.

(*Failure*) – The command displays a descriptive error message and error code.

iaas-create-snapshot

Creates a snapshot based on an existing volume for an account.

Syntax

```
iaas-create-snapshot|iaas-CS [--base-url <base_url>] [--debug]
                               [--access-key-file <access_key_file>]
                               [--header] [--help]
                               --name <name> [--desc <descr>]
                               [--volume-id] <volume-id>
                               [--cols <columnNames>]
                               [--cols <columnSortNames>]
                               [--colw <columnWidth>]
                               [--sep <separator>]
                               [--trust-store <truststore_file>]
                               [--verbose] [--xml]
```

Description

This command creates a snapshot based on an existing volume.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, /tmp/ak.file). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--desc | -d <descr>

Description of the snapshot.

--name | -n <name>

Name of the snapshot.

--volume-id <volume-id>

ID of the volume.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is TAB.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example creates a snapshot from the specified volume ID. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/

Option	Option Value
access-key-file	ak.file
volume-id	VOL-246b5c62-4072-41cf-885b-99d6c 63583bd

```
bash-3.2$ ./iaas-create-snapshot --base-url https://<EnterpriseControllerHostname>/  
-a ak.file --volume-id VOL-246b5c62-4072-41cf-885b-99d6c63583bd --name mySnapshot  
  
SNAP-d7ca2baf-d10b-4ae9-a2c5-5355da9d7004  
bash-3.2$
```

Example 2

This example creates a snapshot from the specified volume ID. It uses the following options and values:

Option	Environment Variable	Value
base-url	IAAS_BASE_URL	https://<EnterpriseControllerHostname>/
access-key-file	IAAS_ACCESS_KEY_FILE	ak.file
volume-id	NA	VOL-246b5c62-4072-41cf-885b-99d6c 63583bd

```
bash-3.2$ ./iaas-create-snapshot --volume-id  
VOL-246b5c62-4072-41cf-885b-99d6c63583bd --name mySnapshot2  
  
SNAP-d7ca2baf-d10b-4ae9-a2c5-5355da9d7002  
bash-3.2$
```

Exit Status

(Success) – The command returns the snapshot ID of the snapshot created. When using the [iaas-describe-snapshots](#) command, the snapshot is listed.

(Failure) – The command displays a descriptive error message and error code.

iaas-create-tags

Creates tags for a resource in an account.

Syntax

```
iaas-create-tags|iaas-ctag [--base-url <base_url>] [--debug]
                           [--header] [--help]
                           [--access-key-file <access_key_file>]
                           --id <resource-id>
                           [--tags] <name>=<val>[,<name>=<val>]*
                           [--coln <columnNames>]
                           [--cols <columnSortNames>]
                           [--colw <columnWidth>]
                           [--sep <separator>]
                           [--trust-store <truststore_file>]
                           [--verbose] [--xml]
```

Description

This command adds or overwrites tags for the specified resource ID that exists in an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--id <resource-id>

ID of a resource in the account.

--tags <name>=<val>[,<name>=<val>]*

List of tag names and values.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example adds a tag to the specified virtual network ID. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
id	VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t

```
bash-3.2$ ./iaas-create-tags --base-url https://<EnterpriseControllerHostname>/ -a
ak.file --id VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t --tags myTag=myTagValue
```

```
bash-3.2$
```

Example 2

This example adds two tags to the specified virtual network ID. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vNet ID	VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t

```
bash-3.2$ ./iaas-create-tags --base-url https://<EnterpriseControllerHostname>/ -a
ak.file --id VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t --tags myTag=myTagValue
myTag2=myTag2Values
```

```
bash-3.2$
```

Exit Status

(Success) – The command adds or overwrites tags to the specified resource. This command does not return any value, only the command prompt is returned. You can see the attributes of the new tags using the [iaas-describe-tags](#) command.

(Failure) – The command displays a descriptive error message and error code.

See Also

iaas-create-vnet

Creates a private virtual network for the account.

Syntax

```
iaas-create-vnet|iaas-cvn  [--base-url <base_url>] [--debug]
                           [--header] [--help]
                           [--access-key-file <access_key_file>]
                           --name <name> [--desc <descr>]
                           [--size <size>]
                           [--coln <columnNames>]
                           [--cols <columnSortNames>]
                           [--colw <columnWidth>]
                           [--sep <separator>]
                           [--trust-store <truststore_file>]
                           [--verbose] [--xml]
```

Description

This command creates a private virtual network for an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--name | -n <name>
Name of the virtual network.

--size | -s <size>
Size of the subnet of the virtual network.

--desc | -d <descr>
Description of the virtual network.

--coln <column_names>
Specifies which columns to display for the command output.

--cols <column_sort_names>
Specifies the names of the columns used for sorting the command output.

--colw <columns_width>
Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>
Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>
Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v
Starts the command in verbose mode.

--xml
Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example creates a virtual network with the default subnet size. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
name	myVNET

```
bash-3.2$ ./iaas-create-vnet --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --name myVNET
VNET-350c9c3f-0ee5-41be-917e-ebbaed0fa4ad
bash-3.2$
```

Example 2

This example creates a virtual network with a subnet size of 16. It uses the following options and values:

Option	Environment Variable	Value
base-url	IAAS_BASE_URL	https://<EnterpriseControllerHostname>/
access-key-file	IAAS_ACCESS_KEY_FILE	ak.file
name	NA	myVNET2
size	NA	16

```
bash-3.2$ ./iaas-create-vnet --name myVNET2 --size 16
```

```
VNET-480c9c3f-0ee5-41be-917e-ebbaed0fa4gt
bash-3.2$
```

Exit Status

(Success) – The command returns the vNet ID of the vNet created. You can see the attributes of the new vNet using the [iaas-describe-vnets](#) command.

(Failure) – The command displays a descriptive error message and error code.

iaas-create-volume

Creates a volume for an account.

Syntax

```
iaas-create-volume|iaas-cvol [--base-url <base_url>] [--debug] [--header]
[--access-key-file <access_key_file>] [--help]
[--desc <descr>] [--snapshot-id <snapshot_id>]
--name <name> [--shared] [--size <size>]
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command creates an empty volume of the specified size for the account. This command also provides an option to create a volume from a snapshot.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--name | -n <name>

Name of the volume.

--shared

Specifies if the volume is a shared volume. The default is a non-shared volume.

--size | -s <size>

Size of the volume in gigabytes (GB). This option is required if a snapshot ID is not given.

--snapshot-id | -i <snapshot-id>

Snapshot ID. The volume is created based on the specified snapshot.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--desc | -d <descr>

Description of the volume.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example creates an empty volume of 2 GB. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
name	firstVol

```
bash-3.2$ ./iaas-create-volume --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --name firstVol --size 2
```

```
VOL-f23a8ba1-ec55-4159-bbdf-de220d18a1c4
bash-3.2$
```

Example 2

This example creates a volume based on the specified snapshot. It uses the following options and values:

Option	Environment Variable	Value
base-url	IAAS_BASE_URL	https://<EnterpriseControllerHostname>/
access-key-file	IAAS_ACCESS_KEY_FILE	ak.file
snapshot-id	NA	SNAP-7a717e39-fe67-4573-a93d-889b3446176b

```
bash-3.2$ ./iaas-create-volume --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --name myVol --snapshot-id SNAP-7a717e39-fe67-4573-a93d-889b3446176b
```

```
VOL-g23a8ba1-ec55-4159-bbdf-de220d18a1b7
bash-3.2$
```

Exit Status

(Success) – The command returns the volume ID of the volume created. Attributes of the new volume are listed using the [iaas-describe-volumes](#) command.

(Failure) – The command displays a descriptive error message and error code.

iaas-delete-distribution-group

Deletes an existing distribution group.

Syntax

```
iaas-delete-distribution-group|iaas-deldg [--base-url <base_url>] [--debug]
                                           [--header] [--help]
                                           [--access-key-file <access_key_file>]
                                           [--distribution-group-id] <distribution group-id>
                                           [--coln <columnNames>]
                                           [--cols <columnSortNames>]
                                           [--colw <columnWidth>]
                                           [--sep <separator>]
                                           [--trust-store <truststore_file>]
                                           [--verbose] [--xml]
```

Description

This command deletes a distribution group from an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

[--distribution-group-id] <distribution group-id>

ID of the distribution group.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example deletes an existing distribution group from an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
distribution-group-id	DG-3206ed4d-44c9-42c4-8df7-511709a49ead

```
bash-3.2$ ./iaas-delete-distribution-group --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --distribution-group-id DG-3206ed4d-44c9-42c4-8df7-511709a49ead
```

```
bash-3.2$
```

Exit Status

(Success) – The command deletes the specified distribution group from the account. The command does not return any value, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-delete-key-pair

Deletes an existing key pair from an account.

Syntax

```
iaas-delete-key-pair|iaas-delkp  [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
--key-name <key-pair-name>
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command deletes a key pair from an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--key-name <key-pair-name>

ID of the key pair.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example deletes an existing key pair from an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
key-name	key1

```
bash-3.2$ ./iaas-delete-key-pair --base-url https://<EnterpriseControllerHostname>/
--access-key-file ak.file --key-name key1
```

```
bash-3.2$
```

Exit Status

(Success) – The command deletes the key pair. The command does not return any value, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

See Also

- [iaas-create-key-pair](#)
- [iaas-describe-key-pairs](#)
- [iaas-import-volume](#)

iaas-delete-server-template

Deletes an existing server template.

Syntax

```
iaas-delete-server-template|iaas-delstem [--base-url <base_url>] [--debug]
                                         [--header] [--help]
                                         [--access-key-file <access_key_file>]
                                         <server-template-id>
                                         [--coln <columnNames>]
                                         [--cols <columnSortNames>]
                                         [--colw <columnWidth>]
                                         [--sep <separator>]
                                         [--trust-store <truststore_file>]
                                         [--verbose] [--xml]
```

Description

This command deletes the server template with the specified server template ID.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

[--server-template-id] <server-template-id>

ID of the server template.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example deletes an existing server template from an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
server-template-id	TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-eeeeeeeeee03

```
bash-3.2$ ./iaas-delete-server-template --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file --server-template-id TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-eeeeeeeeee03
```

```
bash-3.2$
```

Exit Status

(Success) – The command deletes the server template. The command does not return any value, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-delete-snapshot

Deletes a snapshot from an account.

Syntax

```
iaas-delete-snapshot|iaas-dels [--base-url <base_url>] [--debug]
                               [--access-key-file <access_key_file>]
                               [--header] [--help]
                               [--snapshot-id] <snapshot-id>
                               [--coln <columnNames>]
                               [--cols <columnSortNames>]
                               [--colw <columnWidth>]
                               [--sep <separator>]
                               [--trust-store <truststore_file>]
                               [--verbose] [--xml]
```

Description

This command deletes a snapshot from an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--snapshot-id <snapshot-id>

ID of the snapshot

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples**Example 1**

This example deletes the specified snapshot from an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
snapshot-id	SNAP-d743e90c-53c5-4b01-a297-e2c944755c48
access-key-file	ak.file

```
bash-3.2$ ./iaas-delete-snapshot --base-url https://<EnterpriseControllerHostname>/
-a ak.file --snapshot-id SNAP-d743e90c-53c5-4b01-a297-e2c944755c48
```

```
bash-3.2$
```

Exit Status

(Success) – The command deletes the specified snapshot. The command does not return any value, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-delete-tags

Deletes tags from a resource.

Syntax

```
iaas-delete-tags|iaas-deltag [--base-url <base_url>] [--debug]
                               [--header] [--help]
                               [--access-key-file <access_key_file>]
                               --id <resource-id>
                               [--tags] <name|val>[,<name|val>]*
                               [--coln <columnNames>]
                               [--cols <columnSortNames>]
                               [--colw <columnWidth>]
                               [--sep <separator>]
                               [--trust-store <truststore_file>]
                               [--verbose] [--xml]
```

Description

This command deletes tags from a resource in an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--id <resource-id>

ID of a resource in an account.

--tags <name>=<val>[,<name>=<val>]*

List of tag names or values of the tags to be deleted.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example deletes a tag from the specified resource. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
id	VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t
tags	myTag

```
bash-3.2$ ./iaas-delete-tags --base-url https://<EnterpriseControllerHostname>/ -a
ak.file --id VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t --tags myTag
```

```
bash-3.2$
```

Example 2

This example deletes two tags from the specified resource. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
id	VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t
tags	myTag,myTag2

```
bash-3.2$ ./iaas-delete-tags --base-url https://<EnterpriseControllerHostname>/ -a
ak.file --id VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t --tags myTag,myTag2
```

```
bash-3.2$
```

Exit Status

(Success) – The command deletes tags from the specified resource. This command does not return any value as part of the output, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-delete-vnet

Deletes a private vNet.

Syntax

```
iaas-delete-vnet|iaas-delvn [--base-url <base_url>] [--debug]
                           [--header] [--help]
                           [--access-key-file <access_key_file>]
                           [--vnet] <vnet-id>
                           [--coln <columnNames>]
                           [--cols <columnSortNames>]
                           [--colw <columnWidth>]
                           [--sep <separator>]
                           [--trust-store <truststore_file>]
                           [--verbose] [--xml]
```

Description

This command deletes a private vNet from an account. The vNet must not be associated with a vServer.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--vnet <vnet-id>
ID of the virtual network.

--coln <column_names>
Specifies which columns to display for the command output.

--cols <column_sort_names>
Specifies the names of the columns used for sorting the command output.

--colw <columns_width>
Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>
Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>
Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v
Starts the command in verbose mode.

--xml
Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example deletes the specified virtual network. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vnet	VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t

```
bash-3.2$./iaas-delete-vnet --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t
```

```
bash-3.2$
```

Exit Status

(Success) – The command deletes the specified vNet. This command does not return any response, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-delete-volume

Deletes a volume from an account.

Syntax

```
iaas-delete-volume|iaas-delvol [--base-url <base_url>] [--debug] [--header]
                               [--access-key-file <access_key_file>] [--help]
                               [--volume-id] <volume-id>
                               [--coln <columnNames>]
                               [--cols <columnSortNames>]
                               [--colw <columnWidth>]
                               [--sep <separator>]
                               [--trust-store <truststore_file>]
                               [--verbose] [--xml]
```

Description

This command deletes a volume. A deletion of a volume does not affect any volume snapshots that have been created prior based on the deleted volume.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--volume-id <volume-id>

ID of the volume.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example deletes the specified volume. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
volume ID	VOL-82b4661e-de12-4931-b9a4-cce8edd23532

```
bash-3.2$./iaas-delete-volume --base-url https://<EnterpriseControllerHostname>/ -a ak.file --volume-id VOL-82b4661e-de12-4931-b9a4-cce8edd23532
```

```
bash-3.2$
```

Exit Status

(Success) The command deletes the specified volume. This command does not return any response, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-attributes

Displays attributes of a resource in an account.

Syntax

```
iaas-describe-attributes|iaas-dat [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
--id <resource-id>
[--attr-names] <name>[,<name>]*
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command displays the attributes of a resource in an account. This command requires the input of the ID of the resource and the name of the attribute.

The name of the attribute is displayed as part of the header in the describe command for the related resource. For example, you can use the [iaas-describe-volumes](#) command with the --header option to see the attribute names for volumes.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--id <resource-id>

The ID of the resource. The ID of the resource can be obtained using the corresponding iaas-describe* command, for example iaas-describe-server-template.

--attr-names <name>[,<name>]*

List of attribute names. The name of the attribute is any of the names displayed in the header of the output of an iaas-describe-* command (for example, iaas-describe-server-template -H).

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example displays the name attribute of the specified vNet. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
id	VNET-7403e87f-1bab-4097-98ae-ea72d8fe4b3f

```
bash-3.2$ ./iaas-describe-attributes --base-url https://<EnterpriseControllerHostname>/ -a ak.file --id VNET-7403e87f-1bab-4097-98ae-ea72d8fe4b3f --attr-names name

name myVnet2bash-3.2$
```

Example 2

This example displays the name and status attributes of the specified server template. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
id	TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-eeeeeeeeee01

```
bash-3.2$ ./iaas-describe-attributes --base-url https://<EnterpriseControllerHostname>/ -a ak.file --id TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-eeeeeeeeee01 --attr-names name,status

name      default-server-template1
status    OK
bash-3.2$
```

Exit Status

(Success) – The command returns the list of attributes of the specified resource.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-blacklisted-ip-addresses

Lists the IP addresses in the current blacklist.

Syntax

```
iaas-describe-blacklisted-ip-addresses|iaas-dbip [--base-url <base_url>] [--debug]
                                                [--access-key-file <access_key_file>]
                                                [--vnet] <vnet-id>
                                                [--owner <owner-id>]
                                                [--filters <name>=<val>[,<name>=<val>]*]
```

Description

This command lists all IP addresses on the blacklist or the IP addresses with the same owner.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, the command is directed to the current directory.

--help | -h

Displays the usage information for this command.

--vnet <vnet-id>

vNet ID from which IP addresses are allocated.

--owner <owner-id>

The string used to identify the blacklisted IP address

--filters | -f <name>=<val>[,<name>=<val>]*

List of filters.

Examples

Example 1

This example lists the IP addresses on the blacklist. It uses the following options and values:

Option	Option Value
base-url	<code>https://<EnterpriseControllerHostname>/</code>
access-key-file	<code>ak.file</code>
vNet ID	<code>VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c</code>

```
bash-3.2$ ./iaas-describe-ip-addresses --base-url https://<EnterpriseControllerHostname> -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c
192.0.2.2 VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c BLACKLISTED_TEST
192.0.2.3 VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c BLACKLISTED_FINANCE
192.0.2.4 VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c BLACKLISTED
bash-3.2$
```

Example 1

This example lists the IP addresses on the blacklist for the specified owner. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vNet ID	VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c
owner	test

```
bash-3.2$ ./iaas-describe-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c --owner test
192.0.2.2 VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c BLACKLISTED_TEST
bash-3.2$
```

Exit Status

(Success) – The command returns the IP address that match the owner-id or the complete list.

(Failure) – The command displays a descriptive error message and error code.

See Also

- [iaas-blacklist-ip-addresses](#)
- [iaas-clear-blacklisted-ip-addresses](#)

iaas-describe-distribution-groups

Lists distribution groups for an account.

Syntax

```
iaas-describe-distribution-groups|iaas-ddg [--base-url <base_url>] [--debug]
                                            [--access-key-file <access_key_file>]
                                            [--help] [--header]
                                            [--filters <name>=<val>[,<name>=<val>]*]
                                            [--ids <dg-id>[,<dg-id>]*]
                                            [--coln <columnNames>]
                                            [--cols <columnSortNames>]
                                            [--colw <columnWidth>]
                                            [--sep <separator>]
                                            [--trust-store <truststore_file>]
                                            [--verbose] [--xml]
```

Description

This command lists the distribution groups in an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: https://

<EnterpriseControllerHostname>. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, /tmp/ak.file). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--filters | -f <name>=<val>[,<name>=<val>]*

List of filters.

--ids | -i <dg-id>[,<dg-id>]*

List of distribution group IDs.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is TAB.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example lists all the distribution groups in an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

```
bash-3.2$ ./iaas-describe-distribution-groups --base-url https://<EnterpriseControllerHostname>/ -a ~/ak.file -H

id      name      description      status      vservers      size
DG-8e7b0d64-57ca-492d-806d-a2db6b9a00df myDistributionGroup2          OK
VSRV-0f9b005f-bd7d-4166-a4db-5d81cabf5c89           10
DG-068ae84c-d0fc-406d-aa37-0be4f88d411c myDistributionGroup
OK              21
bash-3.2$
```

Exit Status

(Success) – The command returns the list of distribution groups and their attributes. If no distribution groups are found, then the response is empty.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-ip-addresses

Lists of the IP addresses allocated in an account.

Syntax

```
iaas-describe-ip-addresses|iaas-dip [--base-url <base_url>] [--debug]
                                         [--access-key-file <access_key_file>]
                                         [--help] [--header]
                                         [--filters <name>=<val>[,<name>=<val>]*]
                                         [--coln <columnNames>]
                                         [--cols <columnSortNames>]
                                         [--colw <columnWidth>]
                                         [--sep <separator>]
                                         [--trust-store <truststore_file>]
                                         [--verbose] [--xml]
```

Description

This command lists the IP addresses allocated in an account. The attributes displayed as part of the list include the IP address, the vNet ID, and the vServer ID if the IP address is associated with a vServer.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: https://

<EnterpriseControllerHostname>. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, /tmp/ak.file). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--filters | -f <name>=<val>[,<name>=<val>]*

List of filters. Valid names are *ipAddress*, *vnet*, and *vserver*.

--cols <column_names>

Specifies which columns to display for the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example lists all allocated IP addresses for an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/

Option	Option Value
access-key-file	ak.file

```
bash-3.2$./iaas-describe-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file
```

```
192.0.2.5 VNET-cde375904-9d34-4ec8-86b9-d917712abaaa
VSRV-123456789-1234-1234-123456789123
198.51.100.1 VNET-vfr4375904-9d34-4ec8-86b9-d917712abaaa
bash-3.2$
```

Example 2

This example lists the allocated IP addresses from the specified virtual network. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vnet	VNET-cde375904-9d34-4ec8-86b9-d917712abaaa

```
bash-3.2$./iaas-describe-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --filters vnet=VNET-cbd75904-9d34-4ec8-86b9-d917712abaaa
```

```
192.0.2.5      VNET-cde375904-9d34-4ec8-86b9-d917712abaaa
VSRV-123456789-1234-1234-123456789123
192.0.2.1      VNET-cde375904-9d34-4ec8-86b9-d917712abaaa
bash-3.2$
```

Exit Status

(Success) – The command returns the list of allocated IP addresses and their attributes. If no IP addresses are found, then the response is empty.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-key-pairs

Displays the available key pairs for an account.

Syntax

```
iaas-describe-key-pairs|iaas-dkp [--base-url <base_url>] [--debug]
                                 [--header] [--help]
                                 [--access-key-file <access_key_file>]
                                 [--filters <name>=<val>[,<name>=<val>]*]
                                 [--key-names <key-pair-names>]
                                 [--coln <columnNames>]
                                 [--cols <columnSortNames>]
                                 [--colw <columnWidth>]
                                 [--sep <separator>]
                                 [--trust-store <truststore_file>]
                                 [--verbose] [--xml]
```

Description

This command lists the key pairs for an account. This command also allows filtering of the key pairs displayed.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--filters | -f <name>=<val>[,<name>=<val>]*

List of filters.

--key-name | -n <key-pair-name>

Name of key pairs.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example lists the attributes of all the existing key pairs in an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

```
bash-3.2$ ./iaas-describe-key-pairs --base-url https://<EnterpriseControllerHostname>/ -a ak.file
key1      d8:ab:f4:ca:51:ee:40:61:a1:c2:c0:13:49:7c:23:77
bash-3.2$
```

Example 2

This example lists the attributes of the specified key pair. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
key pair name	key1

```
bash-3.2$./iaas-describe-key-pairs --base-url https://<EnterpriseControllerHostname>/ -a ak.file --key-names key1 -H
name      fingerprint
key1      d8:ab:f4:ca:51:ee:40:61:a1:c2:c0:13:49:7c:23:77
bash-3.2$
```

Exit Status

(Success) – The command returns the list of existing key pairs and their attributes. If no key pairs are found, then the response is empty.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-server-templates

Lists server templates and their attributes for an account.

Syntax

```
iaas-describe-server-templates|iaas-dstem [ --base-url <base_url> ] [ --debug ]
                                         [ --access-key-file <access_key_file> ]
                                         [ --header ] [ --help ]
                                         [ --filters <name>=<val>[,<name>=<val>]* ]
                                         [ --ids <t-id>[,<t-id>]* ]
                                         [ --coln <columnNames> ]
                                         [ --cols <columnSortNames> ]
                                         [ --colw <columnWidth> ]
                                         [ --sep <separator> ]
                                         [ --trust-store <truststore_file> ]
                                         [ --verbose ] [ --xml ]
```

Description

This command lists the server templates and their attributes associated with the account. This command also allows filtering of the server templates displayed.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--filters | -f <name>=<val>[,<name>=<val>]*

List of filters to limit the server templates listed by this command. Valid names for filters are description, ID, imageType, memory, name, public, readOnly, size, and status.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--ids | -i <t-id>[,<t-id>]*

List of server template IDs to filter the server templates listed by this command.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example displays all existing server templates of an account and adds a header row. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

```
bash-3.2$ ./iaas-describe-server-templates --base-url https://<EnterpriseControllerHostname>/ --access-key-file ak.file -H
      id      name      description      status      size      public      imageType      readOnly
TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-eeeeeeeeee03 default-server-template3 Default Server
Template OK 197912092999680 false VDMK false
TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-eeeeeeeeee05 default-server-template5 Default Server
Template OK 197912092999680 false VDMK false
bash-3.2$
```

Example 2

This example displays server templates that are public to other accounts. It uses the following options and values:

Option	Environment Variable	Value
base-url	IAAS_BASE_URL	https://<EnterpriseControllerHostname>/
access-key-file	IAAS_ACCESS_KEY_FILE	<username>
filters	NA	public=true

```
bash-3.2$ ./iaas-describe-server-templates --filters public=true

TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-eeeeeeeeee02      default-server-template2
Default Server Template  OK      197912092999680 true   VDMK    false
TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-eeeeeeeeee01      default-server-template1
Default Server Template  OK      197912092999680 true   VDMK    false
bash-3.2$
```

Exit Status

(Success) – The command returns a list of the found server templates.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-snapshots

Displays the snapshots for an account.

Syntax

```
iaas-describe-snapshots|iaas-ds [--base-url <base_url>] [--debug]
                                [--header] [--help]
                                [--access-key-file <access_key_file>]
                                [--filters <val>[,<name>=<val>]*]
                                [--ids <vs-id>[,<vs-id>]*]
```

```
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command lists the available snapshots for an account. The command also allows filtering of the snapshots displayed.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--filters | -f <val>[,<name>=<val>]*

List of filters. Valid names are description, id, name, and status.

--ids | -i <vs-id>[,<vs-id>]*

IDs of the snapshots.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example lists the attributes of all the existing snapshots in an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

```
bash-3.2$ ./iaas-describe-snapshots --base-url https://<EnterpriseControllerHostname>/ -a ak.file -H
      id      name      description      status
SNAP-2f2039cd-943b-4072-9ded-e96b54b7ca79      mySnapshot2      OK
SNAP-d743e90c-53c5-4b01-a297-e2c944755c48      mySnapshot      OK
bash-3.2$
```

Exit Status

(Success) – The command returns a list of the snapshots and their attributes.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-tags

Displays the existing tags in an account.

Syntax

```
iaas-describe-tags|iaas-dtag [--base-url <base_url>] [--debug]
                           [--header] [--help]
                           [--access-key-file <access_key_file>]
                           [--filters <name>[=<val>][,<name>[=<val>]]*)
                           [--ids <res-id>[,<res-id>]*]
                           [--coln <columnNames>]
                           [--cols <columnSortNames>]
                           [--colw <columnWidth>]
```

```
[--sep <separator>]  
[--trust-store <truststore_file>]  
[--verbose] [--xml]
```

Description

This command lists the resources in an account that have a tag associated with them. The attributes displayed by this command are the resource ID, the name of the tag, and the value of the tag. The command also allows filtering of the tags displayed.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--filters | -f <name>[=<val>][,<name>[=<val>]]*

List of filters to limit the resources listed by this command.

Allows the filtering of tags by tag name, tag value, and resource identifier. The result contains only tags that match all elements of the filter list.

--ids | -i <res-id>[,<res-id>]*

IDs of resources in the account to limit the output to only those tags associated with these resources.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example lists the resources that have a tag associated with them in an account, along with the tag name and value. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

```
bash-3.2$ ./iaas-describe-tags --base-url https://<EnterpriseControllerHostname>/ -a ak.file

VNET-77d2b71b-a5ff-4d76-bdc4-fbd9317bbdc1      vNet1Tag  vNet1TagValue
VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t      vNet2Tag  vNet1TagValue
bash-3.2$
```

Example 2

This example lists the tag names and values of the specified virtual network. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
ids	VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t

```
bash-3.2$./iaas-describe-tags --base-url https://<EnterpriseControllerHostname>/ -a ak.file --ids VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t

VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t      vNet2Tag  vNet1TagValue
bash-3.2$
```

Example 3

This example identifies server templates from a particular assembly filtering with the tag name assemblyKey. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
filters	assemblyKey=ASSM-ad6c7baa-0373-41bd-bd5a-051e4ec5f896

```
bash-3.2$./iaas-describe-tags --base-url https://<EnterpriseControllerHostname>/ -a
~/ak.file -H --ids TMPL-955e701d-1396-4e9a-b427-45b278870e1b,TMPL-fa591348-
bfdf1-40a3-b3a2-e030af76b968,TMPL-bc78b1c1-3a78-4f78-
a486-6b2849e8040a,TMPL-5179af29-4332-434f-a25f-8002e61e87ee --filters
assemblyKey=ASSM-ad6c7baa-0373-41bd-bd5a-051e4ec5f896

resourceId      name      value
TMPL-955e701d-1396-4e9a-b427-45b278870e1b      assemblyKey      ASSM-
ad6c7baa-0373-41bd-bd5a-051e4ec5f896
TMPL-fa591348-bfdf1-40a3-b3a2-e030af76b968      assemblyKey      ASSM-
ad6c7baa-0373-41bd-bd5a-051e4ec5f896
bash-3.2$
```

Exit Status

(Success) – The command returns the list of resources with the name and value of the associated tag.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-vdc-capabilities

Displays the vDC capabilities for an account.

Syntax

```
iaas-describe-vdc-capabilities|iaas-dvcap [--base-url <base_url>] [--debug]
                                           [--header] [--help]
                                           [--access-key-file <access_key_file>]
                                           [--filters <name>[=<val>][,<name>[=<val>]]*)
                                           [--coln <columnNames>]
                                           [--cols <columnSortNames>]
                                           [--colw <columnWidth>]
                                           [--sep <separator>]
                                           [--trust-store <truststore_file>]
                                           [--verbose] [--xml]
```

Description

This command displays the virtual datacenter (vDC) capabilities for an account. It also allows filtering of the vDC capabilities displayed.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--filters | -f <name>[=<val>][,<name>[=<val>]]*

List of capability names and optional values to filter.

--help | -h

Displays the usage information for this command.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example lists the capabilities of the vDC associated with the account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

```
bash-3.2$ ./iaas-describe-vdc-capabilities --base-url https://<EnterpriseControllerHostname>/ -a ak.file -H

name      value
VirtualizationType      OVM
VirtualizationVersion    3.0.2
ProcessorArch   Default_Intel_F6_M23
ProcessorVersion    Default_Intel_Family:6_Model:23
DistributionGroupSupport  disabled
HighAvailabilityUserControl=disabled
HighAvailabilityDefault=true
OpsCenterVersion       12.3.0.1705
bash-3.2$
```

Example 2

This example lists only the virtualization type of the vDC for an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
filters	VirtualizationType

```
bash-3.2$ ./iaas-describe-vdc-capabilities --base-url https://<EnterpriseControllerHostname>/ -a ak.file --filters VirtualizationType

VirtualizationType      OVM
bash-3.2$
```

Exit Status

(Success) – The command returns the list of vDC capabilities of the account.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-vnets

Lists virtual network information for an account.

Syntax

```
iaas-describe-vnets|iaas-dvn  [--base-url <base_url>] [--debug]
                             [--header] [--help]
                             [--access-key-file <access_key_file>]
                             [--filters <name>=<val>[,<name>=<val>]*]
                             [--ids <vn-id>[,<vn-id>]*]
                             [--coln <columnNames>]
                             [--cols <columnSortNames>]
                             [--colw <columnWidth>]
                             [--sep <separator>]
                             [--trust-store <truststore_file>]
                             [--verbose] [--xml]
```

Description

This command lists the available virtual networks for an account. It also allows filtering of the vNets displayed. For private networks, the string `private` is added. For public networks, the string `public_external` is added.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--filters | -f <name>=<val>[,<name>=<val>]*

List of filters to limit the virtual networks listed by this command. Valid names for filters are id, name, description, status, and ipAddress. The result contains only virtual networks that match all elements of the filter list.

--ids <vn-id>[,<vn-id>]*

IDs of the virtual networks.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example lists the attributes of all the virtual networks in an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

```
bash-3.2$ ./iaas-describe-vnets --base-url https://<EnterpriseControllerHostname>/-a ak.file -H
      id          name    description   status  ipAddress  vnetType
VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c  vnet1  xy1  OK  192.0.2.0/24  private
VNET-8521f019-b50d-4051-8028-7ed2b0f5d767  vnet2  ab2  NOT CONNECTED  192.0.3.0/24
private
VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t  vnet4  zx4  OK  192.0.6.0/24
public_external
bash-3.2$
```

The status of NOT CONNECTED indicates that the vNet is healthy but not associated with a vDC server pool. The *iaas-connect-vnet* operation connects the vNet to a server pool and changes the status to OK.

Example 2

This example lists the attributes of the specified virtual network IDs. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

Option	Option Value
ids	VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t VNET-7418613f-efaa-42f4-bc96-9583ec39a481

```
bash-3.2$./iaas-describe-vnets --base-url https://<EnterpriseControllerHostname>/ -a ak.file --ids VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t,VNET-7418613f-efaa-42f4-bc96-9583ec39a481
```

```
VNET-5d74972a-bcdd-4714-8c7f-b67d8010f25t    vnet4 zx4  OK  192.0.6.0/24
public_external
bash-3.2$
```

Exit Status

(Success) – The command returns the list of existing virtual networks and their attributes. If no virtual networks are found, the response is empty.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-volumes

Displays volume information for an account.

Syntax

```
iaas-describe-volumes|iaas-dvol [--base-url <base_url>] [--debug]
[--access-key-file <access_key_file>]
[--filters <name>=<val>[,<name>=<val>]*]
[--ids] <vol-id>[,<vol-id>]*
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>] [--header] [--help]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command lists the available volumes for an account. This command also allows filtering of the volumes displayed.

The value in the paths column of the response identifies the path of volume's attachment to the vServer. For a shared volume, that is, a volume attached to more than one vServer, the vserver column includes each vServer UUID and the paths column includes the path to each vServer in the same order as the UUIDs.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--filters | -f <name>=<val>[,<name>=<val>]*

List of filters. Valid names are: id, status, name, description, size, shared, vservers, and path.

--ids | -i <vol-id>[,<vol-id>]*

List of volume IDs.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

iaas-describe-vserver-metrics

Displays vServers metrics for an account.

Syntax

```
iaas-describe-vserver-metrics|iaas-dvm  [--access-key-file <access_key_file>]
                                         [--base-url <base_url>] [--debug]
                                         [--header] [--help]
                                         [--filters <name>=<val>[,<name>=<val>]*]
                                         [--ids <id>[,<id>]*]
                                         [--coln <columnNames>]
                                         [--cols <columnSortNames>]
                                         [--colw <columnWidth>]
                                         [--sep <separator>]
                                         [--trust-store <truststore_file>]
                                         [--verbose] [--xml]
```

Description

This command displays attributes of vServers in an account. The command also allows filtering of vServers displayed.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--filters | -f <name>=<val>[,<name>=<val>]*

List of filters. Valid filter names are: description, name, id, and cpuUsage.

--ids | -i <id>[,<id>]*

List of vServer IDs.

--sep <separator>

Column separator character. The default separator is *TAB*.

--cols <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example lists the attributes of all the vServers found in an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

```
bash-3.2$ ./iaas-describe-vserver-metrics --base-url https://<EnterpriseControllerHostname>/ -a ak.file -H

  id      name      description      status    cpuUsage
  VSRV-2e4f6688-2c57-4f41-8d3d-83d2d71d1a64      testvserver3  Oracle VM Virtual
  Machine      RUNNING      0.1508

  Machine      RUNNING      0.067
bash-3.2$
```

Example 2

This example lists the attributes of the specified vServers filtering by vServer name. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
filters	name=testvserver3

```
bash-3.2$./iaas-describe-vserver-metrics --base-url https://<EnterpriseControllerHostname>/ -a ak.file --filters name="testvserver3" -H
id      name      description      status      cpuUsage
VSERV-2e4f6688-2c57-4f41-8d3d-83d2d71d1a64      testvserver3      Oracle VM Virtual
Machine      RUNNING      0.1508
bash-3.2$
```

Exit Status

(Success) – The command returns the list of existing vServers and their metrics. If no vServers are found, the response is empty.

(Failure) – The command displays a descriptive error message and error code.

iaas-describe-vservers

Displays vServer information for an account.

Syntax

```
iaas-describe-vservers|iaas-dvss  [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
[--filters <name>=<val>[,<name>=<val>]*]
[--ids <id>[,<id>]*]
[--coln <columnNames>]
```

```
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command displays the attributes of vServers in an account. The command also allows filtering of vServers displayed.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--filters | -f <name>=<val>[,<name>=<val>]*

List of filters. Valid filter names are: description, name, status, id, serverTemplateId, keyPair, vserverType, ha, distributionGroup, volumes, vcpu, memoryMb, dedicatedStorageMb, and attachedStorageMb.

--ids | -i <id>[,<id>]*

List of vServer IDs.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

iaas-describe-vserver-types

Displays the available vServer types for an account.

Syntax

```
iaas-describe-vserver-types|iaas-dvst  [--base-url <base_url>] [--debug]
                                         [--header] [--help]
                                         [--access-key-file <access_key_file>]
                                         [--coln <columnNames>]
                                         [--cols <columnSortNames>]
                                         [--colw <columnWidth>]
                                         [--sep <separator>]
                                         [--trust-store <truststore_file>]
                                         [--verbose] [--xml]
```

Description

This command displays the available vServers types for an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples**Example 1**

This example lists all the permitted vServer types for an account. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file

```
bash-3.2$ ./iaas-describe-vserver-types --base-url https://<EnterpriseControllerHostname>/ -a ak.file -H
```

id	name	description	memorySize	storageSize	vcpu
small	small	small instance type	1073741824	10737418240	1
medium	medium	medium instance type	4294967296	107374182400	2
large	large	large instance type	17179869184	1073741824000	4

Exit Status

(Success) – The command returns the list of existing vServer types and their attributes. If no vServer types are found, then response is empty. If the response is an empty list, contact your cloud administrator to verify your cloud user's privileges.

(Failure) – The command displays a descriptive error message and error code.

iaas-detach-volumes-from-vserver

Detaches one or more volumes from a vServer.

Syntax

```
iaas-detach-volumes-from-vserver|iaas-detvol [--base-url <base_url>] [--debug]
                                              [--access-key-file <access_key_file>]
                                              [--header] [--help]
                                              [--force]
                                              --vserver-id <vserver-id>
                                              [--volume-ids] <vol-id>[,<vol-id>]*
                                              [--coln <columnNames>]
                                              [--cols <columnSortNames>]
                                              [--colw <columnWidth>]
                                              [--sep <separator>]
```

```
[--trust-store <truststore_file>]  
[--verbose] [--xml]
```

Description

This command detaches one or more volumes from a vServer.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--vserver-id | -i <vserver-id>

ID of the vServer.

[--volume-ids] <vol-id>[,<vol-id>]*

Volume IDs.

--force | -f

Force the detach operation.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example detaches the specified volume from a vServer. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vserver-id	VSRV-0fb57293-347c-4717-96ef-6dd23154596f

```
bash-3.2$./iaas-detach-volumes-from-vserver --base-url https://<EnterpriseControllerHostname>/ -a ~/ak.file --vserver-id VSRV-0fb57293-347c-4717-96ef-6dd23154596f --volume-ids VOL-052cb4b4-5e56-4303-8b3a-82d6ba743a15 --force
```

bash-3.2\$

Exit Status

(Success) – The command detaches the specified volumes from the vServer. This command does not return any response, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-import-key-pair

Imports an existing key pair to an account.

Syntax

```
iaas-import-key-pair|iaas-ikp [--base-url <base_url>] [--debug]
                               [--header] [--help]
                               [--access-key-file <access_key_file>]
                               --key-file <key-file-name>
```

```
--key-name <key-pair-name>
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command stores a public RSA key to the application. This public key is created with a third-party tool, and it is stored in the *key-file* used as part of this command.

The supported formats of the public key to be imported are:

- OpenSSH
- SECSH

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--key-file | -k <key-file-name>

Name of the file containing the public key.

--key-name | -n <key-pair-name>

Name of the key pair.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example imports a key pair based on the specified key pair file. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
key-file	myOtherPair.key
key-name	myOtherPair

```
bash-3.2$ ./iaas-import-key-pair --base-url https://<EnterpriseControllerHostname>/
-a ak.file --key-name myOtherPair --key-file myOtherPair.key
```

```
myOtherPair      d9:ab:f4:ca:51:ee:40:61:a1:c2:c0:13:49:7c:23:77
bash-3.2$
```

Exit Status

(Success) – The command returns the name and the fingerprint of the imported key.

(Failure) – The command displays a descriptive error message and error code.

iaas-import-volume

Imports a volume.

Syntax

```
iaas-import-volume|iaas-ivol  [--base-url <base_url>] [--debug]
                             [--access-key-file <access_key_file>]
                             [--header] [--help]
                             --name <name>
                             [--desc <descr>]
                             [--url] <url>
                             [--coln <columnNames>]
                             [--cols <columnSortNames>]
                             [--colw <columnWidth>]
                             [--sep <separator>]
                             [--shared]
                             [--trust-store <truststore_file>]
                             [--verbose] [--xml]
```

Description

This command imports a volume from another location.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--name | -n <name>

Name of the volume.

--url <>

URL of the volume to import.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--shared

Flag to indicate that the volume is shared.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--desc | -d <descr>

Description of the volume.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example imports a volume based on the image file of the specified URL. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
url	http://example.com/volume-image/volume.img
volume name	myVolume

```
bash-3.2$ ./iaas-import-volume --base-url https://<EnterpriseControllerHostname>/ -a ak.file --name myVolume --url http://example.com/volume-image/volume.img
VOL-e9afec8c-dbe2-4e03-8561-15716650b81e
bash-3.2$
```

Exit Status

(Success) – The command returns the volume ID.

(Failure) – The command displays a descriptive error message and error code.

iaas-modify-attributes

Modifies the attributes of a resource in an account.

Syntax

```
iaas-modify-attributes|iaas-ma [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
--id <resource-id>
[--attributes] <name>=<val>[,<name>=<val>]*
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command modifies the attributes of a resource in an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--help | -h

Displays the usage information for this command.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--id <resource-id>

ID of the resource. The ID of the resource can be obtained by using the corresponding iaas-describe* command (for example, iaas-describe-server-templates).

--attributes <name>=<val>[,<name>=<val>]*

List of attribute name and value pair. The name of the attribute is any of the names displayed in the header of output of an iaas-describe-* command (for example, iaas-describe-server-templates -H).

--cols <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example modifies the name attribute of the specified vNet. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
id	VNET-7403e87f-1bab-4097-98ae-ea72d8fe4b3f

```
bash-3.2$ ./iaas-modify-attributes --base-url https://<EnterpriseControllerHostname>/ -a ak.file --id VNET-7403e87f-1bab-4097-98ae-ea72d8fe4b3f --attributes name=myNewName
```

```
bash-3.2$
```

Example 2

This example modifies the name and public attribute of the specified server template. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
id	TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-eeeeeeeeee01

```
bash-3.2$ ./iaas-modify-attributes --base-url https://<EnterpriseControllerHostname>/ -a ak.file --id TMPL-aaaaaaaa8-bbb4-ccc4-ddd4-eeeeeeeeee01 --attributes name=myNewName,public=true
```

bash-3.2\$

Exit Status

(Success) – The command modifies the specified attributes. This command does not return any value, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-reboot-vservers

Reboots vServers for an account.

Syntax

```
iaas-reboot-vservers|iaas-rebvss [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
[--vserver-ids] <id>[,<id>]*
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command reboots one or more vServers for an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--help | -h

Displays the usage information for this command.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--vserver-ids <id>[,<id>]*

vServer IDs.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example reboots a vServer. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vserver-ids	VSRV-8ae29df9-ccfe-4184-acb8-10080665d7f6

```
bash-3.2$./iaas-reboot-vservers --base-url https://<EnterpriseControllerHostname>/-a ak.file --vserver-ids VSRV-0fb57293-347c-4717-96ef-6dd23154596f
```

bash-3.2\$

Exit Status

(Success) The command restarts the specified vServers. This command does not return any response, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-receive-message-from-vserver

Receives one message from a vServer. Use this command with vServers supported by Oracle VM Server for SPARC. Do not use with vServers supported by Oracle Solaris Zones.

Syntax

```
iaas-receive-message-from-vserver|iaas-rmfvs [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
--vserver-id <vserver-id>
[--key] <key>
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command receives a message from a vServer. The command reads the message from the common buffer in the virtualization layer by name. This action might return an error if the vServer is not in an appropriate state to receive messages.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--vserver-id | -i <vserver-id>

vServer ID.

--key <key>

Key of the message to retrieve.

--cols <column_names>

Specifies which columns to display for the command output.

--colw <columns_width>

Specifies the names of the columns used for sorting the command output.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example receives a message from a vServer. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vServer ID	VSRV-8ae29df9-ccfe-4184-acb8-10080665d7f6

```
bash-3.2$./iaas-receive-message-from-server --base-url https://<EnterpriseControllerHostname>/ -a ~/ak.file --vserver-id VSRV-8ae29df9-ccfe-4184-acb8-10080665d7f6 --key com.oracle.ovab.test-response
```

```
MyMessage
bash-3.2$
```

Exit Status

(Success) – The command displays the message received from the specified vServer.

(Failure) – The command displays a descriptive error message and error code.

iaas-release-ip-addresses

Releases allocated IP addresses of a virtual network.

Syntax

```
iaas-release-ip-addresses|iaas-rip [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
--vnet <vnet-id>
[--ip-addresses] <ip>[,<ip>]*
[--coln <columnNames>]
```

```
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command releases the allocated IP addresses of a public or private virtual network. The IP addresses must not be associated with a vServer.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--vnet <vnet-id>

vNet ID of the IP addresses to be released.

--ip-addresses <ip>[,<ip>]*

List of IP addresses to be released.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is `$HOME/.oracle_iaas/truststore`.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example releases an allocated IP address of the specified virtual network. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vnet	VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c

```
bash-3.2$ ./iaas-release-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c --ip-addresses 192.0.2.1
```

```
bash-3.2$
```

Example 2

This example releases three allocated IP addresses of the specified virtual network. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vnet	VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c

```
bash-3.2$ ./iaas-release-ip-addresses --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vnet VNET-9634972a-bcdd-4714-8c7f-b67d8010f13c --ip-addresses 192.0.2.2,192.10.2.3,192.0.2.4
```

```
bash-3.2$
```

Exit Status

(Success) – The command releases the allocated IP addresses of the specified virtual network. The command does not return any messages.

(Failure) – The command displays a descriptive error message and error code.

iaas-run-vserver

Creates and starts a vServer assigning specific IP addresses.

Syntax

```
iaas-run-vserver|iaas-rvs [--base-url <base_url>] [--debug]
                           [--header] [--help]
                           [--access-key-file <access_key_file>]
                           [--dist-group <dg-id>]
                           --ip-addresses <ip>[,<ip>]*
                           [--key-name <key-pair-name>]
                           --name <name>
                           [--desc <descr>]
                           --server-template-id <server-template-id>
                           --vnets <vn-id>[,<vn-id>]*
                           [--volumes <vol-id>[,<vol-id>]*]
                           --vserver-type <type>
                           [--ha <true/false>]
                           [--messages <key>=<value>[,<key>=<value>]*]
                           [--hostname <hostname>]
                           [--root-password-file <root-password-file>]
                           [--coln <columnNames>]
                           [--cols <columnSortNames>]
                           [--colw <columnWidth>]
                           [--sep <separator>]
                           [--trust-store <truststore_file>]
                           [--verbose] [--xml]
```

Description

This command creates and starts a single vServer assigning specific IP addresses.

Options**--base-url <base_url>**

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, /tmp/ak.file). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--dist-group <dg-id>

A distribution group ID.

--ip-addresses <ip>[,<ip>]*

List of reserved IP addresses, one for each virtual network.

--key-name | -k <key-pair-name>

Name of a key pair.

--name | -n <name>

Name of the vServer.

--desc | -d <descr>

Description of the vServer.

--server-template-id <server-template-id>

ID of the server template.

--vnets <vn-id>[,<vn-id>]*

List of virtual network IDs.

--volumes | -m <vol-id>[,<vol-id>]*

List of volume IDs.

--vserver-type <type>

vServer type.

--ha <true/false>

Flag to indicate if HA is enabled or disabled for the vServer. Default value is taken from the HighAvailabilityDefault capability of the vDC.

--messages <key>=<value>[,<key>=<value>]

List of messages for the vServer.

--hostname <hostname>

Internal host name for the vServer. It must be RFC 1123 compliant.

--root-password-file <root-password-file>

Path and file name of the file storing the password to set or override the root password for the vServer.

--cols <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example creates and starts a vServer. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
key-name	myKeyPair

```
bash-3.2$../iaas-run-vserver --base-url https://<EnterpriseControllerHostname>/ -a
~/ak.file --vnets VNET-84ada392-1c13-4f86-8365-1cf7f9c8aadf --key-name myKeyPair --
name myVserver --server-template-id TMPL-9e4a9ed3-e675-45f1-9d7c-b21c25a55632 --ip-
addresses 192.0.2.2 --vserver-type 457
```

```
VSRV-0fb57293-347c-4717-96ef-6dd23154596f
bash-3.2$
```

Exit Status

(Success) – The command creates and starts a vServer. This command returns the vServer ID.

(Failure) – The command displays a descriptive error message and error code.

iaas-run-vservers

Creates and starts one or more vServers assigning IP addresses automatically.

Syntax

```
iaas-run-vservers|iaas-rvss [--base-url <base_url>] [--debug]
                             [--header] [--help]
                             [--access-key-file <access_key_file>]
                             [--key-name <key-pair-name>]
                             --name <name>
                             [--desc <descr>]
                             [--dist-group <dg-id>]
                             [--num <num>]
                             --server-template-id <server-template-id>
                             --vnets <vn-id>[,<vn-id>]*
                             [--volumes <vol-id>[,<vol-id>]*]
                             --vserver-type <type>
                             [--ha <true/false>]
                             [--mesages <key>=<value>[,<key>=<value>]*]
                             [--hostname <hostname>]
                             [--root-password-file <root-password-file>]
                             [--coln <columnNames>]
                             [--cols <columnSortNames>]
                             [--colw <columnWidth>]
                             [--sep <separator>]
                             [--trust-store <truststore_file>]
                             [--verbose] [--xml]
```

Description

This command creates and starts one or more vServers. A suffix is appended to the vServer name to distinguish among all the vServers created. The suffix is a numerical sequence.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--key-name | -k <key-pair-name>

Name of the key pair.

--name | -n <name>

Name of the vServer.

--desc | -d <descr>

Description of the vServer.

--dist-group <dg-id>

Distribution group ID.

--num <num>

The number of vServers to run. The default is 1.

--server-template-id <server-template-id>

ID of the server template.

--vnets <vn-id>[,<vn-id>]*

List of virtual network IDs.

--volumes | -m <vol-id>[,<vol-id>]*

List of volume IDs.

--vserver-type <type>]

vServer type.

--ha <true/false>

Flag to indicate whether HA is enabled or disabled for the vServer. Default value is taken from the *HighAvailabilityDefault* capability of the vDC.

--messages <key>=<value>[,<key>=<value>]

List of messages for the vServers.

--hostname <hostname>

Internal host name for the vServers. It must be RFC 1123 compliant.

--root-password-file <root-password-file>

Path and file name of the file storing the password to set or override the root password for the vServer.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples**Example 1**

This example creates two vServers. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
key-name	myKeyPair

```
bash-3.2$./iaas-run-vservers --base-url https://<EnterpriseControllerHostname>/ -a
ak.file --key-name myKeyPair --name myVserver --num 2 --server-template-id
TMPL-2f313208-433c-4b92-aae6-6373c38b795e --vnets VNET-6ea466f5-6e6b-4159-
adf3-8867473d4cf4 --vserver-type 457
VSRV-d6800889-f59b-4798-a57d-3f9f31b0cf1c
VSRV-d6500889-f59b-4567-a65g-3f9f31b0sel1d
bash-3.2$
```

Exit Status

(Success) – The command creates and starts the number of specified vServers. This command returns the vServer IDs.

(Failure) – The command displays a descriptive error message and error code.

iaas-send-messages-to-vserver

Sends messages to a vServer. Use this command with vServers supported by Oracle VM Server for SPARC. Do not use with vServers supported by Oracle Solaris Zones.

Syntax

```
iaas-send-messages-to-vserver|iaas-smtvs [--base-url <base_url>] [--debug]
                                           [--header] [--help]
                                           [--access-key-file <access_key_file>]
                                           --vserver-id <vserver-id>
                                           [--messages] <key>=<value>[,<key>=<value>]*
                                           [--coln <columnNames>]
                                           [--cols <columnSortNames>]
                                           [--colw <columnWidth>]
                                           [--sep <separator>]
                                           [--trust-store <truststore_file>]
                                           [--verbose] [--xml]
```

Description

This command sends messages to a vServer. These messages can be read from the guest operating system. The message is sent to a common buffer in the virtualization layer that has a limited size. This action might return an error if the size limit is reached or if the vServer is not in an appropriate state to send messages.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--vserver-id | -i <vserver-id>

vServer ID.

--messages <key>=<value>[,<key>=<value>]*

List of messages.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example sends a message to a vServer. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vserver-id	VSRV-8ae29df9-ccfe-4184-acb8-10080665d7f6

```
bash-3.2$../iaas-send-message-to-vserver --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vserver-id VSRV-8ae29df9-ccfe-4184-acb8-10080665d7f6 --messages com.oracle.ovab.test=Running
```

```
bash-3.2$
```

Exit Status

(Success) – The command sends the message to the specified vServer. This command does not return any response, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

iaas-start-vservers

Starts one or more vServers for an account.

Syntax

```
iaas-start-vservers|iaas-stavss [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
[--vserver-ids] <id>[,<id>]*
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command starts one or more vServers for an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--vserver-ids <id>[,<id>]*

List of vServer IDs.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples**Example 1**

The following example starts the specified vServer. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vserver-id	VSRV-c1e236e6-ef4d-4936-911a-97923dfbc291

```
bash-3.2$ ./iaas-start-vservers --base-url https://<EnterpriseControllerHostname> -  
a ak.file --vserver-ids VSRV-c1e236e6-ef4d-4936-911a-97923dfbc291
```

```
bash-3.2$
```

Exit Status

(Success) – The command starts the specified vServer. This command does not return any value, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

See Also

- [iaas-receive-message-from-vserver](#)
- [iaas-run-vserver](#)
- [iaas-run-vservers](#)

- [iaas-send-messages-to-vserver](#)
- [iaas-stop-vservers](#)
- [iaas-terminate-vservers](#)

iaas-stop-vservers

Stops one or more vServers for an account.

Syntax

```
iaas-stop-vservers|iaas-stovss [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
[--vserver-ids] <id>[,<id>]*
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command stops one or more vServers for an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--vserver-ids <id>[,<id>]*

List of vServer IDs.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

The following example stops the specified vServer. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vserver-id	VSRV-c1e236e6-ef4d-4936-911a-97923dfbc291

```
bash-3.2$ ./iaas-stop-vservers --base-url https://<EnterpriseControllerHostname>/ -a ak.file --vserver-ids VSRV-c1e236e6-ef4d-4936-911a-97923dfbc291
```

```
bash-3.2$
```

Exit Status

(Success) – The command stops the specified vServer. This command does not return any response, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

- [iaas-run-vservers](#)

- [iaas-send-messages-to-vserver](#)
- [iaas-start-vservers](#)
- [iaas-terminate-vservers](#)

iaas-terminate-vservers

Stops and deletes one or more vServers for an account.

Syntax

```
iaas-terminate-vservers|iaas-tvss [--base-url <base_url>] [--debug]
[--header] [--help]
[--access-key-file <access_key_file>]
[--force]
[--vserver-ids] <id>[,<id>]*
[--coln <columnNames>]
[--cols <columnSortNames>]
[--colw <columnWidth>]
[--sep <separator>]
[--trust-store <truststore_file>]
[--verbose] [--xml]
```

Description

This command stops and deletes one or more vServers for an account.

Options

--base-url <base_url>

Base URL of the Enterprise Controller where the Web service is running. The value for this option must use the following syntax: `https://<EnterpriseControllerHostname>`. If this option is not specified, then the URL information is taken from the value set in the IAAS_BASE_URL environment variable.

--debug | -D

Starts the command in debug mode.

--header | -H

Adds a header row to the output. The default output shows no header.

--access-key-file | -a <access_key_file>

Complete path and name of the file that stores the access key (for example, `/tmp/ak.file`). If a path is not specified, then the command looks for the file in the current directory.

--help | -h

Displays the usage information for this command.

--force | f

Forces the execution of the command.

--vserver-ids <id>[,<id>]*

List of vServer IDs.

--coln <column_names>

Specifies which columns to display for the command output.

--cols <column_sort_names>

Specifies the names of the columns used for sorting the command output.

--colw <columns_width>

Sets the width of columns for the command output. The default value is 50 characters.

--sep <separator>

Column separator character. The default separator is *TAB*.

--trust-store <truststore_file>

Name of the file containing the trusted SSL certificate. The default is \$HOME/.oracle_iaas/truststore.

--verbose | -v

Starts the command in verbose mode.

--xml

Displays the output result in XML format. The default output is in table format.

Examples

Example 1

This example deletes a vServer. It uses the following options and values:

Option	Option Value
base-url	https://<EnterpriseControllerHostname>/
access-key-file	ak.file
vserver-id	VSRV-0fb57293-347c-4717-96ef-6dd23154 596f

```
bash-3.2$./iaas-terminate-vservers --base-url https://<EnterpriseControllerHostname>/ -a ~/ak.file --vserver-ids VSRV-0fb57293-347c-4717-96ef-6dd23154596f --force
```

```
bash-3.2$
```

Exit Status

(Success) – The command stops and deletes the specified vServers. This command does not return any response, only the command prompt is returned.

(Failure) – The command displays a descriptive error message and error code.

Cloud Infrastructure API Reference

This chapter describes some characteristics of the cloud infrastructure API. It also presents a description of the information contained in a typical request to the cloud infrastructure API, and contains all actions and data types information.

The following topics are covered in this chapter:

- [Overview of the Cloud Infrastructure API](#)
- [Cloud Infrastructure API Requests](#)
- [List of Actions](#)

Overview of the Cloud Infrastructure API

Describes the role of the Cloud Infrastructure API.

The cloud infrastructure API is a Web service API implemented in Oracle Enterprise Manager Ops Center that exposes its virtual datacenter management system. This Web service provides access to a subset of the virtual datacenter functionality available through the Oracle Enterprise Manager Ops Center user interface.

The functionality exposed by the Web service can then be accessed programmatically using the Java client API, the CLI, or by making calls directly to the Web service.

This functionality includes the management of vServers, server templates, network resources, and storage resources for an account.

Cloud Infrastructure API Requests

Describes the process for requests to the Web service.

The Web service was developed as a simple query Web service. This Web service requires an SSL encrypted HTTP connection. A typical request to the Web service is made through HTTP using a GET or POST method that includes the request parameters for the desired action. The Web service returns the result of a request in XML format that conforms to the XML schema of the Web service.

The Web service implementation added the following servlets deployed into the Common Agent Container of Oracle Enterprise Manager Ops Center:

- The AKM servlet handles all actions related to account authentication.
- The IAAS servlet handles all actions related to cloud computing management.

Required Web Service HTTP Request Parameters

All requests to the Web service share some required parameters. Other parameters are only required for requests to the specific servlet, AKM or IAAS. [Table 5-1](#) contains the common parameters that are required in an HTTP request to the Web service.

Table 5-1 Required Parameters for an HTTP Request

Servlet	Parameter	Description
AKM and IAAS	Action	Indicates the name of the IAAS or AKM action to perform
AKM and IAAS	Version	Version of the Web service
IAAS only	AccessKeyId	Access Key ID. This parameter identifies the user and the account. This is the value returned by the <i>RegisterAccessKey</i> action.
AKM and IAAS	Timestamp	Timestamp in milliseconds since January 1, 1970
AKM and IAAS	Expires	Time at which the request expires. Expiry date in milliseconds since January 1, 1970; it must be greater than the timestamp.
IAAS only	Signature	Encoded hash value of the data to be signed. Signature is used to authenticate the data.
IAAS only	SignatureMethod	Type of the signature
IAAS only	SignatureVersion	Version number of the signature

Signing a Web Service Request

Procedure to sign a request for the Web service.

Signing a request to the Web service involves applying the following algorithm.

1. Collect all parameters for the Web service request (see [Table 5-1](#)). The parameters and their values are UTF-8 strings. The signature is not yet included in these parameters because the aim of the algorithm is to calculate the value of this signature parameter.
2. The URL encodes all parameter names and their values. The following characters are not URL encoded and remain as they are: A to Z, a to z, 0 to 9, minus (-), underscore (_), period (.), and asterisk (*). All other characters are encoded as %XX (with XX being a hexadecimal number consisting of 0 to 9 and/or uppercase A to F). Extended UTF-8 characters are encoded with %XX%XX. Space is encoded as a plus sign (+). This is what Java's `java.net.URLEncoder.encode()` method does, using UTF-8 as encoding.
3. Create a string by concatenating the next elements in the same order. A "`\n`" is required between every field.
 - a. POST or GET, depending on request type. "`\n`"
 - b. Host name as given in the HTTP host header field, all in lower case (for example, `opscenter.com`) "`\n`"
 - c. Base URL of the Web service. "`\n`"
 - d. A sequence of the sorted, encoded parameter names, followed directly by the equal sign (=) and their corresponding encoded parameter value. The parameters are joined together with the ampersand (&). "`\n`"

Sign this string using the private key and the specified SignatureMethod and SignatureVersion parameters. The signature method must be SHA512withRSA.

The signing result is then used as the value of the signature parameter for the request.

[Example 5-1](#) and [Example 5-2](#) show a complete URL for an HTTP GET request to the IAAS and AKM servlet. For a detailed example of generating requests to the Web service, see [Web Service Client Example](#).

Example 5-1 URL for an HTTP GET request to the IAAS servlet

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeVnets&Version=1&AccessKeyId=AK_1&Timestamp=1331058169938&Expires=13310  
58469938&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=bj8GfJCqvPZZPU2Jo  
WAGzZdCF+N767rQejILMQwNdgKLfoGGqAwDPRYMr/  
ghUoBc6RB3nKYgAyPdmtCfhzRGtqECgUWy0jCrE99+utGeeJ0/XRQ9LxyYeBgzjO3lHP+hFhUo  
+gUtQaSYPHUH7eTkxg/CrolMxibglypJM/rIf90yEqSeqphQt7hWx1T0DNAy6/cZt8isT/  
Tu8V7ZFjBFkEpLfN97bIOJ2vIIpOeetmftuw4ObtqjbUp6+7dpVkhhCQnX0MAIDj+mjorEOzcwK  
+FlpYuzES0fjaW0MowG+cA/9gttDjg7r5H29i3qbbjIlvAt6fk1HPpSxQTSTOTg==
```

Example 5-2 URL for an HTTP GET request to the AKM servlet

```
https://<<username>>:<<password>>@<EnterpriseControllerHostname>/akm/?  
Action=  
DescribeAccounts&Version=1&Timestamp=1330954619299&Expires=1330954919299
```

List of Actions

The following actions are described in this section:

Functionality	Actions
Account access	CreateAccessKeyAsObjectRequest , CreateAccessKeyToFileRequest , DeleteAccessKeyRequest , DescribeAccessKeysRequest , DescribeAccountsRequest , RegisterAccessKeyRequest
Server template management	DeregisterServerTemplateRequest , DescribeServerTemplatesRequest , RegisterServerTemplateFromUrlRequest , RegisterServerTemplateFromVserverRequest , RegisterServerTemplatesFromAssemblyRequest
Virtual network management	CreateVnetRequest , ConnectVnetRequest , DeleteVnetRequest , DescribeVnetsRequest
vIP address management	AllocateIpAddressesRequest , BlacklistIpAddressesRequest , ClearBlacklistIpAddressesRequest , DescribeIpAddressesRequest , DescribeBlacklistedIpAddressesRequest , ReleaseIpAddressesRequest
Volume management	AttachVolumesToVserverRequest , CreateVolumeRequest , DeleteVolumeRequest , DescribeVolumesRequest , DetachVolumesFromVserverRequest , ImportVolumeRequest
Snapshot management	CreateSnapshotRequest , DeleteSnapshotRequest , DescribeSnapshotsRequest

Functionality	Actions
Key pair management	CreateKeyPairAsObjectRequest , CreateKeyPairToFileRequest , DeleteKeyPairRequest , DescribeKeyPairsRequest , ImportKeyPairRequest
vServer management	DescribeVserversRequest , DescribeVserverTypesRequest , RebootVserversRequest , ReceiveMessageFromVserverRequest , RunVserverRequest , RunVserversRequest , SendMessagesToVserverRequest , StartVserversRequest , StopVserversRequest , TerminateVserversRequest
Distribution group management	CreateDistributionGroupRequest , DeleteDistributionGroupRequest , DescribeDistributionGroupsRequest
Resource attribute management	DescribeAttributesRequest , ModifyAttributesRequest
Tag management	CreateTagsRequest , DeleteTagsRequest , DescribeTagsRequest
vDC capabilities	DescribeVdcCapabilitiesRequest

AllocateIpAddressesRequest

Description

Action to allocate a number of IP addresses from a vNET.

Request Parameters

vnet

ID of the vNET.

Type: *VnetIdType*

Default: *None*

Required: Yes

num

Number of IP addresses to reserve.

Type: *PositiveInteger*

Default: 1

Required: No

Result Elements

The result elements are contained in *AllocateIpAddressesResult*.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

ipAddresses

List of reserved IP addresses.

Type: *xs:string*

Minimum: 0

Maximum: *Unbounded*

Examples

Example 1

The following example allocates an IP address from a vNET.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=AllocateIpAddresses&Version=1&Timestamp=1320342206808&Expires=1320342506808&vnet=VNET-6ea466f5-6e6b-4159-adf3-8867473d4cf4&AccessKeyId=AK_32&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_RELIABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AllocateIpAddressesResult" requestId="403"><ipAddresses>192.0.2.13</ipAddresses></result>
```

Example 2

The following example allocates two IP addresses from the specified vNET.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=AllocateIpAddresses&Version=1&Timestamp=1320341343286&Expires=1320341643286&num=2&vnet=VNET-6ea466f5-6e6b-4159-adf3-8867473d4cf4&AccessKeyId=AK_32&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_RELIABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AllocateIpAddressesResult" requestId="399"><ipAddresses>192.0.2.1</ipAddresses><ipAddresses>192.0.2.2</ipAddresses></result>
```

AttachVolumesToVserverRequest

Description

Action to attach one or more volumes to a vServer.

Request Parameters

vserverId

ID of the vServer.

Type: *VserverIdType*

Default: *None*

Required: *Yes*

volumeIds

List of volume IDs.

Type: *VolumeIdType*

Default: *None*

Required: *Yes*

Minimum: *1*

Maximum: *Unbounded*

Result Elements

The result elements are contained in *AttachVolumesToVserverResult*.

requestId

ID of the request.

Type: *xs:string*

Required: *Yes*

Examples

Example 1

The following example attaches a volume to the specified vServer.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=AttachVolumesToVserver&Version=1&Timestamp=1321384886152&Expires=132138518615  
2&volumeIds.1=VOL-052cb4b4-5e56-4303-8b3a-82d6ba743a15&vserverId=VSRV-8ae29df9-  
ccfe-4184-  
acb8-10080665d7f6&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READ  
ABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="AttachVolumesToVserverResult" requestId="151"/>
```

BlacklistIpAddressesRequest

Description

Action to reserve one or more allocated IP addresses from a virtual network.

Request Parameters

vnet

ID of the virtual network.

Type: *VnetIdType*

Required: Yes

num

Number of IP addresses to be blacklisted.

Type: *Integer*

Required: No

owner

Alphanumeric string to identify the cloud user or the purpose of the blacklisted IP address.

Type: *String*

Required: No

Result Elements

The result elements are contained in BlacklistIpAddressesResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples

Example 1

The following example releases the specified IP addresses from the virtual network.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=BlacklistIpAddresses&Version=1&Timestamp=1320341801846&Expires=1320342101846&  
ipAddresses.2=192.0.2.10&ipAddresses.1=192.0.2.13&vnet=VNET-6ea466f5-6e6b-4159-  
adf3-8867473d4cf4&AccessKeyId=AK_32&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_REA  
DABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://  
www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"  
xsi:type="BlacklistIpAddressesResult" requestId="402"/>
```

See Also

- [AllocateIpAddressesRequest](#)

ClearBlacklistIpAddressesRequest

Description

Action to remove the specified IP addresses from the blacklist, making them available.

Request Parameters

vnet

ID of the virtual network.

Type: *VnetIdType*

Required: Yes

ipAddresses

One or more blacklisted IP addresses.

Type: *GenericString*

Required: Yes

Result Elements

The result elements are contained in *ClearBlacklistIpAddressesResult*.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples

Example 1

The following example releases the specified IP addresses from the blacklist, making them available.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=ClearBlacklistIpAddresses&Version=1&Timestamp=1320341801846&Expires=1320342101846&ipAddresses.2=192.0.2.10&ipAddresses.1=192.0.2.13&vnet=VNET-6ea466f5-6e6b-4159-adf3-8867473d4cf4&AccessKeyId=AK_32&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_ABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="ClearBlacklistIpAddressesResult" requestId="402"/>
```

See Also

- [BlacklistIpAddressesRequest](#)

ConnectVnetRequest**Description**

Action to connect a private virtual network to all the server pools in a vDC.

Request Parameters**vnet**

ID of the virtual network.

Type: *VnetIdType*

Default: *None*

Required: Yes

Result Elements

The result elements are contained in ConnectVnetResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples**Example 1**

The following example connects the specified private virtual network.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=ConnectVnet&Version=1&Timestamp=1318283467620&Expires=1318283767620&vnet=VNET  
-00cd848c-771a-4091-  
b3f4-195a090bbc01&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READ  
ABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://  
www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"  
xsi:type="ConnectVnetResult" requestId="142"/>
```

CreateAccessKeyAsObjectRequest

Description

Action to create an access key for a cloud user for the specified account. This action also allows the creation of an access key on behalf of another user.

Request Parameters

account

ID of the account.Type: *AccountIdType*

Default: *None*

Required: Yes

forUser

User name of a different cloud user. A user can create an access key on behalf of another cloud user. This option requires cloud administrator privileges.Type: *GenericString*

Default: *None*

Required: No

Result Elements

The CreateAccessKeyAsObjectResult type is created by hand as it contains the AccessKey class and is only required on the client side.

Examples

No examples are provided for this action. See the RegisterAccessKeyRequest action for related examples.

See Also

- [CreateAccessKeyToFileRequest](#)
- [DeleteAccessKeyRequest](#)

- [DescribeAccessKeysRequest](#)
- [DescribeAccountsRequest](#)
- [RegisterAccessKeyRequest](#)

CreateAccessKeyToFileRequest

Description

Action to create the access key file of a cloud user for the specified account. This action also allows the creation of an access key on behalf of another user.

Request Parameters

account

ID of the account.Type: *AccountIdType*

Default: *None*

Required: Yes

keyStoreFileName

Name of a file to store the private key of the access key.Type: *GenericString*

Default: *None*

Required: Yes

forUser

User name of a different cloud user. User using this option must have cloud administrator privileges.Type: *GenericString*

Default: *None*

Required: No

Result Elements

The CreateAccessKeyToFileResult structure contains:

requestId

ID of the request.Type: *xs:string*

Required: Yes

accessKeyId

ID of the access key.Type: *xs:string*

Examples

No examples are provided for this action. See the RegisterAccessKeyRequest action for related examples.

CreateDistributionGroupRequest

Description

Action to create a distribution group for an account.

Request Parameters

name

Name of the distribution group.Type: *GenericString*

Required: Yes

description

Description of the distribution group.Type: *GenericString*

Required: No

size

Size of the distribution group. The size is the maximum number of vServers that can be added to the distribution group.Type: *PositiveInteger*

Required: No

Default: 21

Result Elements

The CreateDistributionGroupResult structure contains:

requestId

ID of the request.Type: *xs:string*

Required: Yes

distributionGroupId

ID of the distribution group.

Type: *xs:string*

Examples

Example 1

The following example creates a distribution group for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=CreateDistributionGroup&Version=1&Timestamp=1324407098313&Expires=13244073983  
13&name=myDistributionGroup&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FO  
R_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CreateDistributionGroupResult" requestId="103"><distributionGroupId>DG-8f81381c-a559-4f5b-b45f-086e605a382b</distributionGroupId></result>
```

Example 2

The following example creates a distribution group with a size of 10.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=CreateDistributionGroup&Version=1&Timestamp=1324407098313&Expires=1324407398313&name=myDistributionGroup2&size=10&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```

CreateKeyPairAsObjectRequest

Description

Action to create a key pair. This is a client-side action only, it does not travel through the network.

Request Parameters**keyName**

Name of the key pair to create. Type: *xs:string* Default: *None*

Required: Yes

Result Elements

The CreateKeyPairAsObjectResult type is created by hand as it contains the KeyPair class and is only needed on the client side.

Examples

No examples are provided for this action. See the RegisterKeyPairRequest action for related examples.

CreateKeyPairToFileRequest

Description

Action to create the key pair file for an account.

Request Parameters**keyName**

Name of the key pair to create.Type: *GenericString*

Default: *None*

Required: Yes

keyFileName

Name of the file to store the private key of the key pair.Type: *GenericString*

Default: *None*

Required: Yes

Result Elements

The CreateKeyPairToFileResult structure contains:

requestId

ID of the request.Type: *xs:string*

Required: Yes

keyName

Name of the key pair.Type: *xs:string*

keyFingerprint

Key pair fingerprint.Type: *xs:string*

Examples

No examples are provided for this action. See the RegisterKeyPairRequest action for related examples.

CreateSnapshotRequest

Description

Action to create a snapshot for an account based on an existing volume.

Request Parameters

name

Name of the snapshot.

Type: *GenericString*

Required: Yes

description

Description of the snapshot.

Type: *GenericString*

Required: No

volumeId

ID of the volume.

Type: *VolumeIdType*

Required: Yes

Result Elements

The result elements are contained in CreateSnapshotResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

snapshotId

ID of the snapshot.

Type: *SnapshotIdType*

Examples

Example 1

The following example creates a snapshot based on the specified volume ID.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=CreateSnapshot&Version=1&Timestamp=1318466247111&Expires=1318466547111&volume  
Id=VOL-246b5c62-4072-41cf-885b-99d6c63583bd&name=mySnapshot&AccessKeyId=AK_2&Signatu  
re=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA  
512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://  
www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"  
xsi:type="CreateSnapshotResult" requestId="118"><snapshotId>SNAP-d743e90c-53c5-4b01-

CreateTagsRequest

Description

Action to create or overwrite one or more tags for an existing resource.

Request Parameters

resourceId

ID of the resource.

Type: *ResourceIdType*

Default: *None*

Required: Yes

tags

List of one or more tag names and values.

Type: *TagType*

Default: *None*

Required: Yes

Minimum: 1

Maximum: *Unbounded*

Result Elements

The result elements are contained in CreateTagsResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples**Example 1**

The following example creates a tag for the specified virtual network ID.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=CreateTags&Version=1&Timestamp=1320101484395&Expires=1320101784395&resourceId=VNET-9ba968d5-e64f-4b54-a639-ee3d398e0d50&tags.1.name=myTag&tags.1.value=myTagValue&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_REABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CreateTagsResult" requestId="269"/>
```

CreateVnetRequest**Description**

Action to create a virtual network for an account.

Request Parameters**name**

Name of the virtual network.

Type: *GenericString*

Default: *None*

Required: Yes

description

A description for the virtual network.

Type: *GenericString*

Default: *None*

Required: No

size

Size of the virtual network's subnet.

Type: *PositiveInteger*

Default: 16

Required: No

Result Elements

The result elements are contained in CreateVnetResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

vnetId

ID of the virtual network.

Type: *GenericString*

Examples**Example 1**

The following example creates a virtual network for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=CreateVnet&Version=1&Timestamp=1318282423837&Expires=1318282723837&name=myVne  
t&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_R  
EQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://

CreateVolumeRequest

Description

Action to create a volume for an account.

Request Parameters

name

Name of the volume.

Type: *GenericString*

Default: *None*

Required: Yes

description

Description of the volume.

Type: *GenericString*

Default: *None*

Required: No

size

Size of the volume in gigabytes (GB). This option should not be used if a snapshot ID is given. An error is generated if both parameters are used, size and snapshotId.

Type: *PositiveInteger*

Default: 16

Required: No

shared

Flag to indicate if the volume is shared with other accounts in a vDC.

Type: *xs:boolean*

Default: 0 (*false*)

Required: No

snapshotId

ID of a snapshot. This option should not be used if a size value is given. An error is generated if both size and snapshotId parameters are used.

Type: *SnapshotIdType*

Default: *None*

Required: No

Result Elements

The result elements are contained in CreateVolumeResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

volumeId

ID of the volume.

Type: *xs:string*

Examples

Example 1

The following example creates a volume of 2 GB.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=CreateVolume&Version=1&Timestamp=1318462897126&Expires=1318463197126&name=myVol2&size=1&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="CreateVolumeResult"  
requestId="110"><volumeId>VOL-246b5c62-4072-41cf-885b-99d6c63583bd</volumeId></result>
```

Example 2

The following example creates a volume base on the specified snapshot ID.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=CreateVolume&Version=1&Timestamp=132010009343&Expires=1320100309343&snapshotId=SNAP-7a717e39-fe67-4573-a93d-889b3446176b&name=myVol&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
```

```
xsi:type="CreateVolumeResult" requestId="263">><volumeId>VOL-7d4993d6-f7f0-4611-b1a6-aca218746e64</volumeId></result>

DeleteAccessKeyRequest

Description

Action to unregister an access key from an account.

Request Parameters

accessKeyId

ID of the access key.Type: *xs:string*

Default: *None*

Required: *Yes*

Result Elements

The result elements are contained in DeleteAccessKeyResult.

requestId

ID of the request.Type: *xs:string*

Required: *Yes*

Examples

Example 1

The following example unregisters the specified access key of a cloud user.

HTTP Request

```
https://<EnterpriseControllerHostname>/akm/?  
Action=DeleteAccessKey&Version=1&Timestamp=1318278941862&Expires=1318279241862&acces  
sKeyId=AK_2
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://  
www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

DeleteDistributionGroupRequest

Description

Action to delete a distribution group from an account.

Request Parameters**distributionGroupId**

ID of the distribution group.Type: *DistributionGroupIdType*

Default: *None*

Required: Yes

Result Elements

The result elements are contained in DeleteDistributionGroupResult.

requestId

ID of the request.Type: *xs:string*

Required: Yes

Examples**Example 1**

The following example deletes a distribution group from an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DeleteDistributionGroup&Version=1&Timestamp=1324407269441&Expires=13244075694  
41&distributionGroupId=DG-8f81381c-a559-4f5b-

DeleteKeyPairRequest

Description

Action to delete a key pair from an account.

Request Parameters

keyName

Name of the key pair.Type: *xs:string*

Default: *None*

Required: Yes

Result Elements

The result elements are contained in DeleteKeyPairResult.

requestId

ID of the request.Type: *xs:string*

Required: Yes

Examples

Example 1

The following example deletes a key pair from an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DeleteKeyPair&Version=1&Timestamp=1318281994430&Expires=1318282294430&keyName  
=myKeyPair&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY  
_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://  
www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

DeleteSnapshotRequest

Description

Action to delete an existing snapshot from an account.

Request Parameters

snapshotId

ID of the snapshot.

Type: *SnapshotIdType*

Default: *None*

Required: *Yes*

Result Elements

The result elements are contained in DeleteSnapshotResult.

requestId

ID of the request.

Type: *xs:string*

Required: *Yes*

Examples

Example 1

The following example deletes the specified snapshot.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DeleteSnapshot&Version=1&Timestamp=1318624338550&Expires=1318624638550&snapshotId=SNAP-2f2039cd-943b-4072-9ded-e96b54b7ca79&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="DeleteSnapshotResult" requestId="234"/>

DeleteTagsRequest

Description

Action to delete one or more existing tags from a resource.

Request Parameters

resourceId

ID of the resource.

Type: *ResourceIdType*

Default: *None*

Required: Yes

tags

List of one or more tag names.

Type: *TagType*

Default: *None*

Required: Yes

Result Elements

The result elements are contained in DeleteTagsResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples

Example 1

The following example deletes the specified tag from a virtual network ID.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=DeleteTags&Version=1&Timestamp=1320102752960&Expires=1320103052960&resourceId=VNET-9ba968d5-e64f-4b54-a639-ee3d398e0d50&tags.1.name=myTag&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

DeleteVnetRequest

Description

Action to delete a private virtual network from an account.

Request Parameters

vnet

ID of the virtual network.

Type: *VnetIdType*

Default: *None*

Required: Yes

Result Elements

The result elements are contained in DeleteVnetResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples

Example 1

The following example deletes the specified private virtual network.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?

DeregisterServerTemplateRequest

Description

Action to delete a server template from an account.

Request Parameters

serverTemplateId

ID of the server template.

Type: *ServerTemplateIdType*

Default: *None*

Required: *Yes*

Result Elements

The result elements are contained in DeregisterServerTemplateResult.

requestId

ID of the request.

Type: *xs:string*

Required: *Yes*

Examples

Example 1

The following example deletes the specified server template.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DeregisterServerTemplate&Version=1&Timestamp=1320098301701&Expires=1320098601

DescribeAccessKeysRequest

Description

Action to display the available access keys for a cloud user.

Request Parameters

forUser

User name of a different cloud user. User using this option must have cloud administrator privileges.Type: *GenericString*

Default: *None*

Required: *No*

Result Elements

The result elements are contained in *DescribeAccessKeysResult*.

requestId

ID of the request.Type: *xs:string*

Required: *Yes*

items

List of access keys and their attributes.Type: *DescribeAccessKeysResultItem*

Minimum: *0*

Maximum: *Unbounded*

forUser

User name of the other cloud user.Type: *GenericString*

Examples

Example 1

The following example displays the available access keys for a cloud user.

HTTP Request

```
https://<EnterpriseControllerHostname>/akm/?
Action=DescribeAccessKeys&Version=1&Timestamp=1318278142966&Expires=1318278442966
```

HTTP Response

DescribeAccountsRequest

Description

Action to display account attributes for a cloud user. This action also allows filtering the accounts displayed by account ID.

Request Parameters

account

List of account IDs.Type: *AccountIdType*

Default: *None*

Required: *No*

forUser

User name of a different cloud user. The user executing the action using this option must have cloud administrator privileges.Type: *GenericString*

Default: *None*

Required: *No*

Result Elements

The result elements are contained in *DescribeAccountsResult*.

requestId

ID of the request.Type: *xs:string*

Required: *Yes*

items

List of the accounts and their attributes.Type: *DescribeAccountsResultItem*

Minimum: 0

Maximum: *Unbounded*

forUser

User name of the other cloud user.Type: *GenericString*

Examples

Example 1

The following example displays the attributes of all existing accounts for a cloud user.

HTTP Request

```
https://<EnterpriseControllerHostname>/akm/?  
Action=DescribeAccounts&Version=1&Timestamp=1317054664930&Expires=1317054724930
```

HTTP Response

DescribeAttributesRequest

Description

Action to display the value of one or more attributes of a resource.

This action is limited to the following resource types: server templates, snapshots, virtual networks, virtual servers, and volumes.

Request Parameters

resourceId

ID of a resource.Type: *ResourceIdType*

Default: *None*

Required: Yes

attrNames

List of one or more attribute names of the resource.Type: *GenericString*

Default: *None*

Required: Yes

Result Elements

The result elements are contained in *DescribeAttributesResult*.

requestId

ID of the request.Type: *xs:string*

Required: Yes

items

List of the resource attribute names and values.Type: *ResourceAttribute*

Minimum: 0

Maximum: *Unbounded*

Examples

Example 1

The following example lists the values of the ID, size, status, and share attributes for the specified volume ID.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeAttributes&Version=1&Timestamp=1318464041596&Expires=1318464341596&at  
trNames.4=shared&resourceId=VOL-246b5c62-4072-41cf-885b-99d6c63583bd&attrNames.  
3=size&attrNames.2=status&attrNames.  
1=id&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_TH  
E_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="DescribeAttributesResult" requestId="115"><items><name>id</name><value>VOL-246b5c62-4072-41cf-885b-99d6c63583bd</value></items><items><name>status</name><value>OK</value></items><items><name>size</name><value>0</value></items><items><name>shared</name></items></result>

DescribeBlacklistedIpAddressesRequest

Description

Action to list the IP addresses in the current blacklist, that is, reserved for a purpose and not available. This action allows filtering of by IP address or by attribute names and values. Valid filter names are: ip, vnetID, and owner.

Request Parameters

vnet

ID of the virtual network.

Type: *VnetIdType*

Required: Yes

owner

Alphanumeric string to identify the cloud user or the purpose of the blacklisted IP address.

Type: *String*

Required: No

Result Elements

The result elements are contained in *DescribeBlacklistedIpaddressesResult*.

requestId

ID of the request.Type: *xs:string*

Required: Yes

items

List of blacklisted IP addresses and their attributes.

Type: *DescribeBlacklistedIpAddressesResultItem*

Minimum: 0
Maximum: *Unbounded*

Examples

Example 1

The following example lists the blacklisted IP addresses for a vNet.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeBlacklistedIpAddresses&Version=1&Timestamp=1320339820989&Expires=1320  
340120989&filters.1.filterValue=VNET-6ea466f5-6e6b-4159-adf3-8867473d4cf4&filters.  
1.filterName=vnet&AccessKeyId=AK_32&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_REA  
DABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://

DescribeDistributionGroupsRequest

Description

Action to display the attributes of existing distribution groups for an account. This action allows filtering of distribution groups displayed by ID or by attribute names and values. Valid filter names are: id, name, description, status, vservers, and size.

Request Parameters

ids

List of distribution group IDs.Type: *DistributionGroupIdType*

Default: *None*

Required: *No*

filters

List of distribution group attribute names and values.

Type: *FilterItem*

Default: *None*

Required: *No*

Result Elements

The result elements are contained in `DescribeDistributionGroupsResult`.

requestId

ID of the request.Type: `xs:string`

Required: Yes

items

List of distribution groups and their attributes.

Type: `DescribeDistributionGroupsResultItem`

Minimum: 0

Maximum: *Unbounded*

Examples

Example 1

The following example displays the available distribution groups for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=DescribeDistributionGroups&Version=1&Timestamp=1324407152926&Expires=1324407452926&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

DescribeIpAddressesRequest

Description

Action to display allocated IP addresses attributes for an account. This action also allows filtering of the IP addresses displayed.

Request Parameters

filters

List of IP address attribute names and values.Type: `FilterItem`

Default: *None*

Required: *No*

Result Elements

The result elements are contained in *DescribeIpAddressesResult*.

requestId

ID of the request. Type: *xs:string*

Required: *Yes*

items

List of allocated IP addresses and their attributes.

Type: *DescribeIpAddressesResultItem*

Minimum: *0*

Maximum: *Unbounded*

Examples

Example 1

The following example lists all allocated IP addresses for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeIpAddresses&Version=1&Timestamp=1320339663115&Expires=1320339963115&

DescribeKeyPairsRequest

Description

Action to display attributes of existing key pairs for an account. This action allows filtering of key pairs displayed.

Request Parameters

keyNames

List of key pair names.Type: *GenericString*

Default: *None*

Required: *No*

filters

List of key pair attribute names and values.

Type: *FilterItem*

Default: *None*

Required: *No*

Result Elements

The result elements are contained in *DescribeKeyPairsResult*.

requestId

ID of the request.Type: *xs:string*

Required: *Yes*

items

List of key pairs and their attributes.

Type: *DescribeKeyPairsResultItem*

Minimum: *0*

Maximum: *Unbounded*

Examples

Example 1

The following example displays the available key pairs for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?

DescribeServerTemplatesRequest

Description

Action to display attributes of available server templates for an account. This action also allows filtering of server templates displayed.

Request Parameters**ids**

List of one or more server template IDs. Type: *ServerTemplateIdType*

Default: *None*

Required: *No*

filters

List of server template attribute names and values. Type: *FilterItem*

Default: *None*

Required: *No*

Result Elements

The result elements are contained in *DescribeServerTemplatesResult*.

requestIdID of the request. Type: *xs:string*

Required: Yes

items

List of server templates and their attributes.

Type: *DescribeServerTemplatesResultItem***Examples****Example 1**

The following example lists all the available server templates for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=DescribeServerTemplates&Version=1&Timestamp=1320088801876&Expires=1320089101876&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1

DescribeSchemasRequest

Description

Action to display the attributes of the available snapshots for an account. This action also allows filtering of the snapshots displayed.

Request Parameters

ids

List of one or more snapshot IDs. Type: *GenericString*

Default: *None*

Required: *No*

filters

List of snapshot attribute names and values. Type: *FilterItem*

Default: *None*

Required: *No*

Result Elements

The result elements are contained in *DescribeSchemasResult*.

requestId

ID of the request. Type: *xs:string*

Required: *Yes*

items

List of the snapshots and their attributes.

Type: *DescribeSchemasResultItem*

Examples

Example 1

The following example lists the attributes of all the available snapshots for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeSnapshots&Version=1&Timestamp=1318467903784&Expires=1318468203784&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

DescribeTagsRequest

Description

Action to display the tag attributes of the resources with an associated tag. This action also allows filtering of the tags or resources displayed.

Request Parameters

ids

List of one or more resource IDs.Type: *ResourceIdType*

Default: *None*

Required: No

filters

List of resource attributes or tag names and values.Type: *FilterItem*

Default: *None*

Required: No

Result Elements

The result elements are contained in *DescribeTagsResult*.

requestId

ID of the request.Type: *xs:string*

Required: Yes

items

List of the resource tags and their attributes.

Type: *DescribeTagsResultItem*

Examples**Example 1**

The following example lists all tags available for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeTags&Version=1&Timestamp=1320101837081&Expires=1320102137081&AccessKe

```

DescribeVnetsRequest

Description

Action to display the attributes of the available virtual networks for an account. This action also allows filtering of the virtual networks displayed.

Request Parameters

ids

List of one or more virtual network IDs.Type: *VnetIdType*

Default: *None*

Required: No

filters

List of virtual network attribute names and values. Type: *FilterItem*

Default: *None*

Required: No

Result Elements

The result elements are contained in *DescribeVnetsResult*.

requestId

ID of the request. Type: *xs:string*

Required: Yes

items

List of the virtual networks and their attributes.

Type: *DescribeVnetsResultItem*

Minimum: 0

Maximum: *Unbounded*

Examples

Example 1

The following example lists the available virtual networks for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?

DescribeVolumesRequest

Description

Action to display the attributes of the available volumes for an account. This action also allows filtering of volumes displayed. Valid filter names are: description, name, shared, status, id, and vservers.

Request Parameters**ids**

List of one or more volume IDs.Type: *VolumeIdType*

Default: *None*

Required: *No*

filters

List of volume attribute names and values.Type: *FilterItem*

Default: *None*

Required: *No*

Result Elements

The result elements are contained in *DescribeVolumesResult*.

requestIdID of the request. Type: *xs:string*

Required: Yes

items

List of volumes and their attributes.

Type: *DescribeVolumesResultItem*

Minimum: 0

Maximum: *Unbounded***Examples****Example 1**

The following example displays the attributes of the available volumes for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=DescribeVolumes&Version=1&Timestamp=1318463287921&Expires=1318463587921&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

DescribeVserverMetricsRequest

Description

Action to display vServer metrics.

This action also allows filtering of the vServers displayed. Valid filter names are: description, name, status, id, and cpuUsage.

Request Parameters**ids**

List of one or more vServer IDs.Type: *VserverIdType*

Default: *None*

Required: No

filters

List of vServer attribute names and values.Type: *FilterItem*

Default: *None*

Required: No

Result Elements

The result elements are contained in *DescribeVserversResult*.

requestId

ID of the request.Type: *xs:string*

Required: Yes

items

List of the vServers and their attributes.

Type: *DescribeVserverMetricsResultItem*

Minimum: 0

Maximum: *Unbounded*

Examples

Example 1

The following example displays metrics of all vServers available for an account.

HTTP Request

```

DescribeVserversRequest

Description

Action to display vServer attributes for an account.

This action also allows filtering of vServers displayed. Valid filter names are: description, name, status, id, serverTemplateId, keyName, vserverType, distributionGroup, volumes, vcpu, memoryMb, dedicatedStorageMb, and attachedStorageMb.

Request Parameters

ids

List of one or more vServer IDs.Type: *VserverIdType*

Default: *None*

Required: No

filters

List of vServer attribute names and values.Type: *FilterItem*

Default: *None*

Required: No

Result Elements

The result elements are contained in *DescribeVserversResult*.

requestId

ID of the request.Type: *xs:string*

Required: Yes

items

List of the vServers and their attributes.

Type: *DescribeVserversResultItem*

Minimum: 0

Maximum: *Unbounded*

Examples

Example 1

The following example displays attributes of all vServers available for an account.

HTTP Request

```

DescribeVserverTypesRequest

Description

Action to display the permitted vServer types for an account.

Request Parameters

There are no request parameters for this action.

Result Elements

The result elements are contained in `DescribeVserverTypesResult`. If the response is an empty list, contact your cloud administrator to verify your cloud user's privileges.

requestId

ID of the request. Type: `xs:string`

Required: Yes

items

List of vServer types and their attributes.

Type: `DescribeVserverTypesResultItem`

Minimum: 1

Examples

Example 1

The following example lists all available vServer types for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeVserverTypes&Version=1&Timestamp=1318625453358&Expires=1318625753358&

DetachVolumesFromVserverRequest

Description

Action to detach one or more volumes from a vServer.

Request Parameters

vserverId

ID of the vServer.

Type: *VserverIdType*

Default: *None*

Required: Yes

volumeIds

List of one or more volume IDs.

Type: *VolumeIdType*

Default: *None*

Required: Yes

force

Option to force detach.

Type: *xs:boolean*

Default: 0 (*false*)

Required: No

Result Elements

The result elements are contained in DetachVolumesFromVserverResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples

Example 1

The following example detaches the specified volumes from the vServer.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DetachVolumesFromVserver&Version=1&Timestamp=1321385229679&Expires=1321385529  
679&volumeIds.  
1=VOL-052cb4b4-5e56-4303-8b3a-82d6ba743a15&force=true&vserverId=VSRV-8ae29df9-

ImportKeyPairRequest

Description

Action to import an existing key pair to an account.

When importing a key pair, the cloud user supplies the file that stores the public key and then the public key is registered. The cloud user manages the private key himself.

ImportKeyPair is a client-side action, it internally makes a call to the RegisterKeyPair action.

Request Parameters

keyName

Name of the key pair.Type: *xs:string*

Default: *None*

Required: *Yes*

keyFileName

Name of the file that stores the public key of the key pair to import.Type: *GenericString*

Default: *None*

Required: *Yes*

Result Elements

The result elements are contained in ImportKeyPairResult.

requestId

ID of the request.Type: *xs:string*

Required: *Yes*

keyName

Name of the key pair.Type: *xs:string*

keyFingerprint

Key pair fingerprint.Type: *xs:string*

Examples

Example 1

The following example imports and registers a key pair using the public key in the specified key file.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=RegisterKeyPair&Version=1&Timestamp=1324421510757&Expires=1324421810757&publicKey=ssh-rsa+AAAAB3NzaC1yc2EAAAQABIwAAAQEAtJnFD8INGLtM%2FQIlxkDjh4t2R4%2FtTmpUDzMIRP%0A&keyName=myKeyPair&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="RegisterKeyPairResult" requestId="110"><keyName>myKeyPair</keyName><keyFingerprint>f4:20:bf:ad:ed:e7:0a:1a:a5:74:f9:80:72:bb:74:b4</keyFingerprint></result>
```

ImportVolumeRequest

Description

Action to import a volume to an account.

Request Parameters

name

Name of the volume.

Type: *GenericString*

Required: Yes

description

Description of the volume.

Type: *GenericString*

Required: No

url

URL of the volume to import.

Type: *URLType*

Required: No

shared

Flag to indicate if the volume is shared.

Type: *xs:boolean*

Default: 0 (*false*)

Required: No

Result Elements

The result elements are contained in ImportVolumeResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

volumeId

ID of the volume.

Type: *xs:string*

Examples

Example 1

The following example imports a shared volume for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=ImportVolume&Version=1&Timestamp=1324421943593&Expires=1324422243593&shared=true&name=myVolumeImported&url=http%3A%2Fexample.com%2FES%2FOVM%2Fvolume%2Fvolume1.img&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="ImportVolumeResult" requestId="111"><volumeId>VOL-b71cb98a-52db-49cc-aba4-66a1dfb4d13f</volumeId></result>

ModifyAttributesRequest**Description**

Action to modify one or more attribute values for a resource.

Request Parameters**resourceId**

ID of a resource.Type: *ResourceIdType*

Default: *None*

Required: *Yes*

attributes

List of one or more attribute names and values of a resource.Type: *ResourceAttribute*

Required: *Yes*

Result Elements

The result elements are contained in *ModifyAttributesResult*.

requestIdID of the request. Type: *xs:string*

Required: Yes

Examples**Example 1**

The following example modifies the name and description for the specified volume ID.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=ModifyAttributes&Version=1&Timestamp=1318464546890&Expires=1318464846890&reso

RebootVserversRequest

Description

Action to reboot one or more existing vServers.

Request Parameters**vserverIds**

One or more vServer IDs.

Type: *VserverIdType*

Required: Yes

Result Elements

The result elements are contained in RebootVserversResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples

Example 1

The following example reboots a vServer.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=RebootVservers&Version=1&Timestamp=1321380470326&Expires=1321380770326&vserverIds.1=VSRV-0fb57293-347c-4717-96ef-6dd23154596f&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="RebootVserversResult" requestId="121"/>

ReceiveMessageFromVserverRequest

Description

Action to read a message from a vServer.

This action reads a message by name from the common buffer in the virtualization layer. This action may return an error if the vServer is not in an appropriate state to receive messages. Use this action with vServers supported by Oracle VM Server for SPARC. Do not use with vServers supported by Oracle Solaris Zones.

Request Parameters

vserverId

ID of the vServer.

Type: *VserverIdType*

Required: Yes

key

Name of the key for the message to retrieve.

Type: *GenericString*

Required: Yes

Result Elements

The result elements are contained in *ReceiveMessageFromVserverResult*.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

value

Value of the message.

Type: *xs:string*

Examples**Example 1**

The following example receives a message from a vServer.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=ReceiveMessageFromVserver&Version=1&Timestamp=1321381585564&Expires=132138188  
5564&vserverId=VSRV-8ae29df9-ccfe-4184-  
acb8-10080665d7f6&key=myMessageKey&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REM  
OVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersi  
on=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://  
www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"  
xsi:type="ReceiveMessageFromVserverResult"  
requestId="123"<value>myMessageFromVserver</value></result>
```

RegisterAccessKeyRequest

Description

Action to register an access key of a cloud user to the specified account. This action also allows the creation of an access key on behalf of another cloud user. In that case, the user running this action requires cloud administrator privileges.

Request Parameters

publicKey

Public key of the access key.Type: *xs:string*

Required: Yes

account

ID of the account.Type: *AccountIdType*

Required: Yes

forUser

Name of another cloud user.Type: *GenericString*

Required: No

Result Elements

The result elements are contained in RegisterAccessKeyResult.

requestId

ID of the request.Type: *xs:string*

Required: Yes

accessKeyId

ID of the access key.Type: *xs:string*

Examples

Example 1

The following example registers an access key for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/akm/?Action=RegisterAccessKey&Version=1&Timestamp=1317055640451&Expires=1317055700451&publicKey=MIIIBIjANBqkqhkiG9w0BAQEFAOCAQ8AMIIIBCgKCAQEAA3XtkY0aBtOSFZcmk%2FPjiMj7xyGCzRB2I%0AwQXV%2BQiY5La1Ppj8fSxrs1t85Hy2%2FUy8gfVYy3peGm1mkdo0xtFFP90ACxKAH7Z8%2B8LqgPT6wDxY%0AxlkOF9k80M9fHxXrfWNfxfw87yd%2FNZdeZ0vgRxW8B%2BsuhmAV5HyRRFKuiQFko7EYVAijFIhRv7ez%0AThKNmP%2BSrOGvPuUoG035TD1oSbdpQ08ZGurvIdGevcJpM3IfOEy5tqyfU%2Fdvtalh

RegisterKeyPairRequest

Description

Action to register a key pair for an account.

Request Parameters

keyName

Name of the key pair.Type: *xs:string*

Required: Yes

publicKey

Public key of the key pair.Type: *xs:string*

Required: Yes

Result Elements

The result elements are contained in RegisterKeyPairResult.

requestId

ID of the request.Type: *xs:string*

Required: Yes

keyFingerprint

Key pair fingerprint.Type: *xs:string*

Examples

Example 1

The following example registers a key pair for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=RegisterKeyPair&Version=1&Timestamp=1318279380444&Expires=1318279680444&publicKey=ssh-rsa+AAAAAB3NzaC1yc2EAAAQABAAQDg2eienGE4vEMSMcVMBbYbC8z2q%2Fvhz3H6AanlJ6B4udseK%0A8CpaHJ23eGWcjcgAmuZCJ%2FoHUA2dN2PNPuK6g%2BZndR8wVaaQT89eWDZx9oaf0%2F2Eg%2FLLeKJ3moVH%0AvIVFB9aFCpa4H%2BOmLfM%2FmfQ4CYeDfo0r0jxCB0YL0o876LQqK5X%2BtgRXwbAbPH2Mzbzp%2FzzdkQ%0ArsBqSgUQ%2B1V4LkN6TQe06P5a2QY1lUhRXwUorTnbXczGq9zEJJ7ef%2F74xIQzfAipkYkyGgktsXrM%0A%2F%2Bs789v9ipaDB5B26y3aqj1dvW4ZLDvuGXP60aiUfj2WGIqxOKSVL%2FyB%2FtK1WbuZYwl+IaaS-Generated&keyName=myKeyPairK&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="RegisterKeyPairResult" requestId="137"><keyFingerprint>65:3d:ac:81:90:21:2c:4e:65:78:99:b2:37:13:00:93</keyFingerprint></result>

RegisterServerTemplateFromUrlRequest**Description**

Action to register a server template from a URL.

Request Parameters**name**

Name of the server template.

Type: *GenericString*

Required: Yes

description

Description of the server template.

Type: *GenericString*

Required: No

url

URL of the server template.

Type: *URLType*

Required: Yes

Result Elements

The result elements are contained in RegisterServerTemplateFromUrlResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

serverTemplateId

ID of the server template.

Type: *xs:string*

Examples

Example 1

The following example registers a server template for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=RegisterServerTemplateFromUrl&Version=1&Timestamp=1320096741216&Expires=13200

RegisterServerTemplateFromVserverRequest

Description

Action to register a server template from a vServer.

Request Parameters

name

Name of the server template.

Type: *GenericString*

Required: Yes

description

Description of the server template.

Type: *GenericString*

Required: No

vserverId

ID of the vServer.

Type: *VserverIdType*

Required: Yes

Result Elements

The result elements are contained in RegisterServerTemplateFromVserverResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

serverTemplateId

ID of the server template.

Type: *xs:string*

Examples

Example 1

The following example creates a server template for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=RegisterServerTemplateFromVserver&Version=1&Timestamp=1324422880552&Expires=1324423180552&name=mySTfromVserver&vserverId=VSrv-fdba0b48-6e1c-4f41-bde4-2c739dfeeb2f&AccessKeyId=AK_2&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1

RegisterServerTemplatesFromAssemblyRequest

Description

Action to register a set of server templates from an assembly. Names of the new server templates are taken from the assembly.

Request Parameters**description**

Description of the assembly.

Type: *GenericString*

Required: *No*

url

URL of the assembly.

Type: *URLType*

Required: *Yes*

Result Elements

The result elements are contained in RegisterServerTemplatesFromAssemblyResult.

requestId

ID of the request.

Type: *xs:string*

Required: *Yes*

serverTemplateIds

IDs of the server templates.

Type: *xs:string*

Examples

Example 1

The following example creates a set of server templates for an account.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=RegisterServerTemplatesFromAssembly&Version=1&Timestamp=1320097901377&Expires=1320098201377&url=http%3A%2F%2Fexample.com%3A8888%2FmyAssembly.ova&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="RegisterServerTemplatesFromAssemblyResult" requestId="254"><serverTemplateIds>ASSM-fe68b60a-b28b-45fa-8115-0801e3df67d5</serverTemplateIds></result>

ReleaseIpAddressesRequest

Description

Action to release one or more allocated IP addresses from a virtual network.

Request Parameters

vnet

ID of the virtual network.

Type: *VnetIdType*

Required: Yes

ipAddresses

One or more allocated IP addresses.

Type: *GenericString*

Required: Yes

Result Elements

The result elements are contained in ReleaseIpAddressesResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples

Example 1

The following example releases the specified IP addresses from the virtual network.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=ReleaseIpAddresses&Version=1&Timestamp=1320341801846&Expires=1320342101846&ip  
Addresses.2=192.0.2.10&ipAddresses.1=192.0.2.13&vnet=VNET-6ea466f5-6e6b-4159-  
adf3-8867473d4cf4&AccessKeyId=AK_32&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_REA  
DABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://  
www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"  
xsi:type="ReleaseIpAddressesResult" requestId="402"/>
```

RunVserverRequest

Description

Action to create and start a vServer assigning specific IP addresses.

Request Parameters

name

Name of the vServer.

Type: *GenericString*

Required: Yes

description

Description of the vServer.

Type: *GenericString*

Required: No

serverTemplateId

ID of a server template.

Type: *ServerTemplateIdType*

Required: Yes

ipAddresses

List of one or more reserved IP addresses.

Type: *GenericString*

Required: Yes

keyName

Name of a key pair.

Type: *GenericString*

Required: No

vserverType

ID of the vServer type.

Type: *GenericString*

Required: Yes

vnets

List of one or more virtual network IDs.

Type: *VnetIdType*

Required: Yes

volumes

List of one or more volume IDs.

Type: *VolumeIdType*

Required: No

distGroup

ID of the distribution group.

Type: *DistributionGroupIdType*

Required: No

ha

Flag to indicate if high availability is enabled for the vServer. The flag is boolean; possible values are true or false.

Type: *GenericString*

Required: No

messages

List of messages sent as key-value pairs to the vServer.

Type: *Message*

Required: No

hostname

A host name to set or override the internal host name for the vServer. It must be RFC 1123 compliant.

Type: *HostnameType*

Required: No

rootPasswordFile

Path and name of the file storing the password to set or override the root password for the vServer.

Type: *GenericString*

Required: No

localUser

Name of a local user for the vServer.

Type: *GenericString*

Required: No

localUserPasswordField

Path and name of the file storing the password of the local user for the vServer.

Type: *GenericString*

Required: No

Result Elements

The result elements are contained in RunVserverResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

vserverId

ID of the vServer.

Type: *xs:string*

Examples**Example 1**

The following example creates and starts a vServer.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?
Action=RunVserver&Version=1&Timestamp=1321379615665&Expires=1321379915665&vserverType=457&keyName=myKeyPair&vnets.
1=VNET-84ada392-1c13-4f86-8365-1cf7f9c8aadf&name=myVserver&ipAddresses.
1=192.0.2.2&serverTemplateId=TMPL-9e4a9ed3-e675-45f1-9d7c-
b21c25a55632&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="RunVserverResult" requestId="120"><vserverId>VSRV-8ae29df9-ccfe-4184-acb8-10080665d7f6</vserverId></result>

RunVserversRequest

Description

Action to create and start one or multiple vServers assigning IP addresses automatically.

Request Parameters

name

Name of the vServers.

Type: *GenericString*

Required: Yes

description

Description of the vServers.

Type: *GenericString*

Required: No

serverTemplateId

ID of the server template.

Type: *ServerTemplateIdType*

Required: Yes

num

Number of vServers.

Type: *PositiveInteger*

Default: 1

Required: No

vnets

List of one or more virtual network IDs.

Type: *VnetIdType*

Required: Yes

keyName

Name of the key pair.

Type: *GenericString*

Required: No

vserverType

ID of the vServer type.

Type: *GenericString*

Required: Yes

volumes

List of one or more volume IDs.

Type: *VolumeIdType*

Required: No

distGroup

ID of the distribution group.

Type: *DistributionGroupIdType*

Required: No

ha

Flag to indicate if high availability is enabled for the vServers. The flag is boolean; possible values are true or false.

Type: *GenericString*

Required: No

messages

List of messages sent as key-value pairs to the vServers.

Type: *Message*

Required: No

hostname

A host name to set or override the host name for the vServers. It must be RFC 1123 compliant.

Type: *HostnameType*

Required: No

rootPasswordFile

Path and name of the file storing the password to set or override the root password for the vServer.

Type: *GenericString*

Required: No

localUser

Name of a local user for the vServer.

Type: *GenericString*

Required: No

localUserPasswordFile

Path and name of the file storing the password of the local user for the vServer.

Type: *GenericString*

Required: No

Result Elements

The result elements are contained in RunVserversResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

vserverIds

List of one or more vServer IDs.

Type: *xs:string*

Examples**Example 1**

The following example creates and starts two vServers.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=RunVservers&Version=1&Timestamp=1320343596868&Expires=1320343896868&vserverTy

SendMessagesToVserverRequest

Description

Action to send a list of messages to a vServer. These messages can be read from the guest operating system. Use this action with vServers supported by Oracle VM Server for SPARC. Do not use with vServers supported by Oracle Solaris Zones.

Request Parameters

vserverId

ID of the vServer.

Type: *VserverIdType*

Required: Yes

messages

List of one or more message key names and values.

Type: *Message*

Required: Yes

Result Elements

The result elements are contained in *SendMessagesToVserverResult*.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples

Example 1

The following example sends a message to a vServer.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=SendMessagesToVserver&Version=1&Timestamp=1321381585564&Expires=1321381885564  
&messages.1.value=Running&messages.1.key=myStatus&vserverId=VSRV-8ae29df9-ccfe-4184-  
acb8-10080665d7f6&AccessKeyId=AK_1&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READ  
ABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="SendMessagesToVserverResult" requestId="123"/>
```

StartVserversRequest

Description

Action to start one or more stopped or shutdown vServers.

Request Parameters

vserverIds

One or more vServer IDs.

Type: *VserverIdType*

Required: Yes

Result Elements

The result elements are contained in StartVserversResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples

Example 1

The following example starts a vServer.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=StartVservers&Version=1&Timestamp=1320104759496&Expires=1320105059496&vserver  
Ids.1=VSRV-cle236e6-

StopVserversRequest

Description

Action to stop one or more running vServers.

Request Parameters**vserverIds**

List of one or more vServer IDs.

Type: *VserverIdType*

Required: Yes

force

Flag to force the action.

Type: *xs:boolean*

Default: 0 (*false*)

Required: No

Result Elements

The result elements are contained in StopVserversResult.

requestId

ID of the request.

Type: *xs:string*

Required: Yes

Examples

Example 1

The following example stops a vServer.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?Action=StopVservers&Version=1&Timestamp=1320105610783&Expires=1320105910783&vserverIds.1=VSRV-cle236e6-ef4d-4936-911a-97923dfbc291&AccessKeyId=AK_3&Signature=SIGNATURE_HAS_BEEN_REMOVED_FOR_THE_READABILITY_OF_THE_REQUEST&SignatureMethod=SHA512withRSA&SignatureVersion=1
```

HTTP Response

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?><result xmlns="http://www.oracle.com/xml/ns/iaas" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="StopVserversResult" requestId="278"/>
```

TerminateVserversRequest**Description**

Action to delete one or more vServers.

Request Parameters**vserverIds**

List of one or more vServer IDs.

Type: *VserverIdType*

Required: Yes

force

Flag to force the action.

Type: *xs:boolean*

Default: 0 (*false*)

Required: No

Result Elements

The result elements are contained in *TerminateVserversResult*.

requestId
ID of the request.
Type: *xs:string*
Required: Yes

Examples

Example 1

The following example deletes a vServer.

HTTP Request

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=TerminateVservers&Version=1&Timestamp=1321385662260&Expires=1321385962260&vse

Data Types

The following data types are described in this section:

- [AccountIdType](#)
- [DescribeAccessKeysResultItem](#)
- [DescribeAccountsResultItem](#)
- [DescribeDistributionGroupsResultItem](#)
- [DescribeIpAddressesResultItem](#)
- [DescribeKeyPairsResultItem](#)
- [DescribeServerTemplatesResultItem](#)

- [DescribeSnapshotsResultItem](#)
- [DescribeTagsResultItem](#)
- [DescribeVdcCapabilitiesResultItem](#)
- [DescribeVnetsResultItem](#)
- [DescribeVolumesResultItem](#)
- [DescribeVserverMetricsResultItem](#)
- [DescribeVserverTypesResultItem](#)
- [DistributionGroupIdType](#)
- [FilterItem](#)
- [GenericString](#)
- [Message](#)
- [PositiveInteger](#)
- [ResourceAttribute](#)
- [ResourceIdType](#)
- [SnapshotIdType](#)
- [ServerTemplateIdType](#)
- [TagType](#)
- [URLType](#)
- [VnetIdType](#)
- [VolumeIdType](#)
- [VserverIdType](#)

AccountIdType

Attributes of the AccountID data type.

Data Type Elements

This data type defines the pattern value of an account ID.

Type: *xs:string*

Pattern value: ACC-[0-9a-f]{8}-[0-9a-f]{4}-[0-9a-f]{4}-[0-9a-f]{4}-[0-9a-f]{12}

Ancestors

None

Actions

- [CreateAccessKeyAsObjectRequest](#)

- [CreateAccessKeyToFileRequest](#)
- [DescribeAccountsRequest](#)
- [RegisterAccessKeyRequest](#)

DescribeAccessKeysResultItem

Data Type Elements

accessKeyID

ID of the access key.

Type: *xs:string*

account

Name of the account.

Type: *xs:string*

Ancestors

None

Actions

[DescribeAccessKeysRequest](#)

DescribeAccountsResultItem

Data Type Elements

account

Account ID.

Type: *xs:string*

name

Name of the account.

Type: *xs:string*

description

Description of the account.

Type: *xs:string*

Ancestors

None

Actions

[DescribeAccountsRequest](#)

DescribeDistributionGroupsResultItem

Data Type Elements

id

ID of the distribution group.

Type: *xs:string*

name

Name of the distribution group.

Type: *xs:string*

description

Description of the distribution group.

Type: *xs:string*

status

Status of the distribution group.

Type: *xs:string*

tags

List of tags associated with the distribution group.

Type: *TagType*

vservers

List of vServer IDs associated with the distribution group.

Type: *VserverIdType*

size

Size of the distribution group.

Type: *xs:int*

Ancestors

None

Actions

[DescribeDistributionGroupsRequest](#)

DescribeIpAddressesResultItem

Data Type Elements

ipAddress

Reserved IP address.

Type: *xs:string*

vnet

ID of the virtual network.

Type: *VnetIdType*

vserver

ID of the vServer associated with the IP address.

Type: *VserverIdType*

Ancestors

None

Actions

[DescribeIpAddressesRequest](#)

DescribeKeyPairsResultItem

Data Type Elements**name**

Name of the key pair.

Type: *xs:string*

fingerprint

Fingerprint of the key pair.

Type: *xs:string*

Ancestors

None

Actions

[DescribeKeyPairsRequest](#)

DescribeServerTemplatesResultItem

Data Type Elements**id**

ID of the server template.

Type: *xs:string*

name

Name of the server template.

Type: *xs:string*

description

Description of the server template.

Type: *xs:string*

status

Status of the server template.

Type: *xs:string*

tags

List of none or more tags for the server template.

Type: *TagType*

size

Size of the server template in GB.

Type: *xs:long*

public

Flag to indicate if the server template is available for other accounts.

Type: *xs:boolean*

imageType

Type of the image, VM template or assembly.

Type: *GenericString*

readOnly

Flag to indicate if the server template is read only.

Type: *xs:boolean*

Ancestors

None

Actions

[DescribeServerTemplatesRequest](#)

DescribeSnapshotsResultItem

Data Type Elements

id

ID of the snapshot.

Type: *xs:string*

name

Name of the snapshot.

Type: *xs:string*

description

Description of the snapshot.

Type: *xs:string*

status

Status of the snapshot.

Type: *xs:string*

tags

List of none or more tags for the snapshot.

Type: *TagType*

Ancestors

None

Actions

[DescribeSnapshotsRequest](#)

DescribeTagsResultItem**Data Type Elements****resourceId**

ID of the resource.

Type: *xs:string*

name

Name of the tag.

Type: *xs:string*

value

Value of the tag.

Type: *xs:string*

Ancestors

None

Actions

[DescribeTagsRequest](#)

DescribeVdcCapabilitiesResultItem**Data Type Elements****name**

Name of vDC capability.

Type: *GenericString*

value

Value of the vDC capability.

Type: *GenericString*

Ancestors

None

Actions

[DescribeVdcCapabilitiesRequest](#)

DescribeVnetsResultItem

Data Type Elements

id

ID of the virtual network.

Type: *xs:string*

name

Name of the virtual network.

Type: *xs:string*

description

Description of the virtual network.

Type: *xs:string*

status

Status of the virtual network.

Type: *xs:string*

tags

List of none or more tags for the virtual network.

Type: *TagType*

ipAddress

Subnet of the virtual network.

Type: *GenericString*

Ancestors

DescribeVolumesResultItem

Data Type Elements

id

ID of the volume.

Type: *xs:string*

name

Name of the volume.

Type: *xs:string*

description

Description of the volume.

Type: *xs:string*

status

Status of the volume.

Type: *xs:string*

tags

List of none or more tags for the volume.

Type: *TagType*

size

Size of the volume in GB.

Type: *xs:double*

shared

Flag to indicate if the volume is shared.

Type: *xs:boolean*

vServers

List of vServer IDs associated with the volume.

Type: *VserverIdType*

Ancestors

None

Actions

[DescribeVolumesRequest](#)

DescribeVserverMetricsResultItem

Data Type Elements

id

ID of the vServer.

Type: *xs:string*

name

Name of the vServer.

Type: *xs:string*

description

Description of the vServer.

Type: *xs:string*

status

Status of the vServer.

Type: *xs:string*

tags

List of tags associated with the vServer.

Type: *TagType*

cpuUsage

vServer CPU usage.

Type: *xs:float*

Ancestors

None

Actions

[DescribeVserverMetricsRequest](#)

DescribeVserversResultItem

Data Type Elements

id

ID of the vServer.

Type: *xs:string*

name

Name of the vServer.

Type: *xs:string*

description

Description of the vServer.

Type: *xs:string*

status

Status of the vServer.

Type: *xs:string*

tags

List of tags associated with the vServer.

Type: *TagType*

vnets

List of virtual network IDs to which the vServer belongs to.

Type: *VnetIdType*

ipAddresses

List of IP addresses associated with the vServer.

Type: *xs:string*

serverTemplateId

ID of the server template associated with the vServer.

Type: *ServerTemplateIdType*

keyName

Name of the key pair associated with the vServer.

Type: *GenericString*

vserverType

ID of the vServer type associated with the vServer.

Type: *GenericString*

ha

Flag to indicate whether automatic recovery is enabled for the vServer. Flag is boolean, possible values are true or false.

Type: *GenericString*

distributionGroup

ID of the distribution group associated with the vServer.

Type: *GenericString*

volumes

List of volume IDs associated with the vServer.

Type: *xs:string*

vcpu

Number of vCPUs of the vServer.

Type: *xs:integer*

memoryMb

Total memory allocated for the vServer.

Type: *xs:long*

dedicatedStorageMb

Total storage dedicated to the vServer.

Type: *xs:long*

attachedStorageMb

Total storage of the volumes attached to the vServer.

Type: *xs:long*

Ancestors

None

Actions

[DescribeVserversRequest](#)

DescribeVserverTypesResultItem

Data Type Elements

id

ID of the vServer type.

Type: *xs:string*

name

Name of the vServer type.

Type: *xs:string*

description

Description of the vServer type.

Type: *xs:string*

tags

List of none or more tags of the vServer type.

Type: *TagType*

memorySize

Memory size of the vServer type in GB.

Type: *xs:long*

storageSize

Storage size of the vServer type in GB.

Type: *xs:long*

vcpu

Number of virtual CPUs of the vServer type.

Type: *xs:integer*

Web Service Client Example

Shows how to create requests using WebUtil and send them to the Web service.

This appendix provides an example for generating requests to the Web service of the cloud infrastructure API described in [Cloud Infrastructure API Reference](#).

This example uses the WebUtil application for generating the requests. The appendix includes the following topics:

- [Description of Web Service API Requests](#)
- [Sending a Web Service Request](#)
- [Creating Public and Private Keys](#)
- [Overview of the WebUtil Application](#)
- [Examples of Web Service Requests](#)

Description of Web Service API Requests

This section provides a description of the information contained in a typical request to the Web service. This section describes both types of requests:

- [AKM Request](#)
- [IAAS Request](#)

AKM Request

Lists the parameters of an AKM request to the Web service.

The following URL shows the information required in a typical access key management (AKM) request to the Web service:

`https://USER:PASSWORD@HOST/akm/?REQUEST_DATA`

Name	Description
USER	Cloud user name
PASSWORD	Cloud user password
HOST	IP address or fully qualified host name
REQUEST_DATA	The request data is made of a series of name=value parameters separated by an ampersand (&).

REQUEST_DATA Specification

The parameters required as part of the REQUEST_DATA depend on the value used for the AKM action. However, a set of common parameters is required for every AKM request.

The following table shows the required parameters for the REQUEST_DATA in every AKM request. [Example A-1](#) shows how these parameters appear in a complete request.

Name	Description
Action	One of the AKM actions. See RegisterAccessKeyRequest , DescribeAccessKeysRequest , DeleteAccessKeyRequest , and DescribeAccountsRequest actions for a complete description and extra parameters for each AKM action.
Version	1
Timestamp	Timestamp in milliseconds since January 1, 1970
Expires	Expiry date in milliseconds (ms) since January 1, 1970 must be greater than the timestamp field. A 300000 ms difference between the two values must be enough.

Example A-1 Complete AKM Request

`https://<username>:<password>@<EnterpriseControllerHostname>/akm/?Action=DescribeAccounts&Version=1&Timestamp=1330954619299&Expires=1330954919299`

IAAS Request

The following URL shows the information required in a typical infrastructure as a service (IAAS) request to the Web service:

`https://HOST/iaas/?REQUEST_IAAS_DATA&SIGNATURE_BLOCK`

Name	Description
HOST	IP address or fully qualified host name
REQUEST_IAAS_DATA	The request IAAS data is a series of name=value parameters separated by an ampersand (&).
SIGNATURE_BLOCK	The signature block is a series of name=value parameters separated by an ampersand (&).

REQUEST_IAAS_DATA Specification

The parameters required as part of the REQUEST_IAAS_DATA depend on the value used for the IAAS action. However, a set of common parameters is required for every IAAS request.

The following table shows the common required parameters for the REQUEST_IAAS_DATA in every IAAS request. [Example A-2](#) show how these parameter appears in a complete specification for REQUEST_IAAS_DATA.

Name	Description
Action	One of the IAAS actions. See “ List of Actions ” on page , for a complete list of IAAS actions and extra parameters for each IAAS action.
Version	1
Timestamp	Timestamp in milliseconds since January 1, 1970
Expires	Expiry date in milliseconds (ms) since January 1, 1970 must be greater than the timestamp field. A 300000 ms difference between the two values must be enough.
accessKeyId	The value returned by the AKM RegisterAccessKeyRequest action.

Example A-2 Sample REQUEST_IAAS_DATA Specification

```
Action=DescribeVnets&Version=1&Timestamp=1330954619299&Expires=1330954919299&accessKeyId=AK_1
```

SIGNATURE_BLOCK Specification

The signature block consists of signing some IAAS data with a private key so that the Web service can authenticate the request. The Web server should be able to verify the signature with the public key registered with the [RegisterAccessKeyRequest](#) action.

The following table shows the series of name=value parameters that conform the specification for the SIGNATURE_BLOCK. These parameters are separated by the ampersand(&). [Example A-3](#) shows a complete specification for a SIGNATURE_BLOCK sample.

Name	Description
SignatureVersion	1
SignatureMethod	SHA512withRSA. This is the only method supported.
Signature	Encoded Hash value of the data to be signed. See “ IAAS Data Used for Signature ” for a complete description of the Signature field.

Example A-3 Sample SIGNATURE_BLOCK Specification

```
SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=bj8GfJCqvPZZPU2JoWAGzZdCF+N767rQejILMQwNdgKLfoGGqAwDPRYMr/ghUoBc6RB3nKYgAyPdmtCfhzRGTqECgUWy0jCrE99+utGeeJ0/XRQ9LxyYeBgzjO31HP+hFhUo+gUtQaSYPhUHH7eTkxg/CrolMxibglypJM/rIf90yEqSeqhphQt7hWx1t0DNAY6/cZt8isT/Tu8V7ZFjBFkEpLfN97bIOJ2vIIp0eetmftuw4ObtqjbUp6+7dpVkhhCQnX0MAIDj+mjorE0zcwK+rFlpYuzESOfjaW0MowG+cA/9gttDjg7r5H29i3qbbjIlvAt6fk1HPpSxQTSTOTg==
```

IAAS Data Used for Signature

The following table shows the required information to generate the encoded hash value of the signature for an IAAS request. This data needs to be signed and base64

encoded. [Example A-4](#) shows a complete data set of the IAAS data used for generating a signature. [Example A-5](#) shows a Java representation of the IAAS data to sign.

Name	Description
Http Request type	POST
HostName	IP address or fully qualified host name
Base URL of the Web service	iaas
REQUEST_IAAS_DATA	The request data is made of a series of name=value parameters separated by an ampersand (&). See also " REQUEST_IAAS_DATA Specification ".

Example A-4 Example of the IAAS Data to Sign

A "\n" is required between every field.

```
POST
<EnterpriseControllerHostname>
/iaas/
Action= DescribeAccounts&Version=1&Timestamp=1330954619299&Expires=1330954919299
```

Example A-5 Java Representation of the Data to Sign

```
StringBuilder message = new
StringBuilder();Message.setLength(0);message.append("POST").append("\n");message.appe
nd("<EnterpriseControllerHostname>").append("\n");message.append("/");
iaas/").append("\n");message.append("Action=
DescribeVnets&Version=1&Timestamp=1330954619299&Expires=1330954919299&accessKeyId=AK_
1").append("\n");
```

See "[Examples of Web Service Requests](#)", for an example of generating an IAAS requests with signed data.

Sending a Web Service Request

Describes how a request to a Web service is constructed and sent.

Requests to the Web service are simple HTTP POST or GET operations. After a AKM or IAAS request is dynamically generated, static technology is used to send the request.

This section mentions the use of the Web browser and the WGET utility as the static technology to send requests to the Web service.

Using the Web Browser

Procedure to send a request to the Web browser.

To use the Web browser to send a request to the Web service, enter the complete request in the address bar of the browser.

The following URL is an example of a complete AKM request. The request should be entered in the address bar as a one-line command:

```
https://<username>:<password>@<EnterpriseControllerHostname>/
akm/? Action=
```

DescribeAccounts&Version=1&Timestamp=1330954619299&Expires=1330954919299

Using WGET Utility

Procedure to send a request using the WGET utility.

To use WGET utility, it is necessary to use the *--no-check-certificate* option.

The following is an example of sending a request using WGET with the same AKM request used previously:

```
wget https://<username>:<password>@<EnterpriseControllerHostname>/akm/?Action=DescribeAccounts&Version=1&Timestamp=1330954619299&Expires=1330954919299 --nocheck-certificate
```

Creating Public and Private Keys

Describes requirements for authentication

Both public and private RSA keys are required for signing the required IAAS data so that the Web service can authenticate the request.

Private Key

Describes the purpose of the private key and its location.

A private key must exist before you can create a public key. To create a private key, use the following command:

```
openssl genrsa -out privatekey.pem 2048
```

The private key is stored in the *privatekey.pem* file. This file is used to create the public key. After the public key is registered with the [RegisterAccessKeyRequest](#) action, this private key can be used to sign the IAAS data.

If the WebUtil application is used to sign the IAAS data, the private key must be stored in DER format. You can use the following command:

```
openssl pkcs8 -topk8 -inform PEM -outform DER -in privatekey.pem -nocrypt > privatekey.DER
```

The private key is stored in the *privatekey.DER* file.

Public Key

Procedure to create a public key.

To create a public key use the following command:

```
openssl rsa -in privatekey.pem -pubout -out publickey.pem
```

The public key is stored in the *publickey.pem* file. After the public key is registered using the [RegisterAccessKeyRequest](#) action, the Web server can verify the signed data with the public key.

Overview of the WebUtil Application

WebUtil is a simple Java application that generates the signature for an IAAS request to the Web service. WebUtil uses the SHA512withRSA method and base64 encoding to sign the required data.

The following is the code of the WebUtil application. You can build the application with the javac compiler; it is possible that two warnings are displayed when building the application.

         * This helper method was introduced to minimize the warnings about
         * using a Sun proprietary API. Use full package names to avoid
         * warning on import statement.
         */
        return new sun.misc.BASE64Encoder();
    }
}

```

How the WebUtil Application Works

Describes how to generate an HTTP request.

WebUtil application requires an access key for the account. See “[Creating an Access Key](#)” for information about how to create the access key.

After the access key is created, the IAAS data must be defined, as explained in “[IAAS Data Used for Signature](#)”.

The following is an example of the IAAS data for viewing vNets information:

```

POST
<EnterpriseControllerHostname>
Action=DescribeVnets&Version=1&accessKeyId=AK_1&Timestamp=12333333&Expires=13333444

```

To generate the signature and base64 encoding, use the WebUtil by running the following command:

```
java WebUtil signature privatekey.DER "POST" "<EnterpriseControllerHostname>"  
"Action=DescribeVnets&Version=1&accessKeyId=AK_1" signedData
```

WebUtil generates and stores the signed data in the signedData file:

```
Content of the signedData file: bj8GFJCqvPZZPU2JoWAGzzdCF  
+N767rQejILM0wNdgKLfoGGqAwDPRYMr/  
ghUoBc6RB3nKYgAyPdmtCfhzRGTqECgUWy0jCrE99+utGeeJ0/  
XRQ9LxyYeBgzjO3lHP+hFuO+gUtQaSYPhUHH7eTkxg/CrolMxibg1yPJM/  
rIf90yEqSeqhphQt7hWx1t0DNAy6/cZt8isT/  
Tu8V7ZFjBFkEpLfN97bIOJ2vIIpOeetmftuw4ObtqjbUp6+7dpVkhxCQnX0MAIDj  
+mjorEOzcwK+F1pYuzES0fjaW0MowG+cA/  
9gttDjg7r5H29i3qbbjI1vAt6fk1HPpSxQTSTOTg==
```

WebUtil also generates the iaasPartRequest file with the following information:

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeVnets&Version=1&AccessKeyId=AK_1&Timestamp=133105  
8169938&Expires=1331058469938&SignatureMethod=SHA512withRSA&Sign  
atureVersion=1&Signature=
```

To generate the complete HTTP request, append the content of the signedData file to the iaasPartRequest file as a single-line command. After that, the HTTP request can be sent, see "["Sending a Web Service Request"](#)".

Examples of Web Service Requests

This section presents an example for creating requests to the Web service that allows a cloud user to perform actions for an account. This section includes:

- [Creating an Access Key](#)
- [Executing actions for an account](#)

Creating an Access Key

Procedure to create an access key.

An access key is created for an account. The registered access key is needed to perform any IAAS action in the account.

To create an access key:

1. Create a private RSA key stored as a DER file.
 - a. Run the following command to create a private RSA key file:

```
openssl genrsa -out privatekey.pem 2048
```
 - b. Run the following command to store the private key as DER:

```
openssl pkcs8 -topk8 -inform PEM -outform DER -in  
privatekey.pem -nocrypt > privatekey.DER
```
2. Create a public RSA key base on the privateRSA key. Run the following command:

```
openssl rsa -in privatekey.pem -pubout -out publickey.pem
```

The openssl public key generated must be similar to the following:

```
-----BEGIN PUBLIC KEY-----
MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIIBCgKCAQEAufVdjdp0Mm0LbNypLVMW
Xfmhusawid4Wg4n4FZewSmoBEYA8f8wIA0SI87Shi7RtMcWsEoXvNNHA0wcJoA1R
jyVlsI3rtrq0c0k7AxQSwb4UK/rSXW1NxMh/mE7b3gdA6d9VuwlPnZJ5ZFUZCL
yhaAotLCdACrzbgzYXdq+rstutT1AVkE2UAMcm503KnIoObZKb8JtepSt74A9Rg
VBkcCBjmKGfLNOL1K1ZconkITm85TWKRaGRFuASxd12ZrD723ZNb66X/a9ebxTMr
6vVeskcaZpPlHzvgMOpiyDGwRvxn9yM5WB83zFDGT26Lihn/bKzLJXa+F2YNkLrT
JQIDAQAB
-----END PUBLIC KEY-----
```

3. Display the account attributes for a cloud user.
 - a. Create and send an AKM request using the [DescribeAccountsRequest](#) action. The appropriate hostname, cloud user, timestamp, and expires information must be provided:

```
https://
<username>:<password>@<EnterpriseControllerHostname>/
akm/?
Action=DescribeAccounts&Version=1&Timestamp=1330954619299
&Expires=1330954919299
```

- b. Verify the account ID from the result returned from the previous AKM request. In this example, the account ID is ACC-0162da5a-5d25-4096-af59-3dd1de27cfad

```
<result xsi:type="DescribeAccountsResult" requestId="803">
<items>
<account>ACC-0162da5a-5d25-4096-af59-3dd1de27cfad</account>
<name>acc1</name>
</items>
<forUser><username></forUser>
</result>
```

4. Create the access key for a cloud user account.

- a. Register the public key created in step 2 by using the [RegisterAccessKey](#) action. Ensure that the data is represented as a single line. The following URL shows the HTTPS request to create an access key. The account used is the one from the [DescribeAccount](#) action used in step 3:

```
https://
<username>:<password>@<EnterpriseControllerHostname>/
akm/?
Action=RegisterAccessKey&Version=1&Timestamp=1330975344&Expires=1333975344&account=ACC-0162da5a-5d25-4096-af59-3dd1de27cfad&publicKey=MIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIIBCgKCAQEAufVdjdp0Mm0LbNypLVMWXfmuhsawid4Wg4n4FZewSm0BEYA8f8wIA0SI87Shi7RtMcWsEoXvNNHA0wcJoA1RjyVlsI3rtrq0c0k7AxQSwb4UK/rSXW1NxMh/mE7b3gdA6d9VuwlPnZJ5ZFUZCLyhaAotLCdACrzbgzYXdq+rstutT1AVkE2UAMcm503KnIoObZKb8JtepSt74A9RgVBkcCBjmKGfLNOL1K1ZconkITm85TWKRaGRFuASxd12ZrD723ZNb66X/a9ebxTMr6vVeskcaZpPlHzvgMOpiyDGwRvxn9yM5WB83zFDGT26Lihn/bKzLJXa+F2YNkLrTJQIDAQAB
```

- b. Verify the access key ID that was generated. The access key ID is part of the results returned from the [RegisterAccessKey](#) action. This access key ID is

used for all IAAS requests for the account to authenticate the cloud user to the account. In this examples, the access key ID is AK_1.

```
<result xsi:type="RegisterAccessKeyResult" requestId="1013">
<accessKeyId>AK_1</accessKeyId>
</result>
```

Executing actions for an account

The following actions are explained in this section:

- [Viewing All Available Virtual Networks](#)
- [Viewing Specific Virtual Networks by Using IDs](#)
- [Viewing Specific Virtual Networks by Using Filters](#)
- [Creating a Private Virtual Network](#)

To execute these actions using the Web service, the access key ID and private key file obtained from the previous step.

Viewing All Available Virtual Networks

Procedure to create a request that displays available virtual network.

To view attributes of all available virtual networks for an account:

1. Define the data to be signed by using the DescribeVnets action.

```
Action=DescribeVnets&Version=1&AccessKeyId=AK_1
```

2. Sign the data by using the WebUtil application.

```
java WebUtil signature privatekey.DER "POST" "<EnterpriseControllerHostname>"  
"Action=DescribeVnets&Version=1&accessKeyId=AK_1" signedData
```

3. Get the signed data that is stored in the iaasPartRequest and signedData files.

```
Content of the iaasPartRequest file: https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeVnets&Version=1&AccessKeyId=AK_1&Timestamp=133  
1058169938&Expires=1331058469938&SignatureMethod=SHA512withRS  
A&SignatureVersion=1&Signature=
```

```
Content of the signedData file: bj8GfJCqvPZZPU2JoWAGzzdCF  
+N767rQejILMQwNdgKLfoGGqAwDPRYMr/  
ghUoBc6RB3nKYgAyPdmtCfhzRGTqECgUWy0jCrE99+utGeeJ0/  
XRQ9LxyYeBgzjO31HP+hFhUo+gUtQaSYPhUHH7eTkxg/CrolMxibg1ypJM/  
rIf90yEqSeqhphQt7hWx1T0DNAY6/cZt8ist/  
Tu8V7ZFjBFkEpLfN97bIOJ2vIIp0eetmf tuw40btqjbUp6+7dpVkhhCQnX0MA  
IDj+mjorEOzcwK+F1pYuzES0fjaW0MowG+cA/  
9gttDjg7r5H29i3qbbjIlvAt6fk1HPpSxQTSTOTg==
```

4. Append the signature to get the complete IAAS request, as show in the following example:

```
https://<EnterpriseControllerHostname>/iaas/?  
Action=DescribeVnets&Version=1&AccessKeyId=AK_1&Timestamp=133  
1058169938&Expires=1331058469938&SignatureMethod=SHA512withRS  
A&SignatureVersion=1&Signature=bj8GfJCqvPZZPU2JoWAGzzdCF
```

```
+N767rQejILMQwNdgKLfoGGqAwDPRYMr/
ghUoBc6RB3nKYgAyPdmtCfhzRGTqECgUWy0jCrE99+utGeeJ0/
XRQ9LxyYeBgzjO3lHP+hFhUo+gUtQaSYPhUHH7eTkxg/CrolMxibglypJM/
rIf90yEqSeqhphQt7hWx1T0DNAy6/cZt8isT/
Tu8V7ZFjBFkEpLfN97bIOJ2vIIp0eetmftuw4ObtqjbUp6+7dpVkhhCQnX0MA
IDj+mjorEOzcwK+F1pYuzES0fjaW0MowG+cA/
9gttDjg7r5H29i3qbbjIlvAt6fk1HPpSxQTSTOTg==
```

Note:

The complete request to the Web service must be created as a single-line request.

5. Send the complete IAAS request using the browser or the WGET utility. The result returned is similar to the following output:

```
<result xsi:type="DescribeVnetsResult" requestId="102">
<items>
<id>VNET-6c774d08-d0a7-493b-9fa1-c93a80702f8d</id>
<name>192.0.2.0/24</name>
<description>OVM Discovered Network</description>
<status>OK</status>
<ipAddress>192.0.2.0/24</ipAddress>
</items>
</result>
```

Viewing Specific Virtual Networks by Using IDs

Procedure to create a request that displays information about a virtual network.

To use the virtual networks IDs to specify which virtual networks to display for an account:

1. Define the data to be signed by using the DescribeVnets action.

```
Action=DescribeVnets&Version=1&AccessKeyId=AK_1&ids.
1=VNET-6c774d08-d0a7-493b-9fa1-c93a80702f8d
```

2. Sign the data by using the WebUtil application.

```
java WebUtil signature privatekey.DER "POST" "<EnterpriseControllerHostname>" 
>Action=DescribeVnets&Version=1&AccessKeyId=AK_1&ids.1=VNET-6c774d08-
d0a7-493b-9fa1-c93a80702f8d" signedData
```

3. Get the signed data that is stored in the iaasPartRequest and signedData files.

Content of the iaasPartRequest file: https://<EnterpriseControllerHostname>/iaas/?Action=DescribeVnets&Version=1&AccessKeyId=AK_1&ids.1=VNET-6c774d08-d0a7-493b-9fa1-c93a80702f8d&Timestamp=1331058449900&Expires=1331058749900&SignatureMethod=SHA12withRSA&SignatureVersion=1&Signature=

Content of the signedData file: <B15A5WdQkIwTr1R/NDXbn1RFwWyBFAQFtZTFz1jH8ftkRgvfwU93nxukpw23sHBdRvhzLuhyW2LWm90EIhZHd3H2x9s8D1wCAUFTsSAZoPuIlW40qn0sf9VTEXOlqwnxfray6eSGCcPHQWXaA+TjpCitguoPmHa3LjGKECnbNuqJS15L8VuVfE6otaxyTBzmhH7iI7pBC8gcpomnDZhxZkAFaVT0TFF88epbJa15Yl6aTpptjlUNEz6jDhuV2Qaa3bI50qnJc0>

```
PJgCkhuKU7un8us1JVEk/nf/or5RCBMmPGAluuILIfYBEE/
euVUy7wQ00eyKPRuplZkORmVbFLg==
```

4. Append the signature to get the complete IAAS request, as shown in the following example:

```
https://<EnterpriseControllerHostname>/iaas/?
Action=DescribeVnets&Version=1&AccessKeyId=AK_1&ids=
1=VNET-6c774d08-d0a7-493b-9fa1-

euVUy7wQ00eyKPRuplZkORmVbFLg==
```

Note:

The complete request to the Web service must be created as a single-line request.

5. Send the complete IAAS request using the browser or WGET utility. The result returned is similar to the following output:

```
<result xsi:type="DescribeVnetsResult" requestId="107">
<items>
<id>VNET-6c774d08-d0a7-493b-9fa1-c93a80702f8d</id>
<name>192.0.2.0/24</name>
<description>OVM Discovered Network</description>
<status>OK</status>
<ipAddress>192.0.2.0/24</ipAddress>
</items>
</result>
```

Viewing Specific Virtual Networks by Using Filters

Procedure to create a request that displays information about a virtual network.

To specify which virtual networks to display by using the name of the virtual network as filter:

1. Define the data to be signed by using the DescribeVnets action:

```
Action=DescribeVnets&Version=1&AccessKeyId=AK_1&filters=
1.filterValue=privatevnet1&filters.1.filterName=name
```

2. Sign the data by using the WebUtil application.

```
java WebUtil signature privatekey.DER "POST" "<EnterpriseControllerHostname>" 
>Action=DescribeVnets&Version=1&AccessKeyId=AK_1&filters=
1.filterValue=privatevnet1&filters.1.filterName=name" signedData
```

3. Get the signed data that is stored in the iaasPartRequest and signedData files.

Content of the iaasPartRequest file: `https://<EnterpriseControllerHostname>/iaas/?Action=DescribeVnets&Version=1&AccessKeyId=AK_1&filters.1.filterValue=privatevnet1&filters.1.filterName=name&Timestamp=1331058887344&Expires=1331059187344&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=`

Content of the signedData file: `B15A5WdQkIwTr1R/NDXbn1RFwWyBFAQFtZTFz1jH8ftkRgfwU93nxukpw23sHBdRvhzLuhW2LWm90EIhZhd3H2x9s8D1wCAUFTsSAZoPuI1W40qn0sf9VTEX0lqwnxfray6eSGCcpHQWXaA+TjpCitgguoPmHa3LjGKECnbNuqJS15L8VuVF6otaxyTBzmhH7iI7pBC8gcpomnDZhXZkAFaVT0TFF88epbJa15Y16aTpptjlUNEz6jDhuV2Qaa3bI50qnJc0PJgCkhuKU7un8us1JVEk/nf/or5RCBMmPGAluuILIFYBEE/euVUy7wQ00eyKPRup1ZkORmVbFLg==`

4. Append the signature to get the complete IAAS request, as shown in the following example:

```
https://<EnterpriseControllerHostname>/iaas/?Action/CreateVnet&Version=1&AccessKeyId=AK_1&name=privatevnetWebApi&Timestamp=1331058639019&Expires=1331058939019&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=B15A5WdQkIwTr1R/NDXbn1RFwWyBFAQFtZTFz1jH8ftkRgfwU93nxukpw23sHBdRvhzLuhW2LWm90EIhZhd3H2x9s8D1wCAUFTsSAZoPuI1W40qn0sf9VTEX0lqwnxfray6eSGCcpHQWXaA+TjpCitgguoPmHa3LjGKECnbNuqJS15L8VuVF6otaxyTBzmhH7iI7pBC8gcpomnDZhXZkAFaVT0TFF88epbJa15Y16aTpptjlUNEz6jDhuV2Qaa3bI50qnJc0PJgCkhuKU7un8us1JVEk/nf/or5RCBMmPGAluuILIFYBEE/euVUy7wQ00eyKPRup1ZkORmVbFLg==
```

Note:

The complete request to the Web service must be created as a single-line request.

5. Send the complete IAAS request using the browser or wget. The result returned is similar to the following output:

```
<result xsi:type="DescribeVnetsResult"><requestId="111"><items><id>VNET-8028fbfa-9e6f-4494-82c5-b35367340240</id><name>privatevnet1</name><description>privatevnet1</description><status>OK</status><ipAddress>192.0.2.0/24</ipAddress></items></result>
```

Creating a Private Virtual Network

Procedure to create a private virtual network for an account.

To create a private virtual network for an account:

1. Define the data to be signed by using the DescribeVnets action.

```
Action=CreateVnet&Version=1&AccessKeyId=AK_1&name=privatevnetWebApi
```

-
2. Sign the data by using the WebUtil application.

```
java WebUtil signature privateKey.DER "POST" "<EnterpriseControllerHostname>" "Action/CreateVnet&Version=1&AccessKeyId=AK_1&name=privatevnetWebApi" signedData
```

3. Get the signed data that is stored in the iaasPartRequest and signedData files.

Content of the iaasPartRequest file: *https://<EnterpriseControllerHostname>/iaas/?Action/CreateVnet&Version=1&AccessKeyId=AK_1&name=privatevnetWebApi&Timestamp=1331058639019&Expires=1331058939019&SignatureMethod=SHA512withRSA&SignatureVersion=1&Signature=pHQWXaA*

```

Note:

The complete request to the Web service must be created as a single-line request.

5. Send the complete IAAS request using the browser or WGET utility. The result returned is similar to the following output:

```
<result xsi:type="CreateVnetResult" requestId="109"><vnetId>VNET-7e33ee2e-d0f9-4b39-b8c9-32b8c8bfed87</vnetId></result>
```
